Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

Return Value

Type: `ConnectApi.RepositoryFolderItemsCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRepositoryFolderItems(repositoryId, repositoryFolderId, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

`getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize)`

Get a page of repository folder items in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItemsCollection getRepositoryFolderItems(String communityId, String repositoryId, String repositoryFolderId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

Return Value

Type: `ConnectApi.RepositoryFolderItemsCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

updateRepositoryFile(repositoryId, repositoryFileId, file)

Update the name of a repository file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String repositoryId,
String repositoryFileId, ConnectApi.ContentHubItemInput file)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file
Type: ConnectApi.ContentHubItemInput

The item type ID and fields of the item type.

When updating the metadata of a repository file, only the name field can be updated.

Return Value

Type: ConnectApi.RepositoryFileDetail

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example updates the name of a file in a Google Drive repository. After the file is updated, we show the file's ID, name, description, external URL, download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs', gDriveFileId =
'document:1q9OatVpcyYBK-JWzp_PhR75ulQghwFP15zhkamKrRcQ';

final ConnectApi.ContentHubItemInput updatedItem = new ConnectApi.ContentHubItemInput();
updatedItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
 for creation/update
updatedItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
```

```
final ConnectApi.ContentHubFieldValueInput fieldValueInputName = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputName.name = 'name';
fieldValueInputName.value =  'updated file name.txt';
updatedItem.fields.add(fieldValueInputName);

final ConnectApi.RepositoryFileDetail updatedFile =
ConnectApi.ContentHub.updateRepositoryFile(gDriveRepositoryId, gDriveFileId, updatedItem);
System.debug(String.format('Updated file - id: \'\'{0}\'\', name: \'\'{1}\'\', description:
 \'\'{2}\'\',\n external URL: \'\'{3}\'\', download URL: \'\'{4}\'\'',  new String[]{
updatedFile.id, updatedFile.name, updatedFile.description, updatedFile.externalDocumentUrl,
 updatedFile.downloadUrl}));
```

SEE ALSO:

setTestUpdateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData, result)

Apex Developer Guide: Testing ConnectApi Code

updateRepositoryFile(repositoryId, repositoryFileId, file, fileData)

Update the content of a repository file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String repositoryId,
String repositoryFileId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput
fileData)
```

Parameters

repositoryId

Type: String

The ID of the repository.

repositoryFileId

Type: String

The ID of the repository file.

file

Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

When updating the metadata of a repository file, only the name field can be updated.

fileData
Type: ConnectApi.BinaryInput

The binary file.

Return Value

Type: ConnectApi.RepositoryFileDetail

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example updates the content and name of a file in a Google Drive repository. After the file is updated, we show the file's ID, name, description, external URL, and download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs', gDriveFileId =
'document:1q9OatVpcyYBK-JWzp_PhR75ulQghwFP15zhkamKrRcQ';

final ConnectApi.ContentHubItemInput updatedItem = new ConnectApi.ContentHubItemInput();
updatedItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
 for creation/update
updatedItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
final ConnectApi.ContentHubFieldValueInput fieldValueInputName = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputName.name = 'name';
fieldValueInputName.value =  'updated file name.txt';
updatedItem.fields.add(fieldValueInputName);

//Binary content
final Blob updatedFileBlob = Blob.valueOf('even more awesome content for updated file');
final String updatedFileMimeType = 'text/plain';
final ConnectApi.BinaryInput fileBinaryInput = new ConnectApi.BinaryInput(updatedFileBlob,
 updatedFileMimeType, updatedFileName);

final ConnectApi.RepositoryFileDetail updatedFile =
ConnectApi.ContentHub.updateRepositoryFile(gDriveRepositoryId, gDriveFileId, updatedItem);
System.debug(String.format('Updated file - id: \'\'{0}\'\', name: \'\'{1}\'\', description:
 \'\'{2}\'\',\n external URL: \'\'{3}\'\', download URL: \'\'{4}\'\'',  new String[]{
updatedFile.id, updatedFile.name, updatedFile.description, updatedFile.externalDocumentUrl,
 updatedFile.downloadUrl}));
```

SEE ALSO:

setTestUpdateRepositoryFile(repositoryId, repositoryFileId, file, result)

`updateRepositoryFile(communityId, repositoryId, repositoryFileId, file)`

Update the name of a repository file in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String communityId,
String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

When updating the metadata of a repository file, only the name field can be updated.

Return Value

Type: `ConnectApi.RepositoryFileDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestUpdateRepositoryFile(repositoryId, repositoryFileId, file, fileData, result)

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData)

Update the content of a repository file in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String communityId,
String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file,
ConnectApi.BinaryInput fileData)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

When updating the metadata of a repository file, only the name field can be updated.

fileData
Type: `ConnectApi.BinaryInput`

The binary file.

Return Value

Type: `ConnectApi.RepositoryFileDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

Apex Developer Guide: Testing ConnectApi Code

ContentHub Test Methods

The following are the test methods for `ContentHub`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, result)`

Register a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(repositoryId, repositoryFolderId, file)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestAddRepositoryItem(String repositoryId, String
repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.RepositoryFolderItem
result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

result
Type: `ConnectApi.RepositoryFolderItem`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

addRepositoryItem(repositoryId, repositoryFolderId, file)

Apex Developer Guide: Testing ConnectApi Code

setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, result)

Register a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestAddRepositoryItem(String communityId, String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file,
ConnectApi.RepositoryFolderItem result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

result
Type: `ConnectApi.RepositoryFolderItem`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)

Apex Developer Guide: Testing ConnectApi Code

setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, fileData, result)

Register a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestAddRepositoryItem(String repositoryId, String
repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput fileData,
ConnectApi.RepositoryFolderItem result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

fileData
Type: `ConnectApi.BinaryInput`

The binary file.

result
Type: `ConnectApi.RepositoryFolderItem`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)

Apex Developer Guide: Testing ConnectApi Code

setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData, result)

Register a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestAddRepositoryItem(String communityId, String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput fileData, ConnectApi.RepositoryFolderItem result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

fileData
Type: `ConnectApi.BinaryInput`

The binary file.

result
Type: `ConnectApi.RepositoryFolderItem`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, result)`

Register a `ConnectApi.ContentHubAllowedItemTypeCollection` object to be returned when the matching `getAllowedItemTypes(repositoryId, repositoryFolderId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetAllowedItemTypes(String repositoryId, String
repositoryFolderId, ConnectApi.ContentHubAllowedItemTypeCollection result)
```

Parameters

`repositoryId`
Type: String

The ID of the repository.

`repositoryFolderId`
Type: String

The ID of the repository folder.

`result`
Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getAllowedItemTypes(repositoryId, repositoryFolderId)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, filter, result)`

Register a `ConnectApi.ContentHubAllowedItemTypeCollection` object to be returned when the matching `getAllowedItemTypes(repositoryId, repositoryFolderId, filter)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetAllowedItemTypes(String repositoryId, String
repositoryFolderId, ConnectApi.ContentHubItemType filter,
ConnectApi.ContentHubAllowedItemTypeCollection result)
```

Parameters

`repositoryId`
Type: String

The ID of the repository.

`repositoryFolderId`
Type: String

The ID of the repository folder.

`filter`
Type: `ConnectApi.ContentHubItemType`

Item types. Values are:

- `Any`—Includes files and folders.
- `FilesOnly`—Includes files only.
- `FoldersOnly`—Includes folders only.

`result`
Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getAllowedItemTypes(repositoryId, repositoryFolderId, filter)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetAllowedItemTypes(communityId, repositoryId, repositoryFolderId, result)`

API Version

40.0

Signature

```
public static Void setTestGetAllowedItemTypes(String communityId, String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemType filter,
ConnectApi.ContentHubAllowedItemTypeCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

filter
Type: `ConnectApi.ContentHubItemType`

Item types. Values are:

- `Any`—Includes files and folders.
- `FilesOnly`—Includes files only.
- `FoldersOnly`—Includes folders only.

result
Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFilePreview(repositoryId, repositoryFileId, formatType, result)

Register a `ConnectApi.FilePreview` object to be returned when the matching `getFilePreview(repositoryId, repositoryFileId, formatType)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetFilePreview(String repositoryId, String repositoryFileId,
ConnectApi.FilePreviewFormat formatType, ConnectApi.FilePreview result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: ConnectApi.FilePreviewFormat

Specifies the format of the file preview. Values are:

- Jpg—Preview format is JPG.
- Pdf—Preview format is PDF.
- Svg—Preview format is compressed SVG.
- Thumbnail—Preview format is 240 x 180 PNG.
- ThumbnailBig—Preview format is 720 x 480 PNG.
- ThumbnailTiny—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you're concerned that feature-rich SVG previews don't work in your org, choose alternative file previews. To use JPG file previews, enter *general* in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.

result
Type: ConnectApi.FilePreview

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFilePreview(repositoryId, repositoryFileId, formatType)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber, result)`

Register a `ConnectApi.FilePreview` object to be returned when the matching `getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetFilePreview(String repositoryId, String repositoryFileId,
ConnectApi.FilePreviewFormat formatType, Integer startPageNumber, Integer endPageNumber,
ConnectApi.FilePreview result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: `ConnectApi.FilePreviewFormat`

Specifies the format of the file preview. Values are:

- `Jpg`—Preview format is JPG.
- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you're concerned that feature-rich SVG previews don't work in your org, choose alternative file previews. To use JPG file previews, enter *general* in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.

startPageNumber
Type: Integer

The starting page number in the range of file preview URLs.

endPageNumber
Type: Integer

The ending page number in the range of file preview URLs.

result
Type: ConnectApi.FilePreview

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)

getRepositories()

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRepositories(communityId, result)`

Register a `getRepositories(communityId)` object to be returned when the matching `ConnectApi.ContentHubRepositoryCollection` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositories(String communityId, ConnectApi.ContentHubRepositoryCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

result
Type: ConnectApi.ContentHubRepositoryCollection

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepositories(communityId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetRepositories(pageParam, pageSize, result)

Register a `ConnectApi.ContentHubRepositoryCollection` object to be returned when the matching `getRepositories(pageParam, pageSize)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositories(Integer pageParam, Integer pageSize,
ConnectApi.ContentHubRepositoryCollection result)
```

Parameters

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

result
Type: ConnectApi.ContentHubRepositoryCollection

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepositories(pageParam, pageSize)

`setTestGetRepository(repositoryId, result)`

Register a `ConnectApi.ContentHubRepository` object to be returned when the matching `getRepository(repositoryId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepository(String repositoryId,
ConnectApi.ContentHubRepository result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

result
Type: ConnectApi.ContentHubRepository

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepository(repositoryId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetRepository(communityId, repositoryId, result)

Register a `ConnectApi.ContentHubRepository` object to be returned when the matching `getRepository(communityId, repositoryId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepository(String communityId, String repositoryId,
ConnectApi.ContentHubRepository result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

result
Type: ConnectApi.ContentHubRepository

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepository(communityId, repositoryId)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRepositoryFile(repositoryId, repositoryFileId, result)`

Register a `ConnectApi.RepositoryFileDetail` object to be returned when the matching `getRepositoryFile(repositoryId, repositoryFileId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFile(String repositoryId, String repositoryFileId,
ConnectApi.RepositoryFileDetail result)
```

Parameters

`repositoryId`
Type: String

The ID of the repository.

`repositoryFileId`
Type: String

The ID of the repository file.

`result`
Type: `ConnectApi.RepositoryFileDetail`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepositoryFile(repositoryId, repositoryFileId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo, result)

Register a `ConnectApi.RepositoryFileDetail` object to be returned when the matching `getRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFile(String repositoryId, String repositoryFileId,
Boolean includeExternalFilePermissionsInfo, ConnectApi.RepositoryFileDetail result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

includeExternalFilePermissionsInfo
Type: Boolean

Specifies whether to include permission information, such as whether the file is shared and what are the available permission types.

Managing external file permissions is supported for Google Drive, SharePoint Online, and OneDrive for Business.

result
Type: `ConnectApi.RepositoryFileDetail`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

setTestGetRepositoryFile(communityId, repositoryId, repositoryFileId, result)

Register a `ConnectApi.RepositoryFileDetail` object to be returned when the matching `getRepositoryFile(communityId, repositoryId, repositoryFileId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFile(String communityId, String repositoryId,
String repositoryFileId, ConnectApi.RepositoryFileDetail result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

result
Type: `ConnectApi.RepositoryFileDetail`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

setTestGetRepositoryFolder(repositoryId, repositoryFolderId, result)

Register a `ConnectApi.RepositoryFolderDetail` object to be returned when the matching `getRepositoryFolder(repositoryId, repositoryFolderId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFolder(String repositoryId, String
repositoryFolderId, ConnectApi.RepositoryFolderDetail result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

result
Type: `ConnectApi.RepositoryFolderDetail`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFolder(String communityId, String repositoryId,
String repositoryFolderId, ConnectApi.RepositoryFolderDetail result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

result
Type: `ConnectApi.RepositoryFolderDetail`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepositoryFolder(communityId, repositoryId, repositoryFolderId)

`setTestGetRepositoryFolderItems(repositoryId, repositoryFolderId, result)`

Register a `ConnectApi.RepositoryFolderItemsCollection` object to be returned when the matching `getRepositoryFolderItems(repositoryId, repositoryFolderId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFolderItems(String repositoryId, String
repositoryFolderId, ConnectApi.RepositoryFolderItemsCollection result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

result
Type: `ConnectApi.RepositoryFolderItemsCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

setTestUpdateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData, result)

Register a `ConnectApi.RepositoryFileDetail` object to be returned when the matching `updateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestUpdateRepositoryFile(String communityId, String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput fileData, ConnectApi.RepositoryFileDetail result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

fileData
Type: `ConnectApi.BinaryInput`

The binary file.

result
Type: `ConnectApi.RepositoryFileDetail`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

updateRepositoryFile(repositoryId, repositoryFileId, file)

Apex Developer Guide: Testing ConnectApi Code

ConversationApplicationDefinition Class

Access information about a conversation application definition.

Namespace

ConnectApi

ConversationApplicationDefinition Methods

The following are methods for `ConversationApplicationDefinition`. All methods are static.

IN THIS SECTION:

getConversationApplicationDefinition(integrationName)
Get information about an integration's conversation application definition and the associated bot.

`getConversationApplicationDefinition(integrationName)`

Get information about an integration's conversation application definition and the associated bot.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ConversationApplicationDefinitionDetailRespresentation
getConversationApplicationDefinition(String integrationName)
```

Parameters

`integrationName`
Type: String

Name of the conversation application.

Return Value

Type: `ConnectApi.ConversationApplicationDefinitionDetailRespresentation`

Usage

To access this method, enable the bot feature, and the user must be an admin or have the Manage Bots or Manage Bots Training Data user permissions.

Datacloud Class

Purchase Data.com contact or company records, and retrieve purchase information.

Namespace

ConnectApi

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

IN THIS SECTION:

Datacloud Methods
The following are methods for `Datacloud`. All methods are static.

Datacloud Methods

The following are methods for `Datacloud`. All methods are static.

IN THIS SECTION:

getCompaniesFromOrder(orderId, pageSize, page)
Get a list of purchased company records for an order.

getCompany(companyId)
Get a company record.

getContact(contactId)
Get a contact.

getContactsFromOrder(orderId, page, pageSize)
Get a list of purchased contacts for an order.

getOrder(orderId)
Get an order.

getUsage(userId)
Get purchase usage information for a user.

postOrder(orderInput)
Purchase records that are listed in an input file.

`getCompaniesFromOrder(orderId, pageSize, page)`

Get a list of purchased company records for an order.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudCcompanies getCompaniesFromOrder(String orderId, String
pageSize, String page)
```

Parameters

orderId
Type: String

ID of an order.

page
Type: Integer

Number of the page that you want returned.

pageSize
Type: Integer

Number of companies to show on a page. The default *pageSize* is 25.

Return Value

Type: ConnectApi.DatacloudCompanies

getCompany(companyId)

Get a company record.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudCompany getCompany(String companyId)
```

Parameters

companyId
Type: String

ID of a company in the Data.com database.

Return Value

Type: ConnectApi.DatacloudCompany

getContact(contactId)

Get a contact.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudContact getContact(String contactId)
```

Parameters

contactId
Type: String

ID of a contact in the Data.com database.

Return Value

Type: ConnectApi.DatacloudContact

getContactsFromOrder(orderId, page, pageSize)

Get a list of purchased contacts for an order.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudContacts getContactsFromOrder(String orderId, String
page, String pageSize)
```

Parameters

orderId
Type: String

ID of an order.

page
Type: Integer

Number of the page that you want returned.

pageSize
Type: Integer

Number of contacts to show on a page. The default *pageSize* is 25.

Return Value

Type: ConnectApi.DataCloudContacts

getOrder(orderId)

Get an order.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudOrder getOrder(String orderId)
```

Parameters

orderId
Type: String

ID of an order.

Return Value

Type: ConnectApi.DatacloudOrder

getUsage(userId)

Get purchase usage information for a user.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudPurchaseUsage getUsage(String userId)
```

Parameters

userId
Type: String

ID of a user.

Return Value

Type: ConnectApi.DatacloudPurchaseUsage

postOrder(orderInput)

Purchase records that are listed in an input file.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudOrder postOrder(ConnectApi.DatacloudOrderInput
orderInput)
```

Parameters

orderInput
Type: ConnectApi.DatacloudOrderInput

A list that contains IDs for the contacts or companies that you want to see.

Return Value

Type: ConnectApi.DatacloudOrder

Example

```
ConnectApi.DatacloudOrderInput inputOrder=new ConnectApi.DatacloudOrderInput();
List<String> ids=new List<String>();
ids.add('1234');
inputOrder.companyIds=ids;
ConnectApi.DatacloudOrder datacloudOrderRep = ConnectApi.Datacloud.postOrder(inputOrder);
```

EinsteinLLM Class

Generate responses for prompt templates.

Namespace

ConnectApi

EinsteinLLM Methods

The following are methods for `EinsteinLLM`. All methods are static.

IN THIS SECTION:

generateMessagesForPromptTemplate(promptTemplateDevName, promptTemplateGenerationsInput)
Generates a response using the specified prompt template and input parameters.

`generateMessagesForPromptTemplate(promptTemplateDevName, promptTemplateGenerationsInput)`

Generates a response using the specified prompt template and input parameters.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.EinsteinPromptTemplateGenerationsRepresentation
generateMessagesForPromptTemplate(String promptTemplateDevName,
ConnectApi.EinsteinPromptTemplateGenerationsInput promptTemplateGenerationsInput)
```

Parameters

promptTemplateDevName
Type: String

Developer name or ID of a prompt template record.

promptTemplateGenerationsInput
Type: `ConnectApi.EinsteinPromptTemplateGenerationsInput`

Input for generating a response using the specified prompt template.

Return Value

Type: `ConnectApi.EinsteinPromptTemplateGenerationsRepresentation`

Example

In this example, call `generateMessagesForPromptTemplate(promptTemplateDevName, promptTemplateGenerationsInput)` to resolve a Sales Email prompt template. For more examples, see Resolve a Prompt Template.

```
// Create input
ConnectApi.EinsteinPromptTemplateGenerationsInput promptGenerationsInput = new
ConnectApi.EinsteinPromptTemplateGenerationsInput();
promptGenerationsInput.isPreview = false;

// Build input map
Map<String,ConnectApi.WrappedValue> valueMap = new Map<String,ConnectApi.WrappedValue>();

Map<String, String> recipientEntityRecordIdMap = new Map<String, String>();
recipientEntityRecordIdMap.put('id', '00Qxx000002ToPvEAK');

Map<String, String> senderEntityRecordIdMap = new Map<String, String>();
senderEntityRecordIdMap.put('id', '005xx000001XiWLAA0');

ConnectApi.WrappedValue recipientEntityWrappedValue = new ConnectApi.WrappedValue();
recipientEntityWrappedValue.value = recipientEntityRecordIdMap;

ConnectApi.WrappedValue senderEntityWrappedValue = new ConnectApi.WrappedValue();
senderEntityWrappedValue.value = senderEntityRecordIdMap;

valueMap.put('Input:Account', recipientEntityWrappedValue);
valueMap.put('Input:Recipient', recipientEntityWrappedValue);
valueMap.put('Input:Sender', senderEntityWrappedValue);

promptGenerationsInput.inputParams = valueMap;

// Set additional configuration values
promptGenerationsInput.additionalConfig = new ConnectApi.EinsteinLlmAdditionalConfigInput();
promptGenerationsInput.additionalConfig.applicationName =
'PromptTemplateGenerationsInvocable';

// Call the service
ConnectApi.EinsteinPromptTemplateGenerationsRepresentation generationsOutput =
ConnectApi.EinsteinLLM.generateMessagesForPromptTemplate('0hfxx0000000KTNAA2',
promptGenerationsInput);

// Consume response
System.debug('Prompt Testing: ' + generationsOutput.prompt);
```

EmailMergeFieldService Class

Extract a list of merge fields for an object. A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Namespace

ConnectApi

EmailMergeFieldService Methods

The following are methods for `EmailMergeFieldService`. All methods are static.

IN THIS SECTION:

getMergeFields(objectApiNames)
Extract the merge fields for a specific object.

`getMergeFields(objectApiNames)`

Extract the merge fields for a specific object.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.EmailMergeFieldInfo getMergeFields(List<String> objectApiNames)
```

Parameters

`objectApiNames`
Type: List<String>

The API names for the objects being referenced.

Return Value

Type: `ConnectApi.EmailMergeFieldInfo`

EmployeeProfiles Class

Get, set and crop, and delete employee banner photos and photos.

Namespace

ConnectApi

EmployeeProfiles Methods

These methods are for `EmployeeProfiles`. All methods are static.

IN THIS SECTION:

deleteBannerPhoto(employeeId)
Delete an employee's banner photo.

deletePhoto(employeeId)
Delete an employee's photo.

getBannerPhoto(employeeId)
Get an employee's banner photo.

getPhoto(employeeId)
Get an employee's photo.

setBannerPhoto(employeeId, fileId, versionNumber)
Set an uploaded file as an employee's banner photo.

setBannerPhoto(employeeId, fileUpload)
Set a file that hasn't been uploaded as an employee's banner photo.

setBannerPhotoWithAttributes(employeeId, bannerPhoto)
Set and crop an uploaded file as an employee's banner photo.

setBannerPhotoWithAttributes(employeeId, bannerPhoto, fileUpload)
Set and crop a file that hasn't been uploaded as an employee's banner photo.

setPhoto(employeeId, fileId, versionNumber)
Set an uploaded file as an employee's photo.

setPhoto(employeeId, fileUpload)
Set a file that hasn't been uploaded as an employee's photo.

setPhotoWithAttributes(employeeId, photo)
Set and crop an uploaded file as an employee's photo.

setPhotoWithAttributes(employeeId, photo, fileUpload)
Set and crop a file that hasn't been uploaded as an employee's photo.

`deleteBannerPhoto(employeeId)`

Delete an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static Void deleteBannerPhoto(String employeeId)
```

Parameters

employeeId
Type: String

ID of the employee.

Return Value

Type: Void

deletePhoto(employeeId)

Delete an employee's photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static Void deletePhoto(String employeeId)
```

Parameters

employeeId
Type: String

ID of the employee.

Return Value

Type: Void

getBannerPhoto(employeeId)

Get an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto getBannerPhoto(String employeeId)
```

Parameters

employeeId
Type: String

ID of the employee.

Return Value

Type: ConnectApi.BannerPhoto

getPhoto(employeeId)

Get an employee's photo.

API Version

51.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo getPhoto(String employeeId)
```

Parameters

employeeId
Type: String

ID of the employee.

Return Value

Type: ConnectApi.Photo

setBannerPhoto(employeeId, fileId, versionNumber)

Set an uploaded file as an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String employeeId, String fileId,
Integer versionNumber)
```

Parameters

employeeId
Type: String

ID of the employee.

fileId
Type: String

ID of the uploaded file to use as the employee banner photo. The file must be an image and be smaller than 2 GB.

versionNumber
Type: Integer

Version number of the file. Specify an existing version number or, to get the latest version, specify `null`.

Return Value

Type: `ConnectApi.BannerPhoto`

setBannerPhoto(employeeId, fileUpload)

Set a file that hasn't been uploaded as an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String employeeId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

employeeId
Type: String

ID of the employee.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.BannerPhoto

Usage

Photos are processed asynchronously and might not be visible right away.

setBannerPhotoWithAttributes(employeeId, bannerPhoto)

Set and crop an uploaded file as an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String employeeId,
ConnectApi.BannerPhotoInput bannerPhoto)
```

Parameters

employeeId
Type: String

ID of the employee.

bannerPhoto
Type: ConnectApi.BannerPhotoInput

A `ConnectApi.BannerPhotoInput` object that specifies the ID and version of the file, and how to crop the file.

Return Value

Type: ConnectApi.BannerPhoto

Usage

Photos are processed asynchronously and might not be visible right away.

setBannerPhotoWithAttributes(employeeId, bannerPhoto, fileUpload)

Set and crop a file that hasn't been uploaded as an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String employeeId,
ConnectApi.BannerPhotoInput bannerPhoto, ConnectApi.BinaryInput fileUpload)
```

Parameters

employeeId
Type: String

ID of the employee.

bannerPhoto
Type: ConnectApi.BannerPhotoInput

A `ConnectApi.BannerPhotoInput` object specifying the cropping parameters.

fileUpload
Type: ConnectApi.BinaryInput

File to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.BannerPhoto

Usage

Photos are processed asynchronously and might not be visible right away.

setPhoto(employeeId, fileId, versionNumber)

Set an uploaded file as an employee's photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhoto(String employeeId, String fileId, Integer
versionNumber)
```

Parameters

employeeId
Type: String

ID of the employee.

fileId
Type: String

ID of the uploaded file to use as the employee photo. The file must be an image and be smaller than 2 GB.

versionNumber
Type: Integer

Version number of the file. Specify an existing version number or, to get the latest version, specify `null`.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

setPhoto(employeeId, fileUpload)

Set a file that hasn't been uploaded as an employee's photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhoto(String employeeId, ConnectApi.BinaryInput
fileUpload)
```

Parameters

employeeId
Type: String

ID of the employee.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.Photo

Usage

Photos are processed asynchronously and might not be visible right away.

setPhotoWithAttributes(employeeId, photo)

Set and crop an uploaded file as an employee's photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String employeeId,
ConnectApi.PhotoInput photo)
```

Parameters

employeeId
Type: String

ID of the employee.

photo
Type: ConnectApi.PhotoInput

A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

Return Value

Type: ConnectApi.Photo

Usage

Photos are processed asynchronously and might not be visible right away.

setPhotoWithAttributes(employeeId, photo, fileUpload)

Set and crop a file that hasn't been uploaded as an employee's photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String employeeId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

employeeId
Type: String

ID of the employee.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the cropping parameters.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

Exchanges Class

Preview and submit cart to exchange orders.

Namespace

ConnectApi

Exchanges Methods

These methods are for `Exchanges`. All methods are static.

IN THIS SECTION:

previewCartToExchangeOrder(previewCartToExchangeOrderInput)
Retrieves a preview of an exchange order, taking into account the order summary balance and the difference between the return order and the cart that represents the exchange order.

submitCartToExchangeOrder(submitCartToExchangeOrderInput)

Creates an exchange order summary, based on the return order and the cart used for exchanges. The new exchange order summary is attached to the original order summary (created before any exchanges occurred). You can also provide optional payment information and optional information about order summary sequences, which affect the newly created exchange order summary.

previewCartToExchangeOrder(previewCartToExchangeOrderInput)

Retrieves a preview of an exchange order, taking into account the order summary balance and the difference between the return order and the cart that represents the exchange order.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.PreviewCartToExchangeOrderOutputRepresentation
previewCartToExchangeOrder(ConnectApi.PreviewCartToExchangeOrderInputRepresentation
previewCartToExchangeOrderInput)
```

Parameters

previewCartToExchangeOrderInput

Type: ConnectApi.PreviewCartToExchangeOrderInputRepresentation on page 1823

Information required to preview a cart to exchange order.

Return Value

Type: ConnectApi.PreviewCartToExchangeOrderOutputRepresentation on page 2112

submitCartToExchangeOrder(submitCartToExchangeOrderInput)

Creates an exchange order summary, based on the return order and the cart used for exchanges. The new exchange order summary is attached to the original order summary (created before any exchanges occurred). You can also provide optional payment information and optional information about order summary sequences, which affect the newly created exchange order summary.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.SubmitCartToExchangeOrderOutputRepresentation
submitCartToExchangeOrder(ConnectApi.SubmitCartToExchangeOrderInputRepresentation
submitCartToExchangeOrderInput)
```

Parameters

submitCartToExchangeOrderInput
Type: ConnectApi.SubmitCartToExchangeOrderInputRepresentation on page 1831

Information required to submit a cart to exchange order.

Return Value

Type: ConnectApi.SubmitCartToExchangeOrderOutputRepresentation on page 2174

ExternalEmailServices Class

Access information about integration with external email services, such as sending email within Salesforce through an external email account.

Namespace

ConnectApi

External Email Services Methods

The following are methods for `ExternalEmailService`. All methods are static.

IN THIS SECTION:

getUserOauthInfo(landingPage)
Get information about whether an external email service has been authorized to send email on behalf of a user.

`getUserOauthInfo(landingPage)`

Get information about whether an external email service has been authorized to send email on behalf of a user.

API Version

37.0

Requires Chatter

No

Signature

```
public static getUserOauthInfo(String landingPage)
```

Parameters

landingPage
Type: String

The landing page that the user starts on when they are finished with the OAuth authorization process.

Return Value

Type: `ConnectApi.UserOauthInfo`

SEE ALSO:

Apex Developer Guide: Testing ConnectApi Code

ExternalManagedAccount Class

Get externally managed accounts.

Namespace

ConnectApi

ExternalManagedAccount Methods

These methods are for `ExternalManagedAccount`. All methods are static.

IN THIS SECTION:

getCommunitiesExternalManagedAccounts(communityId)
Get externally managed accounts available to the context user across all Experience Cloud sites.

getCommunitiesExternalManagedAccounts(communityId, includeMyAccount)
Get externally managed accounts available to the context user, including the context user's account, across all Experience Cloud sites.

getExternalManagedAccounts(webstoreId)
Get externally managed accounts for a store.

getExternalManagedAccounts(webstoreId, includeMyAccount)
Get externally managed accounts, including the context user's account, for a store.

`getCommunitiesExternalManagedAccounts(communityId)`

Get externally managed accounts available to the context user across all Experience Cloud sites.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalManagedAccountCollectionOutput
getCommunitiesExternalManagedAccounts(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Note: Regardless of the ID specified, this method returns externally managed accounts available to the context user across all Experience Cloud sites.

Return Value

Type: `ConnectApi.ExternalManagedAccountCollectionOutput`

`getCommunitiesExternalManagedAccounts(communityId, includeMyAccount)`

Get externally managed accounts available to the context user, including the context user's account, across all Experience Cloud sites.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalManagedAccountCollectionOutput
getCommunitiesExternalManagedAccounts(String communityId, Boolean includeMyAccount)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Note: Regardless of the ID specified, this method returns externally managed accounts available to the context user across all Experience Cloud sites.

includeMyAccount
Type: Boolean

Specifies whether to return the context user's account (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ExternalManagedAccountCollectionOutput`

`getExternalManagedAccounts(webstoreId)`

Get externally managed accounts for a store.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalManagedAccountCollectionOutput
getExternalManagedAccounts(String webstoreId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

Return Value

Type: `ConnectApi.ExternalManagedAccountCollectionOutput`

`getExternalManagedAccounts(webstoreId, includeMyAccount)`

Get externally managed accounts, including the context user's account, for a store.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalManagedAccountCollectionOutput
getExternalManagedAccounts(String webstoreId, Boolean includeMyAccount)
```

Parameters

webstoreId
Type: String

ID of the webstore.

includeMyAccount
Type: Boolean

Specifies whether to return the context user's account (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ExternalManagedAccountCollectionOutput`

FieldService Class

Preview and create shifts from a pattern or filter fields on recordset filter criteria.

Namespace

ConnectApi

FieldService Methods

These methods are for `FieldService`. All methods are static.

IN THIS SECTION:

createShiftsFromPattern(shiftsFromPatternInput, shiftPatternId)
Create up to 2,000 shifts from a pattern.

evaluateRecordsetFilterCriteria(recordsetFilterCriteriaInput)
Filter records on recordset filter criteria.

previewShiftsFromPattern(shiftsFromPatternInput, shiftPatternId)
Preview up to 2,000 shifts from a pattern.

`createShiftsFromPattern(shiftsFromPatternInput, shiftPatternId)`

Create up to 2,000 shifts from a pattern.

API Version

51.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ShiftsFromPattern
createShiftsFromPattern(ConnectApi.ShiftsFromPatternInput shiftsFromPatternInput, String
shiftPatternId)
```

Parameters

shiftsFromPatternInput
Type: ConnectApi.ShiftsFromPatternInput

A ConnectApi.ShiftsFromPatternInput object providing the pattern.

shiftPatternId
Type: String

ID of the shift pattern.

Return Value

Type: ConnectApi.ShiftsFromPattern

evaluateRecordsetFilterCriteria(recordsetFilterCriteriaInput)

Filter records on recordset filter criteria.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecordsetFilterCriteriaOutput
evaluateRecordsetFilterCriteria(ConnectApi.RecordsetFilterCriteriaInput
recordsetFilterCriteriaInput)
```

Parameters

recordsetFilterCriteriaInput
Type: ConnectApi.RecordsetFilterCriteriaInput

An ConnectApi.RecordsetFilterCriteriaInput object providing a set of recordset filter criteria and records.

Return Value

Type: ConnectApi.RecordsetFilterCriteriaOutput

Usage

Field service must be enabled.

previewShiftsFromPattern(shiftsFromPatternInput, shiftPatternId)

Preview up to 2,000 shifts from a pattern.

API Version

51.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ShiftsFromPattern
previewShiftsFromPattern(ConnectApi.ShiftsFromPatternInput shiftsFromPatternInput,
String shiftPatternId)
```

Parameters

shiftsFromPatternInput
Type: ConnectApi.ShiftsFromPatternInput

A `ConnectApi.ShiftsFromPatternInput` object providing the pattern.

shiftPatternId
Type: String

ID of the shift pattern.

Return Value

Type: ConnectApi.ShiftsFromPattern

FulfillmentOrder Class

Fulfill orders in Order Management.

Namespace

ConnectApi

FulfillmentOrder Methods

The following are methods for `FulfillmentOrder`. All methods are static.

IN THIS SECTION:

cancelFulfillmentOrderLineItems(fulfillmentOrderId, cancelFulfillmentOrderLineItemsInput)
Cancel FulfillmentOrderLineItems from a FulfillmentOrder. This action doesn't cancel the associated OrderItemSummaries, so reallocate the canceled quantities to a new FulfillmentOrder.

createFulfillmentOrders(fulfillmentOrderInput)
Create one or more FulfillmentOrders and FulfillmentOrderLineItems for an OrderDeliveryGroupSummary, which defines a delivery method and recipient for an OrderSummary. You specify the OrderItemSummaries to allocate, which can be fulfilled from different locations. Specifying multiple fulfillment groups creates one FulfillmentOrder for each location. For each OrderItemSummary, a FulfillmentOrderLineItem is created and assigned to the corresponding FulfillmentOrder.

createInvoice(fulfillmentOrderId, invoiceInput)

Create an invoice for a FulfillmentOrder that doesn't have one.

createMultipleFulfillmentOrder(multipleFulfillmentOrderInput)

Create FulfillmentOrders for multiple OrderDeliveryGroups in a single request.

createMultipleInvoices(invoicesInput)

Create Invoices for multiple FulfillmentOrders.

cancelFulfillmentOrderLineItems(fulfillmentOrderId, cancelFulfillmentOrderLineItemsInput)

Cancel FulfillmentOrderLineItems from a FulfillmentOrder. This action doesn't cancel the associated OrderItemSummaries, so reallocate the canceled quantities to a new FulfillmentOrder.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.FulfillmentOrderCancelLineItemsOutputRepresentation
cancelFulfillmentOrderLineItems(String fulfillmentOrderId,
ConnectApi.FulfillmentOrderLineItemsToCancelInputRepresentation
cancelFulfillmentOrderLineItemsInput)
```

Parameters

fulfillmentOrderId

Type: String

ID of the FulfillmentOrder.

cancelFulfillmentOrderLineItemsInput

Type: ConnectApi.FulfillmentOrderLineItemsToCancelInputRepresentation

List of FulfillmentOrderLineItems to cancel.

Return Value

Type: ConnectApi.FulfillmentOrderCancelLineItemsOutputRepresentation

Example

```
String fulfillmentOrderId = '0a3xx0000000085AAA';
List<ConnectApi.FulfillmentOrderLineItemInputRepresentation> itemToCancelList = new
List<ConnectApi.FulfillmentOrderLineItemInputRepresentation>();

for(FulfillmentOrderLineItem fulfillmentOrderLineItem :
```

```
fulfillmentOrder.FulfillmentOrderLineItems){
  ConnectApi.FulfillmentOrderLineItemInputRepresentation itemToCancel = new
ConnectApi.FulfillmentOrderLineItemInputRepresentation();
  itemToCancel.fulfillmentOrderLineItemId = fulfillmentOrderLineItem.Id;
  itemToCancel.quantity = 1;
  itemToCancelList.add(itemToCancel);
}

ConnectAPI.FulfillmentOrderLineItemsToCancelInputRepresentation input = new
ConnectAPI.FulfillmentOrderLineItemsToCancelInputRepresentation();
input.fulfillmentOrderLineItemsToCancel = itemToCancelList;

ConnectAPI.FulfillmentOrderCancelLineItemsOutputRepresentation result =
ConnectAPI.FulfillmentOrder.cancelFulfillmentOrderLineItems(fulfillmentOrderId, input);
```

`createFulfillmentOrders(fulfillmentOrderInput)`

Create one or more FulfillmentOrders and FulfillmentOrderLineItems for an OrderDeliveryGroupSummary, which defines a delivery method and recipient for an OrderSummary. You specify the OrderItemSummaries to allocate, which can be fulfilled from different locations. Specifying multiple fulfillment groups creates one FulfillmentOrder for each location. For each OrderItemSummary, a FulfillmentOrderLineItem is created and assigned to the corresponding FulfillmentOrder.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.FulfillmentOrderOutputRepresentation
createFulfillmentOrders(ConnectApi.FulfillmentOrderInputRepresentation
fulfillmentOrderInput)
```

Parameters

fulfillmentOrderInput
Type: ConnectApi.FulfillmentOrderInputRepresentation

OrderItemSummaries to allocate, with location and delivery information.

Return Value

Type: ConnectApi.FulfillmentOrderOutputRepresentation

Example

```
String orderSummaryId = '1Osxx0000004CCG';
String fulfillmentType = 'warehouse';
```

```
String warehouseFromLocationId = [SELECT Id from Location WHERE LocationType='Warehouse'
LIMIT 1].Id;

ConnectApi.FulfillmentOrderInputRepresentation fulfillmentOrderInput = new
ConnectApi.FulfillmentOrderInputRepresentation();
fulfillmentOrderInput.orderSummaryId = orderSummaryId;

List<OrderDeliveryGroupSummary> orderDeliveryGroupSummaryList = [SELECT Id FROM
OrderDeliveryGroupSummary WHERE OrderSummaryId =: orderSummaryId];

for (OrderDeliveryGroupSummary orderDeliveryGroupSummary: orderDeliveryGroupSummaryList){

  fulfillmentOrderInput.orderDeliveryGroupSummaryId = orderDeliveryGroupSummary.Id;
  List<ConnectApi.FulfillmentGroupInputRepresentation> fulfillmentGroups = new
List<ConnectApi.FulfillmentGroupInputRepresentation>();
  ConnectApi.FulfillmentGroupInputRepresentation fulfillmentGroup = new
ConnectApi.FulfillmentGroupInputRepresentation();
  fulfillmentGroup.fulfilledFromLocationId = warehouseFromLocationId;
  fulfillmentGroup.fulfillmentType = fulfillmentType;

  List<ConnectApi.OrderItemSummaryInputRepresentation> orderItemSummaries = new
List<ConnectApi.OrderItemSummaryInputRepresentation>();

  List<OrderItemSummary> orderItemSummaryList = [Select Id, quantity FROM OrderItemSummary
 WHERE OrderSummaryId =: orderSummaryId AND OrderDeliveryGroupSummaryId =:
orderDeliveryGroupSummary.Id];
  for(OrderItemSummary orderItemSummary : orderItemSummaryList){
    ConnectApi.OrderItemSummaryInputRepresentation oisInputRepresentation = new
ConnectApi.OrderItemSummaryInputRepresentation();
    oisInputRepresentation.orderItemSummaryId = orderItemSummary.Id;
    oisInputRepresentation.quantity = orderItemSummary.quantity;
    orderItemSummaries.add(oisInputRepresentation);
  }

  fulfillmentGroup.orderItemSummaries = orderItemSummaries;
  fulfillmentGroups.add(fulfillmentGroup);
  fulfillmentOrderInput.fulfillmentGroups = fulfillmentGroups;

}

ConnectApi.FulfillmentOrderOutputRepresentation result =
ConnectAPI.FulfillmentOrder.createFulfillmentOrders(fulfillmentOrderInput);
```

`createInvoice(fulfillmentOrderId, invoiceInput)`

Create an invoice for a FulfillmentOrder that doesn't have one.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.FulfillmentOrderInvoiceOutputRepresentation createInvoice(String
fulfillmentOrderId, ConnectApi.FulfillmentOrderInvoiceInputRepresentation invoiceInput)
```

Parameters

fulfillmentOrderId
Type: String

ID of the FulfillmentOrder.

invoiceInput
Type: ConnectApi.FulfillmentOrderInvoiceInputRepresentation

Required input with no data.

Return Value

Type: ConnectApi.FulfillmentOrderInvoiceOutputRepresentation

Example

```
String fulfillmentOrderId = '0a3xx0000000085AAA';

ConnectApi.FulfillmentOrderInvoiceInputRepresentation input = new
ConnectApi.FulfillmentOrderInvoiceInputRepresentation();
ConnectAPI.FulfillmentOrderInvoiceOutputRepresentation result =
ConnectApi.FulfillmentOrder.createInvoice(fulfillmentOrderId, input);
```

createMultipleFulfillmentOrder(multipleFulfillmentOrderInput)

Create FulfillmentOrders for multiple OrderDeliveryGroups in a single request.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.MultipleFulfillmentOrderOutputRepresentation
createMultipleFulfillmentOrder(ConnectApi.MultipleFulfillmentOrderInputRepresentation
multipleFulfillmentOrderInput)
```

Parameters

multipleFulfillmentOrderInput
Type: ConnectApi.MultipleFulfillmentOrderInputRepresentation

Wraps a list of inputs for creating fulfillment orders.

Return Value

Type: ConnectApi.MultipleFulfillmentOrderOutputRepresentation

createMultipleInvoices(invoicesInput)

Create Invoices for multiple FulfillmentOrders.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.MultipleFulfillmentOrderInvoicesOutputRepresentation
createMultipleInvoices(ConnectApi.MultipleFulfillmentOrderInvoicesInputRepresentation
invoicesInput)
```

Parameters

invoicesInput
Type: ConnectApi.MultipleFulfillmentOrderInvoicesInputRepresentation

The FulfillmentOrders to create Invoices for.

Return Value

Type: ConnectApi.MultipleFulfillmentOrderInvoicesOutputRepresentation

Knowledge Class

Get information about trending articles in Experience Cloud sites.

Namespace

ConnectApi

Knowledge Methods

The following are methods for `Knowledge`. All methods are static.

IN THIS SECTION:

getTopViewedArticlesForTopic(communityId, topicId, maxResults)
Get the top viewed articles for a topic.

getTrendingArticles(communityId, maxResults)
Get trending articles for an Experience Cloud site.

getTrendingArticlesForTopic(communityId, topicId, maxResults)
Get the trending articles for a topic in an Experience Cloud site.

`getTopViewedArticlesForTopic(communityId, topicId, maxResults)`

Get the top viewed articles for a topic.

API Version

41.0

Available to Guest Users

41.0

Requires Chatter

No

Signature

```
public static ConnectApi.KnowledgeArticleVersionCollection
getTopViewedArticlesForTopic(String communityId, String topicId, Integer maxResults)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`topicId`
Type: String

ID of the topic.

`maxResults`
Type: Integer

The maximum number of articles returned for each topic ID. Values can be from 1 to 25. The default value is 5.

Return Value

Type: `ConnectApi.KnowledgeArticleVersionCollection`

`getTrendingArticles(communityId, maxResults)`

Get trending articles for an Experience Cloud site.

API Version

36.0

Available to Guest Users

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.KnowledgeArticleVersionCollection getTrendingArticles(String communityId, Integer maxResults)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`maxResults`
Type: Integer

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

Return Value

Type: `ConnectApi.KnowledgeArticleVersionCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTrendingArticles(communityId, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getTrendingArticlesForTopic(communityId, topicId, maxResults)`

Get the trending articles for a topic in an Experience Cloud site.

API Version

36.0

Available to Guest Users

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.KnowledgeArticleVersionCollection
getTrendingArticlesForTopic(String communityId, String topicId, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

ID of the topic.

maxResults
Type: Integer

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

Return Value

Type: `ConnectApi.KnowledgeArticleVersionCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTrendingArticlesForTopic(communityId, topicId, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

Knowledge Test Methods

The following are the test methods for `Knowledge`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

setTestGetTrendingArticles(communityId, maxResults, result)

Register a `ConnectApi.KnowledgeVersionArticleCollection` object to be returned when the matching `ConnectApi.getTrendingArticles` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

36.0

Signature

```
public static Void setTestGetTrendingArticles(String communityId, Integer maxResults,
ConnectApi.KnowledgeArticleVersionCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

maxResults
Type: Integer

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

result
Type: `ConnectApi.KnowledgeArticleVersionCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getTrendingArticles(communityId, maxResults)

Apex Developer Guide: Testing ConnectApi Code

setTestGetTrendingArticlesForTopic(communityId, topicId, maxResults, result)

Register a `ConnectApi.KnowledgeVersionArticleCollection` object to be returned when the matching `ConnectApi.getTrendingArticlesForTopic` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

36.0

Signature

```
public static Void setTestGetTrendingArticlesForTopic(String communityId, String topicId,
Integer maxResults, ConnectApi.KnowledgeArticleVersionCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

ID of the topic.

maxResults
Type: Integer

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

result
Type: `ConnectApi.KnowledgeArticleVersionCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getTrendingArticlesForTopic(communityId, topicId, maxResults)

Apex Developer Guide: Testing ConnectApi Code

LightningScheduler Class

Create and update service appointments.

Namespace

ConnectApi

LightningScheduler Methods

The following are methods for `LightningScheduler`. All methods are static.

IN THIS SECTION:

createServiceAppointment(createServiceAppointmentInput)
Create a service appointment.

updateServiceAppointment(updateServiceAppointmentInput)
Update a service appointment.

`createServiceAppointment(createServiceAppointmentInput)`

Create a service appointment.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.ServiceAppointmentOutput
createServiceAppointment(ConnectApi.CreateServiceAppointmentInput
createServiceAppointmentInput)
```

Parameters

`createServiceAppointmentInput`
Type: `ConnectApi.CreateServiceAppointmentInput`

Input parameters to create a service appointment.

Return Value

Type: `ConnectApi.ServiceAppointmentOutput`

Usage

Considerations for using engagement channel types with the `service-appointments` resource:

- Enable **Schedule Appointments Using Engagement Channels** in Salesforce Scheduler Settings in your Salesforce org.
- When you create or modify appointments, shifts must be defined in the scheduling policy. For more information on setting up shifts in the scheduling policy, see Define Shift Rules in Scheduling Policy.

  Note: Engagement channel types are not supported with operating hours rules in the scheduling policy.

- When you use engagement channel type and shifts to create a service appointment, Salesforce Scheduler considers the default value for the Appointment Type (if not specified). However, Salesforce Scheduler only considers the engagement channel type and Appointment Type is ignored.

Example

For an account (existing user):

```
ConnectApi.ExtendedFieldInput extendedFieldEmail = new ConnectApi.ExtendedFieldInput();
extendedFieldEmail.name = 'Email';
extendedFieldEmail.value = 'rachael.adams@salesforce.com';

ConnectApi.ExtendedFieldInput extendedFieldPhone = new ConnectApi.ExtendedFieldInput();
```

```
extendedFieldPhone.name = 'Phone';
extendedFieldPhone.value = '1234567890';

List<ConnectApi.ExtendedFieldInput> extendedFieldList = new
List<ConnectApi.ExtendedFieldInput>();
extendedFieldList.add(extendedFieldEmail);
extendedFieldList.add(extendedFieldPhone);

ConnectApi.ServiceAppointmentInput serviceAppInput = new
ConnectApi.ServiceAppointmentInput();
serviceAppInput.extendedFields = extendedFieldList;
serviceAppInput.engagementChannelTypeId = '0eFRM00000000Bv2AI';
serviceAppInput.serviceTerritoryId = '0Hhxx0000004C92CAE';
serviceAppInput.workTypeId = '08qxx0000004C92AAE';
serviceAppInput.parentRecordId = '001xx000003GYR1AAO';
serviceAppInput.schedStartTime = DateTime.valueOf('2021-05-28 12:15:00');
serviceAppInput.schedEndTime = DateTime.valueOf('2021-05-28 12:45:00');
serviceAppInput.appointmentMode = 'Group';
serviceAppInput.attendeeLimit = 20;

ConnectApi.AssignedResourcesInput asResourceInput = new ConnectApi.AssignedResourcesInput();
asResourceInput.serviceResourceId = '0Hnxx0000004CAiCAM';
asResourceInput.isRequiredResource = true;
asResourceInput.isPrimaryResource = true;

List<ConnectApi.AssignedResourcesInput> asResourceInputList = new
List<ConnectApi.AssignedResourcesInput>();
asResourceInputList.add(asResourceInput);

ConnectApi.CreateServiceAppointmentInput createInput = new
ConnectApi.CreateServiceAppointmentInput();
createInput.serviceAppointment = serviceAppInput;
createInput.assignedResources = asResourceInputList;

try{
   ConnectApi.ServiceAppointmentOutput appointmentResult =
ConnectApi.LightningScheduler.createServiceAppointment(createInput);
   String serviceAppointmentId = appointmentResult.result.serviceAppointmentId;
   List<String> assignedResourceIds = appointmentResult.result.assignedResourceIds;
}catch(ConnectApi.ConnectApiException ex){
   //Handle Exception
}
```

For a lead (authenticated guest user):

```

ConnectApi.LeadInput leadInput = new ConnectApi.LeadInput();
leadInput.firstName = 'Rachel';
leadInput.lastName = 'Adams';
leadInput.phone = '012-345-6789';
leadInput.email = 'rachel.adams@salesforce.com';
leadInput.company = 'Salesforce';

ConnectApi.ExtendedFieldInput extendedFieldEmail = new ConnectApi.ExtendedFieldInput();
extendedFieldEmail.name = 'Email';
```

```
extendedFieldEmail.value = 'rachael.adams@salesforce.com';

ConnectApi.ExtendedFieldInput extendedFieldPhone = new ConnectApi.ExtendedFieldInput();
extendedFieldPhone.name = 'Phone';
extendedFieldPhone.value = '1234567890';

List<ConnectApi.ExtendedFieldInput> extendedFieldList = new
List<ConnectApi.ExtendedFieldInput>();
extendedFieldList.add(extendedFieldEmail);
extendedFieldList.add(extendedFieldPhone);

ConnectApi.ServiceAppointmentInput serviceAppInput = new
ConnectApi.ServiceAppointmentInput();
serviceAppInput.extendedFields = extendedFieldList;
serviceAppInput.engagementChannelTypeId = '0eFRM00000000Bv2AI';
serviceAppInput.serviceTerritoryId = '0Hhxx0000004C92CAE';
serviceAppInput.workTypeId = '08qxx0000004C92AAE';
serviceAppInput.schedStartTime = DateTime.valueOf('2021-05-28 12:15:00');
serviceAppInput.schedEndTime = DateTime.valueOf('2021-05-28 12:45:00');

ConnectApi.AssignedResourcesInput asResourceInput = new ConnectApi.AssignedResourcesInput();
asResourceInput.serviceResourceId = '0Hnxx0000004CAiCAM';
asResourceInput.isRequiredResource = true;
asResourceInput.isPrimaryResource = true;

List<ConnectApi.AssignedResourcesInput> asResourceInputList = new
List<ConnectApi.AssignedResourcesInput>();
asResourceInputList.add(asResourceInput);

createInput.lead = leadInput;

try{
   ConnectApi.ServiceAppointmentOutput appointmentResult =
ConnectApi.LightningScheduler.createServiceAppointment(createInput);
   String serviceAppointmentId = appointmentResult.result.serviceAppointmentId;
   List<String> assignedResourceIds = appointmentResult.result.assignedResourceIds;
}catch(ConnectApi.ConnectApiException ex){
   //Handle Exception
}
```

SEE ALSO:

Service Appointments

updateServiceAppointment(updateServiceAppointmentInput)

Update a service appointment.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.ServiceAppointmentOutput
updateServiceAppointment(ConnectApi.UpdateServiceAppointmentInput
updateServiceAppointmentInput)
```

Parameters

updateServiceAppointmentInput
Type: ConnectApi.UpdateServiceAppointmentInput

Input parameters to update a service appointment.

Return Value

Type: ConnectApi.ServiceAppointmentOutput

Usage

Considerations for using engagement channel types with the `service-appointments` resource:

- Enable **Schedule Appointments Using Engagement Channels** in Salesforce Scheduler Settings in your Salesforce org.
- When you create or modify appointments, shifts must be defined in the scheduling policy. For more information on setting up shifts in the scheduling policy, see Define Shift Rules in Scheduling Policy.

  Note: Engagement channel types are not supported with operating hours rules in the scheduling policy.

- When you use engagement channel type and shifts to modify an appointment, Salesforce Scheduler considers the default value for the Appointment Type (if not specified). However, Salesforce Scheduler only considers the engagement channel type and Appointment Type is ignored.

Example

```
ConnectApi.ExtendedFieldInput extendedFieldEmail = new ConnectApi.ExtendedFieldInput();
extendedFieldEmail.name = 'Email';
extendedFieldEmail.value = 'rachel.adams@salesforce.com.example';

ConnectApi.ExtendedFieldInput extendedFieldPhone = new ConnectApi.ExtendedFieldInput();
extendedFieldPhone.name = 'Phone';
extendedFieldPhone.value = '0123456789';

ConnectApi.ExtendedFieldInput extendedFieldStatus = new ConnectApi.ExtendedFieldInput();
extendedFieldStatus.name = 'Status';
extendedFieldStatus.value = 'None';
```

```
List<ConnectApi.ExtendedFieldInput> extendedFieldList = new
List<ConnectApi.ExtendedFieldInput>();
extendedFieldList.add(extendedFieldEmail);
extendedFieldList.add(extendedFieldPhone);
extendedFieldList.add(extendedFieldStatus);

ConnectApi.ServiceAppointmentInput serviceAppInput = new
ConnectApi.ServiceAppointmentInput();
serviceAppInput.extendedFields = extendedFieldList;
serviceAppInput.serviceTerritoryId = '0Hhxx0000004C92CAE';
serviceAppInput.workTypeId = '08qxx0000004C92AAE';
serviceAppInput.schedStartTime = DateTime.valueOf('2021-05-28 12:15:00');
serviceAppInput.schedEndTime = DateTime.valueOf('2021-05-28 12:45:00');

ConnectApi.AssignedResourcesInput asResourceInput = new ConnectApi.AssignedResourcesInput();
asResourceInput.serviceResourceId = '0Hnxx0000004CAiCAM';
asResourceInput.isRequiredResource = true;
asResourceInput.isPrimaryResource = true;

//Multi-resource
ConnectApi.AssignedResourcesInput asResourceInputReq = new
ConnectApi.AssignedResourcesInput();
asResourceInputReq.serviceResourceId = '0Hnxx0000004CAgCAM';
asResourceInputReq.isRequiredResource = true;
asResourceInputReq.isPrimaryResource = false;

List<ConnectApi.AssignedResourcesInput> asResourceInputList = new
List<ConnectApi.AssignedResourcesInput>();
asResourceInputList.add(asResourceInput);
asResourceInputList.add(asResourceInputReq);

ConnectApi.UpdateServiceAppointmentInput updateInput = new
ConnectApi.UpdateServiceAppointmentInput();
updateInput.serviceAppointment = serviceAppInput;
updateInput.assignedResources = asResourceInputList;
updateInput.serviceAppointmentId = '08pxx0000004CYqAAM';

try{
   ConnectApi.ServiceAppointmentOutput appointmentResult =
ConnectApi.LightningScheduler.updateServiceAppointment(updateInput);
   String serviceAppointmentId = appointmentResult.result.serviceAppointmentId;
   List<String> assignedResourceIds = appointmentResult.result.assignedResourceIds;
}catch(ConnectApi.ConnectApiException ex){
   //Handle Exception
}

ManagedContent Class

Get managed content versions. Get a managed content space.

Namespace

ConnectApi

ManagedContent Methods

The following are methods for `ManagedContent`. All methods are static.

IN THIS SECTION:

createManagedContent(ManagedContentInputParam)
Create managed content.

createManagedContentWithMedia(ManagedContentInputParam, contentData)
Create managed content with content data.

deleteManagedContentVariant(variantId)
Delete a managed content variant.

getAllContent(channelId, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate)
Get all managed content versions for a channel.

getAllContent(channelId, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)
Get all managed content versions for a channel with absolute URLs.

getAllDeliveryChannels(pageParam, pageSize)
Get managed content delivery channels for the context user.

getAllManagedContent(communityId, pageParam, pageSize, language, managedContentType)
Get all managed content versions for an Experience Cloud site.

getAllManagedContent(communityId, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)
Get all managed content versions for an Experience Cloud site with absolute URLs.

getContentByContentKeys(channelId, contentKeys, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)
Get managed content versions for a channel using a list of content keys.

getContentByIds(channelId, managedContentIds, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate)
Get managed content versions for a channel using a list of managed content IDs.

getContentByIds(channelId, managedContentIds, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)
Get managed content versions for a channel with absolute URLs using a list of managed content IDs.

getManagedContentByContentKeys(communityId, contentKeys, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)
Get managed content versions for an Experience Cloud site using a list of content keys.

getManagedContentByIds(communityId, managedContentIds, pageParam, pageSize, language, managedContentType)

Get managed content versions for an Experience Cloud site using a list of managed content IDs.

getManagedContentByIds(communityId, managedContentIds, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions for an Experience Cloud site with absolute URLs using a list of managed content IDs.

getManagedContentByTopics(communityId, topics, pageParam, pageSize, language, managedContentType)

Get managed content versions using a list of content topic names.

getManagedContentByTopics(communityId, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions with absolute URLs using a list of content topic names.

getManagedContentByTopicsAndContentKeys(communityId, contentKeys, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions using a list of content keys and content topic names.

getManagedContentByTopicsAndIds(communityId, managedContentIds, topics, pageParam, pageSize, language, managedContentType)

Get managed content versions using a list of managed content IDs and content topic names.

getManagedContentByTopicsAndIds(communityId, managedContentIds, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions with absolute URLs using a list of managed content IDs and content topic names.

getManagedContentSpace(contentSpaceId)

Get a managed content space.

publish(publishInput)

Publish content.

replaceManagedContentVariant(variantId, ManagedContentVariantInputParam)

Replace a managed content variant.

replaceManagedContentVariantWithMedia(variantId, ManagedContentVariantInputParam, contentData)

Replace a managed content variant, including content data.

unpublish(unpublishInput)

Unpublish content.

`createManagedContent(ManagedContentInputParam)`

Create managed content.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDocument
createManagedContent(ConnectApi.ManagedContentDocumentInput ManagedContentInputParam)
```

Parameters

ManagedContentInputParam
Type: ConnectApi.ManagedContentDocumentInput

A ConnectApi.ManagedContentDocumentInput input class with information to create managed content.

Return Value

Type: ConnectApi.ManagedContentDocument

createManagedContentWithMedia(ManagedContentInputParam, contentData)

Create managed content with content data.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDocument
createManagedContentWithMedia(ConnectApi.ManagedContentDocumentInput
ManagedContentInputParam, ConnectApi.BinaryInput contentData)
```

Parameters

ManagedContentInputParam
Type: ConnectApi.ManagedContentDocumentInput

A ConnectApi.ManagedContentDocumentInput input class with information to create managed content.

contentData
Type: ConnectApi.BinaryInput

A new binary file of the content data for the managed content.

Return Value

Type: ConnectApi.ManagedContentDocument

deleteManagedContentVariant(variantId)

Delete a managed content variant.

API Version

60.0

Requires Chatter

No

Signature

```
public static Void deleteManagedContentVariant(String variantId)
```

Parameters

variantId
Type: String

ID of the variant to delete.

Return Value

Type: Void

getAllContent(channelId, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate)

Get all managed content versions for a channel.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getAllContent(String channelId,
Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean
includeMetadata, String startDate, String endDate)
```

Parameters

channelId
Type: String

ID of the channel.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

includeMetadata
Type: Boolean

Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

startDate
Type: String

Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

endDate
Type: String

Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

`getAllContent(channelId, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)`

Get all managed content versions for a channel with absolute URLs.

API Version

50.0

Available to Guest Users

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getAllContent(String channelId,
Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean
includeMetadata, String startDate, String endDate, Boolean showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

includeMetadata
Type: Boolean

Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

startDate
Type: String

Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

endDate
Type: String

Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getAllDeliveryChannels(pageParam, pageSize)

Get managed content delivery channels for the context user.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentChannelCollection getAllDeliveryChannels(Integer pageParam, Integer pageSize)
```

Parameters

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ManagedContentChannelCollection`

getAllManagedContent(communityId, pageParam, pageSize, language, managedContentType)

Get all managed content versions for an Experience Cloud site.

API Version

47.0

Available to Guest Users

47.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getAllManagedContent(String communityId, Integer pageParam, Integer pageSize, String language, String managedContentType)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getAllManagedContent(communityId, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get all managed content versions for an Experience Cloud site with absolute URLs.

API Version

50.0

Available to Guest Users

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getAllManagedContent(String communityId, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getContentByContentKeys(channelId, contentKeys, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)

Get managed content versions for a channel using a list of content keys.

API Version

51.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getContentByContentKeys(String channelId, List<String> contentKeys, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean includeMetadata, String startDate, String endDate, Boolean showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

contentKeys
Type: List<String>

List of up to 50 content keys for the managed content. A content key is a universally unique identifier (UUID) such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

includeMetadata
Type: Boolean

Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

startDate
Type: String

Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

endDate
Type: String

Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getContentByIds(channelId, managedContentIds, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate)

Get managed content versions for a channel using a list of managed content IDs.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getContentByIds(String channelId, List<String> managedContentIds, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean includeMetadata, String startDate, String endDate)
```

Parameters

channelId
Type: String

ID of the channel.

managedContentIds
Type: List<String>

Comma-separated list of managed content IDs. HTTP/2 clients support up to 200 IDs. HTTP/1.1 clients don't.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

includeMetadata
Type: Boolean

Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

startDate
Type: String

Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

endDate
Type: String

Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getContentByIds(channelId, managedContentIds, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)

Get managed content versions for a channel with absolute URLs using a list of managed content IDs.

API Version

50.0

Available to Guest Users

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getContentByIds(String
channelId, List<String> managedContentIds, Integer pageParam, Integer pageSize, String
language, String managedContentType, Boolean includeMetadata, String startDate, String
endDate, Boolean showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

managedContentIds
Type: List<String>

Comma-separated list of managed content IDs. HTTP/2 clients support up to 200 IDs. HTTP/1.1 clients don't.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

includeMetadata
Type: Boolean

Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

startDate
Type: String

Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

endDate
Type: String

Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

`getManagedContentByContentKeys(communityId, contentKeys, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)`

Get managed content versions for an Experience Cloud site using a list of content keys.

API Version

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection
getManagedContentByContentKeys(String communityId, List<String> contentKeys, Integer
pageParam, Integer pageSize, String language, String managedContentType, Boolean
showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

contentKeys
Type: List<String>

List of up to 50 content keys for the managed content. A content key is a universally unique identifier (UUID) such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByIds(communityId, managedContentIds, pageParam, pageSize, language, managedContentType)

Get managed content versions for an Experience Cloud site using a list of managed content IDs.

Available to Guest Users

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getManagedContentByIds(String communityId, List<String> managedContentIds, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

managedContentIds
Type: List<String>

Comma-separated list of managed content IDs.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByTopics(communityId, topics, pageParam, pageSize, language, managedContentType)

Get managed content versions using a list of content topic names.

API Version

47.0

Available to Guest Users

47.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getManagedContentByTopics(String communityId, List<String> topics, Integer pageParam, Integer pageSize, String language, String managedContentType)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

topics
Type: List<String>

Comma-separated list of up to 15 content topic names.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByTopics(communityId, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions with absolute URLs using a list of content topic names.

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getManagedContentByTopics(String communityId, List<String> topics, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

topics
Type: List<String>

Comma-separated list of up to 15 content topic names.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByTopicsAndContentKeys(communityId, contentKeys, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions using a list of content keys and content topic names.

API Version

51.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection
getManagedContentByTopicsAndContentKeys(String communityId, List<String> contentKeys,
List<String> topics, Integer pageParam, Integer pageSize, String language, String
managedContentType, Boolean showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

contentKeys
Type: List<String>

List of up to 50 content keys for the managed content. A content key is a universally unique identifier (UUID) such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

topics
Type: List<String>

Comma-separated list of up to 15 content topic names.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

`getManagedContentByTopicsAndIds(communityId, managedContentIds, topics, pageParam, pageSize, language, managedContentType)`

Get managed content versions using a list of managed content IDs and content topic names.

API Version

47.0

Available to Guest Users

47.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection
getManagedContentByTopicsAndIds(String communityId, List<String> managedContentIds,
List<String> topics, Integer pageParam, Integer pageSize, String language, String
managedContentType)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

managedContentIds
Type: List<String>

Comma-separated list of managed content IDs. HTTP/2 clients support up to 200 IDs. HTTP/1.1 clients don't.

topics
Type: List<String>

Comma-separated list of up to 15 content topic names.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByTopicsAndIds(communityId, managedContentIds, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions with absolute URLs using a list of managed content IDs and content topic names.

API Version

Available to Guest Users

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection
getManagedContentByTopicsAndIds(String communityId, List<String> managedContentIds,
List<String> topics, Integer pageParam, Integer pageSize, String language, String
managedContentType, Boolean showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

managedContentIds
Type: List<String>

Comma-separated list of managed content IDs. HTTP/2 clients support up to 200 IDs. HTTP/1.1 clients don't.

topics
Type: List<String>

Comma-separated list of up to 15 content topic names.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentSpace(contentSpaceId)

Get a managed content space.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentSpace getManagedContentSpace(String
contentSpaceId)
```

Parameters

contentSpaceId
Type: String

ID of the managed content space.

Return Value

Type: ConnectApi.ManagedContentSpace

publish(publishInput)

Publish content.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentPublishOutput
publish(ConnectApi.ManagedContentPublishInput publishInput)
```

Parameters

publishInput
Type: ConnectApi.ManagedContentPublishInput

A ConnectApi.ManagedContentPublishInput request body specifying the content to publish.

Return Value

Type: ConnectApi.ManagedContentPublishOutput

replaceManagedContentVariant(variantId, ManagedContentVariantInputParam)

Replace a managed content variant.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVariant replaceManagedContentVariant(String
variantId, ConnectApi.ManagedContentVariantUpdateInput ManagedContentVariantInputParam)
```

Parameters

variantId
Type: String

ID of the managed content variant to replace.

ManagedContentVariantInputParam
Type: ConnectApi.ManagedContentVariantUpdateInput

A `ConnectApi.ManagedContentVariantUpdateInput` input class with information about the managed content variant that is replacing the existing variant.

Return Value

Type: ConnectApi.ManagedContentVariant

replaceManagedContentVariantWithMedia(variantId, ManagedContentVariantInputParam, contentData)

Replace a managed content variant, including content data.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVariant
replaceManagedContentVariantWithMedia(String variantId,
ConnectApi.ManagedContentVariantUpdateInput ManagedContentVariantInputParam,
ConnectApi.BinaryInput contentData)
```

Parameters

variantId
Type: String

ID of the managed content variant to replace.

ManagedContentVariantInputParam
Type: ConnectApi.ManagedContentVariantUpdateInput

A `ConnectApi.ManagedContentVariantUpdateInput` input class with information about the managed content variant that is replacing the existing variant.

contentData
Type: ConnectApi.BinaryInput

A new binary file to replace the content data of the managed content variant.

Return Value

Type: `ConnectApi.ManagedContentVariant`

`unpublish(unpublishInput)`

Unpublish content.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentUnpublishOutput
unpublish(ConnectApi.ManagedContentUnpublishInput unpublishInput)
```

Parameters

`unpublishInput`
Type: `ConnectApi.ManagedContentUnpublishInput`

A `ConnectApi,ManagedContentUnpublishInput` request body specifying the content to unpublish.

Return Value

Type: `ConnectApi.ManagedContentUnpublishOutput`

ManagedContentDelivery Class

Get collection items. Get a managed content channel. Get managed content.

Namespace

ConnectApi

ManagedContentDelivery Methods

The following are methods for `ManagedContentDelivery`. All methods are static.

IN THIS SECTION:

getCollectionItemsForChannel(channelId, collectionKeyOrId, language)
Get collection items for a channel.

getCollectionItemsForSite(siteId, collectionKeyOrId, language)
Get collection items for an Experience Cloud site.

getManagedContentChannel(channelId)

Get a managed content channel.

getManagedContentForChannel(channelId, contentKeyOrId, showAbsoluteUrl)

Get a piece of published content for a channel.

getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl)

Get a piece of published content in a specified language for a channel.

getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)

Get a piece of published content in a specified language with references for a channel.

getManagedContentForSite(siteId, contentKeyOrId, showAbsoluteUrl)

Get a piece of published content for an Experience Cloud site.

getManagedContentForSite(siteId, contentKeyOrId, language, showAbsoluteUrl)

Get a piece of published content in a specified language for an Experience Cloud site.

getManagedContentForSite(siteId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)

Get a piece of published content in a specified language with references for an Experience Cloud site.

getManagedContentsForChannel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize, showAbsoluteUrl)

Get a collection of published contents for a channel.

getManagedContentsForSite(siteId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize, showAbsoluteUrl)

Get a collection of published contents for an Experience Cloud site.

`getCollectionItemsForChannel(channelId, collectionKeyOrId, language)`

Get collection items for a channel.

API Version

56.0

Available to Guest Users

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentCollectionItems
getCollectionItemsForChannel(String channelId, String collectionKeyOrId, String language)
```

Parameters

channelId
Type: String

ID of the channel.

collectionKeyOrId
Type: String

Collection key or ID of the collection. A collection key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

Return Value

Type: `ConnectApi.ManagedContentCollectionItems`

Example

This example gets a collection of a custom content type that includes references to images and uses the `ConnectApi.ConnectUtilities.unwrapApexWrapper()` utility.

```
ConnectApi.ManagedContentCollectionItems collection =

ConnectApi.ManagedContentDelivery.getCollectionItemsForChannel('0apXXXXXXXXXXXXX','MCVXXXXXXXXXXXXXXXXXXXXXXX','en_US');

System.debug(collection.items); //before ApexWrapper is unwrapped

for(ConnectApi.ManagedContentCollectionItem item : collection.items)
{
 //unwrap ApexWrapper
 Map<String,Object> unwrappedItem =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(item.body.get('contentBody'));

 //replace the wrapped object with the unwrapped object
 item.body.put('contentBody', unwrappedItem);
}

System.debug(collection.items); //after ApexWrapper is unwrapped
```

getCollectionItemsForSite(siteId, collectionKeyOrId, language)

Get collection items for an Experience Cloud site.

API Version

56.0

Available to Guest Users

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentCollectionItems getCollectionItemsForSite(String siteId, String collectionKeyOrId, String language)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

collectionKeyOrId
Type: String

Collection key or ID of the collection. A collection key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

Return Value

Type: `ConnectApi.ManagedContentCollectionItems`

Example

This example gets a collection of a custom content type that includes references to images and uses the `ConnectApi.ConnectUtilities.unwrapApexWrapper()` utility.

```
ConnectApi.ManagedContentCollectionItems collection =

ConnectApi.ManagedContentDelivery.getCollectionItemsForSite('0DMXXXXXXXXXXXXXX','MCVXXXXXXXXXXXXXXXXXXXXXXX','en_US');

System.debug(collection.items); //before ApexWrapper is unwrapped

for(ConnectApi.ManagedContentCollectionItem item : collection.items)
{
 //unwrap ApexWrapper
 Map<String,Object> unwrappedItem =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(item.body.get('contentBody'));

 //replace the wrapped object with the unwrapped object
 item.body.put('contentBody', unwrappedItem);
```

```
}

System.debug(collection.items); //after ApexWrapper is unwrapped
```

getManagedContentChannel(channelId)

Get a managed content channel.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentChannelDetail getManagedContentChannel(String channelId)
```

Parameters

channelId
Type: String

ID of the channel.

Return Value

Type: ConnectApi.ManagedContentChannelDetail

getManagedContentForChannel(channelId, contentKeyOrId, showAbsoluteUrl)

Get a piece of published content for a channel.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument
getManagedContentForChannel(String channelId, String contentKeyOrId, Boolean
showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

Usage

This method returns content only if it's published in the default language of the channel. If you request content that isn't published in the default language of the channel, you get a `ConnectApi.NotFoundException`. To get content for a channel in another language use `getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl)` or `getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)` on page 1464.

Example

This example gets a custom content type with an image reference and uses the `ConnectApi.ConnectUtilities.unwrapApexWrapper()` utility.

```
ConnectApi.ManagedContentDeliveryDocument res =
    ConnectApi.ManagedContentDelivery.getManagedContentForChannel
('0apXXXXXXXXXXXXXX','MCLXXXXXXXXXXXXXXXXXXXXXXXXX',true);

//before contentBody field ApexWrapper is unwrapped
system.debug(res.contentBody);

//unwrap contentBody field in res
Map<String,Object> contentBody =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(res.contentBody);

//after contentBody field ApexWrapper is unwrapped, but image field still wrapped
system.debug(contentBody);
```

```
//before image field ApexWrapper is unwrapped
system.debug(contentBody.get('Image'));

//unwrap Image field in contentBody
Map<String,Object> Image =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(contentBody.get('Image'));

//after image field ApexWrapper is unwrapped
system.debug(Image);

//replace wrapped primary_image in contentBody with unwrapped version
contentBody.put('Image', Image);

//after contentBody field ApexWrapper is unwrapped, with image field also unwrapped
system.debug(contentBody);
```

`getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl)`

Get a piece of published content in a specified language for a channel.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument
getManagedContentForChannel(String channelId, String contentKeyOrId, String language,
Boolean showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. The requested language must be added to the channel, otherwise, you get a `ConnectApi.NotFoundException`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)

Get a piece of published content in a specified language with references for a channel.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument
getManagedContentForChannel(String channelId, String contentKeyOrId, String language,
Boolean showAbsoluteUrl, Integer referenceDepth, Boolean expandReferences, Boolean
referencesAsList)
```

Parameters

channelId
Type: String

ID of the channel.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. The requested language must be added to the channel, otherwise, you get a `ConnectApi.NotFoundException`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

`showAbsoluteUrl`
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

`referenceDepth`
Type: Integer

An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocument` output class is null. If unspecified, the default value is 0.

`expandReferences`
Type: Boolean

Specifies whether to include details of references (`true`) or summaries of references (`false`) in the output class. If unspecified, the default value is `false`.

`referencesAsList`
Type: Boolean

Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocument` output class (`true`). If you specify `false`, the references are returned as key value pairs in the `references` property. If unspecified, the default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

`getManagedContentForSite(siteId, contentKeyOrId, showAbsoluteUrl)`

Get a piece of published content for an Experience Cloud site.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument getManagedContentForSite(String siteId, String contentKeyOrId, Boolean showAbsoluteUrl)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

Example

This example gets a custom content type with an image reference and uses the `ConnectApi.ConnectUtilities.unwrapApexWrapper()` utility.

```
ConnectApi.ManagedContentDeliveryDocument res =
    ConnectApi.ManagedContentDelivery.getManagedContentForSite
('0DMXXXXXXXXXXXXXXX','MCLXXXXXXXXXXXXXXXXXXXXXXXXXX',true);

//before contentBody field ApexWrapper is unwrapped
system.debug(res.contentBody);

//unwrap contentBody field in res
Map<String,Object> contentBody =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(res.contentBody);

//after contentBody field ApexWrapper is unwrapped, but image field still wrapped
system.debug(contentBody);

//before image field ApexWrapper is unwrapped
system.debug(contentBody.get('Image'));

//unwrap Image field in contentBody
Map<String,Object> Image =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(contentBody.get('Image'));

//after image field ApexWrapper is unwrapped
system.debug(Image);

//replace wrapped primary_image in contentBody with unwrapped version
contentBody.put('Image', Image);

//after contentBody field ApexWrapper is unwrapped, with image field also unwrapped
system.debug(contentBody);
```

getManagedContentForSite(siteId, contentKeyOrId, language, showAbsoluteUrl)

Get a piece of published content in a specified language for an Experience Cloud site.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument getManagedContentForSite(String siteId, String contentKeyOrId, String language, Boolean showAbsoluteUrl)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

getManagedContentForSite(siteId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)

Get a piece of published content in a specified language with references for an Experience Cloud site.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument getManagedContentForSite(String siteId, String contentKeyOrId, String language, Boolean showAbsoluteUrl, Integer referenceDepth, Boolean expandReferences, Boolean referencesAsList)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

referenceDepth
Type: Integer

An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocument` output class is null. If unspecified, the default value is 0.

expandReferences
Type: Boolean

Specifies whether to include details of references (`true`) or summaries of references (`false`) in the output class. If unspecified, the default value is `false`.

referencesAsList
Type: Boolean

Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocument` output class (`true`). If you specify `false`, the references are returned as key value pairs in the `references` property. If unspecified, the default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

getManagedContentsForChannel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize, showAbsoluteUrl)

Get a collection of published contents for a channel.

API Version

58.0

Available to Guest Users

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocumentCollection
getManagedContentsForChannel(String channelId, List<String> managedContentIds,
List<String> contentKeys, String contentTypeFQN, String language, String
publishStartDate, String publishEndDate, Boolean includeContentBody, Integer
referenceDepth, Boolean expandReferences, Boolean referencesAsList, Integer pageParam,
Integer pageSize, Boolean showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

managedContentIds
Type: List<String>

Comma-separated list of up to 100 managed content IDs. Specify either managed content IDs or content keys.

contentKeys
Type: List<String>

Comma-separated list of up to 50 content keys. Specify either managed content IDs or content keys.

contentTypeFQN
Type: String

Fully qualified name of the managed content type.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the configured fallback language or the channel's default language. If the content isn't available in the fallback language and the channel's default language, we return an error.

publishStartDate
Type: String

ISO 8601 formatted publish start date.

publishEndDate
Type: String

ISO 8601 formatted publish end date.

includeContentBody
Type: Boolean

Specifies whether to return the content body (`true`) or the content summary (`false`). If unspecified, the default value is `false`.

referenceDepth
Type: Integer

An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class is null. If unspecified, the default value is 0.

expandReferences
Type: Boolean

Specifies whether to include details of references (`true`) or summaries of references (`false`) in the output class. If unspecified, the default value is `false`.

referencesAsList
Type: Boolean

Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class (`true`). If you specify `false`, the references are returned as key value pairs in the `references` property. If unspecified, the default value is `false`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25. If you specify `true` for *expandReferences* or *includeContentBody*, the maximum page size you can specify is 25.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: ConnectApi.ManagedContentDeliveryDocumentCollection

Example

This example gets Event custom content type records and uses the ConnectApi.ConnectUtilities.unwrapApexWrapper() utility.

```
ConnectApi.ManagedContentDeliveryDocumentCollection resCol =
    ConnectApi.ManagedContentDelivery.getManagedContentsForChannel('0apXXXXXXXXXXXXXX',
null, new List<String>{'MCLXXXXXXXXXXXXXXXXXXXXXXXXXX'}, 'Event', null, null, null, true,
3, true, false, null, 25, true);

Map<String, Object> contentBodyMap = new Map<String,Object>();

for(ConnectApi.AbstractManagedContentDeliveryDocument res1 : resCol.contents)
{
 //cast the abstract object as the ManagedContentDeliveryDocument subclass that contains
contentBody
 ConnectApi.ManagedContentDeliveryDocument res =
(ConnectApi.ManagedContentDeliveryDocument)res1;

 //before contentBody field ApexWrapper is unwrapped
 system.debug(res.contentBody);

 //unwrap contentBody field in res
 Map<String,Object> contentBody =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(res.contentBody);

 //after contentBody field ApexWrapper is unwrapped, but image field still wrapped
 system.debug(contentBody);

 //before image field ApexWrapper is unwrapped
 system.debug(contentBody.get('Image'));

 //unwrap Image field in contentBody
 Map<String,Object> Image =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(contentBody.get('Image'));

 //after image field ApexWrapper is unwrapped
 system.debug(Image);

 //replace wrapped primary_image in contentBody with unwrapped version
 contentBody.put('Image', Image);

 //after contentBody field ApexWrapper is unwrapped, with image field also unwrapped
 system.debug(contentBody);

 //put unwrapped contentBody in map
 contentBodyMap.put(res.contentKey, contentBody);

}
```

```
//check unwrapped contentBody map
System.debug(contentBodyMap);
```

getManagedContentsForSite(siteId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize, showAbsoluteUrl)

Get a collection of published contents for an Experience Cloud site.

API Version

58.0

Available to Guest Users

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocumentCollection
getManagedContentsForSite(String siteId, List<String> managedContentIds, List<String>
contentKeys, String contentTypeFQN, String language, String publishStartDate, String
publishEndDate, Boolean includeContentBody, Integer referenceDepth, Boolean
expandReferences, Boolean referencesAsList, Integer pageParam, Integer pageSize, Boolean
showAbsoluteUrl)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

managedContentIds
Type: List<String>

Comma-separated list of up to 100 managed content IDs. Specify either managed content IDs or content keys.

contentKeys
Type: List<String>

Comma-separated list of up to 50 content keys. Specify either managed content IDs or content keys.

contentTypeFQN
Type: String

Fully qualified name of the managed content type.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the configured fallback language or the channel's default language. If the content isn't available in the fallback language and the channel's default language, we return an error.

publishStartDate
Type: String

ISO 8601 formatted publish start date.

publishEndDate
Type: String

ISO 8601 formatted publish end date.

includeContentBody
Type: Boolean

Specifies whether to return the content body (`true`) or the content summary (`false`). If unspecified, the default value is `false`.

referenceDepth
Type: Integer

An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class is null. If unspecified, the default value is 0.

expandReferences
Type: Boolean

Specifies whether to include details of references (`true`) or summaries of references (`false`) in the output class. If unspecified, the default value is `false`.

referencesAsList
Type: Boolean

Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class (`true`). If you specify `false`, the references are returned as key value pairs in the `references` property. If unspecified, the default value is `false`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25. If you specify `true` for *expandReferences* or *includeContentBody*, the maximum page size you can specify is 25.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocumentCollection`

Example

This example gets custom content type Event records and uses the `ConnectApi.ConnectUtilities.unwrapApexWrapper()` utility.

```
ConnectApi.ManagedContentDeliveryDocumentCollection resCol =
    ConnectApi.ManagedContentDelivery.getManagedContentsForSite('0DMXXXXXXXXXXXXXXX', null,
 new List<String>{'MCLXXXXXXXXXXXXXXXXXXXXXXXXX'}, 'Event', null, null, null, true, 3,
true, false, null, 25, true);

Map<String, Object> contentBodyMap = new Map<String,Object>();

for(ConnectApi.AbstractManagedContentDeliveryDocument res1 : resCol.contents)
{
 //cast the abstract object as the ManagedContentDeliveryDocument subclass that contains
contentBody
 ConnectApi.ManagedContentDeliveryDocument res =
(ConnectApi.ManagedContentDeliveryDocument)res1;

 //before contentBody field ApexWrapper is unwrapped
 system.debug(res.contentBody);

 //unwrap contentBody field in res
 Map<String,Object> contentBody =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(res.contentBody);

 //after contentBody field ApexWrapper is unwrapped, but image field still wrapped
 system.debug(contentBody);

 //before image field ApexWrapper is unwrapped
 system.debug(contentBody.get('Image'));

 //unwrap Image field in contentBody
 Map<String,Object> Image =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(contentBody.get('Image'));

 //after image field ApexWrapper is unwrapped
 system.debug(Image);

 //replace wrapped primary_image in contentBody with unwrapped version
 contentBody.put('Image', Image);

 //after contentBody field ApexWrapper is unwrapped, with image field also unwrapped
 system.debug(contentBody);

 //put unwrapped contentBody in map
 contentBodyMap.put(res.contentKey, contentBody);

}

//check unwrapped contentBody map
System.debug(contentBodyMap);
```

Retired ManagedContentDelivery Methods

These methods for `ManagedContentDelivery` are retired.

IN THIS SECTION:

getManagedContentsForChannel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize)
Get a collection of published contents for a channel.

getManagedContentsForSite(siteId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize)
Get a collection of published contents for an Experience Cloud site.

`getManagedContentsForChannel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize)`

Get a collection of published contents for a channel.

API Version

55.0—57.0

In version 58.0 and later, use `getManagedContentsForChannel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize, showAbsoluteUrl)`.

Available to Guest Users

55.0—57.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocumentCollection
getManagedContentsForChannel(String channelId, List<String> managedContentIds,
List<String> contentKeys, String contentTypeFQN, String language, String
publishStartDate, String publishEndDate, Boolean includeContentBody, Integer
referenceDepth, Boolean expandReferences, Boolean referencesAsList, Integer pageParam,
Integer pageSize)
```

Parameters

`channelId`
Type: String

ID of the channel.

managedContentIds
Type: List<String>

Comma-separated list of up to 100 managed content IDs. Specify either managed content IDs or content keys.

contentKeys
Type: List<String>

Comma-separated list of up to 50 content keys. Specify either managed content IDs or content keys.

contentTypeFQN
Type: String

Fully qualified name of the managed content type.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the configured fallback language or the channel's default language. If the content isn't available in the fallback language and the channel's default language, we return an error.

publishStartDate
Type: String

ISO 8601 formatted publish start date.

publishEndDate
Type: String

ISO 8601 formatted publish end date.

includeContentBody
Type: Boolean

Specifies whether to return the content body (`true`) or the content summary (`false`). If unspecified, the default value is `false`.

referenceDepth
Type: Integer

An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class is null. If unspecified, the default value is 0.

expandReferences
Type: Boolean

Specifies whether to include details of references (`true`) or summaries of references (`false`) in the output class. If unspecified, the default value is `false`.

referencesAsList
Type: Boolean

Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class (`true`). If you specify `false`, the references are returned as key value pairs in the `references` property. If unspecified, the default value is `false`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25. If you specify `true` for *expandReferences* or *includeContentBody*, the maximum page size you can specify is 25.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocumentCollection`

getManagedContentsForSite(siteId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize)

Get a collection of published contents for an Experience Cloud site.

API Version

55.0—57.0

In version 58.0 and later, use `getManagedContentsForSite(siteId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize, showAbsoluteUrl)`.

Available to Guest Users

55.0—57.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocumentCollection
getManagedContentsForSite(String siteId, List<String> managedContentIds, List<String>
contentKeys, String contentTypeFQN, String language, String publishStartDate, String
publishEndDate, Boolean includeContentBody, Integer referenceDepth, Boolean
expandReferences, Boolean referencesAsList, Integer pageParam, Integer pageSize)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

managedContentIds
Type: List<String>

Comma-separated list of up to 100 managed content IDs. Specify either managed content IDs or content keys.

contentKeys
Type: List<String>

Comma-separated list of up to 50 content keys. Specify either managed content IDs or content keys.

contentTypeFQN
Type: String

Fully qualified name of the managed content type.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the configured fallback language or the channel's default language. If the content isn't available in the fallback language and the channel's default language, we return an error.

publishStartDate
Type: String

ISO 8601 formatted publish start date.

publishEndDate
Type: String

ISO 8601 formatted publish end date.

includeContentBody
Type: Boolean

Specifies whether to return the content body (`true`) or the content summary (`false`). If unspecified, the default value is `false`.

referenceDepth
Type: Integer

An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class is null. If unspecified, the default value is 0.

expandReferences
Type: Boolean

Specifies whether to include details of references (`true`) or summaries of references (`false`) in the output class. If unspecified, the default value is `false`.

referencesAsList
Type: Boolean

Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class (`true`). If you specify `false`, the references are returned as key value pairs in the `references` property. If unspecified, the default value is `false`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25. If you specify `true` for *expandReferences* or *includeContentBody*, the maximum page size you can specify is 25.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocumentCollection`

ManagedTopics Class

Get managed topics in an Experience Cloud site. Create, delete, and reorder managed topics.

Namespace

ConnectApi

ManagedTopics Methods

The following are methods for `ManagedTopics`. All methods are static.

IN THIS SECTION:

createManagedTopic(communityId, recordId, managedTopicType)
Create a managed topic of a specific type for an Experience Cloud site.

createManagedTopic(communityId, recordId, managedTopicType, parentId)
Create a child managed topic for an Experience Cloud site.

createManagedTopicByName(communityId, name, managedTopicType)
Create a managed topic of a specific type by name for an Experience Cloud site.

createManagedTopicByName(communityId, name, managedTopicType, parentId)
Create a child managed topic by name for an Experience Cloud site.

deleteManagedTopic(communityId, managedTopicId)
Delete a managed topic from an Experience Cloud site.

getManagedTopic(communityId, managedTopicId)
Get a managed topic in an Experience Cloud site.

getManagedTopic(communityId, managedTopicId, depth)
Get a managed topic, including its parent and children managed topics, in an Experience Cloud site.

getManagedTopics(communityId)
Get the featured and navigational managed topics for an Experience Cloud site.

getManagedTopics(communityId, managedTopicType)
Get managed topics of the specified type for an Experience Cloud site.

getManagedTopics(communityId, managedTopicType, depth)
Get managed topics of the specified type, including their parent and children managed topics, in an Experience Cloud site.

getManagedTopics(communityId, managedTopicType, recordIds, depth)
Get managed topics of the specified type, including their parent and children managed topics, that are associated with topics in an Experience Cloud site.

getManagedTopics(communityId, managedTopicType, pageParam, pageSize)
Get a page of managed topics.

reorderManagedTopics(communityId, managedTopicPositionCollection)

Reorder the relative positions of managed topics in an Experience Cloud site.

createManagedTopic(communityId, recordId, managedTopicType)

Create a managed topic of a specific type for an Experience Cloud site.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopic(String communityId, String recordId, ConnectApi.ManagedTopicType managedTopicType)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId

Type: String

ID of the topic.

managedTopicType

Type: `ConnectApi.ManagedTopicType`

Specify the type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

You can create up to 25 `Featured` and 5,000 `Content` topics. You can create up to eight levels of `Navigational` managed topics with 25 top-level topics and 10 children topics per level for a maximum of 2,775 `Navigational` topics.

Return Value

Type: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

createManagedTopic(communityId, recordId, managedTopicType, parentId)

Create a child managed topic for an Experience Cloud site.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopic(String communityId, String recordId, ConnectApi.ManagedTopicType managedTopicType, String parentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID of the topic.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Specify `Navigational` for the type of managed topic to create a child managed topic.

You can create up to 25 `Featured` and 5,000 `Content` topics. You can create up to eight levels of `Navigational` managed topics with 25 top-level topics and 10 children topics per level for a maximum of 2,775 `Navigational` topics.

parentId
Type: String

ID of the parent managed topic.

You can create up to eight levels (parent, direct children, their children, etc.) of managed topics and up to 10 children managed topics per managed topic.

Return Value

Type: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

createManagedTopicByName(communityId, name, managedTopicType)

Create a managed topic of a specific type by name for an Experience Cloud site.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopicByName(String communityId,
String name, ConnectApi.ManagedTopicType managedTopicType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

name
Type: String

Name of the topic.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Specify the type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

You can create up to 25 `Featured` and 5,000 `Content` topics. You can create up to eight levels of `Navigational` managed topics with 25 top-level topics and 10 children topics per level for a maximum of 2,775 `Navigational` topics.

Return Value

Type: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

createManagedTopicByName(communityId, name, managedTopicType, parentId)

Create a child managed topic by name for an Experience Cloud site.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopicByName(String communityId,
String name, ConnectApi.ManagedTopicType managedTopicType, String parentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

name
Type: String

Name of the topic.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Specify `Navigational` for the type of managed topic to create a child managed topic.

You can create up to 25 `Featured` and 5,000 `Content` topics. You can create up to eight levels of `Navigational` managed topics with 25 top-level topics and 10 children topics per level for a maximum of 2,775 `Navigational` topics.

parentId
Type: String

ID of the parent managed topic.

You can create up to eight levels (parent, direct children, their children, etc.) of managed topics and up to 10 children managed topics per managed topic.

Return Value

Type: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

`deleteManagedTopic(communityId, managedTopicId)`

Delete a managed topic from an Experience Cloud site.

API Version

32.0

Requires Chatter

No

Signature

```
public static deleteManagedTopic(String communityId, String managedTopicId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicId
Type: String

ID of managed topic.

Return Value

Type: Void

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can delete managed topics.

`getManagedTopic(communityId, managedTopicId)`

Get a managed topic in an Experience Cloud site.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic getManagedTopic(String communityId, String
managedTopicId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicId
Type: String

ID of managed topic.

Return Value

Type: `ConnectApi.ManagedTopic`

getManagedTopic(communityId, managedTopicId, depth)

Get a managed topic, including its parent and children managed topics, in an Experience Cloud site.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic getManagedTopic(String communityId, String
managedTopicId, Integer depth)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicId
Type: String

ID of managed topic.

depth
Type: Integer

Specify an integer 1–8. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopic`

`getManagedTopics(communityId)`

Get the featured and navigational managed topics for an Experience Cloud site.

To get the content topics for an Experience Cloud site, use `getManagedTopics(communityId, managedTopicType)`.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

`getManagedTopics(communityId, managedTopicType)`

Get managed topics of the specified type for an Experience Cloud site.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

If you specify `Content`, up to 50 topics are returned. If you want more than 50 `Content` topics, use `getManagedTopics(communityId, managedTopicType, pageParam, pageSize)`.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

getManagedTopics(communityId, managedTopicType, depth)

Get managed topics of the specified type, including their parent and children managed topics, in an Experience Cloud site.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType, Integer depth)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

depth

Type: Integer

Specify an integer 1–8. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

`getManagedTopics(communityId, managedTopicType, recordIds, depth)`

Get managed topics of the specified type, including their parent and children managed topics, that are associated with topics in an Experience Cloud site.

API Version

38.0

Available to Guest Users

38.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType, List<String> recordIds, Integer depth)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicType

Type: `ConnectApi.ManagedTopicType`

Type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

`recordIds`
Type: List<String>

A list of up to 100 topic IDs associated with the managed topics.

If you list more than 10 topic IDs, you can't specify 2–8 for *`depth`*.

`depth`
Type: Integer

Specify an integer 1–8. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

`getManagedTopics(communityId, managedTopicType, pageParam, pageSize)`

Get a page of managed topics.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType, Integer pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicType
Type: ConnectApi.ManagedTopicType

Type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 50.

Return Value

Type: ConnectApi.ManagedTopicCollection

reorderManagedTopics(communityId, managedTopicPositionCollection)

Reorder the relative positions of managed topics in an Experience Cloud site.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection reorderManagedTopics(String communityId,
ConnectApi.ManagedTopicPositionCollectionInput managedTopicPositionCollection)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicPositionCollection
Type: ConnectApi.ManagedTopicPositionCollectionInput

A collection of relative positions of managed topics. This collection can include only `Featured` and `Navigational` topics and doesn't have to include all managed topics.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can reorder managed topics.

You can reorder parent managed topics or children managed topics with the same parent. If you don't include all managed topics in the `ConnectApi.ManagedTopicPositionCollectionInput`, the managed topics are reordered by respecting the positions indicated in the `ConnectApi.ManagedTopicPositionCollectionInput` and then by pushing down any managed topics that aren't included in the `ConnectApi.ManagedTopicPositionCollectionInput` to the next available position.

Example

If you have these managed topics:

Managed Topic	Position
ManagedTopicA	0
ManagedTopicB	1
ManagedTopicC	2
ManagedTopicD	3
ManagedTopicE	4

And you reorder managed topics by including this information in `ConnectApi.ManagedTopicPositionCollectionInput`:

Managed Topic	Position
ManagedTopicD	0
ManagedTopicE	2

The result is:

Managed Topic	Position
ManagedTopicD	0
ManagedTopicA	1
ManagedTopicE	2
ManagedTopicB	3
ManagedTopicC	4

Retired ManagedTopics Methods

The following methods for `ManagedTopics` are retired.

IN THIS SECTION:

getManagedTopics(communityId, managedTopicType, recordId, depth)
Get managed topics of the specified type, including their parent and children managed topics, that are associated with a given topic in an Experience Cloud site.

`getManagedTopics(communityId, managedTopicType, recordId, depth)`

Get managed topics of the specified type, including their parent and children managed topics, that are associated with a given topic in an Experience Cloud site.

API Version

35.0–37.0

Important: In version 38.0 and later, use `getManagedTopics(communityId, managedTopicType, recordIds, depth)`.

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType, String recordId, Integer depth)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`managedTopicType`
Type: `ConnectApi.ManagedTopicType`

Type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

recordId
Type: String

ID of the topic associated with the managed topics.

depth
Type: Integer

Specify an integer 1–8. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

MarketingIntegration Class

Get, save, and submit a microsites marketing integration form for an Experience Cloud site.

Namespace

ConnectApi

MarketingIntegration Methods

The following are methods for `MarketingIntegration`. All methods are static.

`MarketingIntegration` methods make calls to Marketing Cloud Engagement REST APIs to create, query, and insert data to the data extension object. If the API returns errors, ConnectinApex error messages include the error code and message from Marketing Cloud Engagement.

IN THIS SECTION:

getForm(siteId, formId)
Get a marketing integration form for an Experience Cloud site.

saveForm(siteId, formInput)
Save a marketing integration form for an Experience Cloud site.

submitForm(siteId, formId, formSubmissionInput)
Submit a marketing integration form for an Experience Cloud site.

`getForm(siteId, formId)`

Get a marketing integration form for an Experience Cloud site.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.Form getForm(String siteId, String formId)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

formId
Type: String

ID of the form.

Return Value

Type: ConnectApi.Form

saveForm(siteId, formInput)

Save a marketing integration form for an Experience Cloud site.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.Form saveForm(String siteId, ConnectApi.FormInput formInput)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

formInput
Type: ConnectApi.FormInput

A `ConnectApi.FormInput` object to save.

Return Value

Type: ConnectApi.Form

Usage

This method attempts to create a read-only data extension in Marketing Cloud Engagement. A Marketing Cloud Engagement admin can change the read-only setting. We recommend keeping the data extension as read-only to maintain schema consistency with the form.

`submitForm(siteId, formId, formSubmissionInput)`

Submit a marketing integration form for an Experience Cloud site.

API Version

53.0

Available to Guest Users

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.FormSubmission submitForm(String siteId, String formId,
ConnectApi.FormSubmissionInput formSubmissionInput)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

formId
Type: String

ID of the form.

formSubmissionInput
Type: `ConnectApi.FormSubmissionInput`

A `ConnectApi.FormSubmissionInput` object to submit.

Return Value

Type: `ConnectApi.FormSubmission`

Mentions Class

Access information about mentions. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.

Namespace

ConnectApi

Mentions Methods

The following are methods for `Mentions`. All methods are static.

IN THIS SECTION:

getMentionCompletions(communityId, q, contextId)
Get the first page of possible users and groups to mention in a feed item body or comment body.

getMentionCompletions(communityId, q, contextId, type, pageParam, pageSize)
Get a page of possible mention proposals of the specified type.

getMentionValidations(communityId, parentId, recordIds, visibility)
Get information about whether the mentions are valid for the context user.

`getMentionCompletions(communityId, q, contextId)`

Get the first page of possible users and groups to mention in a feed item body or comment body.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.MentionCompletionPage getMentionCompletions (String communityId,
String q, String contextId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

contextId
Type: String

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

Return Value

Type: `ConnectApi.MentionCompletionPage`

Usage

Call this method to generate a page of proposed mentions that a user can choose from when they enter characters after @ in a feed item body or a comment body.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetMentionCompletions(communityId, q, contextId, result)

Apex Developer Guide: Testing ConnectApi Code

`getMentionCompletions(communityId, q, contextId, type, pageParam, pageSize)`

Get a page of possible mention proposals of the specified type.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Mentions getMentionCompletions (String communityId, String q,
String contextId, ConnectApi.MentionCompletionType type, Integer pageParam, Integer
pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

contextId
Type: String

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

type
Type: `ConnectApi.MentionCompletionType`

Type of mention completion.

- `All`—All mention completions, regardless of the type of record to which the mention refers.
- `Group`—Mention completions for groups.
- `User`—Mention completions for users.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.MentionCompletionPage`

Usage

Call this method to generate a page of proposed mentions that a user can choose from when they enter characters after @ in a feed item body or a comment body.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetMentionCompletions(communityId, q, contextId, type, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

`getMentionValidations(communityId, parentId, recordIds, visibility)`

Get information about whether the mentions are valid for the context user.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Mentions getMentionValidations(String communityId, String
parentId, List<String> recordIds, ConnectApi.FeedItemVisibilityType visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

parentId
Type: String

The feed item parent ID.

recordIds
Type: List<String>

A comma-separated list of IDs to be mentioned. The maximum value is 25.

visibility
Type: `ConnectApi.FeedItemVisibilityType`

Type of users who can see a feed item.

- `AllUsers`—Visibility is not limited to internal users.
- `InternalUsers`—Visibility is limited to internal users.

Return Value

Type: `ConnectApi.MentionValidations`

Usage

Call this method to check whether the record IDs returned from a call to `ConnectApi.Mentions.getMentionCompletions` are valid for the context user. For example, the context users can't mention private groups they don't belong to. If such a group were included in the list of mention validations, the `ConnectApi.MentionValidations.hasErrors` property would be `true` and the group would have a `ConnectApi.MentionValidation.valdiationStatus` of `Disallowed`.

Mentions Test Methods

These are the test methods for `Mentions`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestGetMentionCompletions(communityId, q, contextId, result)`

Register a `ConnectApi.MentionCompletionPage` object to be returned when `getMentionCompletions(String, String, String)` is called in a test context.

API Version

29.0

Signature

```
public static Void setTestGetMentionCompletions (String communityId, String q, String contextId, ConnectApi.MentionCompletionPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

contextId
Type: String

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

result
Type: `ConnectApi.MentionCompletionPage`

A `ConnectApi.MentionCompletionPage` object containing test data.

Return Value

Type: Void

SEE ALSO:

getMentionCompletions(communityId, q, contextId)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetMentionCompletions(communityId, q, contextId, type, pageParam, pageSize, result)`

Register a `ConnectApi.MentionCompletionPage` object to be returned when `getMentionCompletions(String, String, String, ConnectApi.MentionCompletionType, Integer, Integer)` is called in a test context.

API Version

29.0

Signature

```
public static Void setTestGetMentionCompletions (String communityId, String q, String contextId, ConnectApi.MentionCompletionType type, Integer pageParam, Integer pageSize, ConnectApi.MentionCompletionPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

contextId
Type: String

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

type
Type: `ConnectApi.MentionCompletionType`

Type of mention completion.

- `All`—All mention completions, regardless of the type of record to which the mention refers.
- `Group`—Mention completions for groups.
- `User`—Mention completions for users.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.MentionCompletionPage`

A `ConnectApi.MentionCompletionPage` object containing test data.

Return Value

Type: Void

SEE ALSO:

getMentionCompletions(communityId, q, contextId, type, pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

Missions Class

Export and purge mission activity for users. Get a user's mission progress. Update mission activity counts for users.

Namespace

ConnectApi

Missions Methods

The following are methods for `Missions`. All methods are static.

IN THIS SECTION:

exportUserMissionsActivities(communityId, userId)
Export mission activity for a user.

getUserMissionsProgress(communityId, userId)
Get mission activity progress for a user.

purgeUserMissionsActivities(communityId, userId)
Start a job to purge mission activity for a user.

purgeUserMissionsActivities(communityId)
Start a job to purge mission activity for all users.

updateUserMissionActivityCount(activityType, activityCount, communityId, userId)
Update the mission activity count for a user.

`exportUserMissionsActivities(communityId, userId)`

Export mission activity for a user.

API Version

45.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserMissionActivitiesJob exportUserMissionsActivities(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.UserMissionActivitiesJob`

Usage

You can export these activities with this method.

- `FeedItemAnswerAQuestion`—User answered a question.

- `FeedItemLikeSomething`—User liked a post or comment.
- `FeedItemMarkAnswerAsBest`—User marked an answer as the best answer.
- `FeedItemPostQuestion`—User posted a question.
- `FeedItemReceiveAComment`—User received a comment on a post.
- `FeedItemReceiveALike`—User received a like on a post or comment.
- `FeedItemReceiveAnAnswer`—User received an answer to a question.
- `FeedItemWriteAComment`—User commented on a post.
- `FeedItemWriteAPost`—User made a post.
- `FeedItemYourAnswerMarkedBest`—User's answer was marked as the best answer.

`getUserMissionsProgress(communityId, userId)`

Get mission activity progress for a user.

API Version

46.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserMissionActivityCollection getUserMissionsProgress(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.UserMissionActivityCollection`

`purgeUserMissionsActivities(communityId, userId)`

Start a job to purge mission activity for a user.

API Version

45.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserMissionActivitiesJob purgeUserMissionsActivities(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.UserMissionActivitiesJob`

Usage

This method purges these activities.

- `FeedItemAnswerAQuestion`—User answered a question.
- `FeedItemLikeSomething`—User liked a post or comment.
- `FeedItemMarkAnswerAsBest`—User marked an answer as the best answer.
- `FeedItemPostQuestion`—User posted a question.
- `FeedItemReceiveAComment`—User received a comment on a post.
- `FeedItemReceiveALike`—User received a like on a post or comment.
- `FeedItemReceiveAnAnswer`—User received an answer to a question.
- `FeedItemWriteAComment`—User commented on a post.
- `FeedItemWriteAPost`—User made a post.
- `FeedItemYourAnswerMarkedBest`—User's answer was marked as the best answer.

`purgeUserMissionsActivities(communityId)`

Start a job to purge mission activity for all users.

API Version

49.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserMissionActivitiesJob purgeUserMissionsActivities(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.UserMissionActivitiesJob`

Usage

This method purges these activities.

- `FeedItemAnswerAQuestion`—User answered a question.
- `FeedItemLikeSomething`—User liked a post or comment.
- `FeedItemMarkAnswerAsBest`—User marked an answer as the best answer.
- `FeedItemPostQuestion`—User posted a question.
- `FeedItemReceiveAComment`—User received a comment on a post.
- `FeedItemReceiveALike`—User received a like on a post or comment.
- `FeedItemReceiveAnAnswer`—User received an answer to a question.
- `FeedItemWriteAComment`—User commented on a post.
- `FeedItemWriteAPost`—User made a post.
- `FeedItemYourAnswerMarkedBest`—User's answer was marked as the best answer.

`updateUserMissionActivityCount(activityType, activityCount, communityId, userId)`

Update the mission activity count for a user.

API Version

45.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserMissionActivityStatus updateUserMissionActivityCount(ConnectApi.UserMissionActivityType activityType, Integer activityCount, String communityId, String userId)
```

Parameters

activityType
Type: `ConnectApi.UserMissionActivityType`

Type of mission activity for a user. Values are:

- `FeedItemAnswerAQuestion`—User answered a question.
- `FeedItemLikeSomething`—User liked a post or comment.
- `FeedItemMarkAnswerAsBest`—User marked an answer as the best answer.
- `FeedItemPostQuestion`—User posted a question.
- `FeedItemReceiveAComment`—User received a comment on a post.
- `FeedItemReceiveALike`—User received a like on a post or comment.
- `FeedItemReceiveAnAnswer`—User received an answer to a question.
- `FeedItemWriteAComment`—User commented on a post.
- `FeedItemWriteAPost`—User made a post.
- `FeedItemYourAnswerMarkedBest`—User's answer was marked as the best answer.

activityCount
Type: Integer

Number of mission activities of the specified type for the user.

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.UserMissionActivityStatus`

NamedCredentials Class

Create, refresh, get, delete, replace, and update credentials. Create and get external credentials. Create and get named credentials. Get the URL for the OAuth token flow for an external credential.

Note: Managed packages can access only the named credentials and external credentials that are included in or created from the package's Apex code. If a managed package tries to access non-packaged named credentials and external credentials that a Salesforce admin created in the org, an error occurs.

Namespace

ConnectApi

NamedCredentials Methods

The following are methods for `NamedCredentials`. All methods are static.

IN THIS SECTION:

createCredential(requestBody)
Create a credential.

createCredential(requestBody, action)
Refresh an OAuth or AWS Roles Anywhere credential.

createExternalCredential(requestBody)
Create an external credential.

createNamedCredential(requestBody)
Create a named credential.

deleteCredential(externalCredential, principalName, principalType)
Delete a credential.

deleteCredential(externalCredential, principalName, principalType, authenticationParameters)
Delete a credential with authentication parameters.

getCredential(externalCredential, principalName, principalType)
Get a credential.

getExternalCredential(developerName)
Get an external credential, including the named credentials and principals associated with it and the type and status of each principal.

getExternalCredentials()
Get external credentials that the user can authenticate to.

getNamedCredential(developerName)
Get a named credential.

getNamedCredentials()
Get a list of named credentials for the org.

getOAuthCredentialAuthUrl(requestBody)
Get the URL for the OAuth token flow for an external credential.

patchCredential(requestBody)
Update custom credentials.

updateCredential(requestBody)
Replace a credential.

SEE ALSO:

`createCredential(requestBody)`

Create a credential.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.Credential createCredential(ConnectApi.CredentialInput
requestBody)
```

Parameters

requestBody
Type: ConnectApi.CredentialInput

A ConnectApi.CredentialInput class.

Return Value

Type: ConnectApi.Credential

createCredential(requestBody, action)

Refresh an OAuth or AWS Roles Anywhere credential.

API Version

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.Credential createCredential(ConnectApi.CredentialInput
requestBody, ConnectApi.CreateCredentialAction action)
```

Parameters

requestBody
Type: ConnectApi.CredentialInput

A ConnectApi.CredentialInput class.

action
Type: ConnectApi.CreateCredentialAction

Action to take when creating the credential. Value is:

- Refresh

Return Value

Type: ConnectApi.Credential

createExternalCredential(requestBody)

Create an external credential.

API Version

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalCredential
createExternalCredential(ConnectApi.ExternalCredentialInput requestBody)
```

Parameters

requestBody
Type: ConnectApi.ExternalCredentialInput

Input used to create or update an external credential.

Return Value

Type: ConnectApi.ExternalCredential

createNamedCredential(requestBody)

Create a named credential.

API Version

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.NamedCredential
createNamedCredential(ConnectApi.NamedCredentialInput requestBody)
```

Parameters

requestBody
Type: ConnectApi.NamedCredentialInput

Input used to create or update a named credential.

Return Value

Type: ConnectApi.NamedCredential

deleteCredential(externalCredential, principalName, principalType)

Delete a credential.

API Version

56.0

Requires Chatter

No

Signature

```
public static Void deleteCredential(String externalCredential, String principalName,
ConnectApi.CredentialPrincipalType principalType)
```

Parameters

externalCredential
Type: String

Fully qualified developer name of the external credential.

principalName
Type: String

Name of the external credential named principal.

principalType
Type: ConnectApi.CredentialPrincipalType

Type of credential principal. Values are:

- AwsStsPrincipal
- NamedPrincipal
- PerUserPrincipal

Return Value

Type: Void

deleteCredential(externalCredential, principalName, principalType, authenticationParameters)

Delete a credential with authentication parameters.

API Version

59.0

Requires Chatter

No

Signature

```
public static Void deleteCredential(String externalCredential, String principalName,
ConnectApi.CredentialPrincipalType principalType, List<String> authenticationParameters)
```

Parameters

externalCredential
Type: String

Fully qualified developer name of the external credential.

principalName
Type: String

Name of the external credential named principal.

principalType
Type: ConnectApi.CredentialPrincipalType

Type of credential principal. Values are:

- `AwsStsPrincipal`
- `NamedPrincipal`
- `PerUserPrincipal`

authenticationParameters
Type: List<String>

List of authentication parameters only for custom protocols, for example `myApiKey,myApiSecret`. If unspecified, all credentials are deleted.

Return Value

Type: Void

getCredential(externalCredential, principalName, principalType)

Get a credential.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.Credential getCredential(String externalCredential, String
principalName, ConnectApi.CredentialPrincipalType principalType)
```

Parameters

externalCredential
Type: String

Fully qualified developer name of the external credential.

principalName
Type: String

Name of the external credential named principal.

principalType
Type: ConnectApi.CredentialPrincipalType

Type of credential principal. Values are:

- AwsStsPrincipal
- NamedPrincipal
- PerUserPrincipal

Return Value

Type: ConnectApi.Credential

getExternalCredential(developerName)

Get an external credential, including the named credentials and principals associated with it and the type and status of each principal.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalCredential getExternalCredential(String developerName)
```

Parameters

developerName
Type: String

Fully qualified developer name of the external credential.

Return Value

Type: ConnectApi.ExternalCredential

getExternalCredentials()

Get external credentials that the user can authenticate to.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalCredentialList getExternalCredentials()
```

Return Value

Type: ConnectApi.ExternalCredentialList

getNamedCredential(developerName)

Get a named credential.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.NamedCredential getNamedCredential(String developerName)
```

Parameters

developerName
Type: String

Fully qualified developer name of the named credential.

Return Value

Type: ConnectApi.NamedCredential

getNamedCredentials()

Get a list of named credentials for the org.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.NamedCredentialList getNamedCredentials()
```

Return Value

Type: ConnectApi.NamedCredentialList

getOAuthCredentialAuthUrl(requestBody)

Get the URL for the OAuth token flow for an external credential.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.OAuthCredentialAuthUrl
getOAuthCredentialAuthUrl(ConnectApi.OAuthCredentialAuthUrlInput requestBody)
```

Parameters

requestBody
Type: ConnectApi.OAuthCredentialAuthUrlInput

A ConnectApi.OAuthCredentialAuthUrlInput class indicating the OAuth authentication flow.

Return Value

Type: ConnectApi.OAuthCredentialAuthUrl

Usage

Accepts input parameters representing a specific external credential and, optionally, a named principal. Returns the URL a user must visit to begin the authentication flow, ultimately returning authentication tokens to Salesforce. Use this method as part of building a customized or branded user interface to help users initiate authentication.

Example

```
ConnectApi.OAuthCredentialAuthUrlInput input = new ConnectApi.OAuthCredentialAuthUrlInput();

input.externalCredential = 'MyExternalCredentialDeveloperName';
input.principalType = ConnectApi.CredentialPrincipalType.PerUserPrincipal;
input.principalName = 'MyPrincipal'; // Only required when principalType = NamedPrincipal

ConnectApi.OAuthCredentialAuthUrl output =
ConnectApi.NamedCredentials.getOAuthCredentialAuthUrl(input);

String authenticationUrl = output.authenticationUrl; // Redirect users to this URL to
authenticate in the browser
```

`patchCredential(requestBody)`

Update custom credentials.

This method updates custom credentials. To replace a credential, use `updateCredential(requestBody)`.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.Credential patchCredential(ConnectApi.CredentialInput
requestBody)
```

Parameters

`requestBody`
Type: `ConnectApi.CredentialInput`

A `ConnectApi.CredentialInput` class. Only the custom credentials in the input class are updated.

Return Value

Type: `ConnectApi.Credential`

`updateCredential(requestBody)`

Replace a credential.

This method uses the `ConnectApi.CredentialInput` and the `ConnectApi.CredentialValueInput` input classes to replace a credential's values. In the UI, these values appear as the credential's authentication parameters. To update a credential, use `patchCredential(requestBody)`.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.Credential updateCredential(ConnectApi.CredentialInput
requestBody)
```

Parameters

requestBody
Type: `ConnectApi.CredentialInput`

A `ConnectApi.CredentialInput` class.

Return Value

Type: `ConnectApi.Credential`

NavigationMenu Class

Get navigation menu items for an Experience Cloud site.

Namespace

ConnectApi

NavigationMenu Methods

These methods are for `NavigationMenu`. All methods are static.

IN THIS SECTION:

getCommunityNavigationMenu(communityId, navigationLinkSetId, navigationLinkSetDeveloperName, publishStatus, includeImageUrl, addHomeMenuItem, menuItemTypesToSkip)
Get navigation menu items for an Experience Cloud site.

getCommunityNavigationMenu(communityId, navigationLinkSetId, navigationLinkSetDeveloperName, publishStatus, includeImageUrl, addHomeMenuItem, menuItemTypesToSkip, effectiveAccountId)
Get navigation menu items for an Experience Cloud based on an effective account.

getCommunityNavigationMenu(communityId, navigationLinkSetId, navigationLinkSetDeveloperName, publishStatus, includeImageUrl, addHomeMenuItem, menuItemTypesToSkip)

Get navigation menu items for an Experience Cloud site.

API Version

52.0

Available to Guest Users

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.NavigationMenuItemCollection getCommunityNavigationMenu(String communityId, String navigationLinkSetId, String navigationLinkSetDeveloperName, ConnectApi.PublishStatus publishStatus, Boolean includeImageUrl, Boolean addHomeMenuItem, List<ConnectApi.NavigationMenuItemType> menuItemTypesToSkip)
```

Parameters

communityId
Type: String

ID of an Experience Cloud site.

navigationLinkSetId
Type: String

ID of the navigation link set.

navigationLinkSetDeveloperName
Type: String

Developer name of the navigation link set.

publishStatus
Type: ConnectApi.PublishStatus

Publish status of the navigation menu item. Values are:

- `Draft`
- `Live`

includeImageUrl
Type: Boolean

Specifies whether to include the image URL with the menu item (`true`) or not (`false`).

addHomeMenuItem
Type: Boolean

Specifies whether to add the Home menu item (`true`) or not (`false`).

`menuItemTypesToSkip`
Type: List<`ConnectApi.NavigationMenuItemType`>

List of menu item types to filter out of the results. Values are:

- `DataSourceDriven`—Menu items dynamically added from a data source.
- `Event`—Event, such as logging in, logging out, or switching accounts.
- `ExternalLink`—URL outside of your site.
- `GlobalAction`—Lets users create records that aren't related to other records.
- `InternalLink`—Relative URL inside your site.
- `MenuLabel`—Menu label.
- `Modal`—Modal, such as Account Switcher.
- `NavigationalTopic`—Dropdown list with links to the navigational topics in your site.
- `SalesforceObject`—Objects such as accounts, cases, contacts, and custom objects.
- `SystemLink`—System link, such as a link to Builder, Workspaces, or Setup.

Return Value

Type: `ConnectApi.NavigationMenuItemCollection`

Usage

Supported navigation menu item types are:

- `DataSourceDriven`—Menu items dynamically added from a data source.
- `Event`—Event, such as logging in, logging out, or switching accounts.
- `ExternalLink`—URL outside of your site.
- `GlobalAction`—Lets users create records that aren't related to other records.
- `InternalLink`—Relative URL inside your site.
- `MenuLabel`—Menu label.
- `Modal`—Modal, such as Account Switcher.
- `NavigationalTopic`—Dropdown list with links to the navigational topics in your site.
- `SalesforceObject`—Objects such as accounts, cases, contacts, and custom objects.
- `SystemLink`—System link, such as a link to Builder, Workspaces, or Setup.

`getCommunityNavigationMenu(communityId, navigationLinkSetId, navigationLinkSetDeveloperName, publishStatus, includeImageUrl, addHomeMenuItem, menuItemTypesToSkip, effectiveAccountId)`

Get navigation menu items for an Experience Cloud based on an effective account.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.NavigationMenuItemCollection getCommunityNavigationMenu(String
communityId, String navigationLinkSetId, String navigationLinkSetDeveloperName,
ConnectApi.PublishStatus publishStatus, Boolean includeImageUrl, Boolean addHomeMenuItem,
List<ConnectApi.NavigationMenuItemType> menuItemTypesToSkip, String effectiveAccountId)
```

Parameters

communityId
Type: String

ID of an Experience Cloud site.

navigationLinkSetId
Type: String

ID of the navigation link set.

navigationLinkSetDeveloperName
Type: String

Developer name of the navigation link set.

publishStatus
Type: `ConnectApi.PublishStatus`

Publish status of the navigation menu item. Values are:

- `Draft`
- `Live`

includeImageUrl
Type: Boolean

Specifies whether to include the image URL with the menu item (`true`) or not (`false`).

addHomeMenuItem
Type: Boolean

Specifies whether to add the Home menu item (`true`) or not (`false`).

menuItemTypesToSkip
Type: List<`ConnectApi.NavigationMenuItemType`>

List of menu item types to filter out of the results. Values are:

- `DataSourceDriven`—Menu items dynamically added from a data source.
- `Event`—Event, such as logging in, logging out, or switching accounts.
- `ExternalLink`—URL outside of your site.
- `GlobalAction`—Lets users create records that aren't related to other records.

- `InternalLink`—Relative URL inside your site.
- `MenuLabel`—Menu label.
- `Modal`—Modal, such as Account Switcher.
- `NavigationalTopic`—Dropdown list with links to the navigational topics in your site.
- `SalesforceObject`—Objects such as accounts, cases, contacts, and custom objects.
- `SystemLink`—System link, such as a link to Builder, Workspaces, or Setup.

`effectiveAccountId`
Type: String

ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user.

Return Value

Type: `ConnectApi.NavigationMenuItemCollection`

Usage

Supported navigation menu item types are:

- `DataSourceDriven`—Menu items dynamically added from a data source.
- `Event`—Event, such as logging in, logging out, or switching accounts.
- `ExternalLink`—URL outside of your site.
- `GlobalAction`—Lets users create records that aren't related to other records.
- `InternalLink`—Relative URL inside your site.
- `MenuLabel`—Menu label.
- `Modal`—Modal, such as Account Switcher.
- `NavigationalTopic`—Dropdown list with links to the navigational topics in your site.
- `SalesforceObject`—Objects such as accounts, cases, contacts, and custom objects.
- `SystemLink`—System link, such as a link to Builder, Workspaces, or Setup.

NextBestAction Class

Execute recommendation strategies, get recommendations, manage recommendation reactions.

Namespace

ConnectApi

Usage

Community users can't access this class. Portal and guest users can access strategies only through the Suggested Actions component.

NextBestAction Methods

The following are methods for `NextBestAction`. All methods are static.

IN THIS SECTION:

deleteRecommendationReaction(reactionId)
Delete a recommendation reaction.

executeStrategy(strategyName, maxResults, contextRecordId)
Execute a strategy.

executeStrategy(strategyName, maxResults, contextRecordId, debugTrace)
Execute a strategy and request a trace.

executeStrategy(strategyName, strategyInput)
Execute a strategy using an input class.

getRecommendation(recommendationId)
Get a recommendation.

getRecommendationReaction(reactionId)
Get a recommendation reaction.

getRecommendationReactions(onBehalfOfId, createdById, targetId, contextRecordId, pageParam, pageSize)
Get recommendation reactions.

setRecommendationReaction(reaction)
Record user reactions to recommendations.

`deleteRecommendationReaction(reactionId)`

Delete a recommendation reaction.

API Version

45.0

Requires Chatter

No

Signature

```
public static Void deleteRecommendationReaction(String reactionId)
```

Parameters

`reactionId`
Type: String

ID of the recommendation reaction.

Return Value

Type: Void

Usage

Users with the Manage Next Best Action Recommendations or Modify All Data permission can delete recommendation reactions.

executeStrategy(strategyName, maxResults, contextRecordId)

Execute a strategy.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.NBARecommendations executeStrategy(String strategyName, Integer maxResults, String contextRecordId)
```

Parameters

strategyName
Type: String

Name of the strategy.

maxResults
Type: Integer

Maximum number of results. Valid values are from 1 to 25. The default is 3.

contextRecordId
Type: String

ID of the context record. For example, if the next best action is on a case detail page, the ID of the case.

Return Value

Type: `ConnectApi.NBARecommendations`

executeStrategy(strategyName, maxResults, contextRecordId, debugTrace)

Execute a strategy and request a trace.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.NBARecommendations executeStrategy(String strategyName, Integer
maxResults, String contextRecordId, Boolean debugTrace)
```

Parameters

strategyName
Type: String

Name of the strategy.

maxResults
Type: Integer

Maximum number of results. Valid values are from 1 to 25. The default is 3.

contextRecordId
Type: String

ID of the context record. For example, if the next best action is on a case detail page, the ID of the case.

debugTrace
Type: Boolean

Specifies whether to return trace and debug information in the response (`true`) or not (`false`).

Return Value

Type: `ConnectApi.NBARecommendations`

executeStrategy(strategyName, strategyInput)

Execute a strategy using an input class.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.NBARecommendations executeStrategy(String strategyName,
ConnectApi.NBAStrategyInput strategyInput)
```

Parameters

strategyName
Type: String

Name of the strategy.

strategyInput
Type: ConnectApi.NBAStrategyInput

A ConnectApi.NBAStrategyInput body.

Return Value

Type: ConnectApi.NBARecommendations

getRecommendation(recommendationId)

Get a recommendation.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.Recommendation getRecommendation(String recommendationId)
```

Parameters

recommendationId
Type: String

ID of the recommendation.

Return Value

Type: ConnectApi.Recommendation

getRecommendationReaction(reactionId)

Get a recommendation reaction.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationReaction getRecommendationReaction(String
reactionId)
```

Parameters

reactionId
Type: String

ID of the recommendation reaction.

Return Value

Type: ConnectApi.RecommendationReaction

Usage

Users with the Manage Next Best Action Recommendations or Modify All Data permission can get recommendation reactions.

getRecommendationReactions(onBehalfOfId, createdById, targetId, contextRecordId, pageParam, pageSize)

Get recommendation reactions.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationReactions getRecommendationReactions(String
onBehalfOfId, String createdById, String targetId, String contextRecordId, Integer
pageParam, Integer pageSize)
```

Parameters

onBehalfOfId
Type: String

Use the ID of the user who is indirectly reacting to the recommendation to filter the results.

createdById
Type: String

Use the ID of the user or record that created the recommendation reaction to filter the results.

targetId
Type: String

Use the ID of the target to filter the results.

contextRecordId
Type: String

Use the ID of a context record to filter the results.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.RecommendationReactions`

Usage

Users with the Manage Next Best Action Recommendations or Modify All Data permission can get recommendation reactions.

`setRecommendationReaction(reaction)`

Record user reactions to recommendations.

API Version

45.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationReaction
setRecommendationReaction(ConnectApi.RecommendationReactionInput reaction)
```

Parameters

reaction
Type: ConnectApi.RecommendationReactionInput

A ConnectApi.RecommendationReactionInput object representing a reaction to a recommendation produced by a recommendation strategy.

Return Value

Type: ConnectApi.RecommendationReaction

OmnichannelInventoryService Class

Route orders to inventory locations in Order Management.

Namespace

ConnectApi

OmnichannelInventoryService Methods

The following are methods for OmnichannelInventoryService. All methods are static.

IN THIS SECTION:

createReservation(createReservationInputRepresentation)
Create an inventory reservation in Omnichannel Inventory.

fulfillReservation(fulfillReservationInputRepresentation)
Fulfill one or more inventory reservations.

getInventoryAvailability(inventoryAvailabilityInputRepresentation)
Retrieve inventory availability data for one or more products at one or more inventory locations or location groups.

getInventoryAvailabilityUploadStatus(uploadId)
Retrieve the status of an inventory availability upload job.

getPublishLocationStructureStatus(uploadId)
Retrieve the status of a publish location structure job.

publishLocationStructure()
Asynchronously publish information about your inventory locations and location groups to Omnichannel Inventory. The publish includes records whose IsEnabled and ShouldSyncWithOci fields are both *true*. This method returns an ID that you can use to retrieve the status of the publish job.

releaseReservation(releaseReservationInputRepresentation)
Release one or more existing inventory reservations to free up that inventory.

submitInventoryAvailabilityUpload(fileUpload)
Upload an inventory availability data file to Omnichannel Inventory.

transferReservation(transferReservationInputRepresentation)
Transfer one or more inventory reservations between locations or location groups. This API doesn't change physical quantities, but reduces the reserved quantity at the source and increases it at the destination.

createReservation(createReservationInputRepresentation)

Create an inventory reservation in Omnichannel Inventory.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCICreateReservationOutputRepresentation
createReservation(ConnectApi.OCICreateReservationInputRepresentation
createReservationInputRepresentation)
```

Parameters

createReservationInputRepresentation
Type: ConnectApi.OCICreateReservationInputRepresentation

Data to reserve inventory at one or more Omnichannel Inventory locations or location groups.

Return Value

Type: ConnectApi.OCICreateReservationOutputRepresentation

fulfillReservation(fulfillReservationInputRepresentation)

Fulfill one or more inventory reservations.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIFulfillReservationOutputRepresentation
fulfillReservation(ConnectApi.OCIFulfillReservationInputRepresentation
fulfillReservationInputRepresentation)
```

Parameters

fulfillReservationInputRepresentation
Type: ConnectApi.OCIFulfillReservationInputRepresentation

Wraps a list of inventory reservations to fulfill.

Return Value

Type: ConnectApi.OCIFulfillReservationOutputRepresentation

getInventoryAvailability(inventoryAvailabilityInputRepresentation)

Retrieve inventory availability data for one or more products at one or more inventory locations or location groups.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIGetInventoryAvailabilityOutputRepresentation
getInventoryAvailability(ConnectApi.OCIGetInventoryAvailabilityInputRepresentation
inventoryAvailabilityInputRepresentation)
```

Parameters

inventoryAvailabilityInputRepresentation
Type: ConnectApi.OCIGetInventoryAvailabilityInputRepresentation

Details of a request to retrieve inventory availability.

Return Value

Type: ConnectApi.OCIGetInventoryAvailabilityOutputRepresentation

getInventoryAvailabilityUploadStatus(uploadId)

Retrieve the status of an inventory availability upload job.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIUploadInventoryAvailabilityStatusOutputRepresentation
getInventoryAvailabilityUploadStatus(String uploadId)
```

Parameters

uploadId
Type: String

The upload ID of the upload job.

Return Value

Type: ConnectApi.OCIUploadInventoryAvailabilityStatusOutputRepresentation

getPublishLocationStructureStatus(uploadId)

Retrieve the status of a publish location structure job.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIPublishLocationStructureStatusOutputRepresentation
getPublishLocationStructureStatus(String uploadId)
```

Parameters

uploadId
Type: String

The upload ID of the publish job.

Return Value

Type: ConnectApi.OCIPublishLocationStructureStatusOutputRepresentation

publishLocationStructure()

Asynchronously publish information about your inventory locations and location groups to Omnichannel Inventory. The publish includes records whose IsEnabled and ShouldSyncWithOci fields are both *true*. This method returns an ID that you can use to retrieve the status of the publish job.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIPublishLocationStructureOutputRepresentation
publishLocationStructure()
```

Return Value

Type: ConnectApi.OCIPublishLocationStructureOutputRepresentation

releaseReservation(releaseReservationInputRepresentation)

Release one or more existing inventory reservations to free up that inventory.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIReleaseReservationOutputRepresentation
releaseReservation(ConnectApi.OCIReleaseReservationInputRepresentation
releaseReservationInputRepresentation)
```

Parameters

releaseReservationInputRepresentation
Type: ConnectApi.OCIReleaseReservationInputRepresentation

Details of one or more inventory reservations to release.

Return Value

Type: ConnectApi.OCIReleaseReservationOutputRepresentation

submitInventoryAvailabilityUpload(fileUpload)

Upload an inventory availability data file to Omnichannel Inventory.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIUploadInventoryAvailabilityOutputRepresentation
submitInventoryAvailabilityUpload(ConnectApi.BinaryInput fileUpload)
```

Parameters

fileUpload

Type: ConnectApi.BinaryInput

JSON file containing inventory availability data.

Return Value

Type: ConnectApi.OCIUploadInventoryAvailabilityOutputRepresentation

Usage

To create an inventory data file, format the data as a series of JSON entries representing locations and individual inventory records.

Inventory Import Data Considerations:

- Separate the top-level entries with line feeds, not commas. Each entry must be on a single line.
- When the system reads a location entry, it assigns the subsequent inventory entries to that location until it reads another location entry.
- For each location entry, specify `"mode":"UPDATE"`.
- Each inventory record entry requires a unique recordId. Best practice is to use a UUID. The record Id protects against importing duplicate data.
- Each inventory record entry requires an effectiveDate.
- Each futures entry requires a nonzero quantity and a future expectedDate.
- The system only creates or updates entries that are included in the data. It doesn't delete entries that aren't included. However, if an included entry has an empty value, that value is deleted.

Note: The file size limit is 10 MB, and it must be in NDJSON format. For larger data sets, you can use the headless Commerce API or split the data into multiple files. The headless Commerce API accepts GZIP or JSON files up to 100 MB in size.

This example illustrates the data format:

Note: For readability, this example shows the first few entries on multiple lines. In the import file, each location and inventory record entry must be on a single line.

```
{
  "location":"Warehouse-A",  // location identifier
  "mode":"UPDATE"  // must be UPDATE (other operations might be available in future releases)
}
{
  "recordId":"0a87539d-f3dd-47bc-91c7-9c752e39dbe0",  // unique identifier for the inventory
 record
  "onHand":10,
  "sku":"12389156",
  "effectiveDate":"2020-12-08T14:05:22.790896-07:00",
  "futures":[  // list of future restocks
    {
    "quantity":1,
```

```
    "expectedDate":"2021-04-18T14:05:22.781-07:00"
    },
    {
    "quantity":5,
    "expectedDate":"2021-05-18T14:05:22.781-07:00"
    }
  ],
  "safetyStockCount":0
}
{
  "recordId":"0a87539d-f3dd-47bc-91c7-9c752e312345",
  "onHand":10,
  "sku":"9485728",
  "effectiveDate":"2020-12-08T14:05:22.790896-07:00",
  "futures":[
    {
    "quantity":10,
    "expectedDate":"2021-04-18T14:05:22.781-07:00"
    }
  ],
  "safetyStockCount":0
}
{"location":"Warehouse-B","mode":"UPDATE"}
{"recordId":"0a87539d-f3dd-47bc-91c7-9c752e312345","onHand":10,"sku":"9485728","effectiveDate":"2020-12-08T14:05:22.790896-07:00","futures":[{"quantity":1,"expectedDate":"2021-04-18T14:05:22.781-07:00"}],"safetyStockCount":0}
{"recordId":"0a87539d-f3dd-47bc-91c7-9c752e312345","onHand":10,"sku":"9485721","effectiveDate":"2020-12-08T14:05:22.790896-07:00","futures":[{"quantity":5,"expectedDate":"2021-04-18T14:05:22.781-07:00"}],"safetyStockCount":0}
```

`transferReservation(transferReservationInputRepresentation)`

Transfer one or more inventory reservations between locations or location groups. This API doesn't change physical quantities, but reduces the reserved quantity at the source and increases it at the destination.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCITransferReservationOutputRepresentation
transferReservation(ConnectApi.OCITransferReservationInputRepresentation
transferReservationInputRepresentation)
```

Parameters

transferReservationInputRepresentation

Type: ConnectApi.OCITransferReservationInputRepresentation

Wraps a list of inventory reservation transfers and specifies whether a single failure cancels the entire list.

Return Value

Type: `ConnectApi.OCITransferReservationOutputRepresentation`

OMSAnalytics Class

Get products with return rates, get text classified into different classifications using text analysis, and capture the return reasons from external sources based on the product ids.

Namespace

ConnectApi

IN THIS SECTION:

OMSAnalytics Class

These methods are for `OMSAnalytics`. All methods are static.

OMSAnalytics Class

These methods are for `OMSAnalytics`. All methods are static.

Namespace

ConnectApi

IN THIS SECTION:

getTextClassificationsBulkResults(ids)

Gets text classification results for request IDs.

productsExpand(scope, products, expand)

Fetches expanded details of a product that aren't found in the sObject. The expanded variable fields, such as return reasons, are added as output. This method supports an extensibility framework that lets the context user override the existing implementation so they can fetch the data from third-party apps. The application doesn't require two separate APIs to get return reasons.

productsReturnRate(pageParam, pageSize)

Gets pages of data showing the return rates of products that are calculated by the Customer Data Platform. Return data is paginated in descending order.

productsReturnRate(pageParam, pageSize)

Get a page of products and their return rates.

productsReturnRate(pageParam, pageSize, products)

Get a page of products and their return rates for a list of product IDs.

submitTextClassificationsRequest(textClassificationsRequestInput, llmType)

Submits a text classification request to Einstein

`getTextClassificationsBulkResults(ids)`

Gets text classification results for request IDs.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.TextClassificationsBulkResultsOutputRepresentation
getTextClassificationsBulkResults(List<String> ids)
```

Parameters

ids
Type: List(String)

List of request IDs.

Return Value

Type: ConnectApi.TextClassificationsBulkResultsOutputRepresentation

Example

```
List <String> requestIds = new List <String> ();
        requestIds.add(requestId);
        ConnectApi.TextClassificationsBulkResultsOutputRepresentation output =
ConnectApi.OMSAnalytics.getTextClassificationsBulkResults(requestIds);
```

productsExpand(scope, products, expand)

Fetches expanded details of a product that aren't found in the sObject. The expanded variable fields, such as return reasons, are added as output. This method supports an extensibility framework that lets the context user override the existing implementation so they can fetch the data from third-party apps. The application doesn't require two separate APIs to get return reasons.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductsListOutputRepresentation productsExpand(String scope,
List<String> products, List<ConnectApi.ProductExpandType> expand)
```

Parameters

scope
Type: String

The scope for the extensibility framework. Requires a web store ID.

products
Type: List)String)

A list of IDs to fetch details for.

expand
Type: List)String)

Output representation for expand feature.

Return Value

Type: `ConnectApi.ProductsListOutputRepresentation`

Example

```
String scope = 'webstoreId eq ' + ws.Id;
        ConnectApi.ProductsListOutputRepresentation output =
ConnectApi.OMSAnalytics.productsExpand(scope, productIds, new List
<ConnectApi.ProductExpandType> {
        ConnectApi.ProductExpandType.ReturnReasons
        });
```

productsReturnRate(pageParam, pageSize)

Gets pages of data showing the return rates of products that are calculated by the Customer Data Platform. Return data is paginated in descending order.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductReturnRateListOutputRepresentation
productsReturnRate(Integer pageParam, Integer pageSize)
```

Parameters

page
Type: String

The page number for the list of products. Starts at 0.

products
Type: List)String)

A list of IDs to fetch details for.

pageSize
Type: List)Integer)

The number of products that are returned on each page.

Return Value

Type: ConnectApi.ProductReturnRateListOutputRepresentation

Example

```
ConnectApi.ProductReturnRateListOutputRepresentation output =
ConnectApi.OMSAnalytics.productsReturnRate(page, pageSize);
```

productsReturnRate(pageParam, pageSize)

Get a page of products and their return rates.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductReturnRateListOutputRepresentation
productsReturnRate(Integer pageParam, Integer pageSize)
```

Parameters

pageParam
Type: Integer

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ProductReturnRateListOutputRepresentation`

productsReturnRate(pageParam, pageSize, products)

Get a page of products and their return rates for a list of product IDs.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductReturnRateListOutputRepresentation
productsReturnRate(Integer pageParam, Integer pageSize, List<String> products)
```

Parameters

pageParam
Type: Integer

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

products
Type: List<String>

List of product IDs.

Return Value

Type: `ConnectApi.ProductReturnRateListOutputRepresentation`

submitTextClassificationsRequest(textClassificationsRequestInput, llmType)

Submits a text classification request to Einstein

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.TextClassificationsOutputRepresentation
submitTextClassificationsRequest(ConnectApi.TextClassificationsInputRepresentation
textClassificationsRequestInput, String llmType)
```

Parameters

textClassificationsRequestInput
Type: ConnectApi.TextClassificationsInputRepresentation

Text classification containing a list of text strings and classifiers. Each text string is classified into classifiers based on analysis.

llmType
Type: List)String)

The large language model that's used for analysis. Supports Open AI only.

Return Value

Type: ConnectApi.TextClassificationsOutputRepresentation

Example

```
ConnectApi.TextClassificationsInputRepresentation textClassificationsInputRepresentation
= new ConnectApi.TextClassificationsInputRepresentation();
textClassificationsInputRepresentation.textList = textList;
textClassificationsInputRepresentation.classifiers = classifiers;
List < String > requestIds = new List < String > ();
```

Orchestration Class

Get orchestration instances.

Namespace

ConnectApi

Orchestration Methods

The following are methods for `Orchestration`. All methods are static.

IN THIS SECTION:

getOrchestrationInstanceCollection(relatedRecordId)
Get orchestration instances associated with a Salesforce record that's configured as a context record for orchestration interactive steps.

`getOrchestrationInstanceCollection(relatedRecordId)`

Get orchestration instances associated with a Salesforce record that's configured as a context record for orchestration interactive steps.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrchestrationInstanceCollection
getOrchestrationInstanceCollection(String relatedRecordId)
```

Parameters

relatedRecordId
Type: String

The ID of a record configured as a context record for orchestration interactive steps.

Return Value

Type: `ConnectApi.OrchestrationInstanceCollection`

OrderPaymentSummary Class

Work with payments in Order Management.

Namespace

ConnectApi

OrderPaymentSummary Methods

The following are methods for `OrderPaymentSummary`. All methods are static.

IN THIS SECTION:

createOrderPaymentSummary(orderPaymentSummaryInput)
Create an OrderPaymentSummary for an OrderSummary. Specify a payment authorization or payments that share the same payment method. In an org with the multicurrency feature enabled, the OrderPaymentSummary inherits the CurrencyIsoCode value from the OrderSummary.

`createOrderPaymentSummary(orderPaymentSummaryInput)`

Create an OrderPaymentSummary for an OrderSummary. Specify a payment authorization or payments that share the same payment method. In an org with the multicurrency feature enabled, the OrderPaymentSummary inherits the CurrencyIsoCode value from the OrderSummary.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.CreateOrderPaymentSummaryOutputRepresentation
createOrderPaymentSummary(ConnectApi.CreateOrderPaymentSummaryInputRepresentation
orderPaymentSummaryInput)
```

Parameters

orderPaymentSummaryInput
Type: ConnectApi.CreateOrderPaymentSummaryInputRepresentation

The OrderSummary and payment authorization or payments.

Return Value

Type: ConnectApi.CreateOrderPaymentSummaryOutputRepresentation

Example

```
String orderSummaryId = '1Osxx0000004CCG';
String paymentId1 = '0a3xx0000000085AAA';
String paymentId2 = '0a3xx0000000085BBB';

ConnectApi.CreateOrderPaymentSummaryInputRepresentation orderPaymentSummaryInput = new
ConnectApi.CreateOrderPaymentSummaryInputRepresentation();
orderPaymentSummaryInput.orderSummaryId = orderSummaryId;
List<String> paymentList = new List<String>();
paymentList.add(paymentId1);
paymentList.add(paymentId2);
orderPaymentSummaryInput.paymentIds = paymentList;

ConnectApi.CreateOrderPaymentSummaryOutputRepresentation result =
ConnectAPI.OrderPaymentSummary.createOrderPaymentSummary(orderPaymentSummaryInput);
```

OrderSummary Class

Work with orders in Order Management.

Namespace

ConnectApi

OrderSummary Methods

The following are methods for `OrderSummary`. All methods are static.

IN THIS SECTION:

adjustPreview(orderSummaryId, adjustInput)

Retrieve the expected results of adjusting the price of one or more OrderItemSummaries from an OrderSummary, without actually executing the adjustment. The response data contains the financial changes that would result from submitting the proposed adjustment.

adjustSubmit(orderSummaryId, adjustInput)

Adjust the price of one or more OrderItemSummaries from an OrderSummary, and create corresponding change orders.

createCreditMemo(orderSummaryId, creditMemoInput)

Create a credit memo to represent the refund for one or more change orders associated with an OrderSummary.

createMultipleInvoices(invoicesInput)

Create Invoices to represent the charges for one or more change orders. Create Invoices for change orders that increase order amounts, such as for return fees. When you ensure the refund for a return, include the invoices for any associated return fees in the request.

ensureFundsAsync(orderSummaryId, ensureFundsInput)

Ensure funds for an Invoice and apply them to it. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

Ensure refunds for a CreditMemo or excess funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

multipleEnsureFundsAsync(multipleEnsureFundsInput)

Ensure and apply funds for one or more Invoices. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

previewCancel(orderSummaryId, changeInput)

Retrieve the expected change order values for canceling one or more OrderItemSummaries from an OrderSummary, without actually executing the cancel.

previewReturn(orderSummaryId, changeInput)

Retrieve the expected change order values for a simple return of one or more OrderItemSummaries from an OrderSummary, without actually executing the return.

submitCancel(orderSummaryId, changeInput)

Cancel one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order.

submitReturn(orderSummaryId, changeInput)

Return one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order. This return is a simple return that creates a change order but not a ReturnOrder.

`adjustPreview(orderSummaryId, adjustInput)`

Retrieve the expected results of adjusting the price of one or more OrderItemSummaries from an OrderSummary, without actually executing the adjustment. The response data contains the financial changes that would result from submitting the proposed adjustment.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.AdjustOrderSummaryOutputRepresentation adjustPreview(String orderSummaryId, ConnectApi.AdjustOrderItemSummaryInputRepresentation adjustInput)
```

Parameters

`orderSummaryId`
Type: String

ID of the OrderSummary.

`adjustInput`
Type: `ConnectApi.AdjustOrderItemSummaryInputRepresentation`

Price adjustments to order item summaries that together make up a price adjustment to an order, with options for adjusting items in the process of being fulfilled.

Return Value

Type: `ConnectApi.AdjustOrderSummaryOutputRepresentation`

Usage

When a price adjustment is applied to an OrderItemSummary, its quantities are considered in three groups:

Pre-fulfillment
QuantityAvailableToFulfill, which is equal to QuantityOrdered - QuantityCanceled - QuantityAllocated

In-fulfillment
QuantityAllocated - QuantityFulfilled

Post-fulfillment
QuantityAvailableToReturn, which is equal to QuantityFulfilled - QuantityReturnInitiated

You can apply adjustments to these groups in three different ways, controlled by the *`allocatedItemsChangeOrderType`* input property:

- Distribute the adjustment evenly between pre-fulfillment and post-fulfillment quantities. Ignore in-fulfillment quantities. Submitting the adjustment would create one change order for the adjustments to pre-fulfillment quantities and one change order for the adjustments to post-fulfillment quantities.

- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Submitting the adjustment would create one change order for the adjustments to both pre-fulfillment and in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Submitting the adjustment would create one change order for the adjustments to pre-fulfillment quantities, one change order for the adjustments to in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

adjustSubmit(orderSummaryId, adjustInput)

`adjustSubmit(orderSummaryId, adjustInput)`

Adjust the price of one or more OrderItemSummaries from an OrderSummary, and create corresponding change orders.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.AdjustOrderSummaryOutputRepresentation adjustSubmit(String
orderSummaryId, ConnectApi.AdjustOrderItemSummaryInputRepresentation adjustInput)
```

Parameters

`orderSummaryId`

Type: String

ID of the OrderSummary.

`adjustInput`

Type: `ConnectApi.AdjustOrderItemSummaryInputRepresentation`

Price adjustments to order item summaries that together make up a price adjustment to an order, with options for adjusting items in the process of being fulfilled.

Return Value

Type: `ConnectApi.AdjustOrderSummaryOutputRepresentation`

Usage

When a price adjustment is applied to an OrderItemSummary, its quantities are considered in three groups:

Pre-fulfillment

QuantityAvailableToFulfill, which is equal to QuantityOrdered - QuantityCanceled - QuantityAllocated

In-fulfillment
QuantityAllocated - QuantityFulfilled

Post-fulfillment
QuantityAvailableToReturn, which is equal to QuantityFulfilled - QuantityReturnInitiated

You can apply adjustments to these groups in three different ways, controlled by the `allocatedItemsChangeOrderType` input property:

- Distribute the adjustment evenly between pre-fulfillment and post-fulfillment quantities. Ignore in-fulfillment quantities. Create one change order for the adjustments to pre-fulfillment quantities and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Create one change order for the adjustments to both pre-fulfillment and in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Create one change order for the adjustments to pre-fulfillment quantities, one change order for the adjustments to in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.

After submitting a price adjustment, process refunds as appropriate:

- If the discount only applied to OrderItemSummaries for which payment hasn't been captured, it doesn't require a refund. This situation normally applies to OrderItemSummaries in the US that haven't been fulfilled.
- If the discount applied to OrderItemSummaries that haven't been fulfilled and for which payment has been captured, process a refund. In this case, pass the `totalExcessFundsAmount` from the output representation to the `ensureRefundsAsync()` method.
- If the discount applied to OrderItemSummaries that have been fulfilled, process a refund. Pass the `postFulfillmentChangeOrderId` from the output representation to the `createCreditMemo()` method, then pass the CreditMemo to the `ensureRefundsAsync()` method.
- If the discount applied to both fulfilled and unfulfilled OrderItemSummaries for which payment has been captured, process both refunds. Pass the `postFulfillmentChangeOrderId` from the output representation to the `createCreditMemo()` method, then pass the credit memo and the `totalExcessFundsAmount` from the output representation to the `ensureRefundsAsync()` method.

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

adjustPreview(orderSummaryId, adjustInput)

`createCreditMemo(orderSummaryId, creditMemoInput)`

Create a credit memo to represent the refund for one or more change orders associated with an OrderSummary.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.CreateCreditMemoOutputRepresentation createCreditMemo(String orderSummaryId, ConnectApi.CreateCreditMemoInputRepresentation creditMemoInput)
```

Parameters

orderSummaryId
Type: String

ID of the OrderSummary.

creditMemoInput
Type: ConnectApi.CreateCreditMemoInputRepresentation

The list of change order IDs.

Return Value

Type: ConnectApi.CreateCreditMemoOutputRepresentation

createMultipleInvoices(invoicesInput)

Create Invoices to represent the charges for one or more change orders. Create Invoices for change orders that increase order amounts, such as for return fees. When you ensure the refund for a return, include the invoices for any associated return fees in the request.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.CreateMultipleInvoicesFromChangeOrdersOutputRepresentation createMultipleInvoices(ConnectApi.CreateMultipleInvoicesFromChangeOrdersInputRepresentation invoicesInput)
```

Parameters

invoicesInput
Type: ConnectApi.CreateMultipleInvoicesFromChangeOrdersInputRepresentation

Data about the change orders to create Invoices for.

Return Value

Type: `ConnectApi.CreateMultipleInvoicesFromChangeOrdersOutputRepresentation`

SEE ALSO:

- ensureRefundsAsync(orderSummaryId, ensureRefundsInput)
- createReturnOrder(returnOrderInput)
- returnItems(returnOrderId, returnItemsInput)

`ensureFundsAsync(orderSummaryId, ensureFundsInput)`

Ensure funds for an Invoice and apply them to it. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.EnsureFundsAsyncOutputRepresentation ensureFundsAsync(String
orderSummaryId, ConnectApi.EnsureFundsAsyncInputRepresentation ensureFundsInput)
```

Parameters

`orderSummaryId`
Type: String

ID of the OrderSummary.

`ensureFundsInput`
Type: `ConnectApi.EnsureFundsAsyncInputRepresentation`

The ID of the Invoice.

Return Value

Type: `ConnectApi.EnsureFundsAsyncOutputRepresentation`

Usage

This method checks the OrderPaymentSummaries associated with the specified OrderSummary for funds to apply to the Invoice balance following this logic:

Note: If multiple OrderPaymentSummaries have equal `BalanceAmount` values, their order of selection is random.

1. Verify that the Invoice balance doesn't exceed the total `BalanceAmount` of all the OrderPaymentSummaries associated with the OrderSummary.
2. If an OrderPaymentSummary has a `BalanceAmount` equal to the Invoice balance, apply the funds from that OrderPaymentSummary.
3. If no exact match was found, apply funds from the OrderPaymentSummary with the largest `BalanceAmount`.
4. If the Invoice still has a balance to ensure, repeat steps 2 and 3 until the full balance is ensured or no captured funds remain.
5. If the Invoice still has a balance, look for an OrderPaymentSummary with an authorized amount equal to the remaining Invoice balance. If one exists, capture and apply the funds from that OrderPaymentSummary.
6. If no exact match was found, capture and apply funds from the OrderPaymentSummary with the largest authorized amount.
7. If the Invoice still has a balance to ensure, repeat steps 5 and 6 until the full balance is ensured.

Note: If the method creates a payment, the payment record's ClientContext value isn't predictable. Don't use it in custom logic.

SEE ALSO:

multipleEnsureFundsAsync(multipleEnsureFundsInput)

`ensureRefundsAsync(orderSummaryId, ensureRefundsInput)`

Ensure refunds for a CreditMemo or excess funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.EnsureRefundsAsyncOutputRepresentation ensureRefundsAsync(String
orderSummaryId, ConnectApi.EnsureRefundsAsyncInputRepresentation ensureRefundsInput)
```

Parameters

`orderSummaryId`

Type: String

ID of the OrderSummary.

`ensureRefundsInput`

Type: `ConnectApi.EnsureRefundsAsyncInputRepresentation`

ID of a credit memo to ensure refunds for, an amount of excess funds to refund, or both. At least one is required. Also includes any invoices for fees that reduce the refund amount, such as return fees. If multiple payment methods are available, you can specify how to distribute the refund.

Return Value

Type: `ConnectApi.EnsureRefundsAsyncOutputRepresentation`

Usage

This method applies the refund to the OrderPaymentSummaries associated with the specified OrderSummary following this logic.

Note: If multiple OrderPaymentSummaries have equal `AvailableToRefund` amounts, their order of selection is random.

1. Verify that the CreditMemo balance and excess funds amount don't exceed the total `AvailableToRefund` amount of all the OrderPaymentSummaries associated with the OrderSummary.
2. If `sequences` is specified, follow these steps.
   a. Traverse the `sequences` list in order and apply the specified refund amounts to the specified OrderPaymentSummaries.
   b. If the specified CreditMemo and excess funds are fully refunded, or if `isAllowPartial` is true, then the action stops here.
3. If a CreditMemo is specified, follow these steps.
   a. If an OrderPaymentSummary has an `AvailableToRefund` amount matching the CreditMemo's remaining balance, apply the refund to that payment.
   b. If no exact match was found, apply the refund to the OrderPaymentSummary with the largest `AvailableToRefund` amount.
   c. If the CreditMemo has any remaining balance, repeat steps a and b until that balance is fully refunded.
4. If an excess funds amount is specified, follow these steps.
   a. Examine those OrderPaymentSummaries. If one has an `AvailableToRefund` amount matching the excess funds amount, apply the refund to that OrderPaymentSummary.
   b. If no exact match was found, apply the refund to the OrderPaymentSummary with the largest `AvailableToRefund` amount.
   c. If any excess funds amount remains, repeat steps a and b until it's fully refunded.

Note: If the method creates a refund, the refund record's ClientContext value isn't predictable. Don't use it in custom logic.

SEE ALSO:

createReturnOrder(returnOrderInput)

returnItems(returnOrderId, returnItemsInput)

createMultipleInvoices(invoicesInput)

`multipleEnsureFundsAsync(multipleEnsureFundsInput)`

Ensure and apply funds for one or more Invoices. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.MultipleAsyncOutputRepresentation
multipleEnsureFundsAsync(ConnectApi.MultipleEnsureFundsAsyncInputRepresentation
multipleEnsureFundsInput)
```

Parameters

multipleEnsureFundsInput
Type: `ConnectApi.MultipleEnsureFundsAsyncInputRepresentation`

List of Invoices and the associated OrderSummaries.

Return Value

Type: `ConnectApi.MultipleAsyncOutputRepresentation`

Usage

For each Invoice in the request, this method checks the OrderPaymentSummaries associated with the specified OrderSummary for funds to apply to the Invoice balance following this logic.

Note: If multiple OrderPaymentSummaries have equal `BalanceAmount` values, their order of selection is random.

1. Verify that the Invoice balance doesn't exceed the total `BalanceAmount` of all the OrderPaymentSummaries associated with the OrderSummary.
2. If an OrderPaymentSummary has a `BalanceAmount` equal to the invoice balance, apply the funds from that OrderPaymentSummary.
3. If no exact match was found, apply funds from the OrderPaymentSummary with the largest `BalanceAmount`.
4. If the Invoice still has a balance to ensure, repeat steps 2 and 3 until the full balance is ensured or no captured funds remain.
5. If the Invoice still has a balance, look for an OrderPaymentSummary with an authorized amount equal to the remaining Invoice balance. If one exists, capture and apply the funds from that OrderPaymentSummary.
6. If no exact match was found, capture and apply funds from the OrderPaymentSummary with the largest authorized amount.
7. If the Invoice still has a balance to ensure, repeat steps 5 and 6 until the full balance is ensured.

Note: If the method creates a payment, the payment record's ClientContext value isn't predictable. Don't use it in custom logic.

SEE ALSO:

ensureFundsAsync(orderSummaryId, ensureFundsInput)

`previewCancel(orderSummaryId, changeInput)`

Retrieve the expected change order values for canceling one or more OrderItemSummaries from an OrderSummary, without actually executing the cancel.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.PreviewCancelOutputRepresentation previewCancel(String
orderSummaryId, ConnectApi.ChangeInputRepresentation changeInput)
```

Parameters

orderSummaryId
Type: String

ID of the OrderSummary.

changeInput
Type: ConnectApi.ChangeInputRepresentation

A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Return Value

Type: ConnectApi.PreviewCancelOutputRepresentation

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

submitCancel(orderSummaryId, changeInput)

previewReturn(orderSummaryId, changeInput)

Retrieve the expected change order values for a simple return of one or more OrderItemSummaries from an OrderSummary, without actually executing the return.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.PreviewReturnOutputRepresentation previewReturn(String
orderSummaryId, ConnectApi.ChangeInputRepresentation changeInput)
```

Parameters

orderSummaryId
Type: String

ID of the OrderSummary.

changeInput
Type: ConnectApi.ChangeInputRepresentation

A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Return Value

Type: ConnectApi.PreviewReturnOutputRepresentation

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

submitReturn(orderSummaryId, changeInput)

submitCancel(orderSummaryId, changeInput)

Cancel one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.SubmitCancelOutputRepresentation submitCancel(String
orderSummaryId, ConnectApi.ChangeInputRepresentation changeInput)
```

Parameters

orderSummaryId
Type: String

ID of the OrderSummary.

changeInput
Type: ConnectApi.ChangeInputRepresentation

A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Return Value

Type: ConnectApi.SubmitCancelOutputRepresentation

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

previewCancel(orderSummaryId, changeInput)

submitReturn(orderSummaryId, changeInput)

Return one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order. This return is a simple return that creates a change order but not a ReturnOrder.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.SubmitReturnOutputRepresentation submitReturn(String
orderSummaryId, ConnectApi.ChangeInputRepresentation changeInput)
```

Parameters

orderSummaryId

Type: String

ID of the OrderSummary.

changeInput

Type: ConnectApi.ChangeInputRepresentation

A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Return Value

Type: ConnectApi.SubmitReturnOutputRepresentation

Usage

After submitting a return, process a refund. Pass the *changeOrderId* from the output representation to the `createCreditMemo()` method, then pass the credit memo to the `ensureRefundsAsync()` method.

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

previewReturn(orderSummaryId, changeInput)

OrderSummaryCreation Class

Create Order Summaries in Order Management.

Namespace

ConnectApi

OrderSummaryCreation Methods

The following are methods for `OrderSummaryCreation`. All methods are static.

IN THIS SECTION:

createOrderSummary(orderSummaryInput)

Create an OrderSummary based on an order. That order is considered the original order for the OrderSummary. Subsequent change orders that apply to the OrderSummary are also represented as orders. You can specify whether the order is managed in Salesforce Order Management or by an external system. Most Salesforce Order Management APIs can run only on orders that it manages.

`createOrderSummary(orderSummaryInput)`

Create an OrderSummary based on an order. That order is considered the original order for the OrderSummary. Subsequent change orders that apply to the OrderSummary are also represented as orders. You can specify whether the order is managed in Salesforce Order Management or by an external system. Most Salesforce Order Management APIs can run only on orders that it manages.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryOutputRepresentation
createOrderSummary(ConnectApi.OrderSummaryInputRepresentation orderSummaryInput)
```

Parameters

orderSummaryInput
Type: ConnectApi.OrderSummaryInputRepresentation

Input object that wraps the ID of the source order.

Return Value

Type: ConnectApi.OrderSummaryOutputRepresentation

Organization Class

Access information about an org.

Namespace

ConnectApi

Organization Methods

The following are methods for `Organization`. All methods are static.

IN THIS SECTION:

getSettings()
Get information about the context user and the org, including which features are enabled.

`getSettings()`

Get information about the context user and the org, including which features are enabled.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi. OrganizationSettings getSettings()
```

Return Value

Type: ConnectApi.OrganizationSettings

PardotBusinessUnitContext Class

Get the Pardot business units the context user has access to.

Namespace

ConnectApi

PardotBusinessUnitContext Methods

The following are methods for `PardotBusinessUnitContext`. All methods are static.

IN THIS SECTION:

getBusinessUnitContext()
Get the Pardot business units the context user has access to.

getBusinessUnitContextByIsCurrentStatus(isCurrent)
Get the Pardot business units the context user has access to by specifying the current status.

`getBusinessUnitContext()`

Get the Pardot business units the context user has access to.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.PardotBusinessUnitContextOutput getBusinessUnitContext()
```

Return Value

Type: `ConnectApi.PardotBusinessUnitContextOutput`

`getBusinessUnitContextByIsCurrentStatus(isCurrent)`

Get the Pardot business units the context user has access to by specifying the current status.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.PardotBusinessUnitContextOutput
getBusinessUnitContextByIsCurrentStatus(Boolean isCurrent)
```

Parameters

isCurrent
Type: Boolean

Specifies whether to return only the business unit that's selected as the context user's current business unit context in the business unit switcher of the Pardot Lightning app (`true`) or to return only the business units that aren't selected as the context user's current business unit context (`false`).

Return Value

Type: `ConnectApi.PardotBusinessUnitContextOutput`

Payments Class

Authorize a payment, capture an authorized payment, and refund an authorized payment.

Namespace

ConnectApi

Payments Methods

The following are methods for `Payments`. All methods are static.

IN THIS SECTION:

authorize(authorizePayment)
Authorize a payment.

postAuth(postAuthorizePayment)
Confirms that the merchant is ready to capture payment of an existing pre-authorized transaction.

reverseAuthorization(AuthReversalInput, authorizationId)
Reverses a payment authorization.

capture(AuthCaptureInput, authorizationId)
Capture an authorized payment.

refund(ReferencedRefundInput, paymentId)
Refund an authorized payment.

sale(sale)
Captures a payment without any prior authorization and creates a payment entity. The payment sale transaction is a combination of an Authorize transaction and Capture transaction. This payment sale method allows merchants to request that the funds are transferred to the merchant account in a single command, with no further action (such as charging a credit card) from the merchant.

tokenizePaymentMethod(tokenizePaymentMethodInput)

Method to take the input parameters of the payment method you want to tokenize and then pass them to the payment gateway's tokenization service. The results of the tokenization request are returned as a response from the payment gateway.

authorize(authorizePayment)

Authorize a payment.

API Version

51.0

Requires Chatter

No

Signature

```
global static ConnectApi.AuthorizationResponse authorize(ConnectApi.AuthorizationRequest authorizePayment)
```

Parameters

authorizePayment

Type: ConnectApi.AuthorizationRequest

Represents a payment authorization.

Return Value

Type: ConnectApi.AuthorizationResponse

postAuth(postAuthorizePayment)

Confirms that the merchant is ready to capture payment of an existing pre-authorized transaction.

API Version

54.0

Requires Chatter

No

Signature

```
global static ConnectApi.PostAuthorizationResponse postAuth(ConnectApi.PostAuthRequest postAuthorizePayment)
```

Parameters

postAuthorizePayment
Type: ConnectApi.PostAuthRequest

Information about the payment, payment method, and payment gateway from the original payment authorization.

Return Value

Type: ConnectApi.PostAuthorizationResponse

reverseAuthorization(AuthReversalInput, authorizationId)

Reverses a payment authorization.

API Version

51.0

Requires Chatter

No

Signature

```
global static ConnectApi.AuthorizationReversalResponse
reverseAuthorization(ConnectApi.AuthorizationReversalRequest AuthReversalInput, String
authorizationId)
```

Parameters

AuthReversalInput
Type: ConnectApi.AuthorizationReversalRequest

Input information for the payment authorization reversal.

authorizationId
Type: String

The ID of the payment authorization to be reversed.

Return Value

Type: ConnectApi.AuthorizationReversalResponse

capture(AuthCaptureInput, authorizationId)

Capture an authorized payment.

To access Payments methods, you need these permissions.

- Salesforce Order Management License
- PaymentsAPIUser user permission. This permission is available with the Salesforce Order Management License. Your Salesforce admin assigns it to your profile.

API Version

50.0

Requires Chatter

No

Signature

```
global static ConnectApi.CaptureResponse capture(ConnectApi.CaptureRequest
AuthCaptureInput, String authorizationId)
```

Parameters

AuthCaptureInput
Type: ConnectApi.CaptureRequest

A `ConnectApi.CaptureRequest` object with information about the payment capture.

authorizationId
Type: String

ID of the payment authorization. Required.

Return Value

Type: ConnectApi.CaptureResponse

refund(ReferencedRefundInput, paymentId)

Refund an authorized payment.

To access Payments methods, you need these permissions.

- Salesforce Order Management License
- PaymentsAPIUser user permission. This permission is available with the Salesforce Order Management License. Your Salesforce admin assigns it to your profile.

API Version

50.0

Requires Chatter

No

Signature

```
global static ConnectApi.ReferencedRefundResponse
refund(ConnectApi.ReferencedRefundRequest ReferencedRefundInput, String paymentId)
```

Parameters

ReferencedRefundInput
Type: ConnectApi.ReferencedRefundRequest

A ConnectApi.ReferencedRefundRequest object with information about the refund.

paymentId
Type: String

ID of the payment to be refunded. Required.

Return Value

Type: ConnectApi.ReferencedRefundResponse

sale(sale)

Captures a payment without any prior authorization and creates a payment entity. The payment sale transaction is a combination of an Authorize transaction and Capture transaction. This payment sale method allows merchants to request that the funds are transferred to the merchant account in a single command, with no further action (such as charging a credit card) from the merchant.

API Version

54.0

Requires Chatter

No

Signature

```
global static ConnectApi.SaleResponse sale(ConnectApi.SaleRequest sale)
```

Parameters

sale
Type: ConnectApi.SaleRequest

Payment sale input class.

Return Value

Type: ConnectApi.SaleResponse

tokenizePaymentMethod(tokenizePaymentMethodInput)

Method to take the input parameters of the payment method you want to tokenize and then pass them to the payment gateway's tokenization service. The results of the tokenization request are returned as a response from the payment gateway.

API Version

52.0

Requires Chatter

No

Signature

```
global static ConnectApi.PaymentMethodTokenizationResponse
tokenizePaymentMethod(ConnectApi.PaymentMethodTokenizationRequest
tokenizePaymentMethodInput)
```

Parameters

tokenizePaymentMethodInput
Type: ConnectApi.PaymentMethodTokenizationRequest

Information about the payment method to be tokenized.

Return Value

Type: ConnectApi.PaymentMethodTokenizationResponse

Usage

Accepts input parameters representing a payment method and passes them in a tokenization request to the payment gateway. The results of the tokenization request are returned as a response from the payment gateway. If the tokenization was successful, the response contains the tokenized value and details about the tokenization process. Otherwise, the response contains an error message and details about the error.

Example

```
ConnectApi.PaymentMethodTokenizationRequest request = new
ConnectApi.PaymentMethodTokenizationRequest();
request.paymentGatewayId = '0b0xx0000001Ja5AAE';
ConnectApi.CardPaymentMethodRequest cpmRequest = new ConnectApi.CardPaymentMethodRequest();
cpmRequest.cardHolderName = 'Jo Manager';
cpmRequest.expiryMonth = 11;
cpmRequest.expiryYear = 2222;
cpmRequest.cardNumber = '4111111111111111';
cpmRequest.cvv = '111';
cpmRequest.cardCategory = ConnectApi.CardCategory.CreditCard;
cpmRequest.cardType = ConnectApi.CardType.Visa.name();
request.cardPaymentMethod = cpmRequest;
ConnectApi.PaymentMethodTokenizationResponse response =
ConnectApi.Payments.tokenizePaymentMethod(request);
```

Personalization Class

Get assigned personalization audiences that match the user context. Create, get, update, and delete an audience. Get personalization targets that match the user context, based on the assigned audiences that include the user. Create and update targets. Get and delete a target.

Namespace

ConnectApi

Note: Personalization varies what the user can see in the browser but doesn't secure data in any way. To prevent users accessing sensitive data, use standard Salesforce security features, such as sharing rules and permission sets.

Personalization Methods

The following are methods for `Personalization`. All methods are static.

IN THIS SECTION:

createAudience(communityId, audience)
Create an audience.

createTargets(communityId, target)
Create targets.

deleteAudience(communityId, audienceId)
Delete an audience.

deleteTarget(communityId, targetId)
Delete a target.

getAudience(communityId, audienceId, includeAudienceCriteria)
Get an audience.

getAudienceBatch(communityId, audienceIds)
Get audience information for a comma-separated list of audience IDs.

getAudiences(communityId, ipAddress, domain, userId, publishStatus, includeAudienceCriteria, targetTypes, recordId)
Get a list of assigned audiences that match the user context and record information.

getAudiences(communityId, ipAddress, domain, userId, publishStatus, includeAudienceCriteria, targetTypes)
Get a list of assigned audiences that match the user context.

getTarget(communityId, targetId)
Get a target.

getTargetBatch(communityId, targetIds)
Get target information for a comma-separated list of target IDs.

getTargets(communityId, ipAddress, domain, userId, publishStatus, recordId, targetTypes, includeAudience, includeAllMatchingTargetsWithinGroup, groupNames)
Get a list of targets that match the user context, based on the assigned audiences that include the user.

updateAudience(communityId, audienceId, audience)
Update an audience.

updateTargets(communityId, target)
Update targets.

`createAudience(communityId, audience)`

Create an audience.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.Audience createAudience(String communityId,
ConnectApi.AudienceInput audience)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

audience
Type: ConnectApi.AudienceInput

A `ConnectApi.AudienceInput` object that defines the audience.

Return Value

Type: ConnectApi.Audience

createTargets(communityId, target)

Create targets.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.TargetCollection createTargets(String communityId,
ConnectApi.TargetCollectionInput target)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

target
Type: ConnectApi.TargetCollectionInput

A `ConnectApi.TargetCollectionInput` object that defines the targets.

Return Value

Type: ConnectApi.TargetCollection

deleteAudience(communityId, audienceId)

Delete an audience.

API Version

48.0

Requires Chatter

No

Signature

```
public static Void deleteAudience(String communityId, String audienceId)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

audienceId
Type: String

ID of the audience.

Return Value

Type: Void

deleteTarget(communityId, targetId)

Delete a target.

API Version

48.0

Requires Chatter

No

Signature

```
public static Void deleteTarget(String communityId, String targetId)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

targetId
Type: String

ID of the target.

Return Value

Type: Void

getAudience(communityId, audienceId, includeAudienceCriteria)

Get an audience.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.Audience getAudience(String communityId, String audienceId,
Boolean includeAudienceCriteria)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

audienceId
Type: String

ID of the audience.

includeAudienceCriteria
Type: Boolean

Specifies whether to include audience criteria (`true`) or not (`false`). If unspecified, defaults to `false`.

Return Value

Type: `ConnectApi.Audience`

getAudienceBatch(communityId, audienceIds)

Get audience information for a comma-separated list of audience IDs.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.BatchResult[] getAudienceBatch(String communityId, List<String>
audienceIds)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

audienceIds
Type: List<String>

Comma-separated list of audience IDs.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.Audience` object and errors for audiences that didn't load.

getAudiences(communityId, ipAddress, domain, userId, publishStatus, includeAudienceCriteria, targetTypes, recordId)

Get a list of assigned audiences that match the user context and record information.

API Version

51.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.AudienceCollection getAudiences(String communityId, String ipAddress, String domain, String userId, ConnectApi.PublishStatus publishStatus, Boolean includeAudienceCriteria, List<String> targetTypes, String recordId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

ipAddress
Type: String

IP address of the user. If `null`, no audiences with location criteria are returned.

domain
Type: String

Name of the user's Salesforce custom domain. If `null`, no audiences with domain criteria are returned.

userId
Type: String

ID of the user. If `null`, defaults to the ID of the context user.

publishStatus
Type: `ConnectApi.PublishStatus`

Publish status of the audience. Values are:

- `Draft`
- `Live`

If `null`, defaults to `Live`.

includeAudienceCriteria
Type: Boolean

Specifies whether to include audience criteria (`true`) or not (`false`). If unspecified, defaults to `false`.

targetTypes
Type: List<String>

Comma-separated list of target types to filter the results. Supported values include:

- `ExperienceVariation` (version 48.0 and later)

- Custom object API names, such as ***CustomObjectName***__c (version 48.0 and later)
- NavigationLinkSet (version 49.0 and later)
- Topic (version 49.0 and later)
- CollaborationGroup (version 49.0 and later)
- KnowledgeArticle (version 49.0 and later)
- ContentDocument (version 49.0 and later)
- ManagedContent (version 49.0 and later)
- Report (version 49.0 and later)
- Dashboard (version 49.0 and later)

If null, all target types are returned.

recordId
Type: String

ID of the record for field based criteria. If null, all applicable audiences with field based criteria are returned.

Return Value

Type: ConnectApi.AudienceCollection

getAudiences(communityId, ipAddress, domain, userId, publishStatus, includeAudienceCriteria, targetTypes)

Get a list of assigned audiences that match the user context.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.AudienceCollection getAudiences(String communityId, String ipAddress, String domain, String userId, ConnectApi.PublishStatus publishStatus, Boolean includeAudienceCriteria, List<String> targetTypes)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

ipAddress
Type: String

IP address of the user. If `null`, no audiences with location criteria are returned.

domain
Type: String

Name of the user's Salesforce custom domain. If `null`, no audiences with domain criteria are returned.

userId
Type: String

ID of the user. If `null`, defaults to the ID of the context user.

publishStatus
Type: `ConnectApi.PublishStatus`

Publish status of the audience. Values are:

- `Draft`
- `Live`

If `null`, defaults to `Live`.

includeAudienceCriteria
Type: Boolean

Specifies whether to include audience criteria (`true`) or not (`false`). If unspecified, defaults to `false`.

targetTypes
Type: List<String>

Comma-separated list of target types to filter the results. Supported values include:

- `ExperienceVariation` (version 48.0 and later)
- Custom object API names, such as ***`CustomObjectName`***`__c` (version 48.0 and later)
- `NavigationLinkSet` (version 49.0 and later)
- `Topic` (version 49.0 and later)
- `CollaborationGroup` (version 49.0 and later)
- `KnowledgeArticle` (version 49.0 and later)
- `ContentDocument` (version 49.0 and later)
- `ManagedContent` (version 49.0 and later)
- `Report` (version 49.0 and later)
- `Dashboard` (version 49.0 and later)

If `null`, all target types are returned.

Return Value

Type: `ConnectApi.AudienceCollection`

getTarget(communityId, targetId)

Get a target.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.Target getTarget(String communityId, String targetId)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

targetId
Type: String

ID of the target.

Return Value

Type: ConnectApi.Target

getTargetBatch(communityId, targetIds)

Get target information for a comma-separated list of target IDs.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.BatchResult[] getTargetBatch(String communityId, List<String>
targetIds)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

targetIds
Type: List<String>

Comma-separated list of target IDs.

Return Value

Type: `ConnectApi.BatchResult`

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.Target` object and errors for targets that didn't load.

getTargets(communityId, ipAddress, domain, userId, publishStatus, recordId, targetTypes, includeAudience, includeAllMatchingTargetsWithinGroup, groupNames)

Get a list of targets that match the user context, based on the assigned audiences that include the user.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.TargetCollection getTargets(String communityId, String ipAddress, String domain, String userId, ConnectApi.PublishStatus publishStatus, String recordId, List<String> targetTypes, Boolean includeAudience, Boolean includeAllMatchingTargetsWithinGroup, List<String> groupNames)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

ipAddress
Type: String

IP address of the user. If `null`, no audiences with location criteria are returned.

domain
Type: String

Name of the user's Salesforce custom domain. If `null`, no audiences with domain criteria are returned.

userId
Type: String

ID of the user. If `null`, the default is the ID of the context user.

publishStatus
Type: `ConnectApi.PublishStatus`

Publish status of the target. Values are:

- `Draft`
- `Live`

recordId
Type: String

ID of the record, if you want to specify field based criteria in audiences.

targetTypes
Type: List<String>

Comma-separated list of target types to filter the results. Supported values include:

- `ExperienceVariation` (version 48.0 and later)
- Custom object API names, such as ***`CustomObjectName`*****`__c`** (version 48.0 and later)
- `NavigationLinkSet` (version 49.0 and later)
- `Topic` (version 49.0 and later)
- `CollaborationGroup` (version 49.0 and later)
- `KnowledgeArticle` (version 49.0 and later)
- `ContentDocument` (version 49.0 and later)
- `ManagedContent` (version 49.0 and later)
- `Report` (version 49.0 and later)
- `Dashboard` (version 49.0 and later)

If `null`, all target types are returned.

includeAudience
Type: Boolean

Specifies whether to include the matching audience (`true`) or not (`false`). If `null`, the default is `false`.

includeAllMatchingTargetsWithinGroup
Type: Boolean

Specifies whether to include all the matching targets within a target group (`true`) or not (`false`). If `null`, the default is `false`. If `false`, the first matching target within each group, based on priority within the group, is returned.

groupNames
Type: List<String>

A comma-separated list of group names. Groups bundle related target and audience pairs.

Return Value

Type: ConnectApi.TargetCollection

updateAudience(communityId, audienceId, audience)

Update an audience.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.Audience updateAudience(String communityId, String audienceId,
ConnectApi.AudienceInput audience)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

audienceId
Type: String

ID of the audience.

audience
Type: ConnectApi.AudienceInput

A `ConnectApi.AudienceInput` object that defines the updates to the audience.

Return Value

Type: ConnectApi.Audience

updateTargets(communityId, target)

Update targets.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.TargetCollection updateTargets(String communityId,
ConnectApi.TargetCollectionUpdateInput target)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

target
Type: ConnectApi.TargetCollectionUpdateInput

A `ConnectApi.TargetCollectionUpdateInput` object that defines the updates for the targets.

Return Value

Type: ConnectApi.TargetCollection

PickTicket Class

Create tickets to fulfill orders.

Namespace

ConnectApi

Pick Ticket Methods

These methods are for `Pick Tickets`. All methods are static.

IN THIS SECTION:

distributePickedQuantities(distributePickedQuantitiesInput)
Distribute picked quantities among orders in a pick ticket.

distributePickedQuantities(distributePickedQuantitiesInput)

Distribute picked quantities among orders in a pick ticket.

API Version

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.DistributePickedQuantitiesOutputRepresentation
distributePickedQuantities(ConnectApi.DistributePickedQuantitiesInputRepresentation
distributePickedQuantitiesInput)
```

Parameters

distributePickedQuantitiesInput
Type: `ConnectApi.DistributePickedQuantitiesInputRepresentation`

Input to distribute picked quantities.

Return Value

Type: `ConnectApi.DistributePickedQuantitiesOutputRepresentation`

QuestionAndAnswers Class

Access question and answers suggestions.

Namespace

ConnectApi

IN THIS SECTION:

QuestionAndAnswers Methods
The following are methods for `QuestionAndAnswers`. All methods are static.

QuestionAndAnswers Methods

The following are methods for `QuestionAndAnswers`. All methods are static.

IN THIS SECTION:

getSuggestions(communityId, q, subjectId, includeArticles, maxResults)
Get question and answers suggestions.

setTestGetSuggestions(communityId, q, subjectId, includeArticles, maxResults, result)
Register a `ConnectApi.QuestionAndAnswersSuggestions` object to be returned when `getSuggestions` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

updateQuestionAndAnswers(communityId, feedElementId, questionAndAnswersCapability)
Choose or change the best answer for a question.

`getSuggestions(communityId, q, subjectId, includeArticles, maxResults)`

Get question and answers suggestions.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.QuestionAndAnswersSuggestions getSuggestions(String communityId,
String q, String subjectId, Boolean includeArticles, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

subjectId
Type: String

Specify a subject ID to search only questions on that object. If the ID is a topic or a user, the ID is ignored.

includeArticles
Type: Boolean

Specify `true` to include knowledge articles in the search results. To return only questions, specify `false`.

maxResults
Type: Integer

The maximum number of results to return for each type of item. Possible values are 1–10. The default value is 5.

Return Value

Type: `ConnectApi.QuestionAndAnswersSuggestions`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetSuggestions(communityId, q, subjectId, includeArticles, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

setTestGetSuggestions(communityId, q, subjectId, includeArticles, maxResults, result)

Register a `ConnectApi.QuestionAndAnswersSuggestions` object to be returned when `getSuggestions` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetSuggestions(String communityId, String q, String subjectId, Boolean includeArticles, Integer maxResults, ConnectApi.QuestionAndAnswersSuggestions result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

subjectId
Type: String

Specify a subject ID to search only questions on that object. If the ID is a topic or a user, the ID is ignored.

includeArticles
Type: Boolean

Specify `true` to include knowledge articles in the search results. To return only questions, specify `false`.

maxResults
Type: Integer

The maximum number of results to return for each type of item. Possible values are 1–10. The default value is 5.

result
Type: `ConnectApi.QuestionAndAnswersSuggestions`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getSuggestions(communityId, q, subjectId, includeArticles, maxResults)

Apex Developer Guide: Testing ConnectApi Code

updateQuestionAndAnswers(communityId, feedElementId, questionAndAnswersCapability)

Choose or change the best answer for a question.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.QuestionAndAnswersCapability updateQuestionAndAnswers(String communityId, String feedElementId, ConnectApi.QuestionAndAnswersCapabilityInput questionAndAnswersCapability)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

questionAndAnswersCapability
Type: `ConnectApi.QuestionAndAnswersCapabilityInput`

Specify the best answer (comment ID) for the question.

Return Value

Type: `ConnectApi.QuestionAndAnswersCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Example

```
ConnectApi.QuestionAndAnswersCapabilityInput qaInput = new
ConnectApi.QuestionAndAnswersCapabilityInput();
qaInput.bestAnswerId = '0D7D000000001MAKAY';

ConnectApi.QuestionAndAnswersCapability qa =
ConnectApi.QuestionAndAnswers.updateQuestionAndAnswers(null, '0D5D0000000XZjJ', qaInput);
```

Recommendations Class

Get and reject Chatter, custom, and static recommendations. Create, get, update, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

For Next Best Action recommendations, see NextBestAction Class.

Namespace

ConnectApi

Recommendations Methods

The following are methods for `Recommendations`. All methods are static.

IN THIS SECTION:

createRecommendationAudience(communityId, recommendationAudience)
Create an audience for a custom recommendation.

createRecommendationAudience(communityId, name)
Create an audience for a custom recommendation.

createRecommendationDefinition(communityId, recommendationDefinition)
Create a custom recommendation definition.

createRecommendationDefinition(communityId, name, title, actionUrl, actionUrlName, explanation)
Create a custom recommendation definition with the specified parameters.

createScheduledRecommendation(communityId, scheduledRecommendation)
Create a scheduled custom recommendation.

createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId, channel)
Create a scheduled custom recommendation with the specified parameters.

deleteRecommendationAudience(communityId, recommendationAudienceId)
Delete a custom recommendation audience.

deleteRecommendationDefinition(communityId, recommendationDefinitionId)
Delete a custom recommendation definition.

deleteRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)
Delete a custom recommendation definition photo.

deleteScheduledRecommendation(communityId, scheduledRecommendationId, deleteDefinitionIfLast)
Delete a scheduled custom recommendation.

getRecommendationAudience(communityId, recommendationAudienceId)
Get information about a custom recommendation audience.

getRecommendationAudienceMembership(communityId, recommendationAudienceId)
Get the members of a custom recommendation audience.

getRecommendationAudienceMembership(communityId, recommendationAudienceId, pageParam, pageSize)
Get a page of custom recommendation audience members.

getRecommendationAudiences(communityId)

Get custom recommendation audiences.

getRecommendationAudiences(communityId, pageParam, pageSize)

Get a page of custom recommendation audiences.

getRecommendationDefinition(communityId, recommendationDefinitionId)

Get a custom recommendation definition.

getRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)

Get a custom recommendation definition photo.

getRecommendationDefinitions(communityId)

Get custom recommendation definitions.

getRecommendationForUser(communityId, userId, action, objectId)

Get the Chatter, custom, or static recommendation for the context user for the specified action and object ID.

getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)

Get the Chatter recommendations, such as user, group, file, article, record, and topic recommendations for the context user. Get the custom and static recommendations for the context user.

getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)

Get the Chatter, custom, and static recommendations for the context user for the specified action.

getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)

Get the Chatter, custom, and static recommendations for the context user for the specified action and object category.

getScheduledRecommendation(communityId, scheduledRecommendationId)

Get a scheduled custom recommendation.

getScheduledRecommendations(communityId, channel)

Get scheduled custom recommendations.

rejectRecommendationForUser(communityId, userId, action, objectId)

Reject a Chatter, custom, or static recommendation for the context user for the specified action and object ID.

rejectRecommendationForUser(communityId, userId, action, objectEnum)

Reject a static recommendation for the context user.

updateRecommendationAudience(communityId, recommendationAudienceId, recommendationAudience)

Update a custom recommendation audience.

updateRecommendationDefinition(communityId, recommendationDefinitionId, name, title, actionUrl, actionUrlName, explanation)

Update a custom recommendation definition with the specified parameters.

updateRecommendationDefinition(communityId, recommendationDefinitionId, recommendationDefinition)

Update a custom recommendation definition.

updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileUpload)

Update a custom recommendation definition photo with a file that hasn't been uploaded.

updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileId, versionNumber)

Update a custom recommendation definition photo with an uploaded file.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo)

Update a custom recommendation definition photo with an uploaded file that requires cropping.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo, fileUpload)

Update a custom recommendation definition photo with a file that hasn't been uploaded and requires cropping.

updateScheduledRecommendation(communityId, scheduledRecommendationId, scheduledRecommendation)
Update a scheduled custom recommendation.

updateScheduledRecommendation(communityId, scheduledRecommendationId, rank, enabled, recommendationAudienceId)
Update a scheduled custom recommendation with the specified parameters.

createRecommendationAudience(communityId, recommendationAudience)

Create an audience for a custom recommendation.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationAudience createRecommendationAudience(String communityId, ConnectApi.RecommendationAudienceInput recommendationAudience)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationAudience
Type: `ConnectApi.RecommendationAudienceInput`

A `ConnectApi.RecommendationAudienceInput` object.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

createRecommendationAudience(communityId, name)

Create an audience for a custom recommendation.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationAudience createRecommendationAudience(String communityId, String name)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

name
Type: String

Name of the audience.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

createRecommendationDefinition(communityId, recommendationDefinition)

Create a custom recommendation definition.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationDefinition createRecommendationDefinition(String communityId, ConnectApi.RecommendationDefinitionInput recommendationDefinition)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinition
Type: `ConnectApi.RecommendationDefinitionInput`

A `ConnectApi.RecommendationDefinitionInput` object.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Recommendation definitions allow you to create custom recommendations that appear in Experience Cloud sites, encouraging users to watch videos, take training and more.

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

These recommendations appear by default on the Customer Service template. They appear on the home and question detail pages and in the feed in Salesforce mobile web. They also appear anywhere community managers add recommendations using Experience Builder in the Customer Service template.

So that users don't see the same recommendations all the time, Salesforce periodically removes and brings back custom recommendations that haven't been accepted or dismissed.

createRecommendationDefinition(communityId, name, title, actionUrl, actionUrlName, explanation)

Create a custom recommendation definition with the specified parameters.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationDefinition createRecommendationDefinition(String communityId, String name, String title, String actionUrl, String actionUrlName, String explanation)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

name
Type: String

Name of the custom recommendation definition. The name is displayed in Setup.

title
Type: String

Title of the custom recommendation definition.

actionUrl
Type: String

URL for acting on the custom recommendation, for example, the URL to join a group.

actionUrlName
Type: String

Text label for the action URL in the user interface, for example, "Launch."

explanation
Type: String

Explanation, or body, of the custom recommendation.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Recommendation definitions allow you to create custom recommendations that appear in Experience Cloud sites, encouraging users to watch videos, take training and more.

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

These recommendations appear by default on the Customer Service template. They appear on the home and question detail pages and in the feed in Salesforce mobile web. They also appear anywhere community managers add recommendations using Experience Builder in the Customer Service template.

So that users don't see the same recommendations all the time, Salesforce periodically removes and brings back custom recommendations that haven't been accepted or dismissed.

`createScheduledRecommendation(communityId, scheduledRecommendation)`

Create a scheduled custom recommendation.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String communityId, ConnectApi.ScheduledRecommendationInput scheduledRecommendation)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

scheduledRecommendation
Type: `ConnectApi.ScheduledRecommendationInput`

A `ConnectApi.ScheduledRecommendationInput` object.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId, channel)`

Create a scheduled custom recommendation with the specified parameters.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String communityId, String recommendationDefinitionId, Integer rank, Boolean enabled, String recommendationAudienceId, ConnectApi.RecommendationChannel channel)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

rank
Type: Integer

Relative rank of the scheduled custom recommendation indicated by ascending whole numbers starting with 1.

Setting the rank is comparable to an insertion into an ordered list. The scheduled custom recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled custom recommendations after it is pushed down. See Ranking scheduled custom recommendations example.

If the specified `rank` is larger than the size of the list, the scheduled custom recommendation is put at the end of the list. The `rank` of the scheduled custom recommendation is the size of the list, instead of the one specified.

If a `rank` is not specified, the scheduled custom recommendation is put at the end of the list.

enabled
Type: Boolean

Indicates whether scheduling is enabled. If `true`, the custom recommendation is enabled and appears in Experience Cloud sites. If `false`, custom recommendations in feeds in Salesforce mobile web aren't removed, but no new custom recommendations appear. In Customer Service and Partner Central sites, disabled custom recommendations no longer appear.

recommendationAudienceId
Type: String

ID of the custom recommendation definition that this scheduled recommendation schedules.

channel
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

Use these channel values; you can't rename or create other channels.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Ranking scheduled custom recommendations example

If you have these scheduled custom recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Custom Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

`deleteRecommendationAudience(communityId, recommendationAudienceId)`

Delete a custom recommendation audience.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static Void deleteRecommendationAudience(String communityId, String
recommendationAudienceId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the custom recommendation audience.

Return Value

Type: Void

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`deleteRecommendationDefinition(communityId, recommendationDefinitionId)`

Delete a custom recommendation definition.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static Void deleteRecommendationDefinition(String communityId, String
recommendationDefinitionId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

Return Value

Type: Void

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`deleteRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)`

Delete a custom recommendation definition photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static Void deleteRecommendationDefinitionPhoto(String communityId, String recommendationDefinitionId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

Return Value

Type: Void

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`deleteScheduledRecommendation(communityId, scheduledRecommendationId, deleteDefinitionIfLast)`

Delete a scheduled custom recommendation.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static Void deleteScheduledRecommendation(String communityId, String scheduledRecommendationId, Boolean deleteDefinitionIfLast)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`scheduledRecommendationId`
Type: String

ID of the scheduled custom recommendation.

`deleteDefinitionIfLast`
Type: Boolean

If `true` and if this is the last scheduled custom recommendation of a custom recommendation definition, deletes the custom recommendation definition. Default is `false`.

Return Value

Type: Void

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Deleting a scheduled custom recommendation is comparable to a deletion in an ordered list. All scheduled custom recommendations after the deleted scheduled custom recommendation receive a new, higher rank automatically.

`getRecommendationAudience(communityId, recommendationAudienceId)`

Get information about a custom recommendation audience.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationAudience getRecommendationAudience(String communityId, String recommendationAudienceId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the custom recommendation audience.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationAudienceMembership(communityId, recommendationAudienceId)`

Get the members of a custom recommendation audience.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserReferencePage getRecommendationAudienceMembership(String communityId, String recommendationAudienceId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the custom recommendation audience.

Return Value

Type: `ConnectApi.UserReferencePage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationAudienceMembership(communityId, recommendationAudienceId, pageParam, pageSize)`

Get a page of custom recommendation audience members.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserReferencePage getRecommendationAudienceMembership(String communityId, String recommendationAudienceId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the custom recommendation audience.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of members per page.

Return Value

Type: `ConnectApi.UserReferencePage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

getRecommendationAudiences(communityId)

Get custom recommendation audiences.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationAudiencePage getRecommendationAudiences(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.RecommendationAudiencePage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

getRecommendationAudiences(communityId, pageParam, pageSize)

Get a page of custom recommendation audiences.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationAudiencePage getRecommendationAudiences(String communityId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of audiences per page.

Return Value

Type: `ConnectApi.RecommendationAudiencePage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

getRecommendationDefinition(communityId, recommendationDefinitionId)

Get a custom recommendation definition.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationDefinition getRecommendationDefinition(String communityId, String recommendationDefinitionId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)`

Get a custom recommendation definition photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo getRecommendationDefinitionPhoto(String communityId, String recommendationDefinitionId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`recommendationDefinitionId`
Type: String

ID of the custom recommendation definition.

Return Value

Type: `ConnectApi.Photo`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationDefinitions(communityId)`

Get custom recommendation definitions.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationDefinitionPage getRecommendationDefinitions(String communityId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.RecommendationDefinitionPage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationForUser(communityId, userId, action, objectId)`

Get the Chatter, custom, or static recommendation for the context user for the specified action and object ID.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, String objectId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID for the context user or the keyword `me`.

`action`
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

`objectId`
Type: String

Specifies the object to act on.

- If *`action`* is `follow`, *`objectId`* is a user ID, file ID, record ID, or topic ID (version 36.0 and later).
- If *`action`* is `join`, *`objectId`* is a group ID.
- If *`action`* is `view`, *`objectId`* is a user ID, file ID, group ID, record ID, custom recommendation ID (version 34.0 and later), the enum `Today` for static recommendations (version 35.0 and later), or an article ID (version 37.0 and later).

Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecommendationForUser(communityId, userId, action, objectId, result)

Apex Developer Guide: Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)`

Get the Chatter recommendations, such as user, group, file, article, record, and topic recommendations for the context user. Get the custom and static recommendations for the context user.

API Version

36.0

Available to Guest Users

38.0

Note: Only article and file recommendations are available to guest users.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType contextAction, String contextObjectId, ConnectApi.RecommendationChannel channel, Integer maxResults)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID for the context user or the keyword `me`.

`contextAction`
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`

- `view`

Use *`contextAction`* and *`contextObjectId`* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`contextObjectId`
Type: String

ID of the object that the context user just performed an action on.

- If *`contextAction`* is `follow`, *`contextObjectId`* is a user ID, file ID, record ID, or topic ID.
- If *`contextAction`* is `view`, *`contextObjectId`* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *`contextAction`* and *`contextObjectId`* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`channel`
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

`maxResults`
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *`contextAction`* and *`contextObjectId`* together. For example, if you just followed Pam, you specify `follow` for *`contextAction`* and Pam's user ID for *`contextObjectId`*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)`

Get the Chatter, custom, and static recommendations for the context user for the specified action.

API Version

36.0

Available to Guest Users

38.0

Note: Only article and file recommendations are available to guest users.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String
communityId, String userId, ConnectApi.RecommendationActionType action,
ConnectApi.RecommendationActionType contextAction, String contextObjectId,
ConnectApi.RecommendationChannel channel, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *contextAction* and *contextObjectId* together. For example, if you just followed Pam, you specify `follow` for *contextAction* and Pam's user ID for *contextObjectId*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)`

Get the Chatter, custom, and static recommendations for the context user for the specified action and object category.

API Version

36.0

Available to Guest Users

38.0

Note: Only article and file recommendations are available to guest users.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String
communityId, String userId, ConnectApi.RecommendationActionType action, String
objectCategory, ConnectApi.RecommendationActionType contextAction, String
contextObjectId, ConnectApi.RecommendationChannel channel, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectCategory
Type: String

- If *action* is `follow`, *objectCategory* is `users`, `files`, `topics`, or `records`.
- If *action* is `join`, *objectCategory* is `groups`.
- If *action* is `view`, *objectCategory* is `users`, `files`, `groups`, `records`, `custom`, `apps`, or `articles` (version 37.0 and later).

You can also specify a key prefix, the first three characters of the object ID, as the *objectCategory*. Valid values are:

- If *action* is `follow`, *objectCategory* is `005` (users), `069` (files), `0TO` (topics), or `001` (accounts), for example.
- If *action* is `join`, *objectCategory* is `0F9` (groups).
- If *action* is `view`, *objectCategory* is `005` (users), `069` (files), `0F9` (groups), `0RD` (custom recommendations), `T` (static recommendations), `001` (accounts), or `kA0` (articles), for example, (version 370 and later).

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel
Type: `ConnectApi.RecommendationChannel`

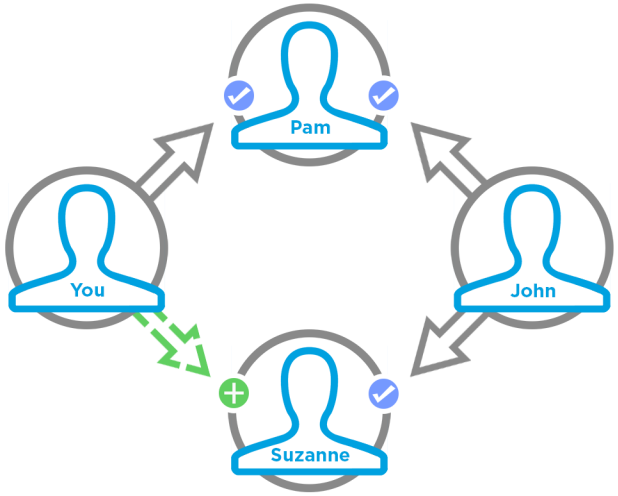
A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.

- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

`maxResults`
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.



Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *`contextAction`* and *`contextObjectId`* together. For example, if you just followed Pam, you specify `follow` for *`contextAction`* and Pam's user ID for *`contextObjectId`*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getScheduledRecommendation(communityId, scheduledRecommendationId)`

Get a scheduled custom recommendation.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ScheduledRecommendation getScheduledRecommendation(String communityId, String scheduledRecommendationId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`scheduledRecommendationId`
Type: String

ID of the scheduled custom recommendation.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getScheduledRecommendations(communityId, channel)`

Get scheduled custom recommendations.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ScheduledRecommendationPage getScheduledRecommendations(String communityId, ConnectApi.RecommendationChannel channel)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

channel
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

Return Value

Type: `ConnectApi.ScheduledRecommendationPage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`rejectRecommendationForUser(communityId, userId, action, objectId)`

Reject a Chatter, custom, or static recommendation for the context user for the specified action and object ID.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static rejectRecommendationForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, String objectId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation. Supported values are:

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectId
Type: String

Specifies the object to take action on.

- If *`action`* is `follow`, *`objectId`* is a user ID, file ID, record ID, or topic ID (version 36.0 and later).
- If *`action`* is `join`, *`objectId`* is a group ID.
- If *`action`* is `view`, *`objectId`* is a custom recommendation ID, the enum `Today` for static recommendations, or an article ID (version 37.0 and later).

Return Value

Type: Void

`rejectRecommendationForUser(communityId, userId, action, objectEnum)`

Reject a static recommendation for the context user.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static rejectRecommendationForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, ConnectApi.RecommendedObjectType objectEnum)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation. Supported values are:

- `view`—View a static recommendation.

objectEnum
Type: `ConnectApi.RecommendedObjectType`

Specifies the object type to take action on.

- `Today`—Static recommendations that don't have an ID, for example, the Today app recommendation.

Return Value

Type: Void

updateRecommendationAudience(communityId, recommendationAudienceId, recommendationAudience)

Update a custom recommendation audience.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationAudience updateRecommendationAudience(String communityId, String recommendationAudienceId, ConnectApi.RecommendationAudienceInput recommendationAudience)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the custom recommendation audience.

recommendationAudience
Type: `ConnectApi.RecommendationAudienceInput`

A `ConnectApi.RecommendationAudienceInput` object.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

updateRecommendationDefinition(communityId, recommendationDefinitionId, name, title, actionUrl, actionUrlName, explanation)

Update a custom recommendation definition with the specified parameters.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationDefinition updateRecommendationDefinition(String communityId, String recommendationDefinitionId, String name, String title, String actionUrl, String actionUrlName, String explanation recommendationDefinition)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

name
Type: String

Name of the custom recommendation definition. The name is displayed in Setup.

title
Type: String

Title of the custom recommendation definition.

actionUrl
Type: String

URL for acting on the custom recommendation, for example, the URL to join a group.

actionUrlName
Type: String

Text label for the action URL in the user interface, for example, "Launch."

explanation
Type: String

Explanation, or body, of the custom recommendation.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`updateRecommendationDefinition(communityId, recommendationDefinitionId, recommendationDefinition)`

Update a custom recommendation definition.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationDefinition updateRecommendationDefinition(String communityId, String recommendationDefinitionId, ConnectApi.RecommendationDefinitionInput recommendationDefinition)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

recommendationDefinition
Type: `ConnectApi.RecommendationDefinitionInput`

A `ConnectApi.RecommendationDefinitionInput` object containing the properties to update.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileUpload)`

Update a custom recommendation definition photo with a file that hasn't been uploaded.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo updateRecommendationDefinitionPhoto(String communityId,
String recommendationDefinitionId, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileId, versionNumber)

Update a custom recommendation definition photo with an uploaded file.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo updateRecommendationDefinitionPhoto(String communityId,
String recommendationDefinitionId, String fileId, Integer versionNumber)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

fileId
Type: String

ID of a file already uploaded. The file must be an image, and be smaller than 2 GB.

versionNumber
Type: Integer

Version number of the existing file. Specify either an existing version number, or `null` to get the latest version.

Return Value

Type: `ConnectApi.Photo`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo)

Update a custom recommendation definition photo with an uploaded file that requires cropping.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo updateRecommendationDefinitionPhotoWithAttributes(String communityId, String recommendationDefinitionId, ConnectApi.PhotoInput photo)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

Return Value

Type: `ConnectApi.Photo`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo, fileUpload)

Update a custom recommendation definition photo with a file that hasn't been uploaded and requires cropping.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo updateRecommendationDefinitionPhotoWithAttributes(String communityId, String recommendationDefinitionId, ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

photo
Type: ConnectApi.PhotoInput

A ConnectApi.PhotoInput object specifying the cropping parameters.

fileUpload
Type: ConnectApi.BinaryInput

File to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.Photo

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

updateScheduledRecommendation(communityId, scheduledRecommendationId, scheduledRecommendation)

Update a scheduled custom recommendation.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ScheduledRecommendation updateScheduledRecommendation(String communityId, String scheduledRecommendationId, ConnectApi.ScheduledRecommendationInput scheduledRecommendation)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, internal, or null.

scheduledRecommendationId
Type: String

ID of the scheduled custom recommendation.

scheduledRecommendation
Type: ConnectApi.ScheduledRecommendationInput

A `ConnectApi.ScheduledRecommendationInput` object containing the properties to update.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Ranking scheduled custom recommendations example

If you have these scheduled custom recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Custom Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

`updateScheduledRecommendation(communityId, scheduledRecommendationId, rank, enabled, recommendationAudienceId)`

Update a scheduled custom recommendation with the specified parameters.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ScheduledRecommendation updateScheduledRecommendation(String communityId, String scheduledRecommendationId, Integer rank, Boolean enabled, String recommendationAudienceId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

scheduledRecommendationId
Type: String

ID of the scheduled custom recommendation.

rank
Type: Integer

Relative rank of the scheduled custom recommendation indicated by ascending whole numbers starting with 1.

Setting the rank is comparable to an insertion into an ordered list. The scheduled custom recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled custom recommendations after it is pushed down. See Ranking scheduled custom recommendations example.

If the specified `rank` is larger than the size of the list, the scheduled custom recommendation is put at the end of the list. The `rank` of the scheduled custom recommendation is the size of the list, instead of the one specified.

If a `rank` is not specified, the scheduled custom recommendation is put at the end of the list.

enabled
Type: Boolean

Indicates whether scheduling is enabled. If `true`, the custom recommendation is enabled and appears in Experience Cloud sites. If `false`, custom recommendations in feeds in Salesforce mobile web aren't removed, but no new custom recommendations appear. In Customer Service and Partner Central sites, disabled custom recommendations no longer appear.

recommendationAudienceId
Type: String

ID of the custom recommendation definition that this scheduled recommendation schedules.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Ranking scheduled custom recommendations example

If you have these scheduled custom recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Custom Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

Recommendations Test Methods

The following are the test methods for `Recommendations`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

IN THIS SECTION:

setTestGetRecommendationForUser(communityId, userId, action, objectId, result)

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults, result)

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults, result)

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults, result)

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationForUser(communityId, userId, action, objectId, result)

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, String objectId,
ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectId
Type: String

Specifies the object to take action on.

- If *`action`* is `follow`, *`objectId`* is a user ID, file ID, record ID, or topic ID (version 36.0 and later).
- If *`action`* is `join`, *`objectId`* is a group ID.
- If *`action`* is `view`, *`objectId`* is a user ID, file ID, group ID, record ID, custom recommendation ID, the enum `Today` for static recommendations, or an article ID (version 37.0 and later).

result
Type: ConnectApi.RecommendationCollection

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationForUser(communityId, userId, action, objectId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults, result)

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType contextAction, String contextObjectId,
ConnectApi.RecommendationChannel channel, Integer maxResults,
ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result
Type: `ConnectApi.RecommendationCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults, result)`

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, ConnectApi.RecommendationActionType
contextAction, String contextObjectId, ConnectApi.RecommendationChannel channel, Integer
maxResults, ConnectApi.RecommendationCollection result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID for the context user or the keyword `me`.

`action`
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

`contextAction`
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *`contextAction`* and *`contextObjectId`* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`contextObjectId`
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result
Type: `ConnectApi.RecommendationCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)

Apex Developer Guide: Testing ConnectApi Code

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults, result)

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, String objectCategory,
ConnectApi.RecommendationActionType contextAction, String contextObjectId,
ConnectApi.RecommendationChannel channel, Integer maxResults,
ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectCategory
Type: String

- If *action* is `follow`, *objectCategory* is `users`, `files`, `records`, or `topics`.
- If *action* is `join`, *objectCategory* is `groups`.
- If *action* is `view`, *objectCategory* is `users`, `files`, `groups`, `records`,`custom`, `apps`, or `articles` (version 37.0 and later).

You can also specify a key prefix, the first three characters of the object ID, as the *objectCategory*. Valid values are:

- If *action* is `follow`, *objectCategory* is `005` (users), `069` (files), `0TO` (topics), or `001` (accounts), for example.
- If *action* is `join`, *objectCategory* is `0F9` (groups).
- If *action* is `view`, *objectCategory* is `005` (users), `069` (files), `0F9` (groups), `0RD` (custom recommendations), `T` (static recommendations), `001` (accounts), or `kA0` (articles), for example, (version 370 and later).

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *`contextAction`* and *`contextObjectId`* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`contextObjectId`
Type: String

ID of the object that the context user just performed an action on.

- If *`contextAction`* is `follow`, *`contextObjectId`* is a user ID, file ID, record ID, or topic ID.
- If *`contextAction`* is `view`, *`contextObjectId`* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *`contextAction`* and *`contextObjectId`* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`channel`
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

`maxResults`
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

`result`
Type: `ConnectApi.RecommendationCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)

Apex Developer Guide: Testing ConnectApi Code

Retired Recommendations Methods

The following methods for `Recommendations` are retired.

IN THIS SECTION:

createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId)
Create a scheduled custom recommendation with the specified parameters.

getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults)
Get the Chatter recommendations, such as user, group, file, and record recommendations for the context user. Get the custom and static recommendations for the context user.

getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults)
Get the Chatter, custom, and static recommendations for the context user for the specified action.

getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults)
Get the Chatter, custom, and static recommendations for the context user for the specified action and object category.

getScheduledRecommendations(communityId)
Get scheduled custom recommendations.

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults, result)
Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults, result)
Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults, result)
Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

`createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId)`

Create a scheduled custom recommendation with the specified parameters.

API Version

35.0 only

Important: In version 36.0 and later, use `createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId, channel)`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String communityId, String recommendationDefinitionId, Integer rank, Boolean enabled, String recommendationAudienceId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

rank
Type: Integer

Relative rank of the scheduled custom recommendation indicated by ascending whole numbers starting with 1.

Setting the rank is comparable to an insertion into an ordered list. The scheduled custom recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled custom recommendations after it is pushed down. See Ranking scheduled custom recommendations example.

If the specified `rank` is larger than the size of the list, the scheduled custom recommendation is put at the end of the list. The `rank` of the scheduled custom recommendation is the size of the list, instead of the one specified.

If a `rank` is not specified, the scheduled custom recommendation is put at the end of the list.

enabled
Type: Boolean

Indicates whether scheduling is enabled. If `true`, the custom recommendation is enabled and appears in Experience Cloud sites. If `false`, custom recommendations in feeds in Salesforce mobile web aren't removed, but no new custom recommendations appear. In Customer Service and Partner Central sites, disabled custom recommendations no longer appear.

recommendationAudienceId
Type: String

ID of the custom recommendation definition that this scheduled recommendation schedules.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Ranking scheduled custom recommendations example

If you have these scheduled custom recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Custom Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

`getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults)`

Get the Chatter recommendations, such as user, group, file, and record recommendations for the context user. Get the custom and static recommendations for the context user.

API Version

33.0–35.0

Important: In version 36.0 and later, use `getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *contextAction* and *contextObjectId* together. For example, if you just followed Pam, you specify `follow` for *contextAction* and Pam's user ID for *contextObjectId*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults)`

Get the Chatter, custom, and static recommendations for the context user for the specified action.

API Version

33.0–35.0

Important: In version 36.0 and later, use `getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *contextAction* and *contextObjectId* together. For example, if you just followed Pam, you specify `follow` for *contextAction* and Pam's user ID for *contextObjectId*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults)`

Get the Chatter, custom, and static recommendations for the context user for the specified action and object category.

API Version

33.0–35.0

Important: In version 36.0 and later, use `getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, String
```

```
objectCategory, ConnectApi.RecommendationActionType contextAction, String
contextObjectId, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectCategory
Type: String

- If *action* is `follow`, *objectCategory* is `users`, `files`, or `records`.
- If *action* is `join`, *objectCategory* is `groups`.
- If *action* is `view`, *objectCategory* is `users`, `files`, `groups`, `records`, `custom`, or `apps`.

You can also specify a key prefix, the first three characters of the object ID, as the *objectCategory*. Valid values are:

- If *action* is `follow`, *objectCategory* is `005` (users), `069` (files), or `001` (accounts), for example.
- If *action* is `join`, *objectCategory* is `0F9` (groups).
- If *action* is `view`, *objectCategory* is `005` (users), `069` (files), `0F9` (groups), `0RD` (custom recommendations), `T` (static recommendations), or `001` (accounts), for example.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

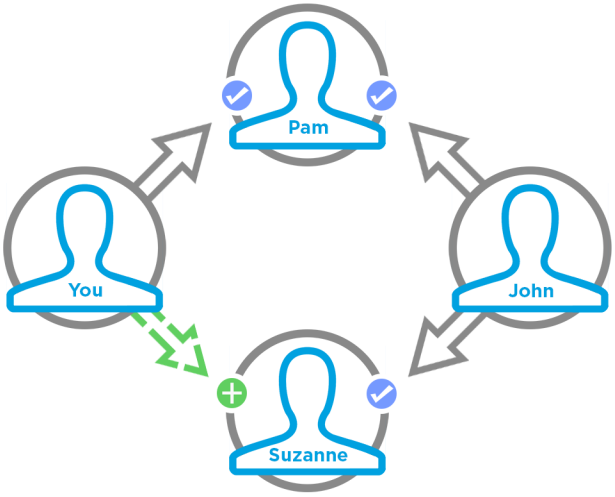
ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.



Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *contextAction* and *contextObjectId* together. For example, if you just followed Pam, you specify `follow` for *contextAction* and Pam's user ID for *contextObjectId*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getScheduledRecommendations(communityId)`

Get scheduled custom recommendations.

API Version

35.0 only

Important: In version 36.0 and later, use `getScheduledRecommendations(communityId, channel)`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.ScheduledRecommendationPage getScheduledRecommendations(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.ScheduledRecommendationPage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults, result)

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

33.0–35.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer maxResults, ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result
Type: `ConnectApi.RecommendationCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults, result)`

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

33.0–35.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, ConnectApi.RecommendationActionType
contextAction, String contextObjectId, Integer maxResults,
ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result
Type: `ConnectApi.RecommendationCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults)

Apex Developer Guide: Testing ConnectApi Code

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults, result)

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

33.0–35.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, String objectCategory,
ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer
maxResults, ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

`objectCategory`
Type: String

- If *`action`* is `follow`, *`objectCategory`* is `users`, `files`, or `records`.
- If *`action`* is `join`, *`objectCategory`* is `groups`.
- If *`action`* is `view`, *`objectCategory`* is `users`, `files`, `groups`, `records`,`custom`, or `apps`.

You can also specify a key prefix, the first three characters of the object ID, as the *`objectCategory`*. Valid values are:

- If *`action`* is `follow`, *`objectCategory`* is `005` (users), `069` (files), or `001` (accounts), for example.
- If *`action`* is `join`, *`objectCategory`* is `0F9` (groups).
- If *`action`* is `view`, *`objectCategory`* is `005` (users), `069` (files), `0F9` (groups), `0RD` (custom recommendations), `T` (static recommendations), or `001` (accounts), for example.

`contextAction`
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *`contextAction`* and *`contextObjectId`* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`contextObjectId`
Type: String

ID of the object that the context user just performed an action on.

- If *`contextAction`* is `follow`, *`contextObjectId`* is a user ID, file ID, or record ID.
- If *`contextAction`* is `view`, *`contextObjectId`* is a user ID, file ID, group ID, or record ID.

Use *`contextAction`* and *`contextObjectId`* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`maxResults`
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

`result`
Type: `ConnectApi.RecommendationCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults)

Apex Developer Guide: Testing ConnectApi Code

Records Class

Access information about record motifs, which are small icons used to distinguish record types in the Salesforce UI.

Namespace

ConnectApi

Records Methods

The following are methods for `Records`. All methods are static.

IN THIS SECTION:

getMotif(communityId, idOrPrefix)
Get a motif that contains the URLs for a set of small, medium, and large motif icons for a record. It can also contain a base color for the record.

getMotifBatch(communityId, idOrPrefixList)
Get a motif for a list of objects.

`getMotif(communityId, idOrPrefix)`

Get a motif that contains the URLs for a set of small, medium, and large motif icons for a record. It can also contain a base color for the record.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi.Motif getMotif(String communityId, String idOrPrefix)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

idOrPrefix
Type: String

An ID or key prefix.

Return Value

Type: `ConnectApi.Motif`

Usage

Each Salesforce record type has its own set of motif icons.

getMotifBatch(communityId, idOrPrefixList)

Get a motif for a list of objects.

API Version

31.0

Requires Chatter

No

Signature

```
public static ConnectApi.BatchResult[] getMotifBatch(String communityId, List<String>
idOrPrefixList)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

idOrPrefixList
Type: List<String>

A list of object IDs or prefixes.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.Motif` object and errors for motifs that didn't load.

Example

```
String communityId = null;
List<String> prefixIds = new List<String> { '001', '01Z', '069' };

// Get info about the motifs of all records in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.Records.getMotifBatch(communityId,
prefixIds);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the color of each motif.
        ConnectApi.Motif motif;
        if(batchResult.getResult() instanceof ConnectApi.Motif) {
            motif = (ConnectApi.Motif) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(motif.color);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

RegisterGuestBuyer Class

Register a guest buyer for a webstore using an account ID, enabling a guest buyer to order on behalf of another buyer.

Namespace

ConnectApi

RegisterGuestBuyer Methods

These methods are for `RegisterGuestBuyer`. All methods are static.

IN THIS SECTION:

registerGuestBuyer(webstoreId, accountId)
Register a guest buyer for a webstore using an account ID. This method enables a guest buyer to order on behalf of another buyer.

`registerGuestBuyer(webstoreId, accountId)`

Register a guest buyer for a webstore using an account ID. This method enables a guest buyer to order on behalf of another buyer.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.RegisterGuestBuyerOutputRepresentation registerGuestBuyer(String webstoreId, String accountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account for which the request is made.

Return Value

Type: `ConnectApi.RegisterGuestBuyerOutputRepresentation` on page 2151

Repricing Class

Perform functions related to repricing orders in Order Management.

Namespace

ConnectApi

Repricing Methods

The following are methods for `Repricing`. All methods are static.

IN THIS SECTION:

productDetails(webstoreId, skuOrProductId, effectiveAccountId, currencyCode, locale)
Get details of a product in a web store.

searchProducts(webstoreId, searchTerm, pageParam, pageSize, effectiveAccountId, facets)
Search products in a webstore.

`productDetails(webstoreId, skuOrProductId, effectiveAccountId, currencyCode, locale)`

Get details of a product in a web store.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductDetailsOutputRepresentation productDetails(String
webstoreId, String skuOrProductId, String effectiveAccountId, String currencyCode,
String locale)
```

Parameters

webstoreId
Type: String

ID of the WebStore.

skuOrProductId
Type: String

SKU or ID of the Product.

effectiveAccountId
Type: String

Effective Account ID. Required for B2B stores. For other stores, pass null.

currencyCode
Type: String

ISO currency code. If you pass null, the default store value is used.

locale
Type: String

Locale. If you pass null, the default store value is used.

excludeAttributeSetInfo
Type: String

Specifies whether the attribute set information for the product is returned.

excludeMedia
Type: String

Specifies whether the media groups and default images of the product are returned.

excludeQuantityRule
Type: String

Specifies whether the quantity rule information for the product is returned.

excludeVariationInfo
Type: String

Specifies whether the variation information for the product is returned.

excludePrices
Type: String

Specifies whether the prices for the product is returned.

Return Value

Type: `ConnectApi.ProductDetailsOutputRepresentation`

searchProducts(webstoreId, searchTerm, pageParam, pageSize, effectiveAccountId, facets)

Search products in a webstore.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductSearchOutputRepresentation searchProducts(String webstoreId, String searchTerm, Integer pageParam, Integer pageSize, String effectiveAccountId, String facets)
```

Parameters

webstoreId
Type: String

ID of the webstore.

searchTerm
Type: String

Term used for the search.

pageParam
Type: Integer

Maximum number of search results pages to return. If you don't specify a value, the default is 1.

pageSize
Type: Integer

Number of items per page. Valid values are from 1 through 100. If you don’t specify a value, the default size is 20.

effectiveAccountId
Type: String

ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user.

facets
Type: String

A list of facet names to filter the search.For example, `["size_medium", "color_red"]` is encoded to `WyJzaXplX21lZGl1bSIsICJjb2xvcl9yZWQiXQ==`

Return Value

Type: `ConnectApi.ProductSearchOutputRepresentation` on page 2131

ReturnOrder Class

Process ReturnOrders in Order Management.

Namespace

ConnectApi

ReturnOrder Methods

The following are methods for `ReturnOrder`. All methods are static.

IN THIS SECTION:

createReturnOrder(returnOrderInput)

Create a ReturnOrder and ReturnOrderLineItems for items belonging to an OrderSummary.

returnItems(returnOrderId, returnItemsInput)

Process ReturnOrderLineItems belonging to a ReturnOrder. Processing a ReturnOrderLineItem generates a change Order and makes that ReturnOrderLineItem read-only. The change order for a returned item or delivery charge has a positive amount and should be used to create a credit memo. The change order for a return fee has a negative amount and should be used to create an invoice. If a processed ReturnOrderLineItem has any remaining expected quantity, then the API creates a separate ReturnOrderLineItem representing that quantity.

`createReturnOrder(returnOrderInput)`

Create a ReturnOrder and ReturnOrderLineItems for items belonging to an OrderSummary.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ReturnOrderOutputRepresentation
createReturnOrder(ConnectApi.ReturnOrderInputRepresentation returnOrderInput)
```

Parameters

returnOrderInput
Type: ConnectApi.ReturnOrderInputRepresentation

Data for creating a ReturnOrder and ReturnOrderLineItems.

Return Value

Type: ConnectApi.ReturnOrderOutputRepresentation

SEE ALSO:

returnItems(returnOrderId, returnItemsInput)

returnItems(returnOrderId, returnItemsInput)

Process ReturnOrderLineItems belonging to a ReturnOrder. Processing a ReturnOrderLineItem generates a change Order and makes that ReturnOrderLineItem read-only. The change order for a returned item or delivery charge has a positive amount and should be used to create a credit memo. The change order for a return fee has a negative amount and should be used to create an invoice. If a processed ReturnOrderLineItem has any remaining expected quantity, then the API creates a separate ReturnOrderLineItem representing that quantity.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.ReturnItemsOutputRepresentation returnItems(String
returnOrderId, ConnectApi.ReturnItemsInputRepresentation returnItemsInput)
```

Parameters

returnOrderId
Type: String

ID of the ReturnOrder.

returnItemsInput
Type: ConnectApi.ReturnItemsInputRepresentation

Data about products and delivery charges to return, as well as associated return fees.

Return Value

Type: `ConnectApi.ReturnItemsOutputRepresentation`

SEE ALSO:

createMultipleInvoices(invoicesInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

createReturnOrder(returnOrderInput)

Routing Class

Route orders to inventory locations in Order Management.

Namespace

ConnectApi

Routing Methods

The following are methods for `Routing`. All methods are static.

IN THIS SECTION:

confirmHeldFOCapacity(confirmHeldFOCapacityInput)

Confirm held fulfillment order capacity at one or more locations. This call decreases a location's held capacity and increases its assigned fulfillment order count. Confirm held capacity when you assign a fulfillment order to a location.

findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)

Returns combinations of inventory locations that can fulfill an order within a specified limit of shipment splits. By default, checks up to 1,000,000 potential routes, returning a maximum of 10,000 results.

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

For one or more order summaries, find inventory availability using Omnichannel Inventory and identify the fulfillment routes with fewest splits. By default, checks up to 1,000,000 potential routes, returning a maximum of 10,000 results. This method combines the functionality of the `getInventoryAvailability()` and `findRoutesWithFewestSplits()` methods.

getFOCapacityValues(getFOCapacityValuesInput)

Get information about the current fulfillment order capacity of one or more locations.

holdFOCapacity(holdFOCapacityInput)

Hold fulfillment order capacity at a location. Holding capacity at a location reserves a space for a fulfillment order that you'll assign to it.

rankAverageDistance(rankAverageDistanceInputRepresentation)

Calculates the average distance from sets of inventory locations to an order recipient, and ranks them. Use this method to compare the average shipping distances for different sets of locations that can fulfill an order. While this method is executing, you can't invoke another Apex callout.

releaseHeldFOCapacity(releaseHeldFOCapacityInput)

Release held fulfillment order capacity at one or more locations. This call decreases a location's held capacity without changing its assigned fulfillment order count. Release held capacity when you cancel the assignment of a fulfillment order to a location.

confirmHeldFOCapacity(confirmHeldFOCapacityInput)

Confirm held fulfillment order capacity at one or more locations. This call decreases a location's held capacity and increases its assigned fulfillment order count. Confirm held capacity when you assign a fulfillment order to a location.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.ConfirmHeldFOCapacityOutputRepresentation
confirmHeldFOCapacity(ConnectApi.ConfirmHeldFOCapacityInputRepresentation
confirmHeldFOCapacityInput)
```

Parameters

confirmHeldFOCapacityInput
Type: ConnectApi.ConfirmHeldFOCapacityInputRepresentation

The input includes, for each fulfillment order, the location where capacity is held for it.

Return Value

Type: ConnectApi.ConfirmHeldFOCapacityOutputRepresentation

findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)

Returns combinations of inventory locations that can fulfill an order within a specified limit of shipment splits. By default, checks up to 1,000,000 potential routes, returning a maximum of 10,000 results.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.FindRoutesWithFewestSplitsOutputRepresentation
findRoutesWithFewestSplits(ConnectApi.FindRoutesWithFewestSplitsInputRepresentation
findRoutesWithFewestSplitsInputRepresentation)
```

Parameters

findRoutesWithFewestSplitsInputRepresentation
Type: ConnectApi.FindRoutesWithFewestSplitsInputRepresentation

The input includes the ordered item quantities, data about available inventory, and, optionally, a maximum allowable number of shipment splits.

Return Value

Type: ConnectApi.FindRoutesWithFewestSplitsOutputRepresentation

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

For one or more order summaries, find inventory availability using Omnichannel Inventory and identify the fulfillment routes with fewest splits. By default, checks up to 1,000,000 potential routes, returning a maximum of 10,000 results. This method combines the functionality of the `getInventoryAvailability()` and `findRoutesWithFewestSplits()` methods.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation
findRoutesWithFewestSplitsUsingOCI(ConnectApi.FindRoutesWithFewestSplitsUsingOCIInputRepresentation
findRoutesWithFewestSplitsUsingOCIInput)
```

Parameters

findRoutesWithFewestSplitsUsingOCIInput
Type: ConnectApi.FindRoutesWithFewestSplitsUsingOCIInputRepresentation

The input includes, for each order, the ordered item quantities, the assigned location group or locations, and, optionally, a maximum allowable number of shipment splits and a list of locations to exclude from the calculation.

Return Value

Type: ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation

SEE ALSO:

getInventoryAvailability(inventoryAvailabilityInputRepresentation)

findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)

getFOCapacityValues(getFOCapacityValuesInput)

Get information about the current fulfillment order capacity of one or more locations.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.GetFOCapacityValuesOutputRepresentation
getFOCapacityValues(ConnectApi.GetFOCapacityValuesRequestInputRepresentation
getFOCapacityValuesInput)
```

Parameters

getFOCapacityValuesInput
Type: ConnectApi.GetFOCapacityValuesRequestInputRepresentation

Locations to get fulfillment order capacity information about.

Return Value

Type: ConnectApi.GetFOCapacityValuesOutputRepresentation

holdFOCapacity(holdFOCapacityInput)

Hold fulfillment order capacity at a location. Holding capacity at a location reserves a space for a fulfillment order that you'll assign to it.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.HoldFOCapacityOutputRepresentation
holdFOCapacity(ConnectApi.HoldFOCapacityInputRepresentation holdFOCapacityInput)
```

Parameters

holdFOCapacityInput
Type: ConnectApi.HoldFOCapacityInputRepresentation

The input includes, for each fulfillment order, the location to hold capacity for it.

Return Value

Type: ConnectApi.HoldFOCapacityOutputRepresentation

rankAverageDistance(rankAverageDistanceInputRepresentation)

Calculates the average distance from sets of inventory locations to an order recipient, and ranks them. Use this method to compare the average shipping distances for different sets of locations that can fulfill an order. While this method is executing, you can't invoke another Apex callout.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.RankAverageDistanceOutputRepresentation
rankAverageDistance(ConnectApi.RankAverageDistanceInputRepresentation
rankAverageDistanceInputRepresentation)
```

Parameters

rankAverageDistanceInputRepresentation
Type: ConnectApi.RankAverageDistanceInputRepresentation

An order recipient's geographic location and information about sets of inventory locations that can fulfill the order.

Return Value

Type: ConnectApi.RankAverageDistanceOutputRepresentation

releaseHeldFOCapacity(releaseHeldFOCapacityInput)

Release held fulfillment order capacity at one or more locations. This call decreases a location's held capacity without changing its assigned fulfillment order count. Release held capacity when you cancel the assignment of a fulfillment order to a location.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.ReleaseHeldFOCapacityOutputRepresentation
releaseHeldFOCapacity(ConnectApi.ReleaseHeldFOCapacityInputRepresentation
releaseHeldFOCapacityInput)
```

Parameters

releaseHeldFOCapacityInput
Type: ConnectApi.ReleaseHeldFOCapacityInputRepresentation

The input includes, for each fulfillment order, the location that holds the capacity to release.

Return Value

Type: ConnectApi.ReleaseHeldFOCapacityOutputRepresentation

SalesforceInbox Class

Access information about Automated Activity Capture, which is available in Einstein and Salesforce Inbox.

Namespace

ConnectApi

SalesforceInbox Methods

The following are methods for `SalesforceInbox`. All methods are static.

IN THIS SECTION:

shareActivity(activityId, sharingInfo)
Share emails or events with certain groups of users.

shareActivity(activityId, sharingInfo)

Share emails or events with certain groups of users.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ActivitySharingResult shareActivity(String activityId,
ConnectApi.ActivitySharingInput sharingInfo)
```

Parameters

activityId
Type: String

The ID of the activity.

sharingInfo
Type: ConnectApi.ActivitySharingInput

A ConnectApi.ActivitySharingInput object.

Return Value

Type: ConnectApi.ActivitySharingResult

Usage

This method is a feature of both Sales Cloud Einstein and Inbox. It lets users connect their email and calendar to Salesforce. Then, their emails and events are automatically added to related Salesforce records. Users can specify who their individual emails and events are shared with.

Sites Class

Search an Experience Cloud site.

Namespace

ConnectApi

Sites Methods

The following are methods for Sites. All methods are static.

IN THIS SECTION:

searchSite(siteId, queryTerm, pageToken, pageSize, language)
Search an Experience Cloud site.

searchSite(siteId, queryTerm, pageToken, pageSize, language)

Search an Experience Cloud site.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.SiteSearchResult searchSite(String siteId, String queryTerm,
String pageToken, Integer pageSize, String language)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

queryTerm
Type: String

White-space separated words used to search for relevant content. Provide a maximum of 1024 characters, composed of up to 32 words and white spaces. Logical operators aren't supported.

pageToken
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 240. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the context user. If unspecified or if the specified language locale isn't available, the default value is `en_US`.

Return Value

Type: `ConnectApi.SiteSearchResult`

SmartDataDiscovery Class

Get predictions on Salesforce objects.

Use the `ConnectApi.SmartDataDiscovery.predict` method to get predictions on Salesforce objects. For more information, see Get Predictions in Apex.

SocialEngagement Class

Manage information about social accounts or fan pages for social networks.

Namespace

ConnectApi

SocialEngagement Methods

The following are methods for `SocialEngagement`. All methods are static.

IN THIS SECTION:

deleteSocialPost(socialPostId, socialAccountId)
Delete a social post from its social network.

followSocialPersona(socialPersonaId, socialAccountId)
Follow a social persona in its social network.

followSocialPostPersona(socialPostId, socialAccountId)
Follow a social persona on a social post in its social network.

getIntents(socialPostId)
Get available intents for a social post.

getManagedSocialAccount(id)
Get a managed social account that is in the org and assigned to the user.

getManagedSocialAccounts()
Gets a list of managed social accounts that are in the org and assigned to the user.

getManagedSocialAccounts(socialNetwork)
Get a list of managed social accounts that are in the org and assigned to the user.

getRelationship(id, socialPersonaId)
Get the follow relationship between a managed social account and a social persona.

hideSocialPost(socialPostId, socialAccountId)
Hide a social post in its social network.

likeSocialPost(socialPostId, socialAccountId)
Like a social post in its social network.

massApprove(massApproval)
Approve or reject the publishing of a large number of social posts.

recallApproval(socialPostId)
Recall an approval request to publish a social post.

unfollowSocialPersona(socialPersonaId, socialAccountId)
Stop following a social persona in its social network.

unfollowSocialPostPersona(socialPostId, socialAccountId)
Stop following a social persona of a social post in its social network.

unhideSocialPost(socialPostId, socialAccountId)
Unhide a social post in its social network.

unlikeSocialPost(socialPostId, socialAccountId)
Unlike a social post in its social network.

deleteSocialPost(socialPostId, socialAccountId)

Delete a social post from its social network.

Note: Deleting a social post from its social network doesn't delete the record from Salesforce.

API Version

46.0

Requires Chatter

No

Signature

```
public static ConnectApi.DeleteSocialPostIntent deleteSocialPost(String socialPostId,
String socialAccountId)
```

Parameters

socialPostId
Type: String

ID of the social post to delete.

socialAccountId
Type: String

ID of the social account that deletes the post.

Return Value

Type: `ConnectApi.DeleteSocialPostIntent`

followSocialPersona(socialPersonaId, socialAccountId)

Follow a social persona in its social network.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.FollowSocialPersonaIntent followSocialPersona(String
socialPersonaId, String socialAccountId)
```

Parameters

socialPersonaId
Type: String

ID of the social persona to follow.

socialAccountId
Type: String

ID of the social account that follows the social persona.

Return Value

Type: ConnectApi.FollowSocialPersonaIntent

followSocialPostPersona(socialPostId, socialAccountId)

Follow a social persona on a social post in its social network.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.FollowSocialPersonaIntent followSocialPostPersona(String
socialPostId, String socialAccountId)
```

Parameters

socialPostId
Type: String

ID of the social post authored by the social persona to follow.

socialAccountId
Type: String

ID of the social account that follows the social persona.

Return Value

Type: ConnectApi.FollowSocialPersonaIntent

getIntents(socialPostId)

Get available intents for a social post.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.SocialPostIntents getIntents(String socialPostId)
```

Parameters

socialPostId
Type: String

ID of a social post.

Return Value

Type: ConnectApi.SocialPostIntents

getManagedSocialAccount(id)

Get a managed social account that is in the org and assigned to the user.

API Version

44.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedSocialAccount getManagedSocialAccount(String id)
```

Parameters

id
Type: String

Description: Internal SFDC ID for this managed social account.

Return Value

Type: ConnectApi.ManagedSocialAccount

getManagedSocialAccounts()

Gets a list of managed social accounts that are in the org and assigned to the user.

API Version

44.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedSocialAccounts getManagedSocialAccounts()
```

Return Value

Type: ConnectApi.ManagedSocialAccounts

getManagedSocialAccounts(socialNetwork)

Get a list of managed social accounts that are in the org and assigned to the user.

API Version

44.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedSocialAccounts
getManagedSocialAccounts(ConnectApi.SocialNetworkProvider socialNetwork)
```

Parameters

socialNetwork

Type: ConnectApi.SocialNetworkProvider

Description: Filters results based on the social network. Values are:

- Facebook
- GooglePlus
- Instagram
- InstagramBusiness
- KakaoTalk
- Kik
- Line
- LinkedIn
- Messenger
- Other
- Pinterest
- QQ
- Rypple
- SinaWeibo
- SMS
- Snapchat

- `Telegram`
- `Twitter`
- `VKontakte`
- `WeChat`
- `WhatsApp`
- `YouTube`

Return Value

Type: `ConnectApi.ManagedSocialAccounts`

`getRelationship(id, socialPersonaId)`

Get the follow relationship between a managed social account and a social persona.

API Version

46.0

Requires Chatter

No

Signature

```
public static ConnectApi.SocialAccountRelationship getRelationship(String id, String socialPersonaId)
```

Parameters

`id`
Type: String

ID of the managed social account.

`socialPersonaId`
Type: String

ID of the social persona.

Return Value

Type: `ConnectApi.SocialAccountRelationship`

`hideSocialPost(socialPostId, socialAccountId)`

Hide a social post in its social network.

API Version

46.0

Requires Chatter

No

Signature

```
public static ConnectApi.HideSocialPostIntent hideSocialPost(String socialPostId, String socialAccountId)
```

Parameters

socialPostId
Type: String

ID of the social post to hide.

socialAccountId
Type: String

ID of the social account that hides the post.

Return Value

Type: ConnectApi.HideSocialPostIntent

likeSocialPost(socialPostId, socialAccountId)

Like a social post in its social network.

API Version

46.0

Requires Chatter

No

Signature

```
public static ConnectApi.LikeSocialPostIntent likeSocialPost(String socialPostId, String socialAccountId)
```

Parameters

socialPostId
Type: String

ID of the social post to like.

socialAccountId
Type: String

ID of the social account that likes the post.

Return Value

Type: ConnectApi.LikeSocialPostIntent

massApprove(massApproval)

Approve or reject the publishing of a large number of social posts.

API Version

46.0

Requires Chatter

No

Signature

```
public static ConnectApi.SocialPostMassApprovalOutput
massApprove(ConnectApi.SocialPostMassApprovalInput massApproval)
```

Parameters

massApproval
Type: ConnectApi.SocialPostMassApprovalInput

A ConnectApi.SocialPostMassApprovalInput body that includes a list of social post IDs and the action to approve or reject publishing them.

Return Value

Type: ConnectApi.SocialPostMassApprovalOutput

recallApproval(socialPostId)

Recall an approval request to publish a social post.

API Version

46.0

Requires Chatter

No

Signature

```
public static Void recallApproval(String socialPostId)
```

Parameters

socialPostId
Type: String

ID of the social post.

Return Value

Type: Void

unfollowSocialPersona(socialPersonaId, socialAccountId)

Stop following a social persona in its social network.

API Version

45.0

Requires Chatter

No

Signature

```
public static Void unfollowSocialPersona(String socialPersonaId, String socialAccountId)
```

Parameters

socialPersonaId
Type: String

ID of the social persona to stop following.

socialAccountId
Type: String

ID of the social account that stops following the social persona.

Return Value

Type: Void

unfollowSocialPostPersona(socialPostId, socialAccountId)

Stop following a social persona of a social post in its social network.

API Version

45.0

Requires Chatter

No

Signature

```
public static Void unfollowSocialPostPersona(String socialPostId, String socialAccountId)
```

Parameters

socialPostId
Type: String

ID of the social post authored by the social persona to stop following.

socialAccountId
Type: String

ID of the social account that stops following the social persona.

Return Value

Type: Void

unhideSocialPost(socialPostId, socialAccountId)

Unhide a social post in its social network.

API Version

46.0

Requires Chatter

No

Signature

```
public static Void unhideSocialPost(String socialPostId, String socialAccountId)
```

Parameters

socialPostId
Type: String

ID of the social post to unhide.

socialAccountId
Type: String

ID of the social account that unhides the post.

Return Value

Type: Void

unlikeSocialPost(socialPostId, socialAccountId)

Unlike a social post in its social network.

API Version

46.0

Requires Chatter

No

Signature

```
public static Void unlikeSocialPost(String socialPostId, String socialAccountId)
```

Parameters

socialPostId
Type: String

ID of the social post to unlike.

socialAccountId
Type: String

ID of the social account that unlikes the post.

Return Value

Type: Void

Surveys Class

Send survey invitations by email.

Namespace

ConnectApi

Surveys Methods

These methods are for `Surveys`. All methods are static.

IN THIS SECTION:

sendSurveyInvitationEmail(surveyID, SurveyEmailInput)
Email survey invitations to up to 300 participants. You can email either leads, contacts, or users in your org. Either a link to launch the survey or a question can be embedded in the email invitations.

`sendSurveyInvitationEmail(surveyID, SurveyEmailInput)`

Email survey invitations to up to 300 participants. You can email either leads, contacts, or users in your org. Either a link to launch the survey or a question can be embedded in the email invitations.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.SurveyInvitationEmailOutput sendSurveyInvitationEmail(String surveyID, ConnectApi.SurveyInvitationEmailInput SurveyEmailInput)
```

Parameters

surveyID
Type: String

ID of the survey.

SurveyEmailInput
Type: ConnectApi.SurveyInvitationEmailInput

A `ConnectApi.SurveyInvitationEmailInput` object.

Return Value

Type: ConnectApi.SurveyInvitationEmailOutput

TaxPlatform Class

Apply or cancel tax.

Namespace

ConnectApi

TaxPlatform Methods

The following are methods for `TaxPlatform`. All methods are static.

IN THIS SECTION:

calculateTax(calculateTax)
Apply tax or cancel tax.

calculateTax(calculateTax)

Apply tax or cancel tax.

API Version

55.0

Requires Chatter

No

Signature

```
global static ConnectApi.CalculateTaxResponse calculateTax(ConnectApi.CalculateTaxRequest
calculateTax)
```

Parameters

calculateTax
Type: ConnectApi.CalculateTaxRequest

Represents a request to calculate tax for one or more line items.

Return Value

Type: ConnectApi.CalculateTaxResponse

Topics Class

Access information about topics, such as their descriptions, the number of people talking about them, related topics, and information about groups contributing to the topic. Update a topic's name or description, merge topics, and add and remove topics from records and feed items.

Namespace

ConnectApi

Topics Methods

The following are methods for `Topics`. All methods are static.

IN THIS SECTION:

assignTopic(communityId, recordId, topicId)
Assign a topic to a record or feed item.

assignTopicByName(communityId, recordId, topicName)
Assign a topic to a record or feed item.

createTopic(communityId, name, description)
Create a topic.

createTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory, topicNames)
Create topic and article assignment rules by data category.

deleteTopic(communityId, topicId)

Delete a topic.

getGroupsRecentlyTalkingAboutTopic(communityId, topicId)

Get information about the five groups that most recently contributed to a topic.

getRecentlyTalkingAboutTopicsForGroup(communityId, groupId)

Get up to five topics most recently used in a group.

getRecentlyTalkingAboutTopicsForUser(communityId, userId)

Get up to five topics most recently used by a user.

getRelatedTopics(communityId, topicId)

Get up to five topics most closely related to a topic.

getTopic(communityId, topicId)

Get a topic.

getTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory)

Get topic and article assignment rules by data category.

getTopics(communityId, recordId)

Get the first page of topics assigned to a record or feed item.

getTopics(communityId)

Get the first page of topics for the org or Experience Cloud site.

getTopics(communityId, sortParam)

Get the first page of sorted topics for the org or community.

getTopics(communityId, pageParam, pageSize)

Get a page of topics.

getTopics(communityId, pageParam, pageSize, sortParam)

Get a page of sorted topics.

getTopics(communityId, q, sortParam)

Get the sorted topics that match the search criteria.

getTopics(communityId, q, pageParam, pageSize)

Get a page of topics that match the search criteria.

getTopics(communityId, q, pageParam, pageSize, sortParam)

Get a page of sorted topics that match the search criteria.

getTopics(communityId, q, exactMatch)

Get the topic that matches the exact, case-insensitive name.

getTopicsOrFallBackToRenamedTopics(communityId, q, exactMatch, fallBackToRenamedTopics)

Get the most recent renamed topic match, if there isn't an exact match.

getTopicSuggestions(communityId, recordId, maxResults)

Get up to a specified number of suggested topics for a record or feed item.

getTopicSuggestions(communityId, recordId)

Get suggested topics for a record or feed item.

getTopicSuggestionsForText(communityId, text, maxResults)

Get up to a specified number of suggested topics for a string of text.

getTopicSuggestionsForText(communityId, text)
Get suggested topics for a string of text.

getTrendingTopics(communityId)
Get trending topics for the org or Experience Cloud site.

getTrendingTopics(communityId, maxResults)
Get up to a specified number of trending topics for the org or Experience Cloud site.

mergeTopics(communityId, topicId, idsToMerge)
Merge up to five secondary topics with a primary topic.

reassignTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory, topicNames)
Reassign topic and article assignment rules by data category by deleting the existing rules and creating new rules.

reassignTopicsByName(communityId, recordId, topicNames)
Reassign all the topics on a record or feed item, that is, remove all the assigned topics on a record or feed item and add topics. Optionally, provide a list of suggested topics to assign to a record or feed item to improve future topic suggestions.

unassignTopic(communityId, recordId, topicId)
Remove a topic from a record or feed item.

updateTopic(communityId, topicId, topic)
Update the description or name of a topic or merge up to five secondary topics with a primary topic.

updateTopicsForArticlesInDataCategory(communityId, dataCategoryGroup, dataCategory, articleTopicAssignmentJob)
Assign topics to articles and unassign topics from articles in a data category.

`assignTopic(communityId, recordId, topicId)`

Assign a topic to a record or feed item.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic assignTopic(String communityId, String recordId, String topicId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID for a record or feed item.

topicId
Type: String

ID for a topic.

Return Value

Type: `ConnectApi.Topic`

Usage

Only users with the Assign Topics permission can add existing topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

`assignTopicByName(communityId, recordId, topicName)`

Assign a topic to a record or feed item.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic assignTopicByName(String communityId, String recordId,
String topicName)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

The ID of the record or feed item to which to assign the topic.

topicName
Type: String

The name of a new or existing topic.

Return Value

Type: `ConnectApi.Topic`

Usage

Only users with the Assign Topics permission can add existing topics to records or feed items. Only users with the Create Topics permission can add new topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

createTopic(communityId, name, description)

Create a topic.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic createTopic(String communityId, String name, String description)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

name
Type: String

The name of the topic.

description
Type: String

The description of the topic.

Return Value

Type: `ConnectApi.Topic`

Usage

Only users with the Create Topics permission can create a topic.

createTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory, topicNames)

Create topic and article assignment rules by data category.

API Version

40.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage createTopicDataCategoryRules(String communityId,
String dataCategoryGroup, String dataCategory, ConnectApi.TopicNamesInput topicNames)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

dataCategoryGroup
Type: String

The data category group used by articles.

dataCategory
Type: String

The data category used by articles.

topicNames
Type: `ConnectApi.TopicNamesInput`

A `ConnectApi.TopicNamesInput` object with the names of topics to assign to articles in a data category.

Return Value

Type: `ConnectApi.TopicPage`

`deleteTopic(communityId, topicId)`

Delete a topic.

API Version

29.0

Requires Chatter

No

Signature

```
public static Void deleteTopic(String communityId, String topicId)
```

Parameters

communityId
Type: String,

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

ID for a topic.

Return Value

Type: Void

Usage

Only users with the Delete Topics or Modify All Data permission can delete topics.

Topic deletion is asynchronous. If a topic is requested before the deletion completes, the response is successful and the `isBeingDeleted` property of `ConnectApi.Topic` is `true` in version 33.0 and later. If a topic is requested after the deletion completes, the response is `ConnectApi.NotFoundException`.

`getGroupsRecentlyTalkingAboutTopic(communityId, topicId)`

Get information about the five groups that most recently contributed to a topic.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupSummaryPage
getGroupsRecentlyTalkingAboutTopic(String communityId, String topicId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

ID for a topic.

Return Value

Type: `ConnectApi.ChatterGroupSummaryPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetGroupsRecentlyTalkingAboutTopic(communityId, topicId, result)

Apex Developer Guide: Testing ConnectApi Code

`getRecentlyTalkingAboutTopicsForGroup(communityId, groupId)`

Get up to five topics most recently used in a group.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.TopicPage getRecentlyTalkingAboutTopicsForGroup(String
communityId, String groupId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`groupId`
Type: String

ID for a group.

Return Value

Type: `ConnectApi.TopicPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecentlyTalkingAboutTopicsForGroup(communityId, groupId, result)

Apex Developer Guide: Testing ConnectApi Code

`getRecentlyTalkingAboutTopicsForUser(communityId, userId)`

Get up to five topics most recently used by a user.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.TopicPage getRecentlyTalkingAboutTopicsForUser(String
communityId, String userId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID for a user.

Return Value

Type: `ConnectApi.TopicPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecentlyTalkingAboutTopicsForUser(communityId, userId, result)

Apex Developer Guide: Testing ConnectApi Code

`getRelatedTopics(communityId, topicId)`

Get up to five topics most closely related to a topic.

Two topics that are assigned to the same feed item at least three times are related.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getRelatedTopics(String communityId, String topicId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`topicId`
Type: String

ID for a topic.

Return Value

Type: `ConnectApi.TopicPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRelatedTopics(communityId, topicId, result)

Apex Developer Guide: Testing ConnectApi Code

`getTopic(communityId, topicId)`

Get a topic.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic getTopic(String communityId, String topicId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`topicId`
Type: String

ID for a topic.

Return Value

Type: `ConnectApi.Topic`

`getTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory)`

Get topic and article assignment rules by data category.

API Version

40.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopicDataCategoryRules(String communityId, String dataCategoryGroup, String dataCategory)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

dataCategoryGroup
Type: String

The data category group used by articles.

dataCategory
Type: String

The data category used by articles.

Return Value

Type: `ConnectApi.TopicPage`

getTopics(communityId, recordId)

Get the first page of topics assigned to a record or feed item.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String recordId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID for a record or feed item.

Return Value

Type: `ConnectApi.TopicPage`

Usage

Administrators must enable topics for objects before users can add topics to records of that object type.

getTopics(communityId)

Get the first page of topics for the org or Experience Cloud site.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.TopicPage`

getTopics(communityId, sortParam)

Get the first page of sorted topics for the org or community.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, ConnectApi.TopicSort
sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

sortParam
Type: `ConnectApi.TopicSort`

Values are:

- `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
- `alphaAsc`—Sorts topics alphabetically.

Return Value

Type: `ConnectApi.TopicPage`

`getTopics(communityId, pageParam, pageSize)`

Get a page of topics.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, Integer pageParam,
Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.TopicPage`

`getTopics(communityId, pageParam, pageSize, sortParam)`

Get a page of sorted topics.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, Integer pageParam,
Integer pageSize, ConnectApi.TopicSort sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.TopicSort`

Values are:

- `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
- `alphaAsc`—Sorts topics alphabetically.

Return Value

Type: `ConnectApi.TopicPage`

getTopics(communityId, q, sortParam)

Get the sorted topics that match the search criteria.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String q,
ConnectApi.TopicSort sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The string must contain at least two characters, not including wildcards.

sortParam
Type: `ConnectApi.TopicSort`

Values are:

- `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
- `alphaAsc`—Sorts topics alphabetically.

Return Value

Type: ConnectApi.TopicPage

getTopics(communityId, q, pageParam, pageSize)

Get a page of topics that match the search criteria.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String q, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The string must contain at least two characters, not including wildcards.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: ConnectApi.TopicPage

getTopics(communityId, q, pageParam, pageSize, sortParam)

Get a page of sorted topics that match the search criteria.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String q, Integer pageParam, Integer pageSize, ConnectApi.TopicSort sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The string must contain at least two characters, not including wildcards.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.TopicSort`

Values are:

- `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
- `alphaAsc`—Sorts topics alphabetically.

Return Value

Type: `ConnectApi.TopicPage`

`getTopics(communityId, q, exactMatch)`

Get the topic that matches the exact, case-insensitive name.

API Version

33.0

Available to Guest Users

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String q, Boolean exactMatch)
```

Parameters

communityId
: Type: String

  ID for an Experience Cloud site, `internal`, or `null`.

q
: Type: String

  Specifies the string to search. The string must contain at least two characters, not including wildcards.

exactMatch
: Type: Boolean

  Specify `true` to find a topic by its exact, case-insensitive name.

Return Value

Type: `ConnectApi.TopicPage`

`getTopicsOrFallBackToRenamedTopics(communityId, q, exactMatch, fallBackToRenamedTopics)`

Get the most recent renamed topic match, if there isn't an exact match.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopicsOrFallBackToRenamedTopics(String communityId,
String q, Boolean exactMatch, Boolean fallBackToRenamedTopics)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The string must contain at least two characters, not including wildcards.

exactMatch
Type: Boolean

Specify `true` to find a topic by its exact, case-insensitive name or to find the most recent renamed topic match if there isn't an exact match.

fallBackToRenamedTopics
Type: Boolean

Specify `true` and if there isn't an exact match, the most recent renamed topic match is returned. If there are multiple renamed topic matches, only the most recent is returned. If there are no renamed topic matches, an empty collection is returned.

Return Value

Type: `ConnectApi.TopicPage`

`getTopicSuggestions(communityId, recordId, maxResults)`

Get up to a specified number of suggested topics for a record or feed item.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicSuggestionPage getTopicSuggestions(String communityId,
String recordId, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID for a record or feed item.

maxResults
Type: Integer

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

Return Value

Type: `ConnectApi.TopicSuggestionPage`

Usage

Administrators must enable topics for objects before users can see suggested topics for records of that object type.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTopicSuggestions(communityId, recordId, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getTopicSuggestions(communityId, recordId)`

Get suggested topics for a record or feed item.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicSuggestionPage getTopicSuggestions(String communityId,
String recordId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID for a record or feed item.

Return Value

Type: `ConnectApi.TopicSuggestionPage`

Usage

Administrators must enable topics for objects before users can see suggested topics for records of that object type.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- setTestGetTopicSuggestions(communityId, recordId, result)
- *Apex Developer Guide*: Testing ConnectApi Code

`getTopicSuggestionsForText(communityId, text, maxResults)`

Get up to a specified number of suggested topics for a string of text.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicSuggestionPage getTopicSuggestionsForText(String
communityId, String text, Integer maxResults)
```

Parameters

communityId
: Type: String

  ID for an Experience Cloud site, `internal`, or `null`.

text
: Type: String

  String of text.

maxResults
: Type: Integer

  Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

Return Value

Type: `ConnectApi.TopicSuggestionPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTopicSuggestionsForText(communityId, text, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getTopicSuggestionsForText(communityId, text)`

Get suggested topics for a string of text.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicSuggestionPage getTopicSuggestionsForText(String communityId, String text)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`text`
Type: String

String of text.

Return Value

Type: `ConnectApi.TopicSuggestionPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTopicSuggestionsForText(communityId, text, result)

Apex Developer Guide: Testing ConnectApi Code

`getTrendingTopics(communityId)`

Get trending topics for the org or Experience Cloud site.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTrendingTopics(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.TopicPage`

Usage

The more frequently people add a specific topic to their posts and comments and comment on or like posts with the same topic over a short period, the more likely it is to become a trending topic. For example, if your coworkers are attending the upcoming Dreamforce conference and have started discussing it in Chatter, you might see a trending topic for Dreamforce. A trending topic is not solely based on popularity and usually relates to a one-time or infrequent event that has a spike in activity, such as a conference or a project deadline.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTrendingTopics(communityId, result)

Apex Developer Guide: Testing ConnectApi Code

`getTrendingTopics(communityId, maxResults)`

Get up to a specified number of trending topics for the org or Experience Cloud site.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTrendingTopics(String communityId, Integer
maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

maxResults
Type: Integer

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

Return Value

Type: `ConnectApi.TopicPage`

Usage

The more frequently people add a specific topic to their posts and comments and comment on or like posts with the same topic over a short period, the more likely it is to become a trending topic. For example, if your coworkers are attending the upcoming Dreamforce conference and have started discussing it in Chatter, you might see a trending topic for Dreamforce. A trending topic is not solely based on popularity and usually relates to a one-time or infrequent event that has a spike in activity, such as a conference or a project deadline.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTrendingTopics(communityId, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`mergeTopics(communityId, topicId, idsToMerge)`

Merge up to five secondary topics with a primary topic.

API Version

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic mergeTopics(String communityId, String topicId,
List<String> idsToMerge)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

The ID for the primary topic for the merge. If this topic is a managed topic, it retains its topic type, topic images, and children topics.

idsToMerge
Type: List<String>

A list of up to five comma-separated secondary topic IDs to merge with the primary topic. If any of the secondary topics are navigational or featured topics, they lose their topic type, topic images, and children topics. Their feed items are reassigned to the primary topic. If you merge a topic with a content topic, the content associations are preserved. If you merge a topic with an inactive endorsee, the endorsement isn't mapped to the primary topic.

Return Value

Type: `ConnectApi.Topic`

Usage

Only users with the Delete Topics or Modify All Data permission can merge topics.

reassignTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory, topicNames)

Reassign topic and article assignment rules by data category by deleting the existing rules and creating new rules.

API Version

40.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage reassignTopicDataCategoryRules(String communityId,
String dataCategoryGroup, String dataCategory, ConnectApi.TopicNamesInput topicNames)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

dataCategoryGroup
Type: String

The data category group used by articles.

dataCategory
Type: String

The data category used by articles.

topicNames
Type: `ConnectApi.TopicNamesInput`

A `ConnectApi.TopicNamesInput` object with the names of topics to reassign to articles in a data category.

Return Value

Type: `ConnectApi.TopicPage`

`reassignTopicsByName(communityId, recordId, topicNames)`

Reassign all the topics on a record or feed item, that is, remove all the assigned topics on a record or feed item and add topics. Optionally, provide a list of suggested topics to assign to a record or feed item to improve future topic suggestions.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage reassignTopicsByName(String communityId, String
recordId, ConnectApi.TopicNamesInput topicNames)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

The ID of the record or feed item to which to assign the topic.

topicNames
Type: `ConnectApi.TopicNamesInput`

A list of topics to replace the currently assigned topics. Optionally, a list of suggested topics to assign to improve future topic suggestions.

Return Value

Type: `ConnectApi.TopicPage`

Usage

Only users with the Assign Topics permission can remove topics from records or feed items and add existing topics to records or feed items. Only users with the Create Topics permission can add new topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

`unassignTopic(communityId, recordId, topicId)`

Remove a topic from a record or feed item.

API Version

29.0

Requires Chatter

No

Signature

```
public static Void unassignTopic(String communityId, String recordId, String topicId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`recordId`
Type: String

ID for a record or feed item.

`topicId`
Type: String

ID for a topic.

Return Value

Type: Void

Usage

Only users with the Assign Topics permission can remove topics from feed items or records. Administrators must enable topics for objects before users can add topics to records of that object type.

updateTopic(communityId, topicId, topic)

Update the description or name of a topic or merge up to five secondary topics with a primary topic.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic updateTopic(String communityId, String topicId,
ConnectApi.TopicInput topic)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

ID for a topic.

topic
Type: `ConnectApi.TopicInput`

A `ConnectApi.TopicInput` object containing the name and description of the topic or up to five comma-separated secondary topic IDs to merge with the primary topic.

Return Value

Type: `ConnectApi.Topic`

Usage

Only users with the Edit Topics or Modify All Data permission can update topic names and descriptions. Only users with the Delete Topics or Modify All Data permission can merge topics.

updateTopicsForArticlesInDataCategory(communityId, dataCategoryGroup, dataCategory, articleTopicAssignmentJob)

Assign topics to articles and unassign topics from articles in a data category.

API Version

40.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage updateTopicsForArticlesInDataCategory(String
communityId, String dataCategoryGroup, String dataCategory,
ConnectApi.ArticleTopicAssignmentJobInput articleTopicAssignmentJob)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

dataCategoryGroup
Type: String

The data category group used by articles.

dataCategory
Type: String

The data category used by articles.

articleTopicAssignmentJob
Type: `ConnectApi.ArticleTopicAssignmentJobInput`

A `ConnectApi.ArticleTopicAssignmentJobInput` object that indicates the operation to take on which topics.

Return Value

Type: `ConnectApi.TopicPage`

Topics Test Methods

The following are the test methods for `Topics`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestGetGroupsRecentlyTalkingAboutTopic(communityId, topicId, result)`

Register a `ConnectApi.ChatterGroupSummaryPage` object to be returned when the matching `ConnectApi.getGroupsRecentlyTalkingAboutTopic` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetGroupsRecentlyTalkingAboutTopic(String communityId, String
topicId, ConnectApi.ChatterGroupSummaryPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

ID for a topic.

result
Type: `ConnectApi.ChatterGroupSummaryPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getGroupsRecentlyTalkingAboutTopic(communityId, topicId)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRecentlyTalkingAboutTopicsForGroup(communityId, groupId, result)`

Register a `ConnectApi.TopicPage` object to be returned when the matching `ConnectApi.getRecentlyTalkingAboutTopicsForGroup` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetRecentlyTalkingAboutTopicsForGroup(String communityId,
String groupId, ConnectApi.TopicPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

result
Type: `ConnectApi.TopicPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecentlyTalkingAboutTopicsForGroup(communityId, groupId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetRecentlyTalkingAboutTopicsForUser(communityId, userId, result)

Register a `ConnectApi.TopicPage` object to be returned when the matching `ConnectApi.getRecentlyTalkingAboutTopicsForUser` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetRecentlyTalkingAboutTopicsForUser(String communityId,
String userId, ConnectApi.TopicPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

result
Type: `ConnectApi.TopicPage`

Specify the test topics page.

Return Value

Type: Void

SEE ALSO:

getRecentlyTalkingAboutTopicsForUser(communityId, userId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetRelatedTopics(communityId, topicId, result)

Register a `ConnectApi.TopicPage` object to be returned when the matching `ConnectApi.getRelatedTopics` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetRelatedTopics(String communityId, String topicId,
ConnectApi.TopicPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

ID for a topic.

result
Type: `ConnectApi.TopicPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRelatedTopics(communityId, topicId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetTopicSuggestions(communityId, recordId, maxResults, result)

Register a `ConnectApi.TopicSuggestionPage` object to be returned when the matching `ConnectApi.getTopicSuggestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTopicSuggestions(String communityId, String recordId,
Integer maxResults, ConnectApi.TopicSuggestionPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID for a record or feed item.

maxResults
Type: Integer

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

result
Type: `ConnectApi.TopicSuggestionPage`

Specify the test topic suggestions page.

Return Value

Type: Void

SEE ALSO:

getTopicSuggestions(communityId, recordId, maxResults)

Apex Developer Guide: Testing ConnectApi Code

setTestGetTopicSuggestions(communityId, recordId, result)

Register a `ConnectApi.TopicSuggestionPage` object to be returned when the matching `ConnectApi.getTopicSuggestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTopicSuggestions(String communityId, String recordId,
ConnectApi.TopicSuggestionPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID for a record or feed item.

result
Type: `ConnectApi.TopicSuggestionPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getTopicSuggestions(communityId, recordId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetTopicSuggestionsForText(communityId, text, maxResults, result)

Register a `ConnectApi.TopicSuggestionPage` object to be returned when the matching `ConnectApi.getTopicSuggestionsForText` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTopicSuggestionsForText(String communityId, String text,
Integer maxResults, ConnectApi.TopicSuggestionPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

text
Type: String

String of text.

maxResults
Type: Integer

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

result
Type: `ConnectApi.TopicSuggestionPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getTopicSuggestionsForText(communityId, text, maxResults)

UserProfiles Class

Access user profile data. The user profile data populates the profile page (also called the Chatter profile page). This data includes user information (such as address, manager, and phone number), some user capabilities (permissions), and a set of subtab apps, which are custom tabs on the profile page.

Namespace

ConnectApi

UserProfiles Methods

The following are methods for `UserProfiles`. All methods are static.

IN THIS SECTION:

deleteBannerPhoto(communityId, userId)
Delete a user's banner photo.

deletePhoto(communityId, userId)
Delete a user's photo.

getBannerPhoto(communityId, userId)
Get a user's banner photo.

getPhoto(communityId, userId)
Get a user's photo.

getUserProfile(communityId, userId)
Get the user profile of the context user.

setBannerPhoto(communityId, userId, fileId, versionNumber)
Set an uploaded file as a user's banner photo.

setBannerPhoto(communityId, userId, fileUpload)
Set a file that hasn't been uploaded as a user's banner photo.

setBannerPhotoWithAttributes(communityId, userId, bannerPhoto)
Set and crop an uploaded file as a user's banner photo.

setBannerPhotoWithAttributes(communityId, userId, bannerPhoto, fileUpload)
Set and crop a file that hasn't been uploaded as a user's banner photo.

setPhoto(communityId, userId, fileId, versionNumber)
Set an uploaded file as a user's photo.

setPhoto(communityId, userId, fileUpload)
Set a file that hasn't been uploaded as a user's photo.

setPhotoWithAttributes(communityId, userId, photo)
Set and crop an uploaded file as a user's photo.

setPhotoWithAttributes(communityId, userId, photo, fileUpload)
Set and crop a file that hasn't been uploaded as a user's photo.

`deleteBannerPhoto(communityId, userId)`

Delete a user's banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void deleteBannerPhoto(String communityId, String userId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID of the user.

Return Value

Type: Void

`deletePhoto(communityId, userId)`

Delete a user's photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static Void deletePhoto(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

Return Value

Type: Void

getBannerPhoto(communityId, userId)

Get a user's banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto getBannerPhoto(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: ConnectApi.BannerPhoto

getPhoto(communityId, userId)

Get a user's photo.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo getPhoto(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: ConnectApi.Photo

getUserProfile(communityId, userId)

Get the user profile of the context user.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserProfile getUserProfile(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.UserProfile`

setBannerPhoto(communityId, userId, fileId, versionNumber)

Set an uploaded file as a user's banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String userId,
String fileId, Integer versionNumber)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

fileId
Type: String

ID of the uploaded file to use as the user banner. The key prefix must be 069, and the image must be smaller than 8 MB.

versionNumber
Type: Integer

Version number of the file. Specify an existing version number or, to get the latest version, specify `null`.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

Photos are processed asynchronously and might not be visible right away.

`setBannerPhoto(communityId, userId, fileUpload)`

Set a file that hasn't been uploaded as a user's banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String userId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID of the user.

`fileUpload`
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

Photos are processed asynchronously and might not be visible right away.

setBannerPhotoWithAttributes(communityId, userId, bannerPhoto)

Set and crop an uploaded file as a user's banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,
String userId, ConnectApi.BannerPhotoInput bannerPhoto)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

bannerPhoto
Type: `ConnectApi.BannerPhotoInput`

A `ConnectApi.BannerPhotoInput` object that specifies the ID and version of the file, and how to crop the file.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

Photos are processed asynchronously and might not be visible right away.

setBannerPhotoWithAttributes(communityId, userId, bannerPhoto, fileUpload)

Set and crop a file that hasn't been uploaded as a user's banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,
String userId, ConnectApi.BannerPhotoInput bannerPhoto, ConnectApi.BinaryInput
fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

bannerPhoto
Type: `ConnectApi.BannerPhotoInput`

A `ConnectApi.BannerPhotoInput` object specifying the cropping parameters.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

Photos are processed asynchronously and might not be visible right away.

setPhoto(communityId, userId, fileId, versionNumber)

Set an uploaded file as a user's photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String userId, String
fileId, Integer versionNumber)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

fileId
Type: String

ID of an uploaded file. The file must be an image, and be smaller than 2 GB.

versionNumber
Type: Integer

Version number of the existing file. Specify either an existing version number, or `null` to get the latest version.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

setPhoto(communityId, userId, fileUpload)

Set a file that hasn't been uploaded as a user's photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String userId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

`fileUpload`
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

`setPhotoWithAttributes(communityId, userId, photo)`

Set and crop an uploaded file as a user's photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID for the context user or the keyword `me`.

`photo`
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

`setPhotoWithAttributes(communityId, userId, photo, fileUpload)`

Set and crop a file that hasn't been uploaded as a user's photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the cropping parameters.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

Zones Class

Access information about Chatter Answers zones in your organization. Zones organize questions into logical groups, with each zone having its own focus and unique questions.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

Namespace

ConnectApi

Zones Methods

The following are methods for `Zones`. All methods are static.

IN THIS SECTION:

getZone(communityId, zoneId)
Get a zone.

getZones(communityId)
Get a list of zones.

getZones(communityId, pageParam, pageSize)
Get a page of zones.

searchInZone(communityId, zoneId, q, filter)
Search articles or questions in a zone.

searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)
Search a page of articles or questions in a zone.

searchInZone(communityId, zoneId, q, filter, language)
Search articles or questions in a zone, and specify the language of the results.

`getZone(communityId, zoneId)`

Get a zone.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Zone getZone(String communityId, String zoneId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

zoneId
Type: String

The ID of a zone.

Return Value

Type: `ConnectApi.Zone`

getZones(communityId)

Get a list of zones.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ZonePage getZones(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.ZonePage`

getZones(communityId, pageParam, pageSize)

Get a page of zones.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Zone getZones(String communityId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ZonePage`

searchInZone(communityId, zoneId, q, filter)

Search articles or questions in a zone.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version

29.0

Available to Guest Users

37.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ZoneSearchPage searchInZone(String communityId, String zoneId,
String q, ConnectApi.ZoneSearchResultType filter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

zoneId
Type: String

ID of a zone.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.ZoneSearchResultType`

A `ZoneSearchResultType` enum value. One of the following:

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

Return Value

Type: `ConnectApi.ZoneSearchPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchInZone(communityId, zoneId, q, filter, result)

Apex Developer Guide: Testing ConnectApi Code

`searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)`

Search a page of articles or questions in a zone.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version

29.0

Available to Guest Users

37.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ZoneSearchPage searchInZone(String communityId, String zoneId,
String q, ConnectApi.ZoneSearchResultType filter, String pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

zoneId
Type: String

ID of a zone.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.ZoneSearchResultType`

A `ZoneSearchResultType` enum value. One of the following:

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ZoneSearchPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchInZone(communityId, zoneId, q, filter, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

`searchInZone(communityId, zoneId, q, filter, language)`

Search articles or questions in a zone, and specify the language of the results.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version

36.0

Available to Guest Users

37.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ZoneSearchPage searchInZone(String communityId, String zoneId,
String q, ConnectApi.ZoneSearchResultType filter, String language)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`zoneId`
Type: String

ID of a zone.

`q`
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`filter`
Type: `ConnectApi.ZoneSearchResultType`

- `Article`—Search results contain only articles.

- `Question`—Search results contain only questions.

`language`
Type: String

The language of the articles or questions. The value must be a Salesforce supported locale code.

Return Value

Type: `ConnectApi.ZoneSearchPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchInZone(communityId, zoneId, q, filter, language, result)

Zones Test Methods

The following are the test methods for `Zones`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestSearchInZone(communityId, zoneId, q, filter, result)`

Register a `ConnectApi.ZoneSearchPage` object to be returned when `searchInZone(communityId, zoneId, q, filter)` is called in a test context. Use the method with the same parameters or you receive an exception.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version

29.0

Signature

```
public static Void setTestSearchInZone(String communityId, String zoneId, String q,
ConnectApi.ZoneSearchResultType filter, ConnectApi.ZoneSearchPage result)
```

Parameters

`communityId`
Type: String

Use either the ID for an Experience Cloud site, `internal`, or `null`.

`zoneId`
Type: String

The ID of a zone.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.ZoneSearchResultType`

A `ZoneSearchResultType` enum value. One of the following:

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

result
Type: `ConnectApi.ZoneSearchPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchInZone(communityId, zoneId, q, filter)

Apex Developer Guide: Testing ConnectApi Code

`setTestSearchInZone(communityId, zoneId, q, filter, pageParam, pageSize, result)`

Register a `ConnectApi.ZoneSearchPage` object to be returned when `searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)` is called in a test context. Use the method with the same parameters or you receive an exception.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version

29.0

Signature

```
public static Void setTestSearchInZone(String communityId, String zoneId, String q,
ConnectApi.ZoneSearchResultType filter, String pageParam, Integer pageSize,
ConnectApi.ZoneSearchPage result)
```

Parameters

communityId
Type: String

Use either the ID for an Experience Cloud site, `internal`, or `null`.

zoneId
Type: String

The ID of a zone.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.ZoneSearchResultType`

A `ZoneSearchResultType` enum value. One of the following:

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

pageParam
Type: String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.ZoneSearchPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

`setTestSearchInZone(communityId, zoneId, q, filter, language, result)`

Register a `ConnectApi.ZoneSearchPage` object to be returned when `searchInZone(communityId, zoneId, q, filter, language)` is called in a test context. Use the method with the same parameters or you receive an exception.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version

36.0

Signature

```
public static Void setTestSearchInZone(String communityId, String zoneId, String q,
ConnectApi.ZoneSearchResultType filter, String language, ConnectApi.ZoneSearchPage
result)
```

Parameters

communityId
Type: String

Use either the ID for an Experience Cloud site, `internal`, or `null`.

zoneId
Type: String

The ID of a zone.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.ZoneSearchResultType`

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

language
Type: String

The language of the articles or questions. The value must be a Salesforce supported locale code. In an `<apex:page>`, the default value is the language of the page. Otherwise, the default value is the user's locale.

result
Type: `ConnectApi.ZoneSearchPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchInZone(communityId, zoneId, q, filter, language)

Apex Developer Guide: Testing ConnectApi Code

`ConnectApi` Input Classes

Some `ConnectApi` methods take arguments that are instances of `ConnectApi` input classes.

Input classes are concrete unless marked abstract in this documentation. Concrete input classes have public constructors that have no parameters.

Some methods have parameters that are typed with an abstract class. You must pass in an instance of a concrete child class for these parameters.

Most input class properties can be set. Read-only properties are noted in this documentation.

ConnectApi.ActionLinkDefinitionInput

The definition of an action link. An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can drive productivity and accelerate innovation.

Usage

You can use context variables in the `actionUrl`, `headers`, and `requestBody` properties. Use context variables to pass information about the user who executed the action link to your server-side code. Salesforce substitutes the value when the action link is executed.

The available context variables are:

Context Variable	Description
`{!actionLinkId}`	The ID of the action link the user executed.
`{!actionLinkGroupId}`	The ID of the action link group containing the action link the user executed.
`{!communityId}`	The ID of the site in which the user executed the action link. The value for your internal org is the empty key `"000000000000000000"`.
`{!communityUrl}`	The URL of the site in which the user executed the action link. The value for your internal org is empty string `""`.
`{!orgId}`	The ID of the org in which the user executed the action link.
`{!userId}`	The ID of the user that executed the action link.

Property	Type	Description	Required or Optional	Available Version
`actionType`	`ConnectApi.ActionLinkType`	Defines the type of action link. Values are: • `Api`—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server. • `ApiAsync`—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to `/connect/action-links/`***`actionLinkId`*** to set the status to	Required Can be defined in an action link template.	33.0

Property	Type	Description	Required or Optional	Available Version
		`SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete. • `Download`—The action link downloads a file from the action URL. • `Ui`—The action link takes the user to a web page at the action URL. Use `Ui` if you need to load a page before the user performs an action, for example, to have the user provide input or view something before the action happens. Note: Invoking `ApiAsync` action links from an app requires a call to set the status. However, there isn't currently a way to set the status of an action link using Apex. To set the status, use Connect REST API. See the Action Link resource in the Connect REST API Developer Guidefor more information.		
`actionUrl`	String	The action link URL. For example, a `Ui` action link URL is a Web page. A `Download` action link URL is a link to the file to download. `Ui` and `Download` action link URLs are provided to clients. An `Api` or `ApiAsync` action link URL is a REST resource. `Api` and `ApiAsync` action link URLs aren't provided to clients. Links to Salesforce can be relative. All other links must be absolute and start with `https://`. Tip: To avoid issues due to upgrades or changing functionality in your API, we recommend using a versioned API for `actionUrl`, for example, `https://www.example.com/api/v1/exampleResource`. If your API isn't versioned, you can use the `expirationDate` property of the `ConnectApi.ActionLinkGroupDefinitionInput` class to	Required Can be defined in an action link template.	33.0

Property	Type	Description	Required or Optional	Available Version
		avoid issues due to upgrades or changing functionality in your API.		
`excludedUserId`	String	ID of a single user to exclude from performing the action. If you specify an `excludedUserId`, you can't specify a `userId`.	Optional Can be defined in an action link template using the `User Visibility` and `Custom User Alias` fields.	33.0
`groupDefault`	Boolean	`true` if this action is the default action link in the action link group; `false` otherwise. There can be only one default action link per action link group. The default action link gets distinct styling in the Salesforce UI.	Optional Can be defined in an action link template.	33.0
`headers`	List<`ConnectApi.RequestHeaderInput`>	The request headers for the `Api` and `ApiAsync` action link types. See Action Links Overview, Authentication, and Security.	Optional Can be defined in an action link template.	33.0
`labelKey`	String	Key for the set of labels to show in the user interface. A set includes labels for these states: NewStatus, PendingStatus, SuccessStatus, FailedStatus. For example, if you use the `Approve` key, you get these labels: Approve, Pending, Approved, Failed. For a complete list of keys and labels, see Action Links Labels. If none of the predefined labels work for your action link, use a custom label. To use a custom label, create an action link template. See Create Action Link Templates.	Required Can be defined in an action link template.	33.0
`method`	`ConnectApi.HttpRequestMethod`	One of these HTTP methods: • `HttpDelete`—Returns HTTP 204 on success. Response body or output class is empty. • `HttpGet`—Returns HTTP 200 on success. • `HttpHead`—Returns HTTP 200 on success. Response body or output class is empty.	Required Can be defined in an action link template.	33.0

Property	Type	Description	Required or Optional	Available Version
		• `HttpPatch`—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty. • `HttpPost`—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success. • `HttpPut`—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty.		
`requestBody`	String	The request body for `Api` action links. Note: Escape quotation mark characters in the `requestBody` value.	Optional Can be defined in an action link template.	33.0
`requires Confirmation`	Boolean	`true` to require the user to confirm the action; `false` otherwise.	Required Can be defined in an action link template.	33.0
`userId`	String	The ID of the user who can execute the action. If not specified or `null`, any user can execute the action. If you specify a `userId`, you can't specify an `excludedUserId`.	Optional Can be defined in an action link template using the `User Visibility` and `Custom User Alias` fields.	33.0

SEE ALSO:

ConnectApi.ActionLinkGroupDefinitionInput

ConnectApi.ActionLinkGroupDefinitionInput

The definition of an action link group. All action links must belong to a group. Action links in a group are mutually exclusive and share some properties. Define standalone actions in their own action group.

Action link definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

Property	Type	Description	Required or Optional	Available Version
`actionLinks`	`List<ConnectApi.ActionLinkDefinitionInput>`	The action links that make up this group. Within an action link group, action links are displayed in the order listed in the `actionLinks` property of the `ConnectApi.ActionLinkGroupDefinitionInput` class. Within a feed item, action link groups are displayed in the order specified in the `actionLinkGroupIds` property of the `ConnectApi.AssociatedActionsCapabilityInput` class. You can create up to three action links in a `Primary` group and up to four in an `Overflow` group.	Required to instantiate this action link group without a template. To instantiate from a template, don't specify a value.	33.0
`category`	`ConnectApi.PlatformActionGroupCategory`	Indicates the priority and relative locations of action links in an associated feed item. Values are: • `Primary`—The action link group is displayed in the body of the feed element. • `Overflow`—The action link group is displayed in the overflow menu of the feed element.	Required to instantiate this action link group without a template. To instantiate from a template, don't specify a value.	33.0
`executionsAllowed`	`ConnectApi.ActionLinkExecutionsAllowed`	Defines the number of times an action link can be executed. Values are: • `Once`—An action link can be executed only one time across all users. • `OncePerUser`—An action link can be executed only one time for each user. • `Unlimited`—An action link can be executed an unlimited number of times by each user. If the action link's `actionType` is `Api` or `ApiAsync`, you can't use this value.	Required to instantiate this action link group without a template. To instantiate from a template, don't specify a value.	33.0
`expirationDate`	`Datetime`	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z, that represents	Required to instantiate this action link group without a template.	33.0

Property	Type	Description	Required or Optional	Available Version
		the date and time this action link group is removed from associated feed items and can no longer be executed. The `expirationDate` must be within one year of the creation date. If the action link group definition includes an OAuth token, it is a good idea to set the expiration date of the action link group to the same value as the expiration date of the OAuth token so that users can't execute the action link and get an OAuth error. To set a date when instantiating from a template, see Set the Action Link Group Expiration Time in Design Action Link Templates.	Optional to instantiate from a template.	
`templateBindings`	[illegible]	A collection of key-value pairs to fill in binding variable values or a custom user alias from an action link template. To instantiate this action link group from an action link template that uses binding variables, you must provide values for all the variables. See Define Binding Variables in Design Action Link Templates.	To instantiate without a template, don't specify a value. Required to instantiate this action link group from a template that uses binding variables.	33.0
`templateId`	`String`	The ID of the action link group template from which to instantiate this action link group.	To instantiate without a template, don't specify a value. Required to instantiate this action link group from a template.	33.0

SEE ALSO:

Define an Action Link and Post with a Feed Element

createActionLinkGroupDefinition(communityId, actionLinkGroup)

ConnectApi.ActionLinkTemplateBindingInput

A key-value pair to fill in a binding variable value from an action link template.

Property	Type	Description	Required or Optional	Available Version
`key`	String	The name of the binding variable key specified in the action link template in Setup. For example, if the binding variable in the template is `{!Binding.firstName}`, the key is `firstName`	Required	33.0
`value`	String	The value of the binding variable key. For example, if the key is `firstName`, this value could be `Joan`.	Required	33.0

SEE ALSO:

ConnectApi.ActionLinkGroupDefinitionInput

ConnectApi.ActivitySharingInput

Defines who a captured email or event is shared with.

Property	Type	Description	Required or Optional	Available Version
`groupsToShareWith`	List<`String`>	List of IDs for the groups that you share the activity with. Valid only if `sharingType` is `MyGroups`.	Optional	39.0
`sharingType`	`ConnectApi.ActivitySharingType`	Type of sharing operation. Values are: • `Everyone`—The activity is shared with everyone. • `MyGroups`—The activity is shared only with a selection of the context user's groups. • `OnlyMe`—The activity is private.	Required	39.0

ConnectApi.AddressRequest

Address input representation for a payment method or card payment method.

Name	Type	Description	Required or Optional	Available Version
`city`	String	Payment method city.	Optional	51.0
`companyName`	String	Payment method company name.	Optional	51.0
`country`	String	Payment method country.	Optional	51.0

Name	Type	Description	Required or Optional	Available Version
`postalCode`	String	Payment method postal code.	Optional	51.0
`state`	String	Payment method state.	Optional	51.0
`street`	String	Payment method street.	Optional	51.0

ConnectApi.AdjustItemInputRepresentation

A price adjustment to an OrderItemSummary. It only supports discounts, not increases.

Property	Type	Description	Required or Optional	Available Version
`adjustmentType`	String	Describes how the amount is calculated. It can have one of these values: • `AmountWithTax`—Value of amount is the adjustment, including tax. • `AmountWithoutTax`—Value of amount is the adjustment, not including tax. Tax is calculated on the value and added. • `Percentage`—Value of amount is a percentage discount. It is divided by 100, and then multiplied by the TotalPrice and TotalTaxAmount of the OrderItemSummary to determine the adjustment amount.	Required	49.0
`amount`	Double	Value used to calculate the adjustment amount, as described by the adjustmentType. It must be a negative value.	Required	49.0
`description`	String	Description of the adjustment.	Optional	49.0
`orderItemSummaryId`	String	ID of the OrderItemSummary.	Required	49.0
`reason`	String	Reason for the adjustment. The value must match one of the picklist values on the Reason field of the OrderItemSummaryChange object.	Required	49.0

ConnectApi.AdjustOrderItemSummaryInputRepresentation

Price adjustments to order item summaries that together make up a price adjustment to an order, with options for adjusting items in the process of being fulfilled.

Property	Type	Description	Required or Optional	Available Version
`adjustItems`	List<`ConnectApi.AdjustItemInputRepresentation`>	List of price adjustments to order item summaries.	Required	49.0
`allocatedItemsChangeOrderType`	String	Process to use for order item summary quantities that are currently being fulfilled, defined as `QuantityAllocated - QuantityFulfilled`. Values are: • `Disallowed`—When distributing the adjustment, ignore any quantities being fulfilled. If an order item summary's entire quantity is being fulfilled, return an error. This is the default value. • `InFulfillment`—When distributing the adjustment, include quantities being fulfilled. Create a separate change order for the adjustments made to those quantities. • `PreFulfillment`—When distributing the adjustment, include quantities being fulfilled. Include the adjustments made to those quantities in the change order for pre-fulfillment quantity adjustments.	Optional	55.0
individualItemTaxAdjustments	Boolean	Specifies whether to create multiple lines for each tax adjustment or one line with all tax adjustments. The default value is false.	Optional	59.0

ConnectApi.AlternativeInput

Alternative representation for an extension on a feed element.

Property	Type	Description	Required or Optional	Available Version
`textRepresentation`	String	Text representation of the extension.	Required	40.0
`thumbnailUrl`	String	Thumbnail URL to the extension.	Optional	40.0
`title`	String	Title of the extension.	Optional	40.0

ConnectApi.AnnouncementInput

An announcement.

Property	Type	Description	Required or Optional	Available
`body`	ConnectApi.MessageBodyInput	Text of the announcement.	Required for creating an announcement if `feedItemId` isn't specified Don't specify for updating an announcement.	31.0
`expirationDate`	Datetime	The Salesforce UI displays an announcement until 11:59 p.m. on this date unless another announcement is posted first. The Salesforce UI ignores the time value in the `expirationDate`. However, you can use the time value to create your own display logic in your own UI.	Required for creating an announcement Optional for updating an announcement	31.0
`feedItemId`	String	ID of an `AdvancedTextPost` feed item that is the body of the announcement.	Required for creating an announcement if `body` isn't specified Don't specify for updating an announcement.	36.0
`isArchived`	Boolean	Specifies whether the announcement is archived.	Optional	36.0
`parentId`	String	ID of the parent entity for the announcement, that is, a group ID when the announcement appears in a group.	Required for creating an announcement if `feedItemId` isn't specified Don't specify for updating an announcement.	36.0

Property	Type	Description	Required or Optional	Available
`sendEmails`	Boolean	Specifies whether the announcement is sent as an email to all group members regardless of their email setting for the group. If Chatter emails aren't enabled for the organization, announcement emails aren't sent. Default value is `false`.	Optional for creating an announcement Don't specify for updating an announcement	36.0

SEE ALSO:

postAnnouncement(communityId, groupId, announcement)

postAnnouncement(communityId, announcement)

ConnectApi.ArticleTopicAssignmentJobInput

An article and topic assignment job.

Property	Type	Description	Required or Optional	Available Version
`operation`	`ConnectApi.ArticleTopicJobType`	Type of operation to perform on articles and topics. Values are: • `AssignTopicsToArticle`—Assign topics to articles in a data category. • `UnassignTopicsFromArticle`—Unassign topics from articles in a data category.	Required	40.0
`topicNames`	`ConnectApi.TopicNamesInput`	List of topic names to assign to or unassign from articles.	Required	40.0

ConnectApi.AssociatedActionsCapabilityInput

A list of action link groups to associate with a feed element. To associate an action link group with a feed element, the call must be made from the Apex namespace that created the action link definition. In addition, the user making the call must have created the definition or have View All Data permission.

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can drive productivity and accelerate innovation.

Property	Type	Description	Required or Optional	Available Version
`actionLinkGroupIds`	List<String>	The action link group IDs to associate with the feed element. Associate one `Primary` and up to 10 total action link groups to a feed item. Action link groups are returned in the order specified in this property. An action link group ID is returned from a call to `ConnectApi.ActionLinks.createActionLinkGroupDefinition(communityId, actionLinkGroup)`.	Required	33.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.AssociateRecordsWithRecipientInput

Records associated with the survey invitation.

Property	Type	Description	Required or Optional	Available Version
`associateRecordIds`	List<String>	ID of the associated records.	Required	50.0
`recipientId`	String	Participant ID with whose invitation the record should be associated.	Required	50.0

SEE ALSO:

ConnectApi.SurveyInvitationEmailInput

ConnectApi.AudienceCriteriaInput

Custom recommendation audience criteria type.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass for:

- ConnectApi.CustomListAudienceCriteriaInput
- ConnectApi.NewUserAudienceCriteriaInput

Property	Type	Description	Required or Optional	Available Version
type	ConnectApi.RecommendationAudienceCriteriaType	Specifies the custom recommendation audience criteria type. One of these values: • CustomList—A custom list of users makes up the audience. • MaxDaysInCommunity—New members make up the audience.	Optional If not specified, defaults to CustomList.	36.0

SEE ALSO:

ConnectApi.RecommendationAudienceInput

ConnectApi.AudienceCriterionInput

Personalization audience criterion.

Property	Type	Description	Required or Optional	Available Version
criterion	List<ConnectApi.AudienceCriterionValueInput>	List of mappings of audience criteria fields and values.	Required when creating an audience Optional when updating an audience	48.0
criterionNumber	Integer	Number associated with the audience criterion in a formula. For example, (1 AND 2) OR 3. If unspecified, criteria are assigned numbers in the order that they're added.	Optional	48.0
criterionOperator	ConnectApi.AudienceCriteriaOperator	Operator used in the personalization audience criterion. Values are: • Contains • Equal • GreaterThan • GreaterThanOrEqual • Includes • LessThan • LessThanOrEqual • NotEqual • NotIncludes • StartsWith	Required when creating an audience Optional when updating an audience	48.0

Property	Type	Description	Required or Optional	Available Version
`criterionType`	`ConnectApi.AudienceCriteriaType`	Type of personalization audience criterion. Values are: • `Audience`—Criterion based on audience. • `Default`—Audience has no criteria. • `Domain`—Criterion based on domain. • `FieldBased`—Criterion based on object fields. • `GeoLocation`—Criterion based on location. • `Permission`—Criterion based on standard or custom permissions. • `Profile`—Criterion based on profile.	Required when creating an audience Optional when updating an audience	48.0

SEE ALSO:

ConnectApi.AudienceInput

ConnectApi.AudienceCriterionValueInput

Audience criterion value.

Property	Type	Description	Required or Optional	Available Version
`audienceId`	String	ID of an audience.	Required if creating or updating an audience with the `Audience` criterion type.	53.0
`city`	String	City of a user.	Optional if creating or updating an audience with the `GeoLocation` criterion type	48.0
`country`	String	Country of a user.	Required if creating or updating an audience with the `GeoLocation` criterion type	48.0
`domainId`	String	Domain ID of a user.	Required if creating or updating an audience with the	48.0

Property	Type	Description	Required or Optional	Available Version
			`Domain` criterion type	
`entityField`	String	Field of an object.	Required if creating or updating an audience with the `FieldBased` criterion type	48.0
`entityType`	String	Type of object.	Required if creating or updating an audience with the `FieldBased` criterion type	48.0
`fieldValue`	String	Value of a field.	Required if creating or updating an audience with the `FieldBased` criterion type	48.0
`isEnabled`	Boolean	Specifies whether the permission is enabled (`true`) or not (`false`) for a user.	Required if creating or updating an audience with the `Permission` criterion type	48.0
`permission`	String	Valid API name of a standard user or custom permission.	Required if creating or updating an audience with the `Permission` criterion type	48.0
`profileId`	String	Profile ID of a user.	Required if creating or updating an audience with the `Profile` criterion type	48.0

Property	Type	Description	Required or Optional	Available Version
`subdivision`	String	Subdivision of a user.	Required if creating or updating an audience with the `GeoLocation` criterion type and using the `city` property	48.0

SEE ALSO:

ConnectApi.AudienceCriterionInput

ConnectApi.AudienceInput

A personalization audience.

Property	Type	Description	Required or Optional	Available Version
`criteria`	List<`ConnectApi.AudienceCriterionInput`>	List of audience criteria to update or add. An audience can have up to 100 criteria.	Required when creating an audience Optional when updating an audience	48.0
`customFormula`	String	Custom formula for the audience criteria. For example, (1 AND 2) OR 3.	Required when creating an audience with the `formulaFilterType` set to `CustomLogicMatches` Optional, otherwise	48.0
`formulaFilterType`	`ConnectApi.FormulaFilterType`	Formula filter type for the personalization audience. Values are: • `AllCriteriaMatch`—All audience criteria are true (AND operation). • `AnyCriterionMatches`—Any audience criterion is true (OR operation). • `CustomLogicMatches`—Audience criteria match the custom formula (for example, (1 AND 2) OR 3).	Required when creating an audience Optional when updating an audience	48.0

Property	Type	Description	Required or Optional	Available Version
`name`	String	Name of the audience.	Required when creating an audience Optional when updating an audience	48.0

ConnectApi.AuditParamsRequest

Audit Parameters input.

This class is abstract.

Superclass of ConnectApi.BaseRequest.

Property	Type	Description	Required or Optional	Available Version
`email`	String	Email of the client that made the request.	Optional	50.0
`ipAddress`	String	IP address of the client that made the request.	Optional	50.0
`macAddress`	String	Mac address of the client that made the request.	Optional	50.0
`phone`	String	Phone number of the client that made the request.	Optional	50.0

ConnectApi.AuthApiPaymentMethodRequest

Payment method input representation for payment authorizations.

Subclass of ConnectApi.BaseApiPaymentMethodRequest.

Property	Type	Description	Required or Optional	Available Version
`cardPaymentMethod`	`ConnectApi.CardPaymentMethodRequest`	Card payment method information.	Required	51.0

ConnectApi.AuthorizationReversalRequest

Authorization reversal input consumed by authorization reversal service.

Subclass of ConnectApi.BaseRequest.

Property	Type	Description	Required or Optional	Available Version
`accountId`	String	Account for the payment authorization reversal. Must match the payment authorization's account.		51.0
`amount`	Double	Amount of adjustment applied to the payment authorization.		51.0
`comments`	String	Users can add comments to provide additional details about a record. Maximum of 1,000 characters.		51.0
`effectiveDate`	Datetime	Date that the adjustment takes effect on the authorization.		51.0

ConnectApi.AuthorizationRequest

Payment Authorization input consumed by Payment Authorization service.

Subclass of ConnectApi.BaseRequest.

Property	Type	Description	Required or Optional	Available Version
`accountId`	String	Salesforce account that contains the payment transaction being authorized.	Required	51.0
`amount`	Double	Authorization amount.	Required	51.0
`comments`	String	Optional comments for the payment authorization.	Optional	51.0
`currencyIsoCode`	String	Three-letter ISO 4217 currency code associated with the payment group record.	Required	51.0
`effectiveDate`	Datetime	Date that the authorization will be applied to the transaction.	Required	51.0
`paymentGatewayId`	String	Payment gateway that processes the authorization.	Required	51.0
`paymentGroup`	`ConnectApi.PaymentGroupRequest`	Payment group for the authorization. The payload must reference either a `paymentGroup` or a `paymentGroupId`, but not both.	Optional	51.0
`paymentMethod`	`ConnectApi.AuthApiPaymentMethodRequest`	Payment method used in the payment gateway for the authorization transaction.	Required	51.0

ConnectApi.BannerPhotoInput

A banner photo.

Property	Type	Description	Required or Optional	Available Version
`cropHeight`	Integer	Height of the crop rectangle in pixels.	Optional	36.0
`cropWidth`	Integer	Width of the crop rectangle in pixels.	Optional	36.0
`cropX`	Integer	X position of the crop rectangle from the left edge of the image in pixels. Top left is position (0,0).	Optional	36.0
`cropY`	Integer	Y position of the crop rectangle from the top edge of the image in pixels. Top left is position (0,0).	Optional	36.0
`fileId`	String	18 character ID of an existing file. The key prefix must be 069 and the file must be an image and be smaller than 2 GB. Note: Images uploaded on the Group page and on the User page don't have file IDs and therefore can't be used.	Required	36.0
`versionNumber`	Integer	Version number of an existing file. If not provided, the latest version is used.	Optional	36.0

ConnectApi.BaseRequest

Base parameters for making a request to the payment gateway.

This class is abstract.

Subclass of ConnectApi.AuditParamsRequest.

Superclass of:

- ConnectApi.AuthorizationRequest
- ConnectApi.AuthorizationReversalRequest
- ConnectApi.CaptureRequest
- ConnectApi.PaymentMethodTokenizationRequest
- ConnectApi.PostAuthRequest
- ConnectApi.RefundRequest
- ConnectApi.SaleRequest

Property	Type	Description	Required or Optional	Available Version
`additionalData`	Map<String, String>	An optional map of additional parameters to be sent to the payment gateway.	Optional	50.0
`idempotencyKey`	String	Idempotency key.	Optional	50.0

ConnectApi.BaseApiPaymentMethodRequest

Payment method API input representation.

This class is abstract.

Superclass of:

- ConnectApi.AuthApiPaymentMethodRequest
- ConnectApi.PostAuthApiPaymentMethodRequest
- ConnectApi.SaleApiPaymentMethodRequest

Property	Type	Description	Required or Optional	Available Version
`address`	`ConnectApi.AddressRequest`	Payment method address.	Required	51.0
`id`	String	Payment method record ID. Used in payment transactions.	Required	51.0
`saveForFuture`	Boolean	Shows whether Salesforce saves the payment method for future use.	Required	51.0

ConnectApi.BasePaymentMethodRequest

Base payment method input representation.

This class is abstract.

Superclass of:

- ConnectApi.AlternativePaymentMethod
- ConnectApi.CardPaymentMethodRequest

No additional properties.

ConnectApi.BatchInput

Construct a set of inputs to be passed into a method at the same time.

Use this constructor when there isn't a binary input:

```
ConnectApi.BatchInput(Object input)
```

Use this constructor to pass one binary input:

```
ConnectApi.BatchInput(Object input, ConnectApi.BinaryInput binary)
```

Use this constructor to pass multiple binary inputs:

```
ConnectApi.BatchInput(Object input, List<ConnectApi.BinaryInput> binaries)
```

The constructors takes these parameters:

Argument	Type	Description	Available Version
`input`	Object	An individual input object to be used in the batch operation. For example, for `postFeedElementBatch()`, this should be `ConnectApi.FeedElementInput`.	32.0
`binary`	`ConnectApi.BinaryInput`	A binary file to associate with the input object.	32.0
`binaries`	List<`ConnectApi.BinaryInput`>	A list of binary files to associate with the input object.	32.0

SEE ALSO:

- Post a Batch of Feed Elements
- Post a Batch of Feed Elements with a New (Binary) File

ConnectApi.BinaryInput

Create a `ConnectApi.BinaryInput` object to attach files to feed items and comments, to add repository files, to create managed content, and to replace managed content variants.

The constructor is:

```
ConnectApi.BinaryInput(blob, contentType, filename)
```

The constructor takes these arguments:

Argument	Type	Description	Available Version
`blob`	Blob	Contents of the file to be used for input	28.0
`contentType`	String	MIME type description of the content, such as `image/jpg`	28.0
`filename`	String	File name with the file extension, such as UserPhoto.jpg	28.0

SEE ALSO:

- Post a Feed Element with a New File (Binary) Attachment
- Post a Comment with a New File
- ConnectApi.BatchInput

ConnectApi.BookmarksCapabilityInput

Create or update a bookmark on a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`isBookmarkedByCurrentUser`	Boolean	Specifies if the feed element should be bookmarked for the user (`true`) or not (`false`).	No	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.BotVersionActivationInput

Activation status of the bot version.

Property	Type	Description	Required or Optional	Available Version
`status`	`ConnectApi.BotVersionActivationStatus`	Activation status of the bot version. Values are: • `Active` • `Inactive` Activation status must be specified in the *`status`* or *`postBody`* parameter.	Optional	50.0

ConnectApi.CanvasCapabilityInput

Create or update a canvas app associated with a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`description`	String	A description of the canvas app. The maximum size is 255 characters.	Optional	32.0
`developerName`	String	The API name (developer name) of the connected app.	Required	32.0
`height`	String	The height of the canvas app in pixels.	Optional	32.0
`namespacePrefix`	String	A unique namespace prefix for the canvas app.	Optional	32.0
`parameters`	String	JSON parameters passed to the canvas app.	Optional	32.0

Property	Type	Description	Required or Optional	Available Version
`thumbnailUrl`	String	A thumbnail URL to a preview image. The maximum thumbnail size is 120 pixels by 120 pixels.	Optional	32.0
`title`	String	A title for the canvas link.	Required	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.CapacityRequestInputRepresentation

Request related to a location's fulfillment order capacity.

Property	Type	Description	Required or Optional	Available Version
`actionRequestId`	String	Unique string that identifies the request. Can be a UUID. Use the action request IDs in response data to identify which requests succeeded or failed.	Required	55.0
`locationId`	String	ID of the location associated with the request.	Required	55.0

ConnectApi.CaptureRequest

Payment capture input consumed by the payment capture service.

Subclass of ConnectApi.BaseRequest.

Property	Type	Description	Required or Optional	Available Version
`accountId`	String	ID of the account linked to the capture request.	Optional	50.0
`amount`	Double	Amount captured from the previous authorization.	Required	50.0
`clientContext`	String	Context for payment APIs. Used for a payment caller to re-establish context.	Optional	50.0
`comments`	String	Comments for the payment capture.	Optional	50.0
`effectiveDate`	Datetime	Date when the payment becomes effective.	Optional	50.0
`paymentGroup`	`ConnectApi.PaymentGroupRequest`	Details about the payment group record associated with the payment request.	Optional	50.0

ConnectApi.AlternativePaymentMethod

A payment method that doesn't have a defined Salesforce entity such as CardPaymentMethod or DigitalWallet. Common examples of alternative payment methods include CashOnDeliver, Klarna, and Direct Debit. AlternativePaymentMethod functions the same as any other type of payment method for processing transactions in the payment gateway.

Subclass of ConnectApi.BasePaymentMethodRequest

Property	Type	Description	Required or Optional	Available Version
`accountId`	String	Salesforce Payments account to which this payment method is linked.	Required	54.0
`comments`	String	Details about a record added by a user. Maximum of 1,000 characters.	Optional	54.0
`email`	String	Email address of the card holder.	Optional	54.0
`gatewayToken`	String	A unique, alphanumeric ID, called a token, that a payment gateway generates when it first processes a payment. The token replaces the actual payment data so that the data is kept secure. This token is stored as encrypted text, and can be used for recurring payments.	Required	54.0
`gatewayToken Details`	String	Detailed information about the gateway token.	Required	54.0
`name`	String	Name that you assign to the payment method object.	Optional	54.0

ConnectApi.CardPaymentMethodRequest

Card payment method input representation.

Subclass of ConnectApi.BasePaymentMethodRequest.

Property	Type	Description	Required or Optional	Available Version
`accountId`	String	Salesforce Payments account to which this payment method is linked.	Required	51.0
`autoPay`	Boolean	Indicates whether a token for recurring payments is being requested (`true`) or not (`false`). The token lets the payment method be used for recurring payments.	Optional	55.0
`cardCategory`	`ConnectApi.CardCategory`	Card processing type. Valid values are: • `CreditCard` • `DebitCard`	Required	51.0

Property	Type	Description	Required or Optional	Available Version
`cardHolderFirstName`	String	First name of the card holder.	Required	51.0
`cardHolderLastName`	String	Last name of the card holder.	Required	51.0
`cardHolderName`	String	Full name of the card holder.	Required	51.0
`cardNumber`	String	Card number.	Required	51.0
`cardType`	String	Card network type. Valid values are: • `AmericanExpress` • `DinersClub` • `JCB` • `MasterCard` • `Maestro` • `Visa`	Required	51.0
`comments`	String	Optional comments for the card payment method.	Optional	51.0
`cvv`	String	Card Verification Value.	Required	51.0
`email`	String	Email address of the card holder.	Required	51.0
`expiryMonth`	Integer	Card expiration month.	Required	51.0
`expiryYear`	Integer	Card expiration year.	Required	51.0
`nickName`	String	Optional nickname for the card.	Optional	51.0
`startMonth`	Integer	Month the card becomes active.	Optional	51.0
`startYear`	Integer	Year the card becomes active.	Optional	51.0

ConnectApi.CartInput

A cart.

Property	Type	Description	Required or Optional	Available Version
`currencyIsoCode`	String	Currency ISO code of the cart.	Optional	57.0
`effectiveAccountId`	String	ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.	Optional	49.0

Property	Type	Description	Required or Optional	Available Version
`isSecondary`	Boolean	Specifies whether the cart is secondary (`true`) or not (`false`). If unspecified, defaults to `false`.	Optional	53.0
`name`	String	Name of the cart. The name can have up to 250 Unicode characters. If unspecified, defaults to the generated name.	Optional	49.0
`orderOwnerId`	String	ID of the owner of the order.	Optional	58.0
`type`	`ConnectApi.CartType`	Type of cart. Vaues are: • `Cart`—Cart created by a customer. • `PayNowReadOnly`—Clone of a Template cart that the customer can check out with using the Pay Now feature. • `Template`—Cart created by an internal user. If unspecified, defaults to `Cart`.	Optional	49.0
`typeAsString`	String	Type of the cart provided as a string.	Optional	59.0

ConnectApi.cartCouponInput

Cart coupon input.

Property	Type	Description	Required or Optional	Available Version
`couponCode`	String	The coupon code.	Required	54.0

ConnectApi.CartInventoryReservationInputRepresentation (Pilot)

Input representation to create or update a reservation.

Note: This feature is not generally available and is being piloted with certain Customers subject to additional terms and conditions. It is not part of your purchased Services. This feature is subject to change, may be discontinued with no notice at any time in Salesforce's sole discretion, and Salesforce may never make this feature generally available. Make your purchase decisions only on the basis of generally available products and features. This feature is made available on an AS IS basis and use of this feature is at your sole risk.

Property	Type	Description	Required or Optional	Available Version
`durationInSeconds`	Integer	Reservation duration in seconds.	Required	58.0

ConnectApi.CartItemInput

An item in a cart.

Property	Type	Description	Required or Optional	Available Version
`cartDeliveryGroupId`	String	ID of the cart delivery group.	Optional	59.0
`productId`	String	ID of the product.	Required when adding an item to a cart Not supported when updating a cart item	49.0
`productSellingModelId`	String	Reserved for future use.	Optional	59.0
`quantity`	String	Quantity of the cart item. Use a value that can be converted to BigDecimal.	Required	49.0
`subscriptionTerm`	Integer on page 3353	Reserved for future use.	Optional	59.0
`type`	`ConnectApi.CartItemType`	Type of item in a cart. Value is `Product`. • `DeliveryCharge` • `Product`	Required when adding an item to a cart Not supported when updating a cart item	49.0

ConnectApi.CartItemPromotionCollectionInputRepresentation

Promotions for a cart item.

Property	Type	Description	Required or Optional	Available Version
`items`	List<`ConnectApi.CartItemPromotionInputRepresentation`>	List of cart items to get the associated promotions.	Required	52.0

ConnectApi.CartItemPromotionInputRepresentation

ID of a cart item associated with a promotion.

Property	Type	Description	Required or Optional	Available Version
`cartItemId`	String	ID of the item associated with the cart.	Optional	52.0

ConnectApi.CartMessagesVisibilityInput

Set the visibility for cart messages.

Property	Type	Description	Required or Optional	Available Version
`visibility`	Boolean	Specifies whether to set cart messages as visible (`true`) or not (`false`).	Required	50.0

ConnectApi.CartToWishlistInput

Copy products from a cart to a wishlist.

Property	Type	Description	Required or Optional	Available Version
`wishlistId`	String	ID of the wishlist to copy cart products to.	Required	50.0

ConnectApi.CdpCalculatedInsightInput

Input representation for a calculated insight.

Property	Type	Description	Required or Optional	Available Version
`apiName`	String	API name of the calculated insight with suffix __cio.	Required for creating a calculated insight Optional for updating a calculated insight	57.0
`createdFromPackage`	Boolean	Specifies whether the calculated insight was created from an installed package (`true`) or not (`false`).	Optional	57.0
`dataSpaceName`	String	Name of the data space.	Optional	57.0
`definitionType`	`ConnectApi.CalculatedInsightDefinitionTypeEnum`	Definition type of the calculated insight. Values are: • `CalculatedMetric` • `ExternalMetric` • `StreamingMetric`	Required for creating a calculated insight Optional for updating a calculated insight	57.0
`description`	String	Calculated insight description.	Optional	57.0

Property	Type	Description	Required or Optional	Available Version
`displayName`	String	Calculated insight display name.	Required for creating a calculated insight Optional for updating a calculated insight	57.0
`draft`	Boolean	Specifies whether to save the calculated insight as draft (`true`) or not (`false`).	Optional	57.0
`expression`	String	Calculated insight ANSI SQL expression.	Required for creating a calculated insight Optional for updating a calculated insight	57.0
`packagedCalculatedInsightApiName`	String	API name of the packaged calculated insight.	Optional	57.0

ConnectApi.CdpIdentityResolutionConfigInput

Input representation for creating an identity resolution ruleset.

Property	Type	Description	Required or Optional	Available Version
`configurationType`	`ConnectApi.CdpIdentityResolutionConfigurationType`	Source object for an identity resolution ruleset. Values are: • `Account` • `Individual`	Required	57.0
`description`	String	Description of the identity resolution ruleset.	Optional	57.0
`doesRunAutomatically`	Boolean	Specifies whether automatic job run scheduling is enabled for the ruleset (`true`) or not (`false`). If unspecified, defaults to `false`.	Optional	57.0
`label`	String	User friendly name of the identity resolution ruleset.	Required	57.0
`matchRules`	List<`ConnectApi.CdpIdentityResolutionMatchRule`>	List of match rules for the identity resolution ruleset.	Optional	57.0
`reconciliationRules`	List<`ConnectApi.CdpIdentityResolutionReconciliationRule`>	List of reconciliation rules for the identity resolution ruleset.	Required	57.0

Property	Type	Description	Required or Optional	Available Version
`rulesetId`	String	Extended ID of the ruleset used to differentiate between rulesets created for comparison. The ruleset ID must be unique and can't be longer than 4 characters.	Optional	57.0

ConnectApi.CdpIdentityResolutionConfigPatchInput

Input representation for updating an identity resolution ruleset.

Property	Type	Description	Required or Optional	Available Version
`description`	String	Description of the identity resolution ruleset.	Optional	57.0
`doesRun Automatically`	Boolean	Specifies whether automatic job run scheduling is enabled for the ruleset (`true`) or not (`false`). If unspecified, defaults to `false`.	Optional	57.0
`label`	String	User friendly name of the identity resolution ruleset.	Required	57.0
`matchRules`	List<`ConnectApi.CdpIdentityResolutionMatchRule`>	List of match rules for the identity resolution ruleset.	Optional	57.0
`reconciliationRules`	List<`ConnectApi.CdpIdentityResolutionReconciliationRule`>	List of reconciliation rules for the identity resolution ruleset.	Required	57.0

ConnectApi.CdpIdentityResolutionMatchCriterion

Input representation for an identity resolution ruleset's match rule criterion.

Property	Type	Description	Required or Optional	Available Version
`caseSensitiveMatch`	Boolean	Specifies whether the criterion match is case sensitive (`true`) or not (`false`). Available only when matching is based on the party identifier.	Optional	58.0
`entityName`	String	API name of the Data Model Object the match rule applies to.	Required	57.0
`fieldName`	String	Name of the field the criterion applies to.	Required	57.0

Property	Type	Description	Required or Optional	Available Version
matchMethodType	ConnectApi.CdpIdentityResolutionMatchMethodType	Match method for a match rule criterion. Values are: • Exact—Exact match. • ExactNormalized—Exact normalized match. • Fuzzy—Fuzzy match with medium precision. • FuzzyHigh—Fuzzy match with high precision. • FuzzyLow—Fuzzy match with low precision.	Required	57.0
partyIdentificationInfo	ConnectApi.CdpIdentityResolutionMatchCriterionPartyIdentificationInfo	Party Identifier information.	Optional	57.0
shouldMatchOnBlank	Boolean	Specifies whether blank fields can be used for matching (true) or not (false).	Required	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionMatchRule

ConnectApi.CdpIdentityResolutionMatchCriterionPartyIdentificationInfo

Input representation for information when party identification is used in an identity resolution ruleset's match rule criterion.

Property	Type	Description	Required or Optional	Available Version
partyName	String	Party identification name.	Required if the match rule criterion uses party identification for matching	57.0
partyType	String	Party identification type.	Optional	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionMatchCriterion

ConnectApi.CdpIdentityResolutionMatchRule

Input representation for an identity resolution ruleset's match rule.

Property	Type	Description	Required or Optional	Available Version
`criteria`	List<`ConnectApi.CdpIdentityResolutionMatchCriterion`>	Object and field the match rule applies to and the match method applied.	Required	57.0
`label`	String	User friendly name for the identity resolution match rule.	Required	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionConfigInput

ConnectApi.CdpIdentityResolutionConfigPatchInput

ConnectApi.CdpIdentityResolutionReconciliationFieldRule

Input representation for an identity resolution ruleset's reconciliation rule for a field.

Property	Type	Description	Required or Optional	Available Version
`fieldName`	String	The field that this reconciliation rule applies to.	Required	57.0
`ruleType`	`ConnectApi.CdpIdentityResolutionReconciliationRuleType`	Default reconciliation rule applied to fields in the object the reconciliation rule applies to. Values are: • `LastUpdated` • `MostFrequent` • `SourceSequence`	Required	57.0
`shouldIgnoreEmptyValue`	Boolean	Specifies whether to ignore an empty value (`true`) or not (`false`).	Required	57.0
`sources`	List<`ConnectApi.CdpIdentityResolutionReconciliationSource`>	If `ruleType` is `SourceSequence`, a prioritized list of data sources.	Required if `ruleType` is `SourceSequence`	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionReconciliationRule

ConnectApi.CdpIdentityResolutionReconciliationRule

Input representation for an identity resolution ruleset's default reconciliation rule for an object.

Property	Type	Description	Required or Optional	Available Version
`entityName`	String	API name of the Data Model Object the reconciliation rule applies to.	Required	57.0
`fields`	List<`ConnectApi.CdpIdentityResolutionReconciliationFieldRule`>	Field-specific reconciliation rules that override this default rule for the specified field.	Optional	57.0
`ruleType`	`ConnectApi.CdpIdentityResolutionReconciliationRuleType`	Default reconciliation rule applied to fields in the object the reconciliation rule applies to. Values are: • `LastUpdated` • `MostFrequent` • `SourceSequence`	Required	57.0
`shouldIgnoreEmptyValue`	Boolean	Specifies whether to ignore an empty value (`true`) or not (`false`).	Required	57.0
`sources`	List<`ConnectApi.CdpIdentityResolutionReconciliationSource`>	If `ruleType` is `SourceSequence`, a list of data sources in priority order.	Required if `ruleType` is `SourceSequence`	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionConfigInput

ConnectApi.CdpIdentityResolutionConfigPatchInput

ConnectApi.CdpIdentityResolutionReconciliationSource

Input representation for an identity resolution default reconciliation rule or field-specific rule using the `SourceSequence` match method.

Property	Type	Description	Required or Optional	Available Version
`name`	String	If the `ruleType` for a reconciliation rule is `SourceSequence`, API name of a source Data Lake Object.	Required if `ruleType` is `SourceSequence`	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionReconciliationRule

ConnectApi.CdpIdentityResolutionReconciliationFieldRule

ConnectApi.CdpIdentityResolutionReconciliationFieldRule

ConnectApi.CdpIdentityResolutionRunNowInput

Input representation for running an identity resolution ruleset job on demand.

Property	Type	Description	Required or Optional	Available Version
`callingApp`	String	Calling application.	Optional	57.0
`callingAppInfo`	String	Calling application information.	Optional	57.0

ConnectApi.CdpQueryInput

Data query input.

Property	Type	Description	Required or Optional	Available Version
`sql`	String	ANSI-standard SQL query.	Required	52.0

ConnectApi.CdpSegmentDbtInput

Segment dbt input.

Property	Type	Description	Required or Optional	Available Version
`models`	List<`ConnectApi.CdpSegmentDbtModelInput`>	List of models. The segment data build tool currently supports a single SQL model.	Required	55.0

SEE ALSO:

ConnectApi.CdpSegmentInput

ConnectApi.CdpSegmentDbtModelInput

Segment dbt model input.

Property	Type	Description	Required or Optional	Available Version
`name`	String	Dbt model name.	Required	55.0

Property	Type	Description	Required or Optional	Available Version
`sql`	String	Dbt SQL. Dbt SQL date strings must be in ISO 8601 format , for example, 2011-02-25T18:24:31.000Z. For details about supported validations, see Supported Validations for Segment Data Build Tool Model SQL.	Required	55.0

SEE ALSO:

ConnectApi.CdpSegmentDbtInput

ConnectApi.CdpSegmentInput

Segment input.

Property	Type	Description	Required or Optional	Available Version
`additionalMetadata`	Map<String, String>	Map of additional metadata.	Optional for creating a segment Not supported for updating a segment	55.0
`dataSpace`	String	Segment dataspace. In API version 59.0 and later, this property is not available. Use the `dataspace` request parameter instead.	Optional	57.0–58.0
`description`	String	Segment description.	Optional	55.0
`developerName`	String	Segment developer name.	Required for creating a segment Not supported for updating a segment	55.0
`displayName`	String	Segment display name.	Optional	57.0
`includeDbt`	`ConnectApi.CdpSegmentDbtInput`	Segment data build tool.	Required	55.0
`publishSchedule`	`ConnectApi.PublishSchedule`	Publish refresh schedule. Values are: • `One`—Refreshes every hour. Used to rapidly publish UI and DBT-based segments.	Optional	55.0

Property	Type	Description	Required or Optional	Available Version
		• `Four`—Refreshes every four hours. Used to rapidly publish UI and DBT-based segments. • `Twelve`—Refreshes every twelve hours. • `TwentyFour`—Refreshes every twenty-four hours.		
`publishScheduleEndDate`	String	Date indicating the end of the publish schedule.	Optional if `publishSchedule` isn't specified	55.0
`publishScheduleStartDateTime`	String	Datetime indicating the start of the publish schedule.	Optional if `publishSchedule` isn't specified	55.0
`segmentOnApiName`	String	API name of the SegmentOn entity.	Optional	57.0
`segmentType`	`ConnectApi.SegmentType`	Type of segment. Value is: • `Dbt`—Data build tool After a segment is created, the segment type can't be changed.	Required for creating a segment Not supported for updating a segment	55.0

ConnectApi.ChangeInputRepresentation

A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Property	Type	Description	Required or Optional	Available Version
`changeItems`	List<`ConnectApi.ChangeItemInputRepresentation`>	List of changes to OrderItemSummaries.	Required	48.0

SEE ALSO:

previewCancel(orderSummaryId, changeInput)

previewReturn(orderSummaryId, changeInput)

submitCancel(orderSummaryId, changeInput)

submitReturn(orderSummaryId, changeInput)

ConnectApi.ChangeItemInputRepresentation

Change to an order item summary, such as a return or cancel. You specify whether to prorate the associated shipping charge based on the price change. The order item summary can't be a shipping charge.

Property	Type	Description	Required or Optional	Available Version
changeItemFees	List<ChangeItemFee>	List of input data for fees associated with the order item being returned or canceled.	Optional	57.0
orderItemSummaryId	String	ID of the order item summary.	Required	48.0
quantity	Double	Quantity to change. Use a positive value. For example, a value of 2 means "cancel or return 2 units."	Required	48.0
reason	String	Reason for the change. The value must match one of the picklist values on the Reason field of the OrderItemSummaryChange object.	Required	48.0
reasonForChangeText	String	Reason text used for the return insights. The value has a max of 255 characters.	Optional	59.0
shippingReductionFlag	Boolean	Specifies whether to prorate the shipping charge.	Required	48.0

SEE ALSO:

ConnectApi.ChangeInputRepresentation
previewCancel(orderSummaryId, changeInput)
previewReturn(orderSummaryId, changeInput)
submitCancel(orderSummaryId, changeInput)
submitReturn(orderSummaryId, changeInput)

ConnectApi.ChangeItemFeeInputRepresentation

Input representation for Change Item Fee Input

Property	Type	Description	Required or Optional	Available Version
amount	Double	Positive value used to calculate the fee amount, as described by the amountType.	Required	57.0
amountType	String	Describes how the fee amount is calculated. Valid values are: • AmountWithTax—Value of amount is the fee amount, including tax. • AmountWithoutTax—Value of amount is the fee amount, not	Required	57.0

Property	Type	Description	Required or Optional	Available Version
		including tax. Tax is calculated on the value and added. • `Percentage`—Value of `amount` is a percentage. To determine the fee amount, `amount` is divided by 100, and then multiplied by the TotalPrice and TotalTaxAmount of the associated OrderItemSummary, prorated for the quantity being returned. • `PercentageGross`—Value of `amount` is a percentage. To determine the fee amount, `amount` is divided by 100, and then multiplied by the TotalLineAmountWithTax of the associated OrderItemSummary, prorated for the quantity being returned.		
`description`	String	Description of the fee.	Optional	57.0
`priceBookEntryId`	String	ID of the price book entry associated with the fee product.	Required unless price books are optional in the org	57.0
`product2Id`	String	ID of the product representing the fee.	Required	57.0
`reason`	String	Reason for the fee. The value must match an entry in the OrderProductSummaryChange object's Reason picklist.	Required	57.0

SEE ALSO:

ConnectApi.ChangeInputRepresentation
ConnectApi.ChangeItemInputRepresentation
previewCancel(orderSummaryId, changeInput)
previewReturn(orderSummaryId, changeInput)
submitCancel(orderSummaryId, changeInput)
submitReturn(orderSummaryId, changeInput)

ConnectApi.ChatterGroupInput

Chatter group input.

Property	Type	Description	Available
`announcement`	String	The 18-character ID of an announcement. An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.	31.0
`canHave ChatterGuests`	Boolean	`true` if this group allows Chatter customers, `false` otherwise. After this property is set to `true`, it cannot be set to `false`.	29.0
`description`	String	The "Description" section of the group.	29.0
`information`	`ConnectApi. GroupInformation Input`	The "Information" section of a group. If the group is private, this section is visible only to members.	28.0
`isArchived`	Boolean	`true` if the group is archived, `false` otherwise. Defaults to `false`.	29.0
`isAuto ArchiveDisabled`	Boolean	`true` if automatic archiving is turned off for the group, `false` otherwise. Defaults to `false`.	29.0
`name`	String	The name of the group.	29.0
`owner`	String	The ID of the group owner. This property is available for PATCH requests only.	29.0
`visibility`	`ConnectApi. GroupVisibilityType`	Group visibility type. • `PrivateAccess`—Only members of the group can see posts to this group. • `PublicAccess`—All users within the Experience Cloud site can see posts to this group. • `Unlisted`—Reserved for future use.	29.0

SEE ALSO:

createGroup(communityId, groupInput)

updateGroup(communityId, groupId, groupInput)

ConnectApi.ChatterStreamInput

A Chatter feed stream.

Property	Type	Description	Required or Optional	Available Version
`description`	String	Description of the stream, up to 1,000 characters.	Optional	39.0

Property	Type	Description	Required or Optional	Available Version
`name`	String	Name of the stream, up to 120 characters.	Required when creating a stream Optional when updating a stream	39.0
`subscriptionsToAdd`	List<ConnectApi.StreamSubscriptionInput>	List of up to 25 entities whose feeds are included in the stream. Adding an entity that is already added results in no operation. Including the same entity in `subscriptionsToAdd` and `subscriptionsToRemove` results in no operation.	Optional	39.0
`subscriptionsToRemove`	List<ConnectApi.StreamSubscriptionInput>	List of entities whose feeds are removed from the stream. Removing an entity that is already removed results in no operation. Including the same entity in `subscriptionsToAdd` and `subscriptionsToRemove` results in no operation.	Optional when updating a stream Not supported when creating a stream	39.0

ConnectApi.CommentCapabilitiesInput

A container for all capabilities that can be included with a comment.

Property	Type	Description	Required or Optional	Available Version
`content`	ConnectApi.ContentCapabilityInput	Content to attach to the comment.	Optional	32.0
`feedEntityShare`	ConnectApi.FeedEntityShareCapabilityInput	Feed entity to share to the comment.	Optional	42.0
`record`	ConnectApi.RecordCapabilityInput	Existing knowledge article to attach to the comment.	Optional	42.0

SEE ALSO:

ConnectApi.CommentInput

ConnectApi.CommentInput

Comment input used to add rich comments, for example, comments that include mentions or file attachments.

Property	Type	Description	Required or Optional	Available Version
`attachment`	`ConnectApi.FeedItemAttachmentInput`	Specifies an attachment for the comment. Valid values are: • `ContentAttachmentInput` • `NewFileAttachmentInput` `LinkAttachmentInput` is not permitted for comments. **Important:** As of version 32.0, use the `capabilities` property.	Optional	28.0–31.0
`body`	`ConnectApi.MessageBodyInput`	Description of message body. The body can contain up to 10,000 characters and 25 mentions. Because the character limit can change, clients should make a `describeSObjects()` call on the FeedItem or FeedComment object and look at the length of the `Body` or `CommentBody` field to determine the maximum number of allowed characters. To edit this property in a comment, use `updateComment(communityId, commentId, comment)`. Editing comments is supported in version 34.0 and later. Rich text and inline images are supported in comment bodies in version 35.0 and later. Entity links are supported in version 43.0 and later.	Required	28.0
`capabilities`	`ConnectApi.CommentCapabilityInput`	Specifies any capabilities for the comment, such as a file attachment.	Optional	32.0
`threadParentId`	String	ID of the parent comment for a threaded comment.	Optional	44.0

SEE ALSO:

- Post a Comment with a Mention
- Post a Comment with a New File
- Post a Comment with an Existing File
- Post a Rich-Text Comment with Inline Image
- Post a Rich-Text Feed Comment with a Code Block
- Edit a Comment
- postCommentToFeedElement(communityId, feedElementId, comment, feedElementFileUpload)

ConnectApi.CommerceAddressInput

Commerce address input.

Property	Type	Description	Required or Optional	Available Version
`addressType`	String	Type of address, for example, `Shipping` or `Billing`.	Optional	54.0
`city`	String	The address city.	Optional	54.0
`commerceAddressFieldInputList`	List<`ConnectApi.CommerceAddressFieldInput`>	A list of custom address fields, if any.	Optional	54.0
`companyName`	String	The address company name.	Optional	57.0
`country`	String	The address country.	Optional	54.0
`countryCode`	String	Two-character country code.	Optional	54.0–58.0
`firstName`	String	The address first name.	Optional	57.0
`isDefault`	Boolean	Indicates whether a contact's address is the preferred method of communication (`true`) or not (`false`). The default value is `false`.	Optional	54.0
`lastName`	String	The address last name.	Optional	57.0
`middleName`	String	The address middle name.	Optional	57.0
`name`	String	Name of the contact.	Required	54.0
`phoneNumber`	String	The address phone number.	Optional	57.0
`postalCode`	String	Zip code or postal code for the address.	Optional	54.0
`region`	String	The address state.	Optional	54.0
`regionCode`	String	The address state code.	Optional	54.0–58.0
`street`	String	The address street.	Optional	54.0

ConnectApi.CommerceAddressFieldInput

Commerce address field input. This is used to reference custom fields for the address.

Property	Type	Description	Required or Optional	Available Version
`dataName`	String	The name of the custom address field.	Required	54.0
`text`	String	The value of the custom address field.	Optional	54.0

ConnectApi.ConfirmHeldFOCapacityInputRepresentation

Request to confirm held fulfillment order capacity at one or more locations. Can correspond to one action call.

Property	Type	Description	Required or Optional	Available Version
`confirmHeldFOCapacityRequests`	List<ConnectApi.ConfirmHeldFOCapacityRequestInputRepresentation>	List of requests to confirm held fulfillment order capacity at one or more locations.	Required	55.0

ConnectApi.ConfirmHeldFOCapacityRequestInputRepresentation

Request to confirm held fulfillment order capacity at one or more locations.

Property	Type	Description	Required or Optional	Available Version
`allOrNothing`	Boolean	Controls whether a single failed request cancels all other requests in the list (*`true`*) or whether some requests can succeed if others fail (*`false`*). The default value is *`false`*.	Optional	55.0
`capacityRequests`	List<ConnectApi.CapacityRequestInputRepresentation>	List of requests to confirm held fulfillment order capacity. Each request is for one fulfillment order assigned to one location.	Required	55.0

ConnectApi.ContentCapabilityInput

Attach or update a file on a comment. Use this class to attach a new file or update a file that has already been uploaded to Salesforce.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

To attach or remove files from a feed post (instead of a comment) in version 36.0 and later, use ConnectApi.FilesCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`contentDocumentId`	String	ID of the existing content.	Required for existing content	32.0
`description`	String	Description of the file to be uploaded.	Optional	32.0
`sharingOption`	ConnectApi.FileSharingOption	Sharing option of the file. Values are: • `Allowed`—Resharing of the file is allowed. • `Restricted`—Resharing of the file is restricted.	Optional	35.0

Property	Type	Description	Required or Optional	Available Version
`title`	String	Title of the file. This value is used as the file name for new content. For example, if the title is My Title, and the file is a .txt file, the file name is My Title.txt.	Required for new content	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.ContentHubFieldValueInput

Fields of the item type.

Property	Type	Description	Required or Optional	Available Version
`name`	String	Name of the item field. When updating the metadata of a repository file, only the name field can be updated.	Required	39.0
`value`	String	Value of the item field.	Required	39.0

SEE ALSO:

ConnectApi.ContentHubItemInput

ConnectApi.ContentHubItemInput

Item type ID and fields of the item type.

Property	Type	Description	Required or Optional	Available Version
`fields`	List<`ConnectApi.ContentHubFieldValueInput`>	List of fields for the item.	Required to create a SharePoint file in a repository because the file name is required; otherwise optional	39.0
`itemTypeId`	String	ID of the item type.	Required to create a file in a repository	39.0

ConnectApi.ContractInputRepresentation

Input to create and update contract.

Property	Type	Description	Required or Optional	Available Version
isAutoDocgenRequired	Boolean	Specifies whether automatic document generation is required or not.	Required	56.0
recordTypeName	String	Contract record type name.	Optional	56.0
sourceObjectId	String	Source record ID.	Required	56.0
templateName	String	Document template name for document generation.	Optional	56.0

ConnectApi.CouponCodeRedemptionInput

Input representation for coupon code redemption.

Property	Type	Description	Required or Optional	Available Version
couponCodes	List<String>	Input representation for all coupon codes	Required	58.0
effectiveAccountId	String	ID of the account	Required	58.0
transactionId	String	ID of the transaction, which must be a valid cart ID	Required	58.0

ConnectApi.CouponCodeRedemptionInput

Input representation for coupon code redemption.

Property	Type	Description	Required or Optional	Available Version
couponCodes	List<String>	Input representation for all coupon codes	Required	58.0
effectiveAccountId	String	ID of the account	Required	58.0
transactionId	String	ID of the transaction, which must be a valid cart ID	Required	58.0

ConnectApi.CreateCreditMemoInputRepresentation

A list of change orders used to create a credit memo.

Property	Type	Description	Required or Optional	Available Version
changeOrderIds	List<String>	List of IDs of the change orders.	Required	48.0

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ConnectApi.CreateInvoiceFromChangeOrdersInputRepresentation

OrderSummary and associated change orders to create Invoices for.

Property	Type	Description	Required or Optional	Available Version
changeOrderIds	List<String>	List of IDs of change orders to create Invoices for.	Required	56.0
orderSummaryId	String	ID of the associated Order Summary.	Required	56.0

SEE ALSO:

createMultipleInvoices(invoicesInput)

ConnectApi.CreateMultipleInvoicesFromChangeOrdersInputRepresentation

ConnectApi.CreateMultipleInvoicesFromChangeOrdersInputRepresentation

Data about the change orders to create Invoices for.

Property	Type	Description	Required or Optional	Available Version
invoicesFromChangeOrders	List<ConnectApi.CreateInvoiceFromChangeOrdersInputRepresentation>	List of OrderSummary IDs with the IDs of the associated change orders to create Invoices for. Each entry in the list generates one invoice, which combines the change orders in that entry.	Required	56.0

SEE ALSO:

createMultipleInvoices(invoicesInput)

ConnectApi.CreateOrderPaymentSummaryInputRepresentation

An OrderSummary for which to create an OrderPaymentSummary, with the payment authorization or payments to include in it.

Property	Type	Description	Required or Optional	Available Version
`orderSummaryId`	String	ID of the OrderSummary.	Required	48.0
`paymentAuthorizationId`	String	ID of the payment authorization.	Either a payment authorization or at least one payment is required.	48.0
`paymentIds`	List<String>	List of IDs of the payments.	Either a payment authorization or at least one payment is required.	48.0

SEE ALSO:

createOrderPaymentSummary(orderPaymentSummaryInput)

ConnectApi.CreateServiceAppointmentInput

Contains information to create a service appointment.

Property	Type	Description	Required or Optional	Available Version
`assignedResources`	List<ConnectApi.AssignedResourceInput>	Represents the service resources to be assigned to a service appointment. **Note:** When creating an appointment, use `extendedFields` to add values to any of the fields, including custom fields, in `assignedResources` as long as you have edit access to those fields.	Optional	53.0
`lead`	ConnectApi.LeadInput	Represents a prospect or lead. **Note:** Required to create a service appointment for unauthenticated guest users.	Required if `serviceAppointment` isn't provided.	53.0
`schedulingPolicyId`	String	The ID of the `AppointmentSchedulingPolicy` object. If no scheduling policy is passed in the request body, the default configurations are used. The only scheduling policy configuration that is used in determining time slots is the enforcement of account visiting hours.	Optional	53.0

Property	Type	Description	Required or Optional	Available Version
serviceAppointment	ConnectApi.ServiceAppointmentInput	Represents the service appointment details to book an appointment. Note: When creating an appointment, use extendedFields to add values to any of the fields, including custom fields, in assignedResources as long as you have edit access to those fields.	Required if lead isn't provided.	53.0

ConnectApi.CredentialInput

Credential input.

Property	Type	Description	Required or Optional	Available Version
authenticationProtocol	ConnectApi.CredentialAuthenticationProtocol	Authentication protocol of the external credential. Values are: • AwsSv4 • Basic • Custom • Jwt • OAuth	Required	56.0
authenticationProtocolVariant	ConnectApi.CredentialAuthenticationProtocolVariant	Authentication protocol variant of the external credential. Values are: • AwsSv4_STS—AWS Signature Version 4 with Security Token Service. • ClientCredentialsClientSecret—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's request body. • ClientCredentialsClientSecretBasic—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's authorization header, as with Basic authentication. • ClientCredentialsJwtAssertion—OAuth 2.0 Client Credentials JSON Web Token assertion. • JwtBearer—OAuth 2.0 JSON Web Token bearer flow.	Optional	57.0

Property	Type	Description	Required or Optional	Available Version
		• `NoAuthentication`—No authentication. • `RolesAnywhere`—AWS Signature Version 4 with Identity and Access Management (IAM) Roles Anywhere. If specified, the authentication protocol variant must match the actual protocol variant of the external credential.		
`credentials`	Map<String, `ConnectApi.CredentialValueInput`>	Map of protocol-specific credentials. Authentication protocols have credential allowlists and encryption rules. • `AwsSv4`—`awsAccessKeyId` (not encrypted), `awsSecretAccessKey` (encrypted), `awsRoleArn` (not encrypted) • `Custom`—Any credential name is valid (user sets encryption rules)	Required	56.0
`externalCredential`	String	Fully qualified developer name of the external credential.	Required	56.0
`principalName`	String	Name of the external credential named principal.	Required if `principalType` is `NamedPrincipal`	56.0
`principalType`	`ConnectApi.CredentialPrincipalType`	Type of credential principal. Values are: • `AwsStsPrincipal` • `NamedPrincipal` • `PerUserPrincipal`	Required	56.0

ConnectApi.CredentialCustomHeaderInput

Credential custom header input.

Property	Type	Description	Required or Optional	Available Version
`headerName`	String	Header name.	Required	58.0
`headerValue`	String	Header value.	Required	58.0
`id`	String	Header ID.	Optional	58.0

Property	Type	Description	Required or Optional	Available Version
`sequenceNumber`	Integer	Sequence number.	Required	58.0

SEE ALSO:

ConnectApi.ExternalCredentialInput

ConnectApi.NamedCredentialInput

ConnectApi.CredentialValueInput

Credential value input.

Authentication protocols have credential allowlists and encryption rules.

- `AwsSv4`—`awsAccessKeyId` (not encrypted), `awsSecretAccessKey` (encrypted), `awsRoleArn` (not encrypted)
- `Custom`—Any credential name is valid (user sets encryption rules)

Property	Type	Description	Required or Optional	Available Version
`encrypted`	Boolean	Specifies whether the value of the credential is encrypted (`true`) or not (`false`).	Required	56.0
`revision`	Integer	Revision number of a short-lived credential, such as OAuthToken. If the provided revision isn't the latest version, the authentication endpoint refreshes the credential.	Optional	58.0
`value`	String	Value of the credential.	Required	56.0

SEE ALSO:

ConnectApi.CredentialInput

ConnectApi.CustomListAudienceCriteriaInput

Criteria for the custom list type of custom recommendation audience.

Subclass of ConnectApi.AudienceCriteriaInput.

Property	Type	Description	Required or Optional	Available Version
`memberOperationType`	`ConnectApi.RecommendationAudienceMemberOperationType`	The operation to carry out on the audience members. Values are: • `Add`—Adds specified members to the audience. • `Remove`—Removes specified members from the audience.	Required to update a recommendation audience Don't use or specify `null` to create a recommendation audience	36.0

Property	Type	Description	Required or Optional	Available Version
`members`	List<String>	A collection of user IDs. When updating an audience, you can include up to 100 members. An audience can have up to 100,000 members, and each Experience Cloud site can have up to 100 audiences.	Required to update a recommendation audience Don't use or specify `null` to create a recommendation audience	36.0

ConnectApi.DirectMessageCapabilityInput

Create or update the members of a direct message.

Property	Type	Description	Required or Optional	Available Version
`membersToAdd`	List<String>	List of user IDs for members to include in the direct message.	Required when creating a direct message (POST) Optional when updating a direct message (PATCH)	39.0
`membersToRemove`	List<String>	List of user IDs for members to remove from the direct message.	Optional when updating a direct message (PATCH) Not supported when creating a direct message (POST)	40.0
`subject`	String	Subject of the direct message.	Optional when creating a direct message (POST) Not supported when updating a direct message (PATCH)	39.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.DistinctValueRefinementInput

Attribute-based refinement with distinct values for product search.

This class is a subclass of ConnectApi.RefinementInput.

Property	Type	Description	Required or Optional	Available Version
`values`	List<String>	Comma-separated list of attribute values.	Required	52.0

ConnectApi.EinsteinLlmAdditionalConfigInput

Additional configuration information for the LLM provider.

Property	Type	Description	Required or Optional	Available Version
`additionalParameters`	Map<String, `ConnectApi.WrappedValue`>	Map of parameters and values for the LLM provider.	Optional	60.0
`applicationName`	String	Name of the application.	Required	60.0
`enablePiiMasking`	Boolean	Specifies whether to mask personally identifiable information (PII) (`true`) or not (`false`).	Optional	60.0
`frequencyPenalty`	Double	Use to reduce the repetitiveness of generated tokens. The higher the value, the stronger a penalty is applied to previously present tokens, proportional to how many times they already appeared in the prompt or in prior generations. Minimum value is `0.0`. Maximum value is `1.0`.	Optional	60.0
`maxTokens`	Integer	Maximum number of tokens to generate.	Optional	60.0
`numGenerations`	Integer	Number of generation requests to send to the LLM provider.	Optional	60.0
`presencePenalty`	Double	Use to reduce the repetitiveness of generated tokens. This value is similar to frequency penalty, except that this penalty is applied equally to all tokens that already appeared, regardless of their exact frequencies. Minimum value is `0.0`, and maximum value is `1.0`.	Optional	60.0
`stopSequences`	List<String>	Generated text is cut at the end of the earliest occurrence of a stop sequence.	Optional	60.0
`temperature`	Double	Sampling temperature to use. Higher values mean the model takes more risks. Lower temperatures mean that generations are less random. Minimum value is `0.0`, and maximum value is `1.0`	Optional	60.0

ConnectApi.EinsteinPromptTemplateGenerationsInput

Prompt template input parameters to use for generation.

Property	Type	Description	Required or Optional	Available Version
`additionalConfig`	`ConnectApi.EinsteinLlmAdditionalConfigInput`	Configuration information for the LLM provider.	Required	60.0
`inputParams`	Map<String, ConnectApi.WrappedValue>	Parameters and values to resolve the specified prompt template.	Required	60.0
`isPreview`	Boolean	Specifies whether to only resolve the prompt template (`true`) or to resolve the prompt template and generate an LLM response (`false`).	Required	60.0

ConnectApi.EnsureFundsAsyncInputRepresentation

ID of an Invoice to ensure funds for and apply them to.

Property	Type	Description	Required or Optional	Available Version
`invoiceId`	String	ID of the Invoice.	Required	48.0

SEE ALSO:

ensureFundsAsync(orderSummaryId, ensureFundsInput)

ConnectApi.EnsureRefundsAsyncInputRepresentation

ID of a credit memo to ensure refunds for, an amount of excess funds to refund, or both. At least one is required. Also includes any invoices for fees that reduce the refund amount, such as return fees. If multiple payment methods are available, you can specify how to distribute the refund.

Property	Type	Description	Required or Optional	Available Version
`creditMemoId`	String	ID of the credit memo that represents a refund amount.	Either `creditMemoId` or `excessFundsAmount` is required	48.0
`excessFundsAmount`	Double	Amount of excess funds to refund.	Either `excessFundsAmount` or	49.0

Property	Type	Description	Required or Optional	Available Version
			`creditMemoId` is required	
`invoicesToPay`	List<`ConnectApi.InvoiceToPayInputRepresentation`>	List of invoices for any fees that reduce the refund, such as return fees.	Optional	56.0
`isAllowPartial`	Boolean	This value controls the behavior when the amounts included in the `sequences` list don't cover the entire refund amount. If this value is false, then the default refund logic is applied to ensure the remaining refund amount. If this value is true, then the unrefunded balance remains on the credit memo. If you don't specify a `sequences` list, this value is ignored and the default refund logic is applied. The default value is false.	Optional	56.0
`sequences`	List<`ConnectApi.SequenceOrderPaymentSummaryInputRepresentation`>	Ordered list of refund amounts and OrderPaymentSummaries to apply them to. The process traverses this list in order and stops when it's refunded the full amount.	Optional	56.0

SEE ALSO:

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

ConnectApi.EntityLinkSegmentInput

An entity link segment.

Subclass of ConnectApi.MessageSegmentInput.

Property	Type	Description	Required or Optional	Available Version
`entityId`	String	ID of the entity to link to. Only users with access to the entity see it. It's hidden for users without access.	Required	43.0

ConnectApi.ExtendedFieldInput

Contains information about the extended field.

Property	Type	Description	Required or Optional	Available Version
`name`	String	The name of the field, including custom field.	Optional	53.0
`value`	String	The value of the field.	Optional	53.0

ConnectApi.ExtensionInput

An extension.

Property	Type	Description	Required or Optional	Available Version
`alternativeRepresentation`	ConnectApi.AlternativeInput	Alternative representation of the extension.	Required	40.0
`extensionId`	String	ID of the extension.	Required	40.0
`payload`	String	Payload associated with the extension.	Required	40.0
`payloadVersion`	String	Payload version that identifies the structure of the payload associated with the extension.	Optional	40.0

SEE ALSO:

ConnectApi.ExtensionsCapabilityInput

ConnectApi.ExtensionsCapabilityInput

Create or update extensions associated with a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`itemsToAdd`	List<`ConnectApi.ExtensionInput`>	List of extensions to associate with the feed element.	Required for creating an extension Optional for updating an extension	40.0

Property	Type	Description	Required or Optional	Available Version
`itemsToRemove`	List<String>	List of attachment IDs to remove from the feed element.	Optional for updating an extension Don't specify for creating an extension	41.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.ExternalCredentialInput

Input used to create or update an external credential.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Property	Type	Description	Required or Optional	Available Version
`authenticationProtocol`	`ConnectApi.CredentialAuthenticationProtocol`	Authentication protocol of the external credential. Values are: • `AwsSv4` • `Basic` • `Custom` • `Jwt` • `OAuth`	Required	58.0
`authenticationProtocolVariant`	`ConnectApi.CredentialAuthenticationProtocolVariant`	Authentication protocol variant of the external credential. Values are: • `AwsSv4_STS`—AWS Signature Version 4 with Security Token Service. • `ClientCredentialsClientSecret`—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's request body. • `ClientCredentialsClientSecretBasic`—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's authorization header, as with Basic authentication.	Optional	58.0

Property	Type	Description	Required or Optional	Available Version
		• `ClientCredentialsJwtAssertion`—OAuth 2.0 Client Credentials JSON Web Token assertion. • `JwtBearer`—OAuth 2.0 JSON Web Token bearer flow. • `NoAuthentication`—No authentication. • `RolesAnywhere`—AWS Signature Version 4 with Identity and Access Management (IAM) Roles Anywhere. If specified, the authentication protocol variant must match the actual protocol variant of the external credential.		
`customHeaders`	List<`ConnectApi.CredentialCustomHeaderInput`>	List of credential custom headers.	Optional	58.0
`developerName`	String	Fully qualified developer name of the external credential.	Required for creating an external credential Optional for updating an external credential	58.0
`masterLabel`	String	External credential label.	Required	58.0
`parameters`	List<`ConnectApi.ExternalCredentialParameterInput`>	List of external credential parameters.	Optional depending on `authenticationProtocol` and `authenticationVariant`	58.0
`principals`	List<`ConnectApi.ExternalCredentialPrincipalInput`>	List of principals the credential has.	Optional	58.0

ConnectApi.ExternalCredentialParameterInput

External credential parameter input.

Property	Type	Description	Required or Optional	Available Version
`id`	String	Parameter ID.	Optional	58.0

Property	Type	Description	Required or Optional	Available Version
`parameterDescription`	String	Parameter description.	Optional	58.0
`parameterName`	String	Parameter name of the external credential.	Required	58.0
`parameterType`	`ConnectApi.ExternalCredentialParameterType`	Parameter type of the external credential. Values are: • `AuthParameter` • `AuthProvider` • `AuthProviderUrl` • `AuthProviderUrlQueryParameter` • `JwtBodyClaim` • `JwtHeaderClaim` • `SigningCertificate`	Required	58.0
`parameterValue`	String	Parameter value of the external credential.	Required	58.0

SEE ALSO:

ConnectApi.ExternalCredentialInput

ConnectApi.ExternalCredentialPrincipalInput

ConnectApi.ExternalCredentialPrincipalInput

External credential principal input.

Property	Type	Description	Required or Optional	Available Version
`id`	String	ID of the principal external credential parameter.	Optional	58.0
`parameters`	List<`ConnectApi.ExternalCredentialParameterInput`>	List of external credential parameters.	Optional	58.0
`principalName`	String	Principal name.	Required	58.0
`principalType`	`ConnectApi.CredentialPrincipalType`	Type of credential principal. Values are: • `AwsStsPrincipal` • `NamedPrincipal` • `PerUserPrincipal`	Required	58.0

Property	Type	Description	Required or Optional	Available Version
sequenceNumber	Integer	Sequence number.	Required	58.0

SEE ALSO:

ConnectApi.ExternalCredentialInput

ConnectApi.NamedCredentialInput

ConnectApi.FeedElementCapabilitiesInput

A container for all capabilities that can be included when creating a feed element.

Property	Type	Description	Required or Optional	Available Version
associatedActions	ConnectApi.AssociatedActionsCapabilityInput	Describes actions added to the feed element.	Optional	33.0
bookmarks	ConnectApi.BookmarksCapabilityInput	Describes bookmarks added to the feed element.	Optional	32.0
canvas	ConnectApi.CanvasCapabilityInput	Describes a canvas app added to the feed element.	Optional	32.0
content	ConnectApi.ContentCapabilityInput	Describes content added to the feed element. **Important:** This class isn't available for feed posts in version 36.0 and later. In version 36.0 and later, use ConnectApi.FilesCapabilityInput.	Optional	32.0–35.0
directMessage	ConnectApi.DirectMessageCapabilityInput	Describes the direct message.	Optional	39.0
extensions	ConnectApi.ExtensionsCapabilityInput	Describes the extensions associated with the feed element.	Optional	40.0
feedEntityShare	ConnectApi.FeedEntityShareCapabilityInput	Describes the feed entity shared with the feed element.	Optional	39.0
files	ConnectApi.FilesCapabilityInput	Describes files attached to the feed element.	Optional	36.0

Property	Type	Description	Required or Optional	Available Version
`link`	`ConnectApi.LinkCapabilityInput`	Describes a link added to the feed element.	Optional	32.0
`poll`	`ConnectApi.PollCapabilityInput`	Describes a poll added to the feed element.	Optional	32.0
`questionAndAnswers`	`ConnectApi.QuestionAndAnswersCapabilityInput`	Describes a question and answer capability added to the feed element.	Optional	32.0
`status`	`ConnectApi.StatusCapabilityInput`	Describes the status of the feed element.	Optional	44.0
`topics`	`ConnectApi.TopicsCapabilityInput`	Describes topics assigned to the feed element.	Optional	38.0

SEE ALSO:

ConnectApi.FeedElementInput

ConnectApi.FeedElementCapabilityInput

A feed element capability.

In API version 30.0 and earlier, most feed items can have comments, likes, topics, and so on. In version 31.0 and later, every feed item (and feed element) can have a unique set of *capabilities*. If a capability property exists on a feed element, that capability is available, even if the capability property doesn't have a value. For example, if the `ChatterLikes` capability property exists on a feed element (with or without a value), the context user can like that feed element. If the capability property doesn't exist, it isn't possible to like that feed element. A capability can also contain associated data. For example, the `Moderation` capability contains data about moderation flags.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

This class is a superclass of:

- ConnectApi.AssociatedActionsCapabilityInput
- ConnectApi.BookmarksCapabilityInput
- ConnectApi.CanvasCapabilityInput
- ConnectApi.ContentCapabilityInput
- ConnectApi.DirectMessageCapabilityInput
- ConnectApi.ExtensionsCapabilityInput
- ConnectApi.FeedEntityShareCapabilityInput
- ConnectApi.FilesCapabilityInput
- ConnectApi.LinkCapabilityInput

- ConnectApi.MuteCapabilityInput
- ConnectApi.PollCapabilityInput
- ConnectApi.QuestionAndAnswersCapabilityInput
- ConnectApi.ReadByCapabilityInput
- ConnectApi.RecordCapabilityInput
- ConnectApi.StatusCapabilityInput
- ConnectApi.TopicsCapabilityInput

ConnectApi.FeedElementInput

Feed elements are the top-level items that a feed contains. Feeds are feed element containers.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass of ConnectApi.FeedItemInput.

Property	Type	Description	Required or Optional	Available Version
`capabilities`	`ConnectApi.FeedElementCapabilitiesInput`	The capabilities that define auxiliary information on this feed element.	Optional	31.0
`feedElementType`	`ConnectApi.FeedElementType`	The type of feed element this input represents.	Required when creating a feed element Optional when updating a feed element	31.0

Property	Type	Description	Required or Optional	Available Version
`subjectId`	String	The ID of the parent this feed element is being posted to. This value can be the ID of a user, group, or record, or the string `me` to indicate the context user. In version 45.0 and later, you can move a feed element from one public group to another by setting this property to the ID of the new public group. You can't include or change any other properties when moving a feed element.	Required	31.0

SEE ALSO:

- Post a Feed Element with a Mention
- Post a Feed Element with Existing Content
- Post a Feed Element with a New File (Binary) Attachment
- Define an Action Link and Post with a Feed Element
- Define an Action Link in a Template and Post with a Feed Element
- Share a Feed Element (in Version 39.0 and Later)
- Edit a Feed Element
- Edit a Question Title and Post
- Post a Rich-Text Feed Element with Inline Image

ConnectApi.FeedEntityShareCapabilityInput

Share a feed entity with a feed post or comment.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`feedEntityId`	String	ID of the feed entity to share with the feed post or comment.	Required	39.0

SEE ALSO:

- ConnectApi.FeedElementCapabilitiesInput

ConnectApi.FeedItemInput

Used to create rich feed items, for example, feed items that include @mentions or files.

Subclass of ConnectApi.FeedElementInput as of version 31.0.

Property	Type	Description	Required or Optional	Available Version
`attachment`	`ConnectApi.FeedItemAttachmentInput`	Specifies the attachment for the feed item. The feed item type is inferred based on the provided attachment. **Important:** As of API version 32.0, use the inherited `capabilities` property.	Optional	28.0–31.0
`body`	`ConnectApi.MessageBodyInput`	Message body. The body can contain up to 10,000 characters and 25 mentions. Because the character limit can change, clients should make a `describeSObjects()` call on the FeedItem or FeedComment object and look at the length of the `Body` or `CommentBody` field to determine the maximum number of allowed characters. If you specify `originalFeedElementId` to share a feed item, use the `body` property to add the first comment to the feed item. To edit this property in a feed item, use `updateFeedElement(communityId, feedElementId, feedElement)`. Editing feed posts is supported in version 34.0 and later.	Required unless the feed item has a link capability or a content capability.	28.0
`isBookmarkedByCurrentUser`	Boolean	Specifies if the new feed item should be bookmarked for the user (`true`) or not (`false`). **Important:** As of API version 32.0, use the `capabilities.bookmarks.isBookmarkedByCurrentUser` property.	Optional	28.0–31.0
`originalFeedElementId`	String	To share a feed element, specify its 18-character ID. **Important:** As of API version 39.0, use the `capabilities.feedEntityShare.feedEntityId` property.	Optional	31.0–38.0
`originalFeedItemId`	String	To share a feed item, specify its 18-character ID. **Important:** In API version 32.0–38.0, use the `originalFeedElementId` property. In API version 39.0 and later, use the `capabilities.feedEntityShare.feedEntityId` property.	Optional	28.0–31.0
`visibility`	`ConnectApi.FeedItemVisibilityType` Enum	Type of users who can see a feed item. • `AllUsers`—Visibility is not limited to internal users. • `InternalUsers`—Visibility is limited to internal users.	Optional	28.0

Property	Type	Description	Required or Optional	Available Version
		Default values: • For external users, the default value is `AllUsers`. External users must use this value to see their posts. • For internal users, the default value is `InternalUsers`. Internal users can accept this value or use the value `AllUsers` to allow external users to see their posts. If the parent of the feed item is a user, group, or direct message, the `visibility` of the feed item must be `AllUsers`.		

ConnectApi.FileIdInput

Attach a file that has already been uploaded or remove a file from a feed element.

Property	Type	Description	Required or Optional	Available Version
`id`	String	ID of a file that has already been uploaded.	Required	36.0
`operationType`	`ConnectApi.OperationType`	Operation to carry out on the file. Values are: • `Add`—Adds the file to the feed element. • `Remove`—Removes the file from the feed element. `Remove` operations are processed before `Add` operations. Adding content that is already added and removing content that is already removed result in no operation.	Optional If not specified, defaults to `Add`.	36.0

SEE ALSO:

ConnectApi.FilesCapabilityInput

ConnectApi.FindRoutesWithFewestSplitsInputRepresentation

Data used to calculate order fulfillment routes involving the fewest number of shipment splits.

Property	Type	Description	Required or Optional	Available Version
`locationAvailableInventory`	List<`ConnectApi.LocationAvailabilityInputRepresentation`>	Each list element represents the available quantity of a product at an inventory location.	At least one element is required	51.0

Property	Type	Description	Required or Optional	Available Version
`maximumNumberOfSplits`	Integer	The maximum allowable number of shipment splits. Routing options that involve more than this number of splits are not returned. Note: Each split represents an additional shipment. Specifying a maximum of 0 returns only locations that can fulfill the entire order in a single shipment. A maximum of 1 returns combinations of locations that can fulfill the order in one or two shipments, and so on.	Optional	51.0
`orderedQuantities`	List<`ConnectApi.QuantityWithSkuInputRepresentation`>	Each list element represents a quantity of a product to be routed for fulfillment.	At least one element is required	51.0

SEE ALSO:

findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)

ConnectApi.FindRoutesWithFewestSplitsGroupUsingOCIInputRepresentation

Data used to calculate inventory availability and fulfillment routes for one order involving the fewest number of shipment splits.

Property	Type	Description	Required or Optional	Available Version
`excludeLocations`	List<`String`>	List of locations to exclude from the routing calculations.	Optional	55.0
`maximumNumberOfSplits`	Integer	Maximum allowable number of shipment splits. Routing options that involve more than this number of splits are not returned. Note: Each split represents an additional shipment. Specifying a maximum of 0 returns only locations that can fulfill the entire order in a single shipment. A maximum of 1 returns combinations of locations that can fulfill the order in one or two shipments, and so on.	Optional	54.0

Property	Type	Description	Required or Optional	Available Version
`orderedItems`	[illegible]	Each list element represents a quantity of a product to be routed for fulfillment and the assigned location group or location.	At least one element is required	54.0

SEE ALSO:

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

ConnectApi.FindRoutesWithFewestSplitsUsingOCIInputRepresentation

ConnectApi.FindRoutesWithFewestSplitsUsingOCIInputRepresentation

Data used to calculate order fulfillment routes involving the fewest number of shipment splits, taking into account inventory availability.

Property	Type	Description	Required or Optional	Available Version
[illegible]	[illegible]	Each list element represents a routing request for one order.	At least one element is required	54.0
ociExpandAttributes	Collection	The string value groupEligibilityExclusion excludes specific locations.	Optional	59.0

SEE ALSO:

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

ConnectApi.FindRoutesWithFewestSplitsUsingOCIItemInputRepresentation

A quantity of a product and a location group or location assigned to fulfill it.

Property	Type	Description	Required or Optional	Available Version
`locationGroupIdentifier`	String	The External Reference of the location group or location assigned to the order item. If you specify a location group, inventory is considered for all locations belonging to that group.	Required	54.0
`quantity`	Double	Quantity of the product.	Required	54.0

Property	Type	Description	Required or Optional	Available Version
`stockKeepingUnit`	String	SKU of the product.	Required	54.0

SEE ALSO:

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

ConnectApi.FindRoutesWithFewestSplitsUsingOCIInputRepresentation

ConnectApi.FindRoutesWithFewestSplitsGroupUsingOCIInputRepresentation

ConnectApi.FilesCapabilityInput

Attach up to 10 files that have already been uploaded or remove one or more files from a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`items`	List<`ConnectApi.FileIdInput`>	List of file IDs and operations to be carried out on those files.	Required	36.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.FormFieldInput

Marketing integration form field.

Property	Type	Description	Required or Optional	Available Version
`name`	String	Name of the marketing integration form field.	Required	53.0
`type`	`ConnectApi.FormFieldType`	Type of marketing integration form field. Values are: • `Boolean` • `Date` • `EmailAddress` • `Number` • `Text`	Required	53.0

SEE ALSO:

ConnectApi.FormInput

ConnectApi.FormInput

Marketing integration form.

Property	Type	Description	Required or Optional	Available Version
`formFieldsList`	List<ConnectApi.FormFieldInput>	Fields for the marketing integration form.	Required	53.0
`formName`	String	Name of the marketing integration form.	Required	53.0
`memberIdentificationCode`	String	The member identification code (MID) of the Marketing Cloud Engagement account associated with the form.	Required	53.0

ConnectApi.FormSubmissionFieldInput

Marketing integration form field submission.

Property	Type	Description	Required or Optional	Available Version
`name`	String	Name of the marketing integration form field.	Required	53.0
`value`	String	Value of the marketing integration form field.	Required	53.0

SEE ALSO:

ConnectApi.FormSubmissionInput

ConnectApi.FormSubmissionInput

Marketing integration form submission.

Property	Type	Description	Required or Optional	Available Version
`formFieldsList`	List<ConnectApi.FormFieldSubmissionInput>	Fields for the marketing integration form.	Required	53.0

ConnectApi.FulfillmentGroupInputRepresentation

A list of OrderItemSummaries to be fulfilled together, and the fulfillment location to handle them. The fulfillment type is one of the values defined for the Type field on the FulfillmentOrder object, such as “Warehouse” or “Retail Store.” The specified type is assigned to the FulfillmentOrder for this fulfillment group.

Property	Type	Description	Required or Optional	Available Version
`fulfilledFromLocationId`	String	ID of the fulfillment location.	Required	48.0
`fulfillmentType`	String	Fulfillment type. One of the Type field values defined for FulfillmentOrders.	Required	48.0
`orderItemSummaries`	List<`ConnectApi.OrderItemSummaryInputRepresentation`>	List of OrderItemSummaries.	Required	48.0
`referenceId`	String	Reference to this input for use in troubleshooting failures. This value is only used by the APIs for creating fulfillment orders for multiple order delivery group summaries.	Optional	50.0

SEE ALSO:

ConnectApi.FulfillmentOrderInputRepresentation

createFulfillmentOrders(fulfillmentOrderInput)

ConnectApi.FulfillmentOrderInputRepresentation

An OrderDeliveryGroupSummary that defines a delivery method and recipient, and a list of fulfillment groups to assign to FulfillmentOrders. Each fulfillment group is a set of OrderItemSummaries that match the OrderDeliveryGroupSummary and share the same fulfillment location. The method creates a FulfillmentOrder for each fulfillment group and a FulfillmentOrderLineItem for each OrderItemSummary.

Property	Type	Description	Required or Optional	Available Version
`fulfillmentGroups`	List<`ConnectApi.FulfillmentGroupInputRepresentation`>	List of fulfillment groups that specify the OrderItemSummaries and fulfillment locations.	Required	48.0
`orderDeliveryGroupSummaryId`	String	ID of the OrderDeliveryGroupSummary.	Required	48.0
`orderSummaryId`	String	ID of the OrderSummary.	Required	48.0

SEE ALSO:

createFulfillmentOrders(fulfillmentOrderInput)

ConnectApi.FulfillmentOrderInvoiceInputRepresentation

Instantiate and include this object with no properties when creating an invoice.

This input class has no properties.

SEE ALSO:

createInvoice(fulfillmentOrderId, invoiceInput)

ConnectApi.FulfillmentOrderLineItemInputRepresentation

A FulfillmentOrderLineItem and quantity to cancel. You can cancel less than the full quantity, in which case you reallocate the canceled quantity to a different FulfillmentOrder.

Property	Type	Description	Required or Optional	Available Version
`fulfillmentOrderLineItemId`	String	ID of the FulfillmentOrderLineItem.	Required	48.0
`quantity`	Double	Quantity to cancel.	Required	48.0

SEE ALSO:

ConnectApi.FulfillmentOrderLineItemsToCancelInputRepresentation

cancelFulfillmentOrderLineItems(fulfillmentOrderId, cancelFulfillmentOrderLineItemsInput)

ConnectApi.FulfillmentOrderLineItemsToCancelInputRepresentation

A list of FulfillmentOrderLineItems and quantities to cancel.

Property	Type	Description	Required or Optional	Available Version
`fulfillmentOrderLineItemsToCancel`	List<`ConnectApi.FulfillmentOrderLineItemInputRepresentation`>	List of FulfillmentOrderLineItems and quantities.	Required	48.0

SEE ALSO:

cancelFulfillmentOrderLineItems(fulfillmentOrderId, cancelFulfillmentOrderLineItemsInput)

ConnectApi.BaseRequest

Base parameters for making a request to the payment gateway.

This class is abstract.

Subclass of ConnectApi.AuditParamsRequest.

Superclass of:

- ConnectApi.AuthorizationRequest
- ConnectApi.AuthorizationReversalRequest

- ConnectApi.CaptureRequest
- ConnectApi.PaymentMethodTokenizationRequest
- ConnectApi.PostAuthRequest
- ConnectApi.RefundRequest
- ConnectApi.SaleRequest

Property	Type	Description	Required or Optional	Available Version
`additionalData`	Map<String, String>	An optional map of additional parameters to be sent to the payment gateway.	Optional	50.0
`idempotencyKey`	String	Idempotency key.	Optional	50.0

ConnectApi.GetFOCapacityValuesRequestInputRepresentation

Locations to get fulfillment order capacity information for.

Property	Type	Description	Required or Optional	Available Version
`locationIds`	List<String>	List of IDs of the locations to get fulfillment order capacity information for.	Required	55.0

ConnectApi.GroupInformationInput

Chatter group information input.

Property	Type	Description	Available Version
`text`	String	The text in the “Information” section of a group.	28.0
`title`	String	The title of the “Information” section of a group.	28.0

SEE ALSO:

ConnectApi.ChatterGroupInput

ConnectApi.HashtagSegmentInput

Include a hashtag in a feed item or comment.

Subclass of ConnectApi.MessageSegmentInput.

Property	Type	Description	Available Version
`tag`	String	Text of the hash tag without the # (hash tag) prefix Note: Closing square brackets ( ]) are not supported in hash tag text. If the text contains a closing square bracket ( ]), the hash tag ends at the bracket.	28.0

SEE ALSO:

ConnectApi.MessageBodyInput

ConnectApi.HoldFOCapacityInputRepresentation

Request to hold fulfillment order capacity at one or more locations. Can correspond to one action call.

Property	Type	Description	Required or Optional	Available Version
`holdFOCapacityRequests`	List<`ConnectApi.HoldFOCapacityRequestInputRepresentation`>	List of requests to hold fulfillment order capacity at one or more locations.	Required	55.0

ConnectApi.HoldFOCapacityRequestInputRepresentation

Request to hold fulfillment order capacity at one or more locations.

Property	Type	Description	Required or Optional	Available Version
`allOrNothing`	Boolean	Controls whether a single failed request cancels all other requests in the list (*`true`*) or whether some requests can succeed if others fail (*`false`*). The default value is *`false`*.	Optional	55.0
`capacityRequests`	List<`ConnectApi.CapacityRequestInputRepresentation`>	List of requests to hold fulfillment order capacity. Each request is for one fulfillment order at one location.	Required	55.0

ConnectApi.InlineImageSegmentInput

An inline image segment.

Subclass of ConnectApi.MessageSegmentInput.

Property	Type	Description	Required or Optional	Available Version
`altText`	String	Alt text for the inline image.	Optional If not specified, the title of the inline image file is used as the alt text.	35.0
`fileId`	String	ID of the inline image file.	Required	35.0

SEE ALSO:

Post a Rich-Text Feed Element with Inline Image

ConnectApi.MessageBodyInput

ConnectApi.InnerEnsureFundsAsyncInputRepresentation

ID of an Invoice and ID of the associated OrderSummary.

Property	Type	Description	Required or Optional	Available Version
`invoiceId`	String	ID of the Invoice to ensure funds for.	Required	56.0
`orderSummaryId`	String	ID of the OrderSummary associated with the Invoice.	Required	56.0

SEE ALSO:

multipleEnsureFundsAsync(multipleEnsureFundsInput)

ConnectApi.MultipleEnsureFundsAsyncInputRepresentation

ConnectApi.InviteInput

An invitation.

Property	Type	Description	Required or Optional	Available Version
`invitees`	List<`String`>	List of email addresses to send the invitation to.	Required	39.0
`message`	String	Message to include in the invitation.	Optional	39.0

ConnectApi.InvoiceToPayInputRepresentation

Invoice for a fee.

Property	Type	Description	Required or Optional	Available Version
`invoiceId`	String	ID of the invoice for a fee.	Required	56.0

SEE ALSO:

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

ConnectApi.EnsureRefundsAsyncInputRepresentation

ConnectApi.LeadInput

Contains information about a lead or guest user.

Property	Type	Description	Required or Optional	Available Version
`company`	String	The company of the lead.	Optional	53.0
`email`	String	The email address of the lead.	Optional	53.0
`extendedFields`	Map<String, ConnectApi.ExtendedFieldInput>	Use to add values to any of the fields, including custom fields.	Optional	53.0
`firstName`	String	The first name of the lead.	Optional	53.0
`lastName`	String	The last name of the lead.	Optional	53.0
`phone`	String	The phone number of the lead.	Optional	53.0

ConnectApi.LinkCapabilityInput

Create or update a link on a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`url`	String	Link URL. The URL can be to an external site.	Required	32.0
`urlName`	String	Description of the link.	Optional	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.LinkSegmentInput

Include a link segment in a feed item or comment.

Subclass of ConnectApi.MessageSegmentInput.

Property	Type	Description	Available Version
`url`	String	URL to be used for the link	28.0

SEE ALSO:

ConnectApi.MessageBodyInput

ConnectApi.LocationInputRepresentation

Inventory location data used to calculate shipping distance.

Property	Type	Description	Required or Optional	Available Version
`countryCode`	String	The country code of the location.	Required	51.0
`locationIdentifier`	String	The identifier of the location.	Required	51.0
`postalCode`	String	The postal code of the location.	Required	51.0

ConnectApi.LocationAvailabilityInputRepresentation

The available quantity of a product at an inventory location.

Property	Type	Description	Required or Optional	Available Version
`externalReferenceId`	String	The external reference ID of the inventory location.	Optional	51.0
`quantity`	Double	The available quantity of the product.	Required	51.0
`stockKeepingUnit`	String	The Stock Keeping Unit of the product.	Required	51.0

ConnectApi.ManagedContentBodyInput

Input representation for the body of a piece of managed content.

Property	Type	Description	Required or Optional	Available Version
`nodeMap`	`Object`	Body of the managed content version. The format must be Map<String, Object> , where map values are either primitive values like String, Integer, Double, Boolean, or another Map<String, Object>.	Required	60.0

SEE ALSO:

ConnectApi.ManagedContentDocumentInput

ConnectApi.ManagedContentVariantUpdateInput

ConnectApi.ManagedContentDocumentInput

Input representation for a piece of managed content.

Property	Type	Description	Required or Optional	Available Version
`contentBody`	`ConnectApi.ManagedContentBodyInput`	Body of the managed content.	Required	60.0
`contentKey`	String	Content key to assign to the managed content. A content key is a universally unique identifier (UUID) such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.	Optional	60.0
`contentSpaceOrFolderId`	String	Content space or folder ID where the content is created.	Required	60.0
`contentType`	String	Fully qualified name of the content type to create. If you're uploading a binary file using a multipart/form-data message, `contentType` must be `sfdc_cms__image` or `sfdc_cms__doc`.	Required	60.0
`externalId`	String	External ID of the managed content.	Optional	60.0
`title`	String	Title of the managed content.	Required	60.0
`urlName`	String	URL name of the managed content within the org.	Optional	60.0

ConnectApi.ManagedContentVariantUpdateInput

Input representation for replacing a managed content variant.

Property	Type	Description	Required or Optional	Available Version
`contentBody`	`ConnectApi.ManagedContentBodyInput`	Body of the managed content variant.	Optional	60.0
`title`	String	Title of the managed content variant.	Optional	60.0
`urlName`	String	URL name of the managed content variant within the org.	Optional	60.0

ConnectApi.ManagedContentPublishInput

Input for publishing content.

Property	Type	Description	Required or Optional	Available Version
`contentIds`	List<String>	IDs of content to publish. All variants of the content are published.	Required if `variantIds` isn't specified	60.0
`description`	String	Description for publish action.	Optional	60.0
`includeContentReferences`	Boolean	Specifies whether to include content references (`true`) or not (`false`).	Optional	60.0
`variantIds`	List<String>	IDs of variants to publish. All variants must be from the same content space.	Required if `contentIds` isn't specified	60.0

ConnectApi.ManagedContentUnpublishInput

Input for unpublishing content.

Property	Type	Description	Required or Optional	Available Version
`contentIds`	List<String>	IDs of content to unpublish. All variants of the content are unpublished.	Required if `variantIds` isn't specified	60.0
`description`	String	Description for unpublish action.	Optional	60.0
`variantIds`	List<String>	IDs of variants to unpublish. All variants must be from the same content space.	Required if `contentIds` isn't specified	60.0

ConnectApi.ManagedTopicPositionCollectionInput

A collection of relative positions of managed topics.

Property	Type	Description	Required or Optional	Available Version
`managedTopicPositions`	List<`ConnectApi.ManagedTopicPositionInput`>	List of relative positions of managed topics. This list can include `Featured` and `Navigational` managed topics and doesn't need to include all managed topics. For more information about reordering managed topics, see the example in reorderManagedTopics(communityId, managedTopicPositionCollection).	Required	32.0

ConnectApi.ManagedTopicPositionInput

Relative position of a managed topic.

Property	Type	Description	Required or Optional	Available Version
`managedTopicId`	String	ID of existing managed topic.	Required	32.0
`position`	Integer	Relative position of the managed topic, indicated by zero-indexed, ascending whole numbers.	Required	32.0

SEE ALSO:

ConnectApi.ManagedTopicPositionCollectionInput

ConnectApi.MarkupBeginSegmentInput

The beginning tag for rich text markup.

Subclass of ConnectApi.MessageSegmentInput.

Property	Type	Description	Required or Optional	Available Version
`altText`	String	Alternative text for the `Hyperlink` segment.	Optional	45.0
`markupType`	`ConnectApi.MarkupType`	Type of rich text markup. • `Bold`—Bold tag. • `Code`—Code tag. • `Hyperlink`—Hyperlink anchor tag.	Required	35.0

Property	Type	Description	Required or Optional	Available Version
		• `Italic`—Italic tag. • `ListItem`—List item tag. • `OrderedList`—Ordered list tag. • `Paragraph`—Paragraph tag. • `Strikethrough`—Strikethrough tag. • `Underline`—Underline tag. • `UnorderedList`—Unordered list tag. Markup segments with a `markupType` of `Code` can include only text segments.		
`url`	String	URL for the `Hyperlink` segment. Supported hyperlink URLs start with `http://` or `https://`.	Required for `Hyperlink`	45.0

SEE ALSO:

Post a Rich-Text Feed Element with Inline Image

ConnectApi.MessageBodyInput

ConnectApi.MarkupEndSegmentInput

The end tag for rich text markup.

Subclass of ConnectApi.MessageSegmentInput

Property	Type	Description	Required or Optional	Available Version
`markupType`	`ConnectApi.MarkupType`	Type of rich text markup. • `Bold`—Bold tag. • `Code`—Code tag. • `Hyperlink`—Hyperlink anchor tag. • `Italic`—Italic tag. • `ListItem`—List item tag. • `OrderedList`—Ordered list tag. • `Paragraph`—Paragraph tag. • `Strikethrough`—Strikethrough tag. • `Underline`—Underline tag. • `UnorderedList`—Unordered list tag.	Required	35.0

SEE ALSO:

Post a Rich-Text Feed Element with Inline Image

ConnectApi.MessageBodyInput

ConnectApi.MentionSegmentInput

Include an @mention of a user or group in a feed post or comment. When creating a feed post or comment, you can include up to 25 mentions.

Subclass of ConnectApi.MessageSegmentInput.

Property	Type	Description	Available Version
`id`	String	ID of the user or group to mention. To mention a user, use either `id` or `username`. You can't include both. To mention a group, you must use `id`.	28.0 Groups are available in 29.0.
`username`	String	User name of the user to mention. To mention a user, use either `id` or `username`. You can't include both.	38.0

SEE ALSO:

ConnectApi.MessageBodyInput

ConnectApi.MessageBodyInput

Add rich messages to feed items and comments.

Property	Type	Description	Available Version
`messageSegments`	List<`ConnectApi.MessageSegmentInput`>	List of message segments contained in the body	28.0

SEE ALSO:

- ConnectApi.FeedItemInput
- ConnectApi.CommentInput
- ConnectApi.AnnouncementInput

ConnectApi.MessageSegmentInput

Used to add rich message segments to feed items and comments.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass for:

- ConnectApi.EntityLinkSegmentInput
- ConnectApi.HashtagSegmentInput
- ConnectApi.InlineImageSegmentInput
- ConnectApi.LinkSegmentInput
- ConnectApi.MarkupBeginSegmentInput
- ConnectApi.MarkupEndSegmentInput
- ConnectApi.MentionSegmentInput
- ConnectApi.TextSegmentInput

Use the ConnectApiHelper repository on GitHub to simplify many of the tasks accomplished with ConnectApi.MessageSegmentInput, such as posting with inline images, rich text, and mentions.

Property	Type	Description	Required or Optional	Available Version
`type`	`ConnectApi.MessageSegmentType`	The type of message segment. Values are: • `EntityLink` • `FieldChange` • `FieldChangeName` • `FieldChangeValue` • `Hashtag` • `InlineImage` • `Link` • `MarkupBegin` • `MarkupEnd` • `Mention` • `MoreChanges` • `ResourceLink` • `Text`	Required	23.0

SEE ALSO:

- Edit a Comment
- Edit a Feed Element
- Edit a Question Title and Post
- Post a Rich-Text Feed Element with Inline Image
- ConnectApi.MessageBodyInput

ConnectApi.MultipleEnsureFundsAsyncInputRepresentation

List of Invoices and the associated OrderSummaries.

Property	Type	Description	Required or Optional	Available Version
`asyncInputs`	List<`ConnectApi.InnerEnsureFundsAsyncInputRepresentation`>	List of Invoices to ensure funds for and the associated OrderSummaries.	Required	56.0

SEE ALSO:

- multipleEnsureFundsAsync(multipleEnsureFundsInput)

ConnectApi.MultipleFulfillmentOrderInputRepresentation

List of inputs for creating fulfillment orders.

Property	Type	Description	Required or Optional	Available Version
fulfillmentOrders	List<ConnectApi.FulfillmentOrderInputRepresentation>	Each element contains the data to create one fulfillment order.	Required	50.0

ConnectApi.MultipleFulfillmentOrderInvoicesInputRepresentation

The FulfillmentOrders to create Invoices for.

Property	Type	Description	Required or Optional	Available Version
fulfillmentOrderIds	List<String>	List of IDs of FulfillmentOrders to create Invoices for.	At least one ID is required.	52.0

ConnectApi.MuteCapabilityInput

Mute or unmute a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
isMutedByMe	Boolean	Indicates whether the feed element is muted for the context user. Default value is `false`.	Required	35.0

SEE ALSO:

setIsMutedByMe(communityId, feedElementId, isMutedByMe)

ConnectApi.NamedCredentialInput

Input used to create or update a named credential.

Property	Type	Description	Required or Optional	Available Version
calloutOptions	ConnectApi.NamedCredentialCalloutOptionsInput	Callout options.	Required	58.0
calloutUrl	String	URL of the named credential in a callout.	Required	58.0
customHeaders	List<ConnectApi.CredentialCustomHeaderInput>	Custom HTTP headers.	Optional	58.0

Property	Type	Description	Required or Optional	Available Version
`developerName`	String	Named credential developer name.	Required for creating a named credential Optional for updating a named credential	58.0
`externalCredentials`	List<`ConnectApi.ExternalCredentialInput`>	External credentials used by the named credential. In version 58.0 and later only one external credential is supported.	Required	58.0
`masterLabel`	String	Named credential label.	Required	58.0
`networkConnection`	`ConnectApi.NetworkConnectionInput`	PrivateConnect outbound network connection.	Optional depending on `type`	58.0
`parameters`	List<`ConnectApi.NamedCredentialParameterInput`>	Named credential parameters.	Optional	58.0
`type`	`ConnectApi.NamedCredentialType`	Type of named credential. Values are: • `PrivateEndpoint` • `SecuredEndpoint`	Required	58.0

ConnectApi.NamedCredentialCalloutOptionsInput

Named credential callout options input.

Property	Type	Description	Required or Optional	Available Version
`allowMergeFieldsInBody`	Boolean	Specifies whether to allow merge fields in the HTTP body (`true`) or not (`false`).	Required	58.0
`allowMergeFieldsInHeader`	Boolean	Specifies whether to allow merge fields in the HTTP header (`true`) or not (`false`).	Required	58.0
`generateAuthorizationHeader`	Boolean	Specifies whether to generate an authorization header (`true`) or not (`false`).	Required	58.0

SEE ALSO:

ConnectApi.NamedCredentialInput

ConnectApi.NamedCredentialParameterInput

Named credential parameter input.

Property	Type	Description	Required or Optional	Available Version
`id`	String	ID of the parameter.	Optional	58.0
`parameterDescription`	String	Description of the parameter.	Optional	58.0
`parameterName`	String	Name of the parameter.	Required	58.0
`parameterType`	`ConnectApi.NamedCredentialParameterType`	Type of named credential parameter. Values are: • `AllowedManagedPackageNamespaces` • `ClientCertificate`	Required	58.0
`parameterValue`	String	Value of the parameter.	Required	58.0

SEE ALSO:

ConnectApi.NamedCredentialInput

ConnectApi.NetworkConnectionInput

Network connection input.

Property	Type	Description	Required or Optional	Available Version
`developerName`	String	Developer name of the network connection.	Required	58.0
`namespace`	String	Namespace of the network connection.	Optional	58.0

SEE ALSO:

ConnectApi.NamedCredentialInput

ConnectApi.NBAStrategyInput

A recommendation strategy.

Property	Type	Description	Required or Optional	Available Version
`contextRecordId`	String	ID of the context record. For example, if the next best action is on a case detail page, the ID of the case.	Optional	45.0

Property	Type	Description	Required or Optional	Available Version
`maxResults`	Integer	Maximum number of results. Valid values are from 1 to 25. The default is 3.	Optional	45.0
`strategyContext`	Map<String, String>	Variable and value mappings for the strategy.	Optional	45.0
`debugTrace`	Boolean	Specifies whether to return trace and debug information in the response (`true`) or not (`false`). If unspecified, the default is `false`.	Optional	45.0

ConnectApi.NewUserAudienceCriteriaInput

Criteria for the new members type of custom recommendation audience.

Subclass of ConnectApi.AudienceCriteriaInput.

Property	Type	Description	Required or Optional	Available Version
`value`	Double	The maximum number of days since a user became a site member. For example, if you specify *30*, anyone who became a site member in the last 30 days is included in the new members audience.	Required	36.0

ConnectApi.OAuthCredentialAuthUrlInput

OAuth authentication flow.

Property	Type	Description	Required or Optional	Available Version
`externalCredential`	String	Fully qualified developer name of the external credential.	Required	56.0
`principalName`	String	Name of the external credential named principal.	Required if `principalType` is `NamedPrincipal`	56.0
`principalType`	`ConnectApi.CredentialPrincipalType`	Type of credential principal. Values are: • `AwsStsPrincipal` • `NamedPrincipal` • `PerUserPrincipal`	Required	56.0

Property	Type	Description	Required or Optional	Available Version
`returnUrl`	String	Return URL to apply to the authentication URL.	Optional	56.0

ConnectApi.OCICreateReservationInputRepresentation

Data to reserve inventory at one or more Omnichannel Inventory locations or location groups.

Property	Type	Description	Required or Optional	Available Version
`actionRequestId`	String	A UUID that identifies the request. Use the action request IDs in response data to identify which requests succeeded or failed.	Required	51.0
`allowPartialReservations`	Boolean	When true, if the system can't create the entire reservation, then it attempts to create a partial reservation.	Optional	51.0
`createRecords`	List<`ConnectApi.OCICreateReservationSingleInputRepresentation`>	A list of product quantities and locations or location groups. The list can include up to 100 elements.	At least one element is required	51.0
`expirationSeconds`	Integer	A length of time in seconds. If the reservation isn't fulfilled within this amount of time after the `reservationTime`, then it expires. The maximum value is 14400.	Optional	51.0
`externalRefId`	String	External reference ID.	Optional	51.0
`reservationTime`	String	The time at which to record the reservation. Example: 2020-07-24T21:13:00Z	Optional	51.0

ConnectApi.OCICreateReservationSingleInputRepresentation

A quantity of a product and an Omnichannel Inventory location or location group at which to reserve it.

Property	Type	Description	Required or Optional	Available Version
`locationGroupIdentifier`	String	Identifier of the location group at which to reserve inventory.	Either locationGroupIdentifier or locationIdentifier is required, but not both	51.0

Property	Type	Description	Required or Optional	Available Version
locationIdentifier	String	Identifier of the location at which to reserve inventory.	Either locationGroupIdentifier or locationIdentifier is required, but not both	51.0
quantity	Double	The quantity of the product to reserve.	Required	51.0
stockKeepingUnit	String	The SKU of the product to reserve.	Required	51.0

ConnectApi.OCIFulfillReservationInputRepresentation

A list of inventory reservations to fulfill.

Property	Type	Description	Required or Optional	Available Version
fulfillmentRecords	List<ConnectApi.OCIFulfillReservationSingleInputRepresentation>	A list of inventory reservations. The list can include up to 100 elements.	At least one element is required.	51.0
reservationId	String	The ID of the inventory reservation.	Optional	58.0

ConnectApi.OCIFulfillReservationSingleInputRepresentation

An inventory reservation to fulfill.

Property	Type	Description	Required or Optional	Available Version
actionRequestId	String	A UUID that identifies the request. Use the action request IDs in response data to identify which requests succeeded or failed.	Required	51.0
externalRefId	String	The external reference ID of the location that's fulfilling the reservation.	Optional	51.0
locationIdentifier	String	The identifier of the location that's fulfilling the reservation.	Required	51.0
quantity	Double	The quantity being fulfilled.	Required	51.0
reservationId	String	The ID of the inventory reservation.	Optional	58.0
stockKeepingUnit	String	The SKU of the product being fulfilled.	Required	51.0

ConnectApi.OCIGetInventoryAvailabilityInputRepresentation

Details of a request to retrieve inventory availability.

Property	Type	Description	Required or Optional	Available Version
`locationGroupIdentifier`	String	The External Reference of a location group to retrieve inventory availability data for. Specifying this value retrieves inventory data for all locations belonging to this group.	Optional; can't combine with `locationGroupIdentifiers` or `locationIdentifiers`	51.0
`locationGroupIdentifiers`	List<String>	A list of up to 100 External References of location groups to retrieve inventory availability data for.	Optional; can't combine with `locationGroupIdentifier` or `locationIdentifiers`	51.0
`locationIdentifiers`	List<String>	A list of up to 100 External References of locations to retrieve inventory availability data for.	Optional; can't combine with `locationGroupIdentifier` or `locationGroupIdentifiers`	51.0
`stockKeepingUnit`	String	The SKU of a product to retrieve inventory availability data for. Specifying a SKU with no locations or location groups returns availability data for that SKU at all inventory locations that aren't assigned to location groups.	Optional; can't combine with `stockKeepingUnits`	51.0
`stockKeepingUnits`	List<String>	A list of up to 100 SKUs of products to retrieve inventory availability data for.	Optional; can't combine with `stockKeepingUnit`	51.0
`useCache`	Boolean	Whether to fetch the inventory data from the cache. The default value is True..	Optional	51.0

ConnectApi.OCIReleaseReservationInputRepresentation

Details of one or more inventory reservations to release.

Property	Type	Description	Required or Optional	Available Version
`releaseRecords`	List<`ConnectApi.OCIReleaseReservationSingleInputRepresentation`>	List of inventory reservations to release. The list can include up to 100 elements.	At least one element is required.	51.0
`reservationId`	String	The ID of the inventory reservation.	Optional	58.0

ConnectApi.OCIReleaseReservationSingleInputRepresentation

A single inventory reservation to release.

Property	Type	Description	Required or Optional	Available Version
`actionRequestId`	String	A UUID that identifies the request. Use the action request IDs in response data to identify which requests succeeded or failed.	Required	51.0
`externalRefId`	String	The external reference ID of the location or location group that has the reservation.	Optional	51.0
`locationGroupIdentifier`	String	The identifier of the location group that has the reservation.	The identifier for a location or location group, but not both, is required.	51.0
`locationIdentifier`	String	The identifier of the location that has the reservation.	The identifier for a location or location group, but not both, is required.	51.0
`quantity`	Double	The quantity of reserved inventory to release.	Required	51.0
`reservationId`	String	The ID of the inventory reservation.	Optional	58.0
`stockKeepingUnit`	String	The SKU of the product to release.	Required	51.0

ConnectApi.OCITransferReservationInputRepresentation

A list of inventory reservation transfers and specifies whether a single failure cancels the entire list.

Property	Type	Description	Required or Optional	Available Version
`allOrNothing TransferId`	String	Controls whether a single failed transfer cancels all other transfers in the `transferRecords` list. • To allow some transfers in the `transferRecords` list to succeed when others fail, don't include this property. • To cancel all the transfers in the `transferRecords` list when any of them fail, set this property to a UUID. The ID must be unique, but isn't otherwise used in this version.	Optional	51.0
`reservationId`	String	The ID of the inventory reservation.	Optional	58.0

Property	Type	Description	Required or Optional	Available Version
transferRecords	List<ConnectApi.OCITransferReservationSingleInputRepresentation>	A list of inventory reservation transfers. The list can include up to 100 elements.	At least one element is required.	51.0

ConnectApi.OCITransferReservationSingleInputRepresentation

An inventory reservation transfer.

Property	Type	Description	Required or Optional	Available Version
actionRequestId	String	A UUID that identifies the request. Use the action request IDs in response data to identify which requests succeeded or failed.	Required	51.0
externalRefId	String	The external reference ID of the location receiving the transfer.	Optional	51.0
fromLocationGroupIdentifier	String	The identifier of the location group sending the reservation.	The identifier for a sending location or location group, but not both, is required	51.0
fromLocationIdentifier	String	The identifier of the location sending the reservation.	The identifier for a sending location or location group, but not both, is required	51.0
ignoreAvailabilityCheck	Boolean	If true, force the transfer even if the receiving location doesn't have sufficient available inventory. The default value is false.	Optional	52.0
quantity	Double	The quantity of inventory being transferred.	Required	51.0
reservationId	String	The ID of the inventory reservation.	Optional	58.0
stockKeepingUnit	String	The SKU of the product being transferred.	Required	51.0
toLocationGroupIdentifier	String	The identifier of the location group receiving the reservation.	The identifier for a receiving location or location group, but not both, is required	51.0
toLocationIdentifier	String	The identifier of the location receiving the reservation.	The identifier for a receiving location or location group, but not both, is required	51.0

ConnectApi.OrderItemSummaryInputRepresentation

An OrderItemSummary and quantity.

Property	Type	Description	Required or Optional	Available Version
`orderItemSummaryId`	String	ID of the OrderItemSummary.	Required	48.0
`quantity`	Double	Quantity to include.	Required	48.0

SEE ALSO:

- ConnectApi.FulfillmentGroupInputRepresentation
- ConnectApi.FulfillmentOrderInputRepresentation
- createFulfillmentOrders(fulfillmentOrderInput)

ConnectApi.OrderItemSummaryAdjustmentInput

Order item summary.

Property	Type	Description	Required or Optional	Available Version
`orderItemSummaryId`	String	ID of the order item summary.	Required	53.0

SEE ALSO:

- ConnectApi.OrderItemSummaryAdjustmentCollectionInput

ConnectApi.OrderItemSummaryAdjustmentCollectionInput

Collection of order item summaries.

Property	Type	Description	Required or Optional	Available Version
`orderItemSummaries`	List<`ConnectApi.OrderItemSummaryAdjustmentInput`>	List of order item summaries.	Required	53.0

ConnectApi.OrderSummaryInputRepresentation

An order from which to create an OrderSummary. Optionally, you can specify OrderSummary-specific information such as its Status and whether it is managed in Salesforce Order Management.

Property	Type	Description	Required or Optional	Available Version
`businessModel`	String	The order's business model. It can have one of these values: • B2B • B2C	Optional	53.0
`externalReferenceIdentifier`	String	Used internally to prevent duplicate records. This value is case-sensitive.	Optional	56.0
`name`	String	Specifies an OrderNumber to assign to the order summary.	Optional	50.0
`orderId`	String	ID of the original order.	Required	48.0
`orderLifeCycleType`	String	Specifies whether the order is managed in Salesforce Order Management or by an external system. It can have one of these values: • `MANAGED`—Managed in Salesforce Order Management. • `UNMANAGED`—Managed by an external system. If no value is specified, the default is `MANAGED`.	Optional	49.0
`sourceProcess`	String	Describes the order process creating the OrderSummary. It can have one of these values: • `OrderOnBehalf`—An Order on Behalf Of process. • `Standard`—Any process other than Order on Behalf Of. If no value is specified, the default is `Standard`.	Optional	57.0
`status`	String	Specifies a status to assign to the order summary. The value must match one of the picklist values on the Status field of the OrderSummary object.	Optional	50.0

SEE ALSO:

createOrderSummary(orderSummaryInput)

ConnectApi.OrderSummaryAdjustmentAggregatesAsyncInput

Order summary IDs for calculating adjustment aggregates.

Property	Type	Description	Required or Optional	Available Version
orderSummaryIds	List< String>	List of order summary IDs.	Required	55.0

ConnectApi.OrderSummaryLookupInput

Order summary lookup input.

Property	Type	Description	Required or Optional	Available Version
orderSummaryIdOrRefNumber	String	Either the order summary ID or reference number value.	Required	58.0
verification	ConnectApi.OrderSummaryVerificationInput	Verification attributes for guest shoppers.	Optional	58.0

ConnectApi.OrderSummaryVerificationInput

Order summary verification input.

Property	Type	Description	Required or Optional	Available Version
email	String	Guest shopper or registered buyer's email address.	Optional	58.0
lastName	String	Guest shopper or registered buyer's last name.	Optional	58.0
phoneNumber	String	Guest shopper or registered buyer's phone number.	Optional	58.0

ConnectApi.OrderToCartInput

Input for action adding an order to a cart.

Property	Type	Description	Required or Optional	Available Version
cartStateOrId	String	Cart state (`active` or `current`) or the ID of the cart to which the products from an order are to be copied.	Required	57.0

ConnectApi.PaymentGroupRequest

Payment group input consumed by a payment group service.

Property	Type	Description	Required or Optional	Available Version
createPaymentGroup	Boolean	Specifies whether Salesforce needs to create a payment group (true) or not (false).	Optional	50.0
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the payment group record.	Optional	50.0
id	String	ID of the payment group record.	Optional	50.0
sourceObjectId	String	Source object ID of the payment group record. Supports only OrderId.	Optional	50.0

ConnectApi.PaymentInfoInputRepresentation

Payment information about additional funds required for an order.

Property	Type	Description	Required or Optional	Available Version
lastPaymentGatewayLogId	String	Last payment gateway log ID for the new order payment summary.	Optional	60.0
name	String	Overrides the default name of the order payment summary created.	Optional	60.0
paymentAuthorizationId	String	Payment authorization ID to be used if needed to fund the exchange order.	Optional	60.0
paymentIds	List<String>	Payment IDs for the new order payment summary.	Optional	60.0
paymentMethodId	String	Payment method ID for the new order payment summary.	Optional	60.0

ConnectApi.PaymentMethodTokenizationRequest

Payment method tokenization input consumed by the payment tokenization service.

Subclass of ConnectApi.BaseRequest.

Property	Type	Description	Required or Optional	Available Version
address	ConnectApi.AddressRequest	Address of the payment method.	Required	52.0

Property	Type	Description	Required or Optional	Available Version
cardPaymentMethod	ConnectApi.CardPaymentMethodRequest	Object representation of the card payment method.	Required	52.0
paymentGatewayId	String	ID of the card payment method's payment gateway.	Required	52.0

ConnectApi.PhotoInput

Specify how to crop a photo that has already been uploaded.

Property	Type	Description	Available version
cropSize	Integer	The length, in pixels, of any edge of the crop square.	29.0
cropX	Integer	The position X, in pixels, from the left edge of the image to the start of the crop square. Top left is position (0,0).	29.0
cropY	Integer	The position Y, in pixels, from the top edge of the image to the start of the crop square. Top left is position (0,0).	29.0
fileId	String	18 character ID of an existing file. The key prefix must be 069 and the file must be an image and be smaller than 2 GB. Note: Images uploaded on the Group page and on the User page don't have file IDs and therefore can't be used.	25.0
versionNumber	Integer	Version number of the existing content. If not provided, the latest version is used.	25.0

ConnectApi.PinCapabilityInput

Pin or unpin a feed element to a feed.

Property	Type	Description	Required or Optional	Available Version
entityId	String	ID of the entity to pin or unpin. In version 41.0 and later, entityId must be a feed	Required	41.0

Property	Type	Description	Required or Optional	Available Version
		item ID. In version 41.0–42.0, only one feed item can be pinned per feed. In version 43.0 and later, three feed items can be pinned per feed.		
`isPinned`	Boolean	Specifies whether to pin (`true`) or unpin (`false`) the entity.	Required	41.0

ConnectApi.PollCapabilityInput

Create, update, or vote on a poll on a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`choices`	List<String>	The choices used to create a new poll. You must specify 2–10 poll choices for each poll.	Required for creating a poll	32.0
`myChoiceId`	String	ID of an existing choice on the feed poll. Used to vote on an existing poll.	Required for voting on a poll	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.PostAuthRequest

Payment post authorization input consumed by the payment post authorization service.

Subclass of ConnectApi.BaseRequest.

Property	Type	Description	Required or Optional	Available Version
`accountId`	String	ID of the account of the customer for the authorized payment.	Required	54.0
`amount`	Double	Amount of the post authorization.	Required	54.0
`comments`	String	Comments for payment post authorization. Maximum of 1000 characters.	Optional	54.0
`currencyIsoCode`	String	Three-letter ISO 4217 currency code associated with the payment group record.	Optional	54.0
`effectiveDate`	Datetime	Date that the payment post authorization occurs.	Required	54.0

Property	Type	Description	Required or Optional	Available Version
paymentGatewayId	String	Payment gateway that evaluates the post authorization.	Required	54.0
paymentGroup	ConnectApi.PaymentGroupRequest	Payment group associated with or to be created for the request. Request must contain either a paymentGroupId or paymentGroup, but not both.	Optional	54.0
paymentMethod	ConnectApi.PostAuthApiPaymentMethodRequest	Payment method sent for the post authorization.	Required.	54.0

ConnectApi.PostAuthApiPaymentMethodRequest

Payment method input for post authorization.

Subclass of ConnectApi.BaseApiPaymentMethodRequest.

Property	Type	Description	Required or Optional	Available Version
alternativePaymentMethod	ConnectApi.AlternativePaymentMethod	Alternative payment method.	Required	54.0
cardPaymentMethod	ConnectApi.CardPaymentMethodRequest	Card payment method.	Required	54.0

ConnectApi.PreviewCartToExchangeOrderInputRepresentation

Information required to preview a cart to exchange order.

Property	Type	Description	Required or Optional	Available Version
exchangeCartId	String	ID of the cart used for adding items to the exchange order.	Required	60.0
orderSummaryId	String	Order summary ID.	Required	60.0
referenceId	String	Return order ID.	Required	60.0

ConnectApi.PricingInput

Pricing for multiple products.

Property	Type	Description	Required or Optional	Available Version
pricingLineItems	List<ConnectApi.PricingLineItemInput>	Up to 500 line items for pricing.	Required	49.0

ConnectApi.PricingLineItemInput

Pricing line item.

Property	Type	Description	Required or Optional	Available Version
productId	String	ID of the product to price.	Required	49.0

SEE ALSO:

ConnectApi.PricingInput

ConnectApi.ProductSearchGroupingInput

Grouping information for product search results.

Property	Type	Description	Required or Optional	Available Version
groupingOption	ConnectApi.CommerceSearchGroupingOption	Grouping option for search results. Values are: • NoGrouping—Search results aren't grouped. • VariationParent—Search results are grouped by the variation parent.	Required	52.0
topProductType	ConnectApi.CommerceSearchTopProductType	Type of the top product to return for each product group in search results. Value is: • VariationParent If NoGrouping is specified for groupingOption, topProductType is ignored.	Optional	52.0

ConnectApi.ProductSearchInput

Product search.

Property	Type	Description	Required or Optional	Available Version
`categoryId`	String	Category ID returns results for products in this category or its subcategories.	Required if `searchTerm` isn't specified	52.0
`fields`	List<String>	Product fields to return in search results. Search results include fields you have access to. If unspecified, returns the `Name`, `Description`, `StockKeepingUnit`, `ProductCode`, and `Family` fields.	Optional	52.0
`grouping`	`ConnectApi.ProductSearchGroupingInput`	Specifies whether to group products in search results and how to group them. If unspecified, the default is the value specified in **Search** > **Results Display Settings** > **Results Grouping**.	Optional	52.0
`includePrices`	Boolean	Specifies whether to include prices for products in search results (`true`) or not (`false`). If unspecified, defaults to `false`.	Optional	52.0
`includeQuantityRule`	Boolean	Specifies whether to include purchase quantity rule information for products in search results (`true`) or not (`false`). If unspecified, defaults to `false`.	Optional	52.0
`page`	Integer	Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.	Optional	52.0
`pageSize`	Integer	Specifies the number of items per page. Valid values are from 1 through 200. If unspecified, the default is the value specified in Results per Page in **Search** > **Results Display Settings**.	Optional	52.0
`refinements`	List<`ConnectApi.RefinementInput`>	List up to nine refinements (facets) for search results. Buyers or shoppers can select up to 20 values for each refinement.	Optional	52.0
`searchTerm`	String	List of up to 32 space-separated search terms.	Required if `categoryId` isn't specified	52.0
`sortRuleId`	String	ID of the sort rule that specifies the order of products in the search results.	Optional	52.0

ConnectApi.PromotionCartInput

Cart during promotion evaluation.

Property	Type	Description	Required or Optional	Available Version
`cartItems`	List<`ConnectApi.PromotionCartItemInput`>	A collection of items in the cart.	Required	57.0
`currencyIsoCode`	String	Three-letter ISO 4217 currency code associated with the cart.	Required for multi-currency orgs	57.0
`id`	String	ID of the cart.	Optional	57.0

SEE ALSO:

ConnectApi.PromotionEvaluateInput

evaluate(salesTransaction)

ConnectApi.PromotionCartDeliveryGroupInput

IDs of the cart delivery group and its delivery method.

Property	Type	Description	Required or Optional	Available Version
`cartDeliveryGroupId`	String	ID of the cart delivery group.	Required	57.0
`deliveryMethodId`	String	ID of the order delivery method.	Required	57.0

SEE ALSO:

ConnectApi.PromotionEvaluateInput

evaluate(salesTransaction)

ConnectApi.PromotionCartItemInput

Item in a cart during promotion evaluation.

Property	Type	Description	Required or Optional	Available Version
`cartDeliveryGroupId`	String	ID of the cart delivery group.	Required when evaluating shipping promotions	57.0
`cartId`	String	ID of the cart.	Optional	57.0
`id`	String	ID of the cart item. Must be unique across all items in the cart.	Required	57.0
`itemDescription`	String	Description of the cart item.	Optional	57.0

Property	Type	Description	Required or Optional	Available Version
`itemName`	String	Name of the cart item.	Optional	57.0
`listPrice`	String	List price of the cart item.	Optional	57.0
`product2Id`	String	Product ID of the cart item.	Required if `sku` isn't specified	57.0
`quantity`	String	Number of items in the cart.	Required	57.0
`salesPrice`	String	Sales price of the cart item. This is the price per quantity and the value used to compute the discount. If `salesPrice` and `totalLineBaseAmount` are specified, `totalLineBaseAmount` is used.	Required if `totalLineBaseAmount` isn't specified	57.0
`sku`	String	Stock keeping unit (SKU) of the cart item.	Required if `product2Id` isn't specified	57.0
`totalLineBaseAmount`	String	Total amount for the cart item, equal to sales price multiplied by quantity. This value is used to compute the discount. If `salesPrice` and `totalLineBaseAmount` are specified, `totalLineBaseAmount` is used.	Required if `salesPrice` isn't specified	57.0
`totalListBaseAmount`	String	Total amount for the cart item based on list price and quantity.	Optional	57.0
`type`	`ConnectApi.CartItemType`	Type of item in a cart. Values are: • `DeliveryCharge` • `Product`	Required when evaluating shipping promotions	57.0

SEE ALSO:

ConnectApi.PromotionCartInput
ConnectApi.PromotionEvaluateInput
evaluate(salesTransaction)

ConnectApi.PromotionEvaluateInput

Find promotions that the customer is eligible for and compute their discounts.

Property	Type	Description	Required or Optional	Available Version
`cart`	`ConnectApi.PromotionCartInput`	Cart and its items.	Required	57.0

Property	Type	Description	Required or Optional	Available Version
`cartDeliveryGroups`	<redacted>	List of cart delivery groups associated with the items in the cart. Available if shipping promotions are enabled.	Required when evaluating shipping promotions	57.0
`couponCodes`	List<String>	List of coupon codes to enable promotions. A customer can apply a maximum of two coupons per cart.	Optional	57.0
`effectiveAccountId`	String	ID of the account for which the request is made.	Required if `segments` isn't specified	57.0
`isItemizeHeaderAdjustments`	Boolean	Specifies whether order-level adjustments are itemized (`true`) or not (`false`). If unspecified, the default value is `false`.	Optional	57.0
`parentProducts`	<redacted>	Map of the parent product ID to its variation product IDs.	Optional	57.0
`productCategories`	<redacted>	Map of product IDs to their associated category IDs.	Optional	57.0
`segments`	List<String>	All promotions associated with promotion segments specified in this list are active and can be evaluated against the cart. Additionally, any segments associated with a store or buyer group are also still evaluated against the cart. If this field is not present, only the promotions associated with a store or buyer group are evaluated.	Optional	57.0
`webStoreId`	String	ID of the store for which the request is made. If unspecified, defined segments must be used instead.	Optional	57.0

SEE ALSO:

evaluate(salesTransaction)

ConnectApi.PromotionParentProductsInput

IDs of a parent product and variation product.

Property	Type	Description	Required or Optional	Available Version
`childProductId`	String	ID of the variation product.	Required	57.0

Property	Type	Description	Required or Optional	Available Version
`parentProductId`	String	ID of the parent product.	Required	57.0

SEE ALSO:

ConnectApi.PromotionEvaluateInput

evaluate(salesTransaction)

ConnectApi.PromotionProductCategoriesInput

IDs of a product and associated category.

Property	Type	Description	Required or Optional	Available Version
`categoryId`	String	ID of the category.	Required	57.0
`productId`	String	ID of the product.	Required	57.0

SEE ALSO:

ConnectApi.PromotionEvaluateInput

evaluate(salesTransaction)

ConnectApi.QuantityWithSkuInputRepresentation

A quantity of a product.

Property	Type	Description	Required or Optional	Available Version
`quantity`	Double	Quantity of the product.	Required	51.0
`stockKeepingUnit`	String	SKU of the product.	Required	51.0

ConnectApi.QuestionAndAnswersCapabilityInput

Create or edit a question feed element or set the best answer of the existing question feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`bestAnswerId`	String	A comment ID to use as a best answer for a question feed element. The best answer comment must already exist on the question feed element.	Required to update a feed element. Not supported when posting a feed element.	32.0
`questionTitle`	String	Title for a question feed element. To edit the title of a question, use `updateFeedElement(communityId, feedElementId, feedElement)`. Editing question titles is supported in version 34.0 and later.	Required to post a feed element. Not supported when updating a feed element.	32.0

SEE ALSO:

- Edit a Question Title and Post
- ConnectApi.FeedElementCapabilitiesInput

ConnectApi.RankAverageDistanceInputRepresentation

An order recipient's geographic location and information about sets of inventory locations that can fulfill the order.

Property	Type	Description	Required or Optional	Available Version
`deliveryCountryCode`	String	The country code of the order recipient.	Required	51.0
`deliveryPostalCode`	String	The postal code of the order recipient.	Required	51.0
`distanceUnit`	String	Specify *`mi`* or *`km`* to return average distances in miles or kilometers, respectively.		51.0
`sortResult`	String	Specify *`ASC`* or *`DESC`* to rank the results by average shipping distance in ascending or descending order, respectively.		51.0
`targetLocations`	List<`ConnectApi.TargetLocationInputRepresentation`>	Each element is a set of inventory locations that can combine to fulfill the order.	At least one element is required	51.0

ConnectApi.ReadByCapabilityInput

Mark feed elements as read by the context user.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`isReadByMe`	Boolean	Specifies to mark the feed element as read (`true`) for the context user.	Required	40.0
`lastReadDateByMe`	Datetime	Specifies the last date, in ISO 8601 format, when the feed element is marked as read for the context user. If you don't specify a date or you specify a future date, the current system date is used.	Optional	40.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.SequenceOrderPaymentSummaryInputRepresentation

Amount to apply to specified OrderPaymentSummary as part of a payment or refund.

Property	Type	Description	Required or Optional	Available Version
`amount`	Double	Amount to apply to the OrderPaymentSummary.	Optional	56.0
`orderPaymentSummaryId`	String	ID of the OrderPaymentSummary to apply the Amount to.	Required	56.0

SEE ALSO:

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

ConnectApi.EnsureRefundsAsyncInputRepresentation

ConnectApi.sharedOrderPaymentSummarySequenceInputRepresentation

Shared order payment summary sequence.

Property	Type	Description	Required or Optional	Available Version
`orderPaymentSummaryId`	String	Shared order payment summary ID.	Required	60.0
`reservedBalanceAmount`	Double	Balance amount to be reserved.	Required	60.0

ConnectApi.SubmitCartToExchangeOrderInputRepresentation

Information required for a submit cart to exchange order action.

Property	Type	Description	Required or Optional	Available Version
exchangeCartId	String	ID of the cart used for adding items to the exchange order.	Required	60.0
orderNumber	String	Order number.	Optional	60.0
orderSummaryId	String	Order summary ID.	Required	60.0
paymentInfoList	[illegible] on page 1820>	List of payment information when additional funds are needed for the newly created exchange order.	Optional	60.0
referenceId	String	Return order ID.	Optional	60.0
sequences	[illegible] on page 1831>	Ordered list of order payment summaries and reserved balance amounts to apply them to.	Optional	60.0

ConnectApi.RecipientEngagementContextInput

Context based on which the survey invitation is sent to a participant.

Property	Type	Description	Required or Optional	Available Version
recipientEngagementContext	Map<String, String>	Map each recipient with the context based on which the survey invitation is emailed.	Required	50.0
recipientId	String	Participant ID with whom the engagement context should be associated.	Required	50.0

SEE ALSO:

ConnectApi.SurveyInvitationEmailInput

ConnectApi.RecommendationAudienceInput

A custom recommendation audience.

Property	Type	Description	Required or Optional	Available Version
criteria	[illegible]	The criteria for the custom recommendation audience type.	Optional If not specified when creating a recommendation audience, the audience criteria	36.0

Property	Type	Description	Required or Optional	Available Version
			type defaults to custom list.	
memberOperationType	ConnectApi.RecommendationAudienceMemberOperationType	**Important:** This property is available only in version 35.0. In version 36.0 and later, use ConnectApi.CustomListAudienceCriteriaInput. The operation to carry out on the audience members. • Add—Adds specified members to the audience. • Remove—Removes specified members from the audience.	Required to update a recommendation audience Don't use or specify null to create a recommendation audience	35.0 only
members	List<String>	**Important:** This property is available only in version 35.0. In version 36.0 and later, use ConnectApi.CustomListAudienceCriteriaInput. A collection of user IDs. When updating an audience, you can include up to 100 members. An audience can have up to 100,000 members, and each Experience Cloud site can have up to 100 audiences.	Required to update a recommendation audience Don't use or specify null to create a recommendation audience	35.0 only
name	String	The unique name of the custom recommendation audience.	Optional to update a recommendation audience Required to create a recommendation audience	35.0

SEE ALSO:

createRecommendationAudience(communityId, recommendationAudience)

ConnectApi.RecommendationDefinitionInput

A custom recommendation definition.

Property	Type	Description	Required or Optional	Available Version
`actionUrl`	String	URL for acting on the custom recommendation, for example, the URL to join a group.	Required to create a recommendation definition Optional to update a recommendation definition	35.0
`actionUrlName`	String	Text label for the action URL in the user interface, for example, "Launch."	Required to create a recommendation definition Optional to update a recommendation definition	35.0
`explanation`	String	Explanation, or body, of the custom recommendation.	Required to create a recommendation definition Optional to update a recommendation definition	35.0
`name`	String	Name of the custom recommendation definition. The name is displayed in Setup.	Required to create a recommendation definition Optional to update a recommendation definition	35.0
`title`	String	Title of the custom recommendation definition.	Optional	35.0

SEE ALSO:

createRecommendationDefinition(communityId, recommendationDefinition)

ConnectApi.RecommendationReactionInput

A reaction to a recommendation produced by a recommendation strategy.

Property	Type	Description	Required or Optional	Available Version
`aiModel`	String	Reserved for future use.	Optional	47.0

Property	Type	Description	Required or Optional	Available Version
`contextRecordId`	String	ID of the context record. For example, if the next best action is on a case detail page, the ID of the case.	Optional	45.0
`executionId`	String	ID of the original recommendation strategy execution.	Optional	45.0
`externalId`	String	External ID of the recommendation. This ID doesn't need to be a Salesforce 18-character ID. For example, it can be a product number from an external system.	Optional	46.0
`onBehalfOfId`	String	ID of the user or entity for which the reaction took place.	Optional	45.0
`reactionType`	`ConnectApi.RecommendationReactionType`	Type of reaction to a recommendation. Values are: • `Accepted` • `Rejected`	Required	45.0
`recommendationMode`	String	Reserved for future use.	Optional	46.0
`recommendationScore`	Double	Reserved for future use.	Optional	46.0
`strategyName`	String	Name of the recommendation strategy.	Required	45.0
`targetActionId`	String	ID of the target action.	Optional	45.0
`targetActionName`	String	Name of the target action.	Required	45.0
`targetId`	String	ID of the recommendation that is being reacted to.	Required	45.0

ConnectApi.RecordCapabilityInput

Attach an existing knowledge article to a comment.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`recordId`	String	ID of the existing knowledge article to attach.	Required	42.0

ConnectApi.RecordsetFilterCriteriaInput

A set of recordset filter criteria applied to records, such as service appointment records.

Property	Type	Description	Required or Optional	Available Version
`criteriaIds`	List<String>	Recordset filter criteria IDs.	Required	53.0
`enforceSharing`	Boolean	Determines whether record sharing checks are enforced (`true`) or not (`false`) during the execution of this call.	Optional	53.0
`filteredObjectName`	String	Object that the filter is applied to.	Required	53.0
`recordIds`	List<String>	List of record IDs of the filtered object.	Required	53.0

ConnectApi.ReferencedRefundRequest

Referenced refund input.

Subclass of ConnectApi.RefundRequest.

Property	Type	Description	Required or Optional	Available Version
`accountId`	String	ID of the account linked to the referenced refund request.	Optional	50.0
`amount`	Double	Amount refunded.	Required	50.0
`clientContext`	String	Context for payment APIs. Used for a payment caller to re-establish context.	Optional	50.0
`comments`	String	Optional comments for the refund.	Optional	50.0
`effectiveDate`	Datetime	Date when the refund becomes effective.	Optional	50.0
`paymentGroup`	`ConnectApi.PaymentGroupRequest`	Payment group details associated with the refund request.	Optional	50.0

ConnectApi.RefinementInput

Attribute-based refinement input for product search.

This class is abstract and is a superclass of ConnectApi.DistinctValueRefinementInput.

Property	Type	Description	Required or Optional	Available Version
`attributeType`	`ConnectApi.CommerceSearchAttributeType`	Search attribute type. • `Custom` • `ProductAttribute`	Required	52.0

Property	Type	Description	Required or Optional	Available Version
		• `Standard`		
`nameOrId`	String	Developer name of the attribute. In version 52.0 and later, the ID of the attribute isn't supported.	Required	52.0
`type`	`ConnectApi.CommerceSearchFacetType`	Search facet type. Value is: • `DistinctValue`	Required	52.0

ConnectApi.RefundRequest

Refund input.

This class is abstract.

Subclass of ConnectApi.BaseRequest.

No additional properties.

Superclass of ConnectApi.ReferencedRefundRequest.

ConnectApi.ReleaseHeldFOCapacityInputRepresentation

Request to release held fulfillment order capacity at one or more locations. Can correspond to one action call.

Property	Type	Description	Required or Optional	Available Version
`releaseHeldFOCapacityRequests`	List<`ConnectApi.ReleaseHeldFOCapacityRequestInputRepresentation`>	List of requests to release held fulfillment order capacity at one or more locations.	Required	55.0

ConnectApi.ReleaseHeldFOCapacityRequestInputRepresentation

Request to release held fulfillment order capacity at one or more locations.

Property	Type	Description	Required or Optional	Available Version
`allOrNothing`	Boolean	Controls whether a single failed request cancels all other requests in the list (*`true`*) or whether some requests can succeed if others fail (*`false`*). The default value is *`false`*.	Optional	55.0

Property	Type	Description	Required or Optional	Available Version
capacityRequests	List<ConnectApi.CapacityRequestInputRepresentation>	List of requests to release held fulfillment order capacity. Each request is for capacity for one fulfillment order held at one location.	Required	55.0

ConnectApi.RequestHeaderInput

An HTTP request header name and value pair.

Property	Type	Description	Required or Optional	Available Version
name	String	The name of the request header.	Required	33.0
value	String	The value of the request header.	Required	33.0

SEE ALSO:

Define an Action Link and Post with a Feed Element

ConnectApi.ReturnItemsInputRepresentation

Data about products and delivery charges to return, as well as associated return fees.

Property	Type	Description	Required or Optional	Available Version
returnOrderItemDeliveryCharges	List<ConnectApi.ReturnOrderItemDeliveryChargeInputRepresentation>	List of ReturnOrderLineItems to return that represent delivery charges.	Optional	52.0
returnOrderItemFees	List<ConnectApi.ReturnOrderItemFeeInputRepresentation>	List of ReturnOrderLineItems to process that represent return fees.	Optional	56.0
returnOrderItems	List<ConnectApi.ReturnOrderItemInputRepresentation>	List of ReturnOrderLineItems to process that represent products, along with data about how to process them.	Required	52.0

SEE ALSO:

returnItems(returnOrderId, returnItemsInput)

ConnectApi.ReturnOrderInputRepresentation

Data for creating a ReturnOrder and ReturnOrderLineItems.

Property	Type	Description	Required or Optional	Available Version
orderSummaryId	String	ID of the OrderSummary containing the items to be returned. The OrderSummary's OrderLifeCycleType must be Managed.	Required	50.0
returnOrderLifeCycleType	String	The LifeCycleType of the ReturnOrder. Possible values are: • Managed—Process the ReturnOrder using the APIs and actions. It can generate change orders and affects financial fields and rollup calculations. • Unmanaged—The ReturnOrder is for tracking purposes only. It isn't involved in any financial calculations and doesn't generate any change orders. The system doesn't prevent the creation of duplicate ReturnOrderLineItems in an unmanaged ReturnOrder for the same OrderItem.	Required	51.0
returnOrderLineItems	List<ConnectApi.ReturnOrderLineItemInputRepresentation>	List of data for creating ReturnOrderLineItems.	At least one element is required	50.0
status	String	Status to assign the ReturnOrder. This value must match an entry in the ReturnOrder object's Status picklist.	Required	51.0

SEE ALSO:

createReturnOrder(returnOrderInput)

ConnectApi.ReturnOrderItemInputRepresentation

ID of a ReturnOrderLineItem and instructions for updating it. After the update, the ReturnOrderLineItem is read-only. Any remaining quantity to be returned is added to a new ReturnOrderLineItem.

Property	Type	Description	Required or Optional	Available Version
quantityReceived	Double	The quantity of the ReturnOrderLineItem that has been received. The value must be zero or greater. This value isn't used by any standard features, but is provided for use in customizations.	Required	52.0
quantityRejected	Double	The quantity of the ReturnOrderLineItem that has been rejected for return. The value	Required	52.0

Property	Type	Description	Required or Optional	Available Version
		must be zero or greater. This value isn't used by any standard features, but is provided for use in customizations.		
`quantityReturned`	Double	The quantity of the ReturnOrderLineItem that has been returned. The value must be greater than zero. If this value plus quantityToCancel is less than the expected return quantity, then the remaining quantity to be returned is added to a new ReturnOrderLineItem.	Required	52.0
`quantityToCancel`	Double	The quantity of the ReturnOrderLineItem to remove because it's not being returned. The value must be zero or greater. If this value plus quantityReturned is less than the expected return quantity, then the remaining quantity to be returned is added to a new ReturnOrderLineItem.	Required	52.0
`reasonForRejection`	String	The reason why the rejected quantity, if any, was rejected. This value isn't used by any standard features, but is provided for use in customizations.	Optional	52.0
`returnOrderLineItemId`	String	The ID of the ReturnOrderLineItem.	Required	52.0

SEE ALSO:

ConnectApi.ReturnItemsInputRepresentation

returnItems(returnOrderId, returnItemsInput)

ConnectApi.ReturnOrderItemDeliveryChargeInputRepresentation

ID of a ReturnOrderLineItem representing a delivery charge.

Property	Type	Description	Required or Optional	Available Version
`returnOrderLineItemId`	String	ID of a ReturnOrderLineItem to return.	Required	52.0

SEE ALSO:

ConnectApi.ReturnItemsInputRepresentation

returnItems(returnOrderId, returnItemsInput)

ConnectApi.ReturnOrderItemFeeInputRepresentation

ID of a ReturnOrderLineItem representing a return fee, and instructions for updating it. After the update, the ReturnOrderLineItem is read-only. Any remaining quantity of the fee to be processed is added to a new ReturnOrderLineItem.

Property	Type	Description	Required or Optional	Available Version
`quantityReturned`	Double	Quantity of the ReturnOrderLineItem to process. When the fee is a fixed amount, the charge is determined by multiplying the total fee amount by this value divided by the expected quantity. For example, if the fee amount is $10 and the expected quantity is 2, then if the `quantityReturned` is 1, $5 is charged. This value normally equals the quantity returned of the ReturnOrderLineItem for the returned item that the fee applies to. The value must be greater than zero. If this value plus `quantityToCancel` is less than the expected quantity, then the remaining quantity to be returned is added to a new ReturnOrderLineItem.	Required	56.0
`quantityToCancel`	Double	Quantity of the ReturnOrderLineItem to remove. This value normally equals the quantity canceled of the ReturnOrderLineItem for the returned item that the fee applies to. This value can also be used to cancel a portion of the fee. The value must be zero or greater. If this value plus `quantityReturned` is less than the expected quantity, then the remaining quantity to be returned is added to a new ReturnOrderLineItem.	Required	56.0
`returnOrderLineItemId`	String	ID of the ReturnOrderLineItem representing the return fee.	Required	56.0

SEE ALSO:

ConnectApi.ReturnItemsInputRepresentation

returnItems(returnOrderId, returnItemsInput)

ConnectApi.ReturnOrderLineItemInputRepresentation

Data for creating a ReturnOrderLineItem for an order item being returned, including data to create ReturnOrderLineItems representing any return fees associated with it.

Property	Type	Description	Required or Optional	Available Version
canReduceShipping	Boolean	Whether to refund any associated shipping charge.	Required	50.0
orderItemSummaryId	String	ID of the associated OrderItemSummary. If the OrderItemSummary already has an associated ReturnOrderLineItem, then you must specify a different reasonForReturn. Duplicating the reason breaks the financial calculations.	Required	50.0
quantityExpected	Double	Quantity expected to be returned. This value also applies to any fees specified in returnOrderLineItemFees.	Required	50.0
quantityReceived	Double	Quantity already physically returned.	Optional	50.0
reasonForReturn	String	Reason for the return. The value must match an entry in both the OrderSummaryChange Reason field and the ReturnOrderLineItem object's ReasonForReturn picklist.	Required if the returnOrder LifeCycleType is MANAGED.	50.0
returnOrder LineItemFees	List<ConnectApi. ReturnOrder LineItemFee InputRepresentation>	List of input data for return fees associated with the order item being returned. A ReturnOrderLineItem of Type Fee is created to represent each fee.	Optional	56.0

SEE ALSO:

ConnectApi.ReturnOrderInputRepresentation

createReturnOrder(returnOrderInput)

ConnectApi.ReturnOrderLineItemFeeInputRepresentation

Data for creating a ReturnOrderLineItem that represents a return fee.

Property	Type	Description	Required or Optional	Available Version
amount	Double	Value used to calculate the fee amount, as described by the amountType. It must be a positive value.	Required	56.0
amountType	String	Describes how the fee amount is calculated. It can have one of these values: • AmountWithTax—Value of amount is the fee amount, including tax.	Required	56.0

Property	Type	Description	Required or Optional	Available Version
		• `AmountWithoutTax`—Value of `amount` is the fee amount, not including tax. Tax is calculated on the value and added. • `Percentage`—Value of `amount` is a percentage. To determine the fee amount, `amount` is divided by 100, and then multiplied by the TotalPrice and TotalTaxAmount of the associated OrderItemSummary, prorated for the quantity being returned. • `PercentageGross`—Value of `amount` is a percentage. To determine the fee amount, `amount` is divided by 100, and then multiplied by the TotalLineAmountWithTax of the associated OrderItemSummary, prorated for the quantity being returned.		
`description`	String	Description of the fee.	Required	56.0
`product2Id`	String	ID of the product representing the fee.	Required	56.0
`reason`	String	Reason for the fee. The value must match an entry in the ReturnOrderLineItem object's ReasonForReturn picklist.	Required	56.0

SEE ALSO:

ConnectApi.ReturnOrderInputRepresentation

createReturnOrder(returnOrderInput)

ConnectApi.ReturnOrderLineItemInputRepresentation

ConnectApi.SaleRequest

Payment sale input consumed by the payment sale service.

Subclass of ConnectApi.BaseRequest.

Property	Type	Description	Required or Optional	Available Version
`accountId`	String	Reference to account.	Required	54.0
`amount`	Double	The amount of the sale request.	Required	54.0
`comments`	String	Optional comment for the sale request.	Optional	54.0

Property	Type	Description	Required or Optional	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the payment output.	Required	54.0
effectiveDate	Datetime	Date that the sale request takes effect.	Required	54.0
paymentGatewayId	String	The payment gateway that receives the sale request.	Required	54.0
paymentGroup	ConnectApi.PaymentGroupRequest	Payment group information for the sale request.	Optional	54.0
paymentMethod	ConnectApi.SaleApiPaymentMethodRequest	Payment method used within the sale request.	Reqiured	54.0

ConnectApi.SaleApiPaymentMethodRequest

Payment method request for sale.

Subclass of ConnectApi.BaseApiPaymentMethodRequest.

Property	Type	Description	Required or Optional	Available Version
cardPaymentMethod	ConnectApi.CardPaymentMethodRequest	Payment method used in a sale request.	Required	54.0

ConnectApi.ScheduledRecommendationInput

A scheduled custom recommendation.

Property	Type	Description	Required or Optional	Available Version
channel	ConnectApi.RecommendationChannel	A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are: • CustomChannel1—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear. • CustomChannel2—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.	Optional for creating a scheduled recommendation If not specified, defaults to DefaultChannel. Don't use when updating a scheduled recommendation	36.0

Property	Type	Description	Required or Optional	Available Version
		• `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder. Use these channel values; you can't rename or create other channels.		
`enabled`	Boolean	Indicates whether scheduling is enabled. If `true`, the custom recommendation is enabled and appears in Experience Cloud sites. If `false`, custom recommendations in feeds in Salesforce mobile web aren't removed, but no new custom recommendations appear. In Customer Service and Partner Central sites, disabled custom recommendations no longer appear.	Optional	35.0
`rank`	Integer	Relative rank of the scheduled custom recommendation indicated by ascending whole numbers starting with 1. Setting the rank is comparable to an insertion into an ordered list. The scheduled custom recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled custom recommendations after it is pushed down.	Optional	35.0

Property	Type	Description	Required or Optional	Available Version
		See Ranking scheduled custom recommendations example. If the specified `rank` is larger than the size of the list, the scheduled custom recommendation is put at the end of the list. The `rank` of the scheduled custom recommendation is the size of the list, instead of the one specified. If a `rank` is not specified, the scheduled custom recommendation is put at the end of the list.		
`recommendationAudienceId`	String	ID of the audience for this scheduled custom recommendation.When updating a scheduled custom recommendation, specify `ALL` to remove the association between a custom recommendation audience and a scheduled custom recommendation.	Optional	35.0
`recommendationDefinitionId`	String	ID of the custom recommendation definition that this scheduled recommendation schedules.	Required to create a scheduled recommendation You can't specify a `recommendationDefinitionId` when updating a scheduled recommendation.	35.0

Ranking scheduled custom recommendations example

If you have these scheduled custom recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Custom Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

SEE ALSO:

createScheduledRecommendation(communityId, scheduledRecommendation)

ConnectApi.SellerDetailsRequest

Seller details for the tax calculation

Property	Type	Description	Required or Optional	Available Version
`code`	String	Code used to identify the seller of the taxed items.		55.0

ConnectApi.ServiceAppointmentInput

Contains information about the service appointment.

Property	Type	Description	Required or Optional	Available Version
`additionalInformation`	String	Additional details about the service appointment.	Optional	53.0
`appointmentMode`	ConnectApiSvcApptModeEnum	Mode of the service appointment. • `Group`— Service appointment mode is Group. • `Regular`— Default mode of service appointment.	Optional	60.0
`appointmentType`	String	Type of the appointment.	Optional	53.0
`attendeeLimit`	Integer	Maximum number of customers that's allowed to attend the service appointment.	Required if the appointment mode is Group.	60.0
`city`	String	Name of the city.	Optional	53.0
`comments`	String	Comments about the appointment.	Optional	53.0

Property	Type	Description	Required or Optional	Available Version
`contactId`	String	ID of the contact associated with the parent record.	Optional	53.0
`country`	String	Name of the country.	Optional	53.0
`description`	String	Description of the appointment.	Optional	53.0
`engagementChannelTypeId`	String	ID of the engagement channel type to associate with the appointment. You can use engagement channel type only if: • **Schedule Appointments Using Engagement Channels** is enabled in Salesforce Scheduler Settings in your Salesforce org. • Shifts are defined in the scheduling policy. For more information on setting up shifts in the scheduling policy, see Define Shift Rules in Scheduling Policy. Note: Engagement channel types are not supported with operating hours rules in the scheduling policy.	Optional	56.0
`extendedFields`	Map<String, ConnectApi.ExtendedFieldInput>	Values to add to any of the fields, including custom fields.	Optional	53.0
`parentRecordId`	String	ID of the parent record associated with the account.	Required if `lead` isn't provided.	53.0
`postalCode`	String	Postal code of the city.	Optional	53.0
`schedEndTime`	Datetime	Time at which the appointment is scheduled to end.	Optional	53.0
`schedStartTime`	Datetime	Time at which the appointment is scheduled to start.	Optional	53.0
`serviceTerritoryId`	String	ID of the service territory associated with the service appointment.	Optional	53.0
`state`	String	Name of the state.	Optional	53.0
`street`	String	Name of the street.	Optional	53.0
`subject`	String	Short phrase describing the appointment.	Optional	53.0
`workTypeId`	String	ID of the work type associated with the service appointment. If specified, it is added to the service appointment record.	Optional	53.0

ConnectApi.ShiftsFromPatternInput

Shifts from a pattern.

Property	Type	Description	Required or Optional	Available Version
`schedulingEndDate`	String	Scheduling end date in YYYY-MM-DD format. Provide `schedulingEndDate` or `schedulingOccurrences`. Don't provide both.	Required if `schedulingOccurrences` isn't provided	51.0
`schedulingOccurrences`	Integer	Number of scheduling occurrences. Provide `schedulingEndDate` or `schedulingOccurrences`. Don't provide both.	Required if `schedulingEndDate` isn't provided	51.0
`schedulingStartDate`	String	Scheduling start date in YYYY-MM-DD format.	Required	51.0
`serviceResourceId`	String	ID of the service resource to assign shifts to. In version 53.0 and later, use `serviceResourceIdList`.	Optional	51.0–52.0
`serviceResourceIdList`	List<String>	List of service resource IDs to assign shifts to.	Optional	53.0
`serviceTerritoryId`	String	ID of the service territory to assign shifts to.	Optional	51.0
`shiftStatus`	String	Status of the shifts. Default values are: • `Confirmed` • `Published` • `Tentative` Additional status values can be created.	Optional	52.0

ConnectApi.SocialPostMassApprovalInput

List of social post ids and the action to approve or reject publishing them.

Property	Type	Description	Required or Optional	Available Version
`isApproved`	Boolean	Specifies whether to approve (`true`) or reject (`false`) publishing the social posts. If unspecified, defaults to `false`.	Optional	46.0
`socialPostIdList`	List<String>	A list of up to 200 social post IDs.	Required	46.0

ConnectApi.StatusCapabilityInput

Change the status of a feed post or comment.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`feedEntityStatus`	`ConnectApi.FeedEntityStatus`	Status of the feed post or comment. Values are: • `Draft`—The feed post isn't published but is visible to the author and users with Modify All Data or View All Data permission. Comments can't be drafts. • `Isolated`—The feed post or comment is isolated, and only admins can see it. • `PendingReview`—The feed post or comment isn't approved yet and therefore isn't published or visible. • `Published`—The feed post or comment is approved and visible. Posts that have a status of `PendingReview` or `Published` can't be changed to a status of `Draft` and vice versa. Only admins can change the status of a post or comment to or from `Isolated` status.	Required	37.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.StreamSubscriptionInput

An entity to subscribe to for a Chatter feed stream.

Property	Type	Description	Required or Optional	Available Version
`entityId`	String	The ID of any feed-enabled entity, such as a group, record, or user, that the context user can access. When subscribed, the entity's feed is included in the feed stream.	Required	39.0

SEE ALSO:

ConnectApi.ChatterStreamInput

ConnectApi.SurveyInvitationEmailInput

Survey invitation email.

Property	Type	Description	Required or Optional	Available Version
`allowGuestUserResponse`	Boolean	Specifies whether participants who don't have a Salesforce account can respond (`true`) or not (`false`).	Required	50.0
`allowParticipantsAccessTheirResponse`	Boolean	Specifies whether participants can see their responses (`true`) or not (`false`).	Required	50.0
`associateRecordsWithRecipients`	List<`ConnectApi.AssociateRecordsWithRecipientInput`>	Maps each recipient with another record that must be associated with the recipient's survey invitation.	Optional	50.0
`body`	String	Content of the email. Specify the email body in case you don't specify an email template. The email body must contain one of the following merge fields: • To embed a link to launch the survey: [[SURVEY_INVITATION_URL]] • To embed a survey question: {{{SurveyQuestion.QuestionName}}} and {{{SurveyQuestion.QuestionHtmlContent}}}	Optional	50.0
`collectAnonymousResponse`	Boolean	Specifies whether participants can respond anonymously (`true`) or not (`false`).	Required	50.0
`communityId`	String	ID of the site that's used to open the survey for users outside your org.	Optional	50.0
`emailTemplateId`	String	ID of the Lightning email template that's used to send the survey invitation. The template must contain the required merge fields that embed either the survey link or a question in the email. Only Lightning email templates are used to send survey invitations.	Optional	50.0
`fromEmailAddress`	String	Email ID of the user or the org-wide email address associated with the user's profile.	Required	50.0
`invitationExpirationDate`	Datetime	Date on which the survey invitation expires.	Optional	50.0
`invitationOwner`	String	ID of the owner of the survey invitation records.	Optional	50.0
`isPersonalInvitation`	Boolean	Specifies whether an unique invitation is created for each participant (`true`) or not	Required	50.0

Property	Type	Description	Required or Optional	Available Version
		(`false`). When a participant responds using a personal invitation, the response record is associated with the participant's Salesforce record.		
`recipientEngagementContexts`	List<`ConnectApi.RecipientEngagementContextInput`>	Maps each recipient with the context based on which the survey invitation is emailed.	Optional	50.0
`recipients`	List<String>	List of up to 300 IDs of leads, contacts, or users to whom the survey invitation is emailed.	Required	50.0
`shareInvitationsWith`	List<String>	IDs of the users with whom the survey invitation records must be shared. The invitation records are shared with Read access.	Optional	50.0
`subject`	String	Subject of the email. Specify the subject in case you don't specify an email template.	Optional	50.0
`surveyQuestionIds`	List<String>	IDs of the questions that are embedded in the email. You can send an email invitation for questions of the following types: Net Promoter Score (NPS), rating, and score.	Optional	50.0

ConnectApi.TargetCollectionInput

Collection of targets to create.

Property	Type	Description	Required or Optional	Available Version
`targets`	List<`ConnectApi.TargetInput`>	List of targets to create.	Required	48.0

ConnectApi.TargetCollectionUpdateInput

Collection of targets to update.

Property	Type	Description	Required or Optional	Available Version
`targets`	List<`ConnectApi.TargetUpdateInput`>	List of targets to update.	Required	48.0

ConnectApi.TargetLocationInputRepresentation

A set of inventory locations that together can fulfill an order.

Property	Type	Description	Required or Optional	Available Version
`locations`	List<`ConnectApi.LocationInputRepresentation`>	A list of locations with information about their country and postal codes.	Required	51.0

ConnectApi.TargetInput

Target to create.

Property	Type	Description	Required or Optional	Available Version
`audienceId`	String	ID of the audience to assign to the target.	Required	48.0
`groupName`	String	Group name of the target. Groups bundle related target and audience pairs. You can have up to 2,000 groups and 500 targets per group. To determine the group name for targets of type `ExperienceVariation`, see Personalization Target Developer and Group Names in the *Experience Cloud Developer Guide*.	Required	48.0
`priority`	Integer	Priority of the target. Within a group, priority determines which target is returned if the user matches more than one audience.	Optional	48.0
`publishStatus`	`ConnectApi.PublishStatus`	The publish status of the target. Values are: • `Draft` • `Live` We recommend setting the publish status to `Draft`. If you specify `Live`, your changes revert after you publish the site.	Optional	48.0
`targetType`	String	Type of target, indicating the nature of the data being targeted. Supported values include: • `ExperienceVariation` (version 48.0 and later) • Custom object API names, such as ***`CustomObjectName`***`__c` (version 48.0 and later)	Required	48.0

Property	Type	Description	Required or Optional	Available Version
		• `NavigationLinkSet` (version 49.0 and later) • `Topic` (version 49.0 and later) • `CollaborationGroup` (version 49.0 and later) • `KnowledgeArticle` (version 49.0 and later) • `ContentDocument` (version 49.0 and later) • `ManagedContent` (version 49.0 and later) • `Report` (version 49.0 and later) • `Dashboard` (version 49.0 and later) You can have up to 2,500 `ExperienceVariation` targets and 25,000 record targets.		
`targetValue`	String	Value of the target. If `targetType` is `ExperienceVariation`, `targetValue` is the developer name of the experience variation. If `targetType` is ***`CustomObjectName`***`__c`, `targetValue` is the ID of the custom object. To determine the developer name for targets of type `ExperienceVariation`, see Personalization Target Developer and Group Names in the *Experience Cloud Developer Guide*.	Required	48.0

SEE ALSO:

ConnectApi.TargetCollectionInput

ConnectApi.TargetUpdateInput

Target to update.

Property	Type	Description	Required or Optional	Available Version
`audienceId`	String	ID of the audience to assign to the target.	Required if `priority` isn't	48.0

Property	Type	Description	Required or Optional	Available Version
			specified. Otherwise, Optional	
`priority`	Integer	Priority of the target. Within a group, priority determines which target is returned if the user matches more than one audience.	Required if `audienceId` isn't specified. Otherwise, Optional	48.0
`targetId`	String	ID of the target to update.	Required	48.0

SEE ALSO:

ConnectApi.TargetCollectionUpdateInput

ConnectApi.CalculateTaxRequest

Request to sent through the tax adapter to the external tax engine. Inputs with a `TaxTransactionType` of Debit represent a tax calculation request. Inputs with a `TaxTransactionType` of Credit represent a tax cancellation request.

Subclass of ConnectApi.TaxTransactionRequest.

Property	Type	Description	Required or Optional	Available Version
`isCommit`	Boolean	Commits the transaction for tax calculation.	Required	55.0
`taxEngineId`	String	ID of the Salesforce tax engine entity used to represent the external tax engine.	Required	55.0
`taxTransactionType`	`ConnectApi.TaxTransactionType`	Type of tax transaction. Values are: • `Credit`—Transaction is a credit transaction. • `Debit`—Transaction is a debit transaction.	Required	55.0
`taxType`	`ConnectApi.CalculateTaxType`	Type of tax calculation. Values are: • `Actual`—Calculated tax represents the final taxed amount for the transaction. • `Estimated`—Calculated tax represents only an estimated value before the transaction is finalized.	Required	55.0

ConnectApi.TaxAddressRequest

Address input representation for tax calculation.

Name	Type	Description	Required or Optional	Available Version
`city`	String	City.	Optional	55.0
`country`	String	Country.	Optional	55.0
`latitude`	Double	Latitude.	Optional	55.0
`locationCode`	String	Location code.	Optional	55.0
`longitude`	Double	Longitude.	Optional	55.0
`postalCode`	String	Postal code.	Optional	55.0
`state`	String	State.	Optional	55.0
`street`	String	Street.	Optional	55.0

ConnectApi.TaxAddressesRequest

Addresses, including the Bill To address, Ship From address, Ship to address, and Sold To address.

Name	Type	Description	Required or Optional	Available Version
`billTo`	`ConnectApi.TaxAddressRequest`	Bill To address.	Optional	55.0
`shipFrom`	`ConnectApi.TaxAddressRequest`	Ship From address.	Optional	55.0
`shipTo`	`ConnectApi.TaxAddressRequest`	Ship To address.	Optional	55.0
`soldTo`	`ConnectApi.TaxAddressRequest`	Sold To address.	Optional	55.0

ConnectApi.TaxCustomerDetailsRequest

Customer details for the tax calculation.

Property	Type	Description	Required or Optional	Available Version
`accountId`	String	ID of the customer's account.	Optional	55.0
`code`	String	Customer code.	Optional	55.0
`exemptionNo`	String	Tax exemption number.	Optional	55.0

Property	Type	Description	Required or Optional	Available Version
exemptionReason	String	Tax exemption reason.	Optional	55.0

ConnectApi.TaxLineItemRequest

A list of line items passed to the tax engine for tax calculation.

Property	Type	Description	Required or Optional	Available Version
addresses	ConnectApi.TaxAddressesRequest	Addresses, including the Bill To address, Ship From address, Ship To address, and Sold To address.	Optional	55.0
amount	Double	Amount of the line item.	Optional	55.0
description	String	Description of the line item.	Optional	55.0
effectiveDate	Datetime	Date to apply the tax calculation to the line item.	Optional	55.0
lineNumber	String	Line number of the line item.	Optional	55.0
productCode	String	Product code of the line item.	Optional	55.0
quantity	Double	Quantity of the line item.	Optional	55.0
taxCode	String	Tax code for the line item.	Optional	55.0

ConnectApi.TaxTransactionRequest

Information about the tax transaction sent to the tax adapter as part of a tax calculation request.

This class is abstract.

Superclass of ConnectApi.CalculateTaxRequest.

Property	Type	Description	Required or Optional	Available Version
addresses	ConnectApi.TaxAddressesRequest	Addresses, including the Bill To address, Ship From address, Ship to address, and Sold To address.	Optional	55.0
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the payment group record.	Optional	55.0
customerDetails	ConnectApi.TaxCustomerDetailsRequest	Customer details for the tax calculation.	Optional	55.0

Property	Type	Description	Required or Optional	Available Version
`description`	String	Information about whether the tax transaction failed or was successful.	Optional	55.0
`documentCode`	String	Document code.	Optional	55.0
`effectiveDate`	Datetime	The date that tax is applied to the taxed entity.	Required	55.0
`lineItems`	List<`ConnectApi.TaxLineItemRequest`>	The line items on which tax was calculated.	Required	55.0
`referenceDocumentCode`	String	The original document code. Used in case of subsequent transactions such as credit tax.	Optional	55.0
`referenceEntityId`	String	ID of the reference entity used during tax calculation.	Optional	55.0
`transactionDate`	Datetime	The date that the tax transaction occurred.	Optional	53.0

ConnectApi.TextClassificationsInputRepresentation

Text classification information associating classifiers and text to be classified.

Property	Type	Description	Required or Optional	Available Version
classifiers	List<`String`>	List of classifiers according to which text has to be classified.	Required	59.0
textList	List<`String`>	List of text to be classified.	Required	59.0

ConnectApi.TextSegmentInput

Include a text segment in a feed item or comment.

Subclass of ConnectApi.MessageSegmentInput.

Property	Type	Description	Available Version
`text`	String	Plain text for this segment. If hashtags or links are detected in *`text`*, they're included in the comment as hashtag and link segments. Mentions aren't detected in *`text`* and aren't separated out of the text. Mentions require `ConnectApi.MentionSegmentInput`.	28.0

SEE ALSO:

- Edit a Comment
- Edit a Feed Element
- Edit a Question Title and Post
- Post a Rich-Text Feed Element with Inline Image
- ConnectApi.MessageBodyInput

ConnectApi.TopicInput

Update a topic's name or description or merge topics.

Property	Type	Description	Available Version
`description`	String	Description of the topic	29.0
`idsToMerge`	List<String>	List of up to five secondary topic IDs to merge with the primary topic If any of the secondary topics are navigational or featured topics, they lose their topic type, topic images, and children topics. Their feed items are reassigned to the primary topic. If you merge a topic with a content topic, the content associations are preserved. If you merge a topic with an inactive endorsee, the endorsement isn't mapped to the primary topic.	33.0
`name`	String	Name of the topic Use this property to change only the capitalization and spacing of the topic name.	29.0

SEE ALSO:

- updateTopic(communityId, topicId, topic)

ConnectApi.TopicNamesInput

A list of topic names to replace currently assigned topics. Also a list of suggested topics to assign.

Property	Type	Description	Required or Optional	Available Version
`topicNames`	List<String>	A list of up to 10 topic names for a feed item or 100 topic names for a record.	Required	35.0

Property	Type	Description	Required or Optional	Available Version
`topicSuggestions`	List<String>	A list of suggested topics to assign to a record or feed item to improve future topic suggestions.	Optional	37.0

SEE ALSO:

reassignTopicsByName(communityId, recordId, topicNames)

ConnectApi.ArticleTopicAssignmentJobInput

ConnectApi.TopicsCapabilityInput

Assign topics to a feed element.

Property	Type	Description	Required or Optional	Available Version
`contextTopicName`	String	Name of the parent topic in the site to which the feed element belongs.	Optional	38.0
`topics`	List<String>	List of topics to assign to the feed element.	Required	38.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.UpDownVoteCapabilityInput

Upvote or downvote a feed element or a comment.

Property	Type	Description	Required or Optional	Available Version
`vote`	`ConnectApi.UpDownVoteValue`	Type of vote for a feed element or comment. Values are: • `Down` • `None` • `Up`	Required	41.0

ConnectApi.UpdateServiceAppointmentInput

Contains information to update a service appointment.

Property	Type	Description	Required or Optional	Available Version
serviceAppointmentId	String	The ID of the service appointment to be modified.	Required	53.0
assignedResources	List<ConnectApi.AssignedResourceInput>	Represents the service resources who are assigned to a service appointment. When updating an appointment, pass the complete list of required resources. If you don't pass a resource who is already assigned to the appointment, the API deletes that assigned resource. For example, suppose that an existing service appointment has assigned resources: A and B and you pass B and C in assigned resources in the PATCH request. The API checks the resource availability of B and C for existing work type and service territory, and if both are available, the service appointment gets updated with: • Resource A—Deleted • ResourceB—Updated • ResourceC—Created However, if you don't pass any of the assigned resources, the API assumes there's no change. Note: When creating an appointment, use `extendedFields` to add values to any of the fields, including custom fields, in `assignedResources` as long as you have edit access to those fields.	Optional	53.0
lead	ConnectApi.LeadInput	Represents a prospect or lead. Note: Required to create a service appointment for unauthenticated guest users.	Required if `serviceAppointment` isn't provided.	53.0
schedulingPolicyId	String	The ID of the `AppointmentSchedulingPolicy` object. If no scheduling policy is passed in the request body, the default configurations are used. The only scheduling policy configuration that is used in determining	Optional	53.0

Property	Type	Description	Required or Optional	Available Version
		time slots is the enforcement of account visiting hours.		
serviceAppointment	ConnectApi.ServiceAppointmentInput	Represents the service appointment details to book an appointment. When updating an appointment, pass only the fields that must be updated. Note: When creating an appointment, use `extendedFields` to add values to any of the fields, including custom fields, in `assignedResources` as long as you have edit access to those fields.	Required if `lead` isn't provided.	53.0

ConnectApi.UserInput

Update a user's About Me information.

Property	Type	Description	Available Version
`aboutMe`	String	The `aboutMe` property of a `ConnectApi.UserDetail` output object. This property populates the About Me section of the user profile, which is visible to all members of an Experience Cloud site or org.	29.0

SEE ALSO:

updateUser(communityId, userId, userInput)

ConnectApi.WishlistInput

Create a wishlist.

Property	Type	Description	Required or Optional	Available Version
`name`	String	Name of the wishlist.	Required	49.0
`products`	List<`ConnectApi.WishlistItemInput`>	List of products to add to the wishlist.	Optional	49.0

ConnectApi.WishlistItemInput

Item to update or add to a wishlist.

Property	Type	Description	Required or Optional	Available Version
`productId`	String	ID of the product to update or add to the wishlist.	Required	49.0

SEE ALSO:

ConnectApi.WishlistInput

ConnectApi.WishlistUpdateInput

Update a wishlist name.

Property	Type	Description	Required or Optional	Available Version
`name`	String	Wishlist name to update.	Required	50.0

ConnectApi.WrappedValue

Value wrapped for use as an object.

Property	Type	Description	Required or Optional	Available Version
`value`	`Object`	Value to wrap.	Required	60.0

Retired `ConnectApi` Input Classes

These `ConnectApi` input classes are retired.

IN THIS SECTION:

ConnectApi.CanvasAttachmentInput

Used to attach a canvas app to a feed item.

ConnectApi.ContentAttachmentInput

Used to attach existing content to a comment or feed item.

ConnectApi.DataCloudOrderInput

Input representation for a Datacloud order to purchase contacts or companies and retrieve purchase information.

ConnectApi.FeedItemAttachmentInput

Used to attach a file to a feed item.

ConnectApi.LinkAttachmentInput

Add links to a feed item.

ConnectApi.NewFileAttachmentInput

Attach a new file to a feed item.

ConnectApi.PollAttachmentInput

Attach a poll to a feed item.

ConnectApi.CanvasAttachmentInput

Used to attach a canvas app to a feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.CanvasCapabilityInput.

Subclass of Connectapi.FeedItemAttachmentInput.

Property	Type	Description	Available Version
`description`	String	Optional. The description of the canvas app.	29.0–31.0
`developerName`	String	The developer name (API name) of the canvas app	29.0–31.0
`height`	String	Optional. The height of the canvas app in pixels. Default height is 200 pixels.	29.0–31.0
`namespacePrefix`	String	Optional. The namespace prefix of the Developer Edition organization in which the canvas app was created.	29.0–31.0
`parameters`	String	Optional. Parameters passed to the canvas app in JSON format. Example: `{'isUpdated'='true'}`	29.0–31.0
`thumbnailUrl`	String	Optional. A URL to a thumbnail image for the canvas app. Maximum dimensions are 120x120 pixels.	29.0–31.0
`title`	String	The title of the link used to call the canvas app.	29.0–31.0

ConnectApi.ContentAttachmentInput

Used to attach existing content to a comment or feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.ContentCapabilityInput.

Subclass of ConnectApi.FeedItemAttachmentInput.

Property	Type	Description	Available Version
`contentDocumentId`	String	ID of the existing content.	28.0–31.0

ConnectApi.DataCloudOrderInput

Input representation for a Datacloud order to purchase contacts or companies and retrieve purchase information.

Property	Type	Description	Required or Optional	Available Version
`companyIds`	String	A comma-separated list of identification numbers for the companies to be purchased. You can't include any contact IDs or your purchase fails.	Required to purchase companies	32.0
`contactIds`	String	A comma-separated list of identification numbers for the contacts to be purchased. You can't include any company IDs or your purchase fails.	Required to purchase contacts	32.0
`userType`	ConnectDatacloudUserTypeEnum	Indicates the Data.com user type to be used. There are two user types. • `Monthly` (default) • `Listpool`	Optional	32.0

SEE ALSO:

postOrder(orderInput)

ConnectApi.FeedItemAttachmentInput

Used to attach a file to a feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.FeedElementCapabilityInput.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass for:

- ConnectApi.CanvasAttachmentInput
- ConnectApi.ContentAttachmentInput
- ConnectApi.LinkAttachmentInput
- ConnectApi.NewFileAttachmentInput
- ConnectApi.PollAttachmentInput

ConnectApi.LinkAttachmentInput

Add links to a feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.LinkCapabilityInput.

Subclass of ConnectApi.FeedItemAttachmentInput.

Property	Type	Description	Available Version
`url`	String	URL to be used for the link	28.0–31.0
`urlName`	String	Title of the link	28.0–31.0

ConnectApi.NewFileAttachmentInput

Attach a new file to a feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.ContentCapabilityInput.

The actual binary file, that is the attachment, is provided as part of the BinaryInput in the method that takes this attachment input, such as `postFeedItem` or `postComment`.

Subclass of ConnectApi.FeedItemAttachmentInput.

Property	Type	Description	Available Version
`description`	String	Description of the file to be uploaded.	28.0–31.0
`title`	String	The title of the file. This value is required and is also used as the file name. For example, if the title is My Title, and the file is a .txt file, the file name is My Title.txt.	28.0–31.0

ConnectApi.PollAttachmentInput

Attach a poll to a feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.PollCapabilityInput.

Subclass of ConnectApi.FeedItemAttachmentInput.

Property	Type	Description	Available Version
`pollChoices`	List<String>	The text labels for the poll items. Polls must contain between 2 to 10 poll choices.	28.0–31.0

`ConnectApi` Output Classes

Most `ConnectApi` methods return instances of `ConnectApi` output classes.

All properties are read-only, except for instances of output classes created within test code.

All output classes are concrete unless marked abstract in this documentation.

All concrete output classes have no-argument constructors that you can invoke only from test code. See Testing ConnectApi Code.

ConnectApi.AbstractCartItem

A cart item.

This class is abstract.

Superclass of:

- ConnectApi.CartItem
- ConnectApi.CartItemWithoutPrice

Property Name	Type	Description	Available Version
`billingFrequency`	`ConnectApi.BillingFrequency`	Reserved for future use.	59.0
`cartDeliveryGroupId`	String	ID of the cart delivery group.	60.0
`cartId`	String	ID of the cart.	49.0
`cartItemId`	String	ID of the item.	49.0
`messagesSummary`	`ConnectApi.CartMessagesSummary`	Messages summary for the item.	49.0
`name`	String	Name of the item.	49.0
`productDetails`	`ConnectApi.CartItemProduct`	Summary of the product details.	49.0
`productId`	String	ID of the product.	49.0
`productSellingModelId`	String	Reserved for future use.	59.0
`quantity`	String	Quantity of the item.	49.0
`sellingModelType`	`ConnectApi.SellingModelType`	Reserved for future use.	60.0
`subscriptionTerm`	Integer on page 3353	Reserved for future use.	59.0
`type`	`ConnectApi.CartItemType`	Type of item in a cart. Values are: • `DeliveryCharge` • `Product`	49.0

SEE ALSO:

ConnectApi.CartItemResult

ConnectApi.AbstractContentHubItemType

An item type associated with a repository folder.

This class is abstract.

Superclass of:

- ConnectApi.ContentHubItemTypeDetail
- ConnectApi.ContentHubItemTypeSummary

Property Name	Type	Description	Available Version
`contentStreamSupport`	`ConnectApi.ContentHubStreamSupport`	Support for content streaming. Values are: • `ContentStreamAllowed` • `ContentStreamNotAllowed` • `ContentStreamRequired`	39.0
`description`	String	Description of the item type.	39.0
`displayName`	String	Display name of the item type.	39.0
`id`	String	ID of the item type.	39.0
`isVersionable`	Boolean	Indicates whether the item type can have versions.	39.0
`url`	String	URL to the detailed information of the item type.	39.0

ConnectApi.AbstractDirectoryEntrySummary

A directory entry with summary information.

This class is abstract.

Superclass of:

- ConnectApi.RepositoryGroupSummary
- ConnectApi.RepositoryUserSummary

Property Name	Type	Description	Available Version
`domain`	String	Domain of the directory entry.	39.0
`email`	String	Email of the directory entry.	39.0
`id`	String	ID of the directory entry.	39.0
`type`	`ConnectApi.ContentHubDirectoryEntryType`	Type of directory entry. Values are: • `GroupEntry` • `UserEntry`	39.0

ConnectApi.AbstractExtensionInformation

Extension information.

This class is abstract.

Superclass of ConnectApi.LightningExtensionInformation.

Property Name	Type	Description	Available Version
`extensionInformationType`	`ConnectApi.ExtensionInformationType`	Information type of the extension. Values are: • `Lightning`	40.0

ConnectApi.AbstractGatewayCommonResponse

Payment gateway response fields commonly used in payment services.

This class is abstract.

Superclass of ConnectApi.AbstractGatewayResponse.

Property Name	Type	Description	Available Version
`gatewayAvsCode`	String	Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.	50.0
`gatewayDate`	Datetime	Date when the notification occurred. Some gateways don't send this value.	50.0
`gatewayMessage`	String	Error messages that the gateway returned for the notification request. Maximum length of 255 characters.	50.0
`gatewayResultCode`	String	Gateway-specific result code. You can map the result code to a Salesforce-specific result code. Maximum length of 64 characters.	50.0
`gatewayResultCodeDescription`	String	A description of the gateway-specific result code that a payment gateway returned. Maximum length of 1,000 characters.	50.0
`salesforceResultCode`	String	The Salesforce result code for the gateway result code.	50.0

ConnectApi.AbstractGatewayResponse

Payment gateway response fields used in sale, authorization, and capture services.

This class is abstract.

Subclass of ConnectApi.AbstractGatewayCommonResponse.

Super class of:

- ConnectApi.AuthReversalGatewayResponse
- ConnectApi.AuthorizationGatewayResponse
- ConnectApi.AuthorizationReversalResponse
- ConnectApi.CaptureGatewayResponse
- ConnectApi.PaymentMethodTokenizationGatewayResponse
- ConnectApi.PostAuthGatewayResponse
- ConnectApi.RefundGatewayResponse
- ConnectApi.SaleGatewayResponse

Property Name	Type	Description	Available Version
gatewayReferenceDetails	String	Provides information about the gateway communication.	50.0
gatewayReferenceNumber	String	Unique transaction ID created by the payment gateway.	50.0

ConnectApi.AbstractManagedContentDeliveryDocument

Managed content delivery document.

This class is abstract.

Superclass of:

- ConnectApi.ManagedContentDeliveryDocument
- ConnectApi.ManagedContentDeliveryDocumentSummary

Property Name	Type	Description	Available Version
contentKey	String	Globally unique identifier (GUID) for the managed content.	55.0
contentType	ConnectApi.ManagedContentTypeSummary	Type of managed content.	55.0
language	String	Language locale of the managed content.	55.0
managedContentId	String	ID of the managed content.	55.0
publishedDate	Datetime	Most recent publish date of the managed content.	55.0
resourceUrl	String	URL to the single content delivery resource.	55.0
title	String	Title of the managed content.	55.0
unauthenticatedUrl	String	Public URL for the managed content.	55.0
urlName	String	URL name of the managed content.	55.0

SEE ALSO:

ConnectApi.ManagedContentDeliveryDocumentCollection

ConnectApi.AbstractManagedContentReference

Managed content reference.

This class is abstract.

Superclass of:

- ConnectApi.ManagedContentReference
- ConnectApi.ManagedContentReferenceSummary

Property Name	Type	Description	Available Version
`contentKey`	String	Unique identifier for the managed content reference.	54.0
`managedContentId`	String	ID of the managed content reference.	54.0
`resourceUrl`	String	URL to the single content delivery resource.	55.0

SEE ALSO:

ConnectApi.ManagedContentDeliveryDocumentCollection

ConnectApi.AbstractMessageBody

Abstract message body.

This class is abstract.

Superclass of:

- ConnectApi.FeedBody
- ConnectApi.MessageBody

Name	Type	Description	Available Version
`isRichText`	Boolean	Indicates whether the body is rich text.	35.0
`messageSegments`	List<`ConnectApi.MessageSegment`>	List of message segments	28.0
`text`	String	Display-ready text. Use this text if you don't want to process the message segments.	28.0

ConnectApi.AbstractNBAAction

A recommended action of recommendation strategy.

This class is abstract.

Superclass of ConnectApi.NBAFlowAction.

Property Name	Type	Description	Available Version
`parameters`	List<ConnectApi.NBAActionParameter>	List of parameters to pass to the action.	45.0
`type`	`ConnectApi.NBAActionType`	Type of action. Values are: • `Flow`—Automated process tool with multiple subtypes.	45.0

SEE ALSO:

ConnectApi.NBARecommendation

ConnectApi.AbstractNBATarget

A recommendation target of a recommendation strategy.

This class is abstract.

Superclass of ConnectApi.NBANativeRecommendation.

Property Name	Type	Description	Available Version
`type`	`ConnectApi.NBATargetType`	Type of target. Values are: • `Recommendation`	45.0

SEE ALSO:

ConnectApi.NBARecommendation

ConnectApi.AbstractRecommendation

A Chatter, custom, or static recommendation.

This class is abstract.

Superclass of:

- ConnectApi.EntityRecommendation
- ConnectApi.NonEntityRecommendation

  ConnectApi.NonEntityRecommendation isn't used in version 34.0 and later. In version 34.0 and later, ConnectApi.EntityRecommendation is used for all recommendations.

Property Name	Type	Description	Available Version
`explanation`	`ConnectApi.RecommendationExplanation`	The Chatter, custom, or static recommendation explanation.	32.0
`platformActionGroup`	`ConnectApi.PlatformActionGroup`	A platform action group instance with state appropriate for the context user.	34.0
`recommendationType`	`ConnectApi.RecommendationType`	Specifies the type of record being recommended.	32.0
`url`	String	URL for the Chatter, custom, or static recommendation.	34.0

SEE ALSO:

ConnectApi.RecommendationsCapability

ConnectApi.RecommendationCollection

ConnectApi.AbstractRecommendationExplanation

Explanation for a Chatter recommendation.

This class is abstract.

Superclass of ConnectApi.RecommendationExplanation.

Property Name	Type	Description	Available Version
`summary`	String	Summary explanation for the Chatter recommendation.	32.0
`type`	`ConnectApi.RecommendationExplanationType`	Indicates the reason for the Chatter recommendation. • `ArticleHasRelatedContent`—Articles with related content to a context article. • `ArticleViewedTogether`—Articles often viewed together with the article that the context user just viewed. • `ArticleViewedTogetherWithViewers`—Articles often viewed together with other records that the context user views. • `Custom`—Custom recommendations. • `FilePopular`—Files with many followers or views. • `FileViewedTogether`—Files often viewed at the same time as other files that the context user views. • `FollowedTogetherWithFollowees`—Users often followed together with other records that the context user follows. • `GroupMembersFollowed`—Groups with members that the context user follows. • `GroupNew`—Recently created groups. • `GroupPopular`—Groups with many active members. • `ItemViewedTogether`—Records often viewed at the same time as other records that the context user views. • `PopularApp`—Applications that are popular. • `RecordOwned`—Records that the context user owns. • `RecordParentOfFollowed`—Parent records of records that the context user follows. • `RecordViewed`—Records that the context user recently viewed.	32.0

Property Name	Type	Description	Available Version
		• `TopicFollowedTogether`—Topics often followed together with the record that the context user just followed. • `TopicFollowedTogetherWithFollowees`—Topics often followed together with other records that the context user follows. • `TopicPopularFollowed`—Topics with many followers. • `TopicPopularLiked`—Topics on posts that have many likes. • `UserDirectReport`—Users who report to the context user. • `UserFollowedTogether`—Users often followed together with the record that the context user followed . • `UserFollowsSameUsers`—Users who follow the same users as the context user. • `UserManager`—The context user's manager. • `UserNew`—Recently created users. • `UserPeer`—Users who report to the same manager as the context user. • `UserPopular`—Users with many followers. • `UserViewingSameRecords`—Users who view the same records as the context user.	

ConnectApi.AbstractRecordField

A field on a record.

This class is abstract.

Superclass of:

- ConnectApi.BlankRecordField
- ConnectApi.LabeledRecordField

Message segments in a feed item are typed as `ConnectApi.MessageSegment`. Feed item capabilities are typed as `ConnectApi.FeedItemCapability`. Record fields are typed as `ConnectApi.AbstractRecordField`. These classes are all abstract and have several concrete subclasses. At runtime you can use `instanceof` to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

Important: The composition of a feed can change between releases. Write your code to handle instances of unknown subclasses.

Name	Type	Description	Available Version
`type`	String	Type of the field. One of these values: • `Address` • `Blank` • `Boolean` • `Compound` • `CreatedBy` • `Date` • `DateTime` • `Email` • `LastModifiedBy` • `Location` • `Name` • `Number` • `Percent` • `Phone` • `Picklist` • `Reference` • `Text` • `Time`	29.0

SEE ALSO:

ConnectApi.RecordViewSection

ConnectApi.AbstractRecordView

A view of any record in the org, including a custom object record. This object is used if a specialized object, such as User or ChatterGroup, isn't available for the record type.

This class is abstract.

Subclass of ConnectApi.ActorWithId.

Superclass of:

- ConnectApi.RecordSummary
- ConnectApi.RecordView

Name	Type	Description	Available Version
`name`	String	The localized name of the record.	29.0

ConnectApi.AbstractRepositoryFile

A repository file.

This class is abstract.

Subclass of ConnectApi.AbstractRepositoryItem.

Superclass of:

- ConnectApi.RepositoryFileDetail
- ConnectApi.RepositoryFileSummary

Property Name	Type	Description	Available Version
`checkinComment`	String	Checkin comment of the file.	39.0
`contentBody`	String	Text of the file's content if available, otherwise `null`.	43.0
`contentSize`	Integer	Length in bytes of the content of the file.	39.0
`downloadUrl`	String	URL to the repository file content.	39.0
`external ContentUrl`	String	URL of this file's content in the external system.	39.0
`external DocumentUrl`	String	URL of this file in the external system.	39.0
`external FilePermission Information`	`ConnectApi. ExternalFile PermissionInformation`	External file permission information, such as available groups, available permission types, and current sharing status, or `null` if `includeExternalFilePermissionsInfo` is `false`.	39.0
`mimeType`	String	Mime type of the file.	39.0
`previewUrl Thumbnail`	String	URL to the thumbnail preview (240 x 180 PNG).	39.0
`previewUrl ThumbnailBig`	String	URL to the big thumbnail preview (720 x 480 PNG).	39.0
`previewUrl ThumbnailTiny`	String	URL to the tiny thumbnail preview (120 x 90 PNG).	39.0
`previewsUrl`	String	URL to the previews.	39.0
`title`	String	Title of the file.	39.0
`versionId`	String	ID of the file version in the external system.	39.0

ConnectApi.AbstractRepositoryFolder

A repository folder.

This class is abstract.

Subclass of ConnectApi.AbstractRepositoryItem.

Superclass of:

- ConnectApi.RepositoryFolderDetail
- ConnectApi.RepositoryFolderSummary

Property Name	Type	Description	Available Version
`externalFolderUrl`	String	URL of this folder in the external system.	39.0
`folderItemsUrl`	String	URL that lists the files and folders in this folder.	39.0
`path`	String	Absolute path of the folder in the external system.	39.0

ConnectApi.AbstractRepositoryItem

A repository item.

This class is abstract.

Superclass of:

- ConnectApi.AbstractRepositoryFile
- ConnectApi.AbstractRepositoryFolder

Property Name	Type	Description	Available Version
`createdBy`	String	Name of the user who created the item.	39.0
`createdDate`	Datetime	Date the item was created.	39.0
`description`	String	Description of the Item.	39.0
`id`	String	ID of the item.	39.0
`itemTypeUrl`	String	URL to the item type information.	39.0
`modifiedBy`	String	Name of the user who last modified the item.	39.0
`modifiedDate`	Datetime	Date the item was last modified.	39.0
`motif`	`ConnectApi.Motif`	Motif of the item.	39.0
`name`	String	Name of the item.	39.0
`repository`	`ConnectApi.Reference`	Item external repository.	39.0
`type`	String	Item type, `file` or `folder`.	39.0
`url`	String	The URL to the item.	39.0

ConnectApi.AbstractUserMissionActivity

User activity associated with missions.

This class is abstract.

Superclass of:

- ConnectApi.UserMission
- ConnectApi.UserMissionActivity

Property Name	Type	Description	Available Version
`activityCount`	Integer	Number of mission activities of the specified type for the user.	45.0
`activityType`	String	Type of mission activity for a user. Values are: • `FeedItemAnswerAQuestion`—User answered a question. • `FeedItemLikeSomething`—User liked a post or comment. • `FeedItemMarkAnswerAsBest`—User marked an answer as the best answer. • `FeedItemPostQuestion`—User posted a question. • `FeedItemReceiveAComment`—User received a comment on a post. • `FeedItemReceiveALike`—User received a like on a post or comment. • `FeedItemReceiveAnAnswer`—User received an answer to a question. • `FeedItemWriteAComment`—User commented on a post. • `FeedItemWriteAPost`—User made a post. • `FeedItemYourAnswerMarkedBest`—User's answer was marked as the best answer.	45.0

SEE ALSO:

ConnectApi.UserMissionActivityCollection

ConnectApi.ActionLinkDefinition

The definition of an action link. Action link definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

Property Name	Type	Description	Available Version
`actionUrl`	String	The action link URL. For example, a `Ui` action link URL is a Web page. A `Download` action link URL is a link to the file to download. `Ui` and `Download` action link URLs are provided to clients. An `Api` or	33.0

Property Name	Type	Description	Available Version
		`ApiAsync` action link URL is a REST resource. `Api` and `ApiAsync` action link URLs aren't provided to clients. Links to Salesforce can be relative. All other links must be absolute and start with `https://`.	
`createdDate`	Datetime	ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	33.0
`excludedUserId`	String	ID of a single user to exclude from performing the action. If you specify an `excludedUserId`, you can't specify a `userId`.	33.0
`groupDefault`	Boolean	`true` if this action is the default action link in the action link group; `false` otherwise. There can be only one default action link per action link group. The default action link gets distinct styling in the Salesforce UI.	33.0
`headers`	List<`ConnectApi.RequestHeader`>	The request headers for the `Api` and `ApiAsync` action link types.	33.0
`id`	String	The 18-character ID for the action link definition.	33.0
`label`	String	A custom label to display on the action link button. A `label` value can be set only in an action link template. Action links have four statuses: NewStatus, PendingStatus, SuccessStatus, and FailedStatus. These strings are appended to the label for each status: • *label* • *label* Pending • *label* Success • *label* Failed For example, if the value of `label` is "See Example," the values of the four action link states are: See Example, See Example Pending, See Example Success, and See Example Failed. An action link can use either `label` or `labelKey` to generate label names, it can't use both. If `label` has a value, the value of `labelKey` is `None`. If `labelKey` has a value other than `None`, the value of `label` is `null`.	34.0
`labelKey`	String	Key for the set of labels to show in the user interface. A set includes labels for these states: NewStatus, PendingStatus, SuccessStatus, FailedStatus. For example, if you use the `Approve` key, you get these labels: Approve, Pending, Approved, Failed.	33.0

Property Name	Type	Description	Available Version
		For a complete list of label keys, see Action Links Labels in the *Connect REST API Developer Guide*.	
`method`	`ConnectApi.HttpRequestMethod`	The HTTP method. One of these values: • `HttpDelete`—Returns HTTP 204 on success. Response body or output class is empty. • `HttpGet`—Returns HTTP 200 on success. • `HttpHead`—Returns HTTP 200 on success. Response body or output class is empty. • `HttpPatch`—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty. • `HttpPost`—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success. • `HttpPut`—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty.	33.0
`modifiedDate`	Datetime	ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	33.0
`requestBody`	String	The request body for `Api` and `ApiAsync` action link types. Note: Escape quotation mark characters in the `requestBody` value.	33.0
`requires Confirmation`	Boolean	`true` to require the user to confirm the action; `false` otherwise.	33.0
`templateId`	String	The ID of the action link template from which to instantiate this action link. If the action link isn't associated with a template, the value is `null`.	33.0
`type`	`ConnectApi.ActionLinkType`	Defines the type of action link. Values are: • `Api`—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server. • `ApiAsync`—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to	33.0

Property Name	Type	Description	Available Version
		`/connect/action-links/`***`actionLinkId`*** to set the status to `SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete. • `Download`—The action link downloads a file from the action URL. • `Ui`—The action link takes the user to a web page at the action URL. Note: Invoking `ApiAsync` action links from an app requires a call to set the status. However, there isn't currently a way to set the status of an action link using Apex. To set the status, use Connect REST API. See the Action Link resource in the Connect REST API Developer Guidefor more information.	
`userId`	String	The ID of the user who can execute the action. If not specified or `null`, any user can execute the action. If you specify a `userId`, you can't specify an `excludedUserId`.	33.0

SEE ALSO:

ConnectApi.ActionLinkGroupDefinition

ConnectApi.ActionLinkDiagnosticInfo

Any diagnostic information that may exist for an executed action link. Diagnostic info is provided only for users who can access the action link.

Property Name	Type	Description	Available Version
`diagnosticInfo`	String	Any diagnostic information returned when an action link is executed. Diagnostic information is provided only for users who can access the action link.	33.0
`url`	String	The URL for this action link diagnostic information.	33.0

ConnectApi.ActionLinkGroupDefinition

The definition of an action link group. Information in the action link group definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link group definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

Property Name	Type	Description	Available Version
`actionLinks`	List<`ConnectApi.ActionLinkDefinition`>	A collection of action link definitions that make up the action link group. Within an action link group, action links are displayed in the order listed in the `actionLinks` property of the `ConnectApi.ActionLinkGroupDefinitionInput` class. Within a feed item, action link groups are displayed in the order specified in the `actionLinkGroupIds` property of the `ConnectApi.AssociatedActionsCapabilityInput` class.	33.0
`category`	`ConnectApi.PlatformActionGroupCategory`	Indicates the priority and location of the action links. Values are: • `Primary`—The action link group is displayed in the body of the feed element. • `Overflow`—The action link group is displayed in the overflow menu of the feed element.	33.0
`createdDate`	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	33.0
`executionsAllowed`	`ConnectApi.ActionLinkExecutionsAllowed`	Defines the number of times an action link can be executed. Values are: • `Once`—An action link can be executed only one time across all users. • `OncePerUser`—An action link can be executed only one time for each user. • `Unlimited`—An action link can be executed an unlimited number of times by each user. If the action link's `actionType` is `Api` or `ApiAsync`, you can't use this value.	33.0
`expirationDate`	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z, that represents the date and time this action group expires and can no longer be executed. If the value is `null`, there isn't an expiration date.	33.0
`id`	String	18-character ID of the action link group definition.	33.0
`modifiedDate`	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	33.0
`templateId`	String	The ID of the action link group template from which to instantiate this action link group, or `null` if this group isn't associated with a template.	33.0
`url`	String	The URL for this action link group definition.	33.0

ConnectApi.ActivitySharingResult

The results of sharing a captured email or event.

Property Name	Type	Description	Available Version
`success`	Boolean	Whether the share operation succeeded or not.	39.0

ConnectApi.Actor

Actor.

This class is abstract.

Superclass of:

- ConnectApi.ActorWithId
- ConnectApi.RecommendedObject
- ConnectApi.UnauthenticatedUser

Name	Type	Description	Available Version
`name`	String	Name of the actor, such as the group name.	28.0
`type`	String	One of the following: • `file` • `group` • `recommendedObject` (version 34.0 and later) • `unauthenticateduser` • `user` • *`record type name`*—the name of the record type, such as `myCustomObject__c` or Account	28.0

SEE ALSO:

ConnectApi.CaseCommentCapability
ConnectApi.EntityRecommendation
ConnectApi.EditCapability
ConnectApi.FeedEntitySummary
ConnectApi.FeedItem
ConnectApi.FeedItemSummary
ConnectApi.Subscription

ConnectApi.ActorWithId

Actor with ID.

This class is abstract.

Subclass of ConnectApi.Actor.

Superclass of:

- ConnectApi.AbstractRecordView
- ConnectApi.ArticleSummary
- ConnectApi.ChatterGroup
- ConnectApi.ContentHubRepository
- ConnectApi.File
- ConnectApi.RelatedFeedPost
- ConnectApi.User

Name	Type	Description	Available Version
`id`	String	Actor's 18-character ID	28.0
`motif`	`ConnectApi.Motif`	An icon that identifies the actor as a user, group, file, or custom object. The icon isn't the user or group photo, and it isn't a preview of the file. The motif can also contain the object's base color.	28.0
`mySubscription`	`ConnectApi.Reference`	If the context user is following the item, this contains information about the subscription, else returns `null`.	28.0
`url`	String	Connect REST API URL for the resource	28.0

SEE ALSO:

ConnectApi.FeedElement
ConnectApi.FeedEntitySummary
ConnectApi.GroupRecord
ConnectApi.MentionSegment
ConnectApi.RecordSummaryList

ConnectApi.Address

Address.

Name	Type	Description	Available Version
`city`	String	Name of the city	28.0
`country`	String	Name of the country	28.0
`formattedAddress`	String	Formatted address per the locale of the context user	28.0
`state`	String	Name of the state, province, or so on	28.0
`street`	String	Street number	28.0

Name	Type	Description	Available Version
`zip`	String	Zip or postal code	28.0

SEE ALSO:

- ConnectApi.DatacloudCompany
- ConnectApi.DatacloudContact
- ConnectApi.UserDetail

ConnectApi.AdjustOrderSummaryOutputRepresentation

Output representation of the financial changes for an adjust items action. For a preview action, these values are the expected output. For a submit action, these values are the actual output.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`changeBalances`	`ConnectApi.ChangeItemOutputRepresentation`	Expected (for preview) or actual (for submit) financial values for the price adjustment action. Most of the values match the change order values. If two change orders are returned, then these values combine them. The sign of a value in this output is the opposite of the corresponding value on a change order record. For example, a discount is a positive value in `changeBalances` and a negative value on a change order record.	49.0
`inFulfillmentChangeOrderId`	String	ID of the change Order that holds the financial changes applicable to OrderItemSummary quantities that are in the process of being fulfilled. This change Order is only created for a request that specified an `allocatedItemsChangeOrderType` of InFulfillment. For an adjustPreview call, this value is always null.	55.0
`orderSummaryId`	String	ID of the OrderSummary.	49.0
`postFulfillmentChangeOrderId`	String	ID of the change Order that holds the financial changes applicable to OrderItemSummary quantities that have been fulfilled. For an adjustPreview call, this value is always null.	49.0
`preFulfillmentChangeOrderId`	String	ID of the change Order that holds the financial changes applicable to OrderItemSummary quantities that have not been fulfilled. If the request specified an `allocatedItemsChangeOrderType` of PreFulfillment, this change Order also includes the changes applicable to OrderItemSummary quantities	49.0

Property Name	Type	Description	Available Version
		that are in the process of being fulfilled. For an adjustPreview call, this value is always null.	

ConnectApi.Alternative

Alternative representation for an extension on a feed element.

Property Name	Type	Description	Available Version
`textRepresentation`	String	Text representation of the extension.	40.0
`thumbnailUrl`	String	Thumbnail URL to the extension.	40.0
`title`	String	Title of the extension.	40.0

ConnectApi.AlternativePaymentMethodOutput

Alternative payment method details output.

Property Name	Type	Description	Available Version
`accountId`	String	Salesforce Payments account to which this payment method is linked.	56.0
`comments`	String	Details about a record added by a user. Maximum of 1,000 characters.	56.0
`email`	String	Email address of the card holder.	56.0
`gatewayToken`	String	A unique, alphanumeric ID, called a token, that a payment gateway generates when it first processes a payment. The token replaces the actual payment data so that the data is kept secure. This token is stored as encrypted text, and can be used for recurring payments.	56.0
`gatewayTokenDetails`	String	Detailed information about the gateway token.	56.0
`name`	String	Name that you assign to the payment method object.	56.0

ConnectApi.Announcement

An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.

Name	Type	Description	Available Version
`expirationDate`	Datetime	The Salesforce UI displays an announcement until 11:59 p.m. on this date unless another announcement is posted first. The Salesforce UI ignores the time value in the `expirationDate`. However, you can use the time value to create your own display logic in your own UI.	31.0
`feedElement`	`ConnectApi.FeedElement`	The feed element that contains the body of the announcement and its associated comments, likes, and so on.	31.0
`id`	String	18-character ID of the announcement.	31.0
`isArchived`	Boolean	Specifies whether the announcement is archived.	36.0
`sendEmails`	Boolean	Specifies whether the announcement is sent as an email to all group members.	36.0
`url`	String	The URL to the announcement.	33.0

SEE ALSO:

ConnectApi.AnnouncementPage

ConnectApi.ChatterGroup

ConnectApi.AnnouncementPage

A collection of announcements.

Name	Type	Description	Available Version
`announcements`	`List<ConnectApi.Announcement>`	A collection of `ConnectApi.Announcement` objects.	31.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	31.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	31.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	31.0

ConnectApi.ApprovalCapability

If a feed element has this capability, it includes information about an approval.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`id`	String	The work item ID. The work item ID is `null` if there isn't a pending work item associated with the approval record.	32.0
`postTemplateFields`	List<`ConnectApi.ApprovalPostTemplateField`>	The details of the approval post template field.	32.0
`processInstanceStepId`	String	The process instance step ID. The associated record represents one step in an approval process.	32.0
`status`	`ConnectApi.WorkflowProcessStatus`	The status of the approval.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.ApprovalIntent

Approval intent for a social post.

Property Name	Type	Description	Available Version
`isRecallable`	Boolean	Specifies whether the social post can be recalled (`true`) or not (`false`).	45.0

SEE ALSO:

ConnectApi.SocialPostIntents

ConnectApi.ApprovalPostTemplateField

Approval post template field.

Name	Type	Description	Available Version
`displayName`	String	The field name.	28.0
`displayValue`	String	The field value or `null` if the field is set to `null`.	28.0
`record`	`ConnectApi.Reference`	A record ID. If no record exists or if the reference is `null`, this value is `null`.	28.0

SEE ALSO:

ConnectApi.ApprovalCapability

ConnectApi.ArticleItem

Article item in question and answers suggestions.

Property Name	Type	Description	Available Version
`id`	String	Id of the article.	32.0
`rating`	Double	The rating of the article.	32.0
`title`	String	Title of the article.	32.0
`urlLink`	String	Link URL of the article.	32.0
`viewCount`	Integer	Number of votes given to the article.	32.0

SEE ALSO:

ConnectApi.QuestionAndAnswersSuggestions

ConnectApi.ArticleSummary

A knowledge article summary.

Subclass of ConnectApi.ActorWithId.

Property Name	Type	Description	Available Version
`articleType`	String	Type of the knowledge article.	37.0
`knowledgeArticleVersionId`	String	ID of the knowledge article version.	39.0
`lastPublishedDate`	Datetime	Last published date of the knowledge article.	37.0
`rating`	Double	The rating of the article.	37.0
`summary`	String	Summary of the knowledge article contents.	37.0
`title`	String	Title of the knowledge article.	37.0
`urlName`	String	URL name of the knowledge article.	37.0
`viewCount`	Integer	Number of times the knowledge article has been viewed.	38.0

ConnectApi.AssociatedActionsCapability

If a feed element has this capability, it has platform actions associated with it.

Property Name	Type	Description	Available Version
`platformActionGroups`	List<`ConnectApi.PlatformActionGroup`>	The platform action groups associated with a feed element. Platform action groups are returned in the order specified in the `ConnectApi.AssociatedActionsCapabilityInput` class.	33.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.AsyncOutputRepresentation

Output representation of the async operation.

Subclass of ConnectApi.BaseAsyncOutputRepresentation.

No additional properties.

SEE ALSO:

multipleEnsureFundsAsync(multipleEnsureFundsInput)

ConnectApi.MultipleAsyncOutputRepresentation

ConnectApi.Audience

A personalization audience.

Property Name	Type	Description	Available Version
`criteria`	List<`ConnectApi.AudienceCriteriaDetail`>	Criteria details for the audience.	48.0
`customFormula`	String	Custom formula for the audience criteria. For example, (1 AND 2) OR 3.	48.0
`formulaFilterType`	`ConnectApi.FormulaFilterType`	Formula filter type for the personalization audience. Values are: • `AllCriteriaMatch`—All audience criteria are true (AND operation). • `AnyCriterionMatches`—Any audience criterion is true (OR operation). • `CustomLogicMatches`—Audience criteria match the custom formula (for example, (1 AND 2) OR 3).	48.0
`id`	String	ID of the audience.	48.0
`name`	String	Name of the audience.	48.0

Property Name	Type	Description	Available Version
`targets`	List<`ConnectApi.AudienceTargetAssignment`>	Target assignments for the audience.	48.0
`url`	String	URL to this audience.	48.0

SEE ALSO:

ConnectApi.AudienceCollection

ConnectApi.AudienceCollection

Collection of personalization audiences.

Property Name	Type	Description	Available Version
`audiences`	List<`ConnectApi.Audience`>	Collection of audiences.	48.0

ConnectApi.AudienceCriteria

Custom recommendation audience criteria.

This class is abstract.

This class is a superclass of:

- ConnectApi.CustomListAudienceCriteria
- ConnectApi.NewUserAudienceCriteria

Property Name	Type	Description	Available Version
`type`	`ConnectApi.RecommendationAudienceCriteriaType`	Specifies the custom recommendation audience criteria type. One of these values: • `CustomList`—A custom list of users makes up the audience. • `MaxDaysInCommunity`—New members make up the audience.	36.0

SEE ALSO:

ConnectApi.RecommendationAudience

ConnectApi.AudienceCriteriaDetail

Personalization audience criteria.

Property Name	Type	Description	Available Version
`criterion`	List<`ConnectApi.AudienceCriterionDetail`>	List of mappings of audience criteria fields and values.	48.0
`criterionNumber`	Integer	Number associated with the audience criterion in a formula. For example, (1 AND 2) OR 3. If unspecified, criteria are assigned numbers in the order that they're added.	48.0
`criterionOperator`	`ConnectApi.AudienceCriteriaOperator`	Operator used in the personalization audience criterion. Values are: • `Contains` • `Equal` • `GreaterThan` • `GreaterThanOrEqual` • `Includes` • `LessThan` • `LessThanOrEqual` • `NotEqual` • `NotIncludes` • `StartsWith`	48.0
`criterionType`	`ConnectApi.AudienceCriteriaType`	Type of personalization audience criterion. Values are: • `Audience`—Criterion based on audience. • `Default`—Audience has no criteria. • `Domain`—Criterion based on domain. • `FieldBased`—Criterion based on object fields. • `GeoLocation`—Criterion based on location. • `Permission`—Criterion based on standard or custom permissions. • `Profile`—Criterion based on profile.	48.0

SEE ALSO:

ConnectApi.Audience

ConnectApi.AudienceCriterionDetail

Audience criterion information.

Property Name	Type	Description	Available Version
`value`	Map<String, String>	Mapping of an audience criterion value and field.	48.0

SEE ALSO:

ConnectApi.AudienceCriteriaDetail

ConnectApi.AudienceTarget

Personalization audience assigned to a target.

Property Name	Type	Description	Available Version
`audienceName`	String	Name of the audience assigned to the target.	48.0
`id`	String	ID of the audience assigned to the target.	48.0
`url`	String	URL to the audience assigned to the target.	48.0

SEE ALSO:

ConnectApi.Target

ConnectApi.AudienceTargetAssignment

Target assignments for a personalization audience.

Property Name	Type	Description	Available Version
`formulaScope`	`ConnectApi.FormulaScope`	Formula scope of the target.	51.0
`groupName`	String	Group name of the target. Groups bundle related target and audience pairs.	48.0
`id`	String	ID of the target.	48.0
`isMatch`	Boolean	Specifies whether the target matches the current context (`true`) or doesn't (`false`).	48.0
`priority`	Integer	Priority of the target. Within a group, priority determines which target is returned if the user matches more than one audience.	48.0
`publishStatus`	`ConnectApi.PublishStatus`	Publish status of the target. Values are: • `Draft` • `Live`	48.0
`targetType`	String	Type of target, indicating the nature of the data being targeted.	48.0

Property Name	Type	Description	Available Version
`targetValue`	String	Value of the target.	48.0
`url`	String	URL to the target.	48.0

SEE ALSO:

ConnectApi.Audience

ConnectApi.AvailableLocationOutputRepresentation

A set of inventory locations that can combine to fulfill an order.

Property Name	Type	Description	Available Version
`locations`	List<`String`>	A list of inventory locations.	51.0

SEE ALSO:

findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

ConnectApi.FindRoutesWithFewestSplitsOutputRepresentation

ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation

ConnectApi.AverageDistanceResultOutputRepresentation

Wraps inventory location shipping distance calculation results.

Property Name	Type	Description	Available Version
`distanceCalculation`	`ConnectApi.DistanceCalculationOutputRepresentation`	Results of the shipping distance calculations.	51.0

ConnectApi.PaymentAuthAdjustmentResponse

Authorization Adjustment output representation.

Property Name	Type	Description	Available Version
`accountId`	String	ID of the account containing the payment authorization being adjusted.	51.0
`amount`	Double	Amount of the payment authorization adjustment.	51.0
`currencyIsoCode`	String	Three-letter ISO 4217 currency code associated with the payment authorization adjustment.	51.0

Property Name	Type	Description	Available Version
`effectiveDate`	Datetime	Date when the authorization adjustment becomes effective.	51.0
`id`	String	ID of the PaymentAuthAdjustment record.	51.0
`paymentAuthAdjustmentNumber`	String	System-defined reference number.	51.0
`requestDate`	Datetime	Date when the authorization adjustment transaction occurred.	51.0
`status`	String	Status of the payment authorization adjustment.Possible values are: • `Canceled`: The payment authorization reversal has been canceled. The parent authorization has returned to its pre-reversal balance. • `Draft`: The payment authorization reversal can be edited before applying it against the parent authorization. • `Processed`: The payment authorization reversal has been finalized. Users can change the status as follows: • Draft to Processed • Processed to Canceled • Draft to Canceled	51.0

ConnectApi.AuthReversalGatewayResponse

Authorization Reversal Gateway Response Representation.

Subclass of ConnectApi.AbstractGatewayResponse.

No additional properties.

ConnectApi.AuthorizationReversalResponse

Authorization Reversal output representation.

Property Name	Type	Description	Available Version
`error`	`ConnectApi.ErrorResponse`	Error response representation for the authorization reversal.	51.0
`gatewayResponse`	`ConnectApi.AuthReversalGatewayResponse`	Gateway response representation for authorization reversal.	51.0

Property Name	Type	Description	Available Version
paymentAuthAdjustment	ConnectApi.PaymentAuthAdjustmentResponse	Payment authorization adjustment response representation for the authorization reversal.	51.0
paymentGatewayLogs	List<ConnectApi.GatewayLogResponse>	Gateway log collection representation for the authorization reversal.	51.0

ConnectApi.AuthorizationGatewayResponse

Payment gateway authorization response representation.

Subclass of ConnectApi.AbstractGatewayResponse.

Property Name	Type	Description	Available Version
gatewayAuthorizationCode	String	Gateway authorization code.	51.0

ConnectApi.AuthorizationResponse

Payment Authorization output representation.

Property Name	Type	Description	Available Version
error	ConnectApi.ErrorResponse	Error representation for the payment authorization.	51.0
gatewayResponse	ConnectApi.AuthorizationGatewayResponse	Gateway response representation for the payment authorization.	51.0
paymentAuthorization	ConnectApi.PaymentAuthorizationResponse	Payment authorization representation.	51.0
paymentGatewayLogs	List<ConnectApi.GatewayLogResponse>	Gateway log list representation for the payment authorization.	51.0
paymentGroup	ConnectApi.PaymentGroupResponse	Payment group representation for the payment authorization.	51.0
paymentMethod	ConnectApi.PaymentMethodResponse	Payment method representation for the payment authorization.	51.0

ConnectApi.BannerCapability

If a feed element has this capability, it has a banner motif and style.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`motif`	`ConnectApi.Motif`	A banner motif.	31.0
`style`	`ConnectApi.BannerStyle`	Decorates a feed item with a color and set of icons. Possible value: • `Announcement`—An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.	31.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.BannerPhoto

A banner photo.

Property Name	Type	Description	Available Version
`bannerPhotoUrl`	String	URL to the banner photo in a large format. This URL is available only to authenticated users.	36.0
`bannerPhoto VersionId`	String	18-character version ID of the banner photo.	36.0
`url`	String	URL to the banner photo.	36.0

SEE ALSO:

ConnectApi.ChatterGroup

ConnectApi.UserDetail

ConnectApi.BaseManagedSocialAccount

Base information describing a managed social account or fan page of a social network.

This class is abstract.

Superclass of ConnectApi.ManagedSocialAccount.

Property Name	Type	Description	Available Version
`defaultResponse AccountId`	String	Default response account to use when replying to posts sent to this account.	44.0
`displayName`	String	Real name (or user name if real name not available) for this account on the social network.	44.0
`externalPictureUrl`	String	URL to the account's avatar image.	44.0

Property Name	Type	Description	Available Version
`id`	String	Internal SFDC ID for this managed social account.	44.0
`label`	String	Label for the social account.	44.0
`profileUrl`	String	URL to the account's profile.	44.0
`socialNetwork`	`ConnectApi.SocialNetworkProvider`	Social network that this account belongs to. Values are: • `Facebook` • `GooglePlus` • `Instagram` • `InstagramBusiness` • `KakaoTalk` • `Kik` • `Line` • `LinkedIn` • `Messenger` • `Other` • `Pinterest` • `QQ` • `Rypple` • `SinaWeibo` • `SMS` • `Snapchat` • `Telegram` • `Twitter` • `VKontakte` • `WeChat` • `WhatsApp` • `YouTube`	44.0
`uniqueName`	String	Unique name used for distinguishing same name fan pages; acts like a user name for a fan page.	44.0
`username`	String	Unique user name or handle for this account on the social network.	44.0

ConnectApi.BaseAsyncOutputRepresentation

Base Order Management async output class.

This class is abstract.

Subclass of ConnectApi.BaseOutputRepresentation.

Superclass of:

- ConnectApi.AsyncOutputRepresentation
- ConnectApi.EnsureFundsAsyncOutputRepresentation
- ConnectApi.EnsureRefundsAsyncOutputRepresentation

Property Name	Type	Description	Available Version
`backgroundOperationId`	String	ID of the background operation.	48.0

ConnectApi.BaseInvoiceOutputRepresentation

Base Order Management Invoice output class.

This class is abstract.

Subclass of ConnectApi.BaseOutputRepresentation.

Superclass of ConnectApi.ChangeOrdersInvoiceOutputRepresentation.

Property Name	Type	Description	Available Version
`invoiceId`	String	ID of the created invoice.	56.0

ConnectApi.BaseOutputRepresentation

Base Order Management output class.

This class is abstract.

Superclass of:

- ConnectApi.AdjustOrderSummaryOutputRepresentation
- ConnectApi.BaseAsyncOutputRepresentation
- ConnectApi.BaseInvoiceOutputRepresentation
- ConnectApi.ConfirmHeldFOCapacityOutputRepresentation
- ConnectApi.CreateCreditMemoOutputRepresentation
- ConnectApi.CreateMultipleInvoicesFromChangeOrdersOutputRepresentation
- ConnectApi.CreateOrderPaymentSummaryOutputRepresentation
- ConnectApi.EnsureFundsAsyncOutputRepresentation
- ConnectApi.EnsureRefundsAsyncOutputRepresentation
- ConnectApi.FindRoutesWithFewestSplitsOutputRepresentation
- ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation
- ConnectApi.FindRoutesWithFewestSplitsWithInventoryOutputRepresentation
- ConnectApi.FulfillmentGroupOutputRepresentation
- ConnectApi.FulfillmentOrderCancelLineItemsOutputRepresentation
- ConnectApi.FulfillmentOrderInvoiceOutputRepresentation
- ConnectApi.FulfillmentOrderOutputRepresentation

- ConnectApi.GetFOCapacityValuesOutputRepresentation
- ConnectApi.HoldFOCapacityOutputRepresentation
- ConnectApi.MultipleAsyncOutputRepresentation
- ConnectApi.MultipleFulfillmentOrderInvoicesOutputRepresentation
- ConnectApi.MultipleFulfillmentOrderOutputRepresentation
- ConnectApi.OrderSummaryOutputRepresentation
- ConnectApi.PreviewCancelOutputRepresentation
- ConnectApi.PreviewReturnOutputRepresentation
- ConnectApi.ProductDetailsOutputRepresentation
- ConnectApi.RankAverageDistanceOutputRepresentation
- ConnectApi.RegisterGuestBuyerOutputRepresentation
- ConnectApi.ReleaseHeldFOCapacityOutputRepresentation
- ConnectApi.ReturnItemsOutputRepresentation
- ConnectApi.ReturnOrderItemSplitLineOutputRepresentation
- ConnectApi.ReturnOrderOutputRepresentation
- ConnectApi.SubmitCancelOutputRepresentation
- ConnectApi.SubmitReturnOutputRepresentation

Property Name	Type	Description	Available Version
`errors`	List<`ConnectApi.ErrorResponse`>	Any errors that were returned.	48.0
`success`	Boolean	Indicates whether the transaction was successful.	48.0

ConnectApi.BatchResult

The result of an operation returned by a batch method.

Usage

Calls to batch methods return a list of `BatchResult` objects. Each element in the `BatchResult` list corresponds to the strings in the list parameter passed to the batch method. The first element in the `BatchResult` list matches the first string passed in the list parameter, the second element corresponds with the second string, and so on. If only one string is passed, the `BatchResult` list contains a single element.

Example

The following example shows how to obtain and iterate through the returned `ConnectApi.BatchResult` objects. The code adds two group IDs to a list. One of group IDs is incorrect, which causes a failure when the code calls the batch method. After it calls the batch method, it iterates through the results to determine whether the operation was successful or not for each group ID in the list. The code writes the ID of every group that was processed successfully to the debug log. The code writes an error message for every failed group.

This example generates one successful operation and one failure.

```
List<String> myList = new List<String>();
// Add one correct group ID.
myList.add('0F9D00000000oOT');
// Add one incorrect group ID.
myList.add('0F9D00000000izf');

ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterGroups.getGroupBatch(null,
myList);

// Iterate through each returned result.
for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the group ID.
        ConnectApi.ChatterGroupSummary groupSummary;
        if(batchResult.getResult() instanceof ConnectApi.ChatterGroupSummary) {
           groupSummary = (ConnectApi.ChatterGroupSummary) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(groupSummary.id);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

IN THIS SECTION:

BatchResult Methods

These are instance methods for `BatchResult`.

BatchResult Methods

These are instance methods for `BatchResult`.

IN THIS SECTION:

getError()

If an error occurred, returns a `ConnectApi.ConnectApiException` object providing the error code and description.

getErrorMessage()

Returns a String that contains an error message.

getErrorTypeName()

Returns a String that contains the name of the error type.

getResult()

Returns an object that contains the results of the batch operation. The object is typed according to the batch method. For example, if you call `getMembershipBatch()`, a successful call to BatchResult `getResult()` returns a `ConnectApi.GroupMembership` object.

isSuccess()

Returns a Boolean that is set to `true` if the batch operation was successful for this object, `false` otherwise.

getError()

If an error occurred, returns a `ConnectApi.ConnectApiException` object providing the error code and description.

Signature

```
public ConnectApi.ConnectApiException getError()
```

Return Value

Type: `ConnectApi.ConnectApiException`

getErrorMessage()

Returns a String that contains an error message.

Signature

```
public String getErrorMessage()
```

Return Value

Type: String

Usage

The error message doesn't make a round trip through a Visualforce view state, because exceptions can't be serialized.

getErrorTypeName()

Returns a String that contains the name of the error type.

Signature

```
public String getErrorTypeName()
```

Return Value

Type: String

getResult()

Returns an object that contains the results of the batch operation. The object is typed according to the batch method. For example, if you call `getMembershipBatch()`, a successful call to BatchResult `getResult()` returns a `ConnectApi.GroupMembership` object.

Signature

```
public Object getResult()
```

Return Value

Type: Object

isSuccess()

Returns a Boolean that is set to `true` if the batch operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

ConnectApi.BlankRecordField

Record field displayed as a place holder in a grid of fields.

Subclass of ConnectApi.AbstractRecordField.

ConnectApi.BookmarksCapability

If a feed element has this capability, the context user can bookmark it.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`isBookmarkedByCurrentUser`	Boolean	Indicates whether the feed element has been bookmarked by the context user (`true`) or not (`false`).	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.BookmarkSummary

Summary of a bookmark.

Subclass of ConnectApi.UserFeedEntityActivitySummary.

No additional properties.

ConnectApi.BotInfoRepresentation

Information about the bot associated with the conversation application.

Property Name	Type	Description	Available Version
`botId`	String	ID of the bot.	54.0
`botName`	String	Name of the bot.	54.0
`lastModifiedDate`	Datetime	Last modified date of the bot definition.	54.0

ConnectApi.BotVersionActivationInfo

Success or failure information of the bot version activation.

Property Name	Type	Description	Available Version
`isActivated`	Boolean	Indicates whether the bot is active or not.	51.0
`messages`	List<String>	Failure messages.	50.0
`success`	Boolean	Indicates whether the activation was successful or not.	50.0

ConnectApi.BundleCapability

If a feed element has this capability, it has a container of feed elements called a *bundle*.

This class is abstract.

Subclass of ConnectApi.FeedElementCapability.

Superclass of:

- ConnectApi.GenericBundleCapability
- ConnectApi.TrackedChangeBundleCapability

Property Name	Type	Description	Available Version
`bundleType`	`ConnectApi.BundleType`	Defines this feed element's bundle type. The bundle type determines what additional information appears in the bundle.	31.0
`page`	`ConnectApi.FeedElementPage`	A collection of feed elements.	31.0
`totalElements`	Integer	The total number of feed elements that this bundle aggregates.	31.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.CallCollaborationCapability

If a feed element has this capability, it has a recording comment.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`commentEndTime`	Integer	End time of the comment on the media player, in seconds.	51.0
`commentStartTime`	Integer	Start time of the comment on the media player, in seconds.	51.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.CandidateAnswersStatus

The status of candidate answers on a feed element.

Property Name	Type	Description	Available Version
`hasCandidateAnswers`	Boolean	Indicates whether candidate answers are available for a question.	41.0
`hasCandidateAnswersPublished`	Boolean	Indicates whether any candidate answers are published.	41.0
`hasCandidateAnswersRated`	Boolean	Indicates whether any candidate answers are rated.	41.0

SEE ALSO:

ConnectApi.QuestionAndAnswersCapability

ConnectApi.CanvasCapability

If a feed element has this capability, it renders a canvas app.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`description`	String	A description of the canvas app. The maximum size is 255 characters.	32.0
`developerName`	String	The API name (developer name) of the connected app.	32.0
`height`	String	The height of the canvas app in pixels.	32.0
`icon`	`ConnectApi.Icon`	The icon for the canvas app.	32.0
`namespacePrefix`	String	A unique namespace prefix for the canvas app.	32.0
`parameters`	String	JSON parameters passed to the canvas app.	32.0

Property Name	Type	Description	Available Version
thumbnailUrl	String	A thumbnail URL to a preview image. The maximum thumbnail size is 120 pixels by 120 pixels.	32.0
title	String	A title for the canvas link.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.CapacityResponseOutputRepresentation

Response to a request related to a location's fulfillment capacity.

Property Name	Type	Description	Available Version
actionRequestId	String	Unique string that identifies the original capacity request.	55.0
error	ConnectApi.ErrorResponse	Error returned by the request, if any.	55.0
success	Boolean	Indicates whether the request was successful.	55.0

ConnectApi.CaptureGatewayResponse

Gateway capture response.

Subclass of ConnectApi.AbstractGatewayResponse.

No additional properties.

ConnectApi.CaptureResponse

Capture output.

Property Name	Type	Description	Available Version
error	ConnectApi.ErrorResponse	Error response representation for an authorization capture.	50.0
gatewayResponse	ConnectApi.CaptureGatewayResponse	Gateway log response containing details about gateway logs created during the process of the capture request.	50.0
payment	ConnectApi.PaymentResponse	Payment response object for the capture request. Contains the information related to a payment object created during request processing.	50.0
paymentGatewayLogs	List<ConnectApi.GatewayLogResponse>	Gateway log collection for an authorization capture.	50.0

Property Name	Type	Description	Available Version
paymentGroup	ConnectApi.PaymentGroupResponse	Payment group associated with the capture request.	50.0

ConnectApi.CardPaymentMethodOutput

Card payment method details output.

Property Name	Type	Description	Available Version
accountId	String	Salesforce Payments account to which this payment method is linked.	56.0
autoPay	Boolean	Indicates whether a token for recurring payments is being requested (true) or not (false). The token lets the payment method be used for recurring payments.	56.0
cardBin	String	Bank Identification Number (BIN). The BIN is the first 4-6 numbers on a payment card that identifies the card issuer.	56.0
cardCategory	ConnectApi.CardCategory	• CreditCard • DebitCard	56.0
cardHolderFirstName	String	First name of the card holder	56.0
cardHolderLastName	String	Last name of the card holder	56.0
cardHolderName	String	Full name of card holder	56.0
cardLastFour	String	Last four digits on a card.	56.0
cardType	ConnectApi.CardType	Credit card issuer. • AmericanExpress • DinersClub • JCB • Maestro • MasterCard • Visa	56.0
comments	String	Details about a record added by a user. Maximum of 1,000 characters.	56.0
displayCardNumber	String	Card displayed number	56.0
email	String	Email address of the card holder.	56.0
expiryMonth	Integer	Card expiration month	56.0
expiryYear	Integer	Card expiration year	56.0

Property Name	Type	Description	Available Version
nickName	String	Optional card nickname	56.0
startMonth	Integer	Month when card becomes active	56.0
startYear	Integer	Year when card becomes active	56.0

ConnectApi.CartCoupon

Cart Coupon representation.

Property Name	Type	Description	Available Version
cartCouponId	String	ID of the cart coupon code.	54.0
couponCode	String	The coupon code a buyer can use to manually apply a promotion to the cart.	54.0

ConnectApi.CartCouponCollection

Collection of coupons related to a cart.

Property Name	Type	Description	Available Version
cartCoupons	List<ConnectApi.CartCouponList>	Collection of coupons.	54.0
cartId	String	ID of the cart.	54.0
cartStatus	ConnectApi.CartStatus	Status of the cart. Values are: • Active—Cart is created and available for modifications, like adding or removing products or promotions. • Checkout—Cart is in checkout. If the customer modifies the cart, the current checkout session is canceled. • Closed—Checkout is complete and an order was created. The cart cannot be modified. • PendingClosed—Cart is marked to be closed, but the request isn't completed yet. The cart can't be modified. This value is available in API version 57.0 and later. • PendingDelete—Cart is marked for delete, but the request isn't completed yet. The cart can't be modified. • Processing—Cart is processing. For example, taxes are being calculated. The cart can't be modified.	54.0

Property Name	Type	Description	Available Version
ownerId	String	ID of the user who owns the cart.	54.0

ConnectApi.CartCouponList

List of coupons for a cart.

Property Name	Type	Description	Available Version
coupons	list<ConnectApi.CartCoupon>	List of coupons associated with a cart.	54.0

ConnectApi.CartInventoryItemReservationOutputRepresentation (Pilot)

Inventory item reservation.

Note: This feature is not generally available and is being piloted with certain Customers subject to additional terms and conditions. It is not part of your purchased Services. This feature is subject to change, may be discontinued with no notice at any time in Salesforce's sole discretion, and Salesforce may never make this feature generally available. Make your purchase decisions only on the basis of generally available products and features. This feature is made available on an AS IS basis and use of this feature is at your sole risk.

Property Name	Type	Description	Available Version
errorCode	String	Error code for this reservation item.	58.0
errorMessage	String	Error message for this reservation item.	58.0
id	String	ID for this reservation item.	58.0
itemReservationSourceId	String	Item reservation source ID for this reservation item.	58.0
productId	String	Product ID for this reservation item.	58.0
quantity	Double	Quantity for this reservation item.	58.0
reservedAtLocationId	String	Reserved at location or group ID for this reservation item.	58.0

ConnectApi.CartInventoryReservationOutputRepresentation (Pilot)

Inventory Reservation

Note: This feature is not generally available and is being piloted with certain Customers subject to additional terms and conditions. It is not part of your purchased Services. This feature is subject to change, may be discontinued with no notice at any time in Salesforce's sole discretion, and Salesforce may never make this feature generally available. Make your purchase decisions only on the basis of generally available products and features. This feature is made available on an AS IS basis and use of this feature is at your sole risk.

Property Name	Type	Description	Available Version
errorCode	String	Error code for this reservation.	58.0
errorMessage	String	Error message for this reservation.	58.0
inventoryItemReservations	List<ConnectApi.CartInventoryItemReservationOutputRepresentation>	Collection of inventory item reservations.	58.0
reservationIdentifier	String	Reservation identifier.	58.0
success	Boolean	Indicates whether the transaction was successful.	58.0

ConnectApi.CartItem

An item in a cart.

Subclass of ConnectApi.AbstractCartItem.

Property Name	Type	Description	Available Version
currencyIsoCode	String	Currency ISO code of the cart.	57.0
firstPymtTotalAmount	String	For subscription items, the first payment amount after adjustments and taxes. For non-subscription products, the value is the same as `totalAmount`.	60.0
firstPymtTotalPrice	String	For subscription items, the first term price, including adjustments but excluding taxes. For non-subscription items, the total price, including adjustments but excluding taxes.	60.0
firstPymtTotalTax	String	For subscription items, the tax amount on the first payment. For non-subscription products, the value is the same as `totalTax`.	60.0
itemizedAdjustmentAmount	String	Total itemized adjustment amount for the item, including promotions and excluding taxes.	52.0
listPrice	String	List price for the item.	49.0
salesPrice	String	Sales price for the item.	49.0
totalAdjustmentAmount	String	Total adjustment amount for the item.	50.0
totalAmount	String	Total amount for the item.	49.0
totalListPrice	String	Total list price for the item.	49.0
totalPrice	String	Total price for the item including adjustments but excluding taxes.	49.0

Property Name	Type	Description	Available Version
totalTax	String	Total tax for the item.	49.0
unitAdjustedPrice	String	Unit price, including adjustments, for the item. This value is informational only and isn't used in pricing calculations.	50.0
unitAdjustmentAmount	String	Adjustments made to the unit price for the item. This value is informational only and isn't used in pricing calculations.	50.0

ConnectApi.CartItemBasic

Represents limited details about a cart item.

Property Name	Type	Description	Available Version
cartItemId	String	ID of the cart item.	60.0
name	String	Name of the cart item.	60.0
productId	String	ID of the product associated with the cart item.	60.0
quantity	String	Quantity of the cart item.	60.0
type	ConnectApi.CartItemType	Type of item in a cart. Value is Product.	60.0

ConnectApi.CartItemBasicResult

Represents the result of a cart request.

Property Name	Type	Description	Available Version
cartItem	ConnectApi.CartItemBasic on page 1911	Item in a cart.	60.0
message	String	Error message when the request is not successful.	60.0
status	String	Status of the request.	60.0

ConnectApi.CartItemCollection

A collection of items in a cart.

Property Name	Type	Description	Available Version
cartCoupons	ConnectApi.CartCouponCollection	Collection of coupons in the cart.	59.0

Property Name	Type	Description	Available Version
`cartItems`	List<`ConnectApi.CartItemResult`>	Collection of cart item results.	49.0
`cartPromotions`	`ConnectApi.CartPromotionCollection`	Collection of promotions in the cart.	59.0
`cartSummary`	`ConnectApi.CartSummary`	Summary of the cart.	49.0
`currentPage`	Integer	Current page of cart items. The value matches the requested page number, unless the requested page number exceeds the total number of pages. In this scenario, the current page is the highest available page number.	60.0
`currentPageToken`	String	Token identifying the current page.	49.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	49.0
`hasErrors`	Boolean	Specifies whether at least one of the results contains an error.	49.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	49.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	49.0
`previousPageToken`	String	Token identifying the previous page, or `null` if there isn't a previous page.	49.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	49.0
`totalItemCount`	Integer	Total number of unique products in the cart.	60.0
`totalNumberOfPages`	Integer	Total number of pages for the given page size.	60.0

ConnectApi.CartItemProduct

Product summary for a cart item.

Property Name	Type	Description	Available Version
`fields`	Map<String, String>	Map of product fields and values.	49.0
`name`	String	Name of the product.	49.0
`productId`	String	ID of the product.	49.0
`productSubscriptionInformation`		Reserved for future use.	59.0

Property Name	Type	Description	Available Version
purchaseQuantityRule	ConnectApi.PurchaseQuantityRule	If one exists, purchase quantity rule for the product.	52.0
sku	String	SKU of the product.	49.0
thumbnailImage	ConnectApi.ProductMedia	Thumbnail image of the product.	49.0
variationAttributes	Map<String, ConnectApi.CartProductAttribute>	Variation attributes associated with the product.	50.0

SEE ALSO:

- ConnectApi.AbstractCartItem
- ConnectApi.WishlistItem

ConnectApi.CartItemPromotionCollectionOutputRepresentation

Promotions for the items in a cart.

Property Name	Type	Description	Available Version
currencyIsoCode	String	Currency code associated with the cart.	53.0
items	Map<String, ConnectApi.CartPromotionListRepresentation>	Collection of promotions.	52.0

ConnectApi.CartItemResult

Result after requesting a cart item.

Property Name	Type	Description	Available Version
cartItem	ConnectApi.AbstractCartItem	Cart item.	49.0
message	String	Message when the request isn't successful.	49.0
status	String	Status for the request.	49.0

SEE ALSO:

- ConnectApi.CartItemCollection
- ConnectApi.WishlistToCartResult

ConnectApi.CartItemWithoutPrice

An item without price information in a cart.

Subclass of ConnectApi.AbstractCartItem.

No additional properties.

ConnectApi.CartMessage

Cart message.

Property Name	Type	Description	Available Version
`message`	String	Cart message.	49.0
`messageId`	String	ID of the object supplying the message.	49.0
`relatedEntityId`	String	ID of the entity, for example, cart, cart item, or cart tax, associated with the message.	49.0
`severity`	`ConnectApi.CartMessageSeverity`	Severity of cart message. Values are: • `Error` • `Info` • `Warning`	49.0
`type`	String	Type of message. Standard values include `Inventory`, `Taxes`, `Pricing`, `Shipping`, `Entitlement`, `SystemError`, and `Other`.	49.0
`visible`	Boolean	Specifies whether the message is visible (`true`) or dismissed (`false`).	49.0

SEE ALSO:

ConnectApi.CartMessagesSummary

ConnectApi.CartMessagesSummary

Cart messages summary.

Property Name	Type	Description	Available Version
`errorCount`	Integer	In `ConnectApi.CartItemResult`, the count of messages with the `Error` severity level.	49.0
`hasErrors`	Boolean	Specifies whether there are messages related to the entity (`true`) or not (`false`).	49.0
`limitedMessages`	List<`ConnectApi.CartMessage`>	In `ConnectApi.CartItemResult`, a limited list of messages related to the cart item. In `ConnectApi.CartSummary`, each message	49.0

Property Name	Type	Description	Available Version
		can be related to the cart or to another cart-related entity.	
`relatedEntityId`	String	In `ConnectApi.CartItemResult`, the ID of the related cart item. In `ConnectApi.CartSummary`, each message can be related to the cart or to another cart-related entity.	49.0
`totalLineItemsWithErrors`	Integer	In `ConnectApi.CartItemResult`, either `null` if the cart item has no errors or `1` if the cart item has errors. In `ConnectApi.CartSummary`, the total number of product line items that contain errors.	50.0

SEE ALSO:

ConnectApi.AbstractCartItem

ConnectApi.CartMessagesVisibilityResult

Result of setting the visibility for cart messages.

Property Name	Type	Description	Available Version
`visibility`	Boolean	Specifies whether cart messages are set to visible (`true`) or not (`false`).	50.0

ConnectApi.CartProductAttribute

Product attribute for a cart item.

Property Name	Type	Description	Available Version
`label`	String	Label or display name of the attribute.	50.0
`sequence`	Integer	Sequence of the attribute within the attribute set.	50.0
`value`	String	Display value of the attribute.	50.0

SEE ALSO:

ConnectApi.CartItemProduct

ConnectApi.CartPromotionCollection

All the promotions associated with the cart.

Property Name	Type	Description	Available Version
`cartId`	String	ID of the cart.	53.0
`cartStatus`	`ConnectApi.CartStatus`	Status of the cart. Values are: • `Active`—Cart is created and available for modifications, like adding or removing products or promotions. • `Checkout`—Cart is in checkout. If the customer modifies the cart, the current checkout session is canceled. • `Closed`—Checkout is complete and an order was created. The cart cannot be modified. • `PendingClosed`—Cart is marked to be closed, but the request isn't completed yet. The cart can't be modified. This value is available in API version 57.0 and later. • `PendingDelete`—Cart is marked for delete, but the request isn't completed yet. The cart can't be modified. • `Processing`—Cart is processing. For example, taxes are being calculated. The cart can't be modified.	53.0
`currencyIsoCode`	String	Currency ISO code of the cart.	53.0
`promotions`	List<`ConnectApi.CartPromotionList`>	Collection of promotions.	53.0

ConnectApi.CartPromotionList

A list of promotions for a cart.

Property Name	Type	Description	Available Version
`promotions`	List<`ConnectApi.CartPromotionOutputRepresentation`>	Promotions associated with a cart.	54.0

ConnectApi.CartPromotionOutputRepresentation

A promotion associated with a cart.

Property Name	Type	Description	Available Version
`adjustmentAmount`	String	Adjustment amount out of the promotion.	53.0

Property Name	Type	Description	Available Version
couponCode	String	Coupon code for a promotion. A coupon code is available only for manual promotions, not for automatic promotions.	54.0
currencyIsoCode	String	Currency ISO code associated with the cart.	57.0
displayName	String	Localized display name of the promotion.	52.0
promotionId	String	ID of the promotion.	53.0
targetType	ConnectApi.CartPromotionType	Promotion target type. Values are: • Cart—Promotion targets a cart. • Item—Promotion targets an item in a cart.	53.0
termsAndConditions	String	Localized terms and conditions for the promotion.	53.0

ConnectApi.CartSummary

A cart summary.

Property Name	Type	Description	Available Version
accountId	String	ID of the account for the cart.	49.0
asyncOperationStatus	String	Asynchronous processing status of the cart, if asynchronous processing is enabled for the store. This property returns Completed in Apex, because Apex operations always run synchronously.	59.0
cartId	String	ID of the cart.	49.0
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the cart.	49.0
firstPymtGrandTotalAmount	String	First payment amount for subscription products, plus the total payment amount for non-subscription products. Includes taxes.	60.0
firstPymtTotalTaxAmount	String	Tax amount on the first payment for any subscription products, plus the total tax amount on non-subscription products.	60.0
grandTotalAmount	String	Grand total amount including shipping and tax for items in the cart, in the currency of the cart.	49.0
isSecondary	Boolean	Specifies whether the cart is secondary (true) or not (false).	53.0
name	String	Name of the cart.	49.0
ownerId	String	ID of the owner of the cart.	49.0

Property Name	Type	Description	Available Version
`ownerOrderId`	String	ID of the owner of the order.	58.0
`purchaseOrderNumber`	String	Purchase order for the cart.	50.0
`status`	`ConnectApi.CartStatus`	Status of the cart. Values are: • `Active`—Cart is created and available for modifications, like adding or removing products or promotions. • `Checkout`—Cart is in checkout. If the customer modifies the cart, the current checkout session is canceled. • `Closed`—Checkout is complete and an order was created. The cart cannot be modified. • `PendingClosed`—Cart is marked to be closed, but the request isn't completed yet. The cart can't be modified. This value is available in API version 57.0 and later. • `PendingDelete`—Cart is marked for delete, but the request isn't completed yet. The cart can't be modified. • `Processing`—Cart is processing. For example, taxes are being calculated. The cart can't be modified.	49.0
`taxType`	String	Tax type of the cart. • `Gross`—Gross taxation policy. • `Net`—Net taxation policy.	55.0
`totalChargeAmount`	String	Total amount for shipping and other charges in the currency of the cart.	49.0
`totalListPrice`	String	Total list price for the cart.	49.0
`totalProductAmount`	String	Total amount including discounts, but excluding shipping and tax, for product items in the cart.	49.0
`totalProductAmountAfterAdjustments`	String	Total product amount, including promotions.	52.0
`totalProductCount`	String	Total count of items in the cart.	49.0
`totalProductLineItemCount`	Integer	Total count of line items, of the type Product, in the cart.	60.0
`totalProductListAmount`	String	Total list amount for products in the cart.	59.0
`totalPromotionalAdjustmentAmount`	String	Total promotional adjustment amount for items in the cart.	52.0

Property Name	Type	Description	Available Version
totalSubProductCount	String	Total quantity of all cart items with the selling model type Evergreen or Term-Defined.	60.0
totalTaxAmount	String	Total tax amount for the cart, including tax on shipping, if applicable.	49.0
type	ConnectApi.CartType	Type of cart. Values are: • Cart—Cart created by a customer. • PayNowReadOnly—Clone of a Template cart that the customer can check out with using the Pay Now feature. • Template—Cart created by an internal user.	49.0
uniqueProductCount	Integer	Total count of unique items, or SKUs, in the cart.	49.0
webstoreId	String	ID of the webstore of the cart.	49.0

SEE ALSO:

ConnectApi.CartItemCollection

ConnectApi.CartToWishlistResult

Result of copying products from a cart to a wishlist.

Property Name	Type	Description	Available Version
productsAddedCount	Integer	Number of products copied from the cart to the wishlist.	50.0
wishlistId	String	ID of the wishlist that cart products were copied to.	50.0

ConnectApi.CaseCommentCapability

If a feed element has this capability, it has a case comment on the case feed.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
actorType	ConnectApi.CaseActorType	Specifies the type of user who made the comment.	32.0
createdBy	ConnectApi.Actor	Information about the user who created the comment.	32.0
createdDate	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	32.0

Property Name	Type	Description	Available Version
`eventType`	`ConnectApi.CaseCommentEventType`	Specifies an event type for a comment in the case feed.	32.0
`id`	String	18-character ID of case comment.	32.0
`published`	Boolean	Specifies whether the comment has been published.	32.0
`text`	String	Text of the case comment.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.CdpActionResponse

Customer Data Platform action response.

This class is abstract.

Superclass of:

- ConnectApi.CdpCalculatedInsightStandardActionResponseRepresentation
- ConnectApi.CdpSegmentActionOutput in API version 59.0 and later.

Property Name	Type	Description	Available Version
`errors`	List<`ConnectApi.CdpErrorResponse`>	List of errors that resulted from the action.	57.0
`success`	Boolean	Indicates whether the call was successful (`true`) or not (`false`).	57.0

ConnectApi.CdpCalculatedInsightPage

Collection of calculated insights.

Property Name	Type	Description	Available Version
`collection`	`ConnectApi.CdpCalculatedInsightPageData`	Collection of calculated insights.	57.0

ConnectApi.CdpCalculatedInsightPageData

Calculated insight collection data.

Property Name	Type	Description	Available Version
`count`	Integer	Number of results returned in the page.	57.0

Property Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	57.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	57.0
`items`	List<`ConnectApi.CdpCalculatedInsightOutput`>	List of calculated insights.	57.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	57.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	57.0
`previousPageToken`	String	Token identifying the previous page, or `null` if there isn't a previous page.	57.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	57.0
`total`	Integer	Total row count of calculated insights.	57.0

SEE ALSO:

ConnectApi.CdpCalculatedInsightPage

ConnectApi.CdpCalculatedInsightDataSource

Calculated insight data source.

Property Name	Type	Description	Available Version
`sourceApiName`	String	Data source API name.	57.0
`type`	String	Data source type.	57.0

SEE ALSO:

ConnectApi.CdpCalculatedInsightDimension

ConnectApi.CdpCalculatedInsightMeasure

ConnectApi.CdpCalculatedInsightDimension

Calculated insight dimension.

Property Name	Type	Description	Available Version
`apiName`	String	API name of the dimension.	57.0
`creationType`	String	Creation type of the dimension.	57.0

Property Name	Type	Description	Available Version
dataSource	ConnectApi.CdpCalculatedInsightDataSource	Data source of the dimension.	57.0
dataType	String	Data type of the dimension.	57.0
dateGranularity	String	Date granularity of the dimension.	57.0
displayName	String	Display name of the dimension.	57.0
fieldRole	String	Field role of the dimension.	57.0
formula	String	Formula of the dimension.	57.0

SEE ALSO:

ConnectApi.CdpCalculatedInsightOutput

ConnectApi.CdpCalculatedInsightMeasure

Calculated insight measure.

Property Name	Type	Description	Available Version
apiName	String	API name of the measure.	57.0
creationType	String	Creation type of the measure.	57.0
dataSource	ConnectApi.CdpCalculatedInsightDataSource	Data source of the measure.	57.0
dataType	String	Data type of the measure.	57.0
displayName	String	Display name of the measure.	57.0
fieldAggregationType	String	Field aggregation type of the measure.	57.0
fieldRole	String	Field role of the measure.	57.0
formula	String	Formula of the measure.	57.0

SEE ALSO:

ConnectApi.CdpCalculatedInsightOutput

ConnectApi.CdpCalculatedInsightOutput

Calculated insight.

Property Name	Type	Description	Available Version
`apiName`	String	API name of the calculated insight.	57.0
`calculatedInsightStatus`	String	Status of the calculated insight.	57.0
`creationType`	String	Creation type of the calculated insight.	57.0
`dataSpace`	String	Data space of the calculated insight.	57.0
`definitionStatus`	String	Definition status of the calculated insight.	57.0
`definitionType`	String	Definition type of the calculated insight.	57.0
`description`	String	Description of the calculated insight.	57.0
`dimensions`	List<`ConnectApi.CdpCalculatedInsightDimension`>	Dimensions of the calculated insight.	57.0
`displayName`	String	Display name of the calculated insight.	57.0
`expression`	String	Expression of the calculated insight.	57.0
`isEnabled`	Boolean	Specifies whether the calculated insight is enabled (`true`) or not (`false`).	57.0
`lastCalcInsightStatusDateTime`	String	Last calculated insight status date and time.	57.0
`lastCalcInsightStatusErrorCode`	String	Last calculated insight status error code.	57.0
`lastRunDateTime`	String	Last run date and time of the calculated insight.	57.0
`lastRunStatus`	String	Last run status of the calculated insight.	57.0
`lastRunStatusDateTime`	String	Last run status date and time of the calculated insight.	57.0
`lastRunStatusErrorCode`	String	Last run status error code of the calculated insight.	57.0
`measures`	List<`ConnectApi.CdpCalculatedInsightMeasure`>	Measures of the calculated insight.	57.0

SEE ALSO:

ConnectApi.CdpCalculatedInsightPageData

ConnectApi.CdpCalculatedInsightStandardActionResponseRepresentation

Response of the calculated insight run action.

Subclass of ConnectApi.CdpActionResponse.

No additional properties.

ConnectApi.CdpErrorResponse

Error response.

Property Name	Type	Description	Available Version
`errorCode`	String	Error code.	57.0
`message`	String	Message stating the reason for the error, if any.	57.0

SEE ALSO:

ConnectApi.CdpActionResponse

ConnectApi.CdpIdentityResolutionMatchCriterionOutput

Identity resolution ruleset's match rule criterion.

Property Name	Type	Description	Available Version
`caseSensitiveMatch`	Boolean	Specifies whether the criterion match is case sensitive (`true`) or not (`false`). Available only when matching is based on the party identifier.	58.0
`entityName`	String	API name of the Data Model Object the match rule applies to.	57.0
`fieldName`	String	Name of the field the criterion applies to.	57.0
`matchMethodType`	`ConnectApi.CdpIdentityResolutionMatchMethodType`	Match method for a match rule criterion. Values are: • `Exact`—Exact match. • `ExactNormalized`—Exact normalized match. • `Fuzzy`—Fuzzy match with medium precision. • `FuzzyHigh`—Fuzzy match with high precision. • `FuzzyLow`—Fuzzy match with low precision.	57.0
`partyIdentificationInfo`	`ConnectApi.CdpIdentityResolutionMatchCriterionPartyIdentificationInfoOutput`	Party Identifier information.	57.0
`shouldMatchOnBlank`	Boolean	Specifies whether blank fields can be used for matching (`true`) or not (`false`).	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionMatchRuleOutput

ConnectApi.CdpIdentityResolutionMatchCriterionPartyIdentificationInfoOutput

Information when party identification is used in an identity resolution ruleset's match rule criterion.

Property Name	Type	Description	Available Version
`partyName`	String	Party identification name.	57.0
`partyType`	String	Party identification type.	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionMatchCriterionOutput

ConnectApi.CdpIdentityResolutionMatchRuleOutput

Identity resolution ruleset's match rule.

Property Name	Type	Description	Available Version
`criteria`	List<`ConnectApi.CdpIdentityResolutionMatchCriterionOutput`>	Object and field the match rule applies to and the match method applied.	57.0
`label`	String	User friendly name for the identity resolution match rule.	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionOutput

ConnectApi.CdpIdentityResolutionOutput

Identity resolution ruleset.

Property Name	Type	Description	Available Version
`anonymousUnifiedProfiles`	Long	Count of anonymous unified profiles created by running the identity resolution ruleset.	57.0
`configurationType`	`ConnectApi.CdpIdentityResolutionConfigurationType`	Source object for an identity resolution ruleset. Values are: • `Account` • `Individual`	57.0
`consolidationRate`	Double	Consolidation rate resulting from the run of an identity resolution ruleset.	57.0
`dataSpaceName`	String	Data space used as source data for an identity resolution ruleset.	57.0

Property Name	Type	Description	Available Version
`description`	String	Description of the identity resolution ruleset.	57.0
`doesRun Automatically`	Boolean	Specifies whether automatic job run scheduling is enabled for the ruleset (`true`) or not (`false`). If unspecified, defaults to `false`.	57.0
`id`	String	Identity resolution ruleset's ID. This is not the identity resolution's extended ruleset ID (`rulesetId`).	57.0
`knownUnified Profiles`	Long	Count of known unified profiles created by running the identity resolution ruleset.	57.0
`label`	String	User friendly name of the identity resolution ruleset.	57.0
`lastJobCompleted`	Datetime	Date and time the last job completed.	57.0
`lastJobStatus`	String	Last job's status. Possible values are: • `SUCCESS` • `IN_PROGRESS` • `FAIL` • `SCHEDULED` • `SKIPPED`	57.0
`matchRules`	List<`ConnectApi.CdpIdentityResolutionMatchRuleOutput`>	List of match rules.	57.0
`matchedSource Profiles`	Long	Count of matched source profiles identified by running the identity resolution ruleset.	57.0
`objectApiName`	String	Object name of the identity resolution ruleset.	57.0
`reconciliationRules`	List<`ConnectApi.CdpIdentityResolutionReconciliationRuleOutput`>	List of reconciliation rules.	57.0
`rulesetId`	String	Extension ID of a ruleset. The ruleset ID must be unique and no longer than 4 characters. This ID is not the identifying ID for the ruleset.	57.0
`rulesetStatus`	String	Status of a ruleset job. Possible values are: • `NEW` • `PUBLISHING` • `PUBLISHED` • `ERROR` • `DELETING` • `DELETE_FAILED`	57.0

Property Name	Type	Description	Available Version
`sourceProfiles`	Long	Count of source profiles that were processed by a ruleset job.	57.0
`totalUnifiedProfiles`	Long	Count of unified profiles created by running the identity resolution ruleset.	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionsOutput

ConnectApi.CdpIdentityResolutionReconciliationFieldRuleOutput

Identity resolution ruleset's reconciliation rule for a field.

Property Name	Type	Description	Available Version
`fieldName`	String	The field that this reconciliation rule applies to.	57.0
`ruleType`	`ConnectApi.CdpIdentityResolutionReconciliationRuleType`	Default reconciliation rule applied to fields in the object the reconciliation rule applies to. Values are: • `LastUpdated` • `MostFrequent` • `SourceSequence`	57.0
`shouldIgnoreEmptyValue`	Boolean	Specifies whether to ignore an empty value (`true`) or not (`false`).	57.0
`sources`	List<`ConnectApi.CdpIdentityResolutionReconciliationSourceOutput`>	If `ruleType` is `SourceSequence`, a prioritized list of data sources.	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionReconciliationRuleOutput

ConnectApi.CdpIdentityResolutionReconciliationRuleOutput

Identity resolution ruleset's reconciliation rule for an object.

Property Name	Type	Description	Available Version
`entityName`	String	API name of the Data Model Object the reconciliation rule applies to.	57.0
`fields`	List<`ConnectApi.CdpIdentityResolutionReconciliationFieldRuleOutput`>	Field-specific reconciliation rules that override this default rule for the specified field.	57.0

Property Name	Type	Description	Available Version
`linkDmoName`	String	API name of the unified link object created by the identity resolution process.	57.0
`ruleType`	`ConnectApi.CdpIdentityResolutionReconciliationRuleType`	Default reconciliation rule applied to fields in the object the reconciliation rule applies to. Values are: • `LastUpdated` • `MostFrequent` • `SourceSequence`	57.0
`shouldIgnoreEmptyValue`	Boolean	Specifies whether to ignore an empty value (`true`) or not (`false`).	57.0
`sources`	List<`ConnectApi.CdpIdentityResolutionReconciliationSourceOutput`>	If `ruleType` is `SourceSequence`, a list of data sources in priority order.	57.0
`unifiedDmoName`	String	API name of the unified data model object created by the identity resolution process.	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionOutput

ConnectApi.CdpIdentityResolutionReconciliationSourceOutput

Source for an identity resolution default reconciliation rule or field-specific rule using the `SourceSequence` match method.

Property Name	Type	Description	Available Version
`name`	String	If the `ruleType` for a reconciliation rule is `SourceSequence`, API name of a source Data Lake Object.	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionReconciliationRuleOutput

ConnectApi.CdpIdentityResolutionReconciliationFieldRuleOutput

ConnectApi.CdpIdentityResolutionRunNowOutput

Identity resolution ruleset run now output.

Property Name	Type	Description	Available Version
resultCode	ConnectApi.CdpIdentityResolutionRunNowResultCode	Result of an identity resolution ruleset job run. Values are: • ExceededMaximumNumberOfSuccessfulRunsAllowedIn24Hours • IdentityResolutionJobIsAlreadyRunning • NoPendingChangesJobRunSkipped • SuccessfullySubmittedIdentityResolutionJobRunRequest	57.0

ConnectApi.CdpIdentityResolutionsOutput

Identity resolution rulesets.

Property Name	Type	Description	Available Version
identityResolutions	List<ConnectApi.CdpIdentityResolutionOutput>	List of identity resolution rulesets.	57.0

ConnectApi.CdpQueryDataOutput

Query data output.

Property Name	Type	Description	Available Version
data	List<Object>	Result data set.	54.0

ConnectApi.CdpQueryMetadataItem

Metadata item.

Property Name	Type	Description	Available Version
placeInOrder	Integer	Attribute place order in the result.	55.0
type	String	Metadata type for column.	55.0
typeCode	Integer	Metadata type code.	55.0

SEE ALSO:

ConnectApi.CdpQueryOutputV2

ConnectApi.CdpQueryMetadataOutput

Query metadata result.

Property Name	Type	Description	Available Version
`metadata`	List<Object>	Metadata set.	52.0

ConnectApi.CdpQueryOutput

Query result.

Property Name	Type	Description	Available Version
`data`	List<Object>	Result data set.	52.0
`done`	Boolean	Specifies whether the query is done (`true`) or not (`false`).	52.0
`endTime`	String	Query end time.	52.0
`metadata`	Map<String, Object>	Result metadata set.	52.0
`queryId`	String	Query ID.	52.0
`rowCount`	Integer	Number of rows in the result data set.	52.0
`startTime`	String	Query start time.	52.0

ConnectApi.CdpQueryOutputV2

Query output for the V2 API.

Property Name	Type	Description	Available Version
`data`	List<`ConnectApi.CdpQueryV2Row`> (in version 55.0 and later) List<Object> (version 54.0 only)	Result data set.	54.0
`done`	Boolean	Specifies whether the query is done (`true`) or not (`false`).	54.0
`endTime`	String	Query end time.	54.0
`metadata`	Map<String, `ConnectApi.CdpQueryMetadataItem`> (version 55.0 and later)	Result metadata set.	54.0

Property Name	Type	Description	Available Version
	Map<String, Object> (version 54.0 only)		
`nextBatchId`	String	Next batch ID. Use this property as the *`nextBatchId`* parameter in the `nextBatchAnsiSqlV2(nextBatchId)` method to get the next batch of data.	54.0
`queryId`	String	Query ID.	54.0
`rowCount`	Integer	Number of rows in the result data set.	54.0
`startTime`	String	Query start time.	54.0

ConnectApi.CdpQueryV2Row

Row in the query output for the V2 API.

Property Name	Type	Description	Available Version
`rowData`	List<Object>	Row values.	55.0

SEE ALSO:

ConnectApi.CdpQueryOutputV2

ConnectApi.CdpSegmentActionOutput

Segment action.

Subclass of ConnectApi.CdpActionResponse in API version 59.0 and later.

Property Name	Type	Description	Available Version
`errorCode`	String	Error code associated with the action, if any.	57.0
`errorMessage`	String	Error message associated with the action, if any.	57.0
`jobId`	String	Job ID for the publish job.	56.0
`partitionId`	String	ID of the partition.	56.0
`publishStatus`	String	Publish status of the segment.	57.0
`segmentApiName`	String	API name of the segment.	59.0
`segmentId`	String	ID of the segment.	56.0

ConnectApi.CdpSegmentContainerOutput

Segment container.

Property Name	Type	Description	Available Version
`batchSize`	Integer	Number of items returned.	56.0
`offset`	Integer	Number of rows skipped before returning results.	56.0
`orderByExpression`	String	Expression indicating how results are ordered.	56.0
`segments`	List<`ConnectApi.CdpSegmentOutput`>	List of segments.	55.0

ConnectApi.CdpSegmentDbtModel

Segment dbt model.

Property Name	Type	Description	Available Version
`name`	String	Dbt model name.	55.0
`sql`	String	Dbt model SQL.	55.0

SEE ALSO:

ConnectApi.CdpSegmentDbtPipeline

ConnectApi.CdpSegmentDbtPipeline

Segment dbt pipeline.

Property Name	Type	Description	Available Version
`models`	List<`ConnectApi.CdpSegmentDbtModel`>	Dbt models.	55.0

SEE ALSO:

ConnectApi.CdpSegmentOutput

ConnectApi.CdpSegmentMemberOutput

Data Cloud segment member output.

Property Name	Type	Description	Available Version
`data`	List<`ConnectApi.CdpSegmentMemberRowOutput`>	Result data set.	58.0
`endTime`	Datetime	Query end time.	58.0
`filter`	String	Filter information for the query.	58.0
`limit`	Integer	Batch size information.	58.0
`nextPageUrl`	String	URL for the next page.	58.0
`offSet`	Integer	Offset information.	58.0
`orderBy`	String	Order by information.	58.0
`rowCount`	Integer	Total row count.	58.0
`startTime`	Datetime	Query start time.	58.0
`totalCount`	Integer	Total count of records.	58.0

ConnectApi.CdpSegmentMemberRowOutput

Data Cloud segment member row output.

Property Name	Type	Description	Available Version
`deltaType`	String	Delta type, for example, `new`, `existing`, or `removed`.	58.0
`id`	String	Segment member ID.	58.0
`kqId`	String	Fully qualified key ID.	58.0
`snapshotType`	String	Type of snapshot, for example, `full` or `incremental`.	58.0
`timestamp`	String	Timestamp.	58.0
`versionStamp`	String	Version timestamp.	58.0

SEE ALSO:

ConnectApi.CdpSegmentMemberOutput

ConnectApi.CdpSegmentMembershipTableOutput

Data Cloud segment membership table.

Property Name	Type	Description	Available Version
`historyTable`	String	Segment membership history table.	58.0

Property Name	Type	Description	Available Version
latestTable	String	Segment membership latest table.	58.0
profileTable	String	Segment membership profile table.	58.0

SEE ALSO:

ConnectApi.CdpSegmentOutput

ConnectApi.CdpSegmentOutput

Segment.

Property Name	Type	Description	Available Version
apiName	String	API name of the segment.	56.0
dataSpace	String	Data space of the segment.	57.0
description	String	Segment description.	55.0
developerName	String	Segment developer name.	55.0
displayName	String	Segment display name.	57.0
excludeCriteria	String	Segment exclude criteria.	57.0
includeCriteria	String	Segment include criteria.	57.0
includeDbt	ConnectApi.CdpSegmentDbtPipeline	Segment dbt pipeline.	55.0
lookalikeCriteria		Reserved for future use.	56.0
marketSegmentDefinitionId	String	ID of the market segment definition.	55.0
marketSegmentId	String	ID of the market segment.	56.0
nextPublishDateTime	String	Date and time of the next segment publish.	57.0
publishInterval	String	Segment publish interval.	55.0
publishScheduleEndDate	String	Publish schedule end date.	55.0
publishScheduleStartDateTime	String	Publish schedule start date time.	55.0
publishStatus	String	Segment publish status.	55.0

Property Name	Type	Description	Available Version
segmentMembershipDmo	ConnectApi.CdpSegmentMembershipTableOutput	Segment membership tables.	58.0
segmentMembershipTable	String	Name of the segment membership table.	56.0
segmentOnApiName	String	API name of the SegmentOn entity.	56.0
segmentOnId	String	ID of the DMO segment.	55.0
segmentStatus	String	Segment status.	55.0
segmentType	String	Type of segment.	56.0

SEE ALSO:

ConnectApi.CdpSegmentContainerOutput

ConnectApi.ChangeItemOutputRepresentation

The financial changes resulting from a change to one or more OrderItemSummaries. Most of the values represent the deltas of the values on the associated OrderSummary. The sign of each value is the opposite of the corresponding value on a change order record. For example, a discount is a positive value here and a negative value on a change order record.

Property Name	Type	Description	Available Version
grandTotalAmount	Double	Change to the GrandTotalAmount field.	48.0
totalAdjDeliveryAmtWithTax	Double	Change to the TotalAdjDeliveryAmtWithTax field.	49.0
totalAdjDistAmountWithTax	Double	Change to the TotalAdjDistAmountWithTax field.	49.0
totalAdjProductAmtWithTax	Double	Change to the TotalAdjProductAmtWithTax field.	49.0
totalAdjustedDeliveryAmount	Double	Change to the TotalAdjustedDeliveryAmount field.	48.0
totalAdjustedDeliveryTaxAmount	Double	Change to the TotalAdjustedDeliveryTaxAmount field.	48.0
totalAdjustedProductAmount	Double	Change to the TotalAdjustedProductAmount field.	48.0
totalAdjustedProductTaxAmount	Double	Change to the TotalAdjustedProductTaxAmount field.	48.0
totalAdjustmentDistributedAmount	Double	Change to the TotalAdjustmentDistributedAmount field.	48.0

Property Name	Type	Description	Available Version
`totalAdjustmentDistributedTaxAmount`	Double	Change to the TotalAdjustmentDistributedTaxAmount field.	48.0
`totalAmount`	Double	Change to the TotalAmount field.	48.0
`totalExcessFundsAmount`	Double	Amount of excess funds available on the OrderPaymentSummaries related to the OrderSummary. It is equal to the captured amount that is owed as a refund but is not associated with an invoice or credit memo. Excess funds normally occur when order items are canceled before fulfillment but after payment has been captured. This situation is not common in the US, where funds are normally authorized but not captured until the fulfillment process begins. This value includes all current excess funds related to the OrderSummary, not only the funds related to the current change.	48.0
`totalFeeAmount`	Double	Total amount of the fees charged for the change.	57.0
`totalFeeTaxAmount`	Double	Total amount of tax on the fees charged for the change.	57.0
`totalRefundableAmount`	Double	Total amount available to be refunded. It is the sum of the excess funds and any outstanding change order grand total amounts that apply to post-fulfillment changes. This value includes all current refundable amounts related to the OrderSummary, not only the amount related to the current change.	48.0
`totalRequiredFundsAmount`	Double	The required funds associated with added order items.	54.0
`totalTaxAmount`	Double	Change to the TotalTaxAmount field.	48.0

ConnectApi.ChatterActivity

Chatter activity.

Name	Type	Description	Available Version
`commentCount`	Integer	Total number of comments in the org or site made by the user.	28.0
`commentReceivedCount`	Integer	Total number of comments in the org or site received by the user.	28.0
`likeReceivedCount`	Integer	Total number of likes and upvotes (in version 45.0 and later) on posts and comments in the org or site received by the user.	28.0
`postCount`	Integer	Total number of posts in the org or site made by the user.	28.0

SEE ALSO:

ConnectApi.UserDetail

ConnectApi.ChatterActivitySummary

Summary of Chatter activity.

Subclass of ConnectApi.UserFeedEntityActivitySummary.

Property Name	Type	Description	Available Version
`commentCount`	Integer	Total number of comments in the org or site made by the user.	42.0
`commentReceivedCount`	Integer	Total number of comments in the org or site received by the user.	42.0
`likeReceivedCount`	Integer	Total number of likes and upvotes (in version 45.0 and later) on posts and comments in the org or site received by the user.	42.0
`postCount`	Integer	Total number of posts in the org or site made by the user.	42.0

ConnectApi.ChatterConversation

Chatter conversation.

Name	Type	Description	Available Version
`conversationId`	String	ID for the conversation.	29.0
`conversationUrl`	String	Connect REST API URL identifying the conversation.	29.0
`members`	`List<ConnectApi.UserSummary>`	List of users in the conversation.	29.0

Name	Type	Description	Available Version
messages	ConnectApi.ChatterMessagePage	Content of the conversation.	29.0
read	Boolean	Specifies if the conversation is read (true) or not read (false).	29.0

ConnectApi.ChatterConversationPage

Chatter conversation page.

Name	Type	Description	Available Version
conversations	List<ConnectApi.ChatterConversationSummary>	List of conversations on the page.	29.0
currentPageToken	String	Token identifying the current page.	29.0
currentPageUrl	String	Connect REST API URL identifying the current page.	29.0
nextPageToken	String	Token identifying the next page, or null if there isn't a next page.	29.0
nextPageUrl	String	Connect REST API URL identifying the next page, or null if there isn't a next page.	29.0

ConnectApi.ChatterConversationSummary

Chatter conversation summary.

Name	Type	Description	Available Version
id	String	ID for the conversation summary.	29.0
latestMessage	ConnectApi.ChatterMessage	Contents of the latest message.	29.0
members	List<ConnectApi.UserSummary>	List of members in the conversation.	29.0
read	Boolean	Specifies if the conversation is read (true) or not read (false).	29.0
url	String	Connect REST API URL to the conversation summary.	29.0

SEE ALSO:

ConnectApi.ChatterConversationPage

ConnectApi.ChatterGroup

Chatter group.

This class is abstract.

Subclass of ConnectApi.ActorWithId.

Superclass of:

- ConnectApi.ChatterGroupDetail
- ConnectApi.ChatterGroupSummary

Name	Type	Description	Available Version
additionalLabel	String	An extra label for the group, for example, "Archived," "Private," or "Private With Customers." If there isn't an extra label, the value is null.	30.0
announcement	ConnectApi.Announcement	The current announcement for this group. An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.	31.0
bannerPhoto	ConnectApi.BannerPhoto	The banner photo for the group.	36.0
canHaveChatterGuests	Boolean	true if this group allows Chatter guests.	28.0
community	ConnectApi.Reference	Information about the Experience Cloud site the group is in.	28.0
description	String	Group's description.	28.0
emailToChatterAddress	String	Group's email address for posting to this group by email. Returns null if Chatter emails and posting to Chatter by email aren't both enabled in your organization.	30.0
isArchived	Boolean	Specifies whether the group is archived (true) or not (false).	29.0
isAutoArchiveDisabled	Boolean	Specifies whether automatic archiving is disabled for the group (true) or not (false).	29.0
isBroadcast	Boolean	Specifies whether the group is a broadcast group (true) or not (false). In a broadcast group, only group owners and managers can post to the group.	36.0
lastFeedElementPostDate	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z, of the most recent feed element posted to the group.	31.0
lastFeedItemPostDate	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z, of the most recent feed item posted to the group. Use lastFeedElementPosted.	28.0–30.0
memberCount	Integer	Total number of group members.	28.0
myRole	ConnectApi.GroupMembershipType	Type of membership the user has with the group. • GroupOwner	28.0

Name	Type	Description	Available Version
		• GroupManager • NotAMember • NotAMemberPrivateRequested • StandardMember	
mySubscription	ConnectApi.Reference	If the context user is a member of this group, contains information about that subscription; otherwise, returns null.	28.0
name	String	Name of the group.	28.0
owner	ConnectApi.UserSummary	Information about the owner of the group.	28.0
photo	ConnectApi.Photo	Information about the group photo.	28.0
visibility	Connectapi.GroupVisibilityType	Group visibility type. Valid values are: • PrivateAccess—Only members of the group can see posts to this group. • PublicAccess—All users within the Experience Cloud site can see posts to this group. • Unlisted—Reserved for future use.	28.0

ConnectApi.ChatterGroupDetail

Chatter group details.

Subclass of ConnectApi.ChatterGroup.

Name	Type	Description	Available Version
fileCount	Integer	The number of files posted to the group.	28.0
information	ConnectApi.GroupInformation	Describes the Information section of the group. If the group is private, this section is visible only to members. If the context user is not a member of the group or does not have Modify All Data or View All Data permission, this value is null.	28.0
pendingRequests	Integer	The number of requests to join a group that are in a pending state.	29.0

SEE ALSO:

ConnectApi.ChatterGroupPage

ConnectApi.UserGroupDetailPage

ConnectApi.ChatterGroupPage

Page of groups.

Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	28.0
`groups`	`List<ConnectApi.ChatterGroupDetail>`	List of group details.	28.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	28.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	28.0

ConnectApi.ChatterGroupSummary

Chatter group summary.

Subclass of ConnectApi.ChatterGroup.

Name	Type	Description	Available Version
`fileCount`	Integer	The number of files posted to the group.	28.0

SEE ALSO:

- ConnectApi.ChatterGroupSummaryPage
- ConnectApi.UserGroupPage

ConnectApi.ChatterGroupSummaryPage

Page of group summaries.

Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	29.0
`groups`	`List<ConnectApi.ChatterGroupSummary>`	List of group summary objects.	29.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	29.0

Name	Type	Description	Available Version
previousPageUrl	String	Connect REST API URL identifying the previous page, or null if there isn't a previous page.	29.0

ConnectApi.ChatterLike

Chatter like information.

Name	Type	Description	Available Version
id	String	Like's 18-character ID	28.0
likedItem	ConnectApi.Reference	A reference to the liked comment or feed element.	28.0
url	String	Like's Connect REST API URL	28.0
user	ConnectApi.UserSummary	Like's creator	28.0

SEE ALSO:

ConnectApi.ChatterLikePage

ConnectApi.ChatterLikePage

Page of Chatter likes.

Name	Type	Description	Available Version
currentPageToken	Integer	Token identifying the current page.	28.0
currentPageUrl	String	Connect REST API URL identifying the current page.	28.0
items	List<ConnectApi.ChatterLike>	List of likes.	32.0
likes	List<ConnectApi.ChatterLike>	List of likes. **Important:** As of API version 32.0, use the items property.	28.0–31.0
nextPageToken	Integer	Token identifying the next page, or null if there isn't a next page.	28.0
nextPageUrl	String	Connect REST API URL identifying the next page, or null if there isn't a next page.	28.0

Name	Type	Description	Available Version
previousPageToken	Integer	Token identifying the previous page, or null if there isn't a previous page.	28.0
previousPageUrl	String	Connect REST API URL identifying the previous page, or null if there isn't a previous page.	28.0
total	Integer	Total number of likes across all pages.	28.0

SEE ALSO:

ConnectApi.ChatterLikesCapability

ConnectApi.Comment

ConnectApi.ChatterLikesCapability

If a feed element has this capability, the context user can like it. Exposes information about existing likes.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
isLikedBy CurrentUser	Boolean	Indicates whether the feed element is liked by the context user (true) or not (false).	32.0
page	ConnectApi. ChatterLikePage	Likes information for this feed element.	32.0
likesMessage	ConnectApi. MessageBody	A message body that describes who likes the feed element.	32.0
myLike	ConnectApi. Reference	If the context user has liked the feed element, this property is a reference to the specific like, null otherwise.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.ChatterMessage

Chatter message.

Name	Type	Description	Available Version
body	ConnectApi.MessageBody	Contents of the message.	29.0
conversationId	String	ID for the conversation.	29.0
conversationUrl	String	Connect REST API URL identifying the conversation.	29.0

Name	Type	Description	Available Version
`id`	String	ID of the message.	29.0
`recipients`	`List<ConnectApi.UserSummary>`	List of the recipients of the message.	29.0
`sender`	`ConnectApi.UserSummary`	Sender of the message.	29.0
`sendingCommunity`	`ConnectApi.Reference`	Information about the Experience Cloud site from which the message was sent. Returns `null` for the default site or if digital experiences isn't enabled.	32.0
`sentDate`	Datetime	The date and time the message was sent.	29.0
`url`	String	Connect REST API URL identifying the current page of the conversation.	29.0

SEE ALSO:

ConnectApi.ChatterConversationSummary

ConnectApi.ChatterMessagePage

ConnectApi.ChatterMessagePage

Chatter message page.

Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	29.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	29.0
`messages`	`List<ConnectApi.ChatterMessage>`	Messages on the current page.	29.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	29.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	29.0

SEE ALSO:

ConnectApi.ChatterConversation

ConnectApi.ChatterStream

A Chatter feed stream.

Property Name	Type	Description	Available Version
community	ConnectApi.CommunitySummary	Experience Cloud site where the stream is.	41.0
createdDate	Datetime	Date the stream was created.	39.0
description	String	Description of the stream.	39.0
id	String	18-character ID of the stream.	39.0
name	String	Name of the stream.	39.0
subscriptions	List<ConnectApi.FeedEntity>	List of entities whose feeds are included in the stream.	39.0
url	String	URL to the stream.	39.0

SEE ALSO:

ConnectApi.ChatterStreamPage

ConnectApi.ChatterStreamPage

A collection of Chatter feed streams.

Property Name	Type	Description	Available Version
currentPageUrl	String	URL to the current page of streams.	39.0
items	List<ConnectApi.ChatterStream>	List of streams.	39.0
nextPageUrl	String	URL to the next page of streams. In version 39.0, all streams are included in `currentPageUrl` and `nextPageUrl` is `null`.	39.0
total	Integer	Total number of streams in the collection.	39.0

ConnectApi.ClientInfo

Client information.

Name	Type	Description	Available Version
applicationName	String	Name of the connected app used for authentication.	28.0

Name	Type	Description	Available Version
`applicationUrl`	String	Value from the `Info URL` field of the connected app used for authentication.	28.0

SEE ALSO:

ConnectApi.Comment

ConnectApi.FeedItem

ConnectApi.CloseCapability

If a feed element has this capability, users with permission can close it.

Users can't edit (specifically the feed item body or title), comment on, or delete a closed feed element. If the closed feed element is a poll, users can't vote on it. Users can't edit (specifically the comment body) or delete a comment on a closed feed element or select or remove it as best answer.

Admins and moderators can edit and delete closed feed elements and comments on closed feed elements. Admins and moderators can select or remove the best answer status on comments on closed feed elements.

Property Name	Type	Description	Available Version
`canContextUserUpdateIsClosed`	Boolean	Specifies whether the context user has permission to set the feed element to closed (`true`) or not (`false`).	43.0
`isClosed`	Boolean	Specifies whether the feed element is closed (`true`) or not (`false`).	43.0

ConnectApi.FeedElementCapabilities

ConnectApi.Comment

A comment.

Name	Type	Description	Available Version
`attachment`	`ConnectApi.FeedItemAttachment`	If the comment contains an attachment, property value is `ContentAttachment`. If the comment does not contain an attachment, it is `null`. **Important:** As of version 32.0, use the `capabilities` property.	28.0–31.0
`body`	`ConnectApi.FeedBody`	Body of the comment.	28.0

Name	Type	Description	Available Version
`capabilities`	`ConnectApi.CommentCapabilities`	Capabilities associated with the comment, such as any file attachments.	32.0
`clientInfo`	`ConnectApi.ClientInfo`	Information about the connected app used to authenticate the connection.	28.0
`createdDate`	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	28.0
`feedElement`	`ConnectApi.Reference`	Feed element on which the comment is posted.	
`feedItem`	`ConnectApi.Reference`	Feed item on which the comment is posted. **Important:** As of version 32.0, use the `feedElement` property.	28.0–31.0
`id`	String	Comment's 18–character ID.	28.0
`isDeleteRestricted`	Boolean	If this property is `true`, the context user can't delete the comment. If this property is `false`, the context user might be able to delete the comment.	28.0
`likes`	`ConnectApi.ChatterLikePage`	The first page of likes for the comment. This property has no information for comments on direct messages.	28.0
`likesMessage`	`ConnectApi.MessageBody`	A message body that describes who likes the comment. This property is `null` for comments on direct messages.	28.0
`moderationFlags`	`ConnectApi.ModerationFlags`	Information about the moderation flags on a comment. If `ConnectApi.Features.communityModeration` is `false`, this property is `null`.	29.0
`myLike`	`ConnectApi.Reference`	If the context user liked the comment, this property is a reference to the specific like, `null` otherwise. This property is `null` for comments on direct messages.	28.0
`parent`	`ConnectApi.Reference`	Information about the parent feed-item for this comment.	28.0
`relativeCreatedDate`	String	The created date formatted as a relative, localized string, for example, "17m ago" or "Yesterday."	28.0
`threadLevel`	Integer	Level of nesting for a comment. 0 indicates a standard comment with a parent post. 1 indicates a threaded comment with a parent comment and a parent post. 2 indicates a threaded comment with two parent comments and a parent post. The UI is limited to these three levels.	44.0
`threadParentId`	String	ID of the parent comment for a threaded comment.	44.0

Name	Type	Description	Available Version
type	ConnectApi.CommentType	Type of comment. • ContentComment—Comment holds a content capability. • TextComment—Comment contains only text.	28.0
url	String	Connect REST API URL to this comment.	28.0
user	ConnectApi.UserSummary	Information about the comment author.	28.0

SEE ALSO:

ConnectApi.CommentPage

ConnectApi.QuestionAndAnswersCapability

ConnectApi.CommentCapabilities

A set of capabilities on a comment.

Property Name	Type	Description	Available Version
comments	ConnectApi.CommentsCapability	If a comment has this capability, it has threaded comments.	44.0
content	ConnectApi.ContentCapability	If a comment has this capability, it has a file attachment. Most ConnectApi.ContentCapability properties are null if the content has been deleted from the feed element or if the access has changed to private.	32.0
edit	ConnectApi.EditCapability	If a comment has this capability, users who have permission can edit it.	34.0
feedEntityShare	ConnectApi.FeedEntityShareCapability	If a comment has this capability, a feed entity is shared with it.	42.0
record	ConnectApi.RecordCapability	If a comment has this capability, it has a record attachment.	42.0
status	ConnectApi.StatusCapability	If a comment has this capability, it has a status that determines its visibility.	38.0
upDownVote	ConnectApi.UpDownVoteCapability	If a comment has this capability, users can upvote or downvote it.	41.0

Property Name	Type	Description	Available Version
`verified`	ConnectApi.VerifiedCapability	If a comment has this capability, users with permission can mark it as verified or unverified.	41.0

SEE ALSO:

ConnectApi.Comment

ConnectApi.CommentPage

A page of comments.

Name	Type	Description	Available Version
`comments`	List<ConnectApi.Comment>	Collection of comments. **Important:** As of version 32.0, use the `items` property.	28.0–31.0
`currentPageToken`	String	Token identifying the current page.	28.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	28.0
`items`	List<ConnectApi.Comment>	Collection of comments for this feed element.	32.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page. If you want to read more of the comments in search results, all the comments in the thread are refreshed, not just the ones that match the search term. Avoid using `nextPageToken` until the comments are refreshed.	28.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page. If you want to read more of the comments in search results, all the comments in the thread are refreshed, not just the ones that match the search term. Avoid using `nextPageUrl` until the comments are refreshed.	28.0
`previousPageToken`	String	Token identifying the previous page, or `null` if there isn't a previous page.	44.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	44.0
`total`	Integer	Total number of published comments for the parent feed element.	28.0

SEE ALSO:

ConnectApi.CommentsCapability

ConnectApi.CommentSummary

Summary of the comment.

Subclass of ConnectApi.UserActivitySummary.

Property Name	Type	Description	Available Version
`commentId`	String	ID of the comment.	42.0

ConnectApi.CommentsCapability

If a feed element or comment has this capability, the context user can add a comment to it.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`page`	`ConnectApi.CommentPage`	The comments information for this feed element or comment. Threaded comments are supported in version 44.0 and later.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.CommerceActionResult

Result of executing a commerce action.

Property Name	Type	Description	Available Version
`isSuccess`	Boolean	Specifies whether the action is a success (`true`) or not (`false`).	53.0
`message`	String	Action result message.	53.0

ConnectApi.CommerceAddressCollection

A collection of Commerce addresses.

Property Name	Type	Description	Available Version
`count`	Integer	Count of addresses.	54.0
`currentPageToken`	String	Token to the current page of addresses.	54.0
`currentPageUrl`	String	URL to the current page of addresses.	54.0
`items`	List<ConnectApi.CommerceAddressOutput>	Address Details	54.0

Property Name	Type	Description	Available Version
`nextPageToken`	String	Token to the next page of addresses.	54.0
`nextPageUrl`	String	URL to the next page of addresses.	54.0
`pageSize`	Integer	Page size for addresses.	54.0
`previousPageToken`	String	Token to previous page of addresses.	54.0
`previousPageUrl`	String	URL to the previous page of addresses.	54.0
`sortOrder`	ConnectApi.CommerceAddressSort	Sort order for Commerce addresses. • `CreatedDateAsc`—Sort in ascending order of created date. • `CreatedDateDesc`—Sort in descending order of created date. • `NameAsc`—Sort in ascending order of name. • `NameDesc`—Sort in descending order of name.	54.0

ConnectApi.CommerceAddressOutput

Address for a Commerce account.

Property Name	Type	Description	Available Version
`addressId`	String	ID of the address.	54.0
`addressType`	String	Type of address (for example, "Shipping" or "Billing").	54.0
`city`	String	The address city.	54.0
`companyName`	String	The address company name.	57.0
`country`	String	The address country.	54.0
`countryCode`	String	Two-character country code.	54.0–58.0
`fields`	Map<String, Record Field>	A list of custom address fields, if any.	54.0
`firstName`	String	The address first name.	57.0
`isDefault`	Boolean	Indicates whether a contact's address is the preferred method of communication (`true`) or not (`false`). The default value is `false`.	54.0
`lastName`	String	The address last name.	57.0
`middleName`	String	The address middle name.	57.0
`name`	String	Name of the contact.	54.0
`phoneNumber`	String	The address phone number.	57.0

Property Name	Type	Description	Available Version
postalCode	String	Zip code or postal code for the address.	54.0
region	String	The address state.	54.0
regionCode	String	The address state code.	54.0–58.0
street	String	The address street.	54.0

ConnectApi.CommerceProductSearchResults

Product search results information.

Property Name	Type	Description	Available Version
categories	ConnectApi.SearchCategory	Categories from the search results.	52.0
correlationId	String	Reserved for future use.	55.0
facets	List<ConnectApi.SearchFacet>	Facets from the search results.	52.0
locale	String	Locale of the search results.	52.0
productsPage	ConnectApi.ProductSummaryPage	Page of products from the search results.	52.0

ConnectApi.CommerceProductSellingModel

Product selling model information.

Property Name	Type	Description	Available Version
isSubscriptionProduct	Boolean	Indicates whether the product selling model is a subscription product or not.	59.0

ConnectApi.CommerceProductSummary

Summary of a product in product search results.

Property Name	Type	Description	Available Version
productSellingModelInformation	ConnectApi.CommerceProductSellingModel on page 1952	Information about the product selling model.	59.0
purchaseQuantityRule	ConnectApi.PurchaseQuantityRule on page 2140	Purchase quantity rule for the product.	58.0
variationAttributeSet	String	Reserved for future use.	55.0

ConnectApi.CommerceProductSummaryPage

Collection of product summary representations in product search results.

Property Name	Type	Description	Available Version
`pageSize`	Integer	Number of products per page in search results.	55.0
`products`	List<ConnectApi.CommerceProductSummary>	Collection of product summaries.	55.0
`total`	Long	Number of products in search results across all pages.	55.0

ConnectApi.CommerceSearchIndex

Index information.

Property Name	Type	Description	Available Version
`completionDate`	Datetime	Completion date and time of the index.	52.0
`createdDate`	Datetime	Creation date of the index.	52.0
`creationType`	`ConnectApi.CommerceSearchIndexCreationType`	Creation type of the index. Values are: • `Manual` • `Scheduled`	52.0
`id`	String	ID of the index.	52.0
`indexBuildType`	`ConnectApi.CommerceSearchIndexBuildType`	Build type of the index. Values are: • `Full` • `Incremental`	57.0
`indexStatus`	`ConnectApi.CommerceSearchIndexStatus`	Status of the index. Values are: • `Completed` • `Failed` • `InProgress`	52.0
`indexUsage`	`ConnectApi.CommerceSearchIndexUsage`	Usage of the index. Values are: • `Live` • `OutOfUse`	52.0
`isIncrementable`	Boolean	Specifies whether the index allows incremental indexing (`true`) or not (`false`).	57.0
`lastCatalogSnapshotTime`	Datetime	Catalog snapshot time of the index.	57.0

Property Name	Type	Description	Available Version
message	String	Detailed message for the index status.	52.0

SEE ALSO:

ConnectApi.CommerceSearchIndexCollection

ConnectApi.CommerceSearchIndexCollection

Collection of indexes.

Property Name	Type	Description	Available Version
indexes	List<ConnectApi.CommerceSearchIndex>	List of up to two indexes. Returns the completed, live index and either the in-progress, out-of-use index or the most-recently-failed, out-of-use index.	52.0

ConnectApi.CommerceSearchIndexLog

Search index log information.

Property Name	Type	Description	Available Version
catalogSnapshotTime	Datetime	Catalog snapshot time of the index build.	57.0
completionDate	Datetime	Completion date of the index build.	57.0
createdById	String	ID of the user who initiated the index build.	57.0
indexBuildStatus	ConnectApi.CommerceSearchIndexStatus	Status of the index. Values are: • Completed • Failed • InProgress	57.0
indexBuildType	ConnectApi.CommerceSearchIndexBuildType	Build type of the index. Values are: • Full • Incremental	57.0
indexId	String	ID of the index build.	57.0
message	String	Detailed message for the index build status.	57.0
numberOfProducts	Integer	Number of new or changed products in the index build.	57.0

ConnectApi.CommerceSearchIndexLogCollection

Collection of search index logs for a webstore.

Property Name	Type	Description	Available Version
`indexLogs`	List<`ConnectApi.CommerceSearchIndexLog`>	List of up to 100 index logs sorted by most recent catalog snapshot time of the index.	57.0

ConnectApi.Community

Experience Cloud site.

Name	Type	Description	Available Version
`allowChatterAccessWithoutLogin`	Boolean	Specifies if guest users can access public groups without logging in.	31.0
`allowMembersToFlag`	Boolean	Specifies if members can flag content.	30.0
`builderBasedSnaEnabled`	Boolean	Specifies whether the Service Not Available page is an auto-generated Experience Builder-based page (`true`) or a static resource page that's set in **Workspaces** > **Administration** > **Pages** (`false`).	52.0
`builderUrl`	String	Experience Builder URL for the site.	56.0
`description`	String	Site description.	28.0
`guestMemberVisibilityEnabled`	Boolean	Specifies whether guest members can see other members (`true`) or not (`false`).	47.0
`id`	String	Site ID.	28.0
`imageOptimizationCDNEnabled`	Boolean	Specifies whether images are optimized for guest users on all devices for sites using Salesforce's CDN for Digital Experiences (`true`) or not (`false`).	56.0
`invitationsEnabled`	Boolean	Specifies whether users can invite other external users.	28.0
`knowledgeableEnabled`	Boolean	Specifies whether knowledgeable people and endorsements are available for topics (`true`), or not (`false`).	30.0
`loginUrl`	String	Login URL for the site.	36.0
`memberVisibilityEnabled`	Boolean	Specifies whether members can see other members (`true`) or not (`false`).	45.0
`name`	String	Site name.	28.0
`nicknameDisplayEnabled`	Boolean	Specifies whether nicknames are displayed.	32.0

Name	Type	Description	Available Version
`privateMessagesEnabled`	Boolean	Specifies whether members can send and receive private messages to and from other members (`true`) or not (`false`).	30.0
`reputationEnabled`	Boolean	Specifies whether reputation is calculated and displayed for members.	31.0
`sendWelcomeEmail`	Boolean	Specifies whether emails are sent to all new users when they join.	28.0
`siteAsContainerEnabled`	Boolean	Specifies whether the site is an Experience Builder site (`true`) or a Salesforce Tabs + Visualforce site (`false`).	41.0
`siteUrl`	String	URL for the site, which is your Experience Cloud sites domain plus a URL prefix. For example, *`MyDomainName`*`.my.site.com/customers`.	30.0
`status`	`ConnectApi.CommunityStatus` Enum	Status of the Experience Cloud site. • `Live` • `Inactive` • `UnderConstruction`	28.0
`templateName`	String	Name of the Experience Builder template.	46.0
`url`	String	Connect REST API URL to the site.	28.0
`urlPathPrefix`	String	Site-specific URL prefix. For example, in the site URL *`MyDomainName`*`.my.site.com/customers`, `customers` is the `UrlPathPrefix`.	28.0

SEE ALSO:

ConnectApi.CommunityPage

ConnectApi.CommunityPage

Page of Experience Cloud sites.

Name	Type	Description	Available Version
`communities`	`List<ConnectApi.Community>`	List of Experience Cloud sites the context user has access to.	28.0
`total`	Integer	Total number of Experience Cloud sites.	28.0

ConnectApi.CommunitySummary

Summary of an Experience Cloud site.

Property Name	Type	Description	Available Version
`id`	String	18-character ID of the site.	41.0

Property Name	Type	Description	Available Version
`name`	String	Localized name of the site.	41.0

SEE ALSO:

ConnectApi.UserActivitySummary

ConnectApi.CompanyVerifySummary

Company verify summary.

Subclass of ConnectApi.UserFeedEntityActivitySummary.

No additional properties.

ConnectApi.ComplexSegment

Complex segments of field changes.

This class is abstract.

Subclass of ConnectApi.MessageSegment.

Superclass of ConnectApi.FieldChangeSegment.

Name	Type	Description	Available Version
`segments`	`List<ConnectApi.MessageSegment>`	List of message segments.	28.0

ConnectApi.CompoundRecordField

Record field that is a composite of subfields.

Subclass of ConnectApi.LabeledRecordField.

Name	Type	Description	Available Version
`fields`	`List<ConnectApi.AbstractRecordField>`	Collection of subfields that make up the compound field.	29.0

ConnectApi.ConfirmHeldFOCapacityOutputRepresentation

Response to a request to confirm held fulfillment order capacity at one or more locations. Can correspond to one action call.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`confirmHeldFO CapacityResponses`	List<`ConnectApi. ConfirmHeldFO CapacityResponse OutputRepresentation`>	List of responses to the requests to confirm held fulfillment order capacity at one or more locations.	55.0

ConnectApi.ConfirmHeldFOCapacityResponseOutputRepresentation

Response to a request to confirm held fulfillment order capacity at one or more locations.

Property Name	Type	Description	Available Version
`capacityResponses`	List<`ConnectApi. CapacityResponse OutputRepresentation`>	List of responses to the requests to confirm held fulfillment order capacity at individual locations.	55.0

ConnectApi.Content

A file attached to a feed item.

Property Name	Type	Description	Available Version
`checksum`	String	MD5 checksum for the file.	36.0
`contentUrl`	String	URL of the content for links.	36.0
`description`	String	Description of the attachment.	36.0
`downloadUrl`	String	URL to the content.	36.0
`fileExtension`	String	Extension of the file.	36.0
`fileSize`	String	Size of the file in bytes. If size can't be determined, returns `unknown`.	36.0
`fileType`	String	Type of file, such as PDF.	36.0
`hasPdfPreview`	Boolean	`true` if the file has a PDF preview available; `false` otherwise.	36.0
`id`	String	18-character ID of the content.	36.0
`imageDetails`	ConnectApi.ContentImageFileDetails	Image details, or `null` if the file isn't an image.	40.0
`isInMyFileSync`	Boolean	`true` if the file is synced with Salesforce Files Sync. Note: Salesforce Files Sync was retired on May 25, 2018.	36.0
`mimeType`	String	MIME type of the file.	36.0
`renditionUrl`	String	URL to the rendition resource for the file. For shared files, renditions process asynchronously after upload.	36.0

Property Name	Type	Description	Available Version
		For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	
`renditionUrl 240By180`	String	URL to the 240 x 180 pixel rendition resource for the file. For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	36.0
`renditionUrl 720By480`	String	URL to the 720 x 480 pixel rendition resource for the file. For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	36.0
`sharingOption`	`ConnectApi. FileSharingOption`	Sharing option of the file. Values are: • `Allowed`—Resharing of the file is allowed. • `Restricted`—Resharing of the file is restricted.	36.0
`textPreview`	String	Text preview of the file if available; `null` otherwise.	36.0
`thumb120By90 RenditionStatus`	String	Specifies the rendering status of the 120 x 90 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	36.0
`thumb240By180 RenditionStatus`	String	Specifies the rendering status of the 240 x 180 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	36.0
`thumb720By480 RenditionStatus`	String	Specifies the rendering status of the 720 x 480 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	36.0

Property Name	Type	Description	Available Version
`title`	String	Title of the file.	36.0
`versionId`	String	Version ID of the file.	36.0

SEE ALSO:

ConnectApi.FilesCapability

ConnectApi.ContentCapability

If a comment has this capability, it has a file attachment.

Subclass of ConnectApi.FeedElementCapability.

For files attached to a feed post (instead of a comment) in version 36.0 and later, use `ConnectApi.FilesCapability`.

If content is deleted from a feed element after it's posted or if the access to the content is changed to private, the `ConnectApi.ContentCapability` exists, however most of its properties are null.

Property Name	Type	Description	Available Version
`checksum`	String	MD5 checksum for the file.	32.0
`contentUrl`	String	URL of the content for links and Google docs.	32.0
`description`	String	Description of the attachment.	32.0
`downloadUrl`	String	URL to the content.	32.0
`fileExtension`	String	Extension of the file.	32.0
`fileSize`	String	Size of the file in bytes. If size cannot be determined, returns `Unknown`.	32.0
`fileType`	String	Type of file.	32.0
`hasPdfPreview`	Boolean	`true` if the file has a PDF preview available, `false` otherwise.	32.0
`id`	String	18-character ID of the content.	32.0
`isInMyFileSync`	Boolean	`true` if the file is synced with Salesforce Files Sync; `false` otherwise. Note: Salesforce Files Sync was retired on May 25, 2018.	32.0
`mimeType`	String	MIME type of the file.	32.0
`renditionUrl`	String	URL to the rendition resource for the file. Renditions are processed asynchronously and may not be available immediately after the file has been uploaded.	32.0

Property Name	Type	Description	Available Version
renditionUrl240By180	String	URL to the 240x180 size rendition resource for the file. Renditions are processed asynchronously and may not be available immediately after the file has been uploaded.	32.0
renditionUrl720By480	String	URL to the 720x480 size rendition resource for the file. Renditions are processed asynchronously and may not be available immediately after the file has been uploaded.	32.0
sharingOption	ConnectApi.FileSharingOption	Sharing option of the file. Values are: • Allowed—Resharing of the file is allowed. • Restricted—Resharing of the file is restricted.	35.0
textPreview	String	Text preview of the file if available, null otherwise. The maximum number of characters is 200.	32.0
thumb120By90RenditionStatus	String	The status of the rendering of the 120x90 pixel sized preview image of the file. Should be either Processing, Failed, Success, or Na if unavailable.	32.0
thumb240By180RenditionStatus	String	The status of the rendering of the 240x180 pixel sized preview image of the file. Should be either Processing, Failed, Success, or Na if unavailable.	32.0
thumb720By480RenditionStatus	String	The status of the rendering of the 720x480 pixel sized preview image of the file. Should be either Processing, Failed, Success, or Na if unavailable.	32.0
title	String	Title of the file.	32.0
versionId	String	Version ID of the file.	32.0

ConnectApi.CommentCapabilities

ConnectApi.ContentHubAllowedItemTypeCollection

The item types that the context user is allowed to create in a repository folder.

Property Name	Type	Description	Available Version
allowedItemTypes	List<ConnectApi.ContentHubItemTypeSummary>	A collection of item types that the context user is allowed to create in a repository folder.	39.0

ConnectApi.ContentHubFieldDefinition

A field definition.

Property Name	Type	Description	Available Version
`displayName`	String	Label or caption of this field.	39.0
`isMandatory`	Boolean	Specifies whether this field is mandatory for the item type.	39.0
`maxLength`	Integer	Maximum length of the value of this field.	39.0
`name`	String	Name of the field.	39.0
`type`	`ConnectApi.ContentHubVariableType`	Data type of the value of the field. Values are: • `BooleanType` • `DateTimeType` • `DecimalType` • `HtmlType` • `IdType` • `IntegerType` • `StringType` • `UriType` • `XmlType`	39.0

SEE ALSO:

ConnectApi.ContentHubItemTypeDetail

ConnectApi.ContentHubItemTypeDetail

The details of an item type associated with a repository folder.

Subclass of ConnectApi.AbstractContentHubItemType.

Property Name	Type	Description	Available Version
`fields`	List<`ConnectApi.ContentHubFieldDefinition`>	A list of fields that the context user is allowed to set in the metadata of this item type.	39.0

ConnectApi.ContentHubItemTypeSummary

The summary of an item type associated with a repository folder.

Subclass of ConnectApi.AbstractContentHubItemType.

No additional properties.

SEE ALSO:

ConnectApi.ContentHubAllowedItemTypeCollection

ConnectApi.ContentHubPermissionType

A permission type.

Property Name	Type	Description	Available Version
`id`	String	Internal ID of the permission type in the repository.	39.0
`label`	String	Label as returned by the repository.	39.0

SEE ALSO:

ConnectApi.ExternalFilePermissionInformation

ConnectApi.ContentHubProviderType

The type of repository.

Property Name	Type	Description	Available Version
`label`	String	Localized label of the provider type.	39.0
`type`	String	Provider type. One of these values: • `ContentHubBox` • `ContentHubGDrive` • `ContentHubSharepoint` • `ContentHubSharepointOffice365` • `ContentHubSharepointOneDrive` • `SimpleUrl`	39.0

SEE ALSO:

ConnectApi.ContentHubRepository

ConnectApi.ContentHubRepository

A repository.

Subclass of ConnectApi.ActorWithId.

Property Name	Type	Description	Available Version
`authentication`	ConnectApi.ContentHubRepositoryAuthentication	Repository authentication information.	40.0

Property Name	Type	Description	Available Version
features	ConnectApi.ContentHubRepositoryFeatures	Repository features.	39.0
label	String	Repository label.	39.0
name	String	Repository name.	39.0
providerType	ConnectApi.ContentHubProviderType	Repository provider type.	39.0
rootFolderItemsUrl	String	URL to the list of items in the repository root folder.	39.0

SEE ALSO:

ConnectApi.ContentHubRepositoryCollection

ConnectApi.ContentHubRepositoryAuthentication

Authentication information for a repository.

Property Name	Type	Description	Available Version
authFlowUrl	String	Depends on the authProtocol. • NoAuthentication—null. • Oauth—URL to start the OAuth flow. • Password—URL to the authentication settings for external systems.	40.0
authProtocol	ConnectApi.ContentHubAuthenticationProtocol	Authentication protocol used for the repository. Values are: • NoAuthentication—Repository doesn't require authentication. • Oauth—Repository uses OAuth authentication protocol. • Password—Repository uses user name and password authentication protocol.	40.0
userHasAuthSettings	Boolean	Specifies whether the user has credentials or the administrator configured the external data source to use the same set of credentials for every user (true). Otherwise, false.	40.0

SEE ALSO:

ConnectApi.ContentHubRepository

ConnectApi.ContentHubRepositoryCollection

A collection of repositories.

Property Name	Type	Description	Available Version
`currentPageUrl`	String	URL to the current page of repositories.	39.0
`nextPageUrl`	String	URL to the next page of repositories, or `null` if there isn't a next page.	39.0
`previousPageUrl`	String	URL to the previous page of repositories, or `null` if there isn't a previous page.	39.0
`repositories`	List<`ConnectApi.ContentHubRepository`>	Collection of repositories.	39.0

ConnectApi.ContentHubRepositoryFeatures

The features of a repository.

Property Name	Type	Description	Available Version
`canBrowse`	Boolean	Specifies whether the repository's folder hierarchy can be browsed (`true`) or not (`false`).	39.0
`canSearch`	Boolean	Specifies whether the repository can be searched (`true`) or not (`false`).	39.0

SEE ALSO:

ConnectApi.ContentHubRepository

ConnectApi.ContentImageFileDetails

Image file details.

Property Name	Type	Description	Available Version
`height`	Integer	Image's height in pixels.	40.0
`imageFormat`	String	Image's format.	40.0
`orientation`	String	Image's EXIF orientation value, if present.	40.0
`width`	Integer	Image's width in pixels.	40.0

SEE ALSO:

ConnectApi.InlineImageSegment

ConnectApi.ContractOutputRepresentation

Contract list.

Property Name	Type	Description	Available Version
`data`	List<`String`>	Record IDs of the contacts.	56.0

ConnectApi.ConversationApplicationDefinitionDetailRespresentation

Information about the conversation application definition.

Property Name	Type	Description	Available Version
`botInfo`	`ConnectApi.BotInfo Representation`	Basic information of the bot associated with this conversation application.	54.0
`errorMessage`	String	Error message for the failed get operation.	54.0
`integration Application`	`ConnectApi. Conversation Application IntegrationType`	Conversation application integration types. Values are: • `Api` • `Slack`	54.0
`integrationName`	String	Name of the conversation application.	54.0
`isSuccess`	Boolean	Success indicator of the get operation.	54.0
`runtimeUrl`	String	Base URL of the bot runtime API.	54.0

ConnectApi.CouponCodeRedemptionResult

Coupon code redemption result.

Property Name	Type	Description	Available Version
`availableRedemptions`	Integer	Number of coupon code redemptions available.	58.0
`couponCode`	String	Coupon code.	58.0
`errorMsg`	String	Error message when coupon code redemption isn't successful.	58.0
`isSuccess`	Boolean	Specifies whether increasing or decreasing the coupon code redemption is successful (`true`) or not (`false`).	58.0
`redemptionLimit`	Integer	Number of coupon code redemptions allowed.	58.0

ConnectApi.CouponCodeRedemptionCollection

Collection of coupon code redemption results.

Property Name	Type	Description	Available Version
`couponCodeRedemptionResults`	List<`ConnectApi.CouponCodeRedemptionResult`>	List of coupon code redemption results.	58.0

ConnectApi.CreateCreditMemoOutputRepresentation

ID of a created Credit Memo.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`creditMemoId`	String	ID of the created Credit Memo.	48.0

ConnectApi.ChangeOrdersInvoiceOutputRepresentation

List of IDs of invoices created for change orders.

Subclass of ConnectApi.BaseInvoiceOutputRepresentation.

No additional properties.

SEE ALSO:

createMultipleInvoices(invoicesInput)

ConnectApi.CreateMultipleInvoicesFromChangeOrdersOutputRepresentation

ConnectApi.CreateMultipleInvoicesFromChangeOrdersOutputRepresentation

List of lists of invoices created from change orders for fees.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`invoices`	List<`ConnectApi.ChangeOrdersInvoiceOutputRepresentation`>	List of IDs of invoices created from change orders for fees. Include these invoice IDs when calling Ensure Refunds for the return that the fees applied to.	56.0

SEE ALSO:

createMultipleInvoices(invoicesInput)

ConnectApi.CreateOrderPaymentSummaryOutputRepresentation

ID of the created Order Payment Summary.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`orderPaymentSummaryId`	String	ID of the Order Payment Summary.	48.0

ConnectApi.Credential

Credential.

Property Name	Type	Description	Available Version
`authenticationProtocol`	`ConnectApi.CredentialAuthenticationProtocol`	Authentication protocol of the external credential. Values are: • `AwsSv4` • `Basic` • `Custom` • `Jwt` • `OAuth`	56.0
`authenticationProtocolVariant`	`ConnectApi.CredentialAuthenticationProtocolVariant`	Authentication protocol variant of the external credential. Values are: • `AwsSv4_STS`—AWS Signature Version 4 with Security Token Service. • `ClientCredentialsClientSecret`—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's request body. • `ClientCredentialsClientSecretBasic`—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's authorization header, as with Basic authentication. • `ClientCredentialsJwtAssertion`—OAuth 2.0 Client Credentials JSON Web Token assertion. • `JwtBearer`—OAuth 2.0 JSON Web Token bearer flow. • `NoAuthentication`—No authentication. • `RolesAnywhere`—AWS Signature Version 4 with Identity and Access Management (IAM) Roles Anywhere.	57.0
`authenticationStatus`	`ConnectApi.CredentialAuthenticationStatus`	Status of the credential authentication. Values are: • `Configured`—Credential has all required credentials for at least one principal. • `NotConfigured`—Credential isn't configured.	56.0

Property Name	Type	Description	Available Version
		• `Unknown`—Credential status can't be determined because the authentication protocol is custom.	
`credentials`	Map<String, `ConnectApi.CredentialValue`>	Map of protocol-specific credentials.	56.0
`externalCredential`	String	Fully qualified developer name of the external credential.	56.0
`principalName`	String	Name of the external credential named principal.	56.0
`principalType`	`ConnectApi.CredentialPrincipalType`	Type of credential principal. Values are: • `AwsStsPrincipal` • `NamedPrincipal` • `PerUserPrincipal`	56.0

ConnectApi.CredentialCustomHeader

Credential custom header.

Property Name	Type	Description	Available Version
`headerName`	String	Header name.	57.0
`headerValue`	String	Header value that can contain formulas.	57.0
`id`	String	ID of the customer header parameter.	58.0
`sequenceNumber`	Integer	Sequence number of the header. The sequence number determines the order of the header.	57.0

SEE ALSO:

ConnectApi.ExternalCredential

ConnectApi.NamedCredential

ConnectApi.CredentialValue

Credential value.

Property Name	Type	Description	Available Version
`encrypted`	Boolean	Specifies whether the credential value is encrypted (`true`) or not (`false`).	56.0
`revision`	Integer	Revision number of a short-lived credential.	58.0

Property Name	Type	Description	Available Version
value	String	Value of the credential.	56.0

SEE ALSO:

ConnectApi.Credential

ConnectApi.CurrencyRecordField

Record field containing a currency value.

Subclass of ConnectApi.LabeledRecordField.

ConnectApi.CustomListAudienceCriteria

Criteria for the custom list type of custom recommendation audience.

Subclass of ConnectApi.AudienceCriteria.

Property Name	Type	Description	Available Version
memberCount	Integer	Total number of members in the custom recommendation audience.	36.0
members	ConnectApi.UserReferencePage	Members of the custom recommendation audience.	36.0

ConnectApi.DashboardComponentSnapshot

Represents both dashboard component snapshots and alerts you receive when a dashboard component value crosses a threshold.

Property Name	Type	Description	Available Version
componentId	String	18-character ID of the dashboard component.	32.0
componentName	String	The dashboard component name.	32.0
dashboardBodyText	String	Display this text next to the actor in the feed element.Use this text in place of the default body text.	32.0
dashboardId	String	18-character ID of the dashboard.	32.0
dashboardName	String	The name of the dashboard.	32.0
fullSizeImageUrl	String	The source URL to retrieve the full-size image of a snapshot. Access this URL with OAuth credentials.	32.0
lastRefreshDate	Datetime	ISO 8601 date specifying when this dashboard component was last refreshed.	32.0
lastRefresh DateDisplayText	String	Display text for the last refresh date, for example, "Last Refreshed on October 31, 2013."	32.0

Property Name	Type	Description	Available Version
`runningUser`	`ConnectApi.UserSummary`	The running user of the dashboard at the time the snapshot was posted. This value may be `null`. Each dashboard has a running user, whose security settings determine which data to display in a dashboard.	32.0
`thumbnailUrl`	String	The source URL to retrieve the thumbnail image of a snapshot. Access this URL with OAuth credentials.	32.0

SEE ALSO:

ConnectApi.DashboardComponentSnapshotCapability

ConnectApi.DatacloudCompanies

ConnectApi.DashboardComponentSnapshotCapability

If a feed element has this capability, it has a dashboard component snapshot. A snapshot is a static image of a dashboard component at a specific point in time.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`dashboardComponentSnapshot`	ConnectApi.DashboardComponentSnapshot	The dashboard component snapshot.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.DateRecordField

Record field containing a date.

Subclass of ConnectApi.LabeledRecordField.

Name	Type	Description	Available Version
`dateValue`	Datetime	Date that a machine can read. Ignore the trailing `00:00:00.000Z` characters.	29.0

ConnectApi.DeleteIntent

Delete intent for a social post.

Property Name	Type	Description	Available Version
managedSocialAccount	ConnectApi.ManagedSocialAccount	Managed social account that deletes the social post.	45.0

SEE ALSO:

ConnectApi.DeleteIntents

ConnectApi.DeleteIntents

List of delete intents for a social post.

Property Name	Type	Description	Available Version
deletes	List<ConnectApi.DeleteIntent>	List of delete intents for the social post.	45.0

SEE ALSO:

ConnectApi.SocialPostIntents

ConnectApi.DeleteSocialPostIntent

Delete intent for the social post.

Property Name	Type	Description	Available Version
socialAccountId	String	ID of the social account that deletes the social post.	46.0
socialPostId	String	ID of the social post to delete.	46.0

ConnectApi.DigestJob

Represents a successfully enqueued API digest job request.

Property Name	Type	Description	Available Version
period	ConnectApi.DigestPeriod	Time period that's included in a Chatter email digest. Values are: • DailyDigest—The email includes up to the 50 latest posts from the previous day. • WeeklyDigest—The email includes up to the 50 latest posts from the previous week.	37.0

ConnectApi.DirectMessageCapability

If a feed element has this capability, it's a direct message.

Property Name	Type	Description	Available Version
memberChanges	ConnectApi.DirectMessageMemberActivityPage	Member activities of the direct message, with the most recent activity first.	40.0
members	ConnectApi.DirectMessageMemberPage	Members included in the direct message.	39.0
originalMembers	ConnectApi.DirectMessageMemberPage	Original members of the direct message.	40.0
subject	String	Subject of the direct message.	39.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.DirectMessageMemberActivity

Direct message member activity.

Property Name	Type	Description	Available Version
activityDate	Datetime	Direct message member activity date.	40.0
actor	ConnectApi.UserSummary	User who changed the direct message membership.	40.0
membersAdded	ConnectApi.DirectMessageMemberPage	Members added to the direct message as part of the activity.	40.0
membersRemoved	ConnectApi.DirectMessageMemberPage	Members removed from the direct message as part of the activity.	40.0

SEE ALSO:

ConnectApi.DirectMessageMemberActivityPage

ConnectApi.DirectMessageMemberActivityPage

A page of direct message member activities.

Property Name	Type	Description	Available Version
activities	List<ConnectApi.DirectMessageMemberActivity>	Collection of direct message member activities.	40.0

Property Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	40.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	40.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	40.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	40.0

SEE ALSO:

ConnectApi.DirectMessageCapability

ConnectApi.DirectMessageMemberPage

A collection of direct message members.

Property Name	Type	Description	Available Version
`currentPageToken`	String	Page token to access the current page of direct message members.	39.0
`currentPageUrl`	String	URL to the current page of direct message members.	39.0
`nextPageToken`	String	Page token to access the next page of direct message members.	39.0
`nextPageUrl`	String	URL to the next page of direct message members.	39.0
`users`	List<`ConnectApi.UserSummary`>	Collection of direct message members.	39.0

SEE ALSO:

ConnectApi.DirectMessageCapability

ConnectApi.DirectMessageCapability

ConnectApi.DirectMessageMemberActivity

ConnectApi.DistanceCalculationOutputRepresentation

Shipping distance data for a set of inventory locations.

Property Name	Type	Description	Available Version
`averageDistance`	Double	The average distance from the locations to the order recipient.	51.0

Property Name	Type	Description	Available Version
locations	List<ConnectApi.LocationOutputRepresentation>	The list of locations and their distances to the order recipient.	51.0
rank	Integer	This result's rank among all results by average distance to the order recipient.	51.0

ConnectApi.DistinctFacetValue

Distinct facet value.

This class is a subclass of ConnectApi.FacetValue.

Property Name	Type	Description	Available Version
displayName	String	Display name of the facet value.	52.0
nameOrId	String	Developer name of the attribute.	52.0
productCount	Long	Number of products in the search result that match the facet value.	52.0

SEE ALSO:

ConnectApi.DistinctValueSearchFacet

ConnectApi.DistinctValueSearchFacet

Facet with distinct values in product search results.

This class is a subclass of ConnectApi.SearchFacet.

Property Name	Type	Description	Available Version
values	List<ConnectApi.DistinctFacetValue>	Values of the facet found in the search result. Sorted by display name in alphabetical order.	52.0

ConnectApi.DownVoteSummary

Summary of a downvote.

Subclass of ConnectApi.UserFeedEntityActivitySummary.

No additional properties.

ConnectApi.EinsteinLLMGenerationItemOutput

Generated response from the LLM provider.

Property Name	Type	Description	Available Version
`parameters`	String	Parameter values for the LLM provider.	60.0
`responseId`	String	ID of the generated response.	60.0
`safetyScore Representation`	`ConnectApi.EinsteinLlmGenerationSafetyScoreOutput`	Safety score information related to the generated response.	60.0
`text`	String	Text of generated response.	60.0

ConnectApi.EinsteinLlmGenerationSafetyScoreOutput

Safety score information related to the LLM response.

Property Name	Type	Description	Available Version
`hateScore`	Double	A higher value means the generated response is more likely to contain text that expresses, incites, or promotes hatred, violence, or severe harm towards the targeted group. Minimum value of `0.0`. Maximum value of `1.0`.	60.0
`physicalScore`	Double	A higher value means the generated response is more likely to contain text with unsafe advice that may harm the user or others physically, or text that promotes, encourages, or depicts acts of self-harm. Minimum value of `0.0`. Maximum value of `1.0`.	60.0
`profanityScore`	Double	A higher value means the generated response is more likely to contain swear words, curse words, or obscene or profane language. Minimum value of `0.0`. Maximum value of `1.0`.	60.0
`safetyScore`	Double	Overall safety score based on the `hateScore`, `physicalScore`, `profanityScore`, `sexualScore`, `toxicityScore`, and `violenceScore`. A higher value means the generated response is more likely to be safe. Minimum value of `0.0`. Maximum value of `1.0`.	60.0
`sexualScore`	Double	A higher value means the generated response is more likely to contain text meant to arouse sexual excitement or promote sexual services. Minimum value of `0.0`. Maximum value of `1.0`.	60.0
`toxicityScore`	Double	A higher value means the generated response is more likely to contain text that is rude, disrespectful, or	60.0

Property Name	Type	Description	Available Version
		unreasonable. Minimum value of `0.0`. Maximum value of `1.0`.	
`violenceScore`	Double	A higher value means the generated response is more likely to contain text that promotes or glorifies violence or celebrates the suffering or humiliation of others. Minimum value of `0.0`. Maximum value of `1.0`.	60.0

ConnectApi.EinsteinPromptTemplateGenerationsRepresentation

Generated response from the LLM provider and resolved prompt template text.

Property Name	Type	Description	Available Version
`generations`	List< `ConnectApi.EinsteinLlmGenerationItemOutput`>	List of generated responses from the LLM provider.	60.0
`parameters`	`ConnectApi.WrappedMapObject`	Map of parameters and values for the LLM provider parameters.	60.0
`prompt`	String	Prompt template text with resolved inputs.	60.0
`promptTemplateDevName`	String	Developer name or ID of the prompt template record.	60.0
`requestId`	String	ID of the generation request sent to the LLM provider.	60.0

ConnectApi.EditCapability

If a feed element or comment has this capability, users who have permission can edit it.

Property Name	Type	Description	Available Version
`isEditRestricted`	Boolean	Specifies whether editing this feed element or comment is restricted. If `true`, the context user can't edit this feed element or comment. If `false`, the context user may or may not have permission to edit this feed element or comment. To determine if the context user can edit a feed element or comment, use the `isFeedElementEditableByMe(communityId, feedElementId)` or `isCommentEditableByMe(communityId, commentId)` method.	34.0

Property Name	Type	Description	Available Version
`isEditableByMeUrl`	String	The URL to check if the context user is able to edit this feed element or comment.	34.0
`lastEditedBy`	`ConnectApi.Actor`	Who last edited this feed element or comment.	34.0
`lastEditedDate`	Datetime	The most recent edit date of this feed element or comment.	34.0
`latestRevision`	Integer	The most recent revision of this feed element or comment.	34.0
`relativeLastEditedDate`	String	Relative last edited date, for example, "2h ago."	34.0

SEE ALSO:

ConnectApi.CommentCapabilities

ConnectApi.FeedElementCapabilities

ConnectApi.EmailAddress

Email address.

Name	Type	Description	Available Version
`displayName`	String	The display name for the email address.	29.0
`emailAddress`	String	The email address.	29.0
`relatedRecord`	ConnectApi.RecordSummary	The summary of a related record, for example, a contact or user summary.	36.0

SEE ALSO:

ConnectApi.EmailMessageCapability

ConnectApi.EmailAttachment

An email attachment in an email message.

Property Name	Type	Description	Available Version
`attachment`	`ConnectApi.RecordSummary`	Record summary of the attachment.	36.0
`contentType`	String	Type of attachment.	36.0

Property Name	Type	Description	Available Version
`fileName`	String	Name of the attachment.	36.0

SEE ALSO:

ConnectApi.EmailMessageCapability

ConnectApi.EmailMergeFieldCollectionInfo

The merge fields for an object.

Property Name	Type	Description	Available Version
`mergeFields`	List<String>	List of merge fields for a single object.	39.0

SEE ALSO:

ConnectApi.EmailMergeFieldInfo

ConnectApi.EmailMergeFieldInfo

The map for objects and their merge fields.

Property Name	Type	Description	Available Version
`entityToMergeFieldsMap`	Map<String, `ConnectApi.EmailMergeFieldCollectionInfo`>	Map for multiple objects and their merge field collections.	39.0

ConnectApi.EmailMessageCapability

If a feed element has this capability, it has an email message from a case.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`attachments`	List<ConnectApi.EmailAttachment>	Attachments in the email message.	36.0
`bccAddresses`	List<ConnectApi.EmailAddress>	BCC addresses for the email message.	36.0
`body`	String	Body of the email message.	36.0
`ccAddresses`	List<ConnectApi.EmailAddress>	CC addresses for the email message.	36.0
`direction`	`ConnectApi.EmailMessageDirection`	Direction of the email message. Values are: • `Inbound`—An inbound message (sent by a customer).	32.0

Property Name	Type	Description	Available Version
		• `Outbound`—An outbound message (sent to a customer by a support agent).	
`emailMessageId`	String	ID of the email message.	32.0
`fromAddress`	`ConnectApi.EmailAddress`	From address for the email message.	36.0
`htmlExpandEmailThread`	Integer	Start location of previous email thread.	47.0
`isRichText`	Boolean	Indicates whether the body of the email message is in rich text format.	36.0
`status`	`ConnectApi.EmailMessageStatus`	Status of an email message on a case. Values are: • `DraftStatus` • `ForwardedStatus` • `NewStatus` • `ReadStatus` • `RepliedStatus` • `SentStatus`	47.0
`subject`	String	Subject of the email message.	32.0
`textBody`	String	Body of the email message. **Important:** In version 36.0 and later, use the `body` property.	32.0–35.0
`toAddresses`	List<`ConnectApi.EmailAddress`>	To addresses of the email message.	32.0
`totalAttachments`	Integer	Total number of attachments in the email message.	38.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.Emoji

An emoji.

Property Name	Type	Description	Available Version
`category`	String	Emoji category.	39.0
`shortcut`	String	Emoji shortcut.	39.0

Property Name	Type	Description	Available Version
`unicodeCharacter`	String	Emoji's unicode character.	39.0

SEE ALSO:

ConnectApi.EmojiCollection

ConnectApi.EmojiCollection

A collection of emoji.

Property Name	Type	Description	Available Version
`emojis`	List<`ConnectApi.Emoji`>	A collection of emoji.	39.0

SEE ALSO:

ConnectApi.SupportedEmojis

ConnectApi.EnhancedLinkCapability

If a feed element has this capability, it has a link that may contain supplemental information like an icon, a title, and a description.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`description`	String	A description with a 500 character limit.	32.0
`icon`	`ConnectApi.Icon`	A icon.	32.0
`linkRecordId`	String	A ID associated with the link if the link URL refers to a Salesforce record.	32.0
`linkUrl`	String	A link URL to a detail page if available content can't display inline.	32.0
`title`	String	A title to a detail page.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.EnsureFundsAsyncOutputRepresentation

ID of the asynchronous background operation. This output only includes the operation ID, regardless of whether a call is made to an external payment gateway. It doesn't include any errors from the operation.

Subclass of ConnectApi.BaseAsyncOutputRepresentation.

No additional properties.

SEE ALSO:

ensureFundsAsync(orderSummaryId, ensureFundsInput)

ConnectApi.EnsureRefundsAsyncOutputRepresentation

ID of the asynchronous background operation. This output only includes the operation ID, regardless of whether a call is made to an external payment gateway. It doesn't include any errors from the operation.

Subclass of ConnectApi.BaseAsyncOutputRepresentation.

No additional properties.

SEE ALSO:

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

ConnectApi.EntityLabel

An entity's label.

Property Name	Type	Description	Available Version
`label`	String	Localized singular label of the entity.	40.0
`labelPlural`	String	Localized plural label of the entity.	40.0

SEE ALSO:

ConnectApi.RecordSummary

ConnectApi.EntityLinkSegment

Entity link segment.

Subclass of ConnectApi.MessageSegment.

Name	Type	Description	Available Version
`motif`	`ConnectApi.Motif Class`	A set of small, medium, and large icons that indicate whether the entity is a file, group, record, or user. The motif can also contain the object's base color.	28.0
`reference`	`ConnectApi. Reference`	A reference to the link object if applicable, otherwise, `null`.	28.0

ConnectApi.EntityRecommendation

A Chatter, custom, or static recommendation.

Subclass of ConnectApi.AbstractRecommendation.

Property Name	Type	Description	Available Version
`actOnUrl`	String	For user, file, group, topic, and record `entity` types, use this Connect REST URL with a POST request to take action on the recommendation. For `ConnectApi.RecommendedObject` `entity` types, such as custom recommendations, use the `actionUrl` property of the ConnectApi.PlatformAction to take action on the recommendation.	32.0
`action`	`ConnectApi.RecommendationActionType`	Specifies the action to take on a recommendation. • `follow`—Follow a file, record, topic, or user. • `join`—Join a group. • `view`—View a file, group, article, record, user, custom, or static recommendation.	32.0
`entity`	`ConnectApi.Actor`	The entity with which the receiver is recommended to take action.	32.0

ConnectApi.ErrorResponse

Base error response.

Property Name	Type	Description	Available Version
`errorCode`	String	Error code.	48.0
`message`	String	More error detail, if available.	48.0

SEE ALSO:

ConnectApi.BaseOutputRepresentation

ConnectApi.Extension

An extension.

Property Name	Type	Description	Available Version
`alternativeRepresentation`	`ConnectApi.Alternative`	Alternative representation of the extension.	40.0
`attachmentId`	String	Attachment ID of the extension.	41.0
`extensionId`	String	ID of the extension.	40.0
`payload`	String	Payload associated with the extension.	40.0

Property Name	Type	Description	Available Version
`payloadVersion`	String	Payload version that identifies the structure of the payload associated with the extension.	40.0

SEE ALSO:

ConnectApi.ExtensionsCapability

ConnectApi.ExtensionDefinition

An extension's definition.

Property Name	Type	Description	Available Version
`canAccess`	Boolean	Indicates whether users can access the extension when it's associated with a feed element.	40.0
`canCreate`	Boolean	Indicates whether users can create a feed element with the extension in the org.	40.0
`createdDate`	Datetime	Date when the extension was created.	40.0
`description`	String	Description of the extension.	40.0
`iconUrl`	String	URL to the icon for the extension.	40.0
`id`	String	ID of the extension.	40.0
`informationCollection`	List<`ConnectApi.AbstractExtensionInformation`>	Collection of extension information.	40.0
`isEnabledInCommunity`	Boolean	Indicates whether the extension is enabled in the site.	40.0 only
`isEnabledInLightningPublisher`	Boolean	Indicates whether the extension is enabled in the Lightning publisher.	40.0 only
`name`	String	Name of the extension.	40.0
`position`	Integer	Position in which the extension is displayed in the publisher.	41.0

SEE ALSO:

ConnectApi.ExtensionDefinitions

ConnectApi.ExtensionDefinitions

A collection of extension definitions.

Property Name	Type	Description	Available Version
currentPageToken	String	Token identifying the current page.	40.0
currentPageUrl	String	Connect REST API URL identifying the current page.	40.0
extensionDefinitions	List<ConnectApi.ExtensionDefinition>	Collection of extension definitions.	40.0
nextPageToken	String	Token identifying the next page, or null if there isn't a next page.	40.0
nextPageUrl	String	Connect REST API URL identifying the next page, or null if there isn't a next page.	40.0
total	Integer	Total number of extensions returned.	40.0

ConnectApi.ExtensionsCapability

If a feed element has this capability, it has one or more extension attachments.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
items	List<ConnectApi.Extension>	List of extensions associated with the feed element.	40.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.ExternalCredential

External credential, including the named credentials and principals associated with it and the type and status of each principal.

If you don't have the View Setup and Configuration permission, some properties are empty or show limited information.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Property Name	Type	Description	Available Version
authenticationProtocol	ConnectApi.CredentialAuthenticationProtocol	Authentication protocol of the external credential. Values are: • AwsSv4 • Basic • Custom • Jwt • OAuth	56.0

Property Name	Type	Description	Available Version
authenticationProtocolVariant	ConnectApi.CredentialAuthenticationProtocolVariant	Authentication protocol variant of the external credential. Values are: • AwsSv4_STS—AWS Signature Version 4 with Security Token Service. • ClientCredentialsClientSecret—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's request body. • ClientCredentialsClientSecretBasic—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's authorization header, as with Basic authentication. • ClientCredentialsJwtAssertion—OAuth 2.0 Client Credentials JSON Web Token assertion. • JwtBearer—OAuth 2.0 JSON Web Token bearer flow. • NoAuthentication—No authentication. • RolesAnywhere—AWS Signature Version 4 with Identity and Access Management (IAM) Roles Anywhere.	57.0
authenticationStatus	ConnectApi.CredentialAuthenticationStatus	Status of the credential authentication. Values are: • Configured—Credential has all required credentials for at least one principal. • NotConfigured—Credential isn't configured. • Unknown—Credential status can't be determined because the authentication protocol is custom.	56.0
createdByNamespace	String	Namespace of the package that created the external credential.	59.0
customHeaders	List<ConnectApi.CredentialCustomHeader>	List of custom headers.	57.0
developerName	String	Fully qualified developer name of the external credential.	56.0
id	String	External credential ID.	58.0
masterLabel	String	External credential label.	56.0
parameters	List<ConnectApi.ExternalCredentialParameter>	List of parameters of the external credential.	57.0

Property Name	Type	Description	Available Version
`principals`	List<`ConnectApi.ExternalCredentialPrincipal`>	List of principals the credential has.	56.0
`relatedNamedCredentials`	List<`ConnectApi.NamedCredential`>	List of named credentials associated to the external credential.	56.0
`url`	String	Connect REST API URL for the external credential.	58.0

SEE ALSO:

ConnectApi.ExternalCredentialList

ConnectApi.NamedCredential

ConnectApi.ExternalCredentialList

List of external credentials.

Property Name	Type	Description	Available Version
`externalCredentials`	List<`ConnectApi.ExternalCredential`>	List of external credentials.	56.0

ConnectApi.ExternalCredentialParameter

External credential parameter.

Property Name	Type	Description	Available Version
`id`	String	Parameter ID.	58.0
`parameterDescription`	String	Parameter description.	58.0
`parameterName`	String	Parameter name. If the `parameterType` is `AuthParameter`, valid values are: • `AwsAccountId`—Valid for AwsSv4. • `AwsProfileArn`—Valid for AwsSv4 with RolesAnywhere. • `AwsRegion`—Valid for AwsSv4. • `AwsService`—Valid for AwsSv4. • `AwsStsDuration`—Valid for AwsSv4 with STS or RolesAnywhere. • `AwsStsExternalId`—Valid for AwsSv4 with STS. • `AwsTrustAnchorArn`—Valid for AwsSv4 with RolesAnywhere.	57.0

Property Name	Type	Description	Available Version
		• `Scope`—Valid for OAuth. Other parameter types can be any value.	
`parameterType`	`ConnectApi.ExternalCredentialParameterType`	Parameter type of the external credential. Values are: • `AuthParameter` • `AuthProvider` • `AuthProviderUrl` • `AuthProviderUrlQueryParameter` • `JwtBodyClaim` • `JwtHeaderClaim` • `SigningCertificate`	57.0
`parameterValue`	String	Parameter value. If the `parameterType` is `JwtBodyClaim` or `JwtHeaderClaim`, the parameter value can contain formulas. If the `parameterType` is `AuthProvider` or `SigningCertificate`, the parameter value is the fully qualified entity name of the corresponding entity.	57.0

SEE ALSO:

ConnectApi.ExternalCredential

ConnectApi.ExternalCredentialPrincipal

External credential principal.

If you don't have the View Setup and Configuration permission, some properties are empty or show limited information.

Property Name	Type	Description	Available Version
`authenticationStatus`	`ConnectApi.CredentialAuthenticationStatus`	Status of the credential authentication. Values are: • `Configured`—Credential has all required credentials for at least one principal. • `NotConfigured`—Credential isn't configured. • `Unknown`—Credential status can't be determined because the authentication protocol is custom.	56.0
`id`	String	ID of the external credential principal.	58.0
`parameters`	List<`ConnectApi.ExternalCredentialParameter`>	List of external credential parameters.	58.0

Property Name	Type	Description	Available Version
`principalAccess`	List<`ConnectApi.ExternalCredentialPrincipalAccess`>	List of access entities associated with the external credential principal.	58.0
`principalName`	String	Name of the external credential named principal.	56.0
`principalType`	`ConnectApi.CredentialPrincipalType`	Type of credential principal. Values are: • `AwsStsPrincipal` • `NamedPrincipal` • `PerUserPrincipal`	56.0
`sequenceNumber`	Integer	Sequence number of the external credential principal.	58.0

SEE ALSO:

ConnectApi.ExternalCredential

ConnectApi.ExternalCredentialPrincipalAccess

External credential principal access.

Property Name	Type	Description	Available Version
`developerName`	String	Developer name of the associated access entity.	58.0
`id`	String	ID of the associated access entity.	58.0
`type`	`ConnectApi.ExternalCredentialPrincipalAccessType`	Access type of the external credential principal. Values are: • `PermissionSet` • `PermissionSetGroup` • `Profile`	58.0

SEE ALSO:

ConnectApi.ExternalCredentialPrincipal

ConnectApi.ExternalFilePermissionInformation

External file permission information.

Property Name	Type	Description	Available Version
`externalFilePermissionTypes`	List<`ConnectApi.ContentHubPermissionType`>	Available permission types for the parent folder of the external file, or `null` for non-external files or when	39.0

Property Name	Type	Description	Available Version
		`includeExternalFilePermissionsInfo` is `false`.	
`externalFilePermissionsFailure`	Boolean	`true` if the retrieval of external file information failed or if `includeExternalFilePermissionsInfo` is `false`; `false` otherwise.	39.0
`externalFilePermissionsInfoFailureReason`	String	Explanation of the failure if a failure occurred and `includeExternalFilePermissionsInfo` is `true`; `null` otherwise.	39.0
`externalFileSharingStatus`	`ConnectApi.ContentHubExternalItemSharingType`	Sharing status for the external file. Values are: • `DomainSharing`—File is shared with the domain. • `PrivateSharing`—File is private or shared only with individuals. • `PublicSharing`—File is publicly shared. Value is `null` for non-external files or when `includeExternalFilePermissionsInfo` is `false`.	39.0
`repositoryPublicGroups`	List<`ConnectApi.RepositoryGroupSummary`>	Available public groups in the external repository or `null` for non-external files or when `includeExternalFilePermissionsInfo` is `false`.	39.0

SEE ALSO:

ConnectApi.AbstractRepositoryFile

ConnectApi.ExternalManagedAccountAddressOutput

Default shipping address for an externally managed account.

Property Name	Type	Description	Available Version
`city`	String	City of the external managed account record.	53.0
`country`	String	Country of the external managed account record.	53.0
`geolocationAccuracy`	String	Geolocation accuracy of the external managed account record.	53.0
`latitude`	String	Latitude of the external managed account record.	53.0
`longitude`	String	Longitude of the external managed account record.	53.0
`state`	String	State of the external managed account record.	53.0

Property Name	Type	Description	Available Version
`street`	String	Street of the external managed account record.	53.0
`zip`	String	Postal code of the external managed account record.	53.0

SEE ALSO:

ConnectApi.ExternalManagedAccountOutput

ConnectApi.ExternalManagedAccountCollectionOutput

Collection of externally managed accounts.

Property Name	Type	Description	Available Version
`externalManagedAccounts`	List<`ConnectApi.ExternalManagedAccountOutput`>	Collection of externally managed accounts.	49.0
`totalExternalManagedAccounts`	Integer	Total number of externally managed accounts.	49.0

ConnectApi.ExternalManagedAccountOutput

Externally managed account.

Property Name	Type	Description	Available Version
`accountId`	String	ID of the account managed by another account.	49.0
`accountName`	String	Name of the external managed account record.	53.0
`address`	`ConnectApi.ExternalManagedAccountAddressOutput`	Default shipping address of the external managed account.	53.0
`externalManagedAccountId`	String	ID of the external managed account record.	49.0
`isMyAccount`	Boolean	Specifies whether the account is the context user's account (`true`) or not (`false`).	53.0

SEE ALSO:

ConnectApi.ExternalManagedAccountCollectionOutput

ConnectApi.FacetValue

Facet value.

This class is abstract and is a superclass of ConnectApi.DistinctFacetValue.

Property Name	Type	Description	Available Version
`type`	`ConnectApi.CommerceSearchFacetType`	Search facet type. Value is: • `DistinctValue`	52.0

ConnectApi.Features

Features available to the context user in the org.

Property	Type	Description	Available Version
`activityReminderNotificationsEnabled`	Boolean	Reserved for future use.	37.0
`chatter`	Boolean	Specifies whether Chatter is enabled.	28.0
`chatterActivity`	Boolean	Specifies whether user details include information about Chatter activity.	28.0
`chatterAnswers`	Boolean	Specifies whether Chatter Answers is enabled. Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.	29.0
`chatterGlobalInfluence`	Boolean	Specifies whether user details include global Chatter activity.	28.0
`chatterGroupRecords`	Boolean	Specifies whether Chatter groups can have records associated with them.	30.0
`chatterGroupRecordSharing`	Boolean	Specifies whether Chatter records are implicitly shared among group members when records are added to groups.	30.0
`chatterMessages`	Boolean	Specifies whether Chatter messages are enabled.	28.0
`chatterTopics`	Boolean	Specifies whether topics are enabled.	28.0
`communitiesEnabled`	Boolean	Specifies whether digital experiences is enabled.	31.0
`communityModeration`	Boolean	Specifies whether moderation is enabled.	29.0
`communityReputation`	Boolean	Specifies whether reputation is enabled.	32.0

Property	Type	Description	Available Version
`dashboardComponentSnapshots`	Boolean	Specifies whether the user can post dashboard component snapshots.	28.0
`defaultCurrencyIsoCode`	String	ISO code of the default currency. Applicable only when `multiCurrency` is `false`.	28.0
`einsteinVoiceEnabled`	Boolean	Reserved for future use.	46.0
`einsteinVoiceInPilotEnabled`	Boolean	Reserved for future use.	46.0
`einsteinVoiceLoggingEnabled`	Boolean	Reserved for future use.	46.0
`einsteinVoiceProviderId`	Integer	Reserved for future use.	46.0
`favoritesEnabled`	Boolean	Specifies whether favorites in Lightning are enabled.	41.0
`feedPolling`	Boolean	Reserved for future use.	28.0
`feedStreamEnabled`	Boolean	Specifies whether Chatter feed streams are enabled.	39.0
`files`	Boolean	Specifies whether files can act as resources for Connect REST API.	28.0
`filesOnComments`	Boolean	Specifies whether files can be attached to comments.	28.0
`forecasting3AggregatedEnabled`	Boolean	Specifies whether aggregated forecasting is enabled for mobile clients.	38.0
`forecastingEnabled`	Boolean	Specifies whether forecasting is enabled.	38.0
`forecastingPeriodRange`	Integer	Range of the forecasting period.	38.0
`forecastingPeriodStart`	Integer	Start index for the forecasting period.	38.0
`forecastingPeriodType`	`ConnectApi.PeriodType`	Time period used for forecasting. Values are: • `Month` • `Quarter` • `Week`	38.0

Property	Type	Description	Available Version
		• `Year`	
`groupsCanFollow`	Boolean	Reserved for future use.	28.0–29.0
`ideas`	Boolean	Specifies whether Ideas is enabled.	29.0
`liveAgentHostName`	String	Live Agent host name configured for the org.	41.0
`managedTopicsEnabled`	Boolean	Specifies whether managed topics are enabled.	32.0
`maxEntitySubscriptionsPerStream`	Integer	Specifies the maximum number of feed-enabled entities that can be subscribed to in a Chatter stream.	39.0
`maxFilesPerFeedItem`	Integer	Specifies the maximum number of files that can be added to a feed item.	36.0
`maxStreamsPerPerson`	Integer	Specifies the maximum number of Chatter streams that a user can have.	39.0
`mobileNotificationsEnabled`	Boolean	Reserved for future use.	29.0
`multiCurrency`	Boolean	Specifies whether the org uses multiple currencies (`true`) or not (`false`). When `false`, the `defaultCurrencyIsoCode` indicates the ISO code of the default currency.	28.0
`offlineEditEnabled`	Boolean	Specifies whether the offline object permissions are enabled for Salesforce for Android and Salesforce for iOS mobile clients.	37.0
`publisherActions`	Boolean	Specifies whether actions in the publisher are enabled.	28.0
`storeDataOnDevicesEnabled`	Boolean	Specifies whether the Salesforce for Android and Salesforce for iOS can use secure, persistent storage on mobile devices to cache data.	30.0
`thanksAllowed`	Boolean	Reserved for future use.	28.0
`trendingTopics`	Boolean	Specifies whether trending topics are enabled.	28.0
`userNavItemsEnabled`	Boolean	Specifies whether users can customize the navigation bar in Lightning.	41.0
`viralInvitesAllowed`	Boolean	Specifies whether existing Chatter users can invite people in their company to use Chatter.	28.0

Property	Type	Description	Available Version
`wave`	Boolean	Specifies whether CRM Analytics is enabled.	36.0

SEE ALSO:

- getSettings()
- ConnectApi.OrganizationSettings

ConnectApi.Feed

Chatter feed.

Name	Type	Description	Available Version
`feedElementPostUrl`	String	Connect REST API URL to post feed elements to this subject.	31.0
`feedElements`	ConnectApi.FeedElementPage	Page of feed elements for the feed specified in `redirectedFeedType`. Otherwise, `null`.	40.0
`feedElementsUrl`	String	Connect REST API URL to feed elements.	31.0
`feedItemsUrl`	String	Connect REST API URL to feed items.	28.0–31.0
`isModifedUrl`	String	Connect REST API URL with a *`since`* request parameter that contains an opaque token that describes when the feed was last modified. Returns `null` if the feed isn't a news feed. Use this URL to poll a news feed for updates. **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	28.0
`pinnedFeedElementsUrl`	String	URL to pinned feed items.	41.0
`redirectedFeedFilter`	`ConnectApi.FeedFilter`	Filter for the feed specified in `redirectedFeedType`. Otherwise, `null`.	42.0
`redirectedFeedSort`	`ConnectApi.FeedSortOrder`	Sort order for the feed specified in `redirectedFeedType`. Otherwise, `null`.	42.0
`redirectedFeedType`	`ConnectApi.FeedType`	Specifies which feed is returned if `pageSize` is specified. Otherwise, `null`.	40.0
`respectsMute`	Boolean	Indicates whether the feed respects the mute feature. If `true`, the feed shows the ability to mute or unmute each element, depending on the value of `isMutedByMe`; `null` if the mute feature is disabled for the organization.	35.0

ConnectApi.FeedBody

Feed body.

Subclass of ConnectApi.AbstractMessageBody.

No additional properties.

SEE ALSO:

- ConnectApi.Comment
- ConnectApi.FeedElement
- ConnectApi.FeedEntitySummary

ConnectApi.FeedDirectory

Directory of feeds and favorites.

Name	Type	Description	Available Version
`favorites`	`List<ConnectApi.FeedFavorite>`	A list of feed favorites	30.0
`feeds`	`List<ConnectApi.FeedDirectoryItem>`	A list of feeds	30.0

ConnectApi.FeedDirectoryItem

Definition of a feed.

Name	Type	Description	Available Version
`feedElementsUrl`	String	Connect REST API resource URL for the feed elements.	
`feedItemsUrl`	String	Connect REST API resource URL for the feed items of a specific feed.	30.0–31.0
`feedType`	`ConnectApi.FeedType` Enum	The feed type. One of these values: • `Bookmarks`—Contains all feed items saved as bookmarks by the context user. • `Company`—Contains all feed items except feed items of type `TrackedChange`. To see the feed item, the user must have sharing access to its parent. • `DirectMessageModeration`—Contains all direct messages that are flagged for moderation. The Direct Message Moderation feed is available only to users with Moderate Experiences Chatter Messages permissions. • `DirectMessages`—Contains all feed items of the context user's direct messages. • `Draft`—Contains all the feed items that the context user drafted.	30.0

Name	Type	Description	Available Version
		• `Files`—Contains all feed items that contain files posted by people or groups that the context user follows. • `Filter`—Contains the news feed filtered to contain feed items whose parent is a specified object type. • `Groups`—Contains all feed items from all groups the context user either owns or is a member of. • `Home`—Contains all feed items associated with any managed topic in an Experience Cloud site. • `Isolated`—Contains all the feed items and comments that are isolated. • `Landing`—Contains all feed items that best drive user engagement when the feed is requested. Allows clients to avoid an empty feed when there aren't many personalized feed items. • `Moderation`—Contains all feed items that are flagged for moderation, except direct messages. The moderation feed is available only to users with Moderate Experiences Feeds permissions. • `Mute`—Contains all feed items that the context user muted. • `News`—Contains all updates for people the context user follows, groups the user is a member of, and files and records the user is following. Contains all updates for records whose parent is the context user. • `PendingReview`—Contains all feed items and comments that are pending review. • `People`—Contains all feed items posted by all people the context user follows. • `Record`—Contains all feed items whose parent is a specified record, which could be a group, user, object, file, or any other standard or custom object. When the record is a group, the feed also contains feed items that mention the group. When the record is a user, the feed contains only feed items on that user. You can get another user's record feed. • `Streams`—Contains all feed items for any combination of up to 25 feed-enabled entities that the context user subscribes to in a stream. Examples of feed-enabled entities include people, groups, and records, • `To`—Contains all feed items with mentions of the context user. Contains feed items the context user commented on and feed items created by the context user that are commented on. • `Topics`—Contains all feed items that include the specified topic. • `UserProfile`—Contains feed items created when a user changes records that can be tracked in a feed. Contains feed items whose parent is the user and feed items that @mention the user. This feed is different than the news feed, which returns more feed items,	

Name	Type	Description	Available Version
		including group updates. You can get another user's user profile feed.	
`feedUrl`	String	Connect REST API resource URL for a specific feed	30.0
`keyPrefix`	String	A *key prefix* is the first three characters of a record ID, which specifies the object type. For filter feeds, this value is the key prefix associated with the object type used to filter this feed. All feed items in this feed have a parent whose object type matches this key prefix value. For non-filter feeds, this value is `null`.	30.0
`label`	String	Localized label of the feed	30.0

SEE ALSO:

ConnectApi.FeedDirectory

ConnectApi.FeedElement

Feed elements are the top-level items that a feed contains. Feeds are feed element containers.

This class is abstract.

Superclass of:

- ConnectApi.FeedItem
- ConnectApi.GenericFeedElement

Property Name	Type	Description	Available Version
`body`	`ConnectApi.FeedBody`	Information about the feed element. **Important:** Use the `header.text` property as the default value for rendering text because the `body.text` property can be `null`.	22.0
`capabilities`	`ConnectApi.FeedElementCapabilities`	A container for all capabilities that can be included with a feed element.	31.0
`createdDate`	Datetime	ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	31.0
`feedElementType`	`ConnectApi.FeedElementType`	Feed elements are the top-level objects that a feed contains. The feed element type describes the characteristics of that feed element. One of these values:	31.0

Property Name	Type	Description	Available Version
		• `Bundle`—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values. • `FeedItem`—A feed item has a single parent and is scoped to oneExperience Cloud site or across all Experience Cloud sites. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values. • `Recommendation`—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user.	
`header`	`ConnectApi.MessageBody`	The header is the title of the post. This property contains renderable plain text for all the segments of the message. If a client doesn't know how to render a feed element type, it should render this text.	31.0
`id`	String	18-character ID of the feed element.	22.0
`modifiedDate`	Datetime	ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	31.0
`parent`	`ConnectApi.ActorWithId`	Feed element's parent	28.0
`relativeCreatedDate`	String	The created date formatted as a relative, localized string, for example, "17m ago" or "Yesterday."	31.0
`url`	String	Connect REST API URL to this feed element.	22.0

SEE ALSO:

- ConnectApi.Announcement
- ConnectApi.FeedElementPage
- ConnectApi.PinnedFeedElements
- ConnectApi.QuestionAndAnswersSuggestions

ConnectApi.FeedElementCapabilities

A container for all capabilities that can be included with a feed element.

Property Name	Type	Description	Available Version
approval	ConnectApi.ApprovalCapability	If a feed element has this capability, it includes information about an approval.	32.0
associatedActions	ConnectApi.AssociatedActionsCapability	If a feed element has this capability, it has platform actions associated with it.	33.0
banner	ConnectApi.BannerCapability	If a feed element has this capability, it has a banner motif and style.	31.0
bookmarks	ConnectApi.BookmarksCapability	If a feed element has this capability, the context user can bookmark it.	31.0
bundle	ConnectApi.BundleCapability	If a feed element has this capability, it has a container of feed elements called a *bundle*.	31.0
callCollaboration	ConnectApi.CallCollaborationCapability	If a feed element has this capability, it has a recording comment.	51.0
canvas	ConnectApi.CanvasCapability	If a feed element has this capability, it renders a canvas app.	32.0
caseComment	ConnectApi.CaseCommentCapability	If a feed element has this capability, it has a case comment on the case feed.	32.0
chatterLikes	ConnectApi.ChatterLikesCapability	If a feed element has this capability, the context user can like it. Exposes information about existing likes.	31.0
close	ConnectApi.CloseCapability	If a feed element has this capability, users with permission can close it.	43.0
comments	ConnectApi.CommentsCapability	If a feed element or comment has this capability, the context user can add a comment to it.	31.0
content	ConnectApi.ContentCapability	If a comment has this capability, it has a file attachment. Most `ConnectApi.ContentCapability` properties are null if the content has been deleted from the feed element or if the access has changed to private. **Important:** In version 36.0 and later, use the `files` property.	32.0–35.0
dashboardComponentSnapshot	ConnectApi.DashboardComponentSnapshotCapability	If a feed element has this capability, it has a dashboard component snapshot. A snapshot is a static image of a dashboard component at a specific point in time.	32.0

Property Name	Type	Description	Available Version
directMessage	ConnectApi.DirectMessageCapability	If a feed element has this capability, it's a direct message.	39.0
edit	ConnectApi.EditCapability	If a feed element has this capability, users who have permission can edit it.	34.0
emailMessage	ConnectApi.EmailMessageCapability	If a feed element has this capability, it has an email message from a case.	32.0
enhancedLink	ConnectApi.EnhancedLinkCapability	If a feed element has this capability, it has a link that may contain supplemental information like an icon, a title, and a description.	32.0
extensions	ConnectApi.ExtensionsCapability	If a feed element has this capability, it has one or more extension attachments.	40.0
feedEntityShare	ConnectApi.FeedShareCapability	If a feed element or comment has this capability, a feed entity is shared with it.	39.0
files	ConnectApi.FilesCapability	If a feed element has this capability, it has one or more file attachments.	36.0
interactions	ConnectApi.InteractionsCapability	If a feed element has this capability, it has information about user interactions.	37.0
link	ConnectApi.LinkCapability	If a feed element has this capability, it has a link.	32.0
mediaReferences	ConnectApi.MediaReferenceCapability	If a feed element has this capability, it has one or more media references.	41.0
moderation	ConnectApi.ModerationCapability	If a feed element has this capability, users in an Experience Cloud site can flag it for moderation.	31.0
mute	ConnectApi.MuteCapability	If a feed element has this capability, users can mute it.	35.0
origin	ConnectApi.OriginCapability	If a feed element has this capability, it was created by a feed action.	33.0
pin	ConnectApi.PinCapability	If a feed element has this capability, users who have permission can pin it to a feed.	41.0
poll	ConnectApi.PollCapability	If a feed element has this capability, it includes a poll.	31.0
questionAndAnswers	ConnectApi.QuestionAndAnswersCapability	If a feed element has this capability, it has a question and comments on the feed element are answers to the question.	31.0

Property Name	Type	Description	Available Version
readBy	ConnectApi.ReadByCapability	If a feed element has this capability, the context user can mark it as read.	40.0
recommendations	ConnectApi.RecommendationsCapability	If a feed element has this capability, it has a recommendation.	32.0
recordSnaphot	ConnectApi.RecordSnapshotCapability	If a feed element has this capability, it contains all the snapshotted fields of a record for a single create record event.	32.0
socialPost	ConnectApi.SocialPostCapability	If a feed element has this capability, it can interact with a social post on a social network.	36.0
status	ConnectApi.StatusCapability	If a feed post or comment has this capability, it has a status that determines its visibility.	37.0
topics	ConnectApi.TopicsCapability	If a feed element has this capability, the context user can add topics to it. Topics help users organize and discover conversations.	31.0
trackedChanges	ConnectApi.TrackedChangesCapability	If a feed element has this capability, it contains all changes to a record for a single tracked change event.	32.0
upDownVote	ConnectApi.UpDownVoteCapability	If a feed post or comment has this capability, users can upvote or downvote it.	41.0

SEE ALSO:

- ConnectApi.FeedElement
- ConnectApi.FeedItemSummary

ConnectApi.FeedElementCapability

A feed element capability, which defines the characteristics of a feed element.

In API version 30.0 and earlier, most feed items can have comments, likes, topics, and so on. In version 31.0 and later, every feed item (and feed element) can have a unique set of *capabilities*. If a capability property exists on a feed element, that capability is available, even if the capability property doesn't have a value. For example, if the `ChatterLikes` capability property exists on a feed element (with or without a value), the context user can like that feed element. If the capability property doesn't exist, it isn't possible to like that feed element. A capability can also contain associated data. For example, the `Moderation` capability contains data about moderation flags.

This class is abstract.

This class is a superclass of:

- ConnectApi.AssociatedActionsCapability
- ConnectApi.ApprovalCapability

- ConnectApi.BannerCapability
- ConnectApi.BookmarksCapability
- ConnectApi.BundleCapability
- ConnectApi.CallCollaborationCapability
- ConnectApi.CanvasCapability
- ConnectApi.CaseCommentCapability
- ConnectApi.ChatterLikesCapability
- ConnectApi.CloseCapability
- ConnectApi.CommentsCapability
- ConnectApi.ContentCapability
- ConnectApi.DashboardComponentSnapshotCapability
- ConnectApi.DirectMessageCapability
- ConnectApi.EmailMessageCapability
- ConnectApi.EnhancedLinkCapability
- ConnectApi.ExtensionsCapability
- ConnectApi.FeedEntityShareCapability
- ConnectApi.FilesCapability
- ConnectApi.InteractionsCapability
- ConnectApi.LinkCapability
- ConnectApi.MediaReferenceCapability
- ConnectApi.ModerationCapability
- ConnectApi.MuteCapability
- ConnectApi.OriginCapability
- ConnectApi.PinCapability
- ConnectApi.PollCapability
- ConnectApi.QuestionAndAnswersCapability
- ConnectApi.ReadByCapability
- ConnectApi.RecommendationsCapability
- ConnectApi.RecordCapability
- ConnectApi.RecordSnapshotCapability
- ConnectApi.SocialPostCapability
- ConnectApi.StatusCapability
- ConnectApi.TopicsCapability
- ConnectApi.TrackedChangesCapability
- ConnectApi.UpDownVoteCapability
- ConnectApi.VerifiedCapability

This class doesn't have any properties.

ConnectApi.FeedElementPage

A paged collection of `ConnectApi.FeedElement` objects.

Property Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	31.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	31.0
`elements`	List<`ConnectApi.FeedElement`>	Collection of feed elements.	31.0
`isModifiedToken`	String	Opaque polling token to use in the *`since`* parameter of the `ChatterFeeds.isModified` method. The token describes when the feed was last modified. **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	31.0
`isModifiedUrl`	String	Connect REST API URL with a *`since`* request parameter that contains an opaque token that describes when the feed was last modified. Returns `null` if the feed isn't a news feed. Use this URL to poll a news feed for updates. **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	31.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	31.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	31.0
`updatesToken`	String	A token to use in a request to the `ConnectApi.ChatterFeeds.getFeedElementsUpdatedSince` method.	31.0
`updatesUrl`	String	Connect REST API feed resource containing the feed elements that have been updated since the feed was refreshed. If the feed doesn't support this feature, the value is `null`.	31.0

SEE ALSO:

ConnectApi.BundleCapability

ConnectApi.Feed

ConnectApi.FeedEnabledEntity

An entity that can have feeds associated with it.

Property Name	Type	Description	Available Version
`id`	String	The 18-character ID of the record.	39.0
`motif`	`ConnectApi.Motif`	Small, medium, and large icons indicating the record's type.	39.0
`name`	String	The localized name of the record.	39.0
`type`	String	The type of the record.	39.0
`url`	String	URL to the record.	39.0

SEE ALSO:

ConnectApi.ChatterStream

ConnectApi.FeedEntityIsEditable

Indicates if the context user can edit a feed element or comment.

Property Name	Type	Description	Available Version
`areAttachmentsEditableByMe`	Boolean	`true` if the context user can add and remove attachments on the feed element or comment, `false` otherwise.	36.0
`feedEntityUrl`	String	URL of the feed element or comment.	34.0
`isEditableByMe`	Boolean	`true` if the context user can edit the feed element or comment, `false` otherwise.	34.0

ConnectApi.FeedEntityNotAvailableSummary

A summary when the feed entity isn't available.

Subclass of ConnectApi.FeedEntitySummary.

No additional properties.

ConnectApi.FeedEntityReadSummary

Summary of the feed post or comment that was read.

Subclass of ConnectApi.UserFeedEntityActivitySummary.

No additional properties.

ConnectApi.FeedEntityShareCapability

If a feed element or comment has this capability, a feed entity is shared with it.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`feedEntity`	`ConnectApi.FeedEntitySummary`	The summary of the feed entity that is shared with the feed element or comment.	39.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.FeedEntitySummary

The summary of a feed entity that is shared with a feed element.

This class is abstract.

Superclass of:

- ConnectApi.FeedItemSummary
- ConnectApi.FeedEntityNotAvailableSummary

Property Name	Type	Description	Available Version
`actor`	`ConnectApi.Actor`	Entity that created the feed entity.	39.0
`body`	`ConnectApi.FeedBody`	Information about the feed entity.	39.0
`createdDate`	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z, when the entity was created.	39.0
`feedElementType`	`ConnectApi.FeedElementType`	Type of feed entity. • `Bundle`—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values. • `FeedItem`—A feed item has a single parent and is scoped to oneExperience Cloud site or across all Experience Cloud sites. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values. • `Recommendation`—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow,	39.0

Property Name	Type	Description	Available Version
		groups to join, or applications that are helpful to the context user.	
id	String	18-character ID of the feed entity.	39.0
isEntityAvailable	Boolean	Specifies whether the entity is available. If false, either the user doesn't have access to the entity or the entity was deleted.	39.0
parent	ConnectApi.ActorWithId	Parent of the feed entity.	39.0
relativeCreatedDate	String	Relative created date, for example, "2h ago."	39.0
url	String	URL to the feed entity.	39.0

SEE ALSO:

ConnectApi.FeedEntityShareCapability

ConnectApi.FeedFavorite

Feed favorite.

Name	Type	Description	Available Version
community	ConnectApi.Reference	Information about the Experience Cloud site that contains the favorite.	28.0
createdBy	ConnectApi.UserSummary	Favorite's creator.	28.0
feedUrl	String	Connect REST API URL identifying the feed item for this favorite.	28.0
id	String	Favorite's 18–character ID.	28.0
lastViewDate	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	28.0
name	String	Favorite's name.	28.0
searchText	String	If the favorite is from a search, contains the search text, otherwise, an empty string.	28.0
target	ConnectApi.Reference	A reference to the topic if applicable, null otherwise.	28.0
type	ConnectApi.FeedFavoriteType Enum	An empty string or one of the following values: • ListView • Search • Topic	28.0

Name	Type	Description	Available Version
`url`	String	Connect REST API URL to this favorite.	28.0
`user`	`ConnectApi.UserSummary`	Information about the user who saved this favorite.	28.0

SEE ALSO:

ConnectApi.FeedDirectory

ConnectApi.FeedFavorites

ConnectApi.FeedFavorites

Feed favorites.

Name	Type	Description	Available Version
`favorites`	`List<ConnectApi.FeedFavorite>`	Complete list of favorites.	28.0
`total`	Integer	Total number of favorites.	28.0

ConnectApi.FeedItem

Feed item.

Subclass of ConnectApi.FeedElement Class as of version 31.0.

Name	Type	Description	Available Version
`actor`	`ConnectApi.Actor`	The entity that created the feed item.	28.0
`attachment`	`ConnectApi.FeedItemAttachment`	Information about the attachment. If there is no attachment, returns `null`. **Important:** As of version 32.0, use the inherited `capabilities` property.	28.0–31.0
`canShare`	Boolean	Indicates whether the feed item can be shared. If a feed item has multiple file attachments and at least one attachment has been deleted or is inaccessible, the feed item can't be shared. The `canShare` value is incorrectly set to `true` in these cases. **Important:** As of version 39.0, use the `isSharable` property.	28.0–38.0
`clientInfo`	`ConnectApi.ClientInfo`	Information about the connected app used to authenticate the connection.	28.0

Name	Type	Description	Available Version
comments	ConnectApi.CommentPage	First page of comments for this feed item. **Important:** As of version 32.0, use the inherited capabilities.comments.page property.	28.0–31.0
event	Boolean	true if feed item is created due to an event change, false otherwise.	22.0
hasVerifiedComment	Boolean	true if the feed item has a verified comment, otherwise false.	41.0
isBookmarkedByCurrentUser	Boolean	true if the context user has bookmarked this feed item, otherwise, false. **Important:** As of version 32.0, use the inherited capabilities.bookmarks.isBookmarkedByCurrentUser property.	28.0–31.0
isDeleteRestricted	Boolean	If this property is true the comment cannot be deleted by the context user. If it is false, it might be possible for the context user to delete the comment, but it is not guaranteed.	28.0
isLikedByCurrentUser	Boolean	true if the context user has liked this feed item, otherwise, false. **Important:** As of version 32.0, use the inherited capabilities.chatterLikes.isLikedByCurrentUser property.	28.0–31.0
isSharable	Boolean	Indicates whether the feed item can be shared.	39.0
likes	ConnectApi.ChatterLikePage	First page of likes for this feed item. **Important:** As of version 32.0, use the inherited capabilities.chatterLikes.page property.	28.0–31.0
likesMessage	ConnectApi.MessageBody	A message body the describes who likes the feed item. **Important:** As of version 32.0, use the inherited capabilities.chatterLikes.likesMessage property.	28.0–31.0

Name	Type	Description	Available Version
moderationFlags	ConnectApi.ModerationFlags	Information about the moderation flags on a feed item. If ConnectApi.Features.communityModeration is false, this property is null. **Important:** As of version 31.0, use the inherited capabilities.moderation.moderationFlags property.	29.0–30.0
myLike	ConnectApi.Reference	If the context user has liked the feed item, this property is a reference to the specific like, otherwise, null. **Important:** As of version 32.0, use the inherited capabilities.chatterLikes.myLike property.	28.0–31.0
originalFeedItem	ConnectApi.Reference	A reference to the original feed item if this feed item is a shared feed item, otherwise, null.	28.0
originalFeedItemActor	ConnectApi.Actor	If this feed item is a shared feed item, returns information about the original poster of the feed item, otherwise, returns null.	28.0
photoUrl	String	URL of the photo associated with the feed item	28.0
preamble	ConnectApi.MessageBody	A collection of message segments, including the unformatted text of the message that you can use as the title of a feed item. Message segments include name, link, and motif icon information for the actor that created the feed item. **Important:** For API versions 29.0 and 30.0, use the ConnectApi.FeedItem.preamble.text property as the default case to render text. For API versions 31.0 and later, use the ConnectApi.FeedElement.header.text property as the default case to render text.	28.0-30.0
topics	ConnectApi.FeedItemTopicPage	Topics for this feed item. **Important:** As of version 31.0, use the inherited capabilities.topics.items property.	28.0–31.0

Name	Type	Description	Available Version
`type`	`ConnectApi.FeedItemType`	Type of feed item. **Important:** As of API version 32.0, use the `capabilities` property to determine what can be done with a feed item. See Working with Feeds and Feed Elements. One of these values: • `ActivityEvent`—Feed item generated in Case Feed when an event or task associated with a parent record with a feed enabled is created or updated. • `AdvancedTextPost`—A feed item with advanced text formatting, such as a group announcement post. • `ApprovalPost`—Feed item with an approval capability. Approvers can act on the feed item parent. • `AttachArticleEvent`—Feed item generated when an article is attached to a case in Case Feed. • `BasicTemplateFeedItem`—Feed item with an enhanced link capability. • `CallLogPost`—Feed item generated when a call log is saved to a case in Case Feed. • `CanvasPost`—Feed item generated by a canvas app in the publisher or from Connect REST API or Connect in Apex. The post itself is a link to a canvas app. • `CaseCommentPost`—Feed item generated when a case comment is saved in Case Feed. • `ChangeStatusPost`—Feed item generated when the status of a case is changed in Case Feed. • `ChatTranscriptionPost`—Feed item generated in Case Feed when a Live Agent chat transcript is saved to a case. • `CollaborationGroupCreated`—Feed item generated when a new public group is created. Contains a link to the new group. • `CollaborationGroupUnarchived`—Deprecated. Feed item generated when an archived group is activated. • `ContentPost`—Feed item with a content capability.	28.0

Name	Type	Description	Available Version
		• `CreateRecordEvent`—Feed item that describes a record created in the publisher. • `DashboardComponentAlert`—Feed item with a dashboard alert. • `DashboardComponentSnapshot`—Feed item with a dashboard component snapshot capability. • `EmailMessageEvent`—Feed item generated when an email is sent from a case in Case Feed. • `FacebookPost`—Deprecated. Feed item generated when a Facebook post is created from a case in Case Feed. • `LinkPost`—Feed item with a link capability. • `MilestoneEvent`—Feed item generated when a case milestone is either completed or reaches a violation status. Contains a link to the case milestone. • `PollPost`—Feed item with a poll capability. Viewers of the feed item are allowed to vote on the options in the poll. • `ProfileSkillPost`—Feed item generated when a skill is added to a user's profile. • `QuestionPost`—Feed item generated when a question is asked. As of API version 33.0, a feed item of this type can have a content capability and a link capability. • `ReplyPost`—Feed item generated by a Chatter Answers reply. • `RypplePost`—Feed item generated when a user posts thanks. • `SocialPost`—Feed item generated when a social post is created from a case in Case Feed. • `TextPost`—Feed item containing text only. • `TrackedChange`—Feed item created when one or more fields on a record have been changed. • `UserStatus`—Deprecated. A user's post to their own profile.	
`visibility`	`ConnectApi.FeedItemVisibilityType`	Type of users who can see a feed item. • `AllUsers`—Visibility is not limited to internal users.	28.0

Name	Type	Description	Available Version
		• `InternalUsers`—Visibility is limited to internal users.	

ConnectApi.FeedItemSummary

A feed item summary.

Subclass of ConnectApi.FeedEntitySummary.

Property Name	Type	Description	Available Version
`capabilities`	`ConnectApi.FeedElementCapabilities`	Container for all capabilities that can be included with a feed item.	39.0
`header`	`ConnectApi.MessageBody`	Title of the post. This property contains renderable plain text for all the message segments. If a client doesn't know how to render a feed element type, it should render this text.	39.0
`modifiedDate`	Datetime	When the feed item was modified in the form of an ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	39.0
`originalFeedItem`	`ConnectApi.Reference`	Reference to the original feed item if this feed item is a shared feed item; otherwise, `null`.	39.0
`originalFeedItemActor`	`ConnectApi.Actor`	If this feed item is a shared feed item, information about the original poster of the feed item; otherwise, `null`.	39.0
`photoUrl`	String	URL of the photo associated with the feed item.	39.0
`visibility`	`ConnectApi.FeedItemVisibility`	Specifies who can see a feed item. • `AllUsers`—Visibility is not limited to internal users. • `InternalUsers`—Visibility is limited to internal users.	39.0

ConnectApi.FeedModifiedInfo

Feed modified information.

Important: This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.

Name	Type	Description	Available Version
`isModified`	Boolean	`true` if the news feed has been modified since the last time it was polled; `false` otherwise. Returns `null` if the feed is not a news feed.	28.0
`isModifiedToken`	String	Opaque polling token to use in the *`since`* parameter of the `ChatterFeeds.isModified` method. The token describes when the feed was last modified.	28.0
`nextPollUrl`	String	Connect REST API URL with a *`since`* request parameter that contains an opaque token that describes when the feed was last modified. Returns `null` if the feed isn't a news feed. Use this URL to poll a news feed for updates.	28.0

ConnectApi.FeedPollChoice

Feed poll choice.

Name	Type	Description	Available Version
`id`	String	Poll choice ID.	28.0
`position`	Integer	The location in the poll where this poll choice exists. The first poll choice starts at 1.	28.0
`text`	String	Label text associated with the poll choice.	28.0
`voteCount`	Integer	Total number of votes for this poll choice.	28.0
`voteCountRatio`	Double	The ratio of total number of votes for this poll choice to all votes cast in the poll. Multiply the ratio by 100 to get the percentage of votes cast for this poll choice.	28.0

SEE ALSO:

ConnectApi.PollCapability

ConnectApi.FeedPostSummary

Summary of the post.

Subclass of ConnectApi.UserActivitySummary.

Property Name	Type	Description	Available Version
`feedItemId`	String	ID of the post.	42.0

ConnectApi.FeedReadSummary

Summary of the feed that was read.

Subclass of ConnectApi.UserActivitySummary.

Property Name	Type	Description	Available Version
`containerId`	String	ID of the parent of the feed.	42.0
`feedType`	`ConnectApi.FeedType`	Type of feed. • `Bookmarks`—Contains all feed items saved as bookmarks by the context user. • `Company`—Contains all feed items except feed items of type `TrackedChange`. To see the feed item, the user must have sharing access to its parent. • `DirectMessageModeration`—Contains all direct messages that are flagged for moderation. The Direct Message Moderation feed is available only to users with Moderate Experiences Chatter Messages permissions. • `DirectMessages`—Contains all feed items of the context user's direct messages. • `Draft`—Contains all the feed items that the context user drafted. • `Files`—Contains all feed items that contain files posted by people or groups that the context user follows. • `Filter`—Contains the news feed filtered to contain feed items whose parent is a specified object type. • `Groups`—Contains all feed items from all groups the context user either owns or is a member of. • `Home`—Contains all feed items associated with any managed topic in an Experience Cloud site. • `Isolated`—Contains all the feed items and comments that are isolated. • `Landing`—Contains all feed items that best drive user engagement when the feed is requested. Allows clients to avoid an empty feed when there aren't many personalized feed items. • `Moderation`—Contains all feed items that are flagged for moderation, except direct messages. The moderation feed is available only to users with Moderate Experiences Feeds permissions. • `Mute`—Contains all feed items that the context user muted.	42.0

Property Name	Type	Description	Available Version
		• `News`—Contains all updates for people the context user follows, groups the user is a member of, and files and records the user is following. Contains all updates for records whose parent is the context user. • `PendingReview`—Contains all feed items and comments that are pending review. • `People`—Contains all feed items posted by all people the context user follows. • `Record`—Contains all feed items whose parent is a specified record, which could be a group, user, object, file, or any other standard or custom object. When the record is a group, the feed also contains feed items that mention the group. When the record is a user, the feed contains only feed items on that user. You can get another user's record feed. • `Streams`—Contains all feed items for any combination of up to 25 feed-enabled entities that the context user subscribes to in a stream. Examples of feed-enabled entities include people, groups, and records, • `To`—Contains all feed items with mentions of the context user. Contains feed items the context user commented on and feed items created by the context user that are commented on. • `Topics`—Contains all feed items that include the specified topic. • `UserProfile`—Contains feed items created when a user changes records that can be tracked in a feed. Contains feed items whose parent is the user and feed items that @mention the user. This feed is different than the news feed, which returns more feed items, including group updates. You can get another user's user profile feed.	

ConnectApi.FieldChangeSegment

Field change segment.

Subclass of ConnectApi.ComplexSegment.

No additional properties.

SEE ALSO:

ConnectApi.MoreChangesSegment

ConnectApi.FieldChangeNameSegment

Field change name segment.

Subclass of ConnectApi.MessageSegment.

No additional properties.

ConnectApi.FieldChangeValueSegment

Field change value segment.

Subclass of ConnectApi.MessageSegment.

Name	Type	Description	Available Version
`valueType`	`ConnectApi.FieldChangeValueType Enum`	Value type of a field change. • `NewValue`—A new value • `OldValue`—An old value	28.0
`url`	String	URL value if the field change is to a URL field (such as a web address)	28.0

ConnectApi.FieldValue

Field's value in product search results.

Property Name	Type	Description	Available Version
`value`	String	Value of the field.	52.0

SEE ALSO:

ConnectApi.ProductSummary

ConnectApi.File

File.

This class is abstract.

Subclass of ConnectApi.ActorWithId.

Superclass of ConnectApi.FileSummary.

Name	Type	Description	Available Version
`checksum`	String	MD5 checksum for the file.	28.0
`contentModifiedDate`	Datetime	ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z. File-specific modified date, which is updated only for direct file operations, such as rename. Modifications to the file from outside of Salesforce can update this date.	32.0
`contentSize`	Integer	Size of the file in bytes.	28.0
`contentUrl`	String	If the file is a link, returns the URL, otherwise, the string `null`.	28.0
`createdDate`	Datetime	ISO 8601 date string when the file was created.	41.0
`description`	String	Description of the file.	28.0
`downloadUrl`	String	URL to the file, that can be used for downloading the file.	28.0
`fileExtension`	String	Extension of the file.	28.0
`fileType`	String	Type of file, such as PDF, PowerPoint.	28.0
`flashRenditionStatus`	String	Specifies if a flash preview version of the file has been rendered. Note: Flash renditions were retired on July 16, 2021.	28.0
`isFileAsset`	Boolean	Specifies whether the file is an asset.	46.0
`isInMyFileSync`	Boolean	`true` if the file is synced with Salesforce Files Sync; `false` otherwise. Note: Salesforce Files Sync was retired on May 25, 2018.	28.0
`isMajorVersion`	Boolean	`true` if the file is a major version; `false` if the file is a minor version. Major versions can't be replaced.	31.0
`mimeType`	String	File's MIME type.	28.0
`moderationFlags`	`ConnectApi.ModerationFlags`	Information about the moderation flags on a file. If `ConnectApi.Features.communityModeration` is `false`, this property is `null`.	30.0
`modifiedDate`	Datetime	ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z. Modifications to the file from within Salesforce update this date.	28.0
`name`	String	Name of the file.	28.0
`origin`	String	Specifies the file source. Valid values are: • `Chatter`—file came from Chatter • `Content`—file came from content	28.0

Name	Type	Description	Available Version
`owner`	`ConnectApi.UserSummary`	File's owner.	28.0
`pdfRenditionStatus`	String	Specifies if a PDF preview version of the file has been rendered.	28.0
`publishStatus`	`ConnectApi.FilePublishStatus`	Specifies the publish status of the file. • `PendingAccess`—File is pending publishing. • `PrivateAccess`—File is private. • `PublicAccess`—File is public.	28.0
`renditionUrl`	String	URL to the rendition for the file.	28.0
`renditionUrl240By180`	String	URL to the 240 x 180 rendition resource for the file. For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	29.0
`renditionUrl720By480`	String	URL to the 720 x 480 rendition resource for the file. For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	29.0
`sharingOption`	`ConnectApi.FileSharingOption`	Sharing option of the file. Values are: • `Allowed`—Resharing of the file is allowed. • `Restricted`—Resharing of the file is restricted.	35.0
`sharingPrivacy`	`ConnectApi.FileSharingPrivacy`	Sharing privacy of a file. Values are: • `None`—File is visible to anyone with record access. • `PrivateOnRecords`—File is private on records.	41.0
`sharingRole`	`ConnectApi.FileSharingType`	Sharing role of the file. • `Admin`—Owner permission, but doesn't own the file. • `Collaborator`—Viewer permission, and can edit, change permissions, and upload a new version of a file. • `Owner`—Collaborator permission, and can make a file private, and delete a file. • `Viewer`—Can view, download, and share a file. • `WorkspaceManaged`—Permission controlled by the library.	28.0
`systemModstamp`	Datetime	ISO 8601 date string indicating when a user or any automated system process, such as a trigger, updated the file.	41.0
`textPreview`	String	Text preview of the file if available; `null` otherwise.	30.0

Name	Type	Description	Available Version
`thumb120By90RenditionStatus`	String	Specifies the rendering status of the 120 x 90 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	28.0
`thumb240By180RenditionStatus`	String	Specifies the rendering status of the 240 x 180 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	28.0
`thumb720By480RenditionStatus`	String	Specifies the rendering status of the 720 x 480 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	28.0
`title`	String	Title of the file.	28.0
`versionNumber`	String	File's version number.	28.0

ConnectApi.FileAsset

An asset file.

Property Name	Type	Description	Available Version
`baseAssetUrl`	String	Base download URL of the asset.	45.0
`baseUnauthenticatedAssetUrl`	String	Base download URL of the asset for unauthenticated users if `isVisibleByExternalUsers` is `true`, otherwise `null`.	45.0
`id`	String	ID of the asset.	45.0
`isVisibleByExternalUsers`	Boolean	Indicates whether unauthenticated users can see the asset file (`true`) or not (`false`).	45.0
`masterLabel`	String	Label of the asset.	45.0
`name`	String	Unique name of the asset.	45.0

Property Name	Type	Description	Available Version
`namespacePrefix`	String	Namespace prefix of the package containing the asset.	45.0
`type`	String	Type of asset.	45.0

SEE ALSO:

ConnectApi.Recommendation

ConnectApi.NBANativeRecommendation

ConnectApi.FilePreview

A file preview.

Property Name	Type	Description	Available Version
`format`	`ConnectApi.FilePreviewFormat`	The format of the preview. Values are: • `Jpg`—Preview format is JPG. • `Pdf`—Preview format is PDF. • `Svg`—Preview format is compressed SVG. • `Thumbnail`—Preview format is 240 x 180 PNG. • `ThumbnailBig`—Preview format is 720 x 480 PNG. • `ThumbnailTiny`—Preview format is 120 x 90 PNG.	39.0
`previewUrlCount`	Integer	The total number of preview URLs for this preview format.	39.0
`previewUrls`	List<`ConnectApi.FilePreviewUrl`>	A list of file preview URLs.	39.0
`status`	`ConnectApi.FilePreviewStatus`	The availability status of the preview. Values are: • `Available`—Preview is available. • `InProgress`—Preview is being processed. • `NotAvailable`—Preview is unavailable. • `NotScheduled`—Generation of the preview isn't scheduled yet.	39.0
`url`	String	The URL for the file preview.	39.0

SEE ALSO:

ConnectApi.FilePreviewCollection

ConnectApi.FilePreviewCollection

A collection of file previews.

Property Name	Type	Description	Available Version
`fileId`	String	ID of the file.	39.0
`previews`	List<`ConnectApi.FilePreview`>	Previews supported for the file.	39.0
`url`	String	URL to the current page of file previews.	39.0
`versionNumber`	String	Version number of the file.	40.0

SEE ALSO:

ConnectApi.InlineImageSegment

ConnectApi.FilePreviewUrl

A URL to a file preview.

Property Name	Type	Description	Available Version
`pageNumber`	Integer	Preview page number starting from zero, or `null` for PDF files.	39.0
`previewUrl`	String	File preview URL.	39.0

SEE ALSO:

ConnectApi.FilePreview

ConnectApi.FilesCapability

If a feed element has this capability, it has one or more file attachments.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`items`	List<`ConnectApi.Content`>	Collection of files.	36.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.FileSummary

A file summary.

Subclass of ConnectApi.File.

No additional properties.

ConnectApi.FindRoutesWithFewestSplitsOutputRepresentation

A list of inventory location combinations that can fulfill an order without exceeding the maximum number of shipments.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`targetLocations`	List<`ConnectApi.AvailableLocationOutputRepresentation`>	Each element of the list is a set of inventory locations that together can fulfill the order being routed.	51.0

SEE ALSO:

findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)

ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation

A list of order fulfillment routes with inventory availability information.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`results`	List<`ConnectApi.FindRoutesWithFewestSplitsWithInventoryOutputRepresentation`>	Each element of the list is the response for one element of the input list.	54.0

SEE ALSO:

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

ConnectApi.FindRoutesWithFewestSplitsWithInventoryOutputRepresentation

Sets of inventory locations that can combine to fulfill an order, with availability data for those locations.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`inventory`	`ConnectApi.OCIGetInventoryAvailabilityOutputRepresentation`	Inventory availability data for the location groups and locations specified in the input.	54.0

Property Name	Type	Description	Available Version
`targetLocations`	List<`ConnectApi.AvailableLocationOutputRepresentation`>	Each entry in the list is a set of inventory locations that can combine to fulfill an order.	54.0

SEE ALSO:

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation

ConnectApi.FollowerPage

Page of followers.

Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	28.0
`followers`	`List<ConnectApi.Subscription>`	List of subscriptions.	28.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	28.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	28.0
`total`	Integer	Total number of followers across all pages.	28.0

ConnectApi.FollowingCounts

Following counts.

Name	Type	Description	Available Version
`people`	Integer	Number of people user is following.	28.0
`records`	Integer	Number of records user is following. Topics are a type of record that can be followed as of version 29.0.	28.0
`total`	Integer	Total number of items user is following.	28.0

SEE ALSO:

ConnectApi.UserDetail

ConnectApi.FollowingPage

Page of following subscriptions.

Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	28.0
`following`	`List<ConnectApi.Subscription>`	List of subscriptions.	28.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	28.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	28.0
`total`	Integer	Total number of records being followed across all pages.	28.0

ConnectApi.FollowIntents

A list of follow intents for a social persona.

Property Name	Type	Description	Available Version
`follows`	`List<ConnectApi.FollowSocialPersonaIntent>`	List of follow intents for the social persona.	45.0

SEE ALSO:

ConnectApi.SocialPostIntents

ConnectApi.FollowSocialPersonaIntent

Follow intent on a social persona.

Property Name	Type	Description	Available Version
`managedSocialAccount`	`ConnectApi.ManagedSocialAccount`	Managed social account that follows the social persona.	45.0
`socialPersonaId`	String	ID of the social persona to follow.	45.0

SEE ALSO:

ConnectApi.FollowIntents

ConnectApi.Form

Marketing integration form.

Property Name	Type	Description	Available Version
`dataExtensionId`	String	ID of the data extension associated with the marketing integration form.	53.0
`formFieldsList`	`ConnectApi.FormFields`	List of form fields associated with the marketing integration form.	53.0
`formId`	String	ID of the marketing integration form.	53.0
`formName`	String	Name of the marketing integration form.	53.0

ConnectApi.FormField

Marketing integration form field.

Property Name	Type	Description	Available Version
`name`	String	Name of the marketing integration form field.	53.0
`type`	`ConnectApi.FormFieldType`	Type of marketing integration form field. Values are: • `Boolean` • `Date` • `EmailAddress` • `Number` • `Text`	53.0

SEE ALSO:

ConnectApi.FormFields

ConnectApi.FormFields

List of marketing integration form fields.

Property Name	Type	Description	Available Version
`formFields`	List<`ConnectApi.FormField`>	List of form fields associated with the marketing integration form.	53.0

SEE ALSO:

ConnectApi.Form

ConnectApi.FormSubmission

Marketing integration form submission.

Property Name	Type	Description	Available Version
`formSubmissionId`	String	ID of the form submission, representing the submission data that was saved.	53.0

ConnectApi.FormulaScope

Formula scope for a target.

Property Name	Type	Description	Available Version
`contextValues`	Map<String, String>	Map of context values for the scope. Note: In version 52.0 and later, use the `contextValuesMap` property.	50.0–51.0
`contextValuesMap`	Map<String, Object>	Map of context values for the scope.	52.0
`fields`	List<String>	List of fields of the scope.	50.0
`formula`	String	Formula of the scope.	50.0

SEE ALSO:

ConnectApi.Target

ConnectApi.FulfillmentGroupOutputRepresentation

Information about one FulfillmentOrder from a request to create fulfillment orders from multiple OrderDeliveryGroupSummaries. If the FulfillmentOrder was created, then its ID is returned. If it failed, then data from the input is returned so you can resubmit it.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`fulfilledFromLocationId`	String	(Creation failed) The input FulfilledFromLocationId.	50.0
`fulfillmentOrderId`	String	The FulfillmentOrderId from the successfully created FulfillmentOrder.	50.0
`fulfillmentType`	String	(Creation failed) The input FulfillmentType.	50.0
`orderDeliveryGroupSummaryId`	String	(Creation failed) The input OrderDeliveryGroupSummaryId.	50.0
`orderItemSummaries`	List<`ConnectApi.OrderItemSummaryOutputRepresentation`>	(Creation failed) The input list of OrderItemSummaries.	50.0
`orderSummaryId`	String	(Creation failed) The input OrderSummaryId.	50.0

Property Name	Type	Description	Available Version
`referenceId`	String	The referenceId from the FulfillmentGroup input representation. Use this value to troubleshoot a failure.	50.0

ConnectApi.FulfillmentOrderCancelLineItemsOutputRepresentation

Wraps the base output.

Subclass of ConnectApi.BaseOutputRepresentation.

No additional properties.

ConnectApi.FulfillmentOrderInvoiceOutputRepresentation

ID of the created invoice.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`invoiceId`	String	ID of the created invoice.	48.0

ConnectApi.FulfillmentOrderOutputRepresentation

A list of IDs of the created FulfillmentOrders.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`fulfillment OrderIds`	List<String>	A list of IDs of created Fulfillment Orders.	48.0

ConnectApi.GatewayLogResponse

Gateway log output.

Property Name	Type	Description	Available Version
`createdDate`	Datetime	Date when the gateway log was created.	50.0
`gatewayResultCode`	String	Result codes that show the status of a transaction as it is passed to the financial institution and then returned to the client.	50.0
`id`	String	ID of the gateway log record.	50.0
`interactionStatus`	String	Gateway interaction status. It can be SUCCESS, FAILED, or TIMEOUT.	50.0

ConnectApi.GenericBundleCapability

If a feed element has this capability, the feed element has a group of other feed elements condensed into one feed element. This group is called a *bundle*.

Subclass of ConnectApi.BundleCapability.

ConnectApi.GenericFeedElement

A concrete implementation of the abstract `ConnectApi.FeedElement` class.

Subclass of ConnectApi.FeedElement.

ConnectApi.GetFOCapacityValuesOutputRepresentation

Response to a request for fulfillment order capacity values for one or more locations.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`locations`	List<`ConnectApi.LocationCapacityOutputRepresentation`>	List of fulfillment order capacity values for one or more locations.	55.0

ConnectApi.GlobalInfluence

Chatter influence.

Name	Type	Description	Available Version
`percentile`	String	Percentile value for the user's influence rank within the org or Experience Cloud site.	28.0
`rank`	Integer	Number indicating the user's influence rank, relative to all other users within the org or Experience Cloud site.	28.0

SEE ALSO:

ConnectApi.UserDetail

ConnectApi.GroupChatterSettings

A user's Chatter settings for a specific group.

Name	Type	Description	Available Version
`emailFrequency`	`ConnectApi.GroupEmailFrequency` on page 2240	The frequency with which a group member receives email from a group.	28.0

ConnectApi.GroupInformation

Describes the Information section of the group. If the group is private, this section is visible only to members.

Name	Type	Description	Available Version
`text`	String	The text of the "Information" section of the group.	28.0
`title`	String	The title of the "Information" section of the group.	28.0

SEE ALSO:

ConnectApi.ChatterGroupDetail

ConnectApi.GroupMember

Member of a group.

Name	Type	Description	Available Version
`id`	String	User's 18-character ID.	28.0
`lastFeedAccessDate`	Datetime	The date and time at which the group member last accessed the group feed.	31.0
`role`	`ConnectApi.GroupMembershipType` Enum	Type of membership the user has with the group. • `GroupOwner` • `GroupManager` • `NotAMember` • `NotAMemberPrivateRequested` • `StandardMember`	28.0
`url`	String	Connect REST API URL to this membership.	28.0
`user`	`ConnectApi.UserSummary`	Information about the user who is subscribed to this group.	28.0

SEE ALSO:

ConnectApi.GroupMemberPage

ConnectApi.GroupMemberPage

Page of group members.

Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	28.0

Name	Type	Description	Available Version
`members`	`List<ConnectApi.GroupMember>`	List of group members.	28.0
`myMembership`	`ConnectApi.Reference`	If the context user is a member of this group, returns information about that membership, otherwise, `null`.	28.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	28.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	28.0
`totalMemberCount`	Integer	Total number of group members across all pages.	28.0

ConnectApi.GroupMembershipRequest

Request to become a group member.

Name	Type	Description	Available Version
`createdDate`	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	28.0
`id`	String	ID for the group membership request object.	28.0
`lastUpdateDate`	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	28.0
`requestedGroup`	`ConnectApi.Reference`	Information about the group the context user is requesting to join.	28.0
`responseMessage`	String	A message for the user if their membership request is declined. The value of this property is used only when the value of the `status` property is `Declined`. The maximum length is 756 characters.	28.0
`status`	`ConnectApi.GroupMembershipRequestStatus` Enum	Status of a request to join a private group. Values are: • `Accepted` • `Declined` • `Pending`	28.0
`url`	String	URL of the group membership request object.	28.0
`user`	`ConnectApi.UserSummary`	Information about the user requesting membership in a group.	28.0

SEE ALSO:

ConnectApi.GroupMembershipRequests

ConnectApi.GroupMembershipRequests

Requests to become group members.

Name	Type	Description	Available Version
`requests`	`List<ConnectApi.GroupMembershipRequest>`	Information about group membership requests.	28.0
`total`	Integer	The total number of requests.	28.0

ConnectApi.GroupRecord

A record associated with a group.

Property	Type	Description	Available Version
`id`	String	Record's 18-character ID.	33.0
`record`	`ConnectApi.ActorWithId`	Information about the record associated with the group.	33.0
`url`	String	Record URL.	33.0

SEE ALSO:

ConnectApi.GroupRecordPage

ConnectApi.GroupRecordPage

A paginated list of `ConnectApi.GroupRecord` objects.

Property	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	33.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	33.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	33.0
`records`	`List<ConnectApi.GroupRecord>`	List of records on the current page.	33.0
`totalRecordCount`	Integer	Total number of records associated with the group.	33.0

ConnectApi.HashtagSegment

Hashtag segment.

Subclass of ConnectApi.MessageSegment.

Name	Type	Description	Available Version
`tag`	String	Text of the topic without the hash symbol (#).	28.0
`topicUrl`	String	Connect REST API Topics resource that searches for the topic: `/services/data/v60.0/chatter/topics?exactMatch=true&q=topic`	28.0
`url`	String	Connect REST API Feed Items resource URL that searches for the topic in all feed items in an organization: `/services/data/v60.0/chatter/feed-items?q=topic`	28.0

ConnectApi.HideSocialPostIntent

Hide intent for a social post.

Property Name	Type	Description	Available Version
`isHidden`	Boolean	Specifies whether the managed social account hid the social post (`true`) or not (`false`).	45.0
`managedSocialAccount`	`ConnectApi.ManagedSocialAccount`	Managed social account that hides the social post.	45.0

SEE ALSO:

ConnectApi.SocialPostIntents

ConnectApi.HoldFOCapacityOutputRepresentation

Response to a request to hold fulfillment order capacity at one or more locations. Can correspond to one action call.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`holdFOCapacityResponses`	List<`ConnectApi.HoldFOCapacityResponseOutputRepresentation`>	List of responses to the requests to hold fulfillment order capacity at one or more locations.	55.0

ConnectApi.HoldFOCapacityResponseOutputRepresentation

Response to a request to hold fulfillment order capacity at one or more locations.

Property Name	Type	Description	Available Version
`capacityResponses`	List<`ConnectApi.CapacityResponseOutputRepresentation`>	List of responses to the requests to hold fulfillment order capacity at individual locations.	55.0

ConnectApi.HttpHeaderOutputRepresentation

HTTP header with information about a text classification

Property Name	Type	Description	Available Version
`name`	String	Name of the HTTP header.	59.0
`value`	String	Value of the HTTP header.	59.0

ConnectApi.Icon

Icon.

Property	Type	Description	Available Version
`height`	Integer	The height of the icon in pixels.	28.0
`width`	Integer	The width of the icon in pixels.	28.0
`url`	String	The URL of the icon. This URL is available to unauthenticated users. This URL does not expire.	28.0

SEE ALSO:

- ConnectApi.CanvasCapability
- ConnectApi.EnhancedLinkCapability
- ConnectApi.SocialPostCapability

ConnectApi.InlineImageSegment

An inline image in the feed body.

Subclass of ConnectApi.MessageSegment.

Property Name	Type	Description	Available Version
`altText`	String	Alt text for the inline image.	35.0
`contentSize`	Integer	Size of the file in bytes.	35.0

Property Name	Type	Description	Available Version
`fileExtension`	String	Extension of the file, such as gif.	37.0
`thumbnails`	`ConnectApi.FilePreviewCollection`	Information about the available thumbnails for the image.	35.0
`url`	String	URL to the latest version of the inline image.	35.0

ConnectApi.InteractionsCapability

If a feed element has this capability, it has information about user interactions.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`count`	Long	The number of individual views, likes, and comments on a feed post. Note: This count appears in the UI under the feed post as the number of views, for example, "5 views."	37.0

SEE ALSO:

- ConnectApi.FeedElementCapabilities
- ConnectApi.RelatedQuestion

ConnectApi.Invitation

An invitation.

Property Name	Type	Description	Available Version
`email`	String	Email address of the user.	39.0
`status`	`ConnectApi.GroupViralInvitationsStatus`	Specifies the status of an invitation to join a group. Values are: • `ActedUponUser`—The user was added to the group. An email was sent asking the user to visit the group. • `Invited`—An email was sent asking the user to sign up for the org. • `MaxedOutUsers`—The group has the maximum allowed members. • `MultipleError`—The user wasn't invited due to multiple errors.	39.0

Property Name	Type	Description	Available Version
		• `NoActionNeededUser`—The user is already a member of the group. • `NotVisibleToExternalInviter`—The user is not accessible to the user sending the invitation. • `Unhandled`—The user couldn't be added to the group for an unknown reason.	
`userId`	String	ID of the user.	39.0

SEE ALSO:

ConnectApi.Invitations

ConnectApi.Invitations

A collection of invitations.

Property Name	Type	Description	Available Version
`invitations`	List<`ConnectApi.Invitation`>	Collection of invitations.	39.0

ConnectApi.KnowledgeArticleVersion

A knowledge article version.

Property Name	Type	Description	Available Version
`articleType`	String	Type of the knowledge article.	36.0
`id`	String	ID of the knowledge article version.	36.0
`knowledgeArticleId`	String	ID of the corresponding knowledge article.	36.0
`lastPublishedDate`	Datetime	Last published date of the knowledge article.	36.0
`summary`	String	Summary of the knowledge article contents.	36.0
`title`	String	Title of the knowledge article.	36.0
`urlName`	String	URL name of the knowledge article.	36.0

SEE ALSO:

ConnectApi.KnowledgeArticleVersionCollection

ConnectApi.KnowledgeArticleVersionCollection

A collection of knowledge article versions.

Property Name	Type	Description	Available Version
`items`	[illegible]	A collection of knowledge article versions.	36.0

ConnectApi.LabeledRecordField

Record field containing a label and a text value.

This class is abstract.

Subclass of ConnectApi.AbstractRecordField.

Superclass of:

- ConnectApi.CompoundRecordField
- ConnectApi.CurrencyRecordField
- ConnectApi.DateRecordField
- ConnectApi.PercentRecordField
- ConnectApi.PicklistRecordField
- ConnectApi.RecordField
- ConnectApi.ReferenceField
- ConnectApi.ReferenceWithDateRecordField

Important: The composition of a feed can change between releases. Write your code to handle instances of unknown subclasses.

Name	Type	Description	Available Version
`label`	String	Localized string describing the record field.	29.0
`text`	String	Text value of the record field. All record fields have a text value. To ensure that all clients can consume new content, inspect the record field's `type` property. If it isn't recognized, render the text value as the default case.	29.0

ConnectApi.LightningExtensionInformation

Lightning extension information.

Subclass of ConnectApi.AbstractExtensionInformation.

Property Name	Type	Description	Available Version
`compositionComponent`	String	Component to use in compose state.	40.0
`headerTextLabel`	String	Label for the extension's header.	40.0
`hoverTextLabel`	String	Label for hovering over the extension.	40.0

Property Name	Type	Description	Available Version
`renderComponent`	String	Component to use in render or preview state.	40.0

SEE ALSO:

ConnectApi.ExtensionDefinition

ConnectApi.LikeIntent

Like intent for a social post.

Property Name	Type	Description	Available Version
`isLiked`	Boolean	Specifies whether the managed social account liked the social post (`true`) or not (`false`).	45.0
`managedSocialAccount`	`ConnectApi.ManagedSocialAccount`	Managed social account that likes the social post.	45.0

SEE ALSO:

ConnectApi.LikeIntents

ConnectApi.LikeIntents

List of like intents for a social post.

Property Name	Type	Description	Available Version
`likes`	List<`ConnectApi.LikeIntent`>	List of like intents for the social post.	45.0

SEE ALSO:

ConnectApi.SocialPostIntents

ConnectApi.LikeSocialPostIntent

Like intent on a social post.

Property Name	Type	Description	Available Version
`socialAccountId`	String	ID of the social account that likes the social post.	46.0
`socialPostId`	String	ID of the social post to like.	46.0

ConnectApi.LikeSummary

Summary of a like.

Subclass of ConnectApi.UserFeedEntityActivitySummary.

Property Name	Type	Description	Available Version
`likeId`	String	ID of the like.	42.0

ConnectApi.LinkCapability

If a feed element has this capability, it has a link.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`url`	String	Link URL. The URL can be to an external site.	32.0
`urlName`	String	Description of the link.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.LinkMetadata

Metadata for a link.

Property Name	Type	Description	Available Version
`description`	String	Description of the link.	42.0
`frameSource`	String	HTML required to display the resource.	42.0
`height`	Integer	Height required to display the HTML.	42.0
`originalUrl`	String	Original URL that was used to request the metadata.	42.0
`providerUrl`	String	URL of the provider that the information is retrieved from.	42.0
`source`	`ConnectApi.LinkMetadataSource`	Source of the link metadata. Values are: • `None`—Link metadata wasn't retrieved. • `Sfdc`—Salesforce is the source.	42.0
`thumbnailUrl`	String	Thumbnail of the resource.	42.0
`title`	String	Title of the link.	42.0
`type`	`ConnectApi.LinkMetadataType`	Type of link that the metadata represents. Values are: • `Error`—Link metadata couldn't be retrieved. • `Link`—Represents a link. • `None`—Link metadata wasn't retrieved because the link isn't an allowed domain.	42.0

Property Name	Type	Description	Available Version
		• `Photo`—Represents a photo. • `Rich`—Represents rich content, typically HTML content. • `Unknown`—Link metadata was retrieved, but the type is unknown. • `Video`—Represents a video.	
`url`	String	URL of the image to display, if one is available.	42.0
`width`	Integer	Width required to display the HTML.	42.0

SEE ALSO:

ConnectApi.LinkMetadataCollection

ConnectApi.LinkMetadataCollection

Collection of link metadata.

Property Name	Type	Description	Available Version
`linkMetadataList`	List<`ConnectApi.LinkMetadata`>	List of metadata for links.	42.0

ConnectApi.LinkSegment

Link segment.

Subclass of ConnectApi.MessageSegment.

Name	Type	Description	Available Version
`url`	String	The link URL.	28.0

ConnectApi.LocationOutputRepresentation

An inventory location's distance to an order recipient.

Property Name	Type	Description	Available Version
`distance`	Double	The distance from the location to the order recipient.	51.0
`locationIdentifier`	String	The location identifier.	51.0

ConnectApi.LocationCapacityOutputRepresentation

Fulfillment order capacity values for a location.

Property Name	Type	Description	Available Version
`assigned`	Integer	Value of the location's Assigned Fulfillment Order Count.	55.0
`capacity`	Integer	Value of the location's Fulfillment Order Capacity. This property represents the location's maximum capacity.	55.0
`error`	`ConnectApi.ErrorResponse`	Error returned by the request, if any.	55.0
`heldCapacity`	Integer	Number of fulfillment orders that the location is holding capacity for.	55.0
`locationId`	String	ID of the location.	55.0

ConnectApi.MaintenanceInfo

Information about the upcoming scheduled maintenance for the organization.

Property Name	Type	Description	Available Version
`description`	String	Description of the maintenance.	34.0
`maintenanceTitle`	String	Title of the maintenance.	34.0
`maintenanceType`	`ConnectApi.MaintenanceType`	Type of maintenance. Values are: • `Downtime`—Downtime maintenance. • `GenerallyAvailable`—Maintenance with generally available mode. • `MaintenanceWithDowntime`—Scheduled maintenance with downtime. • `ReadOnly`—Maintenance with read-only mode.	34.0
`messageEffectiveTime`	Datetime	Effective time when users start seeing the maintenance message.	34.0
`messageExpirationTime`	Datetime	Expiration time of the maintenance message.	34.0
`scheduledEndDowntime`	Datetime	Scheduled end of downtime. `null` for `GenerallyAvailable` and `ReadOnly` maintenance types.	34.0
`scheduledEndMaintenanceTime`	Datetime	Scheduled end of maintenance. `null` for `Downtime` maintenance type.	34.0
`scheduledStartDowntime`	Datetime	Scheduled start of downtime. `null` for `GenerallyAvailable` and `ReadOnly` maintenance types.	34.0

Property Name	Type	Description	Available Version
`scheduledStartMaintenanceTime`	Datetime	Scheduled start time of maintenance. `null` for `Downtime` maintenance type.	34.0

SEE ALSO:

ConnectApi.OrganizationSettings

ConnectApi.ManagedContentAssociations

Content topics associated with managed content.

Property Name	Type	Description	Available Version
`topics`	List<`ConnectApi.TopicSummary`>	A collection of topics associated with the managed content.	47.0

SEE ALSO:

ConnectApi.ManagedContentVersion

ConnectApi.ManagedContentChannel

Managed content channel.

Property Name	Type	Description	Available Version
`cacheControlMaxAge`	Long	HTTP cache control max age response header for content delivered from the channel.	55.0
`channelId`	String	ID of the managed content channel.	48.0
`channelName`	String	Name of the managed content channel.	48.0
`channelType`	`ConnectApi.ManagedContentChannelType`	Type of managed content channel. Values are: • `CloudToCloud`—Cloud-to-Cloud integrated channel. • `Community`—Experience Cloud site channel. • `ConnectedApp`—Channel served by a connected app. • `PublicUnauthenticated`—Public channel. All published content is publicly available. • `UserPermission`—Channel backed by a system permission. All published content is available only to users with the permission.	48.0
`domain`	String	ID or name of the domain assigned to the channel.	52.0

Property Name	Type	Description	Available Version
`domainId`	String	ID of the domain assigned to the channel. In version 52.0 and later, this information is returned in the `domain` property.	50.0–51.0
`domainName`	String	Name of the domain assigned to the channel.	50.0
`isChannelSearchable`	Boolean	Specifies whether the text contents of the channel are searchable (`true`) or not (`false`).	48.0
`isDomainLocked`	Boolean	Specifies whether the domain is locked and can't be changed (`true`) or not (`false`).	50.0
`mediaCacheControlMaxAge`	Long	HTTP cache control max age response header for media delivered from the channel.	57.0

SEE ALSO:

ConnectApi.ManagedContentChannelCollection

ConnectApi.ManagedContentChannelCollection

Collection of managed content channels.

Property Name	Type	Description	Available Version
`channels`	List<`ConnectApi.ManagedContentChannel`>	List of managed content channels.	48.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	48.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	48.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	48.0
`totalChannels`	Integer	Total number of managed content channels.	48.0

ConnectApi.ManagedContentChannelDetail

Managed content channel detail.

Property Name	Type	Description	Available Version
`channelId`	String	ID of the managed content channel.	54.0
`channelName`	String	Name of the managed content channel.	54.0

Property Name	Type	Description	Available Version
channelType	ConnectApi.ManagedContentChannelType	Type of managed content channel. Values are: • CloudToCloud—Cloud-to-Cloud integrated channel. • Community—Experience Cloud site channel. • ConnectedApp—Channel served by a connected app. • PublicUnauthenticated—Public channel. All published content is publicly available. • UserPermission—Channel backed by a system permission. All published content is available only to users with the permission.	54.0
domain	String	Domain assigned to the managed content channel.	54.0
domainName	String	Name of the domain assigned to the managed content channel.	54.0
isChannelSearchable	Boolean	Specifies whether the text of the channel's contents is searchable (true) or not (false).	54.0
isDomainLocked	Boolean	Specifies whether the channel's domain is locked and can't be changed (true) or not (false).	54.0

ConnectApi.ManagedContentChannelSummary

Managed content channel.

Property Name	Type	Description	Available Version
domainUrl	String	Domain URL of the channel.	55.0
name	String	Name of the managed content channel.	54.0
resourceUrl	String	Resource URL to complete information of the channel.	54.0
target	ConnectApi.ManagedContentChannelTargetSummary	Target site associated with the channel.	54.0

SEE ALSO:

ConnectApi.ManagedContentDeliveryDocument

ConnectApi.ManagedContentCollectionItems

ConnectApi.ManagedContentDeliveryDocumentCollection

ConnectApi.ManagedContentChannelTargetSummary

Target site associated with the channel.

Property Name	Type	Description	Available Version
`id`	String	ID of the site associated with the channel.	54.0

SEE ALSO:

ConnectApi.ManagedContentChannelSummary

ConnectApi.ManagedContentCollectionItem

Managed content collection item.

Property Name	Type	Description	Available Version
`body`	Map<String, Object>	Map of properties of the collection item with their values.	56.0
`contentType`	`ConnectApi.ManagedContentCollectionItemTypeSummary`	Type of collection item.	56.0
`id`	String	ID of the collection item.	56.0
`name`	String	Name or title for collection item.	56.0

SEE ALSO:

ConnectApi.ManagedContentCollectionItems

ConnectApi.ManagedContentCollectionItems

Managed content collection Items.

Property Name	Type	Description	Available Version
`channelInfo`	`ConnectApi.ManagedContentChannelSummary`	Information about the managed content channel.	56.0
`collectionKey`	String	Unique identifier for the collection.	56.0
`collectionType`	`ConnectApi.ManagedContentTypeSummary`	Type of collection.	56.0
`id`	String	ID of the collection.	56.0

Property Name	Type	Description	Available Version
items	List<ConnectApi.ManagedContentCollectionItem>	List of collection Items.	56.0
language	String	Language locale of the collection.	56.0
publishedDate	Datetime	Most recent publish date of the collection.	56.0
title	String	Title of the collection.	56.0
total	Integer	Total number of items in the current collection detail page.	56.0
urlName	String	URL name of the collection.	56.0

SEE ALSO:

getCollectionItemsForChannel(channelId, collectionKeyOrId, language)

getCollectionItemsForSite(siteId, collectionKeyOrId, language)

ConnectApi.ManagedContentCollectionItemTypeSummary

Summary of a collection item type.

Property Name	Type	Description	Available Version
fullyQualifiedName	String	Fully qualified name of the collection item type.	56.0
name	String	Name of the collection item type.	56.0

SEE ALSO:

ConnectApi.ManagedContentCollectionItem

ConnectApi.ManagedContentDateAndTimeNodeValue

Managed content node of date and time type.

Subclass of ConnectApi.ManagedContentNodeValue.

Property Name	Type	Description	Available Version
dateTimeValue	Datetime	UTC date and time value of the managed content node.	48.0
timeZone	String	Time zone in which the date and time is authored.	48.0

ConnectApi.ManagedContentDateNodeValue

Managed content node of date type.

Subclass of ConnectApi.ManagedContentNodeValue.

Property Name	Type	Description	Available Version
`value`	Datetime	Date value of the managed content node.	48.0

ConnectApi.ManagedContentDeliveryDocument

Managed content in delivery scope.

Subclass of ConnectApi.AbstractManagedContentDeliveryDocument in version 55.0 and later. Properties with an available version of 54.0 only are included in ConnectApi.AbstractManagedContentDeliveryDocument in version 55.0 and later.

Property Name	Type	Description	Available Version
`channelInfo`	`ConnectApi.ManagedContentChannelSummary`	Information about the managed content channel.	54.0
`contentBody`	Map<String, Object>	Map of properties of the managed content with their values.	54.0
`contentKey`	String	Globally unique identifier (GUID) for the managed content.	54.0 only
`contentType`	`ConnectApi.ManagedContentTypeSummary`	Type of managed content.	54.0 only
`language`	String	Language locale of the managed content.	54.0 only
`managedContentId`	String	ID of the managed content.	54.0 only
`publishedDate`	Datetime	Most recent publish date of the managed content.	54.0 only
`references`	Map<String, `ConnectApi.AbstractManagedContentReference`>	Map of references with `contentKey` as the key.	54.0
`referencesList`	List<`ConnectApi.AbstractManagedContentReference`>	List of references.	54.0
`title`	String	Title of the managed content.	54.0 only
`unauthenticatedUrl`	String	Public URL for the managed content.	54.0 only
`urlName`	String	URL name of the managed content.	54.0 only

SEE ALSO:

ConnectApi.ManagedContentDeliveryDocumentCollection

ConnectApi.ManagedContentDeliveryDocumentCollection

Managed content delivery document collection.

Property Name	Type	Description	Available Version
`channelInfo`	`ConnectApi.ManagedContentChannelSummary`	Information about the managed content channel.	55.0
`contents`	List<`ConnectApi.AbstractManagedContentDeliveryDocument`>	List of managed content delivery documents.	55.0
`currentPageUrl`	String	URL to the current page of managed content records.	55.0
`nextPageUrl`	String	URL to the next page of managed content records.	55.0
`previousPageUrl`	String	URL to the previous page of managed content records.	55.0
`references`	Map<String, `ConnectApi.AbstractManagedContentReference`>	Map of references with `contentKey` as the key.	55.0
`referencesList`	List<`ConnectApi.AbstractManagedContentReference`>	List of references.	55.0

ConnectApi.ManagedContentDeliveryDocumentSummary

Managed content delivery document summary.

Subclass of ConnectApi.AbstractManagedContentDeliveryDocument.

No additional properties.

ConnectApi.ManagedContentDocument

Information about a piece of managed content in an authoring space.

Property Name	Type	Description	Available Version
`contentBody`	Map<String, Object>	Map of properties of the managed content with their values.	60.0
`contentKey`	String	Globally unique identifier (GUID) for the managed content.	60.0
`contentSpace`	`ConnectApi.ManagedContentSpaceSummary`	Content space of the managed content.	60.0

Property Name	Type	Description	Available Version
`contentType`	`ConnectApi.ManagedContentTypeSummary`	Type of managed content.	60.0
`createdBy`	`ConnectApi.ManagedContentUserSummary`	User who created the managed content.	60.0
`createdDate`	Datetime	Date when the managed content was created.	60.0
`externalId`	String	External ID of the managed content.	60.0
`folder`	`ConnectApi.ManagedContentFolderSummary`	Folder of the managed content.	60.0
`isPublished`	Boolean	Specifies whether the managed content variant is published to a channel (`true`) or not (`false`).	60.0
`language`	String	Language locale of the managed content.	60.0
`lastModifiedBy`	`ConnectApi.ManagedContentUserSummary`	User who last modified the managed content.	60.0
`lastModifiedDate`	Datetime	Date when the managed content was last modified.	60.0
`managedContentId`	String	ID of the managed content.	60.0
`managedContentVariantId`	String	Managed content variant ID.	60.0
`managedContentVersionId`	String	Managed content version ID.	60.0
`status`	`ConnectApi.ManagedContentVariantStatusOutput`	Status of the managed content variant.	60.0
`title`	String	Title of the managed content.	60.0
`urlName`	String	URL name of the managed content.	60.0
`versionNumber`	String	Version number of the managed content.	60.0

ConnectApi.ManagedContentFolderSummary

Information about the managed content folder.

Property Name	Type	Description	Available Version
`id`	String	ID of the managed content folder in the authoring space.	60.0
`resourceUrl`	String	Resource URL of the managed content folder.	60.0

SEE ALSO:

ConnectApi.ManagedContentDocument

ConnectApi.ManagedContentVariant

ConnectApi.ManagedContentMediaNodeValue

Managed content node of media type.

Subclass of ConnectApi.ManagedContentNodeValue.

Property Name	Type	Description	Available Version
`altText`	String	Alternative text for the managed content node.	47.0
`altUrl`	String	Alternative URL to the managed content node. In version 49.0 and later, this information is returned in the `thumbnailUrl` property.	47.0–48.0
`contentKey`	String	Content key of the managed content.	51.0
`fileName`	String	File name of the managed content node.	48.0
`mediaType`	`ConnectApi.ManagedContentMediaType`	Type of managed content media. Value is `Image`.	47.0
`mimeType`	String	MIME type of the managed content node.	47.0
`resourceUrl`	String	Resource URL to the image. In version 48.0, the resource URL is available if referencing asset files and is `null` if referencing media. In version 49.0 and later, the resource URL is available if referencing asset files or media.	48.0
`thumbnailUrl`	String	URL to the thumbnail of the media.	49.0
`title`	String	Title of the managed content node.	47.0
`unauthenticatedUrl`	String	Unauthenticated URL to the image or `null` if the image isn't visible to external users.	48.0
`url`	String	URL to the image.	47.0

ConnectApi.ManagedContentMediaSourceNodeValue

Source of managed content media.

Property Name	Type	Description	Available Version
`fileName`	String	File name of the media source.	49.0
`isExternal`	Boolean	Specifies whether the media source is referenced via an external URL (`true`) or uploaded (`false`).	49.0
`mediaType`	`ConnectApi.ManagedContentMediaType`	Type of managed content media. Values are: • `Document` • `Image`	49.0
`mimeType`	String	MIME type of the media source.	49.0
`referenceId`	String	Reference ID of the uploaded media source.	49.0
`resourceUrl`	String	Resource URL of the media source.	49.0
`unauthenticatedUrl`	String	URL to the media source for unauthenticated users, or `null` if the media source isn't available to external users.	49.0
`url`	String	URL to the media source for authenticated users.	49.0

ConnectApi.ManagedContentNodeType

Managed content node type.

Property Name	Type	Description	Available Version
`label`	String	Label of the managed content node type.	47.0
`name`	String	Developer name of the managed content node type.	47.0

Property Name	Type	Description	Available Version
nodeType	ConnectApi.ManagedContentNodeTypeEnum	Type of managed content node. Values are: • Date • DateTime • Media • MediaSource • MultilineText • NameField • RichText • Text • Url	47.0

SEE ALSO:

ConnectApi.ManagedContentType

ConnectApi.ManagedContentNodeValue

Managed content node.

This class is abstract.

Superclass of:

- ConnectApi.ManagedContentDateAndTimeNodeValue
- ConnectApi.ManagedContentDateNodeValue
- ConnectApi.ManagedContentMediaNodeValue
- ConnectApi.ManagedContentMediaSourceNodeValue
- ConnectApi.ManagedContentTextNodeValue

Property Name	Type	Description	Available Version
nodeType	ConnectApi.ManagedContentNodeType	Type of managed content node. Values are: • Date • DateTime • Media • MediaSource • MultilineText • NameField • RichText • Text • Url	47.0

SEE ALSO:

ConnectApi.ManagedContentVersion

ConnectApi.ManagedContentPublishOutput

Information about a Publish action

Property Name	Type	Description	Available Version
deploymentId	String	ID of the managed content deployment.	60.0
description	String	Publish description.	60.0
publishDate	Datetime	Publish date.	60.0

ConnectApi.ManagedContentReference

Managed content reference.

Subclass of ConnectApi.AbstractManagedContentReference.

Property Name	Type	Description	Available Version
contentBody	Map<String, Object>	Map of properties of the managed content reference with their values.	54.0
title	String	Title of the managed content reference.	54.0

SEE ALSO:

ConnectApi.ManagedContentReferenceSummary

ConnectApi.ManagedContentReferenceSummary

Summary of the managed content reference.

Subclass of ConnectApi.AbstractManagedContentReference.

Property Name	Type	Description	Available Version
`title`	String	Title of the managed content reference.	54.0

ConnectApi.ManagedContentSpace

Managed content space.

Property Name	Type	Description	Available Version
`createdBy`	String	ID of the user who created the managed content space.	55.0
`createdDate`	Datetime	Date when the managed content space was created.	55.0
`defaultLanguage`	String	Default language of the managed content space.	55.0
`description`	String	Description of the managed content space.	55.0
`id`	String	ID of the managed content space.	55.0
`isEnhancedSpace`	Boolean	Specifies whether the space is enhanced (`true`) or not (`false`).	60.0
`lastModifiedBy`	String	ID of the user who last modified the managed content space.	55.0
`lastModifiedDate`	Datetime	Date when the managed content space was last modified.	55.0
`name`	String	Name of the managed content space.	55.0
`rootFolderId`	String	ID of the root folder of the managed content space.	55.0

ConnectApi.ManagedContentSpaceSummary

Information about the managed content space.

Property Name	Type	Description	Available Version
`id`	String	ID of the managed content space.	60.0
`resourceUrl`	String	Resource URL of the managed content space.	60.0

SEE ALSO:

- ConnectApi.ManagedContentDocument
- ConnectApi.ManagedContentVariant

ConnectApi.ManagedContentTextNodeValue

Managed content node of text type.

Subclass of ConnectApi.ManagedContentNodeValue.

Property Name	Type	Description	Available Version
`value`	String	Text value of the managed content node.	47.0

ConnectApi.ManagedContentType

Managed content type.

Property Name	Type	Description	Available Version
`label`	String	Label of the managed content type.	47.0
`name`	String	Developer name of the managed content type.	47.0
`nodeTypes`	Map<String, `ConnectApi.ManagedContentNodeType`>	Map of node types for the managed content type.	47.0

SEE ALSO:

- ConnectApi.ManagedContentVersionCollection

ConnectApi.ManagedContentTypeSummary

Managed content type.

Property Name	Type	Description	Available Version
`fullyQualifiedName`	String	Fully qualified name of the managed content type.	54.0
`name`	String	Reserved for future use.	55.0

SEE ALSO:

- ConnectApi.ManagedContentDeliveryDocument
- ConnectApi.ManagedContentCollectionItems
- ConnectApi.ManagedContentDocument
- ConnectApi.ManagedContentVariant

ConnectApi.ManagedContentUnpublishOutput

Managed content unpublish action.

Property Name	Type	Description	Available Version
deploymentId	String	ID of the Managed content deployment.	60.0
description	String	Unpublish description.	60.0
unpublishDate	Datetime	Unpublish date.	60.0

ConnectApi.ManagedContentUserSummary

Information about the user who created or modified the content.

Property Name	Type	Description	Available Version
id	String	ID of the user.	60.0
name	String	Reserved for future use.	60.0
resourceUrl	String	Resource URL of the user.	60.0

SEE ALSO:

ConnectApi.ManagedContentDocument

ConnectApi.ManagedContentVariant

ConnectApi.ManagedContentVariant

Managed content variant.

Property Name	Type	Description	Available Version
contentBody	Map<String, Object>	Map of properties of the managed content with their values.	60.0
contentKey	String	Globally unique identifier (GUID) for the managed content.	60.0
contentSpace	ConnectApi.ManagedContentSpaceSummary	Content space of the managed content.	60.0
contentType	ConnectApi.ManagedContentTypeSummary	Type of managed content.	60.0
createdBy	ConnectApi.ManagedContentUserSummary	User who created the managed content variant.	60.0
createdDate	Datetime	Date when the managed content variant was created.	60.0
externalId	String	External ID of the managed content.	60.0

Property Name	Type	Description	Available Version
folder	ConnectApi.ManagedContentFolderSummary	Folder of the managed content.	60.0
isPublished	Boolean	Specifies whether the managed content variant is published to a channel (true) or not (false).	60.0
language	String	Language locale of the managed content.	60.0
lastModifiedBy	ConnectApi.ManagedContentUserSummary	User who last modified the managed content variant.	60.0
lastModifiedDate	Datetime	Date when the managed content variant was last modified.	60.0
managedContentId	String	ID of the managed content.	60.0
managedContentVariantId	String	ID of the managed content variant.	60.0
managedContentVersionId	String	Managed content version ID.	60.0
status	ConnectApi.ManagedContentVariantStatusOutput	Information about a managed content variant's status in the authoring space.	60.0
title	String	Title of the managed content.	60.0
urlName	String	URL name of the managed content.	60.0

ConnectApi.ManagedContentVariantStatusOutput

Information about a managed content variant's status in the authoring space.

Property Name	Type	Description	Available Version
label	String	Localized label for the status.	60.0

Property Name	Type	Description	Available Version
`status`	`ConnectApi.ManagedContentVariantStatus`	Status of the managed content variant. Values are: • `Draft`—Content isn't published. • `Published`—Content is published and available for use in your live sites. • `Revised`—Content that's published and edited. Publish this content to make the changes available for use in your live sites.	60.0

SEE ALSO:

ConnectApi.ManagedContentDocument

ConnectApi.ManagedContentVariant

ConnectApi.ManagedContentVersion

Managed content version.

Property Name	Type	Description	Available Version
`associations`	`ConnectApi.ManagedContentAssociations`	Content topics associated with the managed content.	47.0
`contentKey`	String	Content key of the managed content.	51.0
`contentNodes`	Map<String, `ConnectApi.ManagedContentNodeValue`>	Map of content nodes.	47.0
`contentUrlName`	String	Content URL name of the managed content version.	48.0
`language`	String	Language of the managed content version.	48.0
`managedContentId`	String	ID of the managed content.	47.0
`publishedDate`	Datetime	Date when the managed content version was last published.	47.0
`title`	String	Title of the managed content version.	47.0
`type`	String	Type of managed content version.	47.0
`typeLabel`	String	Type label of the managed content type.	47.0
`unauthenticatedUrl`	String	Unauthenticated delivery URL.	50.0

SEE ALSO:

ConnectApi.ManagedContentVersionCollection

ConnectApi.ManagedContentVersionCollection

Collection of managed content versions.

Property Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	47.0
`items`	List<`ConnectApi.ManagedContentVersion`>	List of managed content versions.	47.0
`managedContentTypes`	Map<String, `ConnectApi.ManagedContentType`>	Map of managed content types.	47.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	47.0
`total`	Integer	Total number of managed content versions.	47.0
`totalTypes`	Integer	Total number of managed content types.	47.0

ConnectApi.ManagedSocialAccount

Information describing a managed social account or fan page of a social network.

Subclass of ConnectApi.BaseManagedSocialAccount

No additional properties.

ConnectApi.ManagedSocialAccounts

A list of managed social accounts.

Property Name	Type	Description	Available Version
`managedSocialAccounts`	List<`ConnectApi.ManagedSocialAccount`>	List of managed social accounts.	44.0

ConnectApi.ManagedTopic

Represents a managed topic in an Experience Cloud site.

Property Name	Type	Description	Available Version
`children`	List<`ConnectApi.ManagedTopic`>	Children managed topics of the managed topic; `null` if the `depth` request parameter isn't specified or is *1*.	35.0
`id`	String	ID of managed topic.	32.0

Property Name	Type	Description	Available Version
managedTopicType	ConnectApi.ManagedTopicType	Type of managed topic. • Content—Topics that are associated with native content. • Featured—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation. • Navigational—Topics that display in a navigational menu in the Experience Cloud site.	32.0
parent	ConnectApi.Reference	Parent managed topic of the managed topic.	35.0
topic	ConnectApi.Topic	Information about the topic.	32.0
url	String	Connect REST API URL to the managed topic.	32.0

SEE ALSO:

ConnectApi.ManagedTopicCollection

ConnectApi.ManagedTopicCollection

A collection of managed topics.

Property Name	Type	Description	Available Version
currentPageUrl	String	Connect REST API URL identifying the current page.	32.0
managedTopics	List<ConnectApi.ManagedTopic>	List of managed topics.	32.0
nextPageUrl	String	Connect REST API URL identifying the next page, or null if there isn't a next page.	44.0

ConnectApi.MarkupBeginSegment

The beginning of rich text markup.

Subclass of ConnectApi.MessageSegment.

Property Name	Type	Description	Available Version
altText	String	Alternative text for the segment, if available.	45.0
htmlTag	String	The HTML tag for this markup.	35.0
markupType	ConnectApi.MarkupType	Type of rich text markup. • Bold—Bold tag. • Code—Code tag.	35.0

Property Name	Type	Description	Available Version
		• `Hyperlink`—Hyperlink anchor tag. • `Italic`—Italic tag. • `ListItem`—List item tag. • `OrderedList`—Ordered list tag. • `Paragraph`—Paragraph tag. • `Strikethrough`—Strikethrough tag. • `Underline`—Underline tag. • `UnorderedList`—Unordered list tag.	
`url`	String	URL to the segment, if available.	45.0

ConnectApi.MarkupEndSegment

The end of rich text markup.

Subclass of ConnectApi.MessageSegment.

Property Name	Type	Description	Available Version
`htmlTag`	String	The HTML tag for this markup.	35.0
`markupType`	`ConnectApi.MarkupType`	Type of rich text markup. • `Bold`—Bold tag. • `Code`—Code tag. • `Hyperlink`—Hyperlink anchor tag. • `Italic`—Italic tag. • `ListItem`—List item tag. • `OrderedList`—Ordered list tag. • `Paragraph`—Paragraph tag. • `Strikethrough`—Strikethrough tag. • `Underline`—Underline tag. • `UnorderedList`—Unordered list tag.	35.0

ConnectApi.MediaReference

A media reference.

Property Name	Type	Description	Available Version
`mediaUrl`	String	URL to stream or download the media.	41.0

Property Name	Type	Description	Available Version
`thumbnailUrl`	String	If one exists, URL of the media's thumbnail.	41.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.MediaReferenceCapability

ConnectApi.MediaReferenceCapability

If a feed element has this capability, it has one or more media references.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`media`	List<`ConnectApi.MediaReference`>	Collection of media references.	41.0

ConnectApi.MentionCompletion

Information about a record that could be used to @mention a user or group.

Name	Type	Description	Available Version
`additionalLabel`	String	If one exists, an additional label for the record represented by this completion, for example, "(Customer)" or "(Acme Corporation)".	29.0
`description`	String	A description of the record represented by this completion.	29.0
`name`	String	The name of the record represented by this completion. The name is localized, if possible.	29.0
`outOfOffice`	ConnectApi.OutOfOffice	If the record represented by this completion is a user, an additional out-of-office message, if one exists, for the user.	40.0
`photoUrl`	String	A URL to the photo or icon of the record represented by this completion.	29.0
`recordId`	String	The ID of the record represented by this completion.	29.0

Name	Type	Description	Available Version
`userType`	`ConnectApi.UserType` Enum	If the record represented by this completion is a user, this value is the user type associated with that user; otherwise the value is `null`. One of these values: • `ChatterGuest`—User is an external user in a private group. • `ChatterOnly`—User is a Chatter Free customer. • `Guest`—User is unauthenticated. • `Internal`—User is a standard org member. • `Portal`—User is an external user in an Experience Cloud site. • `System`—User is Chatter Expert or a system user. • `Undefined`—User is a user type that is a custom object.	30.0

SEE ALSO:

ConnectApi.MentionCompletionPage

ConnectApi.MentionCompletionPage

Paginated list of Mention Completion response bodies.

Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	29.0
`mentionCompletions`	`List<ConnectApi.MentionCompletion>`	A list of mention completion proposals. Use these proposals to build a feed post body.	29.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	29.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	29.0

ConnectApi.MentionSegment

Mention segment.

Subclass of ConnectApi.MessageSegment.

Name	Type	Description	Available Version
`accessible`	Boolean	Specifies whether the mentioned user or group can see the post in which they are mentioned (`true`) or not (`false`).	28.0
`name`	String	Name of the mentioned user or group.	28.0

Name	Type	Description	Available Version
record	ConnectApi.ActorWithId	Information about the mentioned user or group.	29.0
user	ConnectApi.UserSummary	Information about the mentioned user. **Important:** In versions 29.0 and later, use the record property.	28.0 only In versions before 29.0, if the mention is not a user, the mention is in a ConnectApi.TextSegment object.

ConnectApi.MentionValidation

Information about whether a proposed mention is valid for the context user.

Name	Type	Description	Available Version
recordId	String	The ID of the mentioned record.	29.0
validationStatus	ConnectApi.MentionValidationStatus Enum	Type of validation error for a proposed mention, if any. • Disallowed—The proposed mention is invalid and is rejected because the context user is trying to mention something that is not allowed. For example, a user who is not a member of a private group is trying to mention the private group. • Inaccessible—The proposed mention is allowed, but the user or record being mentioned isn't notified. They don't have access to the parent record that's being discussed. • Ok—There is no validation error for this proposed mention.	29.0

SEE ALSO:

ConnectApi.MentionValidations

ConnectApi.MentionValidations

Information about whether a set of mentions is valid for the context user.

Name	Type	Description	Available Version
hasErrors	Boolean	Indicates whether at least one of the proposed mentions has an error (true), or not (false). For example, context users can't mention private groups	29.0

Name	Type	Description	Available Version
		they don't belong to. If such a group is included in the list of mention validations, `hasErrors` is `true` and the group has a `validationStatus` of `Disallowed` in its mention validation.	
`mentionValidations`	`List<ConnectApi.MentionValidation>`	List of mention validation information in the same order as the provided record IDs.	29.0

ConnectApi.MessageBody

Message body.

Subclass of ConnectApi.AbstractMessageBody.

No additional properties.

SEE ALSO:

- ConnectApi.ChatterLikesCapability
- ConnectApi.ChatterMessage
- ConnectApi.Comment
- ConnectApi.FeedElement
- ConnectApi.FeedItemSummary

ConnectApi.MessageSegment

Message segment.

This class is abstract.

Superclass of:

- ConnectApi.ComplexSegment
- ConnectApi.EntityLinkSegment
- ConnectApi.FieldChangeSegment
- ConnectApi.FieldChangeNameSegment
- ConnectApi.FieldChangeValueSegment
- ConnectApi.HashtagSegment
- ConnectApi.InlineImageSegment
- ConnectApi.LinkSegment
- ConnectApi.MarkupBeginSegment
- ConnectApi.MarkupEndSegment
- ConnectApi.MentionSegment
- ConnectApi.MoreChangesSegment
- ConnectApi.ResourceLinkSegment
- ConnectApi.TextSegment

Message segments in a feed item are typed as `ConnectApi.MessageSegment`. Feed item capabilities are typed as `ConnectApi.FeedItemCapability`. Record fields are typed as `ConnectApi.AbstractRecordField`. These classes are all abstract and have several concrete subclasses. At runtime you can use `instanceof` to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

Important: The composition of a feed can change between releases. Write your code to handle instances of unknown subclasses.

Name	Type	Description	Available Version
`text`	String	Text-only rendition of this segment. If a client encounters an unknown message segment type, it can render this value.	28.0
`type`	`ConnectApi.MessageSegmentType` Enum	The message segment type. One of these values: • `EntityLink` • `FieldChange` • `FieldChangeName` • `FieldChangeValue` • `Hashtag` • `InlineImage` • `Link` • `MarkupBegin` • `MarkupEnd` • `Mention` • `MoreChanges` • `ResourceLink` • `Text`	28.0

SEE ALSO:

ConnectApi.AbstractMessageBody

ConnectApi.ModerationCapability

If a feed element has this capability, users in an Experience Cloud site can flag it for moderation.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`moderationFlags`	`ConnectApi.ModerationFlags`	The moderation flags for this feed element. Moderators can view and take action on flagged items.	31.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.ModerationFlagItemDetail

Flag details on a feed item, comment, or file.

Property Name	Type	Description	Available Version
`createdBy`	String	ID of the user who flagged the item.	40.0
`createdDate`	Datetime	Date when the item was flagged.	40.0
`id`	String	ID of the moderation flag.	40.0
`moderationType`	`ConnectApi.CommunityFlagType`	Type of moderation flag. Values are: • `FlagAsInappropriate`—Flag for inappropriate content. • `FlagAsSpam`—Flag for spam.	40.0
`note`	String	Note from user who flagged the item.	40.0
`visibility`	`ConnectApi.CommunityFlagVisibility`	Visibility behavior of a flag for various user types. Values are: • `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item. • `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.	40.0

SEE ALSO:

ConnectApi.ModerationFlagsCollection

ConnectApi.ModerationFlags

Information about the moderation flags on a feed item, comment, or file.

Name	Type	Description	Available Version
`flagCount`	Integer	Number of moderation flags on this feed item, comment, or file. If the context user is not a moderator, the property is `null`.	29.0
`flagCountByReason`	`Map<ConnectApi.CommunityFlagReasonType, Integer>`	Number of moderation flags categorized by reason. Values for `ConnectApi.CommunityFlagReasonType` are: • `FlaggedByRule`—Moderation rule flagged the item. • `FlaggedBySystem`—Einstein flagged the item. • `FlaggedByUserAsInappropriate`—User flagged the item as inappropriate. • `FlaggedByUserAsSpam`—User flagged the item as spam.	40.0

Name	Type	Description	Available Version
`flaggedByMe`	Boolean	`true` if the context user flagged the feed item, comment, or file for moderation; `false` otherwise.	29.0
`flags`	[illegible]	Collection of flags.	40.0

SEE ALSO:

- ConnectApi.Comment
- ConnectApi.File
- ConnectApi.ModerationCapability

ConnectApi.ModerationFlagsCollection

A collection of flags on a feed item, comment, or file.

Property Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	40.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	40.0
`flags`	List<`ConnectApi.ModerationFlagItemDetail`>	List of flag details.	40.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	40.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	40.0
`pageSize`	Integer	Number of items per page.	40.0

SEE ALSO:

- ConnectApi.ModerationFlags

ConnectApi.MoreChangesSegment

In feed items with a large number of tracked changes, the message is formatted as: "changed A, B, and made X more changes." The `MoreChangesSegment` contains the "X more changes."

Subclass of ConnectApi.MessageSegment.

Name	Type	Description	Available Version
`moreChanges`	List<`ConnectApi.FieldChangeSegment`>	Complete list of tracked changes.	29.0

Name	Type	Description	Available Version
`moreChangesCount`	Integer	Number of additional changes.	28.0

ConnectApi.Motif

The motif properties contain URLs for small, medium, and large icons that indicate the Salesforce record type. Common record types are files, users, and groups, but all record types have a set of motif icons. Custom object records use their tab style icon. All icons are available to unauthenticated users so that, for example, you can display the motif icons in an email. The motif can also contain the record type's base color.

The motif images are icons, not user uploaded images or photos. For example, every user has the same set of motif icons.

Custom object records use their tab style icon, for example, the following custom object uses the "boat" tab style:

```
   "motif": {
      "color: "8C004C",
      "largeIconUrl": "/img/icon/custom51_100/boat64.png",
      "mediumIconUrl": "/img/icon/custom51_100/boat32.png",
      "smallIconUrl": "/img/icon/custom51_100/boat16.png",
      "svgIconUrl": null
   },
```

Users use the following icons:

```
   "motif": {
      "color: "1797C0",
      "largeIconUrl": "/img/icon/profile64.png",
      "mediumIconUrl": "/img/icon/profile32.png",
      "smallIconUrl": "/img/icon/profile16.png",
      "svgIconUrl": null
   },
```

Groups use the following icons:

```
   "motif": {
      "color: "1797C0",
      "largeIconUrl": "/img/icon/groups64.png",
      "mediumIconUrl": "/img/icon/groups32.png",
      "smallIconUrl": "/img/icon/groups16.png",
      "svgIconUrl": null
   },
```

Files use the following icons:

```
  "motif": {
      "color: "1797C0",
      "largeIconUrl": "/img/content/content64.png",
      "mediumIconUrl": "/img/content/content32.png",
      "smallIconUrl": "/img/icon/files16.png",
      "svgIconUrl": null
   },
```

Note: To view the icons in the previous examples, preface the URL with `https://instance_name`. For example, `https://instance_name/img/icon/profile64.png`.

Name	Type	Description	Available Version
`color`	String	A hex value representing the base color of the record type, or `null`.	29.0
`largeIconUrl`	String	A large icon indicating the record type.	28.0
`mediumIconUrl`	String	A medium icon indicating the record type.	28.0
`smallIconUrl`	String	A small icon indicating the record type.	28.0
`svgIconUrl`	String	An icon in SVG format indicating the record type, or `null` if the icon doesn't exist.	34.0

ConnectApi.MultipleAsyncOutputRepresentation

IDs of the asynchronous background operations. This output only includes the operation IDs, regardless of whether calls are made to an external payment gateway. It doesn't include any errors from the operations.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`asyncOutputs`	List<`ConnectApi.AsyncOutputRepresentation`>	List of IDs of background operations.	56.0

SEE ALSO:

multipleEnsureFundsAsync(multipleEnsureFundsInput)

ConnectApi.MultipleFulfillmentOrderInvoicesOutputRepresentation

IDs of the created Invoices.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`invoiceIds`	List<String>	List of IDs of the created Invoices.	52.0

ConnectApi.MultipleFulfillmentOrderOutputRepresentation

List of responses for the individual FulfillmentOrder creation attempts from a create multiple fulfillment orders request.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`fulfillmentOrders`	List<`ConnectApi.FulfillmentGroupOutputRepresentation`>	A list of response data for created and failed FulfillmentOrders.	50.0

ConnectApi.MuteCapability

If a feed element has this capability, users can mute it. Muted feed elements are visible in the muted feed, and invisible in all other feeds that respect mute.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`isMutedByMe`	Boolean	Indicates whether the context user muted the feed element.	35.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.MuteSummary

Summary of a mute.

Subclass of ConnectApi.UserFeedEntityActivitySummary.

No additional properties.

ConnectApi.NamedCredential

Named credential associated with an external credential.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Property Name	Type	Description	Available Version
`calloutOptions`	`ConnectApi.NamedCredentialCalloutOptions`	Callout options for the named credential.	58.0
`calloutStatus`	`ConnectApi.CalloutStatus`	Indicates whether a named credential is enabled for callout. Values are: • `Disabled` • `Enabled`	59.0
`calloutUrl`	String	URL of the named credential in a callout.	58.0
`createdByNamespace`	String	Namespace of the package that created the named credential.	59.0
`customHeaders`	List<`ConnectApi.CredentialCustomHeader`>	Custom HTTP headers for the named credential.	58.0
`developerName`	String	Fully qualified developer name of the named credential.	56.0

Property Name	Type	Description	Available Version
`externalCredentials`	List<`ConnectApi.ExternalCredential`>	External credentials used by the named credential.	58.0
`id`	String	Named credential ID.	58.0
`masterLabel`	String	Named credential label.	56.0
`networkConnection`	`ConnectApi.NetworkConnection`	PrivateConnect outbound network connection for the named credential.	58.0
`parameters`	List<`ConnectApi.NamedCredentialParameter`>	Named credential parameters.	58.0
`type`	`ConnectApi.NamedCredentialType`	Type of named credential. Values are: • `PrivateEndpoint` • `SecuredEndpoint`	58.0
`url`	String	Connect REST API URL of the named credential.	58.0

SEE ALSO:

ConnectApi.ExternalCredential

ConnectApi.NamedCredentialList

ConnectApi.NamedCredentialCalloutOptions

Named credential callout options.

Property Name	Type	Description	Available Version
`allowMergeFieldsInBody`	Boolean	Specifies whether to allow merge fields in the HTTP body (`true`) or not (`false`).	58.0
`allowMergeFieldsInHeader`	Boolean	Specifies whether to allow merge fields in the HTTP header (`true`) or not (`false`).	58.0
`generateAuthorizationHeader`	Boolean	Specifies whether to generate an authorization header (`true`) or not (`false`).	58.0

SEE ALSO:

ConnectApi.NamedCredential

ConnectApi.NamedCredentialList

List of named credentials.

Property Name	Type	Description	Available Version
`namedCredentials`	List<`ConnectApi.NamedCredential`>	List of named credentials.	58.0

ConnectApi.NamedCredentialParameter

Named credential parameter.

Property Name	Type	Description	Available Version
`id`	String	ID of the parameter.	58.0
`parameterName`	String	Name of the parameter.	58.0
`parameterType`	`ConnectApi.NamedCredentialParameterType`	Type of named credential parameter. Values are: • `AllowedManagedPackageNamespaces` • `ClientCertificate`	58.0
`parameterValue`	String	Value of the parameter.	58.0

SEE ALSO:

ConnectApi.NamedCredential

ConnectApi.NavigationMenuItem

Navigation menu item.

Property Name	Type	Description	Available Version
`actionType`	`ConnectApi.NavigationMenuItemActionType`	Event, URL type, or modal navigation menu item. Values are: • `Event`—Event-based navigation. Note: `Event` is internal only and can't be used in custom components. • `ExternalLink`—URL outside of your Experience Cloud site. • `InternalLink`—Relative URL inside your Experience Cloud site. • `Modal`—Modal, such as Account Switcher.	52.0
`actionValue`	String	For `Event` action type, the event fully qualified name for the navigation menu item. For `ExternalLink` and `InternalLink` action types, the route URL for the navigation menu item.	52.0

Property Name	Type	Description	Available Version
		For `Modal` action type, the component fully qualified name for the navigation menu item.	
`imageUrl`	String	URL to the image of the navigation menu item.	52.0
`label`	String	Label for the navigation menu item.	52.0
`pageReference`	`ConnectApi.NavigationMenuPageReference`	Page reference for the navigation menu item. Page reference is returned only for the Storefront Categories data source.	59.0
`subMenu`	List<`ConnectApi.NavigationMenuItem`>	Submenu for the navigation menu item.	52.0
`target`	`ConnectApi.NavigationMenuItemOpenTarget`	Target for the navigation menu item. Values are: • `CurrentWindow`—Navigation menu item opens in the current window. • `NewWindow`—Navigation menu item opens in a new window.	52.0

SEE ALSO:

ConnectApi.NavigationMenuItemCollection

ConnectApi.NavigationMenuItemCollection

Collection of navigation menu items.

Property Name	Type	Description	Available Version
`menuItems`	List<`ConnectApi.NavigationMenuItem`>	Collection of navigation menu items.	52.0

ConnectApi.NavigationMenuPageReference

Navigation menu item page reference.

Property Name	Type	Description	Available Version
`attributes`	Map<String, String>	Attributes for the navigation menu item page reference.	59.0
`state`	Map<String, String>	State for the navigation menu item page reference.	59.0
`type`	String	Type for the navigation menu item page reference.	59.0

SEE ALSO:

ConnectApi.NavigationMenuItem

ConnectApi.NBAActionParameter

A parameter for an action.

Property Name	Type	Description	Available Version
`name`	String	Name of the parameter.	45.0
`type`	String	Type of the parameter.	45.0
`value`	String	Value of the parameter.	45.0

ConnectApi.NBAFlowAction

A recommended flow.

Subclass of ConnectApi.AbstractNBAAction.

Property Name	Type	Description	Available Version
`flowLabel`	String	Label of the recommended flow.	47.0
`flowType`	`ConnectApi.NBAFlowType`	Type of recommended flow. Values are: • `AutoLaunchedFlow`—Autolaunched flow that runs in the background. • `Flow`—Screen flow that accepts user inputs.	47.0
`id`	String	ID of the flow.	45.0
`name`	String	Name of the flow.	45.0

ConnectApi.NBANativeRecommendation

A record the user is recommended to take action on.

Subclass of ConnectApi.AbstractNBATarget.

Property Name	Type	Description	Available Version
`id`	String	ID of the recommendation.	45.0
`name`	String	Name of the recommendation.	45.0
`url`	String	URL to the recommendation.	45.0

ConnectApi.NBARecommendation

A recommendation returned by a recommendation strategy.

Property Name	Type	Description	Available Version
`aiModel`	String	Reserved for future use.	47.0

Property Name	Type	Description	Available Version
acceptanceLabel	String	Text indicating user acceptance of the recommendation.	45.0
description	String	Description of the recommendation.	45.0
externalId	String	External ID of the recommendation. This ID doesn't need to be a Salesforce 18-character ID. For example, it can be a product number from an external system.	46.0
imageUrl	String	URL to the asset file to display.	45.0
recommendationMode	String	Reserved for future use.	46.0
recommendationScore	Double	Reserved for future use.	46.0
rejectionLabel	String	Text indicating user rejection of the recommendation.	45.0
target	ConnectApi.AbstractNBATarget	Target to act on.	45.0
targetAction	ConnectApi.AbstractNBAAction	Action to recommend.	45.0

SEE ALSO:

ConnectApi.NBARecommendations

ConnectApi.NBARecommendations

Recommendations returned by a recommendation strategy.

Property Name	Type	Description	Available Version
debug	String	Runtime debug information recorded during recommendation strategy execution.	45.0
errors	String	Runtime errors that occurred during recommendation strategy execution.	45.0
executionId	String	ID of the recommendation strategy execution.	45.0
onBehalfOfId	String	ID of the user or entity for which the recommendation strategy was executed.	45.0
recommendations	List<ConnectApi.NBARecommendation>	List of recommendations returned by a recommendation strategy.	45.0
trace	ConnectApi.StrategyTrace	Trace information for the recommendation strategy execution, if requested.	45.0

ConnectApi.NetworkConnection

External network connection.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Property Name	Type	Description	Available Version
`developerName`	String	Name of the network connection.	58.0
`id`	String	ID of the network connection.	58.0
`masterLabel`	String	Label of the network connection.	58.0
`namespacePrefix`	String	Namespace prefix of the network connection.	58.0

SEE ALSO:

ConnectApi.NamedCredential

ConnectApi.NewUserAudienceCriteria

Criteria for the new members type of custom recommendation audience.

Subclass of ConnectApi.AudienceCriteria.

Property Name	Type	Description	Available Version
`maxDaysInCommunity`	Double	The maximum number of days since a user became a site member.	36.0

ConnectApi.OAuthCredentialAuthUrl

OAuth authentication URL for a credential.

Property Name	Type	Description	Available Version
`authenticationUrl`	String	Authentication URL for the user external credential. Authentication URLs have encoded and escaped special characters. Before using the URL, undo the encoded and escaped characters.	56.0
`external Credential`	String	Fully qualified developer name of the external credential.	56.0
`principalName`	String	Name of the external credential named principal.	56.0
`principalType`	`ConnectApi.CredentialPrincipalType`	Type of credential principal. Values are: • `AwsStsPrincipal` • `NamedPrincipal` • `PerUserPrincipal`	56.0

ConnectApi.OauthProviderInfo

OAuth provider information.

Name	Type	Description	Available Version
`authorizationUrl`	String	The URL used for authorization.	37.0
`name`	String	The name of the OAuth service provider.	37.0

SEE ALSO:

ConnectApi.UserOauthInfo

ConnectApi.OCIBaseOutputRepresentation

Base Omnichannel Inventory output class.

This class is abstract.

Superclass of:

- ConnectApi.OCIGetInventoryAvailabilityOutputRepresentation
- ConnectApi.OCIPublishLocationStructureOutputRepresentation
- ConnectApi.OCIPublishLocationStructureStatusOutputRepresentation
- ConnectApi.OCIUploadInventoryAvailabilityOutputRepresentation
- ConnectApi.OCIUploadInventoryAvailabilityStatusOutputRepresentation

Property Name	Type	Description	Available Version
`errors`	List<`ConnectApi.ErrorResponse`>	Any errors that were returned.	51.0
`success`	Boolean	Indicates whether the request was successful.	51.0

ConnectApi.OCICreateReservationErrorOutputRepresentation

Error returned from an attempt to create an Omnichannel Inventory reservation.

Property Name	Type	Description	Available Version
`errorCode`	String	The error code.	51.0
`message`	String	Details of the error, if available.	51.0

ConnectApi.OCICreateReservationOutputRepresentation

Result of an Omnichannel Inventory reservation creation request.

Property Name	Type	Description	Available Version
details	List<ConnectApi.OCICreateReservationSingleOutputRepresentation>	Details for each product in the reservation.	51.0
errors	List<ConnectApi.OCICreateReservationErrorOutputRepresentation>	Any errors returned by the reservation request.	51.0
expirationTime	String	The time at which the reservation would expire.	51.0
reservationTime	String	The time when the reservation was recorded.	51.0
success	Boolean	Indicates whether the reservation was successfully created.	51.0

ConnectApi.OCICreateReservationSingleOutputRepresentation

Details of an inventory reservation for one product.

Property Name	Type	Description	Available Version
errorCode	String	The error code, if any.	51.0
locationGroupIdentifier	String	Identifier of the location group where the inventory is reserved.	51.0
locationIdentifier	String	Identifier of the location where the inventory is reserved.	51.0
quantity	Double	The reserved quantity of the product.	51.0
stockKeepingUnit	String	The SKU of the reserved product.	51.0

ConnectApi.OCIFulfillReservationErrorOutputRepresentation

Response to a request to fulfill one inventory reservation.

Property Name	Type	Description	Available Version
details	ConnectApi.OCIFulfillReservationSingleOutputRepresentation	Details of the fulfilled reservation, if successful.	51.0
errorCode	String	Error code, if any.	51.0
message	String	Details of the error, if available.	51.0

ConnectApi.OCIFulfillReservationOutputRepresentation

Response to a request to fulfill one or more inventory reservations.

Property Name	Type	Description	Available Version
errors	List<ConnectApi.OCIFulfillReservationErrorOutputRepresentation>	Responses for the individual reservations in the fulfillment request.	51.0
success	Boolean	Indicates whether the request was successful.	51.0

ConnectApi.OCIFulfillReservationSingleOutputRepresentation

Details of a single fulfilled reservation.

Property Name	Type	Description	Available Version
actionRequestId	String	The UUID that identifies the original fulfill reservation request.	51.0
externalRefId	String	The external reference ID of the location that fulfilled the reservation.	51.0
locationIdentifier	String	The identifier of the location that fulfilled the reservation.	51.0
quantity	Double	The fulfilled quantity.	51.0
stockKeepingUnit	String	The SKU of the fulfilled product.	51.0

ConnectApi.OCIFutureInventoryOutputRepresentation

An expected future inventory restock.

Property Name	Type	Description	Available Version
expectedDate	Datetime	Date when the future inventory is expected.	51.0
quantity	Double	Quantity of the future inventory.	51.0

ConnectApi.OCIGetInventoryAvailabilityOutputRepresentation

Response to a request for inventory availability data.

Subclass of ConnectApi.OCIBaseOutputRepresentation.

Property Name	Type	Description	Available Version
locationGroups	List<ConnectApi.OCILocationGroupAvailabilityOutputRepresentation>	A list of inventory availability data for individual location groups.	51.0

Property Name	Type	Description	Available Version
locations	List<ConnectApi.OCILocationAvailabilityOutputRepresentation>	A list of inventory availability data for individual locations.	51.0

SEE ALSO:

getInventoryAvailability(inventoryAvailabilityInputRepresentation)

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation

ConnectApi.OCIInventoryRecordOutputRepresentation

Inventory availability data for a product.

Property Name	Type	Description	Available Version
availableToFulfill	Double	The Available To Fulfill quantity.	51.0
availableToOrder	Double	The Available To Order quantity.	51.0
effectiveDate	Datetime	The effective date of the inventory.	51.0
futures	List<ConnectApi.OCIFutureInventoryOutputRepresentation>	A list of any expected future inventory restocks.	51.0
onHand	Double	The On Hand quantity.	51.0
reserved	Double	The Reserved quantity.	51.0
safetyStockCount	Double	The Safety Stock Count.	51.0
stockKeepingUnit	String	The SKU of the product.	51.0

ConnectApi.OCILocationAvailabilityOutputRepresentation

A set of inventory availability data for one inventory location.

Property Name	Type	Description	Available Version
inventoryRecords	List<ConnectApi.OCIInventoryRecordOutputRepresentation>	A list of availability data for individual products at this location.	51.0
locationIdentifier	String	The identifier of the location.	51.0

ConnectApi.OCILocationGroupAvailabilityOutputRepresentation

A set of inventory availability data for one inventory location group.

Property Name	Type	Description	Available Version
inventoryRecords	List<ConnectApi.OCIInventoryRecordOutputRepresentation>	A list of availability data for individual products. The data combines the quantities for all locations belonging to this location group.	51.0
locationGroupIdentifier	String	The identifier of the location group.	51.0

ConnectApi.OCIPublishLocationStructureOutputRepresentation

Response to a publish location structure request.

Subclass of ConnectApi.OCIBaseOutputRepresentation.

Property Name	Type	Description	Available Version
uploadId	String	Identifier of the publish job. Use this value to retrieve the status of the job.	51.0

ConnectApi.OCIPublishLocationStructureStatusOutputRepresentation

Detailed status of a publish location structure job.

Subclass of ConnectApi.OCIBaseOutputRepresentation.

Property Name	Type	Description	Available Version
endTimeUTC	String	The UTC time when the job finished. (for example: "2020-07-06T22:54:08.012Z")	51.0
recordsProcessedCount	Integer	The number of records processed by the job.	51.0
recordsReadCount	Integer	The number of records read by the job.	51.0
recordsSkippedCount	Integer	The number of records skipped by the job.	51.0
startTimeUTC	String	The UTC time when the job started. (for example: "2020-07-06T22:53:06.788Z")	51.0
status	String	The status of the job. (e.g., "PENDING," "COMPLETED," etc.).	51.0
uploadId	String	Identifier of the job.	51.0
validationErrors	List<String>	List of any validation errors returned by the job.	51.0
validationStatus	String	The validation status of the job.	51.0

ConnectApi.OCIReleaseReservationErrorOutputRepresentation

Response to a request to release one inventory reservation.

Property Name	Type	Description	Available Version
details	ConnectApi.OCIReleaseReservationSingleOutputRepresentation	Details of the released reservation, if successful.	51.0
errorCode	String	Error code, if any.	51.0
message	String	Details of the error, if available.	51.0

ConnectApi.OCIReleaseReservationOutputRepresentation

Response to a request to release one or more inventory reservations.

Property Name	Type	Description	Available Version
errors	List<ConnectApi.OCIReleaseReservationErrorOutputRepresentation>	Responses for the individual reservations in the release request.	51.0
success	Boolean	Indicates whether the request was successful.	51.0

ConnectApi.OCIReleaseReservationSingleOutputRepresentation

Details of a single released reservation.

Property Name	Type	Description	Available Version
actionRequestId	String	The UUID that identifies the original release reservation request.	51.0
externalRefId	String	The external reference ID of the location that released the reservation.	51.0
locationGroupIdentifier	String	The identifier of the location group that released the reservation.	51.0
locationIdentifier	String	The identifier of the location that released the reservation.	51.0
quantity	Double	The released quantity.	51.0
stockKeepingUnit	String	The SKU of the released product.	51.0

ConnectApi.OCITransferReservationErrorOutputRepresentation

Response to a request to fulfill one inventory reservation.

Property Name	Type	Description	Available Version
details	ConnectApi.OCITransferReservationSingleOutputRepresentation	Details of the transferred reservation, if successful.	51.0
errorCode	String	Error code, if any.	51.0
message	String	Details of the error, if available.	51.0

ConnectApi.OCITransferReservationOutputRepresentation

Response to a request to transfer one or more inventory reservations.

Property Name	Type	Description	Available Version
errors	List<ConnectApi.OCITransferReservationErrorOutputRepresentation>	Responses for the individual reservations in the transfer request.	51.0
success	Boolean	Indicates whether the request was successful.	51.0

ConnectApi.OCITransferReservationSingleOutputRepresentation

Details of a single transferred reservation.

Property Name	Type	Description	Available Version
actionRequestId	String	The UUID that identifies the original transfer reservation request.	51.0
externalRefId	String	The external reference ID of the location that received the reservation.	51.0
fromLocationGroupIdentifier	String	The identifier of the location group that sent the reservation.	51.0
fromLocationIdentifier	String	The identifier of the location that sent the reservation.	51.0
ignoreAvailabilityCheck	Boolean	Whether this call ignored availability data at the location that received the reservation.	52.0
quantity	Double	The quantity of transferred inventory.	51.0
stockKeepingUnit	String	The SKU of the transferred product.	51.0
toLocationGroupIdentifier	String	The identifier of the location group that received the reservation.	51.0
toLocationIdentifier	String	The identifier of the location that received the reservation.	51.0

ConnectApi.OCIUploadInventoryAvailabilityOutputRepresentation

Response to an upload inventory availability job.

Subclass of ConnectApi.OCIBaseOutputRepresentation.

Property Name	Type	Description	Available Version
`uploadId`	String	Identifier of the upload job. Use this value to retrieve the status of the job.	51.0

ConnectApi.OCIUploadInventoryAvailabilityStatusOutputRepresentation

Detailed status of an upload inventory availability job.

Subclass of ConnectApi.OCIBaseOutputRepresentation.

Property Name	Type	Description	Available Version
`endTimeUTC`	String	The UTC time when the job finished. (for example: "2020-07-06T22:54:08.012Z")	51.0
`recordsProcessedCount`	Integer	The number of records processed by the job.	51.0
`recordsReadCount`	Integer	The number of records read by the job.	51.0
`recordsSkippedCount`	Integer	The number of records skipped by the job.	51.0
`startTimeUTC`	String	The UTC time when the job started. (for example: "2020-07-06T22:53:06.788Z")	51.0
`status`	String	The status of the job. (e.g., "PENDING," "COMPLETED," etc.).	51.0
`uploadId`	String	Identifier of the job.	51.0
`validationErrors`	List<`String`>	List of any validation errors returned by the job.	51.0
`validationStatus`	String	The validation status of the job.	51.0

ConnectApi.OrchestrationInstance

Orchestration instance.

Property Name	Type	Description	Available Version
`flowDefinitionDeveloperName`	String	Developer name of the flow definition.	54.0
`flowDefinitionId`	String	ID of the flow definition.	54.0
`flowDefinitionName`	String	Name of the flow definition.	54.0
`id`	String	ID of the orchestration instance.	54.0
`interviewId`	String	ID of the interview to resume.	54.0

Property Name	Type	Description	Available Version
stageInstances	List<ConnectApi.OrchestrationStageInstance>	Orchestration stage instances.	54.0
status	ConnectApi.OrchestrationStatus	Status of the orchestration instance. Values are: • Completed • InProgress • NotStarted	54.0

SEE ALSO:

ConnectApi.OrchestrationInstanceCollection

ConnectApi.OrchestrationInstanceCollection

Collection of orchestration instances.

Property Name	Type	Description	Available Version
instances	List<ConnectApi.OrchestrationInstance>	Collection of orchestration instances.	54.0

ConnectApi.OrchestrationStageInstance

Orchestration stage instance.

Property Name	Type	Description	Available Version
id	String	ID of the orchestration stage instance.	54.0
label	String	Orchestration stage instance label.	54.0
name	String	Orchestration stage instance name.	54.0
status	ConnectApi.OrchestrationStatus	Status of the orchestration instance. Values are: • Completed • InProgress • NotStarted	54.0
stepInstances	List<ConnectApi.OrchestrationStepInstance>	Orchestration stage instance steps.	54.0

SEE ALSO:

ConnectApi.OrchestrationInstance

ConnectApi.OrchestrationStepInstance

Orchestration step instance.

Property Name	Type	Description	Available Version
`id`	String	ID of the orchestration step instance.	54.0
`label`	String	Orchestration step instance label.	54.0
`name`	String	Orchestration step instance name.	54.0
`status`	`ConnectApi.OrchestrationStatus`	Status of the orchestration instance. Values are: • `Completed` • `InProgress` • `NotStarted`	54.0
`stepType`	`ConnectApi.OrchestrationStepType`	Type of orchestration step. Values are: • `AsynchronousBackgroundStep` • `BackgroundStep` • `InteractiveStep` • `ManagedContentRoleInteractiveStep` • `ManagedContentVariantAutoPublishBackgroundStep` • `ManagedContentVariantAutoUnpublishBackgroundStep` • `ManagedContentVariantSetLockBackgroundStep` • `ManagedContentVariantSetReadyBackgroundStep` • `MuleSoftStep`	54.0
`workItems`	List<`ConnectApi.OrchestrationWorkItem`>	Orchestration step instance work items.	54.0

SEE ALSO:

ConnectApi.OrchestrationStageInstance

ConnectApi.OrchestrationWorkItem

Orchestration work item.

Property Name	Type	Description	Available Version
`assigneeId`	String	ID of the assignee for the orchestration work item.	54.0
`description`	String	Description of the orchestration work item.	54.0
`id`	String	ID of the orchestration work item.	54.0

Property Name	Type	Description	Available Version
`label`	String	Label key for the orchestration work item.	54.0
`relatedRecordId`	String	ID of the record the orchestration work item is related to.	54.0
`screenFlowDeveloperName`	String	Developer name of the screen flow to start when assignees work on the orchestration work item.	54.0
`screenFlowId`	String	ID of the screen flow to start when assignees work on the orchestration work item.	54.0
`screenFlowInputs`	String	Input parameters for the screen flow.	54.0
`status`	`ConnectApi.OrchestrationWorkItemStatus`	Status of the orchestration work item. Values are: • `Assigned` • `Completed`	54.0

SEE ALSO:

ConnectApi.OrchestrationStepInstance

ConnectApi.OrderDeliveryGroupSummary

Order delivery group summary.

Property Name	Type	Description	Available Version
`fields`	Map<String, `ConnectApi.RecordField`>	Map of fields from order delivery group summary and other related objects that were queried.	51.0

SEE ALSO:

ConnectApi.OrderDeliveryGroupSummaryCollection

ConnectApi.OrderDeliveryGroupSummaryCollection

Collection of order delivery group summaries.

Property Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page of order delivery group summaries.	51.0
`currentPageUrl`	String	URL to the current page of order delivery group summaries.	51.0
`nextPageToken`	String	Token identifying the next page of order delivery group summaries.	51.0

Property Name	Type	Description	Available Version
nextPageUrl	String	URL to the next page of order delivery group summaries.	51.0
orderDeliveryGroups	List<ConnectApi.OrderDeliveryGroupSummary>	Collection of order delivery group summaries.	51.0
previousPageToken	String	Token identifying previous page of order delivery group summaries.	51.0
previousPageUrl	String	URL to the previous page of order delivery group summaries.	51.0

ConnectApi.OrderDeliveryGroupSummaryLookupOutput

Order delivery group summary lookup output.

Property Name	Type	Description	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the order delivery group summary record.	58.0
deliveryMethod	ConnectApi.OrderDeliveryMethodLookupOutput	Delivery method associated with order the delivery group summary.	58.0
fields	Map<String, ConnectApi.RecordField on page 2149>	Map of requested order delivery group summary fields.	58.0
id	String	ID of the order delivery group summary.	58.0
lineItems	List<ConnectApi.OrderSummaryLookupOutput>	Line items associated with the order delivery group summary.	58.0

ConnectApi.OrderDeliveryMethodLookupOutput

Order delivery method lookup output.

Property Name	Type	Description	Available Version
fields	Map<String, ConnectApi.RecordField>	Map of requested order delivery method fields.	58.0
id	String	ID of the order delivery method.	58.0

ConnectApi.OrderItemSummary

Order item summary.

Property Name	Type	Description	Available Version
adjustmentAggregates	ConnectApi.OrderItemSummaryAdjustmentAggregates	Adjustment aggregates associated with an order item summary.	55.0
fields	Map<String, ConnectApi.RecordField>	Map of fields from order item summary and other related objects that were queried.	51.0
orderItemSummaryId	String	ID of the order item summary.	51.0
orderSummaryId	String	ID of the order summary.	51.0
product	ConnectApi.OrderItemSummaryProduct	Associated product item information.	51.0

SEE ALSO:

ConnectApi.OrderItemSummaryCollection

ConnectApi.OrderItemSummaryAdjustmentAggregates

Adjustment aggregates associated with an order item summary.

Property Name	Type	Description	Available Version
available	Boolean	Indicates whether adjustment aggregates are available (`true`) or not (`false`).	55.0
status	ConnectApi.OrderSummaryAdjustmentAggregatesStatus	Order summary adjustment aggregate job status. • `Failed`—The adjustment aggregate data job for the order summary failed. • `InProgress`—The adjustment aggregate data job for the order summary is in progress. • `NotInitiated`—The adjustment aggregate data job for the order summary is not initiated. • `Submitted`—The adjustment aggregate data job for the order summary is submitted.	55.0
totalLinePromotionAmount	String	Total of all line item promotions applied to this specific product.	55.0
totalPromotionDistAmount	String	Total of all order level promotions applied to this specific product.	55.0

ConnectApi.OrderItemSummaryAdjustmentCollection

Collection of adjustments for order item summaries.

Property Name	Type	Description	Available Version
`orderItemSummaries`	Map<String, `ConnectApi.OrderItemSummaryAdjustmentList`>	Order item summaries and their associated adjustments.	53.0

ConnectApi.OrderItemSummaryAdjustmentList

Representation for list of adjustments for an Order Item Summary.

Property Name	Type	Description	Available Version
`adjustments`	List<`ConnectApi.OrderSummaryAdjustment`>	Adjustments associated with an order item summary.	53.0

SEE ALSO:

ConnectApi.OrderItemSummaryAdjustmentCollection

ConnectApi.OrderItemSummaryCollection

Collection of order item summaries.

Property Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page of items.	51.0
`currentPageUrl`	String	URL to the current page of items.	51.0
`items`	List<`ConnectApi.OrderItemSummary`>	Collection of order item summaries.	51.0
`nextPageToken`	String	Token identifying the next page of items.	51.0
`nextPageUrl`	String	URL to the next page of items.	51.0
`previousPageToken`	String	Token identifying the previous page of items.	51.0
`previousPageUrl`	String	URL to the previous page of items.	51.0

ConnectApi.OrderItemSummaryLookupOutput

Order item summary lookup output.

Property Name	Type	Description	Available Version
adjustmentAggregates	ConnectApi.OrderItemSummaryAdjustmentAggregates	Adjustment aggregates for the order item summary.	58.0
adjustments	List<ConnectApi.OrderSummaryAdjustment>	Adjustments associated with the order item summary.	58.0
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the order item summary record.	58.0
fields	Map<String, ConnectApi.RecordField>	Map of requested order item summary fields.	58.0
id	String	ID of the order item summary.	58.0
product	ConnectApi.OrderSummaryProductLookupOutput	Details of the product associated with order item summary.	58.0

ConnectApi.OrderItemSummaryOutputRepresentation

Details of an OrderItemSummary from a failed FulfillmentOrder in a create multiple fulfillment orders request.

Property Name	Type	Description	Available Version
errors	List<ConnectApi.ErrorResponse>	List of errors specific to the OrderItemSummary, if any.	50.0
orderItemSummaryId	String	ID of the OrderItemSummary.	50.0
quantity	Double	Quantity of the OrderItemSummary.	50.0

ConnectApi.OrderItemSummaryProduct

Product item mapped to the order item summary.

Property Name	Type	Description	Available Version
canViewProduct	Boolean	Specifies whether the context user can view the product (`true`) or not (`false`).	51.0
errorCode	String	Error code for the product with errors.	51.0
errorMessage	String	Error message for the product with errors.	51.0
fields	Map<String, ConnectApi.RecordField>	Map of the product fields queried.	51.0
media	ConnectApi.ProductMedia	Associated product media.	51.0
productAttributes	ConnectApi.ProductAttributeSetSummary	Summary of the product attributes.	51.0

Property Name	Type	Description	Available Version
productId	String	ID of the product.	51.0

SEE ALSO:

ConnectApi.OrderItemSummary

ConnectApi.OrderShipment

Order shipment.

Property Name	Type	Description	Available Version
expectedDeliveryDate	Datetime	Expected delivery date for the shipment.	52.0
fields	Map<String, ConnectApi.RecordField>	Map of requested fields.	52.0
orderSummaryId	String	ID of the order summary.	52.0
shipmentId	String	ID of the shipment.	52.0
shipmentNumber	String	Number of the shipment.	52.0
status	String	Status of the shipment.	52.0

SEE ALSO:

ConnectApi.OrderShipmentCollection

ConnectApi.OrderShipmentCollection

Collection of order shipments.

Property Name	Type	Description	Available Version
count	Integer	Total number of records returned in the collection.	52.0
currentPageToken	String	Token identifying the current page of order shipments.	52.0
currentPageUrl	String	URL to the current page of order shipments.	52.0
nextPageToken	String	Token identifying the next page of order shipments.	52.0
nextPageUrl	String	URL to the next page of order shipments.	52.0
previousPageToken	String	Token identifying the previous page of order shipments.	52.0
previousPageUrl	String	URL to the previous page of order shipments.	52.0

Property Name	Type	Description	Available Version
shipments	List<ConnectApi.OrderShipment>	Collection of order shipments.	52.0
sortOrder	ConnectApi.OrderShipmentSort	Sort order for order shipments. Values are: • ExpectedDeliveryDateAsc—Sorts by the oldest expected delivery date. • ExpectedDeliveryDateDesc—Sorts by the most recent expected delivery date. • ShipmentNumberAsc—Sorts by shipment number in ascending order (0–9). • ShipmentNumberDesc—Sorts by shipment number in descending order (9–0).	52.0

ConnectApi.OrderShipmentItem

Shipment item.

Property Name	Type	Description	Available Version
fields	Map<String, ConnectApi.RecordField>	Map of requested fields.	52.0
orderItemSummaryId	String	ID of the order item summary.	52.0
product	ConnectApi.OrderItemSummaryProduct	Product mapped to an order item summary.	52.0
productId	String	ID of the product.	52.0
quantity	Double	Quantity of the product.	52.0
shipmentId	String	ID of the shipment.	52.0
shipmentItemId	String	ID of the shipment item.	52.0

ConnectApi.OrderShipmentItemCollection

Collection of order shipment items.

Property Name	Type	Description	Available Version
count	Integer	Total number of records returned in a page.	52.0
currentPageToken	String	Token identifying the current page of order shipment items.	52.0
currentPageUrl	String	URL to the current page of order shipment items.	52.0

Property Name	Type	Description	Available Version
items	List<ConnectApi.OrderShipmentItem>	Collection of order shipment items.	52.0
nextPageToken	String	Token identifying the next page of order shipment items.	52.0
nextPageUrl	String	URL to the next page of order shipment items.	52.0
previousPageToken	String	Token identifying the previous page of order shipment items.	52.0
previousPageUrl	String	URL to the previous page of order shipment items.	52.0
sortOrder	ConnectApi.OrderShipmentItemSort	Sort order for order shipment items. Values are: • IdAsc—Sorts by ID in ascending alphanumeric order (A–Z, 0–9). • IdDesc—Sorts by ID in descending alphanumeric order (Z–A, 9–0).	52.0

ConnectApi.OrderSummaryLookupOutput

Order summary lookup output.

Property Name	Type	Description	Available Version
adjustmentAggregates	[illegible]	Adjustment aggregates associated with the order summary.	58.0
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the order summary.	58.0
deliveryGroups	[illegible]	Delivery groups associated with the order summary.	58.0
fields	Map<String, ConnectApi.RecordField>	Map of requested order summary fields.	58.0
id	String	ID of the order summary.	58.0
orderNumber	String	Reference number of the order summary.	58.0
status	String	Status associated with the order summary.	58.0

ConnectApi.OrderSummaryOutputRepresentation

ID of the created Order Summary.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
orderSummaryId	String	ID of the Order Summary.	48.0

ConnectApi.OrderSummaryProductLookupOutput

Order summary product lookup output.

Property Name	Type	Description	Available Version
canViewProduct	Boolean	Specifies whether the context user can view the product (true) or not (false).	58.0
errorCode	String	Error code captured during product load.	58.0
errorMessage	String	Error message captured during product load.	58.0
fields	Map<String, ConnectApi.RecordField>	Map of requested product fields.	58.0
id	String	Id of the product	58.0
media	ConnectApi.ProductMedia	Associated product media.	58.0
variationAttributes	Map<String, ConnectApi.OrderSummaryProductAttribute>	Variation attributes (color, size, and so on) associated with the product.	58.0

ConnectApi.OrderSummaryRepresentation

Order summary.

Property Name	Type	Description	Available Version
adjustmentAggregates	ConnectApi.OrderSummaryAdjustmentAggregates	Adjustment aggregates associated with the order summary.	55.0
createdDate	Datetime	Created date of the order summary.	51.0
fields	Map< String, ConnectApi.RecordField >	Map of requested order summary fields.	51.0
orderNumber	String	Order number of the order summary.	51.0
orderSummaryId	String	ID of the order summary.	51.0
orderedDate	Datetime	Ordered date of the order summary.	51.0
ownerId	String	ID of the owner of the order summary.	51.0
status	String	Status of the order summary.	51.0
totalAmount	String	Total amount of the order summary.	51.0

SEE ALSO:

ConnectApi.OrderSummaryCollectionRepresentation

ConnectApi.OrderSummaryAdjustment

Adjustment associated with an order summary.

Property Name	Type	Description	Available Version
`amount`	String	Amount associated with the adjustment.	53.0
`basisReferenceDisplayName`	String	Display name for secondary cause of the adjustment (for example, Null or the CouponCode that's associated with a Coupon)	54.0
`currencyIsoCode`	String	Three-letter ISO 4217 currency code associated with the adjustment.	53.0
`displayName`	String	Display name for the primary cause of the adjustment (for example, Display name of the Promotion)	53.0
`targetType`	`ConnectApi.OrderSummaryAdjustmentTargetType`	Type of price adjustment in promotions. Values are: • `SplitLine`—Price adjustment on an order item. • `Header`—Price adjustment on the entire order.	56.0
`type`	String	Type of adjustment (for example, Promotion, Other).	53.0

SEE ALSO:

ConnectApi.OrderSummaryAdjustmentCollection

ConnectApi.OrderItemSummaryAdjustmentList

ConnectApi.OrderSummaryAdjustmentAggregates

Adjustment aggregates associated with an order summary.

Property Name	Type	Description	Available Version
`available`	Boolean	Indicates if adjustment aggregate values are available (`true`) or not (`false`).	55.0
`status`	`ConnectApi.OrderSummaryAdjustmentAggregatesStatus`	Order summary adjustment aggregate job status. Values are: • `Failed`—The adjustment aggregate data job for the order summary failed. • `InProgress`—The adjustment aggregate data job for the order summary is in progress. • `NotInitiated`—The adjustment aggregate data job for the order summary is not initiated. • `Submitted`—The adjustment aggregate data job for the order summary is submitted.	55.0

Property Name	Type	Description	Available Version
`totalDelivery PromotionDistAmount`	String	Total distributed delivery promotion amounts associated with an order summary.	55.0
`totalDelivery PromotionLineAmount`	String	Total delivery promotion line amounts associated with an order summary.	55.0
`totalDelivery Promotion TotalAmount`	String	Total delivery promotion amount associated with an order summary.	55.0
`totalProduct PromotionDistAmount`	String	Total distributed product promotion amounts associated with an order summary.	55.0
`totalProduct PromotionLineAmount`	String	Total product promotion line amount associated with an order summary.	55.0
`totalProduct Promotion TotalAmount`	String	Total product promotion amount associated with an order summary.	55.0

ConnectApi.OrderSummaryAdjustmentAggregatesAsyncOutput

Async adjustment aggregates output.

Property Name	Type	Description	Available Version
`statusURL`	String	Status URL.	55.0

ConnectApi.OrderSummaryAdjustmentCollection

Collection of adjustments for an order summary.

Property Name	Type	Description	Available Version
`adjustments`	List<`ConnectApi.OrderSummaryAdjustment`>	Collection of adjustments for an order summary.	53.0

ConnectApi.OrderSummaryCollectionRepresentation

Collection of order summaries.

Property Name	Type	Description	Available Version
`count`	Integer	Total count of order summaries returned on the current page.	51.0
`currentPageToken`	String	Token identifying the current page.	51.0

Property Name	Type	Description	Available Version
currentPageUrl	String	Connect REST API URL identifying the current page.	51.0
nextPageToken	String	Token identifying the next page, or null if there isn't a next page.	51.0
nextPageUrl	String	Connect REST API URL identifying the next page, or null if there isn't a next page.	51.0
orderSummaries	List<ConnectApi.OrderSummaryRepresentation>	Collection of order summaries.	51.0
previousPageToken	String	Token identifying the previous page, or null if there isn't a previous page.	51.0
previousPageUrl	String	Connect REST API URL identifying the previous page, or null if there isn't a previous page.	51.0
sortOrder	ConnectApi.OrderSummarySortOrder	Sort order for order summaries. Values are: • CreatedDateAsc—Sorts by the oldest created date. • CreatedDateDesc—Sorts by the most recent created date. • OrderedDateAsc—Sorts by the oldest ordered date. • OrderedDateDesc—Sorts by the most recent ordered date.	51.0

ConnectApi.OrderSummaryProductAttribute

Order summary product attribute representation.

Property Name	Type	Description	Available Version
label	String	Label or display name of the attribute.	58.0
sequence	Integer	Sequence of the attribute set with regard to the product.	58.0
value	String	Display value of the attribute.	58.0

ConnectApi.OrderToCartFailedProduct

Product that could not be added to the cart from an order, with error information.

Property Name	Type	Description	Available Version
errorCode	String	Error code.	57.0

Property Name	Type	Description	Available Version
errorMessage	String	Error message about the cause of the failure.	57.0
productId	String	ID of the product.	57.0
productName	String	Name of the product.	57.0
productSKU	String	SKU of the product.	57.0

ConnectApi.OrderToCartResult

Result of action adding an order to a cart.

Property Name	Type	Description	Available Version
cartId	String	ID of the cart.	57.0
totalFailedProductCount	Integer	Number of products that could not be successfully added to the cart from the order.	57.0
totalSucceededProductCount	Integer	Number of products successfully added to the cart from the order.	57.0
unaddedProducts	List<ConnectApi.OrderToCartFailedProduct>	List of products not successfully added to the cart.	57.0

ConnectApi.OrganizationSettings

Org settings.

Name	Type	Description	Available Version
accessTimeout	Integer	Amount of time after which the system prompts users who have been inactive to log out or continue working.	28.0
features	ConnectApi.Features	Information about features available in the org.	28.0
maintenanceInfo	List<ConnectApi.MaintenanceInfo>	Information about a list of upcoming scheduled maintenances for the org.	34.0
name	String	Org name.	28.0
orgId	String	18-character ID for the org.	28.0
userSettings	ConnectApi.UserSettings	Information about the org permissions for the user.	28.0

ConnectApi.OriginCapability

If a feed element has this capability, it was created by a feed action.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`actor`	ConnectApi.UserSummary	The user who executed the feed action.	33.0
`originRecord`	ConnectApi.Reference	A reference to the feed element containing the feed action.	33.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.OutOfOffice

User's out-of-office message.

Property Name	Type	Description	Available Version
`message`	String	Out-of-office message for the user.	40.0

SEE ALSO:

ConnectApi.User

ConnectApi.MentionCompletion

ConnectApi.PardotBusinessUnitContextItem

Pardot business unit context item.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Property Name	Type	Description	Available Version
`id`	String	ID of the PardotTenant record.	55.0
`isCurrent`	Boolean	Specifies whether the business unit is selected as the context user's current business unit context in the business unit switcher of the Pardot Lightning app (`true`) or not (`false`).	55.0
`name`	String	Name of the Pardot business unit as it is specified in the `MasterLabel` of the PardotTenant record.	55.0

SEE ALSO:

ConnectApi.PardotBusinessUnitContextOutput

ConnectApi.PardotBusinessUnitContextOutput

Pardot business unit context.

Property Name	Type	Description	Available Version
businessUnits	List<ConnectApi.PardotBusinessUnitContextItem>	List of the Pardot business unit context items that the context user has access to.	55.0
isSuccess	Boolean	Indicates whether the requested resource was successfully provided.	55.0
totalBusinessUnits	Integer	Indicates the total number of Pardot business units that the context user has access to.	55.0

ConnectApi.PaymentAuthorizationResponse

Payment authorization output representation.

Property Name	Type	Description	Available Version
accountId	String	Salesforce account for the payment authorization.	51.0
amount	Double	Amount that the gateway authorized for the payment transaction.	51.0
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the payment group record.	51.0
effectiveDate	Datetime	Date that the authorization becomes effective.	51.0
expirationDate	Datetime	Date that the authorization expires.	51.0
id	String	ID of the payment authorization record.	51.0
paymentAuthorizationNumber	String	System-defined number for the payment authorization record.	51.0
requestDate	Datetime	Date that the authorization occurred.	51.0
status	String	Status of the payment authorization as returned by the gateway.	51.0

ConnectApi.PaymentGroupResponse

Payment group.

Property Name	Type	Description	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the payment group record.	50.0
id	String	ID of the payment group record.	50.0
sourceObjectId	String	Source object ID of the payment group record. Supports only OrderId.	50.0

ConnectApi.PaymentMethodDetails

Details about the payment method.

Property Name	Type	Description	Available Version
`alternativePaymentMethod`	ConnectApi.AlternativePaymentMethodOutput	Alternative Payment Method details.	56.0
`cardPaymentMethod`	ConnectApi.CardPaymentMethodOutput	Card Payment Method details.	56.0

ConnectApi.PaymentMethodResponse

Payment method information response.

Property Name	Type	Description	Available Version
`accountId`	String	Salesforce Payments account to which this payment method is linked.	51.0
`id`	String	ID of the payment method.	51.0
`paymentMethodDetails`	ConnectApi.PaymentMethodDetails	Details about the payment method.	
`status`	String	Status of the payment method.	51.0

ConnectApi.PaymentMethodTokenizationGatewayResponse

Payment method tokenization gateway response representation.

Subclass of ConnectApi.AbstractGatewayResponse.

Property Name	Type	Description	Available Version
`gatewayToken`	String	The payment method token sent from the gateway.	52.0

ConnectApi.PaymentMethodTokenizationResponse

Payment method tokenization output representation.

Property Name	Type	Description	Available Version
`error`	`ConnectApi.ErrorResponse`	Error representation for the payment method tokenization process. Sent only if the tokenization process encounters an error in the gateway.	52.0
`gatewayResponse`	`ConnectApi.PaymentMethodTokenizationGatewayResponse`	Response containing the tokenized payment method value from the payment gateway.	52.0

Property Name	Type	Description	Available Version
paymentGatewayLogs	List<ConnectApi.GatewayLogResponse>	Logs showing more details about the tokenization process that occurred in the gateway.	52.0
paymentMethod	ConnectApi.PaymentMethodResponse	Object representation of the payment method object that was tokenized.	52.0

ConnectApi.PaymentResponse

Payment output.

Property Name	Type	Description	Available Version
accountId	String	ID of the account related the payment record.	50.0
amount	Double	Total amount of the payment transaction performed in the payment request.	50.0
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the payment output.	50.0
effectiveDate	Datetime	Date that the payment becomes effective.	50.0
id	String	ID of the payment record.	50.0
paymentNumber	String	Number of the payment record created as a result of the request processing.	50.0
requestDate	Datetime	Date when the payment transaction occurred.	50.0
status	String	Status of the new payment record. Can be DRAFT, PROCESSED or CANCELLED.	50.0

ConnectApi.PercentRecordField

Record field containing a percentage value.

Subclass of ConnectApi.LabeledRecordField.

Name	Type	Description	Available Version
value	Double	Value of the percentage.	29.0

ConnectApi.PhoneNumber

Phone number.

Name	Type	Description	Available Version
label	String	A localized string indicating the phone type.	30.0
phoneNumber	String	Phone number.	28.0

Name	Type	Description	Available Version
`phoneType`	String	Phone type. Values are: • `Fax` • `Mobile` • `Work` These values are not localized.	30.0
`type`	String	Note: This property is not available after version 29.0. Use the `phoneType` property instead. Values are: • `Fax` • `Mobile` • `Work` These values are not localized.	28.0–29.0

SEE ALSO:

ConnectApi.DatacloudCompany
ConnectApi.DatacloudContact
ConnectApi.UserDetail

ConnectApi.Photo

Profile photo.

Name	Type	Description	Available Version
`fullEmailPhotoUrl`	String	A temporary URL to the large profile picture. The URL expires after 30 days and is available to unauthenticated users.	28.0
`largePhotoUrl`	String	URL to the large profile picture. The default width is 200 pixels, and the height is scaled so the original image proportions are maintained. If a user hasn't uploaded a photo, this URL points to a default photo. If the user hasn't uploaded a photo and the request header included `X-Connect-Theme: Salesforce1`, this URL points to a default photo based on a theme that the admin selected for the org.	28.0
`mediumPhotoUrl`	String	URL to the medium profile picture. The default width is 160 pixels, and the height is scaled so the original image proportions are maintained. If a user hasn't uploaded a photo, this URL points to a default photo. If the user hasn't uploaded a photo and the request header included	37.0

Name	Type	Description	Available Version
		`X-Connect-Theme: Salesforce1`, this URL points to a default photo based on a theme that the admin selected for the org.	
`photoVersionId`	String	18–character ID to that version of the photo	28.0
`smallPhotoUrl`	String	URL to the small profile picture. The default size is 64x64 pixels. If a user hasn't uploaded a photo, this URL points to a default photo. If the user hasn't uploaded a photo and the request header included `X-Connect-Theme: Salesforce1`, this URL points to a default photo based on a theme that the admin selected for the org.	28.0
`standardEmailPhotoUrl`	String	A temporary URL to the small profile. The URL expires after 30 days and is available to unauthenticated users.	28.0
`url`	String	A resource that returns a Photo object: for example, `/services/data/v60.0/chatter/users/005D0000001LL8OIAW/photo`	28.0

ConnectApi.PicklistRecordField

Record field containing an enumerated value.

Subclass of ConnectApi.LabeledRecordField.

ConnectApi.PinCapability

If a feed element has this capability, users who have permission can pin it to a feed.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`isPinnableByMe`	Boolean	Specifies whether the context user can pin or unpin the entity to the feed (`true`) or not (`false`).	41.0
`isPinned`	Boolean	Specifies whether the entity is pinned (`true`) or not pinned (`false`) to the feed.	41.0

SEE ALSO:

- ConnectApi.FeedElementCapabilities

ConnectApi.PinnedFeedElements

List of pinned feed elements for a feed.

Property Name	Type	Description	Available Version
`elements`	List<`ConnectApi.FeedElement`>	List of pinned feed elements. Note: In the UI, pinned feed elements don't show all auxiliary information, such as comments, likes, interaction counts, or read by information. As a result, the `ConnectApi.PinnedFeedElements` output class doesn't include all the information for these capabilities.	41.0

ConnectApi.PlatformAction

A platform action instance with state information for the context user.

Property Name	Type	Description	Available Version
`actionUrl`	String	For action links of `subtype Ui` or `Download`, direct the user to download or visit the UI from this link. Salesforce issues a Javascript redirect for the link in this format: `/action-link-redirect/`***`communityId`***`/`***`actionLinkId`***`?_bearer=`***`bearerToken`***. For `Api` action links and for all platform actions, this value is `null` and Salesforce handles the call.	33.0
`apiName`	String	The API name. The value may be `null`.	33.0
`confirmationMessage`	String	If this action requires a confirmation and has a status of `NewStatus`, this is a default localized message that should be shown to an end user prior to invoking the action. Otherwise, this is `null`.	33.0
`executingUser`	`ConnectApi.UserSummary`	The user who initiated execution of this platform action.	33.0
`groupDefault`	Boolean	`true` if this platform action is the default or primary platform action in the platform action group; `false` otherwise. There can be only one default platform action per platform action group.	33.0
`iconUrl`	String	The URL of the icon for the platform action. This value may be `null`.	33.0

Property Name	Type	Description	Available Version
`id`	String	The ID for the platform action. If the `type` is `QuickAction` and the `subtype` is `Create`, this value is `null`.	33.0
`label`	String	The localized label for this platform action.	33.0
`modifiedDate`	Datetime	ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	33.0
`platformActionGroup`	`ConnectApi.Reference`	A reference to the platform action group containing this platform action.	33.0
`status`	`ConnectApi.PlatformActionStatus`	The execution status of the platform action. Values are: • `FailedStatus`—The action link execution failed. • `NewStatus`—The action link is ready to be executed. Available for `Download` and `Ui` action links only. • `PendingStatus`—The action link is executing. Choosing this value triggers the API call for `Api` and `ApiAsync` action links. • `SuccessfulStatus`—The action link executed successfully.	33.0
`subtype`	String	The subtype of a platform action or `null`. If the `type` property is `ActionLink`, possible values are: • `Api`—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server. • `ApiAsync`—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to `/connect/action-links/`***`actionLinkId`*** to set the status to `SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete. • `Download`—The action link downloads a file from the action URL. • `Ui`—The action link takes the user to a web page at the action URL.	33.0

Property Name	Type	Description	Available Version
		Note: Invoking `ApiAsync` action links from an app requires a call to set the status. However, there isn't currently a way to set the status of an action link using Apex. To set the status, use Connect REST API. See the Action Link resource in the Connect REST API Developer Guidefor more information.	
`type`	`ConnectApi.PlatformActionType`	The type of platform action. Values are: • `ActionLink`—An indicator on a feed element that targets an API, a web page, or a file, represented by a button in the Salesforce UI. • `CustomButton`—When clicked, opens a URL or a Visualforce page in a window or executes JavaScript. • `ProductivityAction`—Productivity actions are predefined and attached to a limited set of objects. Productivity actions include Send Email, Call, Map, View Website, and Read News. Except for the Call action, you can't edit productivity actions. • `QuickAction`—A global or object-specific action. • `StandardButton`—A predefined Salesforce button such as New, Edit, or Delete.	33.0
`url`	String	The URL for this platform action. If the `type` is `QuickAction` and the `subtype` is `Create`, this value is `null`.	33.0

SEE ALSO:

ConnectApi.PlatformActionGroup

ConnectApi.PlatformActionGroup

A platform action group instance with state appropriate for the context user.

Action link groups are one type of platform action group and are therefore represented as `ConnectApi.PlatformActionGroup` output classes.

Property Name	Type	Description	Available Version
`category`	`ConnectApi.PlatformActionGroupCategory`	Indicates the priority and relative locations of platform actions. Values are: • `Primary`—The action link group is displayed in the body of the feed element. • `Overflow`—The action link group is displayed in the overflow menu of the feed element.	33.0
`id`	String	The 18-character ID or an opaque string ID of the platform action group. If the `ConnectApi.PlatformAction` `type` is `QuickAction` and the `subtype` is `Create`, this value is `null`.	33.0
`modifiedDate`	Datetime	ISO 8601 date string, for example, 2014-02-25T18:24:31.000Z.	33.0
`platformActions`	List<`ConnectApi.PlatformAction`>	The platform action instances for this group. Within an action link group, action links are displayed in the order listed in the `actionLinks` property of the `ConnectApi.ActionLinkGroup` `DefinitionInput` class. Within a feed item, action link groups are displayed in the order specified in the `actionLinkGroupIds` property of the `ConnectApi.AssociatedActions` `CapabilityInput` class.	33.0
`url`	String	The URL for this platform action group. If the `ConnectApi.PlatformAction` `type` is `QuickAction` and the `subtype` is `Create`, this value is `null`.	33.0

SEE ALSO:

ConnectApi.AbstractRecommendation

ConnectApi.AssociatedActionsCapability

ConnectApi.PollCapability

If a feed element has this capability, it includes a poll.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`choices`	List<`ConnectApi.FeedPollChoice`>	Collection of poll choices that make up the poll.	32.0

Property Name	Type	Description	Available Version
myChoiceId	String	18-character ID of the poll choice that the context user has voted for in this poll. Returns null if the context user has not voted.	32.0
totalVoteCount	Integer	Total number of votes cast on the feed poll element.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.PostAuthorizationResponse

Gateway response following a post authorization request.

Property Name	Type	Description	Available Version
error	ConnectApi.ErrorResponse	Information about errors that occurred in the payment gateway while evaluating the post authorization request.	54.0
gatewayResponse	ConnectApi.PostAuthGatewayResponse	Payment gateway's response to the post authorization request.	54.0
paymentAuthorization	ConnectApi.PaymentAuthorizationResponse	Payment gateway's response to the original payment authorization request.	54.0
paymentGatewayLogs	List<ConnectApi.GatewayLogResponse>	Stores information exchanged between the Salesforce payments platform and external payment gateways. Gateway logs can also record payloads from external payment entities.	54.0
paymentGroup	ConnectApi.PaymentGroupResponse	Payment group, consisting of one or more payments, sent to the gateway for the post authorization request.	54.0
paymentMethod	ConnectApi.PaymentMethodResponse	Payment method used in the post authorization request.	54.0

ConnectApi.PostAuthGatewayResponse

Gateway response after confirmation that the merchant is ready to capture payment of an existing pre-authorized transaction.

Sublass of ConnectApi.AbstractGatewayResponse.

Property Name	Type	Description	Available Version
gatewayAuthorizationCode	String	Code used to authorize the payment that the payment gateway is processing.	54.0
paymentMethodDetails	ConnectApi.PaymentMethodDetails	Details about the payment method.	54.0

ConnectApi.PreserveCart

Represents a preserved cart.

Property Name	Type	Description	Available Version
cartId	String	ID of the authenticated cart.	60.0
currencyIsoCode	String	Currency ISO code for the authenticated cart.	60.0
failedCartItems	List<ConnectApi.CartItemBasicResult>	List of products that weren't successfully transferred from the guest cart to the authenticated cart.	60.0
numberOfProducts	Integer	Total number of products in the guest cart.	60.0
numberOfProductsWithError	Integer	Total number of products that weren't successfully transferred from the guest cart to the authenticated cart.	60.0
numberOfProductsWithSuccess	Integer	Total number of products successfully transferred from the guest cart to the authenticated cart.	60.0
succeededCartItems	List<ConnectApi.CartItemBasicResult>	List of products successfully transferred from the guest cart to the authenticated cart.	60.0

ConnectApi.PreviewCancelOutputRepresentation

Expected financial values for a proposed cancel action.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
changeBalances	ConnectApi.ChangeItemOutputRepresentation	Expected financial values for the proposed cancel action.	48.0
orderSummaryId	String	ID of the OrderSummary.	48.0

ConnectApi.PreviewCartToExchangeOrderOutputRepresentation

Expected change order financial values for the preview cart to exchange order action.

Property Name	Type	Description	Available Version
changeBalances	ConnectApi.ChangeItemOutputRepresentation on page 1935	Change order financial values for a preview order action.	48.0
errors	List<ConnectApi.ErrorResponse>	Any errors that were returned.	48.0
orderSummaryId	String	ID of the order summary.	48.0
success	Boolean	Indicates whether the transaction was successful.	48.0

ConnectApi.PreviewReturnOutputRepresentation

Expected financial values for a proposed return action.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
changeBalances	ConnectApi.ChangeItemOutputRepresentation	Expected financial values for the proposed return action.	48.0
orderSummaryId	String	ID of the OrderSummary.	48.0

ConnectApi.PriceAdjustmentSchedule

Price adjustment schedule.

Property Name	Type	Description	Available Version
adjustmentMethod		Reserved for future use.	59.0
id	String	ID of the price adjustment schedule.	49.0
priceAdjustmentTiers	List<ConnectApi.PriceAdjustmentTier>	List of price adjustment tiers.	49.0
scheduleType		Reserved for future use.	59.0

SEE ALSO:

ConnectApi.ProductPrice

ConnectApi.PriceAdjustmentTier

Price adjustment tier.

Property Name	Type	Description	Available Version
adjustmentType	ConnectApi.PriceAdjustmentTierType	Type of price adjustment for the tier. Values are: • AmountBasedAdjustment—Price is adjusted by a specified amount. • PercentageBasedAdjustment—Price is adjusted by a specified percentage.	49.0
adjustmentValue	String	Adjustment value of the tier.	49.0
id	String	ID of the price adjustment tier.	49.0
lowerBound	String	Lower limit of the tier.	49.0
tierUnitPrice	String	Unit price of the tier.	49.0
upperBound	String	Upper limit of the tier.	49.0

SEE ALSO:

ConnectApi.PriceAdjustmentSchedule

ConnectApi.PricingResult

Product pricing result.

Property Name	Type	Description	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the product.	49.0
error	ConnectApi.ErrorResponse	Error code and message.	49.0
pricingLineItemResults	List<ConnectApi.PricingResultLineItem>	Pricing result line Items.	49.0
success	Boolean	Specifies whether the execution was successful (true) or not (false).	49.0

ConnectApi.PricingResultLineItem

Pricing result line item.

Property Name	Type	Description	Available Version
error	ConnectApi.ErrorResponse	Error code and message.	49.0
listPrice	String	List price for the product.	49.0
lowestUnitPrice	String	Lowest unit price for the product.	49.0

Property Name	Type	Description	Available Version
`pricebookEntryId`	String	ID of the pricebook entry.	49.0
`productId`	String	ID of the product to price.	49.0
`success`	Boolean	Specifies whether the execution was successful (`true`) or not (`false`).	49.0
`unitPrice`	String	Unit price for the product.	49.0

SEE ALSO:

- ConnectApi.PricingResult
- ConnectApi.ProductSummary

ConnectApi.ProductAttributeInfo

Product attribute metadata.

Property Name	Type	Description	Available Version
`allowableValues`	List<String>	Active attribute picklist values that can be used to create variations. These values are determined by the order of the picklist values in Object Manager.	50.0
`apiName`	String	API name of the attribute.	50.0
`availableValues`	List<String>	Attribute picklist values that are available for the product in the store. These values are sorted by the order of values in the `allowableValues` property.	50.0
`fieldEnumOrId`	String	Field ID for custom fields or enumeration value for standard fields.	50.0
`label`	String	Label of the attribute.	50.0
`objectName`	String	Name of the object that contains the field.	50.0
`sequence`	Integer	Sequence value determined by the order of the attributes under Commerce Setup for the attribute set.	50.0

SEE ALSO:

- ConnectApi.ProductDetail
- ConnectApi.ProductAttributeSetInfo
- ConnectApi.ProductVariationInfo

ConnectApi.ProductAttributeSelectionInfo

Product attribute.

Property Name	Type	Description	Available Version
`apiName`	String	API name of the attribute.	50.0
`label`	String	Label of the attribute.	50.0
`sequence`	Integer	Sequence value determined by the order of the attributes under Commerce Setup for the attribute set.	50.0
`value`	String	Display value of the attribute.	50.0

SEE ALSO:

ConnectApi.ProductAttributesToProductEntry

ConnectApi.ProductAttributeSet

Product attribute set data.

Property Name	Type	Description	Available Version
`attributes`	Map<String, String>	Map of the attributes that are members of the attribute set.	50.0
`developerName`	String	Name of the attribute set.	50.0
`id`	String	ID of the product attribute record that represents the product attribute set.	50.0

ConnectApi.ProductAttributeSetInfo

Attribute set metadata.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Property Name	Type	Description	Available Version
`attributeInfo`	Map<String, `ConnectApi.ProductAttributeInfo`>	Map of the API name of the attribute field to the attribute metadata.	50.0
`description`	String	Description of the attribute set.	50.0
`developerName`	String	Developer name of the attribute set.	50.0
`id`	String	ID of the attribute set.	50.0
`masterLabel`	String	Label of the attribute set.	50.0

Property Name	Type	Description	Available Version
`sequence`	Integer	Sequence of the attribute set for the product.	50.0

SEE ALSO:

ConnectApi.ProductDetail

ConnectApi.ProductAttributeSetSummary

Summary of a product attribute set.

Property Name	Type	Description	Available Version
`apiName`	String	API name of the attribute set.	51.0
`attributes`	List<`ConnectApi.ProductAttributeSummary`>	List of attributes in the attribute set.	51.0
`label`	String	Display label of the attribute set.	51.0

SEE ALSO:

ConnectApi.OrderItemSummaryProduct

ConnectApi.ProductSummary

ConnectApi.ProductAttributeSummary

Summary of a product attribute.

Property Name	Type	Description	Available Version
`apiName`	String	API name of the attribute.	51.0
`label`	String	Display label of the attribute.	51.0
`sequence`	Integer	Sequence of the attribute in the attribute set.	51.0
`value`	String	Display value of the attribute.	51.0

SEE ALSO:

ConnectApi.ProductAttributeSetSummary

ConnectApi.ProductAttributesToProductEntry

Mapping of an attribute value combination to a variation product ID.

Property Name	Type	Description	Available Version
`canonicalKey`	String	Attribute API values concatenated with an underscore (_) based on the sequence number of the attributes in the attribute set.	50.0
`productId`	String	Variation product ID for the selection of attributes.	50.0
`selectedAttributes`	List<`ConnectApi.ProductAttributeSelectionInfo`>	Ordered list of attribute values and metadata that can be used to form a key that maps to product ID.	50.0
`urlName`	String	Variant URL name for the selection of attributes.	59.0

SEE ALSO:

ConnectApi.ProductVariationInfo

ConnectApi.ProductCartItem

Cart items of a specific product type.

Property Name	Type	Description	Available Version
`cartItems`	List<`ConnectApi.CartItemResult` on page 1913>	Items in a cart.	60.0
`product`	`ConnectApi.CartItemProduct on page 1912`	Product summary for a cart item.	60.0

ConnectApi.ProductCartItemCollection

Items in the cart, grouped by product type.

Property Name	Type	Description	Available Version
`count`	Integer	Number of cart items returned on the current page	60.0
`currentPage`	Integer	Current page of cart items. The value matches the requested page number, unless the requested page number exceeds the total number of pages. In this scenario, the current page is the highest available page number.	60.0
`hasErrors`	Boolean	Indicates whether at least one of the results contains an error (`True`) or not (`False`).	60.0
`products`	List<`ConnectApi.ProductCartItem` on page 2118>	Products in the cart.	60.0

Property Name	Type	Description	Available Version
totalItemCount	Integer	Total number of unique products in the cart.	60.0
totalNumberOfPages	Integer	Total number of pages for the given page size.	60.0

ConnectApi.ProductCategoryData

Product category.

Property Name	Type	Description	Available Version
description	String	Description of the category.	49.0
id	String	ID of the category.	49.0
name	String	Name of the category.	49.0
urlSlug	String	SEO-friendly URL slug of the category.	59.0

SEE ALSO:

ConnectApi.ProductCategoryPath

ConnectApi.SearchCategory

ConnectApi.ProductCategoryDetail

Details of a product category.

Property Name	Type	Description	Available Version
bannerImage	ConnectApi.ProductCategoryMedia	Banner image of the product category.	49.0
fields	Map<String, String>	List of fields for the product category.	49.0
id	String	ID of the product category.	49.0
mediaGroups	List<ConnectApi.ProductCategoryMediaGroup>	List of media groups of the product category.	49.0
tileImage	ConnectApi.ProductCategoryMedia	Tile image of the product category.	49.0
urlName	String	SEO-friendly URL name of the product category.	59.0

SEE ALSO:

ConnectApi.ProductCategoryDetailCollection

ConnectApi.ProductCategoryDetailCollection

Collection of product category details.

Property Name	Type	Description	Available Version
`productCategories`	List<`ConnectApi.ProductCategoryDetail`>	List of product category details.	52.0

ConnectApi.ProductCategoryMedia

Media associated with a product category.

Property Name	Type	Description	Available Version
`alternateText`	String	Alternative text for the product category media.	49.0
`contentVersionId`	String	ID of the latest published content version if the media is stored as a ContentDocument. If the image is a customer-provided external URL, the value is `null`. Not supported in enhanced CMS workspaces.	49.0
`id`	String	ID of the product category image.	49.0
`mediaType`	`ConnectApi.ProductMediaType`	Type of product media. Values are: • `Document` • `Image` • `Video`	49.0
`sortOrder`	Integer	Sort order of a media item inside a media group.	49.0
`thumbnailUrl`	String	URL of the thumbnail for product media. If a value exists, it should be used for the thumbnail whether the image is natively uploaded or hosted externally. Not supported in enhanced CMS workspaces.	49.0
`title`	String	Title of the product category media.	49.0
`url`	String	URL of the product category media.	49.0

SEE ALSO:

ConnectApi.ProductCategoryMediaGroup

ConnectApi.ProductCategoryDetail

ConnectApi.ProductCategoryMediaGroup

Media group associated with a product category.

Property Name	Type	Description	Available Version
`developerName`	String	API name of the product category media group.	49.0
`id`	String	ID of the product category media group.	49.0
`mediaItems`	List<`ConnectApi.ProductCategoryMedia`>	List of media items within a product category media group.	49.0
`name`	String	Name of the product category media group.	49.0
`usageType`	`ConnectApi.ProductMediaUsageType`	Usage type of a product media item within a media group. Values are: • `Attachment`—Product media group with product documents as attachments. • `Banner`—Product category media group with banner images of the product. • `Listing`—Product media group with listing images of the product. • `Standard`—Product media group with standard images and videos of the product. • `Tile`—Product category media group with tile images of the product.	49.0

ConnectApi.ProductCategoryPath

List of product categories in a path.

Property Name	Type	Description	Available Version
`path`	List<`ConnectApi.ProductCategoryData`>	List of product categories in a path.	49.0

SEE ALSO:

ConnectApi.ProductDetail

ConnectApi.ProductChild

Child product related to a parent product.

Property Name	Type	Description	Available Version
`defaultQuantity`	String	Default quantity of child products to be ordered.	57.0
`productInfo`	`ConnectApi.ProductDetail`	Product details of the child product.	57.0

ConnectApi.ProductChildCollection

Collection of child products related to a parent product.

Property Name	Type	Description	Available Version
`count`	Integer	Number of child products returned on this page.	57.0
`currentPageToken`	String	Current page token, if any.	57.0
`currentPageUrl`	String	URL of the current page in the response.	57.0
`items`	List<`ConnectApi.ProductChild`>	List of child products related to the parent product. The child products are sorted by their configured sequence values, in ascending order, with null values sorted last. If there are no configured sequence values, the child products are sorted by `createdDate`, in ascending order.	57.0
`nextPageToken`	String	Token for the next page, if any. A value is included in the response only if a value is returned for `nextPageUrl`.	57.0
`nextPageUrl`	String	URL of the next page, if any.	57.0
`previousPageToken`	String	Token for the previous page, if any. A value is included in the response only if a value is returned for `previousPageUrl`.	57.0
`previousPageUrl`	String	URL of the previous page, if any.	57.0
`total`	Integer	Total number of child products in the collection.	57.0

ConnectApi.ProductDetail

Details of a product.

Property Name	Type	Description	Available Version
`attributeSetInfo`	Map<String, `ConnectApi.ProductAttributeSetInfo`>	Map of the attribute set developer name to its metadata.	50.0
`defaultImage`	`ConnectApi.ProductMedia`	Default image of the product.	49.0
`entitlement`	`ConnectApi.ProductEntitlement`	Entitlement details for the product. To get pricing information for products in version 57 and later, use the CommerceStorePricing Class.	49.0–56.0
`fields`	Map<String, String>	List of fields for the product.	49.0
`id`	String	ID of the product.	49.0

Property Name	Type	Description	Available Version
mediaGroups	List<ConnectApi.ProductMediaGroup>	List of media groups of the product.	49.0
primaryProductCategoryPath	ConnectApi.ProductCategoryPath	Primary category path of the product.	49.0
productClass	ConnectApi.ProductClass	Class of product. Values are: • Simple • Variation • VariationParent	50.0
productSellingModels	List<ConnectApi.ProductSellingModel>	List of product selling models for the product.	56.0
purchaseQuantityRule	ConnectApi.PurchaseQuantityRule	If one exists, purchase quantity rule for the product.	52.0
urlName	String	SEO-friendly URL name for the product.	59.0
variationAttributeSet	ConnectApi.ProductAttributeSet	Variation attribute set for the product.	50.0
variationInfo	ConnectApi.ProductVariationInfo	Available and allowable values for variation attributes and a map to resolve variation product IDs from attribute value combinations.	50.0
variationParentId	String	ID of the variation parent.	50.0

ConnectApi.ProductDetailsOutputRepresentation

Details about a product.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
attributes	List<ConnectApi.ProductVariationAttributeOutputRepresentation>	List of variation attributes that define variations of the product.	55.0
currencyIsoCode	String	Currency ISO code.	55.0
description	String	Description of the product.	55.0
fields	Map<String, String>	List of the product's fields.	55.0
imageGroups	List<ConnectApi.ProductImage	List of the product's image groups.	55.0

Property Name	Type	Description	Available Version
	`GroupOutputRepresentation>`		
`listPrice`	Double	List price.	55.0
`name`	String	Name.	55.0
`productQuantityRule`	Purchase Quantity Rule	If one exists, purchase quantity rule for the product.	55.0
`productId`	String	Product ID.	55.0
`stockKeepingUnit`	String	Stock keeping unit.	55.0
`unitPrice`	Double	Unit price.	55.0
`variants`	List<`ConnectApi.ProductVariantOutputRepresentation`>	List of variations of the product.	55.0

ConnectApi.ProductEntitlement

Entitlements for a product.

Property Name	Type	Description	Available Version
`canViewPrice`	Boolean	Specifies whether the product's price can be viewed (`true`) or not (`false`).	49.0

SEE ALSO:

ConnectApi.ProductDetail

ConnectApi.ProductExpandOutputRepresentation

Product expand information with return reasons.

Property Name	Type	Description	Available Version
`returnReasons`	List<`String`>	Return reasons for products.	59.0

ConnectApi.ProductImageOutputRepresentation

Details about a product image.

Property Name	Type	Description	Available Version
`alternateText`	String	Alternate text for accessibility.	55.0
`mediaType`	String	Media type.	55.0

Property Name	Type	Description	Available Version
`thumbnailUrl`	String	URL of the thumbnail version of the product image.	55.0
`title`	String	Title.	55.0
`url`	String	URL of the product image.	55.0

ConnectApi.ProductImageGroupOutputRepresentation

Details about a product image group.

Property Name	Type	Description	Available Version
`images`	List<`ConnectApi.ProductImageOutputRepresentation`>	List of product images in the group.	55.0
`viewType`	String	The type of product images in the group.	55.0

ConnectApi.ProductsListOutputRepresentation

Output representation of products with product data along with expand details.

Property Name	Type	Description	Available Version
`product`	List<ConnectApi.ProductOutputRepresentation>	The product's identifier.	**59.0**

ConnectApi.ProductMedia

Media associated with a product.

Property Name	Type	Description	Available Version
`alternateText`	String	Alternative text for the product media.	49.0
`contentVersionId`	String	ID of the latest published content version if the media is stored as a ContentDocument. If the image is a customer-provided external URL, the value is `null`. Not supported in enhanced CMS workspaces.	49.0
`id`	String	ID of the product image.	49.0
`mediaType`	`ConnectApi.ProductMediaType`	Type of product media. Values are: • `Document` • `Image` • `Video`	49.0
`sortOrder`	Integer	Sort order of a media item within a media group.	49.0

Property Name	Type	Description	Available Version
`thumbnailUrl`	String	URL of the thumbnail for product media. If a value exists, it should be used for the thumbnail whether the image is natively uploaded or hosted externally. Not supported in enhanced CMS workspaces.	49.0
`title`	String	Title of the product media.	49.0
`url`	String	URL of the product media.	49.0

SEE ALSO:

- ConnectApi.CartItemProduct
- ConnectApi.ProductDetail

- ConnectApi.ProductSummary

ConnectApi.ProductMediaGroup

Media group associated with a product.

Property Name	Type	Description	Available Version
`developerName`	String	API name of the product media group.	49.0
`id`	String	ID of the product media group.	49.0
`mediaItems`	List<`ConnectApi.ProductMedia`>	List of media items within a product media group.	49.0
`name`	String	Name of the product media group.	49.0

Property Name	Type	Description	Available Version
usageType	ConnectApi.ProductMediaUsageType	Usage type of a product media item within a media group. Values are: • Attachment—Product media group with product documents as attachments. • Banner—Product category media group with banner images of the product. • Listing—Product media group with listing images of the product. • Standard—Product media group with standard images and videos of the product. • Tile—Product category media group with tile images of the product.	49.0

SEE ALSO:

ConnectApi.ProductDetail

ConnectApi.ProductCategoryDetail

ConnectApi.ProductOutputRepresentation

Output representation for product data.

Property Name	Type	Description	Available Version
expand	[illegible]	Output representation for expand feature.	**59.0**
products	String	Product data.	**59.0**

ConnectApi.ProductOverview

Overview of a product, with summary information about prices, selected fields, and the product's default image.

Property Name	Type	Description	Available Version
defaultImage	ConnectApi.ProductMedia	Media representation of the product's default image.	54.0
error	ConnectApi.ErrorResponse	Error code and error message.	54.0
fields	Map<String, String>	Map of fields belonging to the product.	54.0
id	String	ID of the product.	54.0
prices	ConnectApi.PricingResultLineItem	Price of the product. To get pricing information for products in version 58 and later, use the CommerceStorePricing Class.	54.0–57.0

Property Name	Type	Description	Available Version
sku	String	SKU of the product.	54.0
success	Boolean	Represents whether execution was successful and product overview information was retrieved without error.	54.0

ConnectApi.ProductOverviewCollection

Collection of product overviews.

Property Name	Type	Description	Available Version
products	List<ConnectApi.ProductOverview>	Collection of product overview.	54.0
total	Integer	Total number of products returned.	54.0

ConnectApi.ProductPrice

Pricing information for a product.

Property Name	Type	Description	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the product. Products are priced using the currency for the buyer account or guest buyer profile. If your store doesn't support the currency for the buyer account or guest buyer profile, products are priced using the default currency for your store.	49.0
listPrice	String	List price for the product.	49.0
lowestUnitPrice	String	Lowest unit price for the product.	49.0
priceAdjustment	ConnectApi.PriceAdjustmentSchedule	Price adjustment schedule for the product. If a product selling model ID is specified in a request parameter, this property is empty.	49.0
pricebookEntryId	String	ID of the price book entry. If a product selling model ID is specified in a request parameter, this property is empty.	49.0
productPriceEntries	List<ConnectApi.ProductPriceEntry>	List of line item prices for the product.	56.0
unitPrice	String	Unit price for the product. If a product selling model ID is specified in a request parameter, this property is empty.	49.0

ConnectApi.ProductPriceEntry

Line item price for the product.

Property Name	Type	Description	Available Version
`error`	`ConnectApi.ErrorResponse`	Error code and error message.	56.0
`listPrice`	String	List price for the product entry.	56.0
`priceAdjustment`	`ConnectApi.PriceAdjustmentSchedule`	Price adjustment schedule.	56.0
`pricebookEntryId`	String	ID of the pricebook entry.	56.0
`productSellingModelId`	String	ID of the product selling model. If no product selling model ID is specified in a request parameter, this property is empty.	56.0
`success`	Boolean	Specifies whether execution was successful (`true`) or not (`false`).	56.0
`unitPrice`	String	Unit price for the product entry.	56.0

ConnectApi.ProductReturnRateListOutputRepresentation

Products with corresponding return rates.

Property Name	Type	Description	Available Version
`productReturnRateList`	[illegible]	List of product return rates.	59.0

ConnectApi.ProductReturnRateOutputRepresentation

Return rate of a product's units returned divided by its units sold.

Property Name	Type	Description	Available Version
`productId`	String	ID of the product.	59.0
`returnRate`	Double	Return rate of specified product. Value range 0 to 1.	59.0

ConnectApi.ProductReturnRateOutputRepresentation

Return rate of a product (units returned divided by units sold).

Property Name	Type	Description	Available Version
`productId`	String	ID of the product.	59.0

Property Name	Type	Description	Available Version
returnRate	Double	Return rate of specified product. Values range from 0 to 1.	59.0

ConnectApi.ProductVariationInfo

Product variation attributes, metadata, and mappings of attribute combinations to variation product IDs.

Property Name	Type	Description	Available Version
attributesToProductMappings	List<ConnectApi.ProductAttributesToProductEntry>	List ordered by ProductAttribute.Sequence values that map the attribute value combinations to the variation product ID.	50.0
variationAttributeInfo	Map<String, ConnectApi.ProductAttributeInfo>	Map of field API name to product attribute information.	51.0

SEE ALSO:

ConnectApi.ProductDetail

ConnectApi.ProductSearchFacetOutputRepresentation

Product search facet value.

Property Name	Type	Description	Available Version
attributeType	String	Attribute type of the facet value.	59.0
displayName	String	Display name of the facet value.	59.0
displayRank	Integer	Display rank of the facet value.	59.0
displayType	String	Display type of the facet value.	59.0
facetType	String	Type of the facet.	59.0
nameOrId	String	Name or ID of the facet.	59.0
values	[illegible]	A list of facet values for the search.	59.0

ConnectApi.ProductSearchFacetValueOutputRepresentation

Output representation of a product search facet value.

Property Name	Type	Description	Available Version
displayName	String	Display name of the search facet.	59.0

Property Name	Type	Description	Available Version
`nameOrId`	String	Unique name or ID of the search facet.	59.0
`productCount`	Integer	Number of products found with the search facet.	59.0
`type`	String	Type of the search facet.	59.0

ConnectApi.ProductSearchImageOutputRepresentation

Output representation of the product search image.

Property Name	Type	Description	Available Version
`alternateText`	String	Alternate text for the product image.	59.0
`mediaType`	String	Media type of the product image.	59.0
`sortOrder`	Integer	Sort order of the product image.	59.0
`title`	String	Title of the product image.	59.0
`url`	String	URL of the product image.	59.0

ConnectApi.ProductSearchOutputRepresentation

Output representation of the product search response

Property Name	Type	Description	Available Version
`currencyIsoCode`	String	Three-letter ISO 4217 currency code associated with the product.	59.0
`facets`	[illegible]	A list of facet names to filter the search.For example, `["size_medium", "color_red"]`.	59.0
`locale`	String	Locale used for the product search.	59.0
`pageNumber`	Integer	Maximum number of search results pages to return. If you don't specify a value, the default is 1.	59.0
`pageSize`	Integer	Number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 20.	59.0
`products`	[illegible]	List of products found by the search.	59.0
`totalRecordsFound`	Integer	Total products found.	59.0

ConnectApi.ProductSearchProductOutputRepresentation

Product found by a product search.

Property Name	Type	Description	Available Version
description	String	Description of the product.	59.0
image	ConnectApi.ProductSearchImageOutputRepresentation	Image of the product.	59.0
name	String	Name of the product.	59.0
productClass	String	Class of the product.	59.0
stockKeepingUnit	String	Stock Keeping Unit (SKU) of the product.	59.0
variationAttributeSet	List<ConnectApi.ProductVariationAttributeOutputRepresentation>	Variation attribute set of the product.	59.0

ConnectApi.ProductSearchResults

Product search results.

Property Name	Type	Description	Available Version
categories	ConnectApi.SearchCategory	Categories from the search results.	52.0
correlationId	String	Reserved for future use.	55.0
facets	List<ConnectApi.SearchFacet>	Facets from the search results.	52.0
locale	String	Locale of the search results.	52.0
productsPage	ConnectApi.ProductSummaryPage	Page of products from the search results.	52.0

ConnectApi.ProductSearchSuggestionsResults

Product search suggestions results.

Property Name	Type	Description	Available Version
recentSearchSuggestions	List<ConnectApi.SearchSuggestion>	Suggestions based on the user's recent searches.	52.0

ConnectApi.ProductSellingModel

Product selling model for Commerce subscriptions.

Property Name	Type	Description	Available Version
description	String	Description of the product selling model displayed on the UI.	60.0

Property Name	Type	Description	Available Version
`displayName`	String	Name of the product selling model displayed on the UI.	60.0
`id`	String	ID of the product selling model.	56.0
`name`	String	Name of the product selling model.	56.0
`pricingTerm`	Integer	Number of pricing term units in the pricing term. Used with `pricingTermUnit` to define the length of the pricing term. For example, if `pricingTermUnit` is `Months` and this property is 1, the subscription is priced monthly. However, if the `sellingModelType` property is set to `OneTime`, the `pricingTerm` property is empty, because the product isn't sold as a subscription. The only allowed value for this property is 1.	56.0
`pricingTermUnit`	`ConnectApi.PricingTermUnit`	Unit of time used to define a pricing term. Value is: • `Months`—Product is priced on a monthly basis. • `Annual`—Product is priced on an annual basis. This unit of time is combined with a number (specified by the `pricingTerm` property) to define the full term of the subscription. For example, if the unit of time is `Months` and the `pricingTerm` property is set to 1, the subscription is priced monthly. However, if the `sellingModelType` property is set to `OneTime`, the `pricingTermUnit` property is empty, because the product isn't sold as a subscription.	56.0
`sellingModelType`	`ConnectApi.SellingModelType`	Type of product selling model. Values are: • `Evergreen`—A subscription without an end date. An evergreen subscription continues until the shopper affirmatively cancels it. • `OneTime`—A product that isn't sold as a subscription. • `TermDefined`—A subscription with a defined end date. The subscription continues for a specified time period. When the term ends, the subscription ends.	56.0
`subscriptionTermRule`	`ConnectApi.SubscriptionTermRule`	Rules for the subscription term.	59.0

ConnectApi.ProductSummary

Product summary.

Property Name	Type	Description	Available Version
defaultImage	ConnectApi.ProductMedia	Default image of the product.	52.0
fields	Map<String, ConnectApi.FieldValue>	Map of fields belonging to the product.	52.0
id	String	ID of the product.	52.0
name	String	Name of the product.	52.0
prices	ConnectApi.PricingResultLineItem	Prices of the product.	52.0
productClass	ConnectApi.ProductClass	Class of product. Values are: • Simple • Variation • VariationParent	52.0
productSellingModelInformation	ConnectApi.CommerceProductSellingModel	Product selling model information.	59.0
purchaseQuantityRule	ConnectApi.PurchaseQuantityRule	If one exists, purchase quantity rule for the product.	52.0
variationAttributeSet	ConnectApi.ProductAttributeSetSummary	Variation attribute set that's associated with the product.	52.0

SEE ALSO:

ConnectApi.ProductSummaryPage

ConnectApi.ProductSummaryPage

Page of product summaries.

Property Name	Type	Description	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the product.	52.0
pageSize	Integer	Number of products per page in the search results.	52.0

Property Name	Type	Description	Available Version
products	List<ConnectApi.ProductSummary>	Collection of product summaries.	52.0
total	Long	Total number of products in the search results.	52.0

SEE ALSO:

ConnectApi.ProductSearchResults

ConnectApi.ProductVariantOutputRepresentation

Details about a product variation.

Property Name	Type	Description	Available Version
listPrice	Double	List price.	55.0
price	Double	Price.	55.0
productId	String	Product ID.	55.0
stockKeepingUnit	String	Stock Keeping Unit.	55.0
unitPrice	Double	Unit price.	55.0
variationValues	Map<String, String>	The variation attribute values that define the variation.	55.0

ConnectApi.ProductVariationAttributeOutputRepresentation

Details about a product variation attribute.

Property Name	Type	Description	Available Version
apiName	String	API name of the attribute.	55.0
label	String	Label of the attribute.	55.0
variationAttributeValues	List<ConnectApi.ProductVariationAttributeValueOutputRepresentation>	List of valid values for the variation attribute.	55.0

ConnectApi.ProductVariationAttributeValueOutputRepresentation

Valid value for a product variation attribute.

Property Name	Type	Description	Available Version
name	String	API Name of the attribute this value belongs to.	55.0

Property Name	Type	Description	Available Version
orderable	Boolean	Whether the value defines an orderable product variation.	55.0
value	String	Value of the value.	55.0

ConnectApi.ProductVariationInfo

Product variation attributes, metadata, and mappings of attribute combinations to variation product IDs.

Property Name	Type	Description	Available Version
attributesToProductMappings	List<ConnectApi.ProductAttributesToProductEntry>	List ordered by ProductAttribute.Sequence values that map the attribute value combinations to the variation product ID.	50.0
variationAttributeInfo	Map<String, ConnectApi.ProductAttributeInfo>	Map of field API name to product attribute information.	51.0

SEE ALSO:

ConnectApi.ProductDetail

ConnectApi.PromotionCart

A cart, its items, and its adjustment groups.

Property Name	Type	Description	Available Version
cartAdjustmentGroups	List<ConnectApi.PromotionCartAdjustmentGroup>	Cart adjustment groups belonging to the cart.	57.0
cartItems	List<ConnectApi.PromotionCartItem>	Cart items belonging to the cart.	57.0
currencyIsoCode	String	Currency code of the cart.	57.0
id	String	ID of the cart.	57.0
totalAdjustmentBaseAmount	String	Total adjustment base amount for the cart.	57.0
totalNetAmount	String	Total price of the cart, including adjustments.	57.0

Property Name	Type	Description	Available Version
`totalProductBaseAmount`	String	Total price of all cart items in the cart.	57.0

SEE ALSO:

ConnectApi.PromotionEvaluation

evaluate(salesTransaction)

ConnectApi.PromotionCartAdjustmentGroup

Adjustment group associated with a cart.

Property Name	Type	Description	Available Version
`adjustmentBasisReference`	String	ID of the associated coupon, if applicable.	57.0
`adjustmentDescription`	String	Description of the adjustment.	57.0
`adjustmentType`	`ConnectApi.AdjustmentType`	How the price adjustment amount is calculated. Values are: • `AdjustmentAmount`—The adjustment is a fixed amount. • `AdjustmentPercentage`—The adjustment is a percentage.	57.0
`adjustmentValue`	String	Price value of the adjustment.	57.0
`baseAmount`	String	Total amount of the adjustment.	57.0
`cartId`	String	ID of the cart.	57.0
`id`	String	ID of the cart adjustment group.	57.0
`priceAdjustmentCauseId`	String	ID of the related promotion.	57.0
`priority`	Integer	Where in the sequence of adjustments this adjustment was applied.	57.0

SEE ALSO:

ConnectApi.PromotionCart

ConnectApi.PromotionEvaluation

evaluate(salesTransaction)

ConnectApi.PromotionCartItem

A cart item and its adjustments.

Property Name	Type	Description	Available Version
`cartDeliveryGroupId`	String	ID of the associated cart delivery group.	57.0
`cartId`	String	ID of the associated cart.	57.0
`cartItemPriceAdjustments`	List<ConnectApi.PromotionCartItemPriceAdjustment>	List of price adjustments applied to the cart item.	57.0
`id`	String	ID of the cart item.	57.0
`itemDescription`	String	Description of the cart item.	57.0
`itemName`	String	Name of the cart item.	57.0
`listPrice`	String	Unit list price of the cart item.	57.0
`product2Id`	String	ID of the product.	57.0
`quantity`	String	Quantity of the cart item.	57.0
`salesPrice`	String	Unit sales price of the cart item.	57.0
`sku`	String	Stock keeping unit of the cart item.	57.0
`totalAdjustmentBaseAmount`	String	Total adjustment amount for the cart item.	57.0
`totalLineBaseAmount`	String	Total amount for the cart item, based on sales price and quantity, not including adjustments.	57.0
`totalListBaseAmount`	String	Total amount for the cart item, based on list price and quantity, not including adjustments.	57.0
`totalNetAmount`	String	Total amount for the cart item, based on list price and quantity, including adjustments.	57.0
`type`	`ConnectApi.CartItemType`	Type of item in a cart. Values are: • `DeliveryCharge` • `Product`	57.0

SEE ALSO:

ConnectApi.PromotionCart

ConnectApi.PromotionEvaluation

evaluate(salesTransaction)

ConnectApi.PromotionCartItemPriceAdjustment

Price adjustments applied to a cart item.

Property Name	Type	Description	Available Version
`adjustmentAmountScope`	`ConnectApi.AdjustmentAmountScope`	Scope of the price adjustment amount. Values are: • `Total`—The adjustment scope is the total price. • `Unit`—The adjustment scope is the unit price. • `UnproratedTotal`—The adjustment scope is the unprorated total price.	57.0
`adjustmentBasisReference`	String	ID of the associated coupon, if applicable.	57.0
`adjustmentDescription`	String	Description of the adjustment.	57.0
`adjustmentTargetType`	`ConnectApi.CartPromotionType`	Level of the promotion target. Values are: • `Cart`—The target is cart-level. • `Item`—The target is item-level.	57.0
`adjustmentType`	`ConnectApi.AdjustmentType`	How the price adjustment amount is calculated. Values are: • `AdjustmentAmount`—The adjustment is a fixed amount. • `AdjustmentPercentage`—The adjustment is a percentage.	57.0
`adjustmentValue`	String	Value of the price adjustment.	57.0
`baseAmount`	String	Total adjustment amount.	57.0
`cartAdjustmentGroupId`	String	ID of the associated cart adjustment group.	57.0
`cartItemId`	String	ID of the associated cart item.	57.0
`id`	String	ID of the cart item price adjustment.	57.0
`priceAdjustmentCauseId`	String	ID of the associated promotion.	57.0

Property Name	Type	Description	Available Version
`priority`	Integer	Where in the sequence of adjustments this adjustment was applied.	57.0

SEE ALSO:

- ConnectApi.PromotionCartItem
- ConnectApi.PromotionCart
- ConnectApi.PromotionEvaluation
- evaluate(salesTransaction)

ConnectApi.PromotionCoupon

A coupon used in a promotion.

Property Name	Type	Description	Available Version
`couponCode`	String	Coupon code.	57.0
`couponErrorCode`	String	Error code returned if the coupon is invalid.	57.0
`id`	String	ID of the coupon.	57.0
`isValidCoupon`	Boolean	Indicates whether the coupon is valid (`true`) or invalid (`false`).	57.0

SEE ALSO:

- ConnectApi.PromotionEvaluation
- evaluate(salesTransaction)

ConnectApi.PromotionEvaluation

Results of a promotion evaluation.

Property Name	Type	Description	Available Version
`cart`	ConnectApi.PromotionCart	Cart and its items.	57.0
`coupons`	List<ConnectApi.PromotionCoupon>	List of coupon codes to enable promotions. A customer can apply a maximum of two coupons.	57.0

SEE ALSO:

- evaluate(salesTransaction)

ConnectApi.PurchaseQuantityRule

Rule that restricts the quantity of a product that can be purchased.

Property Name	Type	Description	Available Version
`increment`	String	Increment value of the quantity that can be purchased.	52.0
`maximum`	String	Maximum quantity that can be purchased.	52.0
`minimum`	String	Minimum quantity that can be purchased.	52.0

SEE ALSO:

- ConnectApi.CartItemProduct
- ConnectApi.ProductDetail
- ConnectApi.ProductSummary

ConnectApi.QuestionAndAnswersCapability

If a feed element has this capability, it has a question and comments on the feed element are answers to the question.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`bestAnswer`	`ConnectApi.Comment`	Comment selected as the best answer for the question.	32.0
`bestAnswerSelectedBy`	`ConnectApi.UserSummary`	User who selected the best answer for the question.	32.0
`canCurrentUserSelectOrRemoveBestAnswer`	Boolean	Indicates whether the context user can select or remove a best answer (`true`) or not (`false`).	32.0
`candidateAnswers`	ConnectApi.CandidateAnswersStatus	Status of candidate answers for the question.	41.0
`escalatedCase`	`ConnectApi.Reference`	If a question post is escalated, this is the case to which it was escalated.	33.0
`questionTitle`	String	Title for the question.	32.0

SEE ALSO:

- ConnectApi.FeedElementCapabilities

ConnectApi.QuestionAndAnswersSuggestions

Question and answers suggestions.

Property Name	Type	Description	Available Version
`articles`	`List<ConnectApi.ArticleItem>`	List of articles.	32.0

Property Name	Type	Description	Available Version
`questions`	`List<ConnectApi.FeedElement>`	List of questions.	32.0

ConnectApi.RankAverageDistanceOutputRepresentation

The results of calculating the average distances from sets of inventory locations to an order recipient.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`distanceUnit`	String	The specified unit of distance (miles or kilometers).	51.0
`results`	List<`ConnectApi.AverageDistanceResultOutputRepresentation`>	The results of the shipping distance calculations.	51.0

ConnectApi.ReadBy

Information about who read the feed element and when.

Property Name	Type	Description	Available Version
`lastReadDateByUser`	Datetime	When the user last read the feed element in ISO 8601 format.	40.0
`user`	`ConnectApi.UserSummary`	Information about the user who read the feed element.	40.0

SEE ALSO:

ConnectApi.ReadByPage

ConnectApi.ReadByCapability

If a feed element has this capability, the context user can mark it as read.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`isReadByMe`	Boolean	Specifies whether the feed element has been read (`true`) or not (`false`) by the context user.	40.0
`lastReadDateByMe`	Datetime	Last date when the feed element was marked read for the context user in ISO 8601 format. Otherwise, `null`.	40.0

Property Name	Type	Description	Available Version
page	ConnectApi.ReadByPage	First page of information about who read the feed element and when.	40.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.ReadByPage

A collection of information about who read the feed element and when.

Property Name	Type	Description	Available Version
currentPageToken	String	Token identifying the current page.	40.0
currentPageUrl	String	Connect REST API URL identifying the current page. The default is 25 items per page.	40.0
items	List<ConnectApi.ReadBy>	Collection of read-by information, including users and when they last read the feed element.	40.0
nextPageToken	String	Token identifying the next page, or null if there isn't a next page.	40.0
nextPageUrl	String	Connect REST API URL identifying the next page, or null if there isn't a next page.	40.0
previousPageToken	String	Reserved for future use.	40.0
previousPageUrl	String	Reserved for future use.	40.0
total	Integer	Total number of users who read the feed element. Note: This count appears in the UI under feed posts in private and unlisted Chatter groups as the "seen by" number, for example, "Seen by 48."	40.0

SEE ALSO:

ConnectApi.ReadByCapability

ConnectApi.Recommendation

A Next Best Action recommendation object.

Property Name	Type	Description	Available Version
acceptanceLabel	String	Text indicating user acceptance of the recommendation.	45.0

Property Name	Type	Description	Available Version
actionReference	String	Reference to the action to perform, for example, launching a flow.	45.0
description	String	Description of the recommendation.	45.0
externalId	String	External ID of the recommendation. This ID doesn't need to be a Salesforce 18-character ID. For example, it can be a product number from an external system.	46.0
id	String	ID of the recommendation.	45.0
image	ConnectApi.FileAsset	Image to display.	45.0
name	String	Name of the recommendation.	45.0
rejectionLabel	String	Text indicating user rejection of the recommendation.	45.0
url	String	URL to the recommendation.	45.0

ConnectApi.RecommendationAudience

A custom recommendation audience.

Property Name	Type	Description	Available Version
criteria	ConnectApi.AudienceCriteria	The criteria for the custom recommendation audience type.	36.0
id	String	18-character ID of the custom recommendation audience.	35.0
memberCount	Integer	**Important:** This property is available only in version 35.0. In version 36.0 and later, this property is available in ConnectApi.CustomListAudienceCriteria. Number of members in the custom recommendation audience.	35.0 only
members	ConnectApi.UserReferencePage	**Important:** This property is available only in version 35.0. In version 36.0 and later, this property is available in ConnectApi.CustomListAudienceCriteria. Members of the custom recommendation audience.	35.0 only
modifiedBy	ConnectApi.User	User who last modified the custom recommendation audience.	36.0
modifiedDate	Datetime	ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	36.0

Property Name	Type	Description	Available Version
`name`	String	Name of the custom recommendation audience.	35.0
`url`	String	URL to the custom recommendation audience.	35.0

SEE ALSO:

ConnectApi.RecommendationAudiencePage

ConnectApi.RecommendationAudiencePage

A list of custom recommendation audiences.

Property Name	Type	Description	Available Version
`audienceCount`	Integer	The total number of custom recommendation audiences.	35.0
`currentPageUrl`	String	URL to the current page.	35.0
`nextPageUrl`	String	URL to the next page.	35.0
`previousPageUrl`	String	URL to the previous page.	35.0
`recommendationAudiences`	List<`ConnectApi.RecommendationAudience`>	A list of custom recommendation audiences.	35.0

ConnectApi.RecommendationCollection

A list of Chatter, custom, and static recommendations.

Property Name	Type	Description	Available Version
`recommendations`	`List<ConnectApi.AbstractRecommendation>`	Collection of Chatter, custom, and static recommendations.	33.0

ConnectApi.RecommendationDefinition

Represents a custom recommendation definition.

Property Name	Type	Description	Available Version
`actionUrl`	String	The URL for acting on this custom recommendation.	35.0
`actionUrlName`	String	The text label for the action URL in the user interface.	35.0
`explanation`	String	Explanation of the custom recommendation definition.	35.0

Property Name	Type	Description	Available Version
`id`	String	18-character ID of the custom recommendation definition.	35.0
`name`	String	Name of the custom recommendation definition. The name is displayed in Setup.	35.0
`photo`	`ConnectApi.Photo`	Photo of the custom recommendation definition.	35.0
`title`	String	Title of the custom recommendation definition.	35.0
`url`	String	URL to the Connect REST API resource for the custom recommendation definition.	35.0

SEE ALSO:

ConnectApi.RecommendationDefinitionPage

ConnectApi.ScheduledRecommendation

ConnectApi.RecommendationDefinitionPage

A list of custom recommendation definitions.

Property Name	Type	Description	Available Version
`recommendationDefinitions`	List<`ConnectApi.RecommendationDefinition`>	A list of custom recommendation definitions.	35.0
`url`	String	URL to the Connect REST API resource for the recommendation definition collection.	35.0

ConnectApi.RecommendationExplanation

Explanation for a Chatter recommendation.

Subclass of ConnectApi.AbstractRecommendationExplanation.

Property Name	Type	Description	Available Version
`detailsUrl`	String	URL to explanation details or `null` if the Chatter recommendation doesn't have a detailed explanation.	32.0

SEE ALSO:

ConnectApi.AbstractRecommendation

ConnectApi.RecommendationReaction

A reaction to a recommendation produced by a recommendation strategy

Property Name	Type	Description	Available Version
aiModel	String	Reserved for future use.	47.0
contextRecord	ConnectApi.Reference	Reference to the context record.	45.0
createdBy	ConnectApi.Reference	Reference to the reaction creator.	45.0
createdDate	Datetime	Reaction creation date.	45.0
externalId	String	External target ID of the recommendation reacted on. This ID doesn't need to be a Salesforce 18-character ID. For example, it can be a product number from an external system.	46.0
id	String	Reaction record ID.	45.0
onBehalfOf	ConnectApi.Reference	Reference to the user or record that is indirectly reacting to the recommendation.	45.0
reactionType	ConnectApi.RecommendationReactionType	Type of reaction to a recommendation. Values are: • Accepted • Rejected	45.0
recommendationMode	String	Reserved for future use.	46.0
recommendationScore	Double	Reserved for future use.	46.0
strategy	ConnectApi.RecordSnapshot	Strategy that recommended the target record.	45.0
targetAction	ConnectApi.RecordSnapshot	Target action that is recommended.	45.0
targetRecord	ConnectApi.Reference	Reference to the target record.	45.0
url	String	URL to the recommendation reaction.	45.0

SEE ALSO:

ConnectApi.RecommendationReactions

ConnectApi.RecommendationReactions

A list of recommendation reactions.

Property Name	Type	Description	Available Version
currentPageUrl	String	URL to the current page of reactions in the collection.	45.0

Property Name	Type	Description	Available Version
`nextPageUrl`	String	URL to the next page of reactions in the collection.	45.0
`reactions`	List<`ConnectApi.RecommendationReaction`>	Collection of recommendation reactions.	45.0

ConnectApi.RecommendationsCapability

If a feed element has this capability, it has a recommendation.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`items`	List<`ConnectApi.AbstractRecommendation`>	A list of recommendations.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.RecommendedObject

A recommended object, such as a custom or static recommendation.

Subclass of ConnectApi.Actor

Property Name	Type	Description	Available Version
`idOrEnum`	String	ID of a recommendation definition for a custom recommendation or the enum value `Today` for static recommendations that don't have an ID (version 35.0 and later).	34.0
`motif`	`ConnectApi.Motif`	Motif of the recommended object.	34.0

ConnectApi.RecordCapability

If a comment has this capability, it has a record attachment.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`recordId`	String	ID of the record.	42.0
`url`	String	URL to the record.	42.0

ConnectApi.RecordField

Generic record field containing a label and text value.

Subclass of ConnectApi.LabeledRecordField.

No additional properties.

SEE ALSO:

- ConnectApi.CompoundRecordField
- ConnectApi.OrderItemSummary
- ConnectApi.OrderItemSummaryProduct
- ConnectApi.OrderDeliveryGroupSummary
- ConnectApi.OrderSummaryRepresentation

ConnectApi.RecordSnapshot

A record snapshot in a recommendation reaction.

Property Name	Type	Description	Available Version
`id`	String	ID of the record.	45.0
`nameAtSnapshot`	String	Name of the record when the ID was recorded.	45.0

SEE ALSO:

- ConnectApi.RecommendationReaction

ConnectApi.RecordSnapshotCapability

If a feed element has this capability, it contains all the snapshotted fields of a record for a single create record event.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`recordView`	`ConnectApi.RecordView`	A record representation that includes metadata and data so you can display the record easily.	32.0

SEE ALSO:

- ConnectApi.FeedElementCapabilities

ConnectApi.RecordSummary

Record summary.

Subclass of ConnectApi.AbstractRecordView.

Property Name	Type	Description	Available Version
entityLabel	ConnectApi.EntityLabel	Label of the record's entity.	40.0

SEE ALSO:

- ConnectApi.EmailAddress
- ConnectApi.EmailAttachment
- ConnectApi.ReferenceRecordField
- ConnectApi.ReferenceWithDateRecordField

ConnectApi.RecordSummaryList

Summary information about a list of records in the organization including custom objects.

Name	Type	Description	Available Version
records	List<ConnectApi.ActorWithId>	A list of records.	30.0
url	String	The URL to this list of records.	30.0

ConnectApi.RecordView

A view of any record in the org, including a custom object record. This object is used if a specialized object, such as User or ChatterGroup, isn't available for the record type.

Subclass of ConnectApi.AbstractRecordView.

Name	Type	Description	Available Version
sections	List<ConnectApi.RecordViewSection>	List of record view sections.	29.0

SEE ALSO:

- ConnectApi.RecordSnapshotCapability

ConnectApi.RecordViewSection

Section of record fields and values on a record detail.

Name	Type	Description	Available Version
columnCount	Integer	Number of columns to use to lay out the fields in a record section.	29.0

Name	Type	Description	Available Version
`columnOrder`	`ConnectApi.RecordColumnOrder` Enum	Order of the fields to use in the `fields` property to lay out the fields in a record section. • `LeftRight`—Fields are rendered from left to right. • `TopDown`—Fields are rendered from the top down.	29.0
`fields`	`ConnectApi.AbstractRecordField`	Fields and values for the record contained in this section.	29.0
`heading`	String	Localized label to display when rendering this section of fields.	29.0
`isCollapsible`	Boolean	Indicates whether the section can be collapsed to hide all the fields (`true`) or not (`false`).	29.0

SEE ALSO:

ConnectApi.RecordView

ConnectApi.RecordsetFilterCriteriaCollection

List of the recordset filters and records.

Property Name	Type	Description	Available Version
`recordsetFilters`	List<`ConnectApi.RecordsetFilterCriteria`>	Collection of recordset filter criteria IDs and filtered record IDs.	53.0

ConnectApi.RecordsetFilterCriteria

Recordset filter criteria and the filtered records.

Property Name	Type	Description	Available Version
`criteriaId`	String	Recordset filter criteria ID.	53.0
`recordIds`	List<String>	List of filtered record IDs.	53.0

SEE ALSO:

ConnectApi.RecordsetFilterCriteriaCollection

ConnectApi.RegisterGuestBuyerOutputRepresentation

Indicates success or failure of a register guest buyer action.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
errors	List<ConnectApi.ErrorResponse>	Any errors that were returned.	48.0
success	Boolean	Indicates whether the transaction was successful.	48.0

ConnectApi.Reference

Reference to a record.

Name	Type	Description	Available Version
id	String	The ID of the record being referenced, which could be an 18-character ID or some other string identifier.	28.0
url	String	The URL to the resource endpoint.	28.0

ConnectApi.ReferenceRecordField

Record field with a label and text value.

Subclass of ConnectApi.LabeledRecordField.

Name	Type	Description	Available Version
reference	ConnectApi.RecordSummary	Object referenced by the record field.	29.0

ConnectApi.ReferencedRefundResponse

Refund comprehensive output.

Property Name	Type	Description	Available Version
error	ConnectApi.ErrorResponse	Error response representation for the refund.	50.0
gatewayResponse	ConnectApi.RefundGatewayResponse	Gateway response received for the processed refund request.	50.0
paymentGatewayLogs	List<ConnectApi.GatewayLogResponse>	Gateway log collection representation for the refund.	50.0
paymentGroup	ConnectApi.PaymentGroupResponse	Payment group associated with the refund.	50.0
refund	ConnectApi.RefundResponse	Refund response representation.	50.0

ConnectApi.ReferenceWithDateRecordField

Record field containing a referenced object that acted at a specific time, for example, "Created By...".

Subclass of ConnectApi.LabeledRecordField.

Name	Type	Description	Available Version
`dateValue`	Datetime	Time at which the referenced object acted.	29.0
`reference`	`ConnectApi.RecordSummary`	Object referenced by the record field.	29.0

ConnectApi.RefundGatewayResponse

Refund gateway response.

Subclass of ConnectApi.AbstractGatewayResponse.

No additional properties.

ConnectApi.RefundResponse

Refund output.

Property Name	Type	Description	Available Version
`accountId`	String	ID of the account related to the refund record.	50.0
`amount`	Double	Total amount of the refund transaction performed in the payment request.	50.0
`currencyIsoCode`	String	Three-letter ISO 4217 currency code associated with the payment group record.	50.0
`effectiveDate`	Datetime	Date that the refund becomes effective.	50.0
`id`	String	ID of the refund record.	50.0
`refundNumber`	String	Number of the refund record that was created as a result of the request processing.	50.0
`requestDate`	Datetime	Date when the refund occurred.	50.0
`status`	String	Indicates the results of processing the refund transaction in the gateway. Can be DRAFT, PROCESSED or CANCELLED.	50.0

ConnectApi.RelatedFeedPost

This class is abstract.

Subclass of ConnectApi.ActorWithId.

Superclass of: ConnectApi.RelatedQuestion.

Property Name	Type	Description	Available Version
score	Double	Score of the related feed post that indicates how closely related it is to the context feed post.	37.0
title	String	Title of the related feed post.	37.0

SEE ALSO:

ConnectApi.RelatedFeedPosts

ConnectApi.RelatedFeedPosts

A collection of related feed posts.

Property Name	Type	Description	Available Version
relatedFeedPosts	List<ConnectApi.RelatedFeedPost>	Collection of related feed posts.	37.0

ConnectApi.RelatedQuestion

A related question.

Subclass of ConnectApi.RelatedFeedPost.

Property Name	Type	Description	Available Version
hasBestAnswer	Boolean	Indicates whether the question has a best answer.	37.0
interactions	ConnectApi.InteractionCapability	The number of individual views, likes, and comments on a question.	38.0

ConnectApi.ReleaseHeldFOCapacityOutputRepresentation

Response to a request to confirm held fulfillment order capacity at one or more locations. Can correspond to one action call.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
releaseHeldFOCapacityResponses	List<ConnectApi.ReleaseHeldFOCapacityResponseOutputRepresentation>	List of responses to the requests to confirm held fulfillment order capacity at one or more locations.	55.0

ConnectApi.ReleaseHeldFOCapacityResponseOutputRepresentation

Response to a request to release held fulfillment order capacity at one or more locations.

Property Name	Type	Description	Available Version
capacityResponses	List<ConnectApi.CapacityResponseOutputRepresentation>	List of responses to the requests to release held fulfillment order capacity at individual locations.	55.0

ConnectApi.ReplyIntent

Reply intent for a social post.

Property Name	Type	Description	Available Version
managedSocialAccount	ConnectApi.ManagedSocialAccount	Managed social account that replies to the social post.	45.0

SEE ALSO:

ConnectApi.ReplyIntents

ConnectApi.ReplyIntents

List of reply intents for a social post.

Property Name	Type	Description	Available Version
replies	List<ConnectApi.ReplyIntent>	List of reply intents for the social post.	45.0

SEE ALSO:

ConnectApi.SocialPostIntents

ConnectApi.RepositoryFileDetail

A detailed description of a repository file.

Subclass of ConnectApi.AbstractRepositoryFile.

No additional properties.

ConnectApi.RepositoryFileSummary

A summary of a repository file.

Subclass of ConnectApi.AbstractRepositoryFile.

No additional properties.

SEE ALSO:

ConnectApi.RepositoryFolderItem

ConnectApi.RepositoryFolderDetail

A detailed description of a repository folder.

Subclass of ConnectApi.AbstractRepositoryFolder.

No additional properties.

ConnectApi.RepositoryFolderItem

A folder item.

Property Name	Type	Description	Available Version
`file`	`ConnectApi.RepositoryFileSummary`	If the folder item is a file, the file summary. If the folder item is a folder, `null`.	39.0
`folder`	`ConnectApi.RepositoryFolderSummary`	If the folder item is a folder, the folder summary. If the folder item is a file, `null`.	39.0
`type`	`ConnectApi.FolderItemType`	Type of item in a folder. Values are: • `file` • `folder`	39.0

SEE ALSO:

ConnectApi.RepositoryFolderItemsCollection

ConnectApi.RepositoryFolderItemsCollection

A collection of repository folder items.

Property Name	Type	Description	Available Version
`currentPageUrl`	String	URL to the current page of items.	39.0
`items`	List<`ConnectApi.RepositoryFolderItem`>	Collection of items in a repository folder.	39.0
`nextPageUrl`	String	URL to the next page of items, or `null` if there isn't a next page.	39.0
`previousPageUrl`	String	URL to the previous page of items, or `null` if there isn't a previous page.	39.0

ConnectApi.RepositoryFolderSummary

A summary of a repository folder.

Subclass of ConnectApi.AbstractRepositoryFolder.

No additional properties.

SEE ALSO:

ConnectApi.RepositoryFolderItem

ConnectApi.RepositoryGroupSummary

A group summary.

Subclass of ConnectApi.AbstractDirectoryEntrySummary.

Property Name	Type	Description	Available Version
`groupType`	`ConnectApi.ContentHubGroupType`	Type of group. Values are: • `Everybody`—Group is public to everybody. • `EverybodyInDomain`—Group is public to everybody in the same domain. • `Unknown`—Group type is unknown.	39.0
`name`	String	Name of the group.	39.0

SEE ALSO:

ConnectApi.ExternalFilePermissionInformation

ConnectApi.RepositoryUserSummary

A user summary.

Subclass of ConnectApi.AbstractDirectoryEntrySummary.

Property Name	Type	Description	Available Version
`firstName`	String	First name of the user.	39.0
`lastName`	String	Last name of the user.	39.0

ConnectApi.Reputation

Reputation for a user.

Property Name	Type	Description	Available Version
`reputationLevel`	`ConnectApi.ReputationLevel`	User's reputation level.	32.0
`reputationPoints`	Double	User's reputation points, which can be earned by performing different activities.	32.0

Property Name	Type	Description	Available Version
`url`	String	Connect REST API URL to the reputation.	32.0

SEE ALSO:

ConnectApi.User

ConnectApi.ReputationLevel

Reputation level for a user.

Property Name	Type	Description	Available Version
`levelImageUrl`	String	URL to the reputation level image.	32.0
`levelName`	String	Name of the reputation level.	32.0
`levelNumber`	Integer	Reputation level number, which is the numerical rank of the level, with the lowest level at 1. Administrators define the reputation level point ranges.	32.0

SEE ALSO:

ConnectApi.Reputation

ConnectApi.RequestHeader

An HTTP request header name and value pair.

Property Name	Type	Description	Available Version
`name`	String	The name of the request header.	33.0
`value`	String	The value of the request header.	33.0

SEE ALSO:

ConnectApi.ActionLinkDefinition

ConnectApi.ResourceLinkSegment

Resource link segment.

Name	Type	Description	Available Version
`url`	String	URL to a resource not otherwise identified by an ID field, for example, a link to a list of users.	28.0

ConnectApi.ReturnItemsOutputRepresentation

Output of Return Items. Includes the ID of the generated change order for items and delivery charges being returned, as well as the ID of the generated change order for any charged return fees. Also includes information about any ReturnOrderLineItems that were created to represent remaining return quantities.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`changeOrderId`	String	ID of the change order created by processing the ReturnOrderLineItems representing returned items and delivery charges. Use this change order to create a credit memo.	52.0
`feeChangeOrderId`	String	ID of the change order created by processing the ReturnOrderLineItems representing return fees. Use this change order to create an invoice.	56.0
`returnLineItemSplits`	List<`ConnectApi.ReturnOrderItemSplitLineOutputRepresentation`>	List of properties representing any remaining quantities from partial returns processed by this call. It includes order items, delivery charges, and return fees. Each element of the list includes the ID of a split ReturnOrderLineItem and the ID of the partially processed ReturnOrderLineItem whose remaining quantity it holds.	52.0

SEE ALSO:

returnItems(returnOrderId, returnItemsInput)

ConnectApi.ReturnOrderItemSplitLineOutputRepresentation

After a change order is created for a ReturnOrderLineItem, that ReturnOrderLineItem is read-only. If the Return Items API is used to return a partial quantity, it creates a new "split" ReturnOrderLineItem to hold the remaining quantity to be returned. In that case, it returns this output property, which contains the IDs of the original and split ReturnOrderLineItems.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`newReturnOrderItemId`	String	ID of the new ReturnOrderLineItem that holds the remaining return quantity.	52.0
`originalReturnOrderItemId`	String	ID of the original ReturnOrderLineItem.	52.0

SEE ALSO:

ConnectApi.ReturnItemsOutputRepresentation

returnItems(returnOrderId, returnItemsInput)

ConnectApi.ReturnOrderOutputRepresentation

ID of the created ReturnOrder.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`returnOrderId`	String	ID of the created ReturnOrder.	50.0

SEE ALSO:

createReturnOrder(returnOrderInput)

ConnectApi.SaleResponse

Payment sale response.

Property Name	Type	Description	Available Version
`error`	`ConnectApi.ErrorResponse`	Error representation for the payment sale.	54.0
`gatewayResponse`	`ConnectApi.SaleGatewayResponse`	Information from the payment gateway following the sale request.	54.0
`payment`	`ConnectApi.PaymentResponse`	Information about the payment used in the sale request.	54.0
`paymentGatewayLogs`	List<`ConnectApi.GatewayLogResponse`>	Collection of responses from the gateway following the sale request.	54.0
`paymentGroup`	`ConnectApi.PaymentGroupResponse`	Payment group used in the sale request.	54.0
`paymentMethod`	`ConnectApi.PaymentMethodResponse`	Payment method used in the sale request.	54.0

ConnectApi.SaleGatewayResponse

Sale gateway response.

Subclass of ConnectApi.AbstractGatewayResponse.

No additional properties.

ConnectApi.ScheduledRecommendation

Represents a scheduled custom recommendation.

Property Name	Type	Description	Available Version
`channel`	`ConnectApi.RecommendationChannel`	A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are: • `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear. • `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.	36.0
`enabled`	Boolean	Indicates whether scheduling is enabled. If `true`, the custom recommendation is enabled and appears in Experience Cloud sites. If `false`, custom recommendations in feeds in Salesforce mobile web aren't removed, but no new custom recommendations appear. In Customer Service and Partner Central sites, disabled custom recommendations no longer appear.	35.0
`id`	String	18-character ID of the scheduled custom recommendation.	35.0

Property Name	Type	Description	Available Version
`rank`	Integer	The rank determining the order of this scheduled custom recommendation.	35.0
`recommendationAudienceId`	String	ID of the audience for the scheduled custom recommendation.	35.0
`recommendationDefinitionRepresentation`	`ConnectApi.RecommendationDefinition`	Custom recommendation definition that this scheduled recommendation schedules.	35.0
`url`	String	URL to the Connect REST API resource for the scheduled custom recommendation.	35.0

SEE ALSO:

ConnectApi.ScheduledRecommendationPage

ConnectApi.ScheduledRecommendationPage

A list of scheduled custom recommendations.

Property Name	Type	Description	Available Version
`scheduledRecommendations`	List<`ConnectApi.ScheduledRecommendation`>	A list of scheduled custom recommendations.	35.0
`url`	String	URL to the Connect REST API resource for the scheduled custom recommendation collection.	35.0

ConnectApi.Scope

Scope information for a target.

Property Name	Type	Description	Available Version
`name`	String	Name of the scope for the target.	48.0–49.0
`value`	String	Value of the scope for the target.	48.0–49.0

SEE ALSO:

ConnectApi.Target

ConnectApi.SearchCategory

Search category.

Property Name	Type	Description	Available Version
`category`	`ConnectApi.ProductCategoryData`	Information about the category.	52.0
`children`	List<`ConnectApi.SearchCategory`>	First-level child categories of the category searched with non-empty search results.	52.0
`productCount`	Long	Number of products in the search results that belong to the category.	52.0

SEE ALSO:

ConnectApi.ProductSearchResults

ConnectApi.SearchFacet

Search facet.

This class is abstract and is a superclass of ConnectApi.DistinctValueSearchFacet.

Property Name	Type	Description	Available Version
`attributeType`	`ConnectApi.CommerceSearchAttributeType`	Search attribute type. Values are: • `Custom` • `ProductAttribute` • `ProductCategory` • `Product2` • `Standard`	52.0
`displayName`	String	Display name of the facet.	52.0
`displayRank`	Integer	Display rank of the facet. Valid values are from 1 through 50.	52.0
`displayType`	`ConnectApi.CommerceSearchFacetDisplayType`	Display type of the facet. Values are: • `CategoryTree` • `DatePicker` • `MultiSelect` • `SingleSelect`	52.0
`facetType`	`ConnectApi.CommerceSearchFacetType`	Search facet type. Value is: • `DistinctValue`	52.0

Property Name	Type	Description	Available Version
nameOrId	String	Developer name of the attribute. In version 52.0 and later, the ID of the attribute isn't supported.	52.0

SEE ALSO:

ConnectApi.ProductSearchResults

ConnectApi.SearchSuggestion

Search suggestion.

Property Name	Type	Description	Available Version
value	String	Search suggestion.	52.0

SEE ALSO:

ConnectApi.ProductSearchSuggestionsResults

ConnectApi.ServiceAppointmentOutput

Output of the create service appointment request.

Property Name	Type	Description	Available Version
result	ConnectApi.ServiceAppointmentResult	Result of the create or update service appointment request.	53.0

ConnectApi.ServiceAppointmentResult

Contains result of the service appointment.

Property Name	Type	Description	Available Version
assignedResourceIds	List<String>	The IDs of the assigned resources.	53.0
parentRecordId	String	The ID of the parent record.	53.0
serviceAppointmentId	String	The ID of the service appointment record.	53.0

ConnectApi.ShiftsFromPattern

Shifts created from a pattern.

Property Name	Type	Description	Available Version
count	Integer	Total count of created shifts.	51.0

Property Name	Type	Description	Available Version
`error`	`ConnectApi.ShiftsFromPatternError`	Error details for shifts from a pattern.	53.0
`isSuccess`	Boolean	Indicates if the request is successful (`true`) or not (`false`).	53.0
`recordIds`	List<String>	Collection of created shift IDs.	51.0

ConnectApi.ShiftsFromPatternError

Shifts from pattern error response.

Property Name	Type	Description	Available Version
`code`	String	Error code.	53.0
`invalidServiceResourceId`	String	ID of invalid service resource.	53.0
`message`	String	Error message.	53.0

ConnectApi.SiteSearchItem

Site search result item.

Property Name	Type	Description	Available Version
`contentReference`	String	Content reference field, which is the route developer name for a site page or a content key for a content detail page.	54.0
`contentTypeDeveloperName`	String	Developer name of the content type of the site search result item.	54.0
`highlightedSnippet`	String	Text snippet that contains the query term.	54.0
`id`	String	ID of the site search result item.	54.0
`pageType`	`ConnectApi.SitesPageType`	Type of site search result item. Values are: • `ContentPage` • `SitePage`	54.0
`title`	String	Title of the site search result item.	54.0

SEE ALSO:

ConnectApi.SiteSearchResult

ConnectApi.SiteSearchResult

Site search result.

Property Name	Type	Description	Available Version
`currentPageToken`	String	Token for the current page of search results.	54.0
`currentPageUrl`	String	URL to the current page of search results.	54.0
`items`	List<`ConnectApi.SiteSearchItem`>	Collection of search result items.	54.0
`language`	String	Language of the search results.	54.0
`nextPageToken`	String	Token for the next page of search results.	54.0
`nextPageUrl`	String	URL to the next page of search results, or `null` if there isn't a next page.	54.0
`pageSize`	Integer	Number of items per page in search results.	54.0
`previousPageToken`	String	Token for the previous page of search results.	54.0
`previousPageUrl`	String	URL to the previous page of search results, or `null` if there isn't a previous page.	54.0
`totalItems`	Integer	Total number of items in the search results across all pages.	54.0

ConnectApi.SocialAccount

A social account on a social network.

Property Name	Type	Description	Available Version
`externalSocialAccountId`	String	ID of the external social account, if available.	38.0
`handle`	String	Social handle, screen name, or alias that identifies this account.	36.0
`name`	String	Name of the account as defined by the account's owner.	36.0
`profileUrl`	String	URL to the account's profile.	36.0
`socialPersonaId`	String	ID of the social persona account, if the external social account ID isn't available.	39.0

SEE ALSO:

ConnectApi.SocialPostCapability

ConnectApi.SocialAccountRelationship

Follow relationship between a managed social account and a social persona.

Property Name	Type	Description	Available Version
`isFollowed`	Boolean	Specifies whether the social account is followed by the social persona.	46.0
`isFollowing`	Boolean	Specifies whether the social account is following the social persona.	46.0
`socialAccountId`	String	ID of the social account.	46.0
`socialPersonaId`	String	ID of the social persona.	46.0

ConnectApi.SocialPostCapability

If a feed element has this capability, it can interact with a social post on a social network.

Subclass of ConnectApi.FeedElementCapabilities.

Property Name	Type	Description	Available Version
`author`	`ConnectApi.SocialAccount`	Social account that authored the social post.	36.0
`content`	String	Content body of the social post.	36.0
`deletedBy`	`ConnectApi.UserSummary`	User who deleted the social post.	38.0
`hiddenBy`	`ConnectApi.UserSummary`	User who hid the social post.	41.0
`icon`	`ConnectApi.Icon`	Icon of the social network.	36.0
`id`	String	ID associated with the social post Salesforce record.	36.0
`isOutbound`	Boolean	If `true`, the social post originated from the Salesforce application.	36.0
`likedBy`	String	External social account who liked the social post.	40.0
`messageType`	`ConnectApi.SocialPostMessageType`	Message type of the social post. Values are: • `Comment` • `Direct` • `Post` • `PrivateMessage` • `Reply` • `Retweet` • `Tweet`	38.0
`name`	String	Title or heading of the social post.	36.0
`postUrl`	String	External URL to the social post on the social network.	36.0

Property Name	Type	Description	Available Version
provider	ConnectApi.SocialNetworkProvider	Social network that this social post belongs to. Values are: • Facebook • GooglePlus • Instagram • InstagramBusiness • KakaoTalk • Kik • Line • LinkedIn • Messenger • Other • Pinterest • QQ • Rypple • SinaWeibo • SMS • Snapchat • Telegram • Twitter • VKontakte • WeChat • WhatsApp • YouTube	36.0
recipient	ConnectApi.SocialAccount	Social account that is the recipient of the social post.	36.0
recipientId	String	ID of the recipient of the social post.	38.0
reviewScale	Double	Review scale of the social post.	40.0
reviewScore	Double	Review score of the social post.	40.0
status	ConnectApi.SocialPostStatus	Status of the social post.	36.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.SocialPostIntents

Intents available for a social post.

Property Name	Type	Description	Available Version
approvalIntent	ConnectApi.ApprovalIntent	Approval intent for the social post.	45.0
deleteIntent	ConnectApi.DeleteIntents	Delete intents for the social post.	45.0
followIntent	ConnectApi.FollowIntents	Follow intents for the social persona.	45.0
hideIntent	ConnectApi.HideSocialPostIntent	Hide intent for the social post.	45.0
likeIntent	ConnectApi.LikeIntents	Like intents for the social post.	45.0
replyIntent	ConnectApi.ReplyIntents	Reply intents for the social post.	45.0

ConnectApi.SocialPostMassApprovalOutput

Approval or rejection of a large number of social posts.

Property Name	Type	Description	Available Version
isApproved	Boolean	Specifies whether the social posts were approved (true) or rejected (false) for publishing.	46.0

ConnectApi.SocialPostStatus

The status of a social post.

Property Name	Type	Description	Available Version
message	String	Status message.	36.0

Property Name	Type	Description	Available Version
`type`	`ConnectApi.SocialPostStatusType`	Status type. Values are: • `ApprovalPending` • `ApprovalRecalled` • `ApprovalRejected` • `Deleted` • `Failed` • `Hidden` • `Pending` • `Sent` • `Unknown`	36.0

SEE ALSO:

ConnectApi.SocialPostCapability

ConnectApi.Stamp

A user stamp.

Property Name	Type	Description	Available Version
`description`	String	Description of the stamp.	39.0–43.0
`id`	String	ID of the stamp.	39.0–43.0
`imageUrl`	String	Image URL of the stamp.	39.0–43.0
`label`	String	Label of the stamp.	39.0–43.0

SEE ALSO:

ConnectApi.User

ConnectApi.SortRule

Sort rule.

Property Name	Type	Description	Available Version
`direction`	`ConnectApi.CommerceSearchSortRuleDirection`	Direction of the sort rule. Values are: • `Ascending`—Sorts in ascending alphanumeric order (A–Z, 0–9). • `Default`—When no direction is defined, sorts by relevance.	52.0

Property Name	Type	Description	Available Version
		• `Descending`—Sorts in descending alphanumeric order (Z–A, 9–0).	
`label`	String	Label of the sort rule.	52.0
`labelSuffix`	`ConnectApi.CommerceSearchSortRuleLabelSuffix`	Label suffix of the sort rule.Values are: • `Ascen`—Label suffix for 'Asc' • `Ascending`—Label suffix for 'Ascending' • `Az`—Label suffix for 'A-Z' • `Descen`—Label suffix for 'Desc' • `Descending`—Label suffix for 'Descending' • `FewMany`—Label suffix for 'Few-Many' • `HeavyLight`—Label suffix for 'Heavy-Light' • `HighLow`—Label suffix for 'High-Low' • `HighestLowest`—Label suffix for 'Highest-Lowest' • `LightHeavy`—Label suffix for 'Light-Heavy' • `LowHigh`—Label suffix for 'Low-High' • `LowestHighest`—Label suffix for 'Lowest-Highest' • `ManyFew`—Label suffix for 'Many-Few' • `NewOld`—Label suffix for 'New-Old' • `Newest`—Label suffix for 'Newest' • `NewestOldest`—Label suffix for 'Newest-Oldest' • `NineZero`—Label suffix for '9-0' • `OldNew`—Label suffix for 'Old-New' • `Oldest`—Label suffix for 'Oldest' • `OldestNewest`—Label suffix for 'Oldest-Newest' • `PriceDecreasing`—Label suffix for '$$-$' • `PriceIncreasing`—Label suffix for '$-$$' • `ThickThin`—Label suffix for 'Thick-Thin' • `ThinThick`—Label suffix for 'Thin-Thick' • `Za`—Label suffix for 'Z-A' • `ZeroNine`—Label suffix for '0-9'	54.0
`nameOrId`	String	Name of the sort rule field or, if the sort rule is based on a custom field, ID.	52.0

Property Name	Type	Description	Available Version
`sortOrder`	Integer	Sort order for the rule. A lower number has higher precedence. The first sort option is called when no other option is selected.	54.0
`sortRuleId`	String	ID of the sort rule.	52.0
`type`	`ConnectApi.CommerceSearchSortRuleType`	Type of sort rule. Values are: • `ProductAttributeBased`—Sorts by product attribute fields. • `ProductBased`—Sorts by product field data. • `Relevancy`—Sorts by product and catalog term frequency. • `SortByPricebook`—Sorts by product prices defined in the specified pricebook (version 55.0 and later).	52.0

SEE ALSO:

ConnectApi.SortRulesCollection

ConnectApi.SortRulesCollection

Collection of sort rules.

Property Name	Type	Description	Available Version
`sortRules`	List<`ConnectApi.SortRule`>	Collection of sort rules.	52.0

ConnectApi.StatusCapability

If a feed post or comment has this capability, it has a status that determines its visibility.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`feedEntityStatus`	`ConnectApi.FeedEntityStatus`	Status of the feed post or comment. Values are: • `Draft`—The feed post isn't published but is visible to the author and users with Modify All Data or View All Data permission. Comments can't be drafts. • `Isolated`—The feed post or comment is isolated, and only admins can see it.	37.0

Property Name	Type	Description	Available Version
		• `PendingReview`—The feed post or comment isn't approved yet and therefore isn't published or visible. • `Published`—The feed post or comment is approved and visible.	
`isApprovableByMe`	Boolean	Specifies whether the context user can change the status of the feed post or comment.	37.0

SEE ALSO:

ConnectApi.CommentCapabilities

ConnectApi.FeedElementCapabilities

ConnectApi.StrategyTrace

Messages and trace nodes for a recommendation strategy execution.

Property Name	Type	Description	Available Version
`messages`	List<String>	Messages and errors from the strategy execution.	45.0
`nodes`	List<`ConnectApi.StrategyTraceNode`>	Nodes of the strategy execution used for debugging.	45.0

SEE ALSO:

ConnectApi.NBARecommendations

ConnectApi.StrategyTraceNode

A trace node for a recommendation strategy execution.

Property Name	Type	Description	Available Version
`inputCount`	Integer	Number of items put into the node.	45.0
`messages`	List<String>	Messages that occurred during node execution.	45.0
`nodeName`	String	Name of the node.	45.0
`nodeTime`	Long	Time spent processing inside the node.	45.0
`nodeType`	String	Type of node.	45.0
`outputCount`	Integer	Number of items returned from the node.	45.0
`outputs`	List<String>	Recommendations that are returned from the node.	45.0

Property Name	Type	Description	Available Version
totalTime	Long	Total time spent processing.	45.0

SEE ALSO:

ConnectApi.StrategyTrace

ConnectApi.SubmitCancelOutputRepresentation

ID of the change order created for a cancel action, and a set of its financial values.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
changeBalances	ConnectApi.ChangeItemOutputRepresentation	Financial values resulting from the cancel.	48.0
changeOrderId	String	ID of the change order created for the canceled order items and shipping charges. Use this change order to create a credit memo.	48.0
feeChangeOrderId	String	ID of the change order created by canceling order items with associated cancel fees. Use this change order to create an invoice.	57.0

ConnectApi.SubmitCartToExchangeOrderOutputRepresentation

Exhange order summary resulting from a submit cart to exchange order action.

Property Name	Type	Description	Available Version
exchangeOrderSummaryId	String	Exchange order summary ID.	60.0

ConnectApi.SubmitReturnOutputRepresentation

ID of the change order created for a return action, and a set of its financial values.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
changeBalances	ConnectApi.ChangeItemOutputRepresentation	Financial values resulting from the return.	48.0
changeOrderId	String	ID of the change order created for the returned order items and shipping charges. Use this change order to create a credit memo.	48.0

Property Name	Type	Description	Available Version
`feeChangeOrderId`	String	ID of the change order created by returning order items with associated return fees. Use this change order to create an invoice.	57.0

ConnectApi.Subscription

Subscription.

Name	Type	Description	Available Version
`community`	`ConnectApi.Reference`	Information about the Experience Cloud site in which the subscription exists.	28.0
`id`	String	Subscription's 18–character ID.	28.0
`subject`	`ConnectApi.Actor`	Information about the parent, that is, the thing or person being followed.	28.0
`subscriber`	`ConnectApi.Actor`	Information about the subscriber, that is, the person following this item.	28.0
`url`	String	Connect REST API URL to this specific subscription.	28.0

SEE ALSO:

- ConnectApi.FollowerPage
- ConnectApi.FollowingPage

ConnectApi.SubscriptionTermRule

Subscription term rules.

Property Name	Type	Description	Available Version
`increment`	Integer	Number of pricing term units that can be used to increase the subscription term.	59.0
`maximum`	Integer	Maximum number of pricing term units per subscription term.	59.0
`minimum`	Integer	Minimum number of pricing term units per subscription term.	59.0

ConnectApi.SupportedEmojis

A collection of supported emoji.

Property Name	Type	Description	Available Version
supportedEmojis	ConnectApi.EmojiCollection	A collection of supported emoji.	39.0

ConnectApi.SurveyInvitationEmailOutput

Survey invitation email.

Property Name	Type	Description	Available Version
errorCode	Integer	Error code for the failed call.	50.0
errorMessage	String	Details explaining why the call failed.	50.0
status	ConnectApi.SurveyEmailStatusEnum	Status of a survey invitation email. Values are: • Failed—The survey invitation email wasn't sent. • Queued—The survey invitation email is queued for sending.	50.0

ConnectApi.Target

Personalization target information.

Property Name	Type	Description	Available Version
audience	ConnectApi.AudienceTarget	Audience assigned to the target.	48.0
formulaScope	ConnectApi.FormulaScope	Formula scope of the target.	50.0
groupName	String	Group name of the target. Groups bundle related target and audience pairs.	48.0
id	String	ID of the target.	48.0
priority	Integer	Priority of the target. Within a group, priority determines which target is returned if the user matches more than one audience.	48.0
publishStatus	ConnectApi.PublishStatus	Publish status of the target. Values are: • Draft • Live	48.0
scope	List<ConnectApi.Scope>	List of scopes for the target. In version 50.0 and later, the formulaScope property returns this information.	48.0–49.0

Property Name	Type	Description	Available Version
`targetType`	String	Type of target, indicating the nature of the data being targeted.	48.0
`targetValue`	String	Value of the target.	48.0
`url`	String	URL to the target.	48.0

SEE ALSO:

ConnectApi.TargetCollection

ConnectApi.TargetCollection

List of personalization targets.

Property Name	Type	Description	Available Version
`targets`	List<`ConnectApi.Target`>	List of personalization targets.	48.0

ConnectApi.CalculateTaxResponse

Shows the results of a tax calculation request.

Subclass of ConnectApi.TaxTransactionResponse.

Property Name	Type	Description	Available Version
`adapterError`	`ConnectApi.ErrorResponse`	Adapter error.	55.0
`status`	`ConnectApi.TaxTransactionStatus`	Status of a tax transaction. Values are: • `Committed`—Tax has been committed to the transaction. • `Uncommitted`—Tax hasn't been committed to the transaction.	55.0
`taxEngineLogs`	List<`ConnectApi.TaxEngineLogResponse`>	Tax engine logs.	55.0
`taxTransactionType`	`ConnectApi.TaxTransactionType`	Type of tax transaction. Values are: • `Credit`—Transaction is a credit transaction. • `Debit`—Transaction is a debit transaction.	55.0
`taxType`	`ConnectApi.CalculateTaxType`	Type of tax calculation. Values are: • `Actual`—Calculated tax represents the final taxed amount for the transaction.	55.0

Property Name	Type	Description	Available Version
		• `Estimated`—Calculated tax represents only an estimated value before the transaction is finalized.	

ConnectApi.TaxAddressResponse

Location code of an address.

Property Name	Type	Description	Available Version
`locationCode`	String	Location code of an address.	55.0

ConnectApi.TaxAddressesResponse

The Ship From, Ship To, and Sold To addresses used during tax calculation.

Property Name	Type	Description	Available Version
`shipFrom`	`ConnectApi.TaxAddressResponse`	The Ship From address used in tax calculation.	55.0
`shipTo`	`ConnectApi.TaxAddressResponse`	The Ship To address used in tax calculation.	55.0
`soldTo`	`ConnectApi.TaxAddressResponse`	The Sold To address used in tax calculation.	55.0

ConnectApi.TaxAmountDetailsResponse

Information about tax amount values on the line item.

Property Name	Type	Description	Available Version
`exemptAmount`	Double	Amount of the line item exempt from tax application.	55.0
`taxAmount`	Double	Tax amount for the line item.	55.0
`totalAmount`	Double	Total amount of the line item.	55.0
`totalAmountWithTax`	Double	The line item's total amount with tax.	55.0

ConnectApi.TaxDetailsResponse

Tax details for each line item in a tax line item output.

Property Name	Type	Description	Available Version
exemptAmount	Double	Amount of the line item that is exempt from taxation.	55.0
exemptReason	String	The reason that any tax exemption applied to the line item.	55.0
imposition	ConnectApi.TaxImpositionResponse	The business justification for applying tax to a line item.	55.0
jurisdiction	ConnectApi.TaxJurisdictionResponse	Business address used to calculate the tax rate for the line item.	55.0
rate	Double	Tax rate for the line item.	55.0
tax	Double	Total amount of tax on the line item.	55.0
taxId	String	ID for the type of tax applied to the line item.	55.0
taxableAmount	Double	Amount of line item that can be taxed.	55.0

ConnectApi.TaxAddressResponse

Address output representation for tax calculation.

Property Name	Type	Description	Available Version
locationCode	String	Location code.	55.0

ConnectApi.TaxEngineLogResponse

Shows the results of the tax calculation request to the tax engine.

Property Name	Type	Description	Available Version
createdDate	Datetime	The date that the gateway log was created.	55.0
id	String	ID of the tax engine log record.	55.0
resultCode	String	Result code sent from the external tax engine. Review the tax engine provider's documentation for more information about the code.	55.0

ConnectApi.TaxImpositionResponse

Tax imposition output representation.

Property Name	Type	Description	Available Version
name	String	Name of the tax imposition.	55.0

Property Name	Type	Description	Available Version
type	String	Type of the tax imposition.	55.0

ConnectApi.TaxJurisdictionResponse

Represents the address or jurisdiction of the primary business used for calculating tax.

Property Name	Type	Description	Available Version
country	String	Country of the tax jurisdiction address.	55.0
id	String	ID of the tax jurisdiction address.	55.0
level	String	Level of the tax jurisdiction address.	55.0
name	String	Name of the tax jurisdiction address.	55.0
region	String	Region of the tax jurisdiction address.	55.0
stateAssignedNo	String	State-assigned number of the tax jurisdiction address.	55.0

ConnectApi.LineItemResponse

Response class that stores information about a list of one or more line items on which the tax engine has calculated tax.

Property Name	Type	Description	Available Version
addresses	ConnectApi.TaxAddressesResponse	The Ship From, Ship To, and Sold To addresses used during tax calculation.	55.0
amountDetails	ConnectApi.TaxAmountDetailsResponse	Information about tax amount values on the line item.	55.0
effectiveDate	Datetime	The date that the tax calculation takes effect.	55.0
lineNumber	String	System-generated number used to identify the tax line.	55.0
productCode	String	Product code for the product related to the taxed line item.	55.0
quantity	Double	Quantity of the taxed line item.	55.0
taxCode	String	Tax code for the taxed line item.	55.0
taxes	List<ConnectApi.TaxDetailsResponse>	Tax details for each line item in a tax line item output.	55.0

ConnectApi.TaxTransactionResponse

Tax transaction output representation

This class is abstract.

Superclass of ConnectApi.CalculateTaxResponse.

Property Name	Type	Description	Available Version
addresses	ConnectApi.TaxAddressesResponse	The Ship From, Ship To, and Sold To addresses used during tax calculation.	55.0
amountDetails	ConnectApi.TaxAmountDetailsResponse	Information about tax amount values on the line item.	55.0
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the payment group record.	55.0
description	String	Information about whether the tax transaction failed or was successful.	55.0
documentCode	String	Document code.	55.0
effectiveDate	Datetime	The date that tax is applied to the taxed entity.	55.0
lineItems	List<ConnectApi.LineItemResponse>	A list of line items on which tax was calculated.	55.0
referenceDocumentCode	String	The original document code. Used in case of subsequent transactions such as credit tax.	55.0
referenceEntityId	String	ID of the reference entity used during tax calculation.	55.0
taxTransactionId	String	ID of the tax transaction.	55.0
transactionDate	Datetime	The date that the tax transaction occurred.	55.0

ConnectApi.TextClassificationsResultWithIdOutputRepresentation

Classified text with status and text classification request IDs.

Property Name	Type	Description	Available Version
id	String	Request ID for text classifications.	**59.0**
result	ConnectApi.TextClassificationResultOutputRepresentation	Result for text classifications.	**59.0**
status	String	Request status for text classification.	**59.0**

ConnectApi.TextClassificationsResultOutputRepresentation

Text classifications result.

Property Name	Type	Description	Available Version
`classifications`	List<ConnectApi.TextClassificationOutputRepresentation>	List of classifications that each text string was given after analysis.	**59.0**
`classificationsId`	String	Response ID to receive feedback for classification.	**59.0**

ConnectApi.TextClassificationsOutputRepresentation

HTTP headers containing URLs associating text strings and classifications.

Property Name	Type	Description	Available Version
`httpHeaders`	List<ConnectApi.HttpHeaderOutputRepresentation>	HTTP headers for text classifications output. Each header provides a URL you can use to get the result of the classification. The URL takes a list of text strings and classifiers that each text string can be classified in.	**59.0**

ConnectApi.TextClassificationsBulkResultsOutputRepresentation

Text classification to get results for multiple text classification request IDs.

Property Name	Type	Description	Available Version
`resultsList`	Map<String, ConnectApi.TextClassificationsResultOutputRepresentation>	List of results for passed request IDs.	**59.0**

ConnectApi.TextSegment

Text segment.

Subclass of ConnectApi.MessageSegment.

No additional properties.

ConnectApi.TimeZone

User's time zone as selected in the user's personal settings in Salesforce. This value doesn't reflect a device's current location.

Name	Type	Description	Available Version
`gmtOffset`	Double	Signed offset, in hours, from GMT.	30.0

Name	Type	Description	Available Version
`name`	String	Display name of this time zone.	30.0

SEE ALSO:

ConnectApi.UserSettings

ConnectApi.Topic

Topic.

Name	Type	Description	Available Version
`createdDate`	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	29.0
`description`	String	Description of the topic.	29.0
`id`	String	18-character ID.	29.0
`images`	`ConnectApi.TopicImages`	Images associated with the topic.	32.0
`isBeingDeleted`	Boolean	`true` if the topic is currently being deleted; `false` otherwise. After the topic is deleted, when attempting to retrieve the topic, the output is NOT_FOUND.	33.0
`name`	String	Name of the topic.	29.0
`nonLocalizedName`	String	Non-localized name of the topic.	36.0
`talkingAbout`	Integer	Number of people talking about this topic over the last two months, based on factors such as topic additions and comments on posts with the topic.	29.0
`url`	String	URL to the topic detail page.	29.0

SEE ALSO:

ConnectApi.ManagedTopic
ConnectApi.TopicPage
ConnectApi.TopicEndorsement
ConnectApi.TopicEndorsementCollection
ConnectApi.TopicSuggestion
ConnectApi.TopicsCapability

ConnectApi.TopicEndorsement

Represents one user endorsing another user for a single topic.

Name	Type	Description	Available Version
endorsee	ConnectApi.UserSummary	User being endorsed.	30.0
endorsementId	String	18-character ID of the endorsement record.	30.0
endorser	ConnectApi.UserSummary	User performing the endorsement.	30.0
topic	ConnectApi.Topic	Topic the user is being endorsed for.	30.0
url	String	URL to the resource for the endorsement record.	30.0

ConnectApi.TopicEndorsementCollection

Collection of topic endorsement response bodies.

Name	Type	Description	Available Version
currentPageUrl	String	Connect REST API URL identifying the current page.	30.0
nextPageUrl	String	Connect REST API URL identifying the next page, or null if there isn't a next page.	30.0
previousPageUrl	String	Connect REST API URL identifying the previous page, or null if there isn't a previous page.	30.0
topicEndorsements	List<ConnectApi.Topic>	List of topic endorsements.	30.0

ConnectApi.TopicEndorsementSummary

Topic endorsement summary.

Subclass of ConnectApi.UserActivitySummary.

Property Name	Type	Description	Available Version
endorsementId	ID	ID of the topic endorsement.	42.0

ConnectApi.TopicImages

Images associated with a topic.

Property Name	Type	Description	Available Version
coverImageUrl	String	URL to a topic's cover image, which appears on the topic page. Both topics and managed topics can have cover images.	32.0

Property Name	Type	Description	Available Version
`featuredImageUrl`	String	URL to a managed topic's featured image, which appears wherever you feature it, for example, on your Experience Cloud site home page.	32.0

SEE ALSO:

ConnectApi.Topic

ConnectApi.TopicPage

Page of topics.

Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	29.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	29.0
`topics`	`List<ConnectApi.Topic>`	List of topics.	29.0

ConnectApi.TopicsCapability

If a feed element has this capability, the context user can add topics to it. Topics help users organize and discover conversations.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`canAssignTopics`	Boolean	`true` if a topic can be assigned to the feed element, `false` otherwise.	32.0
`items`	`List<ConnectApi.Topic>`	A collection of topics associated with this feed element.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.TopicSuggestion

Topic suggestion.

Name	Type	Description	Available Version
`existingTopic`	`ConnectApi.Topic`	Topic that already exists or `null` for a new topic	29.0

Name	Type	Description	Available Version
`name`	String	Topic name	29.0

SEE ALSO:

ConnectApi.TopicSuggestionPage

ConnectApi.TopicSuggestionPage

Page of topic suggestions.

Name	Type	Description	Available Version
`TopicSuggestions`	`List<ConnectApi.TopicSuggestion>`	List of topic suggestions.	29.0

ConnectApi.TopicSummary

Summary of a topic.

Property Name	Type	Description	Available Version
`id`	String	ID of the topic.	47.0
`name`	String	Name of the topic.	47.0

SEE ALSO:

ConnectApi.ManagedContentAssociations

ConnectApi.TrackedChangeBundleCapability

If a feed element has this capability, it has a group of other feed elements aggregated into one feed element called a *bundle*. This type of bundle aggregates feed tracked changes.

Subclass of ConnectApi.BundleCapability.

Property Name	Type	Description	Available Version
`changes`	List<`ConnectApi.TrackedChangeItem`>	Collection of feed tracked changes.	31.0

ConnectApi.TrackedChangeItem

Tracked change item.

Name	Type	Description	Available Version
`fieldName`	String	The name of the field that was updated.	28.0
`newValue`	String	The new value of the field or `null` if the field length is long.	28.0
`oldValue`	String	The old value of the field or `null` if the field length is long.	28.0

SEE ALSO:

ConnectApi.TrackedChangesCapability

ConnectApi.TrackedChangeBundleCapability

ConnectApi.TrackedChangesCapability

If a feed element has this capability, it contains all changes to a record for a single tracked change event.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`changes`	List<`ConnectApi.TrackedChangeItem`>	Collection of feed tracked changes.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.UnauthenticatedUser

Unauthenticated user.

Subclass of ConnectApi.Actor.

No additional properties.

Instances of this class are used as the actor for feed items and comments posted by Chatter customers.

ConnectApi.UnreadConversationCount

Unread count for a conversation.

Name	Type	Description	Available Version
`hasMore`	Boolean	Specifies if there are more than 50 unread messages (`true`) or not (`false`).	29.0
`unreadCount`	Integer	The total number of unread messages.	29.0

ConnectApi.UpDownVoteCapability

If a feed post or comment has this capability, users can upvote or downvote it.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`downVoteCount`	Long	Number of downvotes.	41.0
`myVote`	`ConnectApi.UpDownVoteValue`	Specifies the context user's vote. Values are: • `Down` • `None` • `Up`	41.0
`upVoteCount`	Long	Number of upvotes.	41.0

SEE ALSO:

ConnectApi.CommentCapabilities

ConnectApi.FeedElementCapabilities

ConnectApi.UpVoteSummary

Summary of an upvote.

Subclass of ConnectApi.UserFeedEntityActivitySummary.

No additional properties.

ConnectApi.User

User.

This class is abstract.

Subclass of ConnectApi.ActionWithId.

Superclass of:

- ConnectApi.UserDetail
- ConnectApi.UserSummary

Name	Type	Description	Available Version
`additionalLabel`	String	If one exists, an extra label for the user, for example, "Customer," "Partner," or "Acme Corporation."	30.0
`communityNickname`	String	User's nickname in the site.	32.0
`companyName`	String	Name of the company. If your Experience Cloud site allows access without logging in, the value is `null` for guest users.	28.0

Name	Type	Description	Available Version
`displayName`	String	User's name that is displayed in the site. If nicknames are enabled, the nickname is displayed. If nicknames aren't enabled, the full name is displayed.	32.0
`firstName`	String	User's first name. In version 39.0 and later, if nicknames are enabled, `firstName` is `null`.	28.0
`isChatterGuest`	Boolean	`true` if user is a Chatter customer; `false` otherwise.	28.0
`isInThisCommunity`	Boolean	`true` if user is in the same site as the context user; `false` otherwise.	28.0
`lastName`	String	User's last name. In version 39.0 and later, if nicknames are enabled, `lastName` is `null`.	28.0
`outOfOffice`	`ConnectApi.OutOfOffice`	If one exists, extra out-of-office message for the user.	40.0
`photo`	`ConnectApi.Photo`	Information about the user's photos.	28.0
`reputation`	`ConnectApi.Reputation`	Reputation of the user.	32.0
`stamps`	List<`ConnectApi.Stamp`>	Collection of the user's stamps. In version 44.0 and later, use SOQL to get a user's stamps.	39.0–43.0
`title`	String	User's title. If your Experience Cloud site allows access without logging in, the value is `null` for guest users.	28.0
`userType`	`ConnectApi.UserType` Enum	Type of user. • `ChatterGuest`—User is an external user in a private group. • `ChatterOnly`—User is a Chatter Free customer. • `Guest`—User is unauthenticated. • `Internal`—User is a standard org member. • `Portal`—User is an external user in an Experience Cloud site. • `System`—User is Chatter Expert or a system user. • `Undefined`—User is a user type that is a custom object.	28.0

SEE ALSO:

ConnectApi.RecommendationAudience

ConnectApi.UserActivitiesJob

User activities job.

Property Name	Type	Description	Available Version
`jobToken`	String	Token that identifies the user activities job.	42.0
`jobType`	String	Type of user activities job. Value is `export` or `purge`.	42.0
`message`	String	Message describing the status and expected outcome of the job. When the job completes, you receive an email with information about the Salesforce file that contains `ConnectApi.UserActivityCollection`.	42.0

ConnectApi.UserActivityCollection

User activity collection.

Property Name	Type	Description	Available Version
`activityType`	String	Type of user activity. Values are: • `Bookmark`—User bookmarked a post. • `ChatterActivity`—Total counts of posts and comments made and likes and comments received for a user. • `ChatterLike`—User liked a post or comment. • `Comment`—User commented on a post. • `CompanyVerify`—User verified comment. • `DownVote`—User downvoted a post or comment. • `FeedEntityRead`—User read a post. • `FeedRead`—User read a feed. • `Mute`—User muted a post. • `Post`—User made a post. • `TopicEndorsement`—User endorsed another user on a topic or received endorsement on a topic. • `UpVote`—User upvoted a post or comment.	42.0
`userActivities`	List<`ConnectApi.UserActivitySummary`>	Collection of user activities.	42.0

ConnectApi.UserActivitySummary

User activity summary.

This class is abstract.

Superclass of:

- ConnectApi.CommentSummary
- ConnectApi.FeedPostSummary
- ConnectApi.FeedReadSummary
- ConnectApi.TopicEndorsementSummary
- ConnectApi.UserFeedEntityActivitySummary

Property Name	Type	Description	Available Version
`activityDate`	Datetime	Date of the user activity.	42.0
`activityType`	String	Type of user activity. Values are: • `Bookmark`—User bookmarked a post. • `ChatterActivity`—Total counts of posts and comments made and likes and comments received for a user. • `ChatterLike`—User liked a post or comment. • `Comment`—User commented on a post. • `CompanyVerify`—User verified comment. • `DownVote`—User downvoted a post or comment. • `FeedEntityRead`—User read a post. • `FeedRead`—User read a feed. • `Mute`—User muted a post. • `Post`—User made a post. • `TopicEndorsement`—User endorsed another user on a topic or received endorsement on a topic. • `UpVote`—User upvoted a post or comment.	42.0
`activityUrl`	String	URL to the user activity.	42.0
`community`	`ConnectApi.CommunitySummary`	Experience Cloud site in which the user performed the activity.	42.0

SEE ALSO:

ConnectApi.UserActivityCollection

ConnectApi.UserCapabilities

Capabilities associated with a user profile.

Name	Type	Description	Available Version
`canChat`	Boolean	Specifies if the context user can use Chatter Messenger with the subject user (`true`) or not (`false`)	29.0
`canDirectMessage`	Boolean	Specifies if the context user can direct message the subject user (`true`) or not (`false`)	29.0
`canEdit`	Boolean	Specifies if the context user can edit the subject user's account (`true`) or not (`false`)	29.0
`canFollow`	Boolean	Specifies if the context user can follow the subject user's feed (`true`) or not (`false`)	29.0
`canViewFeed`	Boolean	Specifies if the context user can view the feed of the subject user (`true`) or not (`false`)	29.0
`canViewFullProfile`	Boolean	Specifies if the context user can view the full profile of the subject user (`true`) or only the limited profile (`false`)	29.0
`isModerator`	Boolean	Specifies if the subject user is a Chatter moderator or admin (`true`) or not (`false`)	29.0

SEE ALSO:

ConnectApi.UserProfile

ConnectApi.UserChatterSettings

User's global Chatter settings.

Name	Type	Description	Available Version
`defaultGroupEmailFrequency`	`ConnectApi.GroupEmailFrequency` Enum	The default frequency with which a user receives email from a group when they join it.	28.0

ConnectApi.UserDetail

Details about a user in an org.

Subclass of ConnectApi.User.

If the context user doesn't have permission to see a property, its value is set to `null`.

Name	Type	Description	Available Version
`aboutMe`	String	Text from user's profile.	28.0

Name	Type	Description	Available Version
address	ConnectApi.Address	User's address.	28.0
bannerPhoto	ConnectApi.BannerPhoto	User's banner photo.	36.0
chatterActivity	ConnectApi.ChatterActivity	Chatter activity statistics.	28.0
chatterInfluence	ConnectApi.GlobalInfluence	User's influence rank.	28.0
email	String	User's email address.	28.0
followersCount	Integer	Number of users following this user.	28.0
followingCounts	ConnectApi.FollowingCounts	Information about items the user is following.	28.0
groupCount	Integer	Number of groups user is following.	28.0
hasChatter	Boolean	`true` if user has access to Chatter; `false` otherwise.	31.0
isActive	Boolean	`true` if user is active; `false` otherwise.	28.0
managerId	String	18-character ID of the user's manager.	28.0
managerName	String	Locale-based concatenation of manager's first and last names.	28.0
phoneNumbers	List<ConnectApi.PhoneNumber>	Collection of user's phone numbers.	28.0
thanksReceived	Integer	The number of times the user has been thanked.	29.0
username	String	Username of the user, such as *Admin@mycompany.com*.	28.0

SEE ALSO:

- ConnectApi.UserPage
- ConnectApi.UserProfile

ConnectApi.UserFeedEntityActivitySummary

User feed entity activity summary.

This class is abstract.

Subclass of ConnectApi.UserActivitySummary.

Superclass of:

- ConnectApi.BookmarkSummary
- ConnectApi.ChatterActivitySummary
- ConnectApi.CompanyVerifySummary

- ConnectApi.DownVoteSummary
- ConnectApi.FeedEntityReadSummary
- ConnectApi.LikeSummary
- ConnectApi.MuteSummary
- ConnectApi.UpVoteSummary

Property Name	Type	Description	Available Version
`feedEntityId`	String	ID of the feed entity.	42.0

ConnectApi.UserGroupDetailPage

A page of groups that a user is a member of.

Property Name	Type	Description	Available Version
`currentPageUrl`	String	URL to the current page.	45.0
`groups`	List<`ConnectApi.ChatterGroupDetail`>	Collection of groups that the user is a member of.	45.0
`nextPageUrl`	String	URL to the next page, or `null` if there is no next page.	45.0
`previousPageUrl`	String	URL to the previous page, or `null` if there is no previous page.	45.0
`total`	Integer	Total number of groups that the user is a member of.	45.0

ConnectApi.UserGroupPage

A paginated list of groups the context user is a member of.

Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	28.0
`groups`	`List<ConnectApi.ChatterGroupSummary>`	List of groups.	28.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	28.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	28.0
`total`	Integer	Total number of groups across all pages.	28.0

ConnectApi.UserMission

Mission details for a user.

Subclass of ConnectApi.AbstractUserMissionActivity.

Property Name	Type	Description	Available Version
`missionName`	String	Name of the mission.	46.0
`missionThreshold`	Integer	Threshold of the mission. When a user reaches this activity count, the mission is achieved.	46.0

ConnectApi.UserMissionActivitiesJob

User mission activities job.

Property Name	Type	Description	Available Version
`jobToken`	String	Token that identifies the mission user activities job.	45.0
`jobType`	String	Type of user activities job, either `export` or `purge`.	45.0
`message`	String	Message describing the status and expected outcome of the job. When the job completes, you receive an email with information about the Salesforce file that contains `ConnectApi.UserMissionActivityCollection`.	45.0

ConnectApi.UserMissionActivity

User activity associated with missions.

Subclass of ConnectApi.AbstractUserMissionActivity.

No additional properties.

ConnectApi.UserMissionActivityCollection

List of mission activities for a user.

Property Name	Type	Description	Available Version
`community`	`ConnectApi.CommunitySummary`	Experience Cloud site in which the user performed activities.	45.0
`userId`	String	ID of the user.	45.0
`userMissionActivities`	List<`ConnectApi.AbstractUserMissionActivity`>	List of mission activities performed by the user.	45.0

Property Name	Type	Description	Available Version
`userName`	String	Name of the user.	45.0

SEE ALSO:

ConnectApi.UserMissionActivitiesJob

ConnectApi.UserMissionActivityStatus

Status of mission activity for a user.

Property Name	Type	Description	Available Version
`message`	String	Success or error message.	45.0
`status`	String	Status of mission activity for a user.	45.0

ConnectApi.UserOauthInfo

User OAuth information.

Name	Type	Description	Available Version
`availableExternalEmailService`	`Connect.OauthProviderInfo`	The available OAuth service provider.	37.0
`isAuthenticated`	Boolean	Specifies whether the user is authenticated (`true`) or not (`false`).	37.0

ConnectApi.UserPage

Page of users.

Name	Type	Description	Available Version
`currentPageToken`	Integer	Token identifying the current page.	28.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	28.0
`nextPageToken`	Integer	Token identifying the next page, or `null` if there isn't a next page.	28.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	28.0
`previousPageToken`	Integer	Token identifying the previous page, or `null` if there isn't a previous page.	28.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	28.0

Name	Type	Description	Available Version
users	List<ConnectApi.UserDetail>	List of user detail information. If the context user doesn't have permission to see a property, the property is set to null.	28.0

ConnectApi.UserProfile

Details necessary to render a view of a user profile.

Name	Type	Description	Available Version
capabilities	ConnectApi.UserCapabilities	The context user's capabilities specific to the subject user's profile.	29.0
id	String	The ID of the user attached to the profile.	29.0
tabs	List<ConnectApi.UserProfileTab>	The tabs visible to the context user specific to the subject user's profile.	29.0
url	String	The URL of the user's profile.	29.0
userDetail	ConnectApi.UserDetail	The details about the user attached to the profile.	29.0

ConnectApi.UserProfileTab

Information about a profile tab.

Name	Type	Descriptio	Available Version
id	String	The tab's unique identifier or 18–character ID	29.0
isDefault	Boolean	Specifies if the tab appears first when clicking the user profile (true) or not (false)	29.0
tabType	ConnectApi.UserProfileTabType Enum	Specifies the type of tab • CustomVisualForce—Tab that displays data from a Visualforce page. • CustomWeb—Tab that displays data from any external web-based application or web page. • Element—Tab that displays generic content inline. • Feed—Tab that displays the Chatter feed. • Overview—Tab that displays user details.	29.0

Name	Type	Descriptio	Available Version
`tabUrl`	String	The current tab's content URL (for non built-in tab types)	29.0

SEE ALSO:

ConnectApi.UserProfile

ConnectApi.UserReferencePage

A list of user references.

Property Name	Type	Description	Available Version
`currentPageUrl`	String	URL to the current page.	35.0
`nextPageUrl`	String	URL to the next page.	35.0
`previousPageUrl`	String	URL to the previous page.	35.0
`userCount`	Integer	Number of users in the collection.	35.0
`users`	List<`ConnectApi.Reference`>	A collection of user references.	35.0

SEE ALSO:

ConnectApi.CustomListAudienceCriteria

ConnectApi.UserSettings

Settings specific to a user.

Property	Type	Description	Available Version
`approvalPosts`	Boolean	User can approve workflows from Chatter posts.	28.0
`canAccessPersonalStreams`	Boolean	User can access personal stream feeds.	40.0
`canFollow`	Boolean	User can follow users and records.	28.0
`canModifyAllData`	Boolean	User has Modify all Data permission.	28.0
`canOwnGroups`	Boolean	User can own groups.	28.0
`canViewAllData`	Boolean	User has View all Data permission.	28.0
`canViewAllGroups`	Boolean	User has View all Groups permission.	28.0

Property	Type	Description	Available Version
`canViewAllUsers`	Boolean	User has View all Users permission.	28.0
`canViewCommunitySwitcher`	Boolean	User can see the site switcher menu.	34.0
`canViewFullUserProfile`	Boolean	User can see other user's Chatter profile.	28.0
`canViewPublicFiles`	Boolean	User can see all files that are public.	28.0
`currencySymbol`	String	Currency symbol to use for displaying currency values. Applicable only when the `ConnectApi.Features.multiCurrency` property is `false`.	28.0
`externalUser`	Boolean	User is a Chatter customer.	28.0
`fileSyncLimit`	Integer	Maximum number of files user can sync.	32.0
`fileSyncStorageLimit`	Integer	Maximum storage for synced files, in megabytes (MB).	29.0
`folderSyncLimit`	Integer	Maximum number of folders user can sync.	32.0
`hasAccessToInternalOrg`	Boolean	User is a member of the internal org.	28.0
`hasChatter`	Boolean	User has access to Chatter.	31.0
`hasFileSync`	Boolean	User has Sync Files permission.	28.0
`hasFieldServiceLocationTracking`	Boolean	User has Field Service GPS tracking enabled.	41.0
`hasFieldServiceMobileAccess`	Boolean	User has access to the Field Service mobile app.	41.0
`hasFileSyncManagedClientAutoUpdate`	Boolean	Administrator for the user's org allows file sync clients to update automatically.	34.0
`hasRestDataApiAccess`	Boolean	User has access to REST API.	29.0
`timeZone`	`ConnectApi.TimeZone`	The user's time zone as selected in the user's personal settings in Salesforce. This value does not reflect a device's current location.	30.0
`userDefaultCurrencyIsoCode`	String	The ISO code for the default currency. Applicable only when the `ConnectApi.Features.multiCurrency` property is `true`.	28.0
`userId`	String	18-character ID of the user.	28.0

Property	Type	Description	Available Version
`userLocale`	String	Locale of user.	28.0

SEE ALSO:

ConnectApi.OrganizationSettings

ConnectApi.UserSummary

User summary.

Subclass of ConnectApi.User.

Name	Type	Description	Available Version
`isActive`	Boolean	`true` if user is active; `false` otherwise.	28.0

ConnectApi.VerifiedCapability

If a comment has this capability, users with permission can mark it as verified or unverified.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`isVerifiableByMe`	Boolean	Specifies whether the context user has permission to mark comments as verified or unverified (`true`) or not (`false`).	41.0
`isVerified`	Boolean	Specifies whether the comment is marked as verified (`true`) or not (`false`).	41.0
`isVerifiedBy Anonymized`	Boolean	Specifies whether the comment is marked as verified by an anonymous user (`true`) or not (`false`). If the comment has never been marked as verified or unverified, `null`. Also `null` if the context user doesn't have permission to mark comments as verified or unverified.	43.0
`lastVerifiedByUser`	`ConnectApi.UserSummary`	User who last marked the comment as verified or unverified, otherwise `null`. Also `null` if the context user doesn't have permission to mark comments as verified or unverified.	41.0
`lastVerifiedDate`	Datetime	Date when the comment was last marked as verified or unverified, otherwise `null`. Also `null` if the context user doesn't have permission to mark comments as verified or unverified.	41.0

SEE ALSO:

ConnectApi.CommentCapabilities

ConnectApi.Vote

An upvote or downvote on a feed element or comment.

Property Name	Type	Description	Available Version
`type`	`ConnectApi. UpDownVoteValue`	Type of vote for a feed element or comment. • `Down` • `Up`	42.0
`user`	`ConnectApi. UserSummary`	User who voted on the feed element or comment.	42.0

Property Name	Type	Description	Available Version
votedItem	ConnectApi.Reference	Reference to the feed element or comment that was voted on.	42.0

SEE ALSO:

ConnectApi.VotePage

ConnectApi.VotePage

A page of upvotes or downvotes on a feed element or comment.

Property Name	Type	Description	Available Version
currentPageToken	Integer	Token identifying the current page.	42.0
currentPageUrl	String	Connect REST API URL identifying the current page.	42.0
items	List<ConnectApi.Vote>	Collection of users and their upvotes or downvotes. Upvotes include likes and upvotes. For example, if a post receives five likes and three upvotes, the number of upvotes is eight. For this reason, the collection of users and their upvotes also includes users who liked the post or comment. If a user both liked and upvoted a post, they appear only once in the collection.	42.0
nextPageToken	Integer	Token identifying the next page, or null if there isn't a next page.	42.0
nextPageUrl	String	Connect REST API URL identifying the next page, or null if there isn't a next page.	42.0
previousPageToken	Integer	Token identifying the previous page, or null if there isn't a previous page.	42.0
previousPageUrl	String	Connect REST API URL identifying the previous page, or null if there isn't a previous page.	42.0
total	Long	Total number of upvotes or downvotes for the feed element or comment. The number of upvotes includes the number of likes and upvotes. For example, if a post receives five likes and three upvotes, the total number of upvotes is eight. If a user both liked and upvoted a post, we count that as two upvotes.	42.0

ConnectApi.Wishlist

Wishlist, including summary and items.

Property Name	Type	Description	Available Version
page	ConnectApi.WishlistItemCollection	Page of wishlist items.	49.0
summary	ConnectApi.WishlistSummary	Summary of the wishlist.	49.0

SEE ALSO:

ConnectApi.WishlistsSummary

ConnectApi.WishlistItem

Item in a wishlist.

Property Name	Type	Description	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the product.	49.0
error	ConnectApi.ErrorResponse	Error information.	49.0
listPrice	Double	List price of the wishlist item.	49.0
productSummary	ConnectApi.CartItemProduct	Product summary for the wishlist item.	49.0
salesPrice	Double	Sales price of the wishlist item.	49.0
wishlistItemId	String	ID of the wishlist item.	49.0

SEE ALSO:

ConnectApi.WishlistItemCollection

ConnectApi.WishlistItemCollection

Collection of wishlist items.

Property Name	Type	Description	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the product.	49.0
currentPageToken	String	Token identifying the current page.	49.0
currentPageUrl	String	Connect REST API URL identifying the current page.	49.0
hasErrors	Boolean	Specifies whether at least one of the results contains an error (`true`) or not (`false`).	49.0

Property Name	Type	Description	Available Version
items	List<ConnectApi.WishlistItem>	Collection of wishlist items.	49.0
nextPageToken	String	Token identifying the next page, or null if there isn't a next page.	49.0
nextPageUrl	String	Connect REST API URL identifying the next page, or null if there isn't a next page.	49.0
previousPageToken	String	Token identifying the previous page, or null if there isn't a previous page.	49.0
previousPageUrl	String	Connect REST API URL identifying the previous page, or null if there isn't a previous page.	49.0

SEE ALSO:

ConnectApi.Wishlist

ConnectApi.WishlistsSummary

List of wishlist summaries and the displayed list for the context user.

Property Name	Type	Description	Available Version
displayedList	ConnectApi.Wishlist	Oldest wishlist displayed for the context user.	49.0
summaries	List<ConnectApi.WishlistSummary>	Summary of wishlists belonging to the context user.	49.0
wishlistCount	Integer	Total number of wishlists belonging to the context user.	49.0

ConnectApi.WishlistSummary

Summary of a wishlist.

Property Name	Type	Description	Available Version
createdDate	Datetime	Created date for the wishlist in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.	49.0
id	String	ID of the wishlist.	49.0
modifiedDate	Datetime	Last modified date of the wishlist in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.	49.0
name	String	Name of the wishlist.	49.0

Property Name	Type	Description	Available Version
wishlistProductCount	Integer	Unique product count in the wishlist.	49.0

SEE ALSO:

- ConnectApi.Wishlist
- ConnectApi.WishlistsSummary

ConnectApi.WishlistToCartResult

Result of adding a wishlist to a cart.

Property Name	Type	Description	Available Version
cartId	String	ID of the cart to which the products were added.	49.0
failedWishlistToCartItems	List<ConnectApi.CartItemResult>	Wishlist items that weren't successfully added to the cart.	49.0
productsFailedCount	Integer	Total number of products that weren't added to the cart.	49.0
productsRequestedCount	Integer	Total number of products requested to add to the cart.	49.0
productsSucceededCount	Integer	Total number of products that were successfully added to the cart.	49.0
succeededWishlistToCartItems	List<ConnectApi.CartItemResult>	Wishlist items that were successfully added to the cart.	49.0

ConnectApi.WrappedMapObject

Map of a parameter name and value.

Property Name	Type	Description	Available Version
wrappedMap	Map<String, Object>	Map of parameter name and value.	60.0

ConnectApi.Zone

Information about a Chatter Answers zone.

Name	Type	Description	Available Version
description	String	The description of the zone.	29.0
id	String	The zone ID.	29.0

Name	Type	Description	Available Version
`isActive`	Boolean	Indicates whether or not the zone is active.	29.0
`isChatterAnswers`	Boolean	Indicates whether or not the zone is available for Chatter Answers.	29.0
`name`	String	Name of the zone.	29.0
`url`	String	The URL of the zone.	30.0
`visibility`	`ConnectApi.ZoneShowIn`	Zone visibility type. • `Community`—Available in an Experience Cloud site. • `Internal`—Available internally only. • `Portal`—Available in a portal.	29.0
`visibilityId`	String	If the zone is available in a site, this property contains the ID of the site. If the zone is available to all sites, this property contains the value `All`.	29.0

SEE ALSO:

ConnectApi.ZonePage

ConnectApi.ZonePage

Page of zones.

Name	Type	Description	Available Version
`zones`	`List<ConnectApi.Zone>`	A list of one or more zones.	29.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	29.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	29.0

ConnectApi.ZoneSearchPage

Page of zone search results.

Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	29.0

Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	29.0
`items`	`List<ConnectApi.ZoneSearchResult>`	List of search results.	29.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	29.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	29.0

ConnectApi.ZoneSearchResult

Information about a specific zone search result.

Name	Type	Description	Available Version
`hasBestAnswer`	Boolean	Indicates if the search result has a best answer.	29.0
`id`	String	ID of the search result. The search result can be a question or an article.	29.0
`title`	String	Title of the search result.	29.0
`type`	`ConnectApi.ZoneSearchResultType` Enum	Specifies the zone search result type. • `Article`—Search results contain only articles. • `Question`—Search results contain only questions.	29.0
`voteCount`	String	Number of votes given to the search result.	29.0

ConnectApi.ZoneSearchPage

Retired `ConnectApi` Output Classes

These `ConnectApi` output classes are retired.

IN THIS SECTION:

ConnectApi.ApprovalAttachment
Attach an approval to a feed item.

ConnectApi.BasicTemplateAttachment
Attachments in feed items with type `BasicTemplate`.

ConnectApi.CanvasTemplateAttachment

Attachments in feed items with type `CanvasPost`.

ConnectApi.CaseComment

Attachments in feed items with type `CaseCommentPost`.

ConnectApi.ContentAttachment

Attachments in feed items with the type `ContentPost`.

ConnectApi.DashboardComponentAttachment

Attachments in feed items with type `DashboardSnapshot`.

ConnectApi.DatacloudCompany

Information about a Data.com company.

ConnectApi.DatacloudCompanies

Lists all companies that were purchased in a specific order, page URLs, and the number of companies in the order.

ConnectApi.DatacloudContact

Information about a Data.com contact.

ConnectApi.DatacloudContacts

Lists all contacts that were purchased in the specific order, page URLs, and the number of contacts in the order.

ConnectApi.DatacloudOrder

Represents a Datacloud order.

ConnectApi.DatacloudPurchaseUsage

Information about Data.com point usage for monthly and list pool users.

ConnectApi.EmailMessage

Email message from a case.

ConnectApi.FeedItemAttachment

Feed item attachment.

ConnectApi.FeedItemPage

A paged collection of `ConnectApi.FeedItem` objects.

ConnectApi.FeedItemTopicPage

Feed item topic page.

ConnectApi.FeedPoll

Attachment of `ConnectApi.FeedItem` objects where the `type` property is `PollPost`.

ConnectApi.LinkAttachment

Link attached to a feed item.

ConnectApi.NonEntityRecommendation

A recommendation for a non-Salesforce entity, such as an application.

ConnectApi.RecordSnapshotAttachment

Fields of a record at the point in time when the record was created.

ConnectApi.TrackedChangeAttachment

Tracked change attachment to a feed item.

ConnectApi.ApprovalAttachment

Attach an approval to a feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.ApprovalCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Name	Type	Description	Available Version
`id`	String	A work item ID.	28.0–31.0
`postTemplateFields`	`List<ConnectApi.ApprovalPostTemplateField>`	Collection of approval post template fields	28.0–31.0
`processInstanceStepId`	String	An approval step ID.	30.0–31.0
`status`	`ConnectApi.WorkflowProcessStatus` Enum	Status of a workflow process. • `Approved` • `Fault` • `Held` • `NoResponse` • `Pending` • `Reassigned` • `Rejected` • `Removed` • `Started`	28.0–31.0

ConnectApi.BasicTemplateAttachment

Attachments in feed items with type `BasicTemplate`.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.EnhancedLinkCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Property	Type	Description	Available Version
`description`	String	An optional description with a 500 character limit.	28.0–31.0
`icon`	`ConnectApi.Icon`	An optional icon.	28.0–31.0
`linkRecordId`	String	If `linkURL` refers to a Salesforce record, `linkRecordId` contains the ID of the record.	28.0–31.0

Property	Type	Description	Available Version
`linkUrl`	String	An optional URL to a detail page if there is more content that can't be displayed inline. Do not specify `linkUrl` unless you specify a `title`.	28.0–31.0
`title`	String	An optional title to the detail page. If `linkUrl` is specified, the title links to `linkUrl`.	28.0–31.0

ConnectApi.CanvasTemplateAttachment

Attachments in feed items with type `CanvasPost`.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.CanvasCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Property	Type	Description	Available Version
`description`	String	Optional. Description of the canvas app. The maximum length of this field is 500 characters.	29.0–31.0
`developerName`	String	Specifies the developer name (API name) of the canvas app.	29.0–31.0
`height`	String	Optional. The height of the canvas app in pixels. Default height is 200 pixels.	29.0–31.0
`icon`	ConnectApi.Icon	The canvas app icon.	29.0–31.0
`namespacePrefix`	String	Optional. The namespace prefix of the Developer Edition organization in which the canvas app was created.	29.0–31.0
`parameters`	String	Optional. Parameters passed to the canvas app in JSON format. Example: `{'isUpdated'='true'}`	29.0–31.0
`thumbnailUrl`	String	Optional. A URL to a thumbnail image for the canvas app. Maximum dimensions are 120x120 pixels.	29.0–31.0
`title`	String	Specifies the title of the link used to call the canvas app.	29.0–31.0

ConnectApi.CaseComment

Attachments in feed items with type `CaseCommentPost`.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.CaseCommentCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Name	Type	Description	Available Version
`actorType`	`ConnectApi.CaseActorType` Enum	Type of user who made the comment. • `Customer`—if a Chatter customer made the comment • `CustomerService`—if a service representative made the comment	28.0–31.0
`createdBy`	`ConnectApi.UserSummary`	Comment's creator	28.0–31.0
`createdDate`	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z	28.0–31.0
`id`	String	Comment's 18–character ID	28.0–31.0
`published`	Boolean	Specifies whether the comment has been published	28.0–31.0
`text`	String	Comment's text	28.0–31.0

ConnectApi.ContentAttachment

Attachments in feed items with the type `ContentPost`.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.ContentCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Name	Type	Description	Available Version
`checkSum`	String	MD5 checksum for the file.	28.0–31.0
`contentUrl`	String	URL for link files and Google Docs; otherwise the value is `null`.	31.0–31.0
`description`	String	Description of the attachment.	28.0–31.0
`downloadUrl`	String	File's URL. This value is `null` if the content is a link or a Google Doc.	28.0–31.0
`fileExtension`	String	File's extension.	28.0–31.0
`fileSize`	String	Size of the file in bytes. If size cannot be determined, returns `unknown`.	28.0–31.0
`fileType`	String	Type of file.	28.0–31.0
`hasImagePreview`	Boolean	`true` if the file has a preview image available, otherwise ,`false`.	28.0–29.0
`hasPdfPreview`	Boolean	`true` if the file has a PDF preview available, otherwise, `false`.	28.0–31.0
`id`	String	Content's 18-character ID.	28.0–31.0
`isInMyFileSync`	Boolean	`true` if the file is synced with Salesforce Files Sync; `false` otherwise. **Note:** Salesforce Files Sync was retired on May 25, 2018.	28.0–31.0

Name	Type	Description	Available Version
`mimeType`	String	File's MIME type.	28.0–31.0
`renditionUrl`	String	URL to the file's rendition resource.	28.0–31.0
`renditionUrl240By180`	String	URL to the 240 x 180 rendition resource for the file.For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	30.0–31.0
`renditionUrl720By480`	String	URL to the 720 x 480 rendition resource for the file.For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	30.0–31.0
`textPreview`	String	Text preview of the file if available; `null` otherwise.	30.0–31.0
`thumb120By90RenditionStatus`	String	Specifies the rendering status of the 120 x 90 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	30.0–31.0
`thumb240By180RenditionStatus`	String	Specifies the rendering status of the 240 x 180 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	30.0–31.0
`thumb720By480RenditionStatus`	String	Specifies the rendering status of the 720 x 480 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	30.0–31.0
`title`	String	Title of the file.	28.0–31.0
`versionId`	String	18-character ID for this version of the content.	28.0–31.0

ConnectApi.DashboardComponentAttachment

Attachments in feed items with type `DashboardSnapshot`.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.DashboardComponentSnapshotCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Name	Type	Description	Available Version
componentId	String	Component's 18–character ID.	28.0–31.0
componentName	String	Name of the component. If no name is saved with the component, returns the localized string, "Untitled Component.".	28.0–31.0
dashboardBodyText	String	Text displayed next to the actor in the body of a feed item. This is used instead of the default body text. If no text is specified, and there is no default body text, returns null.	28.0–31.0
dashboardId	String	Dashboard's 18–character ID.	28.0–31.0
dashboardName	String	Name of the dashboard.	28.0–31.0
fullSizeImageUrl	String	URL of the full-sized dashboard image.	28.0–31.0
lastRefreshDate	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z, specifying when this dashboard was last refreshed.	28.0–31.0
lastRefreshDate DisplayText	String	The text of the last refresh date to be displayed, such as, "Last refreshed on October 31, 2011."	28.0–31.0
runningUser	ConnectApi. User Summary	The user running the dashboard.	28.0–31.0
thumbnailUrl	String	URL of the thumbnail-sized dashboard image.	28.0–31.0

ConnectApi.DatacloudCompany

Information about a Data.com company.

All company information is visible for companies that you purchased and own. If you haven't purchased a company, some of the fields are hidden. Hidden fields are fully or partially hidden by asterisks "***."

Property Name	Type	Description	Available Version
activeContacts	Integer	The number of active Data.com contacts who work in the company.	32.0
address	ConnectApi.Address	The postal address for the company. This is typically a physical address that can include the city, state, street, and postal code.	32.0
annualRevenue	Double	The amount of money that the company makes in one year. Annual revenue is measured in US dollars.	32.0
companyId	String	A unique numerical identifier for the company. This is the Data.com identifier for a company.	32.0

Property Name	Type	Description	Available Version
`description`	String	A brief synopsis of the company that provides a general overview of the company and what it does.	32.0
`dunsNumber`	String	A randomly generated nine-digit number that's assigned by Dun & Bradstreet (D&B) to identify unique business establishments.	32.0
`industry`	String	A description of the type of industry such as "Telecommunications," "Agriculture," or "Electronics."	32.0
`isInactive`	Boolean	Indicates whether this company is active (true) or not (false). Inactive companies have out-of-date information in Data.com.	32.0
`isOwned`	Boolean	• True: You or your organization owns this company. • False: Neither you nor your organization owns this company.	32.0
`naicsCode`	String	North American Industry Classification System (NAICS) codes were created to provide more details about a business's service orientation. The code descriptions are focused on what a business does.	32.0
`naicsDescription`	String	A description of the NAICS classification.	32.0
`name`	String	The name of the company.	32.0
`numberOfEmployees`	Integer	The number of employees who are working for the company.	32.0
`ownership`	String	The type of ownership of the company: • Public • Private • Government • Other	32.0
`phoneNumbers`	ConnectApi.PhoneNumber	The list of telephone numbers for the company, including the type. Here are some possible types of telephone numbers. • Mobile • Work • Fax	32.0

Property Name	Type	Description	Available Version
`sic`	String	Standard Industrial Codes (SIC) is a numbering convention that indicates what type of service a business provides. It's a four-digit value.	32.0
`sicDescription`	String	A description of the SIC classification.	32.0
`site`	String	Company's site. For example, HQ, Single Location, or Branch. An organization status of the company. • Branch: a secondary location to a headquarter location. • Headquarter: the parent company has branches or subsidiaries. • Single Location: a single business with no subsidiaries or branches.	32.0
`tickerSymbol`	String	The symbol that uniquely identifies companies that are traded on public stock exchanges.	32.0
`tradeStyle`	String	A legal name under which a company conducts business.	32.0
`updatedDate`	Datetime	The date of the most recent change to this company's information.	32.0
`website`	String	The standard URL for the company's home page.	32.0
`yearStarted`	String	The year when the company was founded.	32.0

ConnectApi.DatacloudCompanies

Lists all companies that were purchased in a specific order, page URLs, and the number of companies in the order.

Property Name	Type	Description	Available Version
`companies`	ConnectApi.DatacloudCompany	A detailed list of companies that were part of a single order.	32.0
`currentPageUrl`	String	The URL for the current page of a list of companies.	32.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	32.0
`previousPageUrl`	String	The URL to the previous page of companies that were viewed before the current page. If this value is `null`, there's no previous page.	32.0

Property Name	Type	Description	Available Version
total	Integer	The number of companies in the order. You can calculate the number of pages to display by dividing this number by your page size. The default page size is 25.	32.0

ConnectApi.DatacloudContact

Information about a Data.com contact.

All contact information is visible for contacts that you purchased. If you have not purchased a contact, some of the fields will be hidden. Hidden fields are fully or partially hidden by asterisks "***."

Property Name	Type	Description	Available Version
address	ConnectApi.Address	The contact's business address.	32.0
companyId	String	A unique numerical identifier for the company where the contact works. This is the Data.com identifier for a company.	32.0
companyName	String	The company name where the contact works.	32.0
contactId	String	A unique numerical identifier for the contact. This is the Data.com identifier for a contact.	32.0
department	String	The department in the company where the contact works. Here are some possible departments. • Engineering • IT • Marketing • Sales	32.0
email	String	The most current business email address for the contact.	32.0
firstName	String	The first name of the contact.	32.0
isInactive	Boolean	Whether this contact is active (true) or not (false). Inactive contacts have out-of-date information in Data.com.	32.0
isOwned	Boolean	Whether this contact is owned (true) or not (false).	32.0
lastName	String	The last name of the contact.	32.0
level	String	A human resource label that designates a person's level in the company. Here are some possible levels. • C-Level	32.0

Property Name	Type	Description	Available Version
		• Director • Manager • Staff	
`phoneNumbers`	ConnectApi.PhoneNumber	Telephone numbers for the contact, which can include direct-dial business telephone numbers, mobile telephone numbers, and business headquarters telephone numbers. The type of telephone number is also indicated.	32.0
`title`	String	The title of the contact, such as CEO or Vice President.	32.0
`updatedDate`	Datetime	The date of the most recent change to this contact's information.	32.0

SEE ALSO:

ConnectApi.DatacloudContacts

ConnectApi.DatacloudContacts

Lists all contacts that were purchased in the specific order, page URLs, and the number of contacts in the order.

Property Name	Type	Description	Available Version
`contacts`	List<ConnectApi.DatacloudContact>	A detailed list of purchased contacts.	32.0
`currentPageUrl`	String	URL to the current page of contacts.	32.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	32.0
`previousPageUrl`	String	URL to the previous page of contacts. This value is null if there is no previous page.	32.0
`total`	Integer	Number of contacts that are associated with this order. Can be greater than the number of contacts that are shown on a single page.	32.0

ConnectApi.DatacloudOrder

Represents a Datacloud order.

Property Name	Type	Description	Available Version
`entityUrl`	String	URL to a list of contacts or companies that were purchased with this order.	32.0

Property Name	Type	Description	Available Version
`id`	String	Unique number that's used to track your order information.	32.0
`purchaseCount`	Integer	Number of contacts or companies that were purchased for this order.	32.0
`purchaseDate`	Datetime	Purchase date for this order.	32.0
`url`	String	GET request URL for this order.	32.0

ConnectApi.DatacloudPurchaseUsage

Information about Data.com point usage for monthly and list pool users.

Property Name	Type	Description	Available Version
`listpoolCreditsAvailable`	Integer	The points or credits that are available in a pool of credits for your organization. This pool of credits can be used by any List Pool User in your organization.	32.0
`listpoolCreditsUsed`	Integer	The points or credits that have been used from a pool of credits that are used by List Pool Users to purchase records.	32.0
`monthlyCreditsAvailable`	Integer	The total credits that are assigned to a Monthly User. Unused credits expire at the end of each month.	32.0
`monthlyCreditsUsed`	Integer	The credits that are used by a Monthly User for the current month.	32.0

ConnectApi.EmailMessage

Email message from a case.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.EmailMessageCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Name	Type	Description	Available Version
`direction`	`ConnectApi.EmailMessageDirection` Enum	The direction of the email message. • `Inbound`—An inbound message (sent by a customer). • `Outbound`—An outbound message (sent to a customer by a support agent).	29.0–31.0
`emailMessageId`	String	The ID of the email message.	29.0–31.0

Name	Type	Description	Available Version
`subject`	String	The subject of the email message.	29.0–31.0
`textBody`	String	The body of the email message.	29.0–31.0
`toAddresses`	List<ConnectApi.EmailAddress>	A list of email addresses to send the message to.	29.0–31.0

ConnectApi.FeedItemAttachment

Feed item attachment.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.FeedElementCapability is used.

This class is abstract.

Subclasses:

- ConnectApi.ApprovalAttachment
- ConnectApi.BasicTemplateAttachment
- ConnectApi.CanvasTemplateAttachment
- Connectapi.EmailMessage
- ConnectApi.CaseComment
- ConnectApi.ContentAttachment
- ConnectApi.DashboardComponentAttachment
- ConnectApi.FeedPoll
- ConnectApi.LinkAttachment
- ConnectApi.RecordSnapshotAttachment
- ConnectApi.TrackedChangeAttachment

Message segments in a feed item are typed as `ConnectApi.MessageSegment`. Feed item capabilities are typed as `ConnectApi.FeedItemCapability`. Record fields are typed as `ConnectApi.AbstractRecordField`. These classes are all abstract and have several concrete subclasses. At runtime you can use `instanceof` to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

Important: The composition of a feed can change between releases. Write your code to handle instances of unknown subclasses.

ConnectApi.FeedItemPage

A paged collection of `ConnectApi.FeedItem` objects.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.FeedElementPage is used.

Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	28.0–31.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	28.0–31.0

Name	Type	Description	Available Version
`isModifiedToken`	String	Opaque polling token to use in the *`since`* parameter of the `ChatterFeeds.isModified` method. The token describes when the feed was last modified. **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	28.0–31.0
`isModifiedUrl`	String	Connect REST API URL with a *`since`* request parameter that contains an opaque token that describes when the feed was last modified. Returns `null` if the feed isn't a news feed. Use this URL to poll a news feed for updates. **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	28.0–31.0
`items`	`List<ConnectApi.FeedItem>`	List of feed items	28.0–31.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	28.0–31.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	28.0–31.0
`updatesToken`	String	Token to use in an `updatedSince` parameter, or `null` if not available.	30.0–31.0
`updatesUrl`	String	A Connect REST API resource with a query string containing the value of the `updatesToken` property. The resource returns the feed items that have been updated since the last request. Use the URL as it is—do not modify it. Property is `null` if not available.	30.0–31.0

ConnectApi.FeedItemTopicPage

Feed item topic page.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.TopicsCapability is used.

Name	Type	Description	Available Version
`canAssignTopics`	Boolean	`true` if a topic can be assigned to the feed item, `false` otherwise.	28.0–31.0
`topics`	`List<ConnectApi.Topic>`	List of topics.	28.0–31.0

ConnectApi.FeedPoll

Attachment of `ConnectApi.FeedItem` objects where the `type` property is `PollPost`.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.PollCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Name	Type	Description	Available Version
`choices`	`List<ConnectApi.FeedPollChoice>`	List of choices for poll.	28.0–31.0
`myChoiceId`	String	ID of the poll choice that the context user has voted for in this poll. Returns `null` if the context user hasn't voted.	28.0–31.0
`totalVoteCount`	Integer	Total number of votes cast on the feed poll item.	28.0–31.0

ConnectApi.LinkAttachment

Link attached to a feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.LinkCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Name	Type	Description	Available Version
`title`	String	Title given to the link if available, otherwise, `null`.	28.0–31.0
`url`	String	The link URL.	28.0–31.0

ConnectApi.NonEntityRecommendation

A recommendation for a non-Salesforce entity, such as an application.

Subclass of ConnectApi.AbstractRecommendation.

Important: ConnectApi.NonEntityRecommendation isn't used in version 34.0 and later. In version 34.0 and later, ConnectApi.EntityRecommendation is used for all recommendations.

Property Name	Type	Description	Available Version
`displayLabel`	String	Localized label of the non-entity object.	32.0
`motif`	`ConnectApi.Motif`	Motif for the non-entity object.	32.0

ConnectApi.RecordSnapshotAttachment

Fields of a record at the point in time when the record was created.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.RecordSnapshotCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Name	Type	Description	Available Version
`recordView`	`ConnectApi.RecordView`	The representation of the record.	29.0–31.0

ConnectApi.TrackedChangeAttachment

Tracked change attachment to a feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.TrackedChangesCapability is used.

Name	Type	Description	Available Version
`changes`	`List<ConnectApi.TrackedChangeItem>`	A list of tracked changes.	28.0–31.0

`ConnectApi` Enums

Enums specific to the `ConnectApi` namespace.

`ConnectApi` enums inherit all properties and methods of Apex enums.

Enums are not versioned. Enum values are returned in all API versions. Clients should handle values they don't understand gracefully.

Enum	Description
`ConnectApi.ActionLinkExecutionsAllowed`	Number of times an action link can be executed. • `Once`—An action link can be executed only one time across all users. • `OncePerUser`—An action link can be executed only one time for each user. • `Unlimited`—An action link can be executed an unlimited number of times by each user. If the action link's `actionType` is `Api` or `ApiAsync`, you can't use this value.
`ConnectApi.ActionLinkType`	Type of action link. • `Api`—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server. • `ApiAsync`—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to `/connect/action-links/`***`actionLinkId`*** to set the status to `SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete. • `Download`—The action link downloads a file from the action URL. • `Ui`—The action link takes the user to a web page at the action URL.

Enum	Description
`ConnectApi.ActivitySharingTypeEnum`	Type of sharing operation. • `Everyone`—The activity is shared with everyone. • `MyGroups`—The activity is shared only with a selection of the context user's groups. • `OnlyMe`—The activity is private.
`ConnectApi.AdjustmentAmountScope`	Scope of the price adjustment amount. • `Total`—The adjustment scope is the total price. • `Unit`—The adjustment scope is the unit price. • `UnproratedTotal`—The adjustment scope is the unprorated total price.
`ConnectApi.AdjustmentType`	How the price adjustment amount is calculated. • `AdjustmentAmount`—The adjustment is a fixed amount. • `AdjustmentPercentage`—The adjustment is a percentage.
`ConnectApi.ArticleTopicJobType`	Type of operation to perform on articles and topics. • `AssignTopicsToArticle`—Assign topics to articles in a data category. • `UnassignTopicsFromArticle`—Unassign topics from articles in a data category.
`ConnectApi.AsyncOperationStatus`	Asynchronous processing status of the cart, if asynchronous processing is enabled for the store. • `Completed` • `Errored` • `Processing`
`ConnectApi.AudienceCriteriaOperator`	Operator used in the personalization audience criterion. • `Contains` • `Equal` • `GreaterThan` • `GreaterThanOrEqual` • `Includes` • `LessThan` • `LessThanOrEqual` • `NotEqual` • `NotIncludes` • `StartsWith`
`ConnectApi.AudienceCriteriaType`	Type of personalization audience criterion. • `Audience`—Criterion based on audience. • `Default`—Audience has no criteria. • `Domain`—Criterion based on domain. • `FieldBased`—Criterion based on object fields.

Enum	Description
	• `GeoLocation`—Criterion based on location. • `Permission`—Criterion based on standard or custom permissions. • `Profile`—Criterion based on profile.
`ConnectApi.BannerStyle`	Decorates a feed item with a color and set of icons. • `Announcement`—An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.
`ConnectApi.BillingFrequency`	Billing frequency for a subscription. • `Annual` • `Monthly`
`ConnectApi.BotVersion ActivationStatus`	Activation status of the bot version. • `Active` • `Inactive`
`ConnectApi.BundleType`	Type of bundle. • `GenericBundle`—A bundle that contains no additional information and is just a collection of feed elements. • `TrackedChanges`—A bundle that represents a collection of feed-tracked changes. The bundle includes summary information about the feed-tracked changes that make up the bundle.
`ConnectApi. CalculatedInsight DefinitionTypeEnum`	Definition type of the calculated insight. • `CalculatedMetric` • `ExternalMetric` • `StreamingMetric`
`ConnectApi. CalculateTaxType`	Type of tax calculation. • `Actual`—Calculated tax represents the final taxed amount for the transaction. • `Estimated`—Calculated tax represents only an estimated value before the transaction is finalized.
`ConnectApi.CalloutStatus`	Indicates whether a named credential is enabled for callout. • `Disabled` • `Enabled`
`ConnectApi.CardCategory`	Indicates a credit card or debit card. • `CreditCard` • `DebitCard`

Enum	Description
`ConnectApi.CardType`	Credit card issuer. • `AmericanExpress` • `DinersClub` • `JCB` • `Maestro` • `MasterCard` • `Visa`
`ConnectApi.CartItemSortOrder`	Sort order for items in a cart. • `CreatedDateAsc`—Sorts by oldest creation date. • `CreatedDateDesc`—Sorts by most recent creation date. • `NameAsc`—Sorts by name in ascending alphabetical order (A–Z). • `NameDesc`—Sorts by name in descending alphabetical order (Z–A). • `SalesPriceAsc`—Sorts from lowest to highest negotiated price. • `SalesPriceDesc`—Sorts from highest to lowest negotiated price.
`ConnectApi.CartItemType`	Type of item in a cart. • `DeliveryCharge` • `Product`
`ConnectApi.CartMessageSeverity`	Severity of cart message. • `Error` • `Info` • `Warning`
`ConnectApi.CartPromotionType`	Level of the promotion target. • `Cart`—The target is cart-level. • `Item`—The target is item-level.
`ConnectApi.CartStatus`	Status of the cart. • `Active`—Cart is created and available for modifications, like adding or removing products or promotions. • `Checkout`—Cart is in checkout. If the customer modifies the cart, the current checkout session is canceled. • `Closed`—Checkout is complete and an order was created. The cart cannot be modified. • `PendingClosed`—Cart is marked to be closed, but the request isn't completed yet. The cart can't be modified. This value is available in API version 57.0 and later. • `PendingDelete`—Cart is marked for delete, but the request isn't completed yet. The cart can't be modified. • `Processing`—Cart is processing. For example, taxes are being calculated. The cart can't be modified.

Enum	Description
`ConnectApi.CartTaxType`	Tax type of the cart. • `Gross`—Gross taxation policy. • `Net`—Net taxation policy.
`ConnectApi.CartType`	Type of cart. • `Cart`—Cart created by a customer. • `PayNowReadOnly`—Clone of a Template cart that the customer can check out with using the Pay Now feature. • `Template`—Cart created by an internal user.
`ConnectApi.CaseActorType`	Type of user who made the comment. • `Customer`—if a Chatter customer made the comment • `CustomerService`—if a service representative made the comment
`ConnectApi.CaseCommentEventType`	Event type of a comment in Case Feed. • `NewInternal`—A case comment that has newly been marked Internal Only. • `NewPublished`—A newly published case comment. • `NewPublishedByCustomer`—A case comment by a customer that was newly published. • `PublishExisting`—An existing case comment that was republished. • `PublishExistingByCustomer`—An existing case comment by a customer that was republished. • `UnpublishExistingByCustomer`—An existing case comment by a customer that was unpublished. • `UnpublishExsiting`—An existing case comment that was unpublished. Note: Unfortunately, this typo is in the code, not the documentation. Use this spelling in your code.
`ConnectApi.CdpIdentityResolutionConfigurationType`	Source object for an identity resolution ruleset. • `Account` • `Individual`
`ConnectApi.CdpIdentityResolutionMatchMethodType`	Match method for a match rule criterion. • `Exact`—Exact match. • `ExactNormalized`—Exact normalized match. • `Fuzzy`—Fuzzy match with medium precision. • `FuzzyHigh`—Fuzzy match with high precision. • `FuzzyLow`—Fuzzy match with low precision.

Enum	Description
`ConnectApi.CdpIdentityResolutionReconciliationRuleType`	Default reconciliation rule applied to fields in the object the reconciliation rule applies to. • `LastUpdated` • `MostFrequent` • `SourceSequence`
`ConnectApi.CdpIdentityResolutionRunNowResultCode`	Result of an identity resolution ruleset job run. • `ExceededMaximumNumberOfSuccessfulRunsAllowedIn24Hours` • `IdentityResolutionJobIsAlreadyRunning` • `NoPendingChangesJobRunSkipped` • `SuccessfullySubmittedIdentityResolutionJobRunRequest`
`ConnectApi.CommentType`	Type of comment. • `ContentComment`—Comment holds a content capability. • `TextComment`—Comment contains only text.
`ConnectApi.CommerceAddressSort`	Sort order for Commerce addresses. • `CreatedDateAsc`—Sort in ascending order of created date. • `CreatedDateDesc`—Sort in descending order of created date. • `NameAsc`—Sort in ascending order of name. • `NameDesc`—Sort in descending order of name.
`ConnectApi.CommerceSearchAttributeType`	Search attribute type. • `Custom` • `ProductAttribute` • `ProductCategory` • `Product2` • `Standard`
`ConnectApi.CommerceSearchFacetDisplayType`	Display type of the facet. • `CategoryTree` • `DatePicker` • `MultiSelect` • `SingleSelect`
`ConnectApi.CommerceSearchFacetType`	Search facet type. • `DistinctValue`
`ConnectApi.CommerceSearchGroupingOption`	Grouping option for search results. • `NoGrouping`—Search results aren't grouped. • `VariationParent`—Search results are grouped by the variation parent.

Enum	Description
`ConnectApi.CommerceSearchIndexBuildType`	Build type of the index. • `Full` • `Incremental`
`ConnectApi.CommerceSearchIndexCreationType`	Creation type of the index. • `Manual` • `Scheduled`
`ConnectApi.CommerceSearchIndexStatus`	Status of the index. • `Completed` • `Failed` • `InProgress`
`ConnectApi.CommerceSearchIndexUsage`	Usage of the index. • `Live` • `OutOfUse`
`ConnectApi.CommerceSearchSortRuleDirection`	Direction of the sort rule. • `Ascending`—Sorts in ascending alphanumeric order (A–Z, 0–9). • `Default`—When no direction is defined, sorts by relevance. • `Descending`—Sorts in descending alphanumeric order (Z–A, 9–0).
`ConnectApi.CommerceSearchSortRuleLabelSuffix`	Label suffix of the sort rule. • `Ascen`—Label suffix for 'Asc' • `Ascending`—Label suffix for 'Ascending' • `Az`—Label suffix for 'A-Z' • `Descen`—Label suffix for 'Desc' • `Descending`—Label suffix for 'Descending' • `FewMany`—Label suffix for 'Few-Many' • `HeavyLight`—Label suffix for 'Heavy-Light' • `HighLow`—Label suffix for 'High-Low' • `HighestLowest`—Label suffix for 'Highest-Lowest' • `LightHeavy`—Label suffix for 'Light-Heavy' • `LowHigh`—Label suffix for 'Low-High' • `LowestHighest`—Label suffix for 'Lowest-Highest' • `ManyFew`—Label suffix for 'Many-Few' • `NewOld`—Label suffix for 'New-Old' • `Newest`—Label suffix for 'Newest' • `NewestOldest`—Label suffix for 'Newest-Oldest' • `NineZero`—Label suffix for '9-0'

Enum	Description
	• `OldNew`—Label suffix for 'Old-New' • `Oldest`—Label suffix for 'Oldest' • `OldestNewest`—Label suffix for 'Oldest-Newest' • `PriceDecreasing`—Label suffix for '$$-$' • `PriceIncreasing`—Label suffix for '$-$$' • `ThickThin`—Label suffix for 'Thick-Thin' • `ThinThick`—Label suffix for 'Thin-Thick' • `Za`—Label suffix for 'Z-A' • `ZeroNine`—Label suffix for '0-9'
`ConnectApi.CommerceSearchSortRuleType`	Type of sort rule. • `ProductAttributeBased`—Sorts by product attribute fields. • `ProductBased`—Sorts by product field data. • `Relevancy`—Sorts by product and catalog term frequency. • `SortByPricebook`—Sorts by product prices defined in the specified pricebook (version 55.0 and later).
`ConnectApi.CommerceSearchTopProductType`	Type of the top product to return for each product group in search results. • `VariationParent`
`ConnectApi.CommunityFlagReasonType`	Reason a post, comment, or file is flagged. • `FlaggedByRule`—Moderation rule flagged the item. • `FlaggedBySystem`—Einstein flagged the item. • `FlaggedByUserAsInappropriate`—User flagged the item as inappropriate. • `FlaggedByUserAsSpam`—User flagged the item as spam.
`ConnectApi.CommunityFlagType`	Type of moderation flag. • `FlagAsInappropriate`—Flag for inappropriate content. • `FlagAsSpam`—Flag for spam.
`ConnectApi.CommunityFlagVisibility`	Visibility behavior of a flag for various user types. • `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item. • `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.
`ConnectApi.CommunityStatus`	Status of the Experience Cloud site. • `Live` • `Inactive` • `UnderConstruction`

Enum	Description
`ConnectApi.ActivityType`	Type of activity. • `All` • `Event` • `Task`
`ConnectApi.ContentHub AuthenticationProtocol`	Authentication protocol used for the repository. • `NoAuthentication`—Repository doesn't require authentication. • `Oauth`—Repository uses OAuth authentication protocol. • `Password`—Repository uses user name and password authentication protocol.
`ConnectApi.ContentHub DirectoryEntryType`	Type of directory entry. • `GroupEntry` • `UserEntry`
`ConnectApi.ContentHub ExternalItemSharingType`	Sharing status for the external file. • `DomainSharing`—File is shared with the domain. • `PrivateSharing`—File is private or shared only with individuals. • `PublicSharing`—File is publicly shared.
`ConnectApi.ContentHub GroupType`	Type of group. • `Everybody`—Group is public to everybody. • `EverybodyInDomain`—Group is public to everybody in the same domain. • `Unknown`—Group type is unknown.
`ConnectApi.ContentHub ItemType`	Item types. • `Any`—Includes files and folders. • `FilesOnly`—Includes files only. • `FoldersOnly`—Includes folders only.
`ConnectApi.ContentHub StreamSupport`	Support for content streaming. • `ContentStreamAllowed` • `ContentStreamNotAllowed` • `ContentStreamRequired`
`ConnectApi.ContentHub VariableType`	Data type of the value of the field. • `BooleanType` • `DateTimeType` • `DecimalType` • `HtmlType` • `IdType` • `IntegerType`

Enum	Description
	• `StringType` • `UriType` • `XmlType`
`ConnectApi.ConversationApplicationIntegrationType`	Conversation application integration types. • `Api` • `Slack`
`ConnectApi.CreateCredentialAction`	Action to take when creating the credential. • `Refresh`
`ConnectApi.CredentialAuthenticationProtocol`	Authentication protocol of the external credential. • `AwsSv4` • `Basic` • `Custom` • `Jwt` • `OAuth`
`ConnectApi.CredentialAuthenticationProtocolVariant`	Authentication protocol variant of the external credential. • `AwsSv4_STS`—AWS Signature Version 4 with Security Token Service. • `ClientCredentialsClientSecret`—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's request body. • `ClientCredentialsClientSecretBasic`—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's authorization header, as with Basic authentication. • `ClientCredentialsJwtAssertion`—OAuth 2.0 Client Credentials JSON Web Token assertion. • `JwtBearer`—OAuth 2.0 JSON Web Token bearer flow. • `NoAuthentication`—No authentication. • `RolesAnywhere`—AWS Signature Version 4 with Identity and Access Management (IAM) Roles Anywhere.
`ConnectApi.CredentialAuthenticationStatus`	Status of the credential authentication. • `Configured`—Credential has all required credentials for at least one principal. • `NotConfigured`—Credential isn't configured. • `Unknown`—Credential status can't be determined because the authentication protocol is custom.
`ConnectApi.CredentialPrincipalType`	Type of credential principal. • `AwsStsPrincipal` • `NamedPrincipal` • `PerUserPrincipal`

Enum	Description
`ConnectApi.DatacloudUserType`	Type of user. • `Monthly`—A user type that's assigned monthly point limits for purchasing Data.com records. Only the assigned user can use monthly points. Points expire at the end of the month. Monthly is the default setting for `DatacloudUserType`. • `Listpool`—A user type that allows users to draw from a pool of points to purchase Data.com records.
`ConnectApi.DatacloudImportStatusTypeEnum`	Status of the import. • `Success`—Indicates that selected records were added to the org's CRM. • `Duplicate`—Marks a record that is already in the org's CRM. The API determines whether an org allows the addition of duplicate records in its CRM. • `Error`—Indicates that the selected records weren't added to the org's CRM.
`ConnectApi.DigestPeriod`	Time period that's included in a Chatter email digest. • `DailyDigest`—The email includes up to the 50 latest posts from the previous day. • `WeeklyDigest`—The email includes up to the 50 latest posts from the previous week.
`ConnectApi.EmailMessageDirection`	Direction of an email message on a case. • `Inbound`—An inbound message (sent by a customer). • `Outbound`—An outbound message (sent to a customer by a support agent).
`ConnectApi.EmailMessageStatus`	Status of an email message on a case. • `DraftStatus` • `ForwardedStatus` • `NewStatus` • `ReadStatus` • `RepliedStatus` • `SentStatus`
`ConnectApi.ExtensionInformationType`	Information type of the extension. • `Lightning`
`ConnectApi.ExternalCredentialParameterType`	Parameter type of the external credential. • `AuthParameter` • `AuthProvider` • `AuthProviderUrl` • `AuthProviderUrlQueryParameter` • `JwtBodyClaim` • `JwtHeaderClaim` • `SigningCertificate`

Enum	Description
`ConnectApi.ExternalCredentialPrincipalAccessType`	Access type of the external credential principal. • `PermissionSet` • `PermissionSetGroup` • `Profile`
`ConnectApi.FeedCommentSortOrder`	Order of comments. • `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order. • `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order. • `Relevance`—Sorts by most relevant content.
`ConnectApi.FeedDensity`	Density of the feed. • `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations. • `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.
`ConnectApi.FeedElementCapabilityType`	Capabilities of a feed element in API versions 31.0 and later. If a capability exists on a feed element, the capability is available, even if the value doesn't exist or is `null`. If the capability doesn't exist, it isn't available. • `AssociatedActions`—The feed element includes information about actions associated with it. • `Approval`—The feed element includes information about an approval. • `Banner`—The body of the feed element has an icon and border. • `Bookmarks`—The context user can bookmark the feed element. Bookmarked feed elements are visible in the bookmarks feed. • `Bundle`—The feed element has a group of other feed elements that display as a bundle in the feed. The bundle type determines the additional data associated with the bundle. • `CallCollaboration`—The feed element has a recording comment. • `Canvas`—The feed element renders a canvas app. • `CaseComment`—The feed element has a case comment in the case feed. • `ChatterLikes`—The context user can like the feed element. • `Close`—The feed element can't be edited, commented on, or deleted. If the feed element is a poll, it can't be voted on. • `Comments`—The context user can add comments to the feed element. • `Content`—The feed element has a file. • `DashboardComponentSnapshot`—The feed element has a dashboard component snapshot. • `DirectMessage`—The feed element is a direct message. • `Edit`—Users who have permission can edit the feed element.

Enum	Description
	• `EmailMessage`—The feed element has an email message from a case. • `EnhancedLink`—The feed element has a link that can contain supplemental information like an icon, a title, and a description. • `Extensions`—The feed element has one or more extension attachments. • `FeedEntityShare`—The feed element has a feed entity shared with it. • `Files`—The feed element has one or more file attachments. • `Interactions`—The feed element has information about user interactions. • `Link`—The feed element has a URL. • `MediaReferences`—The feed element has one or more media references. • `Moderation`—Users in an Experience Cloud site can flag the feed element for moderation. • `Mute`—The context user can mute the feed element. • `Origin`—A feed action created the feed element. • `Pin`—Users who have permission can pin the feed element. • `Poll`—The feed element has poll voting. • `QuestionAndAnswers`—The feed element has a question, and users can add answers to the feed element instead of comments. Users can also select the best answer. • `ReadBy`—The context user can mark the feed element as read. • `Recommendations`—The feed element has a recommendation. • `Record`—The comment has a record attachment. • `RecordSnapshot`—The feed element has all the snapshot fields of a record for a single create record event. • `SocialPost`—The feed element can interact with a social post on a social network. • `Status`—The feed element has a status that determines its visibility. • `Topics`—The context user can add topics to the feed element. • `TrackedChanges`—The feed element has all changes to a record for a single tracked change event. • `UpDownVote`—Users can upvote or downvote the feed element. • `Verified`—Users who have permission can mark a comment as verified or unverified.
`ConnectApi.FeedElementType`	Feed elements are the top-level objects that a feed contains. The feed element type describes the characteristics of that feed element. • `Bundle`—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values. • `FeedItem`—A feed item has a single parent and is scoped to oneExperience Cloud site or across all Experience Cloud sites. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values. • `Recommendation`—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user.

Enum	Description
`ConnectApi.FeedEntityStatus`	Status of the feed post or comment. • `Draft`—The feed post isn't published but is visible to the author and users with Modify All Data or View All Data permission. Comments can't be drafts. • `Isolated`—The feed post or comment is isolated, and only admins can see it. • `PendingReview`—The feed post or comment isn't approved yet and therefore isn't published or visible. • `Published`—The feed post or comment is approved and visible.
`ConnectApi.FeedFavoriteType`	Origin of the feed favorite. • `ListView` • `Search` • `Topic`
`ConnectApi.FeedFilter`	Filter value for a feed. • `AllQuestions`—Feed elements that are questions. • `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed. • `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed. • `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission. • `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission. • `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group. • `SolvedQuestions`—Feed elements that are questions and that have a best answer. • `UnansweredQuestions`—Feed elements that are questions and that don't have any answers. • `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission. • `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group. • `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

Enum	Description
`ConnectApi.FeedItemAttachmentType`	Attachment type for feed item output objects. • `Approval`—A feed item requiring approval. • `BasicTemplate`—A feed item with a generic rendering of an image, link, and title. • `Canvas`—A feed item that contains the metadata to render a link to a canvas app. • `CaseComment`—A feed item created from a comment to a case record. • `CaseComment`—A feed item created from a comment to a case record. • `Content`—A feed item with a file attached. • `DashboardComponent`—A feed item with a dashboard attached. • `EmailMessage`—An email attached to a case record in Case Feed. • `Link`—A feed item with a URL attached. • `Poll`—A feed item with a poll attached. • `Question`—A feed item with a question attached. • `RecordSnapshot`—The feed item attachment contains a view of a record at a single `ConnectApi.FeedItemType.CreateRecordEvent`. • `TrackedChange`—All changes to a record for a single `ConnectApi.FeedItemType.TrackedChange` event.
`ConnectApi.FeedItemType`	Type of feed item. • `ActivityEvent`—Feed item generated in Case Feed when an event or task associated with a parent record with a feed enabled is created or updated. • `AdvancedTextPost`—A feed item with advanced text formatting, such as a group announcement post. • `ApprovalPost`—Feed item with an approval capability. Approvers can act on the feed item parent. • `AttachArticleEvent`—Feed item generated when an article is attached to a case in Case Feed. • `BasicTemplateFeedItem`—Feed item with an enhanced link capability. • `CallLogPost`—Feed item generated when a call log is saved to a case in Case Feed. • `CanvasPost`—Feed item generated by a canvas app in the publisher or from Connect REST API or Connect in Apex. The post itself is a link to a canvas app. • `CaseCommentPost`—Feed item generated when a case comment is saved in Case Feed. • `ChangeStatusPost`—Feed item generated when the status of a case is changed in Case Feed. • `ChatTranscriptionPost`—Feed item generated in Case Feed when a Live Agent chat transcript is saved to a case. • `CollaborationGroupCreated`—Feed item generated when a new public group is created. Contains a link to the new group. • `CollaborationGroupUnarchived`—Deprecated. Feed item generated when an archived group is activated. • `ContentPost`—Feed item with a content capability.

Enum	Description
	• `CreateRecordEvent`—Feed item that describes a record created in the publisher. • `DashboardComponentAlert`—Feed item with a dashboard alert. • `DashboardComponentSnapshot`—Feed item with a dashboard component snapshot capability. • `EmailMessageEvent`—Feed item generated when an email is sent from a case in Case Feed. • `FacebookPost`—Deprecated. Feed item generated when a Facebook post is created from a case in Case Feed. • `LinkPost`—Feed item with a link capability. • `MilestoneEvent`—Feed item generated when a case milestone is either completed or reaches a violation status. Contains a link to the case milestone. • `PollPost`—Feed item with a poll capability. Viewers of the feed item are allowed to vote on the options in the poll. • `ProfileSkillPost`—Feed item generated when a skill is added to a user's profile. • `QuestionPost`—Feed item generated when a question is asked. As of API version 33.0, a feed item of this type can have a content capability and a link capability. • `ReplyPost`—Feed item generated by a Chatter Answers reply. • `RypplePost`—Feed item generated when a user posts thanks. • `SocialPost`—Feed item generated when a social post is created from a case in Case Feed. • `TextPost`—Feed item containing text only. • `TrackedChange`—Feed item created when one or more fields on a record have been changed. • `UserStatus`—Deprecated. A user's post to their own profile.
`ConnectApi.FeedItem VisibilityType`	Type of users who can see a feed item. • `AllUsers`—Visibility is not limited to internal users. • `InternalUsers`—Visibility is limited to internal users.
`ConnectApi. FeedSortOrder`	Order of feed items in the feed. • `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds. • `CreatedDateDesc`—Sorts by most recent creation date. • `LastModifiedDateDesc`—Sorts by most recent activity. • `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`. • `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Enum	Description
`ConnectApi.FeedType`	Type of feed. • `Bookmarks`—Contains all feed items saved as bookmarks by the context user. • `Company`—Contains all feed items except feed items of type `TrackedChange`. To see the feed item, the user must have sharing access to its parent. • `DirectMessageModeration`—Contains all direct messages that are flagged for moderation. The Direct Message Moderation feed is available only to users with Moderate Experiences Chatter Messages permissions. • `DirectMessages`—Contains all feed items of the context user's direct messages. • `Draft`—Contains all the feed items that the context user drafted. • `Files`—Contains all feed items that contain files posted by people or groups that the context user follows. • `Filter`—Contains the news feed filtered to contain feed items whose parent is a specified object type. • `Groups`—Contains all feed items from all groups the context user either owns or is a member of. • `Home`—Contains all feed items associated with any managed topic in an Experience Cloud site. • `Isolated`—Contains all the feed items and comments that are isolated. • `Landing`—Contains all feed items that best drive user engagement when the feed is requested. Allows clients to avoid an empty feed when there aren't many personalized feed items. • `Moderation`—Contains all feed items that are flagged for moderation, except direct messages. The moderation feed is available only to users with Moderate Experiences Feeds permissions. • `Mute`—Contains all feed items that the context user muted. • `News`—Contains all updates for people the context user follows, groups the user is a member of, and files and records the user is following. Contains all updates for records whose parent is the context user. • `PendingReview`—Contains all feed items and comments that are pending review. • `People`—Contains all feed items posted by all people the context user follows. • `Record`—Contains all feed items whose parent is a specified record, which could be a group, user, object, file, or any other standard or custom object. When the record is a group, the feed also contains feed items that mention the group. When the record is a user, the feed contains only feed items on that user. You can get another user's record feed. • `Streams`—Contains all feed items for any combination of up to 25 feed-enabled entities that the context user subscribes to in a stream. Examples of feed-enabled entities include people, groups, and records, • `To`—Contains all feed items with mentions of the context user. Contains feed items the context user commented on and feed items created by the context user that are commented on. • `Topics`—Contains all feed items that include the specified topic.

Enum	Description
	• `UserProfile`—Contains feed items created when a user changes records that can be tracked in a feed. Contains feed items whose parent is the user and feed items that @mention the user. This feed is different than the news feed, which returns more feed items, including group updates. You can get another user's user profile feed.
`ConnectApi.FieldChangeValueType`	Value type of a field change. • `NewValue`—A new value • `OldValue`—An old value
`ConnectApi.FilePreviewFormat`	Format of the file preview. • `Jpg`—Preview format is JPG. • `Pdf`—Preview format is PDF. • `Svg`—Preview format is compressed SVG. • `Thumbnail`—Preview format is 240 x 180 PNG. • `ThumbnailBig`—Preview format is 720 x 480 PNG. • `ThumbnailTiny`—Preview format is 120 x 90 PNG.
`ConnectApi.FilePreviewStatus`	Availability status of the file preview. • `Available`—Preview is available. • `InProgress`—Preview is being processed. • `NotAvailable`—Preview is unavailable. • `NotScheduled`—Generation of the preview isn't scheduled yet.
`ConnectApi.FilePublishStatus`	Publish status of the file. • `PendingAccess`—File is pending publishing. • `PrivateAccess`—File is private. • `PublicAccess`—File is public.
`ConnectApi.FileSharingOption`	Sharing option of the file. • `Allowed`—Resharing of the file is allowed. • `Restricted`—Resharing of the file is restricted.
`ConnectApi.FileSharingPrivacy`	Sharing privacy of a file. • `None`—File is visible to anyone with record access. • `PrivateOnRecords`—File is private on records.
`ConnectApi.FileSharingType`	Sharing role of the file. • `Admin`—Owner permission, but doesn't own the file. • `Collaborator`—Viewer permission, and can edit, change permissions, and upload a new version of a file. • `Owner`—Collaborator permission, and can make a file private, and delete a file.

Enum	Description
	• `Viewer`—Can view, download, and share a file. • `WorkspaceManaged`—Permission controlled by the library.
`ConnectApi.FolderItemType`	Type of item in a folder. • `file` • `folder`
`ConnectApi.FormFieldType`	Type of marketing integration form field. • `Boolean` • `Date` • `EmailAddress` • `Number` • `Text`
`ConnectApi.FormulaFilterType`	Formula filter type for the personalization audience. • `AllCriteriaMatch`—All audience criteria are true (AND operation). • `AnyCriterionMatches`—Any audience criterion is true (OR operation). • `CustomLogicMatches`—Audience criteria match the custom formula (for example, (1 AND 2) OR 3).
`ConnectApi.GroupArchiveStatus`	Archive status of groups. • `All`—All groups, including groups that are archived and groups that aren't archived. • `Archived`—Groups that are archived. • `NotArchived`—Groups that aren't archived.
`ConnectApi.GroupEmailFrequency`	Frequency with which a user receives email. • `EachPost` • `DailyDigest` • `WeeklyDigest` • `Never` • `UseDefault`
`ConnectApi.GroupMembershipType`	Type of membership the user has with the group. • `GroupOwner` • `GroupManager` • `NotAMember` • `NotAMemberPrivateRequested` • `StandardMember`

Enum	Description
`ConnectApi.GroupMembershipRequestStatus`	Status of a request to join a private group. • `Accepted` • `Declined` • `Pending`
`ConnectApi.GroupViralInvitationsStatus`	Status of an invitation to join a group. • `ActedUponUser`—The user was added to the group. An email was sent asking the user to visit the group. • `Invited`—An email was sent asking the user to sign up for the org. • `MaxedOutUsers`—The group has the maximum allowed members. • `MultipleError`—The user wasn't invited due to multiple errors. • `NoActionNeededUser`—The user is already a member of the group. • `NotVisibleToExternalInviter`—The user is not accessible to the user sending the invitation. • `Unhandled`—The user couldn't be added to the group for an unknown reason.
`ConnectApi.GroupVisibilityType`	Group visibility type. • `PrivateAccess`—Only members of the group can see posts to this group. • `PublicAccess`—All users within the Experience Cloud site can see posts to this group. • `Unlisted`—Reserved for future use.
`ConnectApi.HttpRequestMethod`	HTTP method. • `HttpDelete`—Returns HTTP 204 on success. Response body or output class is empty. • `HttpGet`—Returns HTTP 200 on success. • `HttpHead`—Returns HTTP 200 on success. Response body or output class is empty. • `HttpPatch`—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty. • `HttpPost`—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success. • `HttpPut`—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty.
`ConnectApi.LinkMetadataSource`	Source of the link metadata. • `None`—Link metadata wasn't retrieved. • `Sfdc`—Salesforce is the source.
`ConnectApi.LinkMetadataType`	Type of link that the metadata represents. • `Error`—Link metadata couldn't be retrieved. • `Link`—Represents a link. • `None`—Link metadata wasn't retrieved because the link isn't an allowed domain.

Enum	Description
	• `Photo`—Represents a photo. • `Rich`—Represents rich content, typically HTML content. • `Unknown`—Link metadata was retrieved, but the type is unknown. • `Video`—Represents a video.
`ConnectApi.MaintenanceType`	Type of maintenance. • `Downtime`—Downtime maintenance. • `GenerallyAvailable`—Maintenance with generally available mode. • `MaintenanceWithDowntime`—Scheduled maintenance with downtime. • `ReadOnly`—Maintenance with read-only mode.
`ConnectApi.ManagedContentChannelType`	Type of managed content channel. • `CloudToCloud`—Cloud-to-Cloud integrated channel. • `Community`—Experience Cloud site channel. • `ConnectedApp`—Channel served by a connected app. • `PublicUnauthenticated`—Public channel. All published content is publicly available. • `UserPermission`—Channel backed by a system permission. All published content is available only to users with the permission.
`ConnectApi.ManagedContentMediaType`	Type of managed content media. • `Document` • `Image`
`ConnectApi.ManagedContentNodeType`	Type of managed content node. • `Date` • `DateTime` • `Media` • `MediaSource` • `MultilineText` • `NameField` • `RichText` • `Text` • `Url`
`ConnectApi.ManagedContentVariantStatus`	Status of the managed content variant. • `Draft`—Content isn't published. • `Published`—Content is published and available for use in your live sites. • `Revised`—Content that's published and edited. Publish this content to make the changes available for use in your live sites.

Enum	Description
`ConnectApi.ManagedTopicType`	Type of managed topic. • `Content`—Topics that are associated with native content. • `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation. • `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.
`ConnectApi.MarkupType`	Type of rich text markup. • `Bold`—Bold tag. • `Code`—Code tag. • `Hyperlink`—Hyperlink anchor tag. • `Italic`—Italic tag. • `ListItem`—List item tag. • `OrderedList`—Ordered list tag. • `Paragraph`—Paragraph tag. • `Strikethrough`—Strikethrough tag. • `Underline`—Underline tag. • `UnorderedList`—Unordered list tag.
`ConnectApi.MentionCompletionType`	Type of mention completion. • `All`—All mention completions, regardless of the type of record to which the mention refers. • `Group`—Mention completions for groups. • `User`—Mention completions for users.
`ConnectApi.MentionValidationStatus`	Type of validation error for a proposed mention, if any. • `Disallowed`—The proposed mention is invalid and is rejected because the context user is trying to mention something that is not allowed. For example, a user who is not a member of a private group is trying to mention the private group. • `Inaccessible`—The proposed mention is allowed, but the user or record being mentioned isn't notified. They don't have access to the parent record that's being discussed. • `Ok`—There is no validation error for this proposed mention.
`ConnectApi.MessageSegmentType`	Type of message segment, such as text, link, field change name, or field change value. • `EntityLink` • `FieldChange` • `FieldChangeName` • `FieldChangeValue` • `Hashtag` • `InlineImage` • `Link`

Enum	Description
	• `MarkupBegin` • `MarkupEnd` • `Mention` • `MoreChanges` • `ResourceLink` • `Text`
`ConnectApi.NamedCredentialParameterType`	Type of named credential parameter. • `AllowedManagedPackageNamespaces` • `ClientCertificate`
`ConnectApi.NamedCredentialType`	Type of named credential. • `PrivateEndpoint` • `SecuredEndpoint`
`ConnectApi.NavigationMenuItemActionType`	Event, URL type, or modal navigation menu item. • `Event`—Event-based navigation. Note: `Event` is internal only and can't be used in custom components. • `ExternalLink`—URL outside of your Experience Cloud site. • `InternalLink`—Relative URL inside your Experience Cloud site. • `Modal`—Modal, such as Account Switcher.
`ConnectApi.NavigationMenuItemOpenTarget`	Target for the navigation menu item. • `CurrentWindow`—Navigation menu item opens in the current window. • `NewWindow`—Navigation menu item opens in a new window.
`ConnectApi.NavigationMenuItemType`	Type of navigation menu item. • `DataSourceDriven`—Menu items dynamically added from a data source. • `Event`—Event, such as logging in, logging out, or switching accounts. • `ExternalLink`—URL outside of your site. • `GlobalAction`—Lets users create records that aren't related to other records. • `InternalLink`—Relative URL inside your site. • `MenuLabel`—Menu label. • `Modal`—Modal, such as Account Switcher. • `NavigationalTopic`—Dropdown list with links to the navigational topics in your site. • `SalesforceObject`—Objects such as accounts, cases, contacts, and custom objects. • `SystemLink`—System link, such as a link to Builder, Workspaces, or Setup.

Enum	Description
`ConnectApi.NBAActionType`	Type of action. • `Flow`—Automated process tool with multiple subtypes.
`ConnectApi.NBAFlowType`	Type of recommended flow. • `AutoLaunchedFlow`—Autolaunched flow that runs in the background. • `Flow`—Screen flow that accepts user inputs.
`ConnectApi.NBATargetType`	Type of target. • `Recommendation`
`ConnectApi.OperationType`	Operation to carry out on the file. • `Add`—Adds the file to the feed element. • `Remove`—Removes the file from the feed element.
`ConnectApi.OrchestrationInstanceStatus`	Status of the orchestration instance. • `Completed` • `InProgress` • `NotStarted`
`ConnectApi.OrchestrationStepType`	Type of orchestration step. • `AsynchronousBackgroundStep` • `BackgroundStep` • `InteractiveStep` • `ManagedContentRoleInteractiveStep` • `ManagedContentVariantAutoPublishBackgroundStep` • `ManagedContentVariantAutoUnpublishBackgroundStep` • `ManagedContentVariantSetLockBackgroundStep` • `ManagedContentVariantSetReadyBackgroundStep` • `MuleSoftStep`
`ConnectApi.OrchestrationWorkItemStatus`	Status of the orchestration work item. • `Assigned` • `Completed`
`ConnectApi.OrderDeliveryGroupSummarySort`	Sort order for order delivery group summaries. • `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9). • `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).
`ConnectApi.OrderItemSummarySort`	Sort order for order item summaries. • `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9). • `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).

Enum	Description
`ConnectApi.OrderShipmentItemSort`	Sort order for order shipment items. • `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9). • `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).
`ConnectApi.OrderShipmentSort`	Sort order for order shipments. • `ExpectedDeliveryDateAsc`—Sorts by the oldest expected delivery date. • `ExpectedDeliveryDateDesc`—Sorts by the most recent expected delivery date. • `ShipmentNumberAsc`—Sorts by shipment number in ascending order (0–9). • `ShipmentNumberDesc`—Sorts by shipment number in descending order (9–0).
`ConnectApi.OrderSummaryAdjustmentAggregatesStatus`	Order summary adjustment aggregate job status. • `Failed`—The adjustment aggregate data job for the order summary failed. • `InProgress`—The adjustment aggregate data job for the order summary is in progress. • `NotInitiated`—The adjustment aggregate data job for the order summary is not initiated. • `Submitted`—The adjustment aggregate data job for the order summary is submitted.
`ConnectApi.OrderSummaryAdjustmentTargetType`	Type of price adjustment in promotions. • `SplitLine`—Price adjustment on an order item. • `Header`—Price adjustment on the entire order.
`ConnectApi.OrderSummarySortOrder`	Sort order for order summaries. • `CreatedDateAsc`—Sorts by the oldest created date. • `CreatedDateDesc`—Sorts by the most recent created date. • `OrderedDateAsc`—Sorts by the oldest ordered date. • `OrderedDateDesc`—Sorts by the most recent ordered date.
`ConnectApi.PeriodType`	Time period used for forecasting. • `Month` • `Quarter` • `Week` • `Year`
`ConnectApi.PlatformActionGroupCategory`	Location of an action link group on an associated feed element. • `Primary`—The action link group is displayed in the body of the feed element. • `Overflow`—The action link group is displayed in the overflow menu of the feed element.
`ConnectApi.PlatformActionStatus`	Status of the action. • `FailedStatus`—The action link execution failed. • `NewStatus`—The action link is ready to be executed. Available for `Download` and `Ui` action links only.

Enum	Description
	• `PendingStatus`—The action link is executing. Choosing this value triggers the API call for `Api` and `ApiAsync` action links. • `SuccessfulStatus`—The action link executed successfully.
`ConnectApi.PlatformActionType`	Type of platform action. • `ActionLink`—An indicator on a feed element that targets an API, a web page, or a file, represented by a button in the Salesforce UI. • `CustomButton`—When clicked, opens a URL or a Visualforce page in a window or executes JavaScript. • `ProductivityAction`—Productivity actions are predefined and attached to a limited set of objects. Productivity actions include Send Email, Call, Map, View Website, and Read News. Except for the Call action, you can't edit productivity actions. • `QuickAction`—A global or object-specific action. • `StandardButton`—A predefined Salesforce button such as New, Edit, or Delete.
`ConnectApi.PriceAdjustmentTierType`	Type of price adjustment for the tier. • `AmountBasedAdjustment`—Price is adjusted by a specified amount. • `PercentageBasedAdjustment`—Price is adjusted by a specified percentage.
`ConnectApi.PricingTermUnit`	Unit of time used to define a pricing term. • `Months`—Product is priced on a monthly basis. • `Annual`—Product is priced on an annual basis.
`ConnectApi.ProductClass`	Class of product. • `Simple` • `Variation` • `VariationParent`
`ConnectApi.ProductMediaType`	Type of product media. • `Document` • `Image` • `Video`
`ConnectApi.ProductMediaUsageType`	Usage type of a product media item within a media group. • `Attachment`—Product media group with product documents as attachments. • `Banner`—Product category media group with banner images of the product. • `Listing`—Product media group with listing images of the product. • `Standard`—Product media group with standard images and videos of the product. • `Tile`—Product category media group with tile images of the product.
`ConnectApi.PublishSchedule`	Publish refresh schedule. • `One`—Refreshes every hour. Used to rapidly publish UI and DBT-based segments.

Enum	Description
	• `Four`—Refreshes every four hours. Used to rapidly publish UI and DBT-based segments. • `Twelve`—Refreshes every twelve hours. • `TwentyFour`—Refreshes every twenty-four hours.
`ConnectApi.PublishStatus`	Publish status of a personalization audience, target, or navigation menu item. • `Draft` • `Live`
`ConnectApi.RecommendationActionType`	Action to take on a recommendation. • `follow`—Follow a file, record, topic, or user. • `join`—Join a group. • `view`—View a file, group, article, record, user, custom, or static recommendation.
`ConnectApi.RecommendationAudienceCriteriaType`	Custom recommendation audience criteria type. • `CustomList`—A custom list of users makes up the audience. • `MaxDaysInCommunity`—New members make up the audience.
`ConnectApi.RecommendationAudienceMemberOperationType`	Operation to carry out on the custom recommendation audience members. • `Add`—Adds specified members to the audience. • `Remove`—Removes specified members from the audience.
`ConnectApi.RecommendationChannel`	A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. • `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear. • `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.
`ConnectApi.RecommendationExplanationType`	Reason for a Chatter recommendation. • `ArticleHasRelatedContent`—Articles with related content to a context article.

Enum	Description
	• `ArticleViewedTogether`—Articles often viewed together with the article that the context user just viewed. • `ArticleViewedTogetherWithViewers`—Articles often viewed together with other records that the context user views. • `Custom`—Custom recommendations. • `FilePopular`—Files with many followers or views. • `FileViewedTogether`—Files often viewed at the same time as other files that the context user views. • `FollowedTogetherWithFollowees`—Users often followed together with other records that the context user follows. • `GroupMembersFollowed`—Groups with members that the context user follows. • `GroupNew`—Recently created groups. • `GroupPopular`—Groups with many active members. • `ItemViewedTogether`—Records often viewed at the same time as other records that the context user views. • `PopularApp`—Applications that are popular. • `RecordOwned`—Records that the context user owns. • `RecordParentOfFollowed`—Parent records of records that the context user follows. • `RecordViewed`—Records that the context user recently viewed. • `TopicFollowedTogether`—Topics often followed together with the record that the context user just followed. • `TopicFollowedTogetherWithFollowees`—Topics often followed together with other records that the context user follows. • `TopicPopularFollowed`—Topics with many followers. • `TopicPopularLiked`—Topics on posts that have many likes. • `UserDirectReport`—Users who report to the context user. • `UserFollowedTogether`—Users often followed together with the record that the context user followed . • `UserFollowsSameUsers`—Users who follow the same users as the context user. • `UserManager`—The context user's manager. • `UserNew`—Recently created users. • `UserPeer`—Users who report to the same manager as the context user. • `UserPopular`—Users with many followers. • `UserViewingSameRecords`—Users who view the same records as the context user.
`ConnectApi.RecommendationReactionType`	Type of reaction to a recommendation. • `Accepted` • `Rejected`

Enum	Description
`ConnectApi.RecommendationType`	Type of record being recommended. • `apps` • `articles` • `files` • `groups` • `records` • `topics` • `users`
`ConnectApi.RecommendedObjectType`	Type of object being recommended. • `Today`—Static recommendations that don't have an ID, for example, the Today app recommendation.
`ConnectApi.RecordColumnOrder`	Order in which fields are rendered in a grid. • `LeftRight`—Fields are rendered from left to right. • `TopDown`—Fields are rendered from the top down.
`ConnectApi.RecordFieldType`	Data type of a record field. • `Address` • `Blank` • `Boolean` • `Compound` • `CreatedBy` • `Date` • `DateTime` • `Email` • `LastModifiedBy` • `Location` • `Name` • `Number` • `Percent` • `Phone` • `Picklist` • `Reference` • `Text` • `Time`
`ConnectApi.RelatedFeedPostType`	Type of related feed post. • `Answered`—Related questions that have at least one answer. • `BestAnswer`—Related questions that have a best answer.

Enum	Description
	• `Generic`—All types of related questions, including answered, with a best answer, and unanswered. • `Unanswered`—Related questions that don't have answers.
`ConnectApi.SearchBoostBuryRuleAction`	Action of the boost and bury rule. • `Boost`—Boost rule. Increases search result rankings for targeted products. • `Bury`—Bury rule. Decreases search result rankings for targeted products.
`ConnectApi.SearchBoostBuryRuleOperation`	Operation for the conditions of the target expression in the boost and bury rule. • `AllOf`—All-of operation. • `AnyOf`—Any-of operation.
`ConnectApi.SegmentType`	Type of segment. • `Dbt`—Data build tool
`ConnectApi.SellingModelType`	Type of product selling model. • `Evergreen`—A subscription without an end date. An evergreen subscription continues until the shopper affirmatively cancels it. • `OneTime`—A product that isn't sold as a subscription. • `TermDefined`—A subscription with a defined end date. The subscription continues for a specified time period. When the term ends, the subscription ends.
`ConnectApi.SitesPageType`	Type of site search result item. • `ContentPage` • `SitePage`
`ConnectApi.SocialNetworkProvider`	Social network provider. • `Facebook` • `GooglePlus` • `Instagram` • `InstagramBusiness` • `KakaoTalk` • `Kik` • `Line` • `LinkedIn` • `Messenger` • `Other` • `Pinterest` • `QQ` • `Rypple` • `SinaWeibo`

Enum	Description
	• SMS • Snapchat • Telegram • Twitter • VKontakte • WeChat • WhatsApp • YouTube
ConnectApi.SocialPostMessageType	Message type of the social post. • Comment • Direct • Post • PrivateMessage • Reply • Retweet • Tweet
ConnectApi.SocialPostStatusType	State of the social post. • ApprovalPending • ApprovalRecalled • ApprovalRejected • Deleted • Failed • Hidden • Pending • Sent • Unknown
ConnectApi.SortOrder	Order for sorting. • Ascending—Items are in ascending alphabetical order (A-Z). • Descending—Items are in descending alphabetical order (Z-A). • MostRecentlyViewed—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.
ConnectApi.SurveyEmailStatusEnum	Status of a survey invitation email. • Failed—The survey invitation email wasn't sent. • Queued—The survey invitation email is queued for sending.

Enum	Description
`ConnectApi.SvcApptModeEnum`	Mode of the service appointment. • `Group`— Service appointment mode is Group. • `Regular`— Default mode of service appointment.
`ConnectApi.TaxTransactionStatus`	Status of a tax transaction. • `Committed`—Tax has been committed to the transaction. • `Uncommitted`—Tax hasn't been committed to the transaction.
`ConnectApi.TaxTransactionType`	Type of tax transaction. • `Credit`—Transaction is a credit transaction. • `Debit`—Transaction is a debit transaction.
`ConnectApi.TopicSort`	Order returned by the sort. • `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default. • `alphaAsc`—Sorts topics alphabetically.
`ConnectApi.UpDownVoteValue`	Type of vote for a feed element or comment. • `Down` • `None` • `Up`
`ConnectApi.UserActivityType`	Type of user activity. • `Bookmark`—User bookmarked a post. • `ChatterActivity`—Total counts of posts and comments made and likes and comments received for a user. • `ChatterLike`—User liked a post or comment. • `Comment`—User commented on a post. • `CompanyVerify`—User verified comment. • `DownVote`—User downvoted a post or comment. • `FeedEntityRead`—User read a post. • `FeedRead`—User read a feed. • `Mute`—User muted a post. • `Post`—User made a post. • `TopicEndorsement`—User endorsed another user on a topic or received endorsement on a topic. • `UpVote`—User upvoted a post or comment.
`ConnectApi.UserMissionActivityType`	Type of mission activity for a user. • `FeedItemAnswerAQuestion`—User answered a question. • `FeedItemLikeSomething`—User liked a post or comment.

Enum	Description
	• `FeedItemMarkAnswerAsBest`—User marked an answer as the best answer. • `FeedItemPostQuestion`—User posted a question. • `FeedItemReceiveAComment`—User received a comment on a post. • `FeedItemReceiveALike`—User received a like on a post or comment. • `FeedItemReceiveAnAnswer`—User received an answer to a question. • `FeedItemWriteAComment`—User commented on a post. • `FeedItemWriteAPost`—User made a post. • `FeedItemYourAnswerMarkedBest`—User's answer was marked as the best answer.
`ConnectApi.UserProfileTabType`	Type of user profile tab. • `CustomVisualForce`—Tab that displays data from a Visualforce page. • `CustomWeb`—Tab that displays data from any external web-based application or web page. • `Element`—Tab that displays generic content inline. • `Feed`—Tab that displays the Chatter feed. • `Overview`—Tab that displays user details.
`ConnectApi.UserType`	Type of user. • `ChatterGuest`—User is an external user in a private group. • `ChatterOnly`—User is a Chatter Free customer. • `Guest`—User is unauthenticated. • `Internal`—User is a standard org member. • `Portal`—User is an external user in an Experience Cloud site. • `System`—User is Chatter Expert or a system user. • `Undefined`—User is a user type that is a custom object.
`ConnectApi.WishlistItemSortOrder`	Sort order for wishlist items. • `CreatedDateAsc`—Sorts by oldest creation date. • `CreatedDateDesc`—Sorts by most recent creation date.
`ConnectApi.WorkflowProcessStatus`	Status of a workflow process. • `Approved` • `Fault` • `Held` • `NoResponse` • `Pending` • `Reassigned` • `Rejected` • `Removed` • `Started`

Enum	Description
`ConnectApi.ZoneSearchResultType`	Zone search result type. • `Article`—Search results contain only articles. • `Question`—Search results contain only questions.
`ConnectApi.ZoneShowIn`	Zone search result location. • `Community`—Available in an Experience Cloud site. • `Internal`—Available internally only. • `Portal`—Available in a portal.

`ConnectApi` Exceptions

The `ConnectApi` namespace contains exception classes.

All exceptions classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions on page 3302.

The `ConnectApi` namespace contains these exceptions:

Exception	Description
`ConnectApi.ConnectApiException`	Any logic error in the way your application is utilizing `ConnectApi` code. This is equivalent to receiving a 400 error from Connect REST API.
`ConnectApi.NotFoundException`	Any issues with the specified resource being found. This is equivalent to receiving a 404 error from Connect REST API.
`ConnectApi.RateLimitException`	When you exceed the rate limit. This is equivalent to receiving a 503 Service Unavailable error from Connect REST API.

`ConnectApi` Utilities

The `ConnectApi` namespace contains a utility class.

Utility	Description
`ConnectApi.ConnectUtilities.unwrapApexWrapper()`	Unwraps obfuscated, Apex-wrapped objects into known types such as `Map<String, Object>`. Example from Apex Debug log: `core.connect.apex.ApexMapWrapper@7270879d`

Example

This example calls `getManagedContentForSite(siteId, contentKeyOrId, showAbsoluteUrl)` to get a custom content type with an image reference and uses the `ConnectApi.ConnectUtilities.unwrapApexWrapper()` utility.

```
ConnectApi.ManagedContentDeliveryDocument res =
    ConnectApi.ManagedContentDelivery.getManagedContentForSite
('0DMXXXXXXXXXXXXXXX','MCLXXXXXXXXXXXXXXXXXXXXXXXXX',true);

//before contentBody field ApexWrapper is unwrapped
system.debug(res.contentBody);

//unwrap contentBody field in res
Map<String,Object> contentBody =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(res.contentBody);

//after contentBody field ApexWrapper is unwrapped, but image field still wrapped
system.debug(contentBody);

//before image field ApexWrapper is unwrapped
system.debug(contentBody.get('Image'));

//unwrap Image field in contentBody
Map<String,Object> Image =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(contentBody.get('Image'));

//after image field ApexWrapper is unwrapped
system.debug(Image);

//replace wrapped primary_image in contentBody with unwrapped version
contentBody.put('Image', Image);

//after contentBody field ApexWrapper is unwrapped, with image field also unwrapped
system.debug(contentBody);
```

ConnectApi Release Notes

Use the Salesforce Release Notes to learn about the most recent updates and changes to the ConnectApi namespace in Apex.

For updates and changes that impact Apex, including ConnectApi, see the Apex Release Notes.

For new and changed ConnectApi classes and enums, see ConnectApi (Connect in Apex): New and Changed Classes and Enums in the Salesforce Release Notes.

Database Namespace

The `Database` namespace provides classes used with DML operations.

The following are the classes in the `Database` namespace.

IN THIS SECTION:

Batchable Interface
The class that implements this interface can be executed as a batch Apex job.

BatchableContext Interface
Represents the parameter type of a batch job method and contains the batch job ID. This interface is implemented internally by Apex.

DeletedRecord Class
Contains information about a deleted record.

DeleteResult Class
Represents the result of a delete DML operation returned by the `Database.delete` method.

DMLOptions Class
Enables you to set options related to DML operations.

DmlOptions.AssignmentRuleHeader Class
Enables setting assignment rule options.

DMLOptions.DuplicateRuleHeader Class
Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.

DmlOptions.EmailHeader Class
Enables setting email options.

DuplicateError Class
Contains information about an error that occurred when an attempt was made to save a duplicate record. Use if your organization has set up duplicate rules, which are part of the Duplicate Management feature.

EmptyRecycleBinResult Class
The result of the emptyRecycleBin DML operation returned by the `Database.emptyRecycleBin` method.

Error Class
Represents information about an error that occurred during a DML operation when using a Database method.

GetDeletedResult Class
Contains the deleted records retrieved for a specific sObject type and time window.

GetUpdatedResult Class
Contains the result for the `Database.getUpdated` method call.

LeadConvert Class
Contains information used for lead conversion.

LeadConvertResult Class
The result of a lead conversion.

MergeResult Class
Contains the result of a merge Database method operation.

QueryLocator Class
Represents the record set returned by `Database.getQueryLocator` and used with Batch Apex.

QueryLocatorIterator Class
Represents an iterator over a query locator record set.

SaveResult Class

The result of an insert or update DML operation returned by a Database method.

UndeleteResult Class

The result of an undelete DML operation returned by the `Database.undelete` method.

UpsertResult Class

The result of an upsert DML operation returned by the `Database.upsert` method.

Batchable Interface

The class that implements this interface can be executed as a batch Apex job.

Namespace

Database

SEE ALSO:

Apex Developer Guide: Using Batch

Batchable Methods

The following are methods for `Batchable`.

IN THIS SECTION:

execute(jobId, recordList)

Gets invoked when the batch job executes and operates on one batch of records. Contains or calls the main execution logic for the batch job.

finish(jobId)

Gets invoked when the batch job finishes. Place any clean up code in this method.

start(jobId)

Gets invoked when the batch job starts. Returns the record set as an iterable that will be batched for execution.

start(jobId)

Gets invoked when the batch job starts. Returns the record set as a QueryLocator object that will be batched for execution.

`execute(jobId, recordList)`

Gets invoked when the batch job executes and operates on one batch of records. Contains or calls the main execution logic for the batch job.

Signature

```
public Void execute(Database.BatchableContext jobId, List<sObject> recordList)
```

Parameters

jobId
Type: Database.BatchableContext

Contains the job ID.

recordList
Type: List<sObject>

Contains the batch of records to process.

Return Value

Type: Void

finish(jobId)

Gets invoked when the batch job finishes. Place any clean up code in this method.

Signature

```
public Void finish(Database.BatchableContext jobId)
```

Parameters

jobId
Type: Database.BatchableContext

Contains the job ID.

Return Value

Type: Void

start(jobId)

Gets invoked when the batch job starts. Returns the record set as an iterable that will be batched for execution.

Signature

```
public System.Iterable start(Database.BatchableContext jobId)
```

Parameters

jobId
Type: Database.BatchableContext

Contains the job ID.

Return Value

Type: System.Iterable

start(jobId)

Gets invoked when the batch job starts. Returns the record set as a QueryLocator object that will be batched for execution.

Signature

```
public Database.QueryLocator start(Database.BatchableContext jobId)
```

Parameters

jobId
Type: Database.BatchableContext

Contains the job ID.

Return Value

Type: Database.QueryLocator

BatchableContext Interface

Represents the parameter type of a batch job method and contains the batch job ID. This interface is implemented internally by Apex.

Namespace

Database

SEE ALSO:

Batchable Interface

BatchableContext Methods

The following are methods for `BatchableContext`.

IN THIS SECTION:

getChildJobId()
Returns the ID of the current batch job chunk that is being processed.

getJobId()
Returns the batch job ID.

getChildJobId()

Returns the ID of the current batch job chunk that is being processed.

Signature

```
public Id getChildJobId()
```

Return Value

Type: ID

`getJobId()`

Returns the batch job ID.

Signature

```
public Id getJobId()
```

Return Value

Type: ID

DeletedRecord Class

Contains information about a deleted record.

Namespace

Database

Usage

The `getDeletedRecords` method of the `Database.GetDeletedResult` class returns a list of `Database.DeletedRecord` objects. Use the methods in the `Database.DeletedRecord` class to retrieve details about each deleted record.

DeletedRecord Methods

The following are methods for `DeletedRecord`. All are instance methods.

IN THIS SECTION:

getDeletedDate()
Returns the deleted date of this record.

getId()
Returns the ID of a record deleted within the time window specified in the `Database.getDeleted` method.

`getDeletedDate()`

Returns the deleted date of this record.

Signature

```
public Date getDeletedDate()
```

Return Value

Type: Date

`getId()`

Returns the ID of a record deleted within the time window specified in the `Database.getDeleted` method.

Signature

```
public Id getId()
```

Return Value

Type: ID

DeleteResult Class

Represents the result of a delete DML operation returned by the `Database.delete` method.

Namespace

Database

Usage

An array of `Database.DeleteResult` objects is returned with the `delete` database method. Each element in the DeleteResult array corresponds to the sObject array passed as the *`sObject[]`* parameter in the `delete` Database method; that is, the first element in the DeleteResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the DeleteResult array contains a single element.

Example

The following example shows how to obtain and iterate through the returned `Database.DeleteResult` objects. It deletes some queried accounts using `Database.delete` with a false second parameter to allow partial processing of records on failure. Next, it iterates through the results to determine whether the operation was successful or not for each record. It writes the ID of every record that was processed successfully to the debug log, or error messages and fields of the failed records.

```
// Query the accounts to delete
Account[] accts = [SELECT Id from Account WHERE Name LIKE 'Acme%'];
// Delete the accounts
Database.DeleteResult[] drList = Database.delete(accts, false);

// Iterate through each returned result
for(Database.DeleteResult dr : drList) {
    if (dr.isSuccess()) {
        // Operation was successful, so get the ID of the record that was processed
        System.debug('Successfully deleted account with ID: ' + dr.getId());
    }
    else {
        // Operation failed, so get all errors
```

```
        for(Database.Error err : dr.getErrors()) {
            System.debug('The following error has occurred.');
            System.debug(err.getStatusCode() + ': ' + err.getMessage());
            System.debug('Account fields that affected this error: ' + err.getFields());
        }
    }
}
```

DeleteResult Methods

The following are methods for `DeleteResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

getId()
Returns the ID of the sObject you were trying to delete.

isSuccess()
A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error[]

`getId()`

Returns the ID of the sObject you were trying to delete.

Signature

```
public ID getId()
```

Return Value

Type: ID

`isSuccess()`

A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

DMLOptions Class

Enables you to set options related to DML operations.

Namespace

Database

Usage

`Database.DMLOptions` is only available for Apex saved against API versions 15.0 and higher. DMLOptions settings take effect only for record operations performed using Apex DML and not through the Salesforce user interface. The DMLOptions class has three child options.

DML Child Options

DmlOptions.AssignmentRuleHeader—Enables setting assignment rule options.

DmlOptions.DuplicateRuleHeader—Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.

DmlOptions.EmailHeader—Enables setting email options.

DmlOptions Properties

The following are properties for `DmlOptions`.

IN THIS SECTION:

allowFieldTruncation

Specifies the truncation behavior of large strings.

assignmentRuleHeader

Specifies the assignment rule to be used when creating a case or lead.

emailHeader

Specifies additional information regarding the automatic email that gets sent when an events occurs.

localeOptions

Specifies the language of any labels that are returned by Apex.

optAllOrNone

Specifies whether the operation allows for partial success.

allowFieldTruncation

Specifies the truncation behavior of large strings.

Signature

```
public Boolean allowFieldTruncation {get; set;}
```

Property Value

Type: Boolean

Usage

In Apex saved against API versions previous to 15.0, if you specify a value for a string and that value is too large, the value is truncated. For API version 15.0 and later, if a value is specified that is too large, the operation fails and an error message is returned. The `allowFieldTruncation` property allows you to specify that the previous behavior, truncation, be used instead of the new behavior in Apex saved against API versions 15.0 and later.

assignmentRuleHeader

Specifies the assignment rule to be used when creating a case or lead.

Signature

```
public Database.DmlOptions.Assignmentruleheader assignmentRuleHeader {get; set;}
```

Property Value

Type: Database.DMLOptions.AssignmentRuleHeader

Usage

DMLOption.AssignmentRuleHeader.useDefaultRule affects only the default assignment rule and does not disable other existing assignment rules on the object.

Note: The Database.DMLOptions object supports assignment rules for cases and leads, but not for accounts.

emailHeader

Specifies additional information regarding the automatic email that gets sent when an events occurs.

Signature

```
public Database.DmlOptions.EmailHeader emailHeader {get; set;}
```

Property Value

Type: Database.DMLOptions.EmailHeader

Usage

The Salesforce user interface allows you to specify whether or not to send an email when the following events occur.

- Creation of a new case or task
- Conversion of a case email to a contact
- New user email notification
- Lead queue email notification
- Password reset

In Apex saved against API version 15.0 or later, the Database.DMLOptions `emailHeader` property enables you to specify additional information regarding the email that gets sent when one of the events occurs because of the code's execution.

`localeOptions`

Specifies the language of any labels that are returned by Apex.

Signature

```
public Database.DmlOptions.LocaleOptions localeOptions {get; set;}
```

Property Value

Type: Database.DMLOptions.LocaleOptions

Usage

The value must be a valid user locale (language and country), such as de_DE or en_GB. The value is a String, 2-5 characters long. The first two characters are always an ISO language code, for example 'fr' or 'en.' If the value is further qualified by a country, then the string also has an underscore (_) and another ISO country code, for example 'US' or 'UK'. For example, the string for the United States is 'en_US', and the string for French Canadian is 'fr_CA'.

`optAllOrNone`

Specifies whether the operation allows for partial success.

Signature

```
public Boolean optAllOrNone {get; set;}
```

Property Value

Type: Boolean

Usage

If `optAllOrNone` is set to `true`, all changes are rolled back if any record causes errors. The default for this property is `false` and successfully processed records are committed while records with errors aren't. If `optAllOrNone` is set to `false` and a record fails, the remainder of the DML operation can still succeed. You must iterate through the returned results to identify which records succeeded or failed.

This property is available in Apex saved against Salesforce API version 20.0 and later.

DmlOptions.AssignmentRuleHeader Class

Enables setting assignment rule options.

Namespace

Database

Example

The following example uses the `useDefaultRule` option:

```
Database.DMLOptions dmo = new Database.DMLOptions();
dmo.assignmentRuleHeader.useDefaultRule= true;

Lead l = new Lead(company='ABC', lastname='Smith');
l.setOptions(dmo);
insert l;
```

The following example uses the `assignmentRuleID` option:

```
Database.DMLOptions dmo = new Database.DMLOptions();
dmo.assignmentRuleHeader.assignmentRuleId= '01QD0000000EqAn';

Lead l = new Lead(company='ABC', lastname='Smith');
l.setOptions(dmo);
insert l;
```

DmlOptions.AssignmentRuleHeader Properties

The following are properties for `DmlOptions.AssignmentRuleHeader`.

IN THIS SECTION:

assignmentRuleID
Specifies the ID of a specific assignment rule to run for the case or lead. The assignment rule can be active or inactive.

useDefaultRule
If specified as `true` for a case or lead, the system uses the default (active) assignment rule for the case or lead. If specified, do not specify an `assignmentRuleId`.

`assignmentRuleID`

Specifies the ID of a specific assignment rule to run for the case or lead. The assignment rule can be active or inactive.

Signature

```
public Id assignmentRuleID {get; set;}
```

Property Value

Type: ID

Usage

The ID can be retrieved by querying the AssignmentRule sObject. If specified, do not specify `useDefaultRule`.

If the value is not in the correct ID format (15-character or 18-character Salesforce ID), the call fails and an exception is returned.

`useDefaultRule`

If specified as `true` for a case or lead, the system uses the default (active) assignment rule for the case or lead. If specified, do not specify an `assignmentRuleId`.

Signature

```
public Boolean useDefaultRule {get; set;}
```

Property Value

Type: Boolean

Usage

If there are no assignment rules in the organization, in API version 29.0 and earlier, creating a case or lead with `useDefaultRule` set to `true` results in the case or lead being assigned to the predefined default owner. In API version 30.0 and later, the case or lead is unassigned and doesn't get assigned to the default owner.

DMLOptions.DuplicateRuleHeader Class

Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.

Namespace

Database

Example

The following example shows how to save an account record that's been identified as a duplicate. To learn how to iterate through duplicate errors, see DuplicateError Class

```
Database.DMLOptions dml = new Database.DMLOptions();
dml.DuplicateRuleHeader.allowSave = true;
dml.DuplicateRuleHeader.runAsCurrentUser = true;
Account duplicateAccount = new Account(Name='dupe');
Database.SaveResult sr = Database.insert(duplicateAccount, dml);
if (sr.isSuccess()) {
 System.debug('Duplicate account has been inserted in Salesforce!');
}
```

IN THIS SECTION:

DMLOptions.DuplicateRuleHeader Properties

DMLOptions.DuplicateRuleHeader Properties

The following are properties for `DMLOptions.DuplicateRuleHeader`.

IN THIS SECTION:

allowSave

For a duplicate rule, when the Alert option is enabled, bypass alerts and save duplicate records by setting this property to `true`. Prevent duplicate records from being saved by setting this property to `false`.

runAsCurrentUser

Make sure that sharing rules for the current user are enforced when duplicate rules run by setting this property to `true`. Use the sharing rules specified in the class for the request by setting this property to `false`. If no sharing rules are specified, Apex code runs in system context and sharing rules for the current user are not enforced.

allowSave

For a duplicate rule, when the Alert option is enabled, bypass alerts and save duplicate records by setting this property to `true`. Prevent duplicate records from being saved by setting this property to `false`.

Signature

```
public Boolean allowSave {get; set;}
```

Property Value

Type: Boolean

Example

This example shows how to save an account record that's been identified as a duplicate. `dml.DuplicateRuleHeader.allowSave = true` means the user should be allowed to save the duplicate. To learn how to iterate through duplicate errors, see DuplicateError Class.

```
Database.DMLOptions dml = new Database.DMLOptions();
dml.DuplicateRuleHeader.allowSave = true;
dml.DuplicateRuleHeader.runAsCurrentUser = true;
Account duplicateAccount = new Account(Name='dupe');
Database.SaveResult sr = Database.insert(duplicateAccount, dml);
if (sr.isSuccess()) {
 System.debug('Duplicate account has been inserted in Salesforce!');
}
```

runAsCurrentUser

Make sure that sharing rules for the current user are enforced when duplicate rules run by setting this property to `true`. Use the sharing rules specified in the class for the request by setting this property to `false`. If no sharing rules are specified, Apex code runs in system context and sharing rules for the current user are not enforced.

Signature

```
public Boolean runAsCurrentUser {get; set;}
```

Property Value

Type: Boolean

Usage

If specified as `true`, duplicate rules run for the current user, which ensures users can't view duplicate records that aren't available to them.

Use `runAsCurrentUser = true` to detect duplicates when converting leads to contacts. Typically, lead conversion Apex code runs in a system context and does not enforce sharing rules for the current user.

Example

This example shows how to set options so that duplicate rules run for the current user when saving a new account.

```
Database.DMLOptions dml = new Database.DMLOptions();
dml.DuplicateRuleHeader.allowSave = true;
dml.DuplicateRuleHeader.runAsCurrentUser = true;
Account duplicateAccount = new Account(Name='dupe');
Database.SaveResult sr = Database.insert(duplicateAccount, dml);
if (sr.isSuccess()) {
 System.debug('Duplicate account has been inserted in Salesforce!');
}
```

DmlOptions.EmailHeader Class

Enables setting email options.

Namespace

Database

Usage

Even though auto-sent emails can be triggered by actions in the Salesforce user interface, the DMLOptions settings for `emailHeader` take effect only for DML operations carried out in Apex code.

Example

In the following example, the `triggerAutoResponseEmail` option is specified:

```
Account a = new Account(name='Acme Plumbing');

    insert a;

    Contact c = new Contact(email='jplumber@salesforce.com',
firstname='Joe',lastname='Plumber', accountid=a.id);

    insert c;

    Database.DMLOptions dlo = new Database.DMLOptions();
```

```
dlo.EmailHeader.triggerAutoResponseEmail = true;

Case ca = new Case(subject='Plumbing Problems', contactid=c.id);

database.insert(ca, dlo);
```

Suppose that you use an after-insert or after-update trigger to change ownership of leads, contacts, or opportunities. If you use the API to change record ownership, or if a Lightning Experience user changes a record's owner, no email notification is sent. To send email notifications to a record's new owner, set the `triggerUserEmail` property to `true`.

DmlOptions.EmailHeader Properties

The following are properties for `DmlOptions.EmailHeader`.

IN THIS SECTION:

triggerAutoResponseEmail
Indicates whether to trigger auto-response rules (`true`) or not (`false`), for leads and cases.

triggerOtherEmail
Indicates whether to trigger email outside the organization (`true`) or not (`false`).

triggerUserEmail
Indicates whether to trigger email that is sent to users in the organization (`true`) or not (`false`).

`triggerAutoResponseEmail`

Indicates whether to trigger auto-response rules (`true`) or not (`false`), for leads and cases.

Signature

```
public Boolean triggerAutoResponseEmail {get; set;}
```

Property Value

Type: Boolean

Usage

This email can be automatically triggered by a number of events, for example creating a case or resetting a user password. If this value is set to `true`, when a case is created, if there is an email address for the contact specified in `ContactID`, the email is sent to that address. If not, the email is sent to the address specified in `SuppliedEmail`

`triggerOtherEmail`

Indicates whether to trigger email outside the organization (`true`) or not (`false`).

Signature

```
public Boolean triggerOtherEmail {get; set;}
```

Property Value

Type: Boolean

Usage

This email can be automatically triggered by creating, editing, or deleting a contact for a case.

Note: Email sent through Apex because of a group event includes additional behaviors. A *group event* is an event for which `IsGroupEvent` is true. The `EventAttendee` object tracks the users, leads, or contacts that are invited to a group event. Note the following behaviors for group event email sent through Apex:

- Sending a group event invitation to a lead or contact respects the `triggerOtherEmail` option
- Email sent when updating or deleting a group event also respects the `triggerUserEmail` and `triggerOtherEmail` options, as appropriate

`triggerUserEmail`

Indicates whether to trigger email that is sent to users in the organization (`true`) or not (`false`).

Signature

```
public Boolean triggerUserEmail {get; set;}
```

Property Value

Type: Boolean

Usage

This email can be automatically triggered by a number of events; resetting a password, creating a new user, or creating or modifying a task.

Note: Adding comments to a case in Apex doesn't trigger email to users in the organization even if `triggerUserEmail` is set to `true`.

Note: Email sent through Apex because of a group event includes additional behaviors. A *group event* is an event for which `IsGroupEvent` is true. The EventAttendee object tracks the users, leads, or contacts that are invited to a group event. Note the following behaviors for group event email sent through Apex:

- Sending a group event invitation to a user respects the `triggerUserEmail` option
- Email sent when updating or deleting a group event also respects the `triggerUserEmail` and `triggerOtherEmail` options, as appropriate

DuplicateError Class

Contains information about an error that occurred when an attempt was made to save a duplicate record. Use if your organization has set up duplicate rules, which are part of the Duplicate Management feature.

Namespace

Database

Example

When you try to save a record that's identified as a duplicate record by a duplicate rule, you'll receive a duplicate error. If the duplicate rule contains the Allow action, an attempt will be made to bypass the error.

```
// Try to save a duplicate account
Account duplicateAccount = new Account(Name='Acme',  BillingCity='San Francisco');
Database.SaveResult sr = Database.insert(duplicateAccount, false);
if (!sr.isSuccess()) {

 // Insertion failed due to duplicate detected
 for(Database.Error duplicateError : sr.getErrors()){
  Datacloud.DuplicateResult duplicateResult =
                 ((Database.DuplicateError)duplicateError).getDuplicateResult();
  System.debug('Duplicate records have been detected by ' +
                 duplicateResult.getDuplicateRule());
  System.debug(duplicateResult.getErrorMessage());
 }

 // If the duplicate rule is an alert rule, we can try to bypass it
 Database.DMLOptions dml = new Database.DMLOptions();
 dml.DuplicateRuleHeader.AllowSave = true;
 Database.SaveResult sr2 = Database.insert(duplicateAccount, dml);
 if (sr2.isSuccess()) {
  System.debug('Duplicate account has been inserted in Salesforce!');
 }
}
```

IN THIS SECTION:

DuplicateError Methods

SEE ALSO:

SaveResult Class

DuplicateResult Class

Error Class

DuplicateError Methods

The following are methods for `DuplicateError`.

IN THIS SECTION:

getDuplicateResult()

Returns the details of a duplicate rule and duplicate records found by the duplicate rule.

getFields()
Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

getMessage()
Returns the error message text.

getStatusCode()
Returns a code that characterizes the error.

getDuplicateResult()

Returns the details of a duplicate rule and duplicate records found by the duplicate rule.

Signature

```
public Datacloud.DuplicateResult getDuplicateResult()
```

Return Value

Type: Datacloud.DuplicateResult

Example

This example shows the code used to get the possible duplicates and related match information after saving a new contact. This code is part of a custom application that implements duplicate management when users add a contact. See DuplicateResult Class on page 2304 to check out the entire sample applicaton.

```
Datacloud.DuplicateResult duplicateResult =
                            duplicateError.getDuplicateResult();
```

getFields()

Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

Signature

```
public List<String> getFields()
```

Return Value

Type: List<String>

getMessage()

Returns the error message text.

Signature

```
public String getMessage()
```

Return Value

Type: String

`getStatusCode()`

Returns a code that characterizes the error.

Signature

```
public StatusCode getStatusCode()
```

Return Value

Type: StatusCode

EmptyRecycleBinResult Class

The result of the emptyRecycleBin DML operation returned by the `Database.emptyRecycleBin` method.

Namespace

Database

Usage

A list of `Database.EmptyRecycleBinResult` objects is returned by the `Database.emptyRecycleBin` method. Each object in the list corresponds to either a record ID or an sObject passed as the parameter in the `Database.emptyRecycleBin` method. The first index in the EmptyRecycleBinResult list matches the first record or sObject specified in the list, the second with the second, and so on.

EmptyRecycleBinResult Methods

The following are methods for `EmptyRecycleBinResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred during the delete for this record or sObject, returns a list of one or more Database.Error objects. If no errors occurred, the returned list is empty.

getId()
Returns the ID of the record or sObject you attempted to delete.

isSuccess()
Returns `true` if the record or sObject was successfully removed from the Recycle Bin; otherwise `false`.

`getErrors()`

If an error occurred during the delete for this record or sObject, returns a list of one or more Database.Error objects. If no errors occurred, the returned list is empty.

Signature

```
public Database.Errors[] getErrors()
```

Return Value

Type: Database.Errors []

`getId()`

Returns the ID of the record or sObject you attempted to delete.

Signature

```
public ID getId()
```

Return Value

Type: ID

`isSuccess()`

Returns `true` if the record or sObject was successfully removed from the Recycle Bin; otherwise `false`.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

Error Class

Represents information about an error that occurred during a DML operation when using a Database method.

Namespace

Database

Usage

`Error` class is part of `SaveResult`, which is generated when a user attempts to save a Salesforce record.

SEE ALSO:

- SaveResult Class
- DuplicateError Class

Error Methods

The following are methods for `Error`. All are instance methods.

IN THIS SECTION:

getFields()
Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

getMessage()
Returns the error message text.

getStatusCode()
Returns a code that characterizes the error.

`getFields()`

Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

Signature

```
public String[] getFields()
```

Return Value

Type: String[]

`getMessage()`

Returns the error message text.

Signature

```
public String getMessage()
```

Return Value

Type: String

`getStatusCode()`

Returns a code that characterizes the error.

Signature

```
public StatusCode getStatusCode()
```

Return Value

Type: StatusCode

Usage

The full list of status codes is available in the WSDL file for your organization (see *Downloading Salesforce WSDLs and Client Authentication Certificates* in the Salesforce online help.)

GetDeletedResult Class

Contains the deleted records retrieved for a specific sObject type and time window.

Namespace

Database

Usage

The `Database.getDeleted` method returns the deleted record information as a `Database.GetDeletedResult` object.

GetDeletedResult Methods

The following are methods for `GetDeletedResult`. All are instance methods.

IN THIS SECTION:

getDeletedRecords()
Returns a list of deleted records for the time window specified in the `Database.getDeleted` method call.

getEarliestDateAvailable()
Returns the date in Coordinated Universal Time (UTC) of the earliest physically deleted object for the sObject type specified in `Database.getDeleted`.

getLatestDateCovered()
Returns the date in Coordinated Universal Time (UTC) of the last date covered in the `Database.getDeleted` call.

`getDeletedRecords()`

Returns a list of deleted records for the time window specified in the `Database.getDeleted` method call.

Signature

```
public List<Database.DeletedRecord> getDeletedRecords()
```

Return Value

Type: List<Database.DeletedRecord>

`getEarliestDateAvailable()`

Returns the date in Coordinated Universal Time (UTC) of the earliest physically deleted object for the sObject type specified in `Database.getDeleted`.

Signature

```
public Date getEarliestDateAvailable()
```

Return Value

Type: Date

`getLatestDateCovered()`

Returns the date in Coordinated Universal Time (UTC) of the last date covered in the `Database.getDeleted` call.

Signature

```
public Date getLatestDateCovered()
```

Return Value

Type: Date

Usage

If there is a value, it is less than or equal to the *`endDate`* argument of `Database.getDeleted`. A value here indicates that, for safety, you should use this value for the *`startDate`* of your next call to capture the changes that started after this date but didn't complete before *`endDate`* and were, therefore, not returned in the previous call.

GetUpdatedResult Class

Contains the result for the `Database.getUpdated` method call.

Namespace

Database

Usage

Use the methods in this class to obtain detailed information about the updated records returned by `Database.getUpdated` for a specific time window.

GetUpdatedResult Methods

The following are methods for `GetUpdatedResult`. All are instance methods.

IN THIS SECTION:

getIds()
Returns the IDs of records updated within the time window specified in the `Database.getUpdated` method.

getLatestDateCovered()
Returns the date in Coordinated Universal Time (UTC) of the last date covered in the `Database.getUpdated` call.

`getIds()`

Returns the IDs of records updated within the time window specified in the `Database.getUpdated` method.

Signature

```
public List<Id> getIds()
```

Return Value

Type: List<ID>

`getLatestDateCovered()`

Returns the date in Coordinated Universal Time (UTC) of the last date covered in the `Database.getUpdated` call.

Signature

```
public Date getLatestDateCovered()
```

Return Value

Type: Date

LeadConvert Class

Contains information used for lead conversion.

Namespace

Database

Usage

The `convertLead` Database method converts a lead into an account and contact or an account and person account, as well as (optionally) an opportunity. The `convertLead` takes an instance of the `Database.LeadConvert` class as a parameter. Create an instance of this class and set the information required for conversion, such as setting the lead, and destination account and contact.

Note: The `Database.convertLead()` method can take one `LeadConvert` object or a list of `LeadConvert` objects.

Example

This example shows how to use the `Database.convertLead` method to convert a lead. It inserts a new lead, creates a `LeadConvert` object, sets its status to converted, then passes it to the `Database.convertLead` method. Finally, it verifies that the conversion was successful.

```
Lead myLead = new Lead(LastName = 'Fry', Company='Fry And Sons');
insert myLead;

Database.LeadConvert lc = new Database.LeadConvert();
```

```
lc.setLeadId(myLead.id);

LeadStatus convertStatus = [SELECT Id, MasterLabel FROM LeadStatus WHERE IsConverted=true
 LIMIT 1];
lc.setConvertedStatus(convertStatus.MasterLabel);

Database.LeadConvertResult lcr = Database.convertLead(lc);
System.assert(lcr.isSuccess());
```

IN THIS SECTION:

LeadConvert Constructors

LeadConvert Methods

LeadConvert Constructors

The following are constructors for `LeadConvert`.

IN THIS SECTION:

LeadConvert()
Creates a new instance of the `Database.LeadConvert` class.

`LeadConvert()`

Creates a new instance of the `Database.LeadConvert` class.

Signature

```
public LeadConvert()
```

LeadConvert Methods

The following are methods for `LeadConvert`. All are instance methods.

IN THIS SECTION:

getAccountId()
Gets the ID of the account into which the lead will be merged.

getContactId()
Gets the ID of the contact into which the lead will be merged.

getConvertedStatus()
Gets the lead status value for a converted lead.

getLeadID()
Gets the ID of the lead to convert.

getOpportunityId()
Gets the ID of the existing opportunity that will be related to the resulting contact.

getOpportunityName()

Gets the name of the opportunity to create.

getOwnerID()

Gets the ID of the person to own any newly created account, contact, and opportunity.

getRelatedPersonAccountId()

Gets the ID of the existing person account into which the lead will be converted.

getRelatedPersonAccountRecord()

Gets the entity record of the new person account into which the lead will be converted.

isDoNotCreateOpportunity()

Indicates whether an Opportunity is created during lead conversion (`false`, the default) or not (`true`).

isOverWriteLeadSource()

Indicates whether the `LeadSource` field on the target Contact object is overwritten with the contents of the `LeadSource` field in the source Lead object (`true`), or not (`false`, the default).

isSendNotificationEmail()

Indicates whether a notification email is sent to the owner specified by `setOwnerId` (`true`) or not (`false`, the default).

setAccountId(accountId)

Sets the ID of the account into which the lead is merged. This value is required only when updating an existing account, including person accounts.

setContactId(contactId)

Sets the ID of the contact into which the lead will be merged (this contact must be associated with the account specified with `setAccountId`, and `setAccountId` must be specified). This value is required only when updating an existing contact.

setConvertedStatus(status)

Sets the lead status value for a converted lead. This field is required.

setDoNotCreateOpportunity(createOpportunity)

Specifies whether to create an opportunity during lead conversion. The default value is `false`: opportunities are created by default. Set this flag to `true` only if you do not want to create an opportunity from the lead.

setLeadId(leadId)

Sets the ID of the lead to convert. This field is required.

setOpportunityId(opportunityId)

Sets the ID of the opportunity into which the lead is merged. This value is required only when updating an existing opportunity.

setOpportunityName(opportunityName)

Sets the name of the opportunity to create. If no name is specified, this value defaults to the company name of the lead.

setOverwriteLeadSource(overwriteLeadSource)

Specifies whether to overwrite the `LeadSource` field on the target contact object with the contents of the `LeadSource` field in the source lead object. The default value is `false`, to not overwrite the field. If you specify this as `true`, you must also specify `setContactId` for the target contact.

setOwnerId(ownerId)

Specifies the ID of the person to own any newly created account, contact, and opportunity. If the application does not specify this value, the owner of the new object will be the owner of the lead.

setRelatedPersonAccountId(relatedPersonAccountId)

Sets the ID of the existing person account into which to convert the lead. This value is required only when updating an existing person account.

setRelatedPersonAccountRecord(Entity relatedPersonAccountRecord)

Sets the entity record of the new person account into which to convert the lead.

setSendNotificationEmail(sendEmail)

Specifies whether to send a notification email to the owner specified by `setOwnerId`. The default value is `false`, that is, to not send email.

getAccountId()

Gets the ID of the account into which the lead will be merged.

Signature

```
public ID getAccountId()
```

Return Value

Type: ID

getContactId()

Gets the ID of the contact into which the lead will be merged.

Signature

```
public ID getContactId()
```

Return Value

Type: ID

getConvertedStatus()

Gets the lead status value for a converted lead.

Signature

```
public String getConvertedStatus()
```

Return Value

Type: String

getLeadID()

Gets the ID of the lead to convert.

Signature

```
public ID getLeadID()
```

Return Value

Type: ID

getOpportunityId()

Gets the ID of the existing opportunity that will be related to the resulting contact.

Signature

```
public ID getOpportunityId()
```

Return Value

Type: ID

getOpportunityName()

Gets the name of the opportunity to create.

Signature

```
public String getOpportunityName()
```

Return Value

Type: String

getOwnerID()

Gets the ID of the person to own any newly created account, contact, and opportunity.

Signature

```
public ID getOwnerID()
```

Return Value

Type: ID

getRelatedPersonAccountId()

Gets the ID of the existing person account into which the lead will be converted.

Signature

```
public ID getRelatedPersonAccountId()
```

Return Value

Type: ID

getRelatedPersonAccountRecord()

Gets the entity record of the new person account into which the lead will be converted.

Signature

```
public ID getRelatedPersonAccountRecord()
```

Return Value

Type: ID

isDoNotCreateOpportunity()

Indicates whether an Opportunity is created during lead conversion (`false`, the default) or not (`true`).

Signature

```
public Boolean isDoNotCreateOpportunity()
```

Return Value

Type: Boolean

isOverWriteLeadSource()

Indicates whether the `LeadSource` field on the target Contact object is overwritten with the contents of the `LeadSource` field in the source Lead object (`true`), or not (`false`, the default).

Signature

```
public Boolean isOverWriteLeadSource()
```

Return Value

Type: Boolean

isSendNotificationEmail()

Indicates whether a notification email is sent to the owner specified by `setOwnerId` (`true`) or not (`false`, the default).

Signature

```
public Boolean isSendNotificationEmail()
```

Return Value

Type: Boolean

setAccountId(accountId)

Sets the ID of the account into which the lead is merged. This value is required only when updating an existing account, including person accounts.

Signature

```
public Void setAccountId(ID accountId)
```

Parameters

accountId
Type: ID

Return Value

Type: Void

setContactId(contactId)

Sets the ID of the contact into which the lead will be merged (this contact must be associated with the account specified with `setAccountId`, and `setAccountId` must be specified). This value is required only when updating an existing contact.

Signature

```
public Void setContactId(ID contactId)
```

Parameters

contactId
Type: ID

Return Value

Type: Void

Usage

If `setContactId` is specified, then the application creates a new contact that is implicitly associated with the account. The contact name and other existing data are not overwritten (unless `setOverwriteLeadSource` is set to true, in which case only the `LeadSource` field is overwritten).

Important: If you are converting a lead into a person account, do not specify `setContactId` or an error will result. Specify only `setAccountId` of the person account.

setConvertedStatus(status)

Sets the lead status value for a converted lead. This field is required.

Signature

```
public Void setConvertedStatus(String status)
```

Parameters

status
Type: String

Return Value

Type: Void

setDoNotCreateOpportunity(createOpportunity)

Specifies whether to create an opportunity during lead conversion. The default value is `false`: opportunities are created by default. Set this flag to `true` only if you do not want to create an opportunity from the lead.

Signature

```
public Void setDoNotCreateOpportunity(Boolean createOpportunity)
```

Parameters

createOpportunity
Type: Boolean

Return Value

Type: Void

setLeadId(leadId)

Sets the ID of the lead to convert. This field is required.

Signature

```
public Void setLeadId(ID leadId)
```

Parameters

leadId
Type: ID

Return Value

Type: Void

setOpportunityId(opportunityId)

Sets the ID of the opportunity into which the lead is merged. This value is required only when updating an existing opportunity.

Signature

```
public Void setOpportunityId(ID opportunityId)
```

Parameters

opportunityId
Type: ID

Return Value

Type: Void

setOpportunityName(opportunityName)

Sets the name of the opportunity to create. If no name is specified, this value defaults to the company name of the lead.

Signature

```
public Void setOpportunityName(String opportunityName)
```

Parameters

opportunityName
Type: String

Return Value

Type: Void

Usage

The maximum length of this field is 80 characters.

If `setDoNotCreateOpportunity` is true, no Opportunity is created and this field must be left blank; otherwise, an error is returned.

setOverwriteLeadSource(overwriteLeadSource)

Specifies whether to overwrite the `LeadSource` field on the target contact object with the contents of the `LeadSource` field in the source lead object. The default value is `false`, to not overwrite the field. If you specify this as `true`, you must also specify `setContactId` for the target contact.

Signature

```
public Void setOverwriteLeadSource(Boolean overwriteLeadSource)
```

Parameters

overwriteLeadSource
Type: Boolean

Return Value

Type: Void

setOwnerId(ownerId)

Specifies the ID of the person to own any newly created account, contact, and opportunity. If the application does not specify this value, the owner of the new object will be the owner of the lead.

Signature

```
public Void setOwnerId(ID ownerId)
```

Parameters

ownerId
Type: ID

Return Value

Type: Void

Usage

This method is not applicable when merging with existing objects—if `setOwnerId` is specified, the `ownerId` field is not overwritten in an existing account or contact.

setRelatedPersonAccountId(relatedPersonAccountId)

Sets the ID of the existing person account into which to convert the lead. This value is required only when updating an existing person account.

Signature

```
public Void setRelatedPersonAccountId(ID relatedPersonAccountId)
```

Parameters

relatedPersonAccountId
Type: ID

Return Value

Type: Void

setRelatedPersonAccountRecord(Entity relatedPersonAccountRecord)

Sets the entity record of the new person account into which to convert the lead.

Signature

```
public Void setRelatedPersonAccountRecord(Entity relatedPersonAccountRecord)
```

Parameters

relatedPersonAccountRecord
Type: ID

Return Value

Type: Void

setSendNotificationEmail(sendEmail)

Specifies whether to send a notification email to the owner specified by `setOwnerId`. The default value is `false`, that is, to not send email.

Signature

```
public Void setSendNotificationEmail(Boolean sendEmail)
```

Parameters

sendEmail
Type: Boolean

Return Value

Type: Void

LeadConvertResult Class

The result of a lead conversion.

Namespace

Database

Usage

An array of LeadConvertResult objects is returned with the `convertLead` Database method. Each element in the LeadConvertResult array corresponds to the sObject array passed as the *`SObject[]`* parameter in the `convertLead` Database method, that is, the first element in the LeadConvertResult array matches the first element passed in the SObject array, the second element corresponds to the second element, and so on. If only one sObject is passed in, the LeadConvertResult array contains a single element.

LeadConvertResult Methods

The following are methods for `LeadConvertResult`. All are instance methods.

IN THIS SECTION:

getAccountId()
The ID of the new account (if a new account was specified) or the ID of the account specified when `convertLead` was invoked.

getContactId()
The ID of the new contact (if a new contact was specified) or the ID of the contact specified when `convertLead` was invoked.

getErrors()
If an error occurred, an array of one or more database error objects providing the error code and description.

getLeadId()
The ID of the converted lead.

getOpportunityId()
The ID of the new opportunity, if one was created when `convertLead` was invoked.

getRelatedPersonAccountId()
The ID of the new or existing person account specified when `convertLead` was invoked.

isSuccess()
A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise

`getAccountId()`

The ID of the new account (if a new account was specified) or the ID of the account specified when `convertLead` was invoked.

Signature

```
public ID getAccountId()
```

Return Value

Type: ID

`getContactId()`

The ID of the new contact (if a new contact was specified) or the ID of the contact specified when `convertLead` was invoked.

Signature

```
public ID getContactId()
```

Return Value

Type: ID

`getErrors()`

If an error occurred, an array of one or more database error objects providing the error code and description.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error[]

getLeadId()

The ID of the converted lead.

Signature

```
public ID getLeadId()
```

Return Value

Type: ID

getOpportunityId()

The ID of the new opportunity, if one was created when `convertLead` was invoked.

Signature

```
public ID getOpportunityId()
```

Return Value

Type: ID

getRelatedPersonAccountId()

The ID of the new or existing person account specified when `convertLead` was invoked.

Signature

```
public ID getRelatedPersonAccountId()
```

Return Value

Type: ID

isSuccess()

A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

MergeResult Class

Contains the result of a merge Database method operation.

Namespace

Database

Usage

The `Database.merge` method returns a `Database.MergeResult` object for each merged record.

MergeResult Methods

The following are methods for `MergeResult`. All are instance methods.

IN THIS SECTION:

getErrors()
Returns a list of `Database.Error` objects representing the errors encountered, if any, during a merge operation using the `Database.merge` method. If no error occurred, returns null.

getId()
Returns the ID of the master record into which other records were merged.

getMergedRecordIds()
Returns the IDs of the records merged into the master record.

getUpdatedRelatedIds()
Returns the IDs of all related records that were reparented as a result of the merge that are viewable by the user sending the merge call.

isSuccess()
Indicates whether the merge was successful (`true`) or not (`false`).

`getErrors()`

Returns a list of `Database.Error` objects representing the errors encountered, if any, during a merge operation using the `Database.merge` method. If no error occurred, returns null.

Signature

```
public List<Database.Error> getErrors()
```

Return Value

Type: List<Database.Error>

`getId()`

Returns the ID of the master record into which other records were merged.

Signature

```
public Id getId()
```

Return Value

Type: ID

`getMergedRecordIds()`

Returns the IDs of the records merged into the master record.

Signature

```
public List<String> getMergedRecordIds()
```

Return Value

Type: List<String>

`getUpdatedRelatedIds()`

Returns the IDs of all related records that were reparented as a result of the merge that are viewable by the user sending the merge call.

Signature

```
public List<String> getUpdatedRelatedIds()
```

Return Value

Type: List<String>

`isSuccess()`

Indicates whether the merge was successful (`true`) or not (`false`).

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

QueryLocator Class

Represents the record set returned by `Database.getQueryLocator` and used with Batch Apex.

Namespace

Database

QueryLocator Methods

The following are methods for `QueryLocator`. All are instance methods.

IN THIS SECTION:

getQuery()
Returns the query used to instantiate the `Database.QueryLocator` object. This is useful when testing the `start` method.

iterator()
Returns a new instance of a query locator iterator.

`getQuery()`

Returns the query used to instantiate the `Database.QueryLocator` object. This is useful when testing the `start` method.

Signature

```
public String getQuery()
```

Return Value

Type: String

Usage

You can't use the `FOR UPDATE` keywords with a getQueryLocator query to lock a set of records. The set of records in the batch is determined when the `start` method is run.

Example

```
System.assertEquals(QLReturnedFromStart.
getQuery(),
Database.getQueryLocator([SELECT Id
   FROM Account]).getQuery() );
```

`iterator()`

Returns a new instance of a query locator iterator.

Signature

```
public Database.QueryLocatorIterator iterator()
```

Return Value

Type: Database.QueryLocatorIterator

Usage

Warning: To iterate over a query locator, save the iterator instance that this method returns in a variable and then use this variable to iterate over the collection. Calling `iterator` every time you want to perform an iteration can result in incorrect behavior because each call returns a new iterator instance.

For an example, see QueryLocatorIterator Class.

QueryLocatorIterator Class

Represents an iterator over a query locator record set.

Namespace

Database

Example

This sample shows how to obtain an iterator for a query locator, which contains five accounts. This sample calls `hasNext` and `next` to get each record in the collection.

```
// Get a query locator
Database.QueryLocator q = Database.getQueryLocator(
    [SELECT Name FROM Account LIMIT 5]);
// Get an iterator
Database.QueryLocatorIterator it =  q.iterator();

// Iterate over the records
while (it.hasNext())
{
    Account a = (Account)it.next();
    System.debug(a);
}
```

QueryLocatorIterator Methods

The following are methods for `QueryLocatorIterator`. All are instance methods.

IN THIS SECTION:

hasNext()

Returns `true` if there are one or more records remaining in the collection; otherwise, returns `false`.

next()

Advances the iterator to the next sObject record and returns the sObject.

`hasNext()`

Returns `true` if there are one or more records remaining in the collection; otherwise, returns `false`.

Signature

```
public Boolean hasNext()
```

Return Value

Type: Boolean

`next()`

Advances the iterator to the next sObject record and returns the sObject.

Signature

```
public sObject next()
```

Return Value

Type: sObject

Usage

Because the return value is the generic sObject type, you must cast it if using a more specific type. For example:

```
Account a = (Account)myIterator.next();
```

Example

```
Account a = (Account)myIterator.next();
```

SaveResult Class

The result of an insert or update DML operation returned by a Database method.

Namespace

Database

Usage

An array of SaveResult objects is returned with the `insert` and `update` database methods. Each element in the SaveResult array corresponds to the sObject array passed as the *`sObject[]`* parameter in the Database method, that is, the first element in the SaveResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the SaveResult array contains a single element.

A SaveResult object is generated when a new or existing Salesforce record is saved.

Example

The following example shows how to obtain and iterate through the returned `Database.SaveResult` objects. It inserts two accounts using `Database.insert` with a false second parameter to allow partial processing of records on failure. One of the accounts is missing the Name required field, which causes a failure. Next, it iterates through the results to determine whether the operation was successful or not for each record. It writes the ID of every record that was processed successfully to the debug log, or error messages and fields of the failed records. This example generates one successful operation and one failure.

```
// Create two accounts, one of which is missing a required field
Account[] accts = new List<Account>{
    new Account(Name='Account1'),
    new Account()};
Database.SaveResult[] srList = Database.insert(accts, false);

// Iterate through each returned result
for (Database.SaveResult sr : srList) {
    if (sr.isSuccess()) {
        // Operation was successful, so get the ID of the record that was processed
        System.debug('Successfully inserted account. Account ID: ' + sr.getId());
    }
    else {
        // Operation failed, so get all errors
        for(Database.Error err : sr.getErrors()) {
            System.debug('The following error has occurred.');
            System.debug(err.getStatusCode() + ': ' + err.getMessage());
            System.debug('Account fields that affected this error: ' + err.getFields());
        }
    }
}
```

SEE ALSO:

- Error Class
- DuplicateError Class

SaveResult Methods

The following are methods for `SaveResult`. All are instance methods.

IN THIS SECTION:

- getErrors()
  If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.
- getId()
  Returns the ID of the sObject you were trying to insert or update.
- isSuccess()
  Returns a Boolean that is set to `true` if the DML operation was successful for this object, `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error[]

`getId()`

Returns the ID of the sObject you were trying to insert or update.

Signature

```
public ID getId()
```

Return Value

Type: ID

Versioned Behavior Changes

Prior to API version 53.0, the method returned a null value if the record wasn't updated successfully. In API version 53.0 and later, the method returns the sObject ID, regardless of whether the update operation is successful or not.

`isSuccess()`

Returns a Boolean that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

Example

This example shows the code used to process duplicate records, which are detected when there is an unsuccessful save due to an error. This code is part of a custom application that implements duplicate management when users add a contact. See DuplicateResult Class on page 2304 to check out the entire sample applicaton.

```
if (!saveResult.isSuccess()) { ... }
```

UndeleteResult Class

The result of an undelete DML operation returned by the `Database.undelete` method.

Namespace

Database

Usage

An array of Database.UndeleteResult objects is returned with the `undelete` database method. Each element in the UndeleteResult array corresponds to the sObject array passed as the *`sObject[]`* parameter in the `undelete` Database method; that is, the first element in the UndeleteResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the UndeleteResults array contains a single element.

UndeleteResult Methods

The following are methods for `UndeleteResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns null.

getId()
Returns the ID of the sObject you were trying to undelete.

isSuccess()
Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns null.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error[]

`getId()`

Returns the ID of the sObject you were trying to undelete.

Signature

```
public ID getId()
```

Return Value

Type: ID

Usage

If this field contains a value, the object was successfully undeleted. If this field is empty, the operation was not successful for that object.

`isSuccess()`

Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

UpsertResult Class

The result of an upsert DML operation returned by the `Database.upsert` method.

Namespace

Database

Usage

An array of Database.UpsertResult objects is returned with the `upsert` database method. Each element in the UpsertResult array corresponds to the sObject array passed as the *`sObject[]`* parameter in the `upsert` Database method; that is, the first element in the UpsertResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the UpsertResults array contains a single element.

UpsertResult Methods

The following are methods for `UpsertResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

getId()
Returns the ID of the sObject you were trying to update or insert.

isCreated()
A Boolean value that is set to `true` if the record was created, `false` if the record was updated.

isSuccess()
Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error []

`getId()`

Returns the ID of the sObject you were trying to update or insert.

Signature

```
public ID getId()
```

Return Value

Type: ID

Versioned Behavior Changes

Prior to API version 53.0, the method returned a null value if the record wasn't upserted successfully. In API version 53.0 and later, the method returns the sObject ID regardless of whether the update operation is successful.

`isCreated()`

A Boolean value that is set to `true` if the record was created, `false` if the record was updated.

Signature

```
public Boolean isCreated()
```

Return Value

Type: Boolean

`isSuccess()`

Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

Datacloud Namespace

The `Datacloud` namespace provides classes and methods for retrieving information about duplicate rules. Duplicate rules let you control whether and when users can save duplicate records within Salesforce.

The `Datacloud` namespace is related to the Duplicate Management feature. For more information, see Manage Duplicate Records in *Salesforce Help* and Duplicate Management in Trailhead. The `Datacloud` namespace isn't related to the Salesforce Data Cloud product. See Data Cloud.

The following are the classes in the `Datacloud` namespace.

IN THIS SECTION:

AdditionalInformationMap Class
Represents other information, if any, about matched records.

DuplicateResult Class
Represents the details of a duplicate rule that detected duplicate records and information about those duplicate records.

FieldDiff Class
Represents the name of a matching rule field and how the values of the field compare for the duplicate and its matching record.

FindDuplicates Class
Performs rule-based searches for duplicate records. The input is an array of sObjects. Each sObject represents a record you want to find duplicates of. The output identifies the detected duplicates for each input sObject based on active duplicate rules for the given object.

FindDuplicatesByIds Class
Performs rule-based searches for duplicate records. The input is an array of IDs. Each ID specifies records to search for duplicates among. The duplicates are detected based on the active duplicate rules applicable to the object type corresponding to the input IDs.

FindDuplicatesResult Class
Output for rule-based searches for duplicate records. `FindDuplicatesResult` contains results of detecting duplicates using instances of `FindDuplicates` or `FindDuplicatesByIds` classes.

MatchRecord Class
Represents a duplicate record detected by a matching rule.

MatchResult Class
Represents the duplicate results for a matching rule.

AdditionalInformationMap Class

Represents other information, if any, about matched records.

Namespace

Datacloud

IN THIS SECTION:

AdditionalInformationMap Methods

AdditionalInformationMap Methods

The following are methods for `AdditionalInformationMap`.

IN THIS SECTION:

getName()
Returns the element name.

getValue()
Returns the value of the element.

`getName()`

Returns the element name.

Signature

```
public String getName()
```

Return Value

Type: String

`getValue()`

Returns the value of the element.

Signature

```
public String getValue()
```

Return Value

Type: String

DuplicateResult Class

Represents the details of a duplicate rule that detected duplicate records and information about those duplicate records.

Namespace

Datacloud

Usage

The `DuplicateResult` class and its methods are available to organizations that use duplicate rules.

`DuplicateResult` is contained within `DuplicateError`, which is part of `SaveResult`. `SaveResult` is generated when a user attempts to save a record in Salesforce.

Example

This example shows a custom application that lets users add a contact. When a contact is saved, an alert displays if there are duplicate records.

The sample application consists of a Visualforce page and an Apex controller. The Visualforce page is listed first so that you can see how the page makes use of the Apex controller. Save the Apex class first before saving the Visualforce page.

```
<apex:page controller="ContactDedupeController">
    <apex:form >
        <apex:pageBlock title="Duplicate Records" rendered="{!hasDuplicateResult}">
            <apex:pageMessages />
            <apex:pageBlockTable value="{!duplicateRecords}" var="item">
                <apex:column >
                    <apex:facet name="header">Name</apex:facet>
                 <apex:outputLink value="/{!item['Id']}">{!item['Name']}</apex:outputLink>

                </apex:column>
                <apex:column >
                    <apex:facet name="header">Owner</apex:facet>
                    <apex:outputField value="{!item['OwnerId']}"/>
                </apex:column>
                <apex:column >
                    <apex:facet name="header">Last Modified Date</apex:facet>
                    <apex:outputField value="{!item['LastModifiedDate']}"/>
                </apex:column>
            </apex:pageBlockTable>
        </apex:pageBlock>

        <apex:pageBlock title="Contact" mode="edit">
            <apex:pageBlockButtons >
                <apex:commandButton value="Save" action="{!save}"/>
            </apex:pageBlockButtons>

            <apex:pageBlockSection >
                <apex:inputField value="{!Contact.FirstName}"/>
                <apex:inputField value="{!Contact.LastName}"/>
                <apex:inputField value="{!Contact.Email}"/>
                <apex:inputField value="{!Contact.Phone}"/>
                <apex:inputField value="{!Contact.AccountId}"/>
            </apex:pageBlockSection>
        </apex:pageBlock>
    </apex:form>
</apex:page>
```

This sample is the Apex controller for the page. This controller contains the action method for the Save button. The `save` method inserts the new contact. If errors are returned, this method iterates through each error, checks if it's a duplicate error, adds the error message to the page, and returns information about the duplicate records to be displayed on the page.

```
public class ContactDedupeController {

    // Initialize a variable to hold the contact record you're processing
    private final Contact contact;

    // Initialize a list to hold any duplicate records
    private List<sObject> duplicateRecords;

    // Define variable that's true if there are duplicate records
    public boolean hasDuplicateResult{get;set;}

    // Define the constructor
    public ContactDedupeController() {

        // Define the values for the contact you're processing based on its ID
        Id id = ApexPages.currentPage().getParameters().get('id');
        this.contact = (id == null) ? new Contact() :
            [SELECT Id, FirstName, LastName, Email, Phone, AccountId
             FROM Contact WHERE Id = :id];

        // Initialize empty list of potential duplicate records
        this.duplicateRecords = new List<sObject>();
        this.hasDuplicateResult = false;
    }

    // Return contact and its values to the Visualforce page for display
    public Contact getContact() {
        return this.contact;
    }

    // Return duplicate records to the Visualforce page for display
    public List<sObject> getDuplicateRecords() {
        return this.duplicateRecords;
    }

    // Process the saved record and handle any duplicates
    public PageReference save() {

        // Optionally, set DML options here, use "DML" instead of "false"
        //   in the insert()
        // Database.DMLOptions dml = new Database.DMLOptions();
        // dml.DuplicateRuleHeader.allowSave = true;
        // dml.DuplicateRuleHeader.runAsCurrentUser = true;
        Database.SaveResult saveResult = Database.insert(contact, false);

        if (!saveResult.isSuccess()) {
            for (Database.Error error : saveResult.getErrors()) {
                // If there are duplicates, an error occurs
                // Process only duplicates and not other errors
                //   (e.g., validation errors)
                if (error instanceof Database.DuplicateError) {
```

```
                    // Handle the duplicate error by first casting it as a
                    //   DuplicateError class
                    // This lets you use methods of that class
                    //  (e.g., getDuplicateResult())
                    Database.DuplicateError duplicateError =
                            (Database.DuplicateError)error;
                    Datacloud.DuplicateResult duplicateResult =
                            duplicateError.getDuplicateResult();

                    // Display duplicate error message as defined in the duplicate rule
                    ApexPages.Message errorMessage = new ApexPages.Message(
                            ApexPages.Severity.ERROR, 'Duplicate Error: ' +
                            duplicateResult.getErrorMessage());
                    ApexPages.addMessage(errorMessage);

                    // Get duplicate records
                    this.duplicateRecords = new List<sObject>();

                    // Return only match results of matching rules that
                    //  find duplicate records
                    Datacloud.MatchResult[] matchResults =
                            duplicateResult.getMatchResults();

                    // Just grab first match result (which contains the
                    //   duplicate record found and other match info)
                    Datacloud.MatchResult matchResult = matchResults[0];

                    Datacloud.MatchRecord[] matchRecords = matchResult.getMatchRecords();

                    // Add matched record to the duplicate records variable
                    for (Datacloud.MatchRecord matchRecord : matchRecords) {
                        System.debug('MatchRecord: ' + matchRecord.getRecord());
                        this.duplicateRecords.add(matchRecord.getRecord());
                    }
                    this.hasDuplicateResult = !this.duplicateRecords.isEmpty();
                }
            }

            //If there's a duplicate record, stay on the page
            return null;
        }

        //  After save, navigate to the view page:
        return (new ApexPages.StandardController(contact)).view();
    }

}
```

DuplicateResult Methods

SEE ALSO:

SaveResult Class
DuplicateError Class

DuplicateResult Methods

The following are methods for `DuplicateResult`.

IN THIS SECTION:

getDuplicateRule()
Returns the developer name of the executed duplicate rule that returned duplicate records.

getErrorMessage()
Returns the error message configured by the administrator to warn users they may be creating duplicate records. This message is associated with a duplicate rule.

getMatchResults()
Returns the duplicate records and match information.

isAllowSave()
Indicates whether the duplicate rule will allow a record that's identified as a duplicate to be saved. Set to `true` if duplicate rule should allow save; otherwise, `false`.

`getDuplicateRule()`

Returns the developer name of the executed duplicate rule that returned duplicate records.

Signature

```
public String getDuplicateRule()
```

Return Value

Type: String

`getErrorMessage()`

Returns the error message configured by the administrator to warn users they may be creating duplicate records. This message is associated with a duplicate rule.

Signature

```
public String getErrorMessage()
```

Return Value

Type: String

Example

This example shows the code used to display the error message when duplicates are found while saving a new contact. This code is part of a custom application that lets users add a contact. When a contact is saved, an alert displays if there are duplicate records. Review DuplicateResult Class on page 2304 to check out the entire sample applicaton.

```
ApexPages.Message errorMessage = new ApexPages.Message(
                            ApexPages.Severity.ERROR, 'Duplicate Error: ' +
                            duplicateResult.getErrorMessage());
                    ApexPages.addMessage(errorMessage);
```

getMatchResults()

Returns the duplicate records and match information.

Signature

```
public List<Datacloud.MatchResult> getMatchResults()
```

Return Value

Type: List<Datacloud.MatchResult>

Example

This example shows the code used to return duplicate record and match information and assign it to the `matchResults` variable. This code is part of a custom application that implements duplicate management when users add a contact. See DuplicateResult Class on page 2304 to check out the entire sample applicaton.

```
Datacloud.MatchResult[] matchResults =
                            duplicateResult.getMatchResults();
```

isAllowSave()

Indicates whether the duplicate rule will allow a record that's identified as a duplicate to be saved. Set to `true` if duplicate rule should allow save; otherwise, `false`.

Signature

```
public Boolean isAllowSave()
```

Return Value

Type: Boolean

FieldDiff Class

Represents the name of a matching rule field and how the values of the field compare for the duplicate and its matching record.

Namespace

Datacloud

IN THIS SECTION:

FieldDiff Methods

FieldDiff Methods

The following are methods for `FieldDiff`.

IN THIS SECTION:

getDifference()
Returns how the field values compare for the duplicate and its matching record.

getName()
Returns the name of a field on a matching rule that detected duplicates.

`getDifference()`

Returns how the field values compare for the duplicate and its matching record.

Signature

```
public String getDifference()
```

Return Value

Type: String

Possible values include:

- `SAME`: Indicates the field values match exactly.
- `DIFFERENT`: Indicates that the field values do not match.
- `NULL`: Indicates that the field values are a match because both values are blank.

`getName()`

Returns the name of a field on a matching rule that detected duplicates.

Signature

```
public String getName()
```

Return Value

Type: String

FindDuplicates Class

Performs rule-based searches for duplicate records. The input is an array of sObjects. Each sObject represents a record you want to find duplicates of. The output identifies the detected duplicates for each input sObject based on active duplicate rules for the given object.

Namespace

Datacloud

IN THIS SECTION:

FindDuplicates Methods

FindDuplicates Methods

The following are methods for `FindDuplicates`.

IN THIS SECTION:

findDuplicates(sObjects)
Identifies duplicates for sObjects provided and returns a list of `FindDuplicatesResult` objects.

`findDuplicates(sObjects)`

Identifies duplicates for sObjects provided and returns a list of `FindDuplicatesResult` objects.

Usage

Use `FindDuplicates` to apply active duplicate rules associated with an object to records represented by input sObjects.

`FindDuplicates` uses the duplicate rules for the object that has the same type as the input sObjects.

Input

- All sObjects in the input array must be of the same object type, and that type must correspond to an object type that supports duplicate rules.
- The input array is limited to 50 elements. If you exceed this limit, an exception is thrown with the following message: `Configuration error: The number of records to check is greater than the permitted batch size.`

Output

- The output of `FindDuplicates` is an array of objects with the same number of elements as the input array, and in the same order. The output objects encapsulate record IDs for duplicate records. The output objects also contain values from the duplicate records.
- Each element contains an array of `DuplicateResult` objects. If `FindDuplicates` doesn't find any duplicates, the `duplicateRule` field in `DuplicateResult` contains the name of the duplicate rule that `FindDuplicates` applied, but the `matchResults` array is empty.

Example

```
Account acct = new Account();
acct.Name = 'Acme';
acct.BillingStreet = '123 Fake St';
acct.BillingCity = 'Springfield';
acct.BillingState = 'VT';
acct.BillingCountry = 'US';

List<Account> acctList = new List<Account>();
acctList.add(acct);

if (Datacloud.FindDuplicates.findDuplicates(acctList).size() == 0) {
// If the new account doesn't have duplicates, insert it.
    insert(acct);
}
```

Signature

```
public static List<Datacloud.FindDuplicatesResult> findDuplicates(List<SObject> sObjects)
```

Parameters

sObjects
Type: List<SObject>

An array of sObjects for which you want to find duplicates.

Return Value

Type: List<FindDuplicatesResult>

FindDuplicatesByIds Class

Performs rule-based searches for duplicate records. The input is an array of IDs. Each ID specifies records to search for duplicates among. The duplicates are detected based on the active duplicate rules applicable to the object type corresponding to the input IDs.

Namespace

Datacloud

IN THIS SECTION:

FindDuplicatesByIds Methods

FindDuplicatesByIds Methods

The following are methods for `FindDuplicatesByIds`.

IN THIS SECTION:

findDuplicatesByIds(ids)
Identifies duplicates of sObjects provided and returns a list of `FindDuplicatesResult` objects.

`findDuplicatesByIds(ids)`

Identifies duplicates of sObjects provided and returns a list of `FindDuplicatesResult` objects.

Usage

Use `FindDuplicatesByIds` to apply active duplicate rules associated with an object to records represented by the record IDs.

`FindDuplicatesByIds` uses the duplicate rules for the object that has the same type as the input record IDs. For example, if the record ID represents an Account, `FindDuplicatesByIds` uses the duplicate rules associated with the Account object.

Input

- All record IDs in the input array must be of the same object type, and that type must correspond to an object type that supports duplicate rules.
- The input array is limited to 50 elements. If you exceed this limit, an exception is thrown with the following message: `Configuration error: The number of records to check is greater than the permitted batch size.`

Output

- The output of `FindDuplicatesByIds` is an array of objects with the same number of elements as the input array, and in the same order. The output objects encapsulate record IDs for duplicate records. The output objects also contain values from the duplicate records.
- Each element contains an array of `DuplicateResult` objects. If `FindDuplicatesByIds` doesn't find any duplicates, the `duplicateRule` field in `DuplicateResult` contains the name of the duplicate rule that `FindDuplicatesByIds` applied, but the `matchResults` array is empty.

Example

```
Account acct = new Account(name='Salesforce');
insert acct;

List<Id> idList = new List<Id>();
idList.add(acct.id);

if (Datacloud.FindDuplicatesByIds.findDuplicatesByIds(idList).size() > 0) {
System.debug('Found duplicates');
}
```

Signature

```
public static List<Datacloud.FindDuplicatesResult> findDuplicatesByIds(List<Id> ids)
```

Parameters

ids
Type: List<ID>

A list of IDs for which you want to find duplicates.

Return Value

Type: List<FindDuplicatesResult>

FindDuplicatesResult Class

Output for rule-based searches for duplicate records. `FindDuplicatesResult` contains results of detecting duplicates using instances of `FindDuplicates` or `FindDuplicatesByIds` classes.

Namespace

Datacloud

IN THIS SECTION:

FindDuplicatesResult Properties

FindDuplicatesResult Methods

FindDuplicatesResult Properties

The following are properties for `FindDuplicatesResult`.

IN THIS SECTION:

duplicateresults

A list of `DuplicateResult` objects representing the results of calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`. Elements in the list correspond to sObjects or IDs in the input list.

errors

A list of `Database.Error` objects holding errors resulting from calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`.

success

Boolean signifying whether the call to `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)` was successful.

`duplicateresults`

A list of `DuplicateResult` objects representing the results of calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`. Elements in the list correspond to sObjects or IDs in the input list.

Signature

```
public List<Datacloud.DuplicateResult> duplicateresults
```

Property Value

Type: List<DuplicateResult>

errors

A list of `Database.Error` objects holding errors resulting from calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`.

Signature

```
public List<Database.Error> errors {get; set;}
```

Property Value

Type: List<Database.Error>

success

Boolean signifying whether the call to `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)` was successful.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

FindDuplicatesResult Methods

The following are methods for `FindDuplicatesResult`.

IN THIS SECTION:

getDuplicateResults()
Returns a list of `DuplicateResult` objects representing the results of calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`. Elements in the list correspond to sObjects or IDs in the input list.

getErrors()
Returns a list of `DatabaseError` objects containing errors resulting from calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`, if errors were encountered.

isSuccess()
Returns a Boolean signifying whether the call to `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)` was successful.

getDuplicateResults()

Returns a list of `DuplicateResult` objects representing the results of calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`. Elements in the list correspond to sObjects or IDs in the input list.

Example

```
Account acct = new Account(name='Salesforce');
List<Account> acctList = new List<Account>();
acctList.add(acct);

Datacloud.FindDuplicatesResult[] results = Datacloud.FindDuplicates.findDuplicates(acctList);
for (Datacloud.FindDuplicatesResult findDupeResult : results) {
  for (Datacloud.DuplicateResult dupeResult : findDupeResult.getDuplicateResults()) {
    for (Datacloud.MatchResult matchResult : dupeResult.getMatchResults()) {
      for (Datacloud.MatchRecord matchRecord : matchResult.getMatchRecords()) {
          System.debug('Duplicate Record: ' + matchRecord.getRecord());
      }
    }
  }
}
```

Signature

```
public List<Datacloud.DuplicateResult> getDuplicateResults()
```

Return Value

Type: List<DuplicateResult>

getErrors()

Returns a list of `DatabaseError` objects containing errors resulting from calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`, if errors were encountered.

Signature

```
public List<Database.Error> getErrors()
```

Return Value

Type: List<Database.Error>

isSuccess()

Returns a Boolean signifying whether the call to `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)` was successful.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

MatchRecord Class

Represents a duplicate record detected by a matching rule.

Namespace

Datacloud

IN THIS SECTION:

MatchRecord Methods

MatchRecord Methods

The following are methods for `MatchRecord`.

IN THIS SECTION:

getAdditionalInformation()
Returns other information about a matched record. For example, a `matchGrade` represents the quality of the data for the D&B fields in the matched record.

getFieldDiffs()
Returns all matching rule fields and how each field value compares for the duplicate and its matching record.

getMatchConfidence()
Returns the ranking of how similar a matched record's data is to the data in your request. Must be equal to or greater than the value of the `minMatchConfidence` specified in your request. Returns -1 if unused.

getRecord()
Returns the fields and field values for the duplicate.

`getAdditionalInformation()`

Returns other information about a matched record. For example, a `matchGrade` represents the quality of the data for the D&B fields in the matched record.

Signature

```
public List<Datacloud.AdditionalInformationMap> getAdditionalInformation()
```

Return Value

Type: List<Datacloud.AdditionalInformationMap>

`getFieldDiffs()`

Returns all matching rule fields and how each field value compares for the duplicate and its matching record.

Signature

```
public List<Datacloud.FieldDiff> getFieldDiffs()
```

Return Value

Type: List<Datacloud.FieldDiff>

`getMatchConfidence()`

Returns the ranking of how similar a matched record's data is to the data in your request. Must be equal to or greater than the value of the `minMatchConfidence` specified in your request. Returns -1 if unused.

Signature

```
public Double getMatchConfidence()
```

Return Value

Type: Double

`getRecord()`

Returns the fields and field values for the duplicate.

Signature

```
public SObject getRecord()
```

Return Value

Type: SObject

MatchResult Class

Represents the duplicate results for a matching rule.

Namespace

Datacloud

IN THIS SECTION:

MatchResult Methods

MatchResult Methods

The following are methods for `MatchResult`.

IN THIS SECTION:

getEntityType()
Returns the entity type of the matching rule.

getErrors()
Returns errors that occurred during matching for the matching rule.

getMatchEngine()
Returns the match engine for the matching rule.

getMatchRecords()
Returns information about the duplicates for the matching rule.

getRule()
Returns the developer name of the matching rule.

getSize()
Returns the number of duplicates detected by the matching rule.

isSuccess()
Returns `false` if there's an error with the matching rule, and `true` if the matching rule successfully ran.

`getEntityType()`

Returns the entity type of the matching rule.

Signature

```
public String getEntityType()
```

Return Value

Type: String

`getErrors()`

Returns errors that occurred during matching for the matching rule.

Signature

```
public List<Database.Error> getErrors()
```

Return Value

Type: List<Database.Error>

`getMatchEngine()`

Returns the match engine for the matching rule.

Signature

```
public String getMatchEngine()
```

Return Value

Type: String

getMatchRecords()

Returns information about the duplicates for the matching rule.

Signature

```
public List<Datacloud.MatchRecord> getMatchRecords()
```

Return Value

Type: List<Datacloud.MatchRecord>

getRule()

Returns the developer name of the matching rule.

Signature

```
public String getRule()
```

Return Value

Type: String

getSize()

Returns the number of duplicates detected by the matching rule.

Signature

```
public Integer getSize()
```

Return Value

Type: Integer

isSuccess()

Returns `false` if there's an error with the matching rule, and `true` if the matching rule successfully ran.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

DataSource Namespace

The `DataSource` namespace provides the classes for the Apex Connector Framework. Use the Apex Connector Framework to develop a custom adapter for Salesforce Connect. Then connect your Salesforce organization to any data anywhere via the Salesforce Connect custom adapter.

The following are the classes in the `DataSource` namespace.

IN THIS SECTION:

AsyncDeleteCallback Class

A callback class that the `Database.deleteAsync` method references. Salesforce calls this class after the remote `deleteAsync` operation is completed. This class provides the compensating transaction in the completion context of the delete operation. Extend this class to define the actions to execute after the remote delete operation finishes execution.

AsyncSaveCallback Class

A callback class that the `Database.insertAsync` or `Database.updateAsync` method references. Salesforce calls this class after the remote operation is completed. This class provides the compensating transaction in the completion context of the insert or update operation. Extend this class to define the actions to execute after the remote insert or update operation finishes execution.

AuthenticationCapability Enum

Specifies the types of authentication that can be used to access the external system.

AuthenticationProtocol Enum

Determines what type of credentials are used to authenticate to the external system.

Capability Enum

Declares which functional operations the external system supports. Also specifies required endpoint settings for the external data source definition.

Column Class

Describes a column on a `DataSource.Table`. This class extends the `DataSourceUtil` class and inherits its methods.

ColumnSelection Class

Identifies the list of columns to return during a query or search.

Connection Class

Extend this class to enable your Salesforce org to sync the external system's schema and to handle queries, searches, and write operations (upsert and delete) of the external data. This class extends the `DataSourceUtil` class and inherits its methods.

ConnectionParams Class

Contains the credentials for authenticating to the external system.

DataSourceUtil Class

Parent class for the `DataSource.Provider`, `DataSource.Connection`, `DataSource.Table`, and `DataSource.Column` classes.

DataType Enum

Specifies the data types that are supported by the Apex Connector Framework.

DeleteContext Class

An instance of `DeleteContext` is passed to the `deleteRows()` method on your `Database.Connection` class. The class provides context information about the delete request to the implementor of `deleteRows()`.

DeleteResult Class

Represents the result of a delete operation on an sObject record. The result is returned by the `DataSource.deleteRows` method of the `DataSource.Connection` class.

Filter Class

Represents a `WHERE` clause in a SOSL or SOQL query.

FilterType Enum

Referenced by the `type` property on a `DataSource.Filter`.

IdentityType Enum

Determines which set of credentials is used to authenticate to the external system.

Order Class

Contains details about how to sort the rows in the result set. Equivalent to an `ORDER BY` statement in a SOQL query.

OrderDirection Enum

Specifies the direction for sorting rows based on column values.

Provider Class

Extend this base class to create a custom adapter for Salesforce Connect. The class informs Salesforce of the functional and authentication capabilities that are supported by or required to connect to the external system. This class extends the `DataSourceUtil` class and inherits its methods.

QueryAggregation Enum

Specifies how to aggregate a column in a query.

QueryContext Class

An instance of `QueryContext` is provided to the `query` method on your `DataSource.Connection` class. The instance corresponds to a SOQL request.

QueryUtils Class

Contains helper methods to locally filter, sort, and apply limit and offset clauses to data rows. This helper class is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

ReadContext Class

Abstract base class for the `QueryContext` and `SearchContext` classes.

SearchContext Class

An instance of `SearchContext` is provided to the search method on your `DataSource.Connection` class. The instance corresponds to a search or SOSL request.

SearchUtils Class

Helper class for implementing search on a custom adapter for Salesforce Connect.

Table Class

Describes a table on an external system that the Salesforce Connect custom adapter connects to. This class extends the `DataSourceUtil` class and inherits its methods.

TableResult Class

Contains the results of a search or query.

TableSelection Class

Contains a breakdown of the SOQL or SOSL query. Its properties represent the FROM, ORDER BY, SELECT, and WHERE clauses in the query.

UpsertContext Class

An instance of `UpsertContext` is passed to the `upsertRows()` method on your `Datasource.Connection` class. This class provides context information about the upsert request to the implementor of `upsertRows()`.

UpsertResult Class

Represents the result of an upsert operation on an external object record. The result is returned by the `upsertRows` method of the `DataSource.Connection` class.

DataSource Exceptions

The `DataSource` namespace contains exception classes.

AsyncDeleteCallback Class

A callback class that the `Database.deleteAsync` method references. Salesforce calls this class after the remote `deleteAsync` operation is completed. This class provides the compensating transaction in the completion context of the delete operation. Extend this class to define the actions to execute after the remote delete operation finishes execution.

Namespace

DataSource

IN THIS SECTION:

AsyncDeleteCallback Methods

AsyncDeleteCallback Methods

The following are methods for `AsyncDeleteCallback`.

IN THIS SECTION:

processDelete(deleteResult)

Override this method to define actions that Salesforce executes after a remote `Database.deleteAsync` operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org..

`processDelete(deleteResult)`

Override this method to define actions that Salesforce executes after a remote `Database.deleteAsync` operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org..

Signature

```
public void processDelete(Database.DeleteResult deleteResult)
```

Parameters

deleteResult
Type: Database.DeleteResult

The result of the asynchronous delete operation.

Return Value

Type: void

AsyncSaveCallback Class

A callback class that the `Database.insertAsync` or `Database.updateAsync` method references. Salesforce calls this class after the remote operation is completed. This class provides the compensating transaction in the completion context of the insert or update operation. Extend this class to define the actions to execute after the remote insert or update operation finishes execution.

Namespace

DataSource

IN THIS SECTION:

AsyncSaveCallback Methods

AsyncSaveCallback Methods

The following are methods for `AsyncSaveCallback`.

IN THIS SECTION:

processSave(saveResult)
Override this method to define actions that Salesforce executes after the remote `Database.insertAsync` or `Database.updateAsync` operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org.

`processSave(saveResult)`

Override this method to define actions that Salesforce executes after the remote `Database.insertAsync` or `Database.updateAsync` operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org.

Signature

```
public void processSave(Database.SaveResult saveResult)
```

Parameters

saveResult
Type: Database.SaveResult

The result of the asynchronous insert or update operation.

Return Value

Type: void

AuthenticationCapability Enum

Specifies the types of authentication that can be used to access the external system.

Usage

The `DataSource.Provider` class returns `DataSource.AuthenticationCapability` enum values. The returned values determine which authentication settings are available on the external data source definition in Salesforce.

If you set up callouts in your `DataSource.Connection` class, you can specify the callout endpoints as named credentials instead of URLs. If you do so for all callouts, return `ANONYMOUS` as the sole entry in the list of data source authentication capabilities. That way, the external data source definition doesn't require authentication settings. Salesforce manages all authentication for Apex callouts that specify a named credential as the callout endpoint so that your code doesn't have to.

Enum Values

The following are the values of the `DataSource.AuthenticationCapability` enum.

Value	Description
`ANONYMOUS`	No credentials are required to authenticate to the external system.
`BASIC`	A username and password can be used to authenticate to the external system.
`CERTIFICATE`	A security certificate can be supplied when establishing each connection to the external system.
`OAUTH`	OAuth can be used to authenticate to the external system.

AuthenticationProtocol Enum

Determines what type of credentials are used to authenticate to the external system.

Enum Values

The following are the values of the `DataSource.AuthenticationProtocol` enum.

Value	Description
`NONE`	No credentials are used to authenticate to the external system.
`OAUTH`	OAuth 2.0 is used to authenticate to the external system.
`PASSWORD`	A username and password are used to authenticate to the external system.

Capability Enum

Declares which functional operations the external system supports. Also specifies required endpoint settings for the external data source definition.

Usage

The `DataSource.Provider` class returns `DataSource.Capability` enum values, which:

- Specify the functional capabilities of the external system.
- Determine which endpoint settings are available on the external data source definition in Salesforce.

Enum Values

The following are the values of the `DataSource.Capability` enum.

Value	Description
`QUERY_PAGINATION_SERVER_DRIVEN`	With server-driven paging, the external system determines the page sizes and batch boundaries. The external system's paging settings can optimize the external system's performance and improve the load times for external objects in your org. Also, the external data set can change while your users or the Lightning Platform are paging through the result set. Typically, server-driven paging adjusts batch boundaries to accommodate changing data sets more effectively than client-driven paging. If you enable server-driven paging on an external data source, Salesforce ignores the requested page sizes, including the default `queryMore()` batch size of 500 rows. The pages returned by the external system determine the batches, but each page can't exceed 2,000 rows. Also, the Apex code must generate a query token and use it to determine and fetch the next batch of results.
`QUERY_TOTAL_SIZE`	The external system can provide the total number of rows that meet the query criteria, even when requested to return a smaller batch size. This capability enables you to simplify how you paginate results by using `queryMore()`.
`REQUIRE_ENDPOINT`	Requires the administrator to specify the endpoint in the URL field in the external data source definition.
`REQUIRE_HTTPS`	Requires the endpoint URL to use secure HTTP. If `REQUIRE_ENDPOINT` isn't declared, `REQUIRE_HTTPS` is ignored.
`ROW_CREATE`	Allows creating of external data.
`ROW_DELETE`	Allows deleting external data.
`ROW_QUERY`	Allows API and SOQL queries of the external data. Also allows reports on the external objects.
`ROW_UPDATE`	Allows updating external data.
`SEARCH`	Allows SOSL and Salesforce searches of the external data. When the custom adapter declares the `SEARCH` capability, you can control which external objects are searchable by selecting or deselecting **Allow Search** on each

Value	Description
	external object. However, syncing always overwrites the external object's search status to match the search status of the external data source. Only text, text area, and long text area fields on external objects can be searched. If an external object has no searchable fields, searches on that object return no records.

SEE ALSO:

Salesforce Help: Validate and Sync an External Data Source

Column Class

Describes a column on a `DataSource.Table`. This class extends the `DataSourceUtil` class and inherits its methods.

Namespace

DataSource

Usage

A list of column metadata is provided by the `DataSource.Connection` class when the `sync()` method is invoked. Each column can become a field on an external object.

The metadata is stored in Salesforce. Updating the Apex code to return new or updated values for the column metadata doesn't automatically update the stored metadata in Salesforce.

IN THIS SECTION:

Column Properties

Column Methods

Column Properties

The following are properties for `Column`.

IN THIS SECTION:

decimalPlaces

If the data type is numeric, the number of decimal places to the right of the decimal point.

description

Description of what the column represents.

filterable

Whether a result set can be filtered based on the values of the column.

label

User-friendly name for the column that appears in the Salesforce user interface.

length
If the column is a string data type, the number of characters in the column. If the column is a numeric data type, the total number of digits on both sides of the decimal point, but excluding the decimal point.

name
Name of the column in the external system.

referenceTargetField
API name of the custom field on the parent object whose values are compared against this column's values. Matching values identify related records in an indirect lookup relationship. Applies only when the column's data type is `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

referenceTo
API name of the parent object in the relationship that's represented by this column. Applies only when the column's data type is `LOOKUP_TYPE`, `EXTERNAL_LOOKUP_TYPE`, or `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

sortable
Whether a result set can be sorted based on the values of the column via an `ORDER BY` clause.

type
Data type of the column.

`decimalPlaces`

If the data type is numeric, the number of decimal places to the right of the decimal point.

Signature

```
public Integer decimalPlaces {get; set;}
```

Property Value

Type: Integer

`description`

Description of what the column represents.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

`filterable`

Whether a result set can be filtered based on the values of the column.

Signature

```
public Boolean filterable {get; set;}
```

Property Value

Type: Boolean

label

User-friendly name for the column that appears in the Salesforce user interface.

Signature

```
public String label {get; set;}
```

Property Value

Type: String

length

If the column is a string data type, the number of characters in the column. If the column is a numeric data type, the total number of digits on both sides of the decimal point, but excluding the decimal point.

Signature

```
public Integer length {get; set;}
```

Property Value

Type: Integer

name

Name of the column in the external system.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

referenceTargetField

API name of the custom field on the parent object whose values are compared against this column's values. Matching values identify related records in an indirect lookup relationship. Applies only when the column's data type is `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

Signature

```
public String referenceTargetField {get; set;}
```

Property Value

Type: String

`referenceTo`

API name of the parent object in the relationship that's represented by this column. Applies only when the column's data type is `LOOKUP_TYPE`, `EXTERNAL_LOOKUP_TYPE`, or `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

Signature

```
public String referenceTo {get; set;}
```

Property Value

Type: String

`sortable`

Whether a result set can be sorted based on the values of the column via an `ORDER BY` clause.

Signature

```
public Boolean sortable {get; set;}
```

Property Value

Type: Boolean

`type`

Data type of the column.

Signature

```
public DataSource.DataType type {get; set;}
```

Property Value

Type: DataSource.DataType

Column Methods

The following are methods for `Column`.

IN THIS SECTION:

boolean(name)
Returns a new column of data type `BOOLEAN_TYPE`.

externalLookup(name, domain)
Returns a new column of data type `EXTERNAL_LOOKUP_TYPE`.

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces, referenceTo, referenceTargetField)
Returns a new column with the ten specified `Column` property values.

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces)
Returns a new column with the eight specified `Column` property values.

get(name, label, description, isSortable, isFilterable, type, length)
Returns a new column with the seven specified `Column` property values.

indirectLookup(name, domain, targetField)
Returns a new column of data type `INDIRECT_LOOKUP_TYPE`.

integer(name, length)
Returns a new numeric column with no decimal places using the specified name and length.

lookup(name, domain)
Returns a new column of data type `LOOKUP_TYPE`.

number(name, length, decimalPlaces)
Returns a new column of data type `NUMBER_TYPE`.

text(name, label, length)
Returns a new column of data type `STRING_SHORT_TYPE` or `STRING_LONG_TYPE`, with the specified name, label, and length.

text(name, length)
Returns a new column of data type `STRING_SHORT_TYPE` or `STRING_LONG_TYPE`, with the specified name and length.

text(name)
Returns a new column of data type `STRING_SHORT_TYPE` with the specified name and the length of 255 characters.

textarea(name)
Returns a new column of data type `STRING_LONG_TYPE` with the specified name and the length of 32,000 characters.

url(name, length)
Returns a new column of data type `URL_TYPE` with the specified name and length.

url(name)
Returns a new column of data type `URL_TYPE` with the specified name and the length of 1,000 characters.

`boolean(name)`

Returns a new column of data type `BOOLEAN_TYPE`.

Signature

```
public static DataSource.Column boolean(String name)
```

Parameters

`name`
Type: String

Name of the column.

Return Value

Type: DataSource.Column

externalLookup(name, domain)

Returns a new column of data type `EXTERNAL_LOOKUP_TYPE`.

Signature

```
public static DataSource.Column externalLookup(String name, String domain)
```

Parameters

name
Type: String

Name of the column.

domain
Type: String

API name of the parent object in the external lookup relationship.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.EXTERNAL_LOOKUP_TYPE
length	255
decimalPlaces	0
referenceTo	*domain*
referenceTargetField	null

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces, referenceTo, referenceTargetField)

Returns a new column with the ten specified `Column` property values.

Signature

```
public static DataSource.Column get(String name, String label, String description,
Boolean isSortable, Boolean isFilterable, DataSource.DataType type, Integer length,
Integer decimalPlaces, String referenceTo, String referenceTargetField)
```

Parameters

See Column Properties on page 2327 for information about each parameter.

name
Type: String

label
Type: String

description
Type: String

isSortable
Type: Boolean

isFilterable
Type: Boolean

type
Type: DataSource.DataType

length
Type: Integer

decimalPlaces
Type: Integer

referenceTo
Type: String

referenceTargetField
Type: String

Return Value

Type: DataSource.Column

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces)

Returns a new column with the eight specified `Column` property values.

Signature

```
public static DataSource.Column get(String name, String label, String description,
Boolean isSortable, Boolean isFilterable, DataSource.DataType type, Integer length,
Integer decimalPlaces)
```

Parameters

See Column Properties on page 2327 for information about each parameter.

name
Type: String

label
Type: String

description
Type: String

isSortable
Type: Boolean

isFilterable
Type: Boolean

type
Type: DataSource.DataType

length
Type: Integer

decimalPlaces
Type: Integer

Return Value

Type: DataSource.Column

get(name, label, description, isSortable, isFilterable, type, length)

Returns a new column with the seven specified `Column` property values.

Signature

```
public static DataSource.Column get(String name, String label, String description,
Boolean isSortable, Boolean isFilterable, DataSource.DataType type, Integer length)
```

Parameters

See Column Properties on page 2327 for information about each parameter.

name
Type: String

label
Type: String

description
Type: String

isSortable
Type: Boolean

isFilterable
Type: Boolean

type
Type: DataSource.DataType

length
Type: Integer

Return Value

Type: DataSource.Column

indirectLookup(name, domain, targetField)

Returns a new column of data type `INDIRECT_LOOKUP_TYPE`.

Signature

```
public static DataSource.Column indirectLookup(String name, String domain, String targetField)
```

Parameters

name
Type: String

Name of the column.

domain
Type: String

API name of the parent object in the indirect lookup relationship.

targetField
Type: String

API name of the custom field on the parent object whose values are compared against this column's values. Matching values identify related records in an indirect lookup relationship.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.INDIRECT_LOOKUP_TYPE

Property	Value
length	255
decimalPlaces	0
referenceTo	*domain*
referenceTargetField	*targetField*

integer(name, length)

Returns a new numeric column with no decimal places using the specified name and length.

Signature

```
public static DataSource.Column integer(String name, Integer length)
```

Parameters

name
Type: String

The column name.

length
Type: Integer

The column length.

Return Value

Type: DataSource.Column

lookup(name, domain)

Returns a new column of data type `LOOKUP_TYPE`.

Signature

```
public static DataSource.Column lookup(String name, String domain)
```

Parameters

name
Type: String

Name of the column.

domain
Type: String

API name of the parent object in the lookup relationship.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.LOOKUP_TYPE
length	255
decimalPlaces	0
referenceTo	*domain*
referenceTargetField	null

number(name, length, decimalPlaces)

Returns a new column of data type `NUMBER_TYPE`.

Signature

```
public static DataSource.Column number(String name, Integer length, Integer
decimalPlaces)
```

Parameters

See Column Properties on page 2327 for information about each parameter.

name
Type: String

length
Type: Integer

decimalPlaces
Type: Integer

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.NUMBER_TYPE
length	*length*
decimalPlaces	*decimalPlaces*

text(name, label, length)

Returns a new column of data type `STRING_SHORT_TYPE` or `STRING_LONG_TYPE`, with the specified name, label, and length.

Signature

```
public static DataSource.Column text(String name, String label, Integer length)
```

Parameters

name
Type: String

Name of the column.

label
Type: String

User-friendly name for the column that appears in the Salesforce user interface.

length
Type: Integer

Number of characters allowed in the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*label*
description	*label*
isSortable	true

Property	Value
isFilterable	true
type	DataSource.DataType.STRING_SHORT_TYPE if *length* is 255 or less DataSource.DataType.STRING_LONG_TYPE if *length* is greater than 255
length	*length*
decimalPlaces	0

text(name, length)

Returns a new column of data type STRING_SHORT_TYPE or STRING_LONG_TYPE, with the specified name and length.

Signature

```
public static DataSource.Column text(String name, Integer length)
```

Parameters

name
Type: String
Name of the column.

length
Type: Integer
Number of characters allowed in the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.STRING_SHORT_TYPE if *length* is 255 or less DataSource.DataType.STRING_LONG_TYPE if *length* is greater than 255
length	*length*

Property	Value
decimalPlaces	0

text(name)

Returns a new column of data type `STRING_SHORT_TYPE` with the specified name and the length of 255 characters.

Signature

```
public static DataSource.Column text(String name)
```

Parameters

name
Type: String

Name of the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.STRING_SHORT_TYPE
length	255
decimalPlaces	0

textarea(name)

Returns a new column of data type `STRING_LONG_TYPE` with the specified name and the length of 32,000 characters.

Signature

```
public static DataSource.Column textarea(String name)
```

Parameters

name
Type: String

Name of the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.STRING_LONG_TYPE
length	32000
decimalPlaces	0

`url(name, length)`

Returns a new column of data type `URL_TYPE` with the specified name and length.

Signature

```
public static DataSource.Column url(String name, Integer length)
```

Parameters

name
Type: String

Name of the column.

length
Type: Integer

Number of characters allowed in the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.URL_TYPE
length	*length*
decimalPlaces	0

`url(name)`

Returns a new column of data type `URL_TYPE` with the specified name and the length of 1,000 characters.

Signature

```
public static DataSource.Column url(String name)
```

Parameters

name
Type: String

Name of the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.URL_TYPE
length	1000
decimalPlaces	0

ColumnSelection Class

Identifies the list of columns to return during a query or search.

Namespace

DataSource Namespace

Usage

This class is associated with the `SELECT` clause for a SOQL query, or the `RETURNING` clause for a SOSL query.

IN THIS SECTION:

ColumnSelection Properties

ColumnSelection Properties

The following are properties for `ColumnSelection`.

IN THIS SECTION:

aggregation
How to aggregate the column's data.

columnName
Name of the selected column.

tableName
Name of the column's table.

`aggregation`

How to aggregate the column's data.

Signature

```
public DataSource.QueryAggregation aggregation {get; set;}
```

Property Value

Type: DataSource.QueryAggregation

`columnName`

Name of the selected column.

Signature

```
public String columnName {get; set;}
```

Property Value

Type: String

`tableName`

Name of the column's table.

Signature

```
public String tableName {get; set;}
```

Property Value

Type: String

Connection Class

Extend this class to enable your Salesforce org to sync the external system's schema and to handle queries, searches, and write operations (upsert and delete) of the external data. This class extends the `DataSourceUtil` class and inherits its methods.

Namespace

DataSource

Usage

Your `DataSource.Connection` and `DataSource.Provider` classes compose a custom adapter for Salesforce Connect.

Changing the `sync` method on the `DataSource.Connection` class doesn't automatically resync any external objects.

Example

```
global class SampleDataSourceConnection extends DataSource.Connection {
    global SampleDataSourceConnection(DataSource.ConnectionParams connectionParams) {
    }

    override global List<DataSource.Table> sync() {
        List<DataSource.Table> tables = new List<DataSource.Table>();
        List<DataSource.Column> columns;
        columns = new List<DataSource.Column>();
        columns.add(DataSource.Column.text('Name', 255));
        columns.add(DataSource.Column.text('ExternalId', 255));
        columns.add(DataSource.Column.url('DisplayUrl'));
        tables.add(DataSource.Table.get('Sample', 'Title', columns));
        return tables;
    }

    override global DataSource.TableResult query(DataSource.QueryContext c) {
       return DataSource.TableResult.get(c, DataSource.QueryUtils.process(c, getRows()));

    }
```

```
override global List<DataSource.TableResult> search(DataSource.SearchContext c) {

    List<DataSource.TableResult> results = new List<DataSource.TableResult>();
    for (DataSource.TableSelection tableSelection : c.tableSelections) {
        results.add(DataSource.TableResult.get(tableSelection, getRows()));
    }
    return results;
}

// Helper method to get record values from the external system for the Sample table.
private List<Map<String, Object>> getRows () {
   // Get row field values for the Sample table from the external system via a callout.

    HttpResponse response = makeGetCallout();
    // Parse the JSON response and populate the rows.
    Map<String, Object> m = (Map<String, Object>)JSON.deserializeUntyped(
            response.getBody());
    Map<String, Object> error = (Map<String, Object>)m.get('error');
    if (error != null) {
        throwException(string.valueOf(error.get('message')));
    }
    List<Map<String,Object>> rows = new List<Map<String,Object>>();
    List<Object> jsonRows = (List<Object>)m.get('value');
    if (jsonRows == null) {
        rows.add(foundRow(m));
    } else {
        for (Object jsonRow : jsonRows) {
            Map<String,Object> row = (Map<String,Object>)jsonRow;
            rows.add(foundRow(row));
        }
    }
    return rows;
}

global override List<DataSource.UpsertResult> upsertRows(DataSource.UpsertContext
        context) {
   if (context.tableSelected == 'Sample') {
       List<DataSource.UpsertResult> results = new List<DataSource.UpsertResult>();
       List<Map<String, Object>> rows = context.rows;

       for (Map<String, Object> row : rows){
          // Make a callout to insert or update records in the external system.
          HttpResponse response;
          // Determine whether to insert or update a record.
          if (row.get('ExternalId') == null){
             // Send a POST HTTP request to insert new external record.
             // Make an Apex callout and get HttpResponse.
             response = makePostCallout(
                 '{"name":"' + row.get('Name') + '","ExternalId":"' +
                 row.get('ExternalId') + '"');
          }
          else {
             // Send a PUT HTTP request to update an existing external record.
```

```
                // Make an Apex callout and get HttpResponse.
                response = makePutCallout(
                    '{"name":"' + row.get('Name') + '","ExternalId":"' +
                    row.get('ExternalId') + '"',
                    String.valueOf(row.get('ExternalId')));
            }

            // Check the returned response.
            // First, deserialize it.
            Map<String, Object> m = (Map<String, Object>)JSON.deserializeUntyped(
                    response.getBody());
            if (response.getStatusCode() == 200){
                results.add(DataSource.UpsertResult.success(
                        String.valueOf(m.get('id'))));
            }
            else {
                results.add(DataSource.UpsertResult.failure(
                                String.valueOf(m.get('id')),
                    'The callout resulted in an error: ' +
                    response.getStatusCode()));
            }
        }
        return results;
    }
    return null;
}

global override List<DataSource.DeleteResult> deleteRows(DataSource.DeleteContext
        context) {
    if (context.tableSelected == 'Sample'){
        List<DataSource.DeleteResult> results = new List<DataSource.DeleteResult>();
        for (String externalId : context.externalIds){
            HttpResponse response = makeDeleteCallout(externalId);
            if (response.getStatusCode() == 200){
                results.add(DataSource.DeleteResult.success(externalId));
            }
            else {
                results.add(DataSource.DeleteResult.failure(externalId,
                            'Callout delete error:'
                            + response.getBody()));
            }
        }
        return results;
    }
    return null;
 }

// Helper methods

// Make a GET callout
 private static HttpResponse makeGetCallout() {
     HttpResponse response;
     // Make callout
     // ...
```

```
        return response;
    }

    // Populate a row based on values from the external system.
    private Map<String,Object> foundRow(Map<String,Object> foundRow) {
       Map<String,Object> row = new Map<String,Object>();
       row.put('ExternalId', string.valueOf(foundRow.get('Id')));
       row.put('DisplayUrl', string.valueOf(foundRow.get('DisplayUrl')));
       row.put('Name', string.valueOf(foundRow.get('Name')));
       return row;
   }

    // Make a POST callout
    private static HttpResponse makePostCallout(String jsonBody) {
        HttpResponse response;
        // Make callout

        // ...
        return response;
    }

    // Make a DELETE callout
    private static HttpResponse makeDeleteCallout(String externalID) {
        HttpResponse response;
        // Make callout
        // ...
        return response;
    }
}
```

IN THIS SECTION:

Connection Methods

Connection Methods

The following are methods for `Connection`.

IN THIS SECTION:

deleteRows(deleteContext)
Invoked when external object records are deleted via the Salesforce user interface, APIs, or Apex.

query(queryContext)
Invoked by a SOQL query of an external object. A SOQL query is generated and executed when a user visits an external object's list view or record detail page in Salesforce. Returns the results of the query.

search(searchContext)

Invoked by a SOSL query of an external object or when a user performs a Salesforce global search that also searches external objects. Returns the results of the query.

sync()

Invoked when an administrator clicks **Validate and Sync** on the external data source detail page. Returns a list of tables that describe the external system's schema.

upsertRows(upsertContext)

Invoked when external object records are created or updated via the Salesforce user interface, APIs, or Apex.

`deleteRows(deleteContext)`

Invoked when external object records are deleted via the Salesforce user interface, APIs, or Apex.

Signature

```
public List<DataSource.DeleteResult> deleteRows(DataSource.DeleteContext deleteContext)
```

Parameters

`deleteContext`

Type: DataSource.DeleteContext

Contains context information about the delete request.

Return Value

Type: List<DataSource.DeleteResult>

The results of the delete operation.

`query(queryContext)`

Invoked by a SOQL query of an external object. A SOQL query is generated and executed when a user visits an external object's list view or record detail page in Salesforce. Returns the results of the query.

Signature

```
public DataSource.TableResult query(DataSource.QueryContext queryContext)
```

Parameters

`queryContext`

Type: DataSource.QueryContext

Represents the query to run against a data table.

Return Value

Type: DataSource.TableResult

`search(searchContext)`

Invoked by a SOSL query of an external object or when a user performs a Salesforce global search that also searches external objects. Returns the results of the query.

Signature

```
public List<DataSource.TableResult> search(DataSource.SearchContext searchContext)
```

Parameters

searchContext
Type: DataSource.SearchContext

Represents the query to run against an external data table.

Return Value

Type: List<DataSource.TableResult>

`sync()`

Invoked when an administrator clicks **Validate and Sync** on the external data source detail page. Returns a list of tables that describe the external system's schema.

Signature

```
public List<DataSource.Table> sync()
```

Return Value

Type: List<DataSource.Table>

Each returned table can be used to create an external object in Salesforce. On the Validate External Data Source page, the administrator views the list of returned tables and selects which tables to sync. When the administrator clicks **Sync**, an external object is created for each selected table. Each column within the selected tables also becomes a field in the external object.

`upsertRows(upsertContext)`

Invoked when external object records are created or updated via the Salesforce user interface, APIs, or Apex.

Signature

```
public List<DataSource.UpsertResult> upsertRows(DataSource.UpsertContext upsertContext)
```

Parameters

upsertContext
Type: DataSource.UpsertContext

Contains context information about the upsert request.

Return Value

Type: List<DataSource.UpsertResult>

The results of the upsert operation.

ConnectionParams Class

Contains the credentials for authenticating to the external system.

Namespace

DataSource

Usage

If your extension of the `DataSource.Provider` class returns `DataSource.AuthenticationCapability` values that indicate support for authentication, the `DataSource.Connection` class is instantiated with a `DataSource.ConnectionParams` instance in the constructor.

The authentication credentials in the `DataSource.ConnectionParams` instance depend on the `Identity Type` field of the external data source definition in Salesforce.

- If `Identity Type` is set to `Named Principal`, the credentials come from the external data source definition.
- If `Identity Type` is set to `Per User`:
  - For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user's authentication settings for the external system.
  - For administrative connections, such as syncing the external system's schema, the credentials come from the external data source definition.

The values in this class can appear in debug logs and can be accessed by users who have the "Author Apex" permission. If you require better security, we recommend that you specify named credentials instead of URLs as your Apex callout endpoints. Salesforce manages all authentication for Apex callouts that specify a named credential as the callout endpoint so that your code doesn't have to.

IN THIS SECTION:

ConnectionParams Properties

ConnectionParams Properties

The following are properties for `ConnectionParams`.

IN THIS SECTION:

certificateName

The name of the certificate for establishing each connection to the external system.

endpoint

The URL of the external system.

oauthToken

The OAuth token that's issued by the external system.

password
The password for authenticating to the external system.

principalType
An instance of DataSource.IdentityType, which determines which set of credentials to use to access the external system.

protocol
The type of protocol that's used to authenticate to the external system.

repository
Reserved for future use.

username
The username for authenticating to the external system.

certificateName

The name of the certificate for establishing each connection to the external system.

Signature

```
public String certificateName {get; set;}
```

Property Value

Type: String

The value comes from the external data source definition in Salesforce.

endpoint

The URL of the external system.

Signature

```
public String endpoint {get; set;}
```

Property Value

Type: String

The value comes from the external data source definition in Salesforce.

oauthToken

The OAuth token that's issued by the external system.

Signature

```
public String oauthToken {get; set;}
```

Property Value

Type: String

password

The password for authenticating to the external system.

Signature

```
public String password {get; set;}
```

Property Value

Type: String

The value depends on the `Identity Type` field of the external data source definition in Salesforce.

- If `Identity Type` is set to `Named Principal`, the credentials come from the external data source definition.
- If `Identity Type` is set to `Per User`:
  - For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user's authentication settings for the external system.
  - For administrative connections, such as syncing the external system's schema, the credentials come from the external data source definition.

principalType

An instance of DataSource.IdentityType, which determines which set of credentials to use to access the external system.

Signature

```
public DataSource.IdentityType principalType {get; set;}
```

Property Value

Type: DataSource.IdentityType

protocol

The type of protocol that's used to authenticate to the external system.

Signature

```
public DataSource.AuthenticationProtocol protocol {get; set;}
```

Property Value

Type: DataSource.AuthenticationProtocol

repository

Reserved for future use.

Signature

```
public String repository {get; set;}
```

Property Value

Type: String

Reserved for future use.

`username`

The username for authenticating to the external system.

Signature

```
public String username {get; set;}
```

Property Value

Type: String

The value depends on the `Identity Type` field of the external data source definition in Salesforce.

- If `Identity Type` is set to `Named Principal`, the credentials come from the external data source definition.
- If `Identity Type` is set to `Per User`:
  - For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user's authentication settings for the external system.
  - For administrative connections, such as syncing the external system's schema, the credentials come from the external data source definition.

DataSourceUtil Class

Parent class for the `DataSource.Provider`, `DataSource.Connection`, `DataSource.Table`, and `DataSource.Column` classes.

Namespace

DataSource

IN THIS SECTION:

DataSourceUtil Methods

DataSourceUtil Methods

The following are methods for `DataSourceUtil`.

IN THIS SECTION:

logWarning(message)
Logs the error message in the debug log.

throwException(message)
Throws a `DataSourceException` and displays the provided message to the user.

`logWarning(message)`

Logs the error message in the debug log.

Signature

```
public void logWarning(String message)
```

Parameters

`message`
Type: String

The error message.

Return Value

Type: void

`throwException(message)`

Throws a `DataSourceException` and displays the provided message to the user.

Signature

```
public void throwException(String message)
```

Parameters

`message`
Type: String

Error message to display to the user.

Return Value

Type: void

DataType Enum

Specifies the data types that are supported by the Apex Connector Framework.

Usage

The `DataSource.DataType` enum is referenced by the `type` property on the `DataSource.Column` class.

Enum Values

The following are the values of the `DataSource.DataType` enum.

Value	Description
`BOOLEAN_TYPE`	Boolean
`DATETIME_TYPE`	Date/time
`EXTERNAL_LOOKUP_TYPE`	External lookup relationship
`INDIRECT_LOOKUP_TYPE`	Indirect lookup relationship
`LOOKUP_TYPE`	Lookup relationship
`NUMBER_TYPE`	Number
`STRING_LONG_TYPE`	Long text area
`STRING_SHORT_TYPE`	Text area
`URL_TYPE`	URL

DeleteContext Class

An instance of `DeleteContext` is passed to the `deleteRows()` method on your `Database.Connection` class. The class provides context information about the delete request to the implementor of `deleteRows()`.

Namespace

DataSource

Usage

The Apex Connector Framework creates context for operations. Context is comprised of parameters about the operations, which other methods can use. An instance of the `DeleteContext` class packages these parameters into an object that can be used when a `deleteRows()` operation is initiated.

IN THIS SECTION:

DeleteContext Properties

DeleteContext Properties

The following are properties for `DeleteContext`.

IN THIS SECTION:

externalIds
The external IDs of the rows representing external object records to delete.

tableSelected
The name of the table to delete rows from.

`externalIds`

The external IDs of the rows representing external object records to delete.

Signature

```
public List<String> externalIds {get; set;}
```

Property Value

Type: List<String>

`tableSelected`

The name of the table to delete rows from.

Signature

```
public String tableSelected {get; set;}
```

Property Value

Type: String

DeleteResult Class

Represents the result of a delete operation on an sObject record. The result is returned by the `DataSource.deleteRows` method of the `DataSource.Connection` class.

Namespace

DataSource

Usage

A delete operation on external object records generates an array of objects of type `DataSource.DeleteResult`. Its methods create result records that indicate whether the delete operation succeeded or failed.

IN THIS SECTION:

DeleteResult Properties

DeleteResult Methods

DeleteResult Properties

The following are properties for `DeleteResult`.

IN THIS SECTION:

errorMessage
The error message that's generated by a failed delete operation. Recorded with a result of type `DataSource.DeleteResult`.

externalId
The unique identifier of a row that represents an external object record to delete.

success
Indicates whether a delete operation succeeded or failed.

errorMessage

The error message that's generated by a failed delete operation. Recorded with a result of type `DataSource.DeleteResult`.

Signature

```
public String errorMessage {get; set;}
```

Property Value

Type: String

externalId

The unique identifier of a row that represents an external object record to delete.

Signature

```
public String externalId {get; set;}
```

Property Value

Type: String

success

Indicates whether a delete operation succeeded or failed.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

DeleteResult Methods

The following are methods for `DeleteResult`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `DeleteResult` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals` method in Java.

failure(externalId, errorMessage)
Creates a delete result indicating the failure of a delete request for a given external ID.

hashCode()
Maintains the integrity of lists of type `DeleteResult` by determining the uniqueness of the external object records in a list.

success(externalId)
Creates a delete result indicating the successful completion of a delete request for a given external ID.

`equals(obj)`

Maintains the integrity of lists of type `DeleteResult` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals` method in Java.

Signature

```
public Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

For information about the `equals` method, see Using Custom Types in Map Keys and Sets.

Return Value

Type: Boolean

`failure(externalId, errorMessage)`

Creates a delete result indicating the failure of a delete request for a given external ID.

Signature

```
public static DataSource.DeleteResult failure(String externalId, String errorMessage)
```

Parameters

externalId
Type: String

The unique identifier of the sObject record to delete.

errorMessage
Type: String

The reason the delete operation failed.

Return Value

Type: DataSource.DeleteResult

Status result of the delete operation.

`hashCode()`

Maintains the integrity of lists of type `DeleteResult` by determining the uniqueness of the external object records in a list.

Signature

```
public Integer hashCode()
```

Return Value

Type: Integer

`success(externalId)`

Creates a delete result indicating the successful completion of a delete request for a given external ID.

Signature

```
public static DataSource.DeleteResult success(String externalId)
```

Parameters

externalId
Type: String

The unique identifier of the sObject record to delete.

Return Value

Type: DataSource.DeleteResult

Status result of the delete operation for the sObject with the given external ID.

Filter Class

Represents a `WHERE` clause in a SOSL or SOQL query.

Namespace

DataSource

Usage

Compound types require child filters. Specifically, the `subfilters` property can't be null if the `type` property is `NOT_`, `AND_`, or `OR_`.

IN THIS SECTION:

Filter Properties

Filter Properties

The following are properties for `Filter`.

IN THIS SECTION:

columnName
Name of the column that's being evaluated in a simple comparative type of filter.

columnValue
Value that the filter compares records against in a simple comparative type of filter.

subfilters
List of subfilters for compound filter types, such as `NOT_`, `AND_`, and `OR_`.

tableName
Name of the table whose column is being evaluated in a simple comparative type of filter.

type
Type of filter operation that limits the returned data.

`columnName`

Name of the column that's being evaluated in a simple comparative type of filter.

Signature

```
public String columnName {get; set;}
```

Property Value

Type: String

`columnValue`

Value that the filter compares records against in a simple comparative type of filter.

Signature

```
public Object columnValue {get; set;}
```

Property Value

Type: Object

subfilters

List of subfilters for compound filter types, such as `NOT_`, `AND_`, and `OR_`.

Signature

```
public List<DataSource.Filter> subfilters {get; set;}
```

Property Value

Type: List<DataSource.Filter>

tableName

Name of the table whose column is being evaluated in a simple comparative type of filter.

Signature

```
public String tableName {get; set;}
```

Property Value

Type: String

type

Type of filter operation that limits the returned data.

Signature

```
public DataSource.FilterType type {get; set;}
```

Property Value

Type: DataSource.FilterType

FilterType Enum

Referenced by the `type` property on a `DataSource.Filter`.

Usage

Determines how to limit the returned data.

Enum Values

The following are the values of the `DataSource.FilterType` enum.

Value	Description
AND_	This compound filter type returns all rows that match all the subfilters.
CONTAINS	Simple comparative filter type.
ENDS_WITH	Simple comparative filter type.
EQUALS	Simple comparative filter type.
GREATER_THAN	Simple comparative filter type.
GREATER_THAN_OR_EQUAL_TO	Simple comparative filter type.
LESS_THAN	Simple comparative filter type.
LESS_THAN_OR_EQUAL_TO	Simple comparative filter type.
LIKE_	Simple comparative filter type.
NOT_	This compound filter type returns the rows that don't match the subfilter.
NOT_EQUALS	Simple comparative filter type.
OR_	This compound filter type returns all rows that match any of the subfilters.
STARTS_WITH	Simple comparative filter type.

IdentityType Enum

Determines which set of credentials is used to authenticate to the external system.

Usage

The relevant credentials are passed to your `DataSource.Connection` class.

Enum Values

The following are the values of the `DataSource.IdentityType` enum.

Value	Description
ANONYMOUS	No credentials are used to authenticate to the external system.
NAMED_USER	The credentials in the external data source definition are used to authenticate to the external system, regardless of which user is accessing the external data from your organization.
PER_USER	For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user's authentication settings for the external system. For administrative connections, such as syncing the external system's schema, the credentials come from the external data source definition.

Order Class

Contains details about how to sort the rows in the result set. Equivalent to an `ORDER BY` statement in a SOQL query.

Namespace

DataSource

Usage

Used in the `order` property on the `DataSource.TableSelection` class.

IN THIS SECTION:

Order Properties

Order Methods

Order Properties

The following are properties for `Order`.

IN THIS SECTION:

columnName
Name of the column whose values are used to sort the rows in the result set.

direction
Direction for sorting rows based on column values.

tableName
Name of the table whose column values are used to sort the rows in the result set.

`columnName`

Name of the column whose values are used to sort the rows in the result set.

Signature

```
public String columnName {get; set;}
```

Property Value

Type: String

`direction`

Direction for sorting rows based on column values.

Signature

```
public DataSource.OrderDirection direction {get; set;}
```

Property Value

Type: DataSource.OrderDirection

`tableName`

Name of the table whose column values are used to sort the rows in the result set.

Signature

```
public String tableName {get; set;}
```

Property Value

Type: String

Order Methods

The following are methods for `Order`.

IN THIS SECTION:

get(tableName, columnName, direction)
Creates an instance of the DataSource.Order class.

`get(tableName, columnName, direction)`

Creates an instance of the DataSource.Order class.

Signature

```
public static DataSource.Order get(String tableName, String columnName,
DataSource.OrderDirection direction)
```

Parameters

`tableName`
Type: String

Name of the table whose column values are used to sort the rows in the result set.

`columnName`
Type: String

Name of the column whose values are used to sort the rows in the result set.

`direction`
Type: DataSource.OrderDirection

Direction for sorting rows based on column values.

Return Value

Type: DataSource.Order

OrderDirection Enum

Specifies the direction for sorting rows based on column values.

Usage

Used by the direction property on the DataSource.Order class.

Enum Values

The following are the values of the `DataSource.OrderDirection` enum.

Value	Description
`ASCENDING`	Sort rows in ascending order (A–Z).
`DESCENDING`	Sort rows in descending order (Z–A).

Provider Class

Extend this base class to create a custom adapter for Salesforce Connect. The class informs Salesforce of the functional and authentication capabilities that are supported by or required to connect to the external system. This class extends the `DataSourceUtil` class and inherits its methods.

Namespace

DataSource

Usage

Create an Apex class that extends `DataSource.Provider` to specify the following.

- The types of authentication that can be used to access the external system
- The features that are supported for the connection to the external system
- The Apex class that extends `DataSource.Connection` to sync the external system's schema and to handle the queries and searches of the external data

The values that are returned by the `DataSource.Provider` class determine which settings are available in the external data source definition in Salesforce. To access the external data source definition from Setup, enter *`External Data Sources`* in the `Quick Find` box, then select **External Data Sources**.

IN THIS SECTION:

Provider Methods

Provider Methods

The following are methods for `Provider`.

IN THIS SECTION:

getAuthenticationCapabilities()
Returns the types of authentication that can be used to access the external system.

getCapabilities()
Returns the functional operations that the external system supports and the required endpoint settings for the external data source definition in Salesforce.

getConnection(connectionParams)
Returns a connection that points to an instance of the external data source.

getAuthenticationCapabilities()

Returns the types of authentication that can be used to access the external system.

Signature

```
public List<DataSource.AuthenticationCapability> getAuthenticationCapabilities()
```

Return Value

Type: List<DataSource.AuthenticationCapability>

getCapabilities()

Returns the functional operations that the external system supports and the required endpoint settings for the external data source definition in Salesforce.

Signature

```
public List<DataSource.Capability> getCapabilities()
```

Return Value

Type: List<DataSource.Capability>

getConnection(connectionParams)

Returns a connection that points to an instance of the external data source.

Signature

```
public DataSource.Connection getConnection(DataSource.ConnectionParams connectionParams)
```

Parameters

connectionParams
Type: DataSource.ConnectionParams

Credentials for authenticating to the external system.

Return Value

Type: DataSource.Connection

QueryAggregation Enum

Specifies how to aggregate a column in a query.

Usage

Used by the aggregation property on the DataSource.ColumnSelection class.

Enum Values

The following are the values of the `DataSource.QueryAggregation` enum.

Value	Description
`AVG`	Reserved for future use.
`COUNT`	Returns the number of rows that meet the query criteria.
`MAX`	Reserved for future use.
`MIN`	Reserved for future use.
`NONE`	No aggregation.
`SUM`	Reserved for future use.

QueryContext Class

An instance of `QueryContext` is provided to the `query` method on your `DataSource.Connection` class. The instance corresponds to a SOQL request.

Namespace

DataSource

IN THIS SECTION:

QueryContext Properties

QueryContext Methods

QueryContext Properties

The following are properties for `QueryContext`.

IN THIS SECTION:

queryMoreToken
Query token that's used for server-driven paging to determine and fetch the subsequent batch of results.

tableSelection
Query details that represent the `FROM`, `ORDER BY`, `SELECT`, and `WHERE` clauses in a SOQL or SOSL query.

queryMoreToken

Query token that's used for server-driven paging to determine and fetch the subsequent batch of results.

Signature

```
public String queryMoreToken {get; set;}
```

Property Value

Type: String

tableSelection

Query details that represent the `FROM`, `ORDER BY`, `SELECT`, and `WHERE` clauses in a SOQL or SOSL query.

Signature

```
public DataSource.TableSelection tableSelection {get; set;}
```

Property Value

Type: DataSource.TableSelection

QueryContext Methods

The following are methods for `QueryContext`.

IN THIS SECTION:

get(metadata, offset, maxResults, tableSelection)
Creates an instance of the `QueryContext` class.

get(metadata, offset, maxResults, tableSelection)

Creates an instance of the `QueryContext` class.

Signature

```
public static DataSource.QueryContext get(List<DataSource.Table> metadata, Integer
offset, Integer maxResults, DataSource.TableSelection tableSelection)
```

Parameters

metadata
Type: List<DataSource.Table>

List of table metadata that describes the external system's tables to query.

offset
Type: Integer

Used for client-driven paging. Specifies the starting row offset into the query's result set.

maxResults
Type: Integer

Used for client-driven paging. Specifies the maximum number of rows to return in each batch.

tableSelection
Type: DataSource.TableSelection

Query details that represent the `FROM`, `ORDER BY`, `SELECT`, and `WHERE` clauses in a SOQL or SOSL query.

Return Value

Type: `DataSource.QueryContext`

QueryUtils Class

Contains helper methods to locally filter, sort, and apply limit and offset clauses to data rows. This helper class is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Namespace

DataSource

Usage

The `DataSource.QueryUtils` class and its helper methods can process query results locally within your Salesforce org. This class is provided for your convenience to simplify the development of your Salesforce Connect custom adapter for initial tests. However, the `DataSource.QueryUtils` class and its methods aren't supported for use in production environments that use callouts to retrieve data from external systems. Complete the filtering and sorting on the external system before sending the query results to Salesforce. When possible, use server-driven paging or another technique to have the external system determine the appropriate data subsets according to the limit and offset clauses in the query.

IN THIS SECTION:

QueryUtils Methods

QueryUtils Methods

The following are methods for `QueryUtils`.

IN THIS SECTION:

applyLimitAndOffset(queryContext, rows)
Returns a subset of data rows after locally applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

filter(queryContext, rows)
Returns a subset of data rows after locally ordering and applying filters from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

process(queryContext, rows)
Returns data rows after locally filtering, sorting, ordering, and applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

sort(queryContext, rows)
Returns data rows after locally sorting and applying the order from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

`applyLimitAndOffset(queryContext, rows)`

Returns a subset of data rows after locally applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Signature

```
public static List<Map<String,Object>> applyLimitAndOffset(DataSource.QueryContext
queryContext, List<Map<String,Object>> rows)
```

Parameters

queryContext
Type: DataSource.QueryContext

Represents the query to run against a data table.

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: List<Map<String, Object>>

`filter(queryContext, rows)`

Returns a subset of data rows after locally ordering and applying filters from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Signature

```
public static List<Map<String,object>> filter(DataSource.QueryContext queryContext,
List<Map<String,Object>> rows)
```

Parameters

queryContext
Type: DataSource.QueryContext

queryContext

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: List<Map<String, Object>>

process(queryContext, rows)

Returns data rows after locally filtering, sorting, ordering, and applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Signature

```
public static List<Map<String,object>> process(DataSource.QueryContext queryContext,
List<Map<String,Object>> rows)
```

Parameters

queryContext
Type: DataSource.QueryContext

Represents the query to run against a data table.

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: List<Map<String, Object>>

sort(queryContext, rows)

Returns data rows after locally sorting and applying the order from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Signature

```
public static List<Map<String,ject>> sort(DataSource.QueryContext queryContext,
List<Map<String,object>> rows)
```

Parameters

queryContext
Type: DataSource.QueryContext

Represents the query to run against a data table.

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: List<Map<String, Object>>

ReadContext Class

Abstract base class for the `QueryContext` and `SearchContext` classes.

Namespace

DataSource

IN THIS SECTION:

ReadContext Properties

ReadContext Properties

The following are properties for `ReadContext`.

IN THIS SECTION:

maxResults
Maximum number of rows that the query can return.

metadata
Describes the external system's tables to query.

offset
The starting row offset into the query's result set. Used for client-driven paging.

`maxResults`

Maximum number of rows that the query can return.

Signature

```
public Integer maxResults {get; set;}
```

Property Value

Type: Integer

metadata

Describes the external system's tables to query.

Signature

```
public List<DataSource.Table> metadata {get; set;}
```

Property Value

Type: List<DataSource.Table>

offset

The starting row offset into the query's result set. Used for client-driven paging.

Signature

```
public Integer offset {get; set;}
```

Property Value

Type: Integer

SearchContext Class

An instance of `SearchContext` is provided to the search method on your `DataSource.Connection` class. The instance corresponds to a search or SOSL request.

Namespace

DataSource

IN THIS SECTION:

SearchContext Constructors

SearchContext Properties

SearchContext Constructors

The following are constructors for `SearchContext`.

IN THIS SECTION:

SearchContext(metadata, offset, maxResults, tableSelections, searchPhrase)

Creates an instance of the `SearchContext` class with the specified parameter values.

SearchContext()

Creates an instance of the `SearchContext` class.

SearchContext(metadata, offset, maxResults, tableSelections, searchPhrase)

Creates an instance of the `SearchContext` class with the specified parameter values.

Signature

```
public SearchContext(List<DataSource.Table> metadata, Integer offset, Integer maxResults,
List<DataSource.TableSelection> tableSelections, String searchPhrase)
```

Parameters

metadata

Type: List<DataSource.Table>

List of table metadata that describes the external system's tables to query.

offset

Type: Integer

Specifies the starting row offset into the query's result set.

maxResults

Type: Integer

Specifies the maximum number of rows to return in each batch.

tableSelections

Type: List<DataSource.TableSelection>

List of queries and their details. The details represent the `FROM`, `ORDER BY`, `SELECT`, and `WHERE` clauses in each SOQL or SOSL query.

searchPhrase

Type: String

The user-entered search string as a case-sensitive single phrase, with all non-alphanumeric characters removed.

SearchContext()

Creates an instance of the `SearchContext` class.

Signature

```
public SearchContext()
```

SearchContext Properties

The following are properties for `SearchContext`.

IN THIS SECTION:

searchPhrase
The user-entered search string as a case-sensitive single phrase, with all non-alphanumeric characters removed.

tableSelections
List of queries and their details. The details represent the FROM, ORDER BY, SELECT, and WHERE clauses in each SOQL or SOSL query.

`searchPhrase`

The user-entered search string as a case-sensitive single phrase, with all non-alphanumeric characters removed.

Signature

```
public String searchPhrase {get; set;}
```

Property Value

Type: String

`tableSelections`

List of queries and their details. The details represent the FROM, ORDER BY, SELECT, and WHERE clauses in each SOQL or SOSL query.

Signature

```
public List<DataSource.TableSelection> tableSelections {get; set;}
```

Property Value

Type: List<DataSource.TableSelection>

SearchUtils Class

Helper class for implementing search on a custom adapter for Salesforce Connect.

Namespace

DataSource

Usage

We recommend that you develop your own search implementation that can search columns in addition to the designated name field.

IN THIS SECTION:

SearchUtils Methods

SearchUtils Methods

The following are methods for `SearchUtils`.

IN THIS SECTION:

searchByName(searchDetails, connection)
Queries all the tables and returns each row whose designated name field contains the search phrase.

`searchByName(searchDetails, connection)`

Queries all the tables and returns each row whose designated name field contains the search phrase.

Signature

```
public static List<DataSource.TableResult> searchByName(DataSource.SearchContext
searchDetails, DataSource.Connection connection)
```

Parameters

`searchDetails`
Type: DataSource.SearchContext

The `SearchContext` class that specifies which data to search and what to search for.

`connection`
Type: DataSource.Connection

The `DataSource.Connection` class that connects to the external system.

Return Value

Type: List<DataSource.TableResult>

Table Class

Describes a table on an external system that the Salesforce Connect custom adapter connects to. This class extends the `DataSourceUtil` class and inherits its methods.

Namespace

DataSource

Usage

A list of table metadata is provided by the `DataSource.Connection` class when the `sync()` method is invoked. Each table can become an external object in Salesforce.

The metadata is stored in Salesforce. Updating the Apex code to return new or updated values for the table metadata doesn't automatically update the stored metadata in Salesforce.

IN THIS SECTION:

Table Properties

Table Methods

Table Properties

The following are properties for `Table`.

IN THIS SECTION:

columns
List of table columns.

description
Description of what the table represents.

labelPlural
Plural form of the user-friendly name for the table. The `labelPlural` becomes the object's plural label in the Salesforce user interface.

labelSingular
Singular form of the user-friendly name for the table. The `labelSingular` becomes the object label in the Salesforce user interface. We recommend that you make object labels unique across all standard, custom, and external objects in the org.

name
Name of the table on the external system.

nameColumn
Name of the table column that becomes the name field of the external object when the administrator syncs the table.

`columns`

List of table columns.

Signature

```
public List<DataSource.Column> columns {get; set;}
```

Property Value

Type: List<DataSource.Column>

`description`

Description of what the table represents.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

`labelPlural`

Plural form of the user-friendly name for the table. The `labelPlural` becomes the object's plural label in the Salesforce user interface.

Signature

```
public String labelPlural {get; set;}
```

```
DataSource.Table, labelPlural
```

Property Value

Type: String

`labelSingular`

Singular form of the user-friendly name for the table. The `labelSingular` becomes the object label in the Salesforce user interface. We recommend that you make object labels unique across all standard, custom, and external objects in the org.

Signature

```
public String labelSingular {get; set;}
```

Property Value

Type: String

`name`

Name of the table on the external system.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

`nameColumn`

Name of the table column that becomes the name field of the external object when the administrator syncs the table.

Signature

```
public String nameColumn {get; set;}
```

Property Value

Type: String

Table Methods

The following are methods for `Table`.

IN THIS SECTION:

get(name, labelSingular, labelPlural, description, nameColumn, columns)
Returns the table metadata with the specified parameter values.

get(name, nameColumn, columns)
Returns the table metadata with the specified parameter values, using the name for the labels and description.

get(name, labelSingular, labelPlural, description, nameColumn, columns)

Returns the table metadata with the specified parameter values.

Signature

```
public static DataSource.Table get(String name, String labelSingular, String labelPlural,
String description, String nameColumn, List<DataSource.Column> columns)
```

Parameters

name
Type: String

Name of the external table.

labelSingular
Type: String

Singular form of the user-friendly name for the table. The `labelSingular` becomes the object label in the Salesforce user interface.

labelPlural
Type: String

Plural form of the user-friendly name for the table. The `labelPlural` becomes the object's plural label in the Salesforce user interface.

description
Type: String

Description of the external table.

nameColumn
Type: String

Name of the table column that becomes the name field of the external object when the administrator syncs the table.

columns
Type: List<DataSource.Column>

List of table columns.

Return Value

Type: DataSource.Table

get(name, nameColumn, columns)

Returns the table metadata with the specified parameter values, using the name for the labels and description.

Signature

```
public static DataSource.Table get(String name, String nameColumn,
List<DataSource.Column> columns)
```

```
DataSource.Table, get, [String, String, List<DataSource.Column>], DataSource.Table
```

Parameters

name
Type: String

Name of the external table.

nameColumn
Type: String

Name of the table column that becomes the name field of the external object when the administrator syncs the table.

columns
Type: List<DataSource.Column>

List of table columns.

Return Value

Type: DataSource.Table

The returned table metadata has these property values.

Property	Value
name	*name*
labelSingular	*name*
labelPlural	*name*
description	*name*
nameColumn	*nameColumn*
columns	*columns*

TableResult Class

Contains the results of a search or query.

Namespace

DataSource

IN THIS SECTION:

TableResult Properties

TableResult Methods

TableResult Properties

The following are properties for `TableResult`.

IN THIS SECTION:

errorMessage
errorMessage

queryMoreToken
Query token that's used for server-driven paging to determine and fetch the subsequent batch of results. This token is passed back to the Apex data source on subsequent queries in the `queryMoreToken` property on the `QueryContext`.

rows
Rows of data.

success
Whether the search or query was successful.

tableName
Name of the table that was queried.

totalSize
The total number of rows that meet the query criteria, even when the external system is requested to return a smaller batch size.

errorMessage

errorMessage

Signature

```
public String errorMessage {get; set;}
```

Property Value

Type: String

queryMoreToken

Query token that's used for server-driven paging to determine and fetch the subsequent batch of results. This token is passed back to the Apex data source on subsequent queries in the `queryMoreToken` property on the `QueryContext`.

Signature

```
public String queryMoreToken {get; set;}
```

Property Value

Type: String

rows

Rows of data.

Signature

```
public List<Map<String,Object>> rows {get; set;}
```

Property Value

Type: List<Map<String, Object>>

`success`

Whether the search or query was successful.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

`tableName`

Name of the table that was queried.

Signature

```
public String tableName {get; set;}
```

Property Value

Type: String

`totalSize`

The total number of rows that meet the query criteria, even when the external system is requested to return a smaller batch size.

Signature

```
public Integer totalSize {get; set;}
```

Property Value

Type: Integer

TableResult Methods

The following are methods for `TableResult`.

IN THIS SECTION:

error(errorMessage)
Returns failed search or query results with the provided error message.

get(success, errorMessage, tableName, rows, totalSize)
Returns a subset of data rows in a `TableResult` with the provided property values and the number of rows in the table.

get(success, errorMessage, tableName, rows)
Returns a subset of data rows in a `TableResult` with the provided property values.

get(queryContext, rows)
Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.

get(tableSelection, rows)
Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.

error(errorMessage)

Returns failed search or query results with the provided error message.

Signature

```
public static DataSource.TableResult error(String errorMessage)
```

Parameters

errorMessage
Type: String

errorMessage

Return Value

Type: DataSource.TableResult

The returned `TableResult` has these property values.

Property	Value
success	false
errorMessage	*errorMessage*
tableName	null
rows	null
rows.size()	0

get(success, errorMessage, tableName, rows, totalSize)

Returns a subset of data rows in a `TableResult` with the provided property values and the number of rows in the table.

Signature

```
public static DataSource.TableResult get(Boolean success, String errorMessage, String
tableName, List<Map<String,Object>> rows, Integer totalSize)
```

Parameters

success
Type: Boolean

Whether the search or query was successful.

errorMessage
Type: String

errorMessage

tableName
Type: String

Name of the table that was queried.

rows
Type: List<Map<String, Object>>

Rows of data.

totalSize
Type: Integer

The total number of rows that meet the query criteria, even when the external system is requested to return a smaller batch size.

Return Value

Type: DataSource.TableResult

get(success, errorMessage, tableName, rows)

Returns a subset of data rows in a `TableResult` with the provided property values.

Signature

```
public static DataSource.TableResult get(Boolean success, String errorMessage, String
tableName, List<Map<String,Object>> rows)
```

Parameters

success
Type: Boolean

Whether the search or query was successful.

errorMessage
Type: String

errorMessage

tableName
Type: String

Name of the table that was queried.

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: DataSource.TableResult

get(queryContext, rows)

Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.

Signature

```
public static DataSource.TableResult get(DataSource.QueryContext queryContext,
List<Map<String,Object>> rows)
```

Parameters

queryContext
Type: DataSource.QueryContext

Represents the query to run against a data table.

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: DataSource.TableResult

get(tableSelection, rows)

Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.

Signature

```
public static DataSource.TableResult get(DataSource.TableSelection tableSelection,
List<Map<String,Object>> rows)
```

Parameters

tableSelection
Type: DataSource.TableSelection

Query details that represent the `FROM`, `ORDER BY`, `SELECT`, and `WHERE` clauses in a SOQL or SOSL query.

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: DataSource.TableResult

TableSelection Class

Contains a breakdown of the SOQL or SOSL query. Its properties represent the FROM, ORDER BY, SELECT, and WHERE clauses in the query.

Namespace

DataSource

IN THIS SECTION:

TableSelection Properties

TableSelection Properties

The following are properties for `TableSelection`.

IN THIS SECTION:

columnsSelected
List of columns to query. Corresponds to the `SELECT` clause in a SOQL or SOSL query.

filter
Identifies the query filter, which can be a compound filter that has a list of subfilters. The filter corresponds to the `WHERE` clause in a SOQL or SOSL query.

order
Identifies the order for sorting the query results. Corresponds to the `ORDER BY` clause in a SOQL or SOSL query.

tableSelected
Name of the table to query. Corresponds to the `FROM` clause in a SOQL or SOSL query.

`columnsSelected`

List of columns to query. Corresponds to the `SELECT` clause in a SOQL or SOSL query.

Signature

```
public List<DataSource.ColumnSelection> columnsSelected {get; set;}
```

Property Value

Type: List<DataSource.ColumnSelection>

`filter`

Identifies the query filter, which can be a compound filter that has a list of subfilters. The filter corresponds to the `WHERE` clause in a SOQL or SOSL query.

Signature

```
public DataSource.Filter filter {get; set;}
```

Property Value

Type: DataSource.Filter

`order`

Identifies the order for sorting the query results. Corresponds to the `ORDER BY` clause in a SOQL or SOSL query.

Signature

```
public List<DataSource.Order> order {get; set;}
```

Property Value

Type: List<DataSource.Order>

`tableSelected`

Name of the table to query. Corresponds to the `FROM` clause in a SOQL or SOSL query.

Signature

```
public String tableSelected {get; set;}
```

Property Value

Type: String

UpsertContext Class

An instance of `UpsertContext` is passed to the `upsertRows()` method on your `Datasource.Connection` class. This class provides context information about the upsert request to the implementor of `upsertRows()`.

Namespace

DataSource

Usage

The Apex Connector Framework creates the contet for operations. Context is comprised of parameters about the operations, which other methods can use. An instance of the `UpsertContext` class packages these parameters into an object that can be used when an `upsertRows()` operation is initiated.

IN THIS SECTION:

UpsertContext Properties

UpsertContext Properties

The following are properties for `UpsertContext`.

IN THIS SECTION:

rows
List of rows corresponding to the external object records to upsert.
tableSelected
The name of the table to upsert rows in.

rows

List of rows corresponding to the external object records to upsert.

Signature

```
public List<Map<String,ANY>> rows {get; set;}
```

Property Value

Type: List<Map<String,Object>>

tableSelected

The name of the table to upsert rows in.

Signature

```
public String tableSelected {get; set;}
```

Property Value

Type: String

UpsertResult Class

Represents the result of an upsert operation on an external object record. The result is returned by the `upsertRows` method of the `DataSource.Connection` class.

Namespace

DataSource

Usage

An upsert operation on external object records generates an array of objects of type `DataSource.UpsertResult`. Its methods create result records that indicate whether the upsert operation succeeded or failed.

IN THIS SECTION:

UpsertResult Properties

UpsertResult Methods

UpsertResult Properties

The following are properties for `UpsertResult`.

IN THIS SECTION:

errorMessage
The error message that's generated by a failed upsert operation.

externalId
The unique identifier of a row that represents an external object record to upsert.

success
Indicates whether a delete operation succeeded or failed.

errorMessage

The error message that's generated by a failed upsert operation.

Signature

```
public String errorMessage {get; set;}
```

Property Value

Type: String

externalId

The unique identifier of a row that represents an external object record to upsert.

Signature

```
public String externalId {get; set;}
```

Property Value

Type: String

success

Indicates whether a delete operation succeeded or failed.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

UpsertResult Methods

The following are methods for `UpsertResult`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `UpsertResult` by determining the equality of external object records in a list. This method is dynamic and is based on the `equals` method in Java.

failure(externalId, errorMessage)
Creates an upsert result that indicates the failure of a delete request for a given external ID.

hashCode()
Maintains the integrity of lists of type `UpsertResult` by determining the uniqueness of the external object records in a list.

success(externalId)
Creates a delete result that indicates the successful completion of an upsert request for a given external ID.

`equals(obj)`

Maintains the integrity of lists of type `UpsertResult` by determining the equality of external object records in a list. This method is dynamic and is based on the `equals` method in Java.

Signature

```
public Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`failure(externalId, errorMessage)`

Creates an upsert result that indicates the failure of a delete request for a given external ID.

Signature

```
public static DataSource.UpsertResult failure(String externalId, String errorMessage)
```

Parameters

externalId
Type: String

The unique identifier of the external object record to upsert.

errorMessage
Type: String

The reason the upsert operation failed.

Return Value

Type: DataSource.UpsertResult

Status result for the upsert operation.

hashCode()

Maintains the integrity of lists of type `UpsertResult` by determining the uniqueness of the external object records in a list.

Signature

```
public Integer hashCode()
```

Return Value

Type: Integer

success(externalId)

Creates a delete result that indicates the successful completion of an upsert request for a given external ID.

Signature

```
public static DataSource.UpsertResult success(String externalId)
```

Parameters

externalId
Type: String

The unique identifier of the external object record to upsert.

Return Value

Type: DataSource.UpsertResult

Status result of the upsert operation for the external object record with the given external ID.

DataSource Exceptions

The `DataSource` namespace contains exception classes.

All exception classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions.

The `DataSource` namespace contains these exceptions.

Exception	Description	Methods
`DataSource.DataSourceException`	Throw this exception to indicate that an error occurred while communicating with an external data source.	To get the error message and write it to debug log, use the `String getMessage()`.
`DataSource.OAuthTokenExpiredException`	Throw this exception to indicate that an OAuth token has expired. The system then attempts to refresh the token automatically and restart the query, search, or sync operation.	To get the error message and write it to debug log, use the `String getMessage()`.

DataWeave Namespace

The DataWeave namespace provides classes and methods to support the invocation of DataWeave scripts from Apex.

DataWeave is the MuleSoft expression language for accessing, parsing, and transforming data that travels through a Mule application. For detailed information, see DataWeave Language.

These are the classes in the `DataWeave` namespace.

IN THIS SECTION:

Result Class
Contains methods to retrieve data that was transformed using Script class methods.

Script Class
Contains the `createScript()` method to load DataWeave scripts and the `execute()` method to obtain script output in a `DataWeave.Result` object.

SEE ALSO:

DataWeave in Apex

Result Class

Contains methods to retrieve data that was transformed using Script class methods.

Namespace

DataWeave

Example

See Script Class for an example to run a DataWeave script from Apex and retrieve the resulting script output.

IN THIS SECTION:

Result Methods

Result Methods

The following are methods for `Result`.

IN THIS SECTION:

getValue()
Returns the result of a DataWeave script execution as an object.

getValueAsString()
Returns the result of a DataWeave script execution as a string value.

`getValue()`

Returns the result of a DataWeave script execution as an object.

Signature

```
public Object getValue()
```

Return Value

Type: Object

`getValueAsString()`

Returns the result of a DataWeave script execution as a string value.

Signature

```
public String getValueAsString()
```

Return Value

Type: String

Script Class

Contains the `createScript()` method to load DataWeave scripts and the `execute()` method to obtain script output in a `DataWeave.Result` object.

Namespace

DataWeave

This example runs a DataWeave script from Apex and retrieves the resulting script output. First deploy the script to the org as `ContactsToJson.dwl`.

```
%dw 2.0
input records application/java
output application/json
---
{
  users: records map(record) -> {
    firstName: record.FirstName,
    lastName: record.LastName
  }
```

Then, execute the script from Apex.

```
List<Contact> data = [SELECT FirstName, LastName FROM Contact WHERE LastName LIMIT 5];
Map<String, Object> args = new Map<String, Object>{ 'records' => data };
DataWeave.Script script = DataWeave.Script.createScript('ContactsToJson');

DataWeave.Result result = script.execute(args);
string jsonOutput = result.getValueAsString();
```

IN THIS SECTION:

Script Methods

Script Methods

The following are methods for `Script`.

IN THIS SECTION:

createScript(scriptName)
Loads a DataWeave 2.0 script from the `.dwl` metadata file that is deployed in an org. The script can then be run using the `Script.execute` method.

createScript(namespace, scriptName)
Loads a DataWeave 2.0 script from a specified namespace. The script can then be run using the `Script.execute` method.

execute(parameters)
Executes the DataWeave script that is loaded using the `createScript()` method and returns the script output.

toString()
Returns the name of the script.

`createScript(scriptName)`

Loads a DataWeave 2.0 script from the `.dwl` metadata file that is deployed in an org. The script can then be run using the `Script.execute` method.

Signature

```
public static createScript(String scriptName)
```

Parameters

scriptName
Type: String

The name of the deployed metadata `.dwl` script (not including the file extension).

Return Value

Type: DataWeave.Script

DataWeave script that is used as a parameter in the `Script.execute()` method.

createScript(namespace, scriptName)

Loads a DataWeave 2.0 script from a specified namespace. The script can then be run using the `Script.execute` method.

Signature

```
public static dataweave.Script createScript(String namespace, String scriptName)
```

Parameters

namespace
Type: String

The namespace name for the deployed script. If the namespace name is null, the caller namespace is used. If the namespace name is empty, the org namespace is used.

scriptName
Type: String

The name of the deployed metadata `.dwl` script (not including the file extension).

Return Value

Type: DataWeave.Script

DataWeave script that is used as a parameter in the `Script.execute()` method.

execute(parameters)

Executes the DataWeave script that is loaded using the `createScript()` method and returns the script output.

Signature

```
public execute(Map<String,Object> parameters)
```

Parameters

parameters
Type: Map<String,Object>

Input to the DataWeave script. The keys correspond to the input directive names defined in the DataWeave header.

See Input Directive and DataWeave Header.

Return Value

Type: DataWeave.Result

The `DataWeave.Result` object contains the script output.

`toString()`

Returns the name of the script.

Signature

```
public String toString()
```

Return Value

Type: String

Dom Namespace

The `Dom` namespace provides classes and methods for parsing and creating XML content.

The following are the classes in the `Dom` namespace.

IN THIS SECTION:

Document Class
Use the `Document` class to process XML content. You can parse nested XML content that's up to 50 nodes deep.

XmlNode Class
Use the `XmlNode` class to work with a node in an XML document.

XmlNodeType Enum
Specifies the node type in an XML document.

Document Class

Use the `Document` class to process XML content. You can parse nested XML content that's up to 50 nodes deep.

Namespace

Dom

Usage

One common application is to use it to create the body of a request for HttpRequest or to parse a response accessed by HttpResponse.

IN THIS SECTION:

Document Constructors

Document Methods

SEE ALSO:

Reading and Writing XML Using the DOM

Document Constructors

The following are constructors for `Document`.

IN THIS SECTION:

Document()

Creates a new instance of the `Dom.Document` class.

`Document()`

Creates a new instance of the `Dom.Document` class.

Signature

```
public Document()
```

Document Methods

The following are methods for `Document`. All are instance methods.

IN THIS SECTION:

createRootElement(name, namespace, prefix)

Creates the top-level root element for a document.

getRootElement()

Returns the top-level root element node in the document. If this method returns `null`, the root element has not been created yet.

load(xml)

Parse the XML representation of the document specified in the *`xml`* argument and load it into a document.

toXmlString()

Returns the XML representation of the document as a String.

`createRootElement(name, namespace, prefix)`

Creates the top-level root element for a document.

Signature

```
public Dom.XmlNode createRootElement(String name, String namespace, String prefix)
```

Parameters

name
Type: String

namespace
Type: String

prefix
Type: String

Return Value

Type: Dom.XmlNode

Usage

For more information about namespaces, see Reading and Writing XML Using the DOM.

Calling this method more than once on a document generates an error as a document can have only one root element.

getRootElement()

Returns the top-level root element node in the document. If this method returns `null`, the root element has not been created yet.

Signature

```
public Dom.XmlNode getRootElement()
```

Return Value

Type: Dom.XmlNode

load(xml)

Parse the XML representation of the document specified in the *xml* argument and load it into a document.

Signature

```
public Void load(String xml)
```

Parameters

xml
Type: String

Return Value

Type: Void

Example

```
Dom.Document doc = new Dom.Document();
doc.load(xml);
```

`toXmlString()`

Returns the XML representation of the document as a String.

Signature

```
public String toXmlString()
```

Return Value

Type: String

XmlNode Class

Use the `XmlNode` class to work with a node in an XML document.

Namespace

Dom

XmlNode Methods

The following are methods for `XmlNode`. All are instance methods.

IN THIS SECTION:

addChildElement(name, namespace, prefix)
Creates a child element node for this node.

addCommentNode(text)
Creates a child comment node for this node.

addTextNode(text)
Creates a child text node for this node.

getAttribute(key, keyNamespace)
Returns *`namespacePrefix:attributeValue`* for the given key and key namespace.

getAttributeCount()
Returns the number of attributes for this node.

getAttributeKeyAt(index)
Returns the attribute key for the given index. Index values start at 0.

getAttributeKeyNsAt(index)
Returns the attribute key namespace for the given index.

getAttributeValue(key, keyNamespace)
Returns the attribute value for the given key and key namespace.

getAttributeValueNs(key, keyNamespace)
Returns the attribute value namespace for the given key and key namespace.

getChildElement(name, namespace)
Returns the child element node for the node with the given name and namespace.

getChildElements()
Returns the child element nodes for this node. This doesn't include child text or comment nodes.

getChildren()
Returns the child nodes for this node. This includes all node types.

getName()
Returns the element name.

getNamespace()
Returns the namespace of the element.

getNamespaceFor(prefix)
Returns the namespace of the element for the given prefix.

getNodeType()
Returns the node type.

getParent()
Returns the parent of this element.

getPrefixFor(namespace)
Returns the prefix of the given namespace.

getText()
Returns the text for this node.

insertBefore(newChild, refChild)
Inserts a new child node before the specified node.

removeAttribute(key, keyNamespace)
Removes the attribute with the given key and key namespace. Returns `true` if successful, `false` otherwise.

removeChild(childNode)
Removes the given child node.

setAttribute(key, value)
Sets the key attribute value.

setAttributeNs(key, value, keyNamespace, valueNamespace)
Sets the key attribute value.

setNamespace(prefix, namespace)
Sets the namespace for the given prefix.

addChildElement(name, namespace, prefix)

Creates a child element node for this node.

Signature

```
public Dom.XmlNode addChildElement(String name, String namespace, String prefix)
```

Parameters

name
Type: String

The *name* argument can't have a `null` value.

namespace
Type: String

prefix
Type: String

Return Value

Type: Dom.XmlNode

Usage

- If the *namespace* argument has a non-`null` value and the *prefix* argument is `null`, the namespace is set as the default namespace.
- If the *prefix* argument is `null`, Salesforce automatically assigns a prefix for the element. The format of the automatic prefix is `ns`***i***, where *i* is a number.If the *prefix* argument is `''`, the namespace is set as the default namespace.

addCommentNode(text)

Creates a child comment node for this node.

Signature

```
public Dom.XmlNode addCommentNode(String text)
```

Parameters

text
Type: String

The *text* argument can't have a `null` value.

Return Value

Type: Dom.XmlNode

addTextNode(text)

Creates a child text node for this node.

Signature

```
public Dom.XmlNode addTextNode(String text)
```

Parameters

text
Type: String

The *text* argument can't have a `null` value.

Return Value

Type: Dom.XmlNode

getAttribute(key, keyNamespace)

Returns *namespacePrefix:attributeValue* for the given key and key namespace.

Signature

```
public String getAttribute(String key, String keyNamespace)
```

Parameters

key
Type: String

keyNamespace
Type: String

Return Value

Type: String

Example

For example, for the `<xyz a:b="c:d" />` element:

- `getAttribute` returns `c:d`
- `getAttributeValue` returns `d`

getAttributeCount()

Returns the number of attributes for this node.

Signature

```
public Integer getAttributeCount()
```

Return Value

Type: Integer

getAttributeKeyAt(index)

Returns the attribute key for the given index. Index values start at 0.

Signature

```
public String getAttributeKeyAt(Integer index)
```

Parameters

index
Type: Integer

Return Value

Type: String

getAttributeKeyNsAt(index)

Returns the attribute key namespace for the given index.

Signature

```
public String getAttributeKeyNsAt(Integer index)
```

Parameters

index
Type: Integer

Return Value

Type: String

getAttributeValue(key, keyNamespace)

Returns the attribute value for the given key and key namespace.

Signature

```
public String getAttributeValue(String key, String keyNamespace)
```

Parameters

key
Type: String

keyNamespace
Type: String

Return Value

Type: String

Example

For example, for the `<xyz a:b="c:d" />` element:

- `getAttribute` returns `c:d`
- `getAttributeValue` returns `d`

getAttributeValueNs(key, keyNamespace)

Returns the attribute value namespace for the given key and key namespace.

Signature

```
public String getAttributeValueNs(String key, String keyNamespace)
```

Parameters

key
Type: String

keyNamespace
Type: String

Return Value

Type: String

getChildElement(name, namespace)

Returns the child element node for the node with the given name and namespace.

Signature

```
public Dom.XmlNode getChildElement(String name, String namespace)
```

Parameters

name
Type: String

namespace
Type: String

Return Value

Type: Dom.XmlNode

getChildElements()

Returns the child element nodes for this node. This doesn't include child text or comment nodes.

Signature

```
public Dom.XmlNode[] getChildElements()
```

Return Value

Type: Dom.XmlNode[]

getChildren()

Returns the child nodes for this node. This includes all node types.

Signature

```
public Dom.XmlNode[] getChildren()
```

Return Value

Type: Dom.XmlNode[]

getName()

Returns the element name.

Signature

```
public String getName()
```

Return Value

Type: String

getNamespace()

Returns the namespace of the element.

Signature

```
public String getNamespace()
```

Return Value

Type: String

getNamespaceFor(prefix)

Returns the namespace of the element for the given prefix.

Signature

```
public String getNamespaceFor(String prefix)
```

Parameters

prefix
Type: String

Return Value

Type: String

getNodeType()

Returns the node type.

Signature

```
public Dom.XmlNodeType getNodeType()
```

Return Value

Type: Dom.XmlNodeType

Uses `XmlNodeType` enum to return *COMMENT*, *ELEMENT*, or *TEXT* as the node type.

getParent()

Returns the parent of this element.

Signature

```
public Dom.XmlNode getParent()
```

Return Value

Type: Dom.XmlNode

getPrefixFor(namespace)

Returns the prefix of the given namespace.

Signature

```
public String getPrefixFor(String namespace)
```

Parameters

namespace
Type: String

The *namespace* argument can't have a `null` value.

Return Value

Type: String

`getText()`

Returns the text for this node.

Signature

```
public String getText()
```

Return Value

Type: String

`insertBefore(newChild, refChild)`

Inserts a new child node before the specified node.

Signature

```
public Dom.XmlNode insertBefore(Dom.XmlNode newChild, Dom.XmlNode refChild)
```

Parameters

newChild
Type: Dom.XmlNode

The node to insert.

refChild
Type: Dom.XmlNode

The node before the new node.

Return Value

Type: Dom.XmlNode

Usage

- If *refChild* is `null`, *newChild* is inserted at the end of the list.
- If *refChild* doesn't exist, an exception is thrown.

`removeAttribute(key, keyNamespace)`

Removes the attribute with the given key and key namespace. Returns `true` if successful, `false` otherwise.

Signature

```
public Boolean removeAttribute(String key, String keyNamespace)
```

Parameters

key
Type: String

keyNamespace
Type: String

Return Value

Type: Boolean

removeChild(childNode)

Removes the given child node.

Signature

```
public Boolean removeChild(Dom.XmlNode childNode)
```

Parameters

childNode
Type: Dom.XmlNode

Return Value

Type: Boolean

setAttribute(key, value)

Sets the key attribute value.

Signature

```
public Void setAttribute(String key, String value)
```

Parameters

key
Type: String

value
Type: String

Return Value

Type: Void

setAttributeNs(key, value, keyNamespace, valueNamespace)

Sets the key attribute value.

Signature

```
public Void setAttributeNs(String key, String value, String keyNamespace, String valueNamespace)
```

Parameters

key
Type: String

value
Type: String

keyNamespace
Type: String

valueNamespace
Type: String

Return Value

Type: Void

setNamespace(prefix, namespace)

Sets the namespace for the given prefix.

Signature

```
public Void setNamespace(String prefix, String namespace)
```

Parameters

prefix
Type: String

namespace
Type: String

Return Value

Type: Void

XmlNodeType Enum

Specifies the node type in an XML document.

Usage

Use `XMLNodeType` enum with the `getNodeType()` method in the `XmlNode` class.

Enum Values

The following are the values of the `Dom.XMLNodeType` enum.

Value	Description
`COMMENT`	Dom node of type comment.
`ELEMENT`	Dom node of type element.
`TEXT`	Dom node of type text.

EventBus Namespace

The `EventBus` namespace provides classes and methods for platform events and Change Data Capture events.

The following are the classes in the `EventBus` namespace.

IN THIS SECTION:

ChangeEventHeader Class

Contains header fields of Change Data Capture events.

EventPublishFailureCallback Interface

Implement this interface to track platform event messages that failed to publish. The `onFailure()` method in this interface is called when the final result of the asynchronous publish operation becomes available.

EventPublishSuccessCallback Interface

Implement this interface to track platform event messages that were published successfully. The `onSuccess()` method in this interface is called when the final result of the asynchronous publish operation becomes available.

FailureResult Interface

Contains the result of an Apex publish callback when the event publishing failed. This interface is used as a parameter in the `onFailure` method of the `EventPublishFailureCallback` interface.

SuccessResult Interface

Contains the result of an Apex publish callback when the event publishing succeeded. This interface is used as a parameter in the `onSuccess` method of the `EventPublishSuccessCallback` interface.

TestBroker Class

Contains methods that simulate the successful delivery or failed publishing of platform event or change event messages in an Apex test.

TriggerContext Class

Provides information about the platform event or change event trigger that's currently executing, such as how many times the trigger was retried due to the `EventBus.RetryableException`. Also, provides a method to resume trigger executions.

SEE ALSO:

Platform Events Developer Guide

ChangeEventHeader Class

Contains header fields of Change Data Capture events.

Namespace

EventBus

IN THIS SECTION:

ChangeEventHeader Properties

SEE ALSO:

Change Data Capture Developer Guide

ChangeEventHeader Properties

The following are properties for `ChangeEventHeader`.

IN THIS SECTION:

changedfields

A list of the fields that were changed in an update operation, including the `LastModifiedDate` system field. This field is empty for other operations, including record creation. This property is available in Apex saved using API version 47.0 or later.

changeorigin

Only populated for changes done by API apps or from Lightning Experience; empty otherwise. The Salesforce API and the API client ID that initiated the change, if set by the client. Use this field to detect whether your app initiated the change to not process the change again and potentially avoid a deep cycle of changes.

changetype

The operation that caused the change.

commitnumber

The system change number (SCN) of a committed transaction, which increases sequentially. This field is provided for diagnostic purposes. The field value is not guaranteed to be unique in Salesforce—it is unique only in a single database instance. If your Salesforce org migrates to another database instance, the commit number might not be unique or sequential.

committimestamp

The date and time when the change occurred, represented as the number of milliseconds since January 1, 1970 00:00:00 GMT.

commituser

The ID of the user that ran the change operation.

difffields

Contains the names of fields whose values are sent as a unified diff because they contain large text values.

entityname

The API name of the standard or custom object that the change pertains to. For example, Account or MyObject__c.

nulledfields

Contains the names of fields whose values were changed to null in an update operation. Use this field in Apex change event messages to determine if a field was changed to null in an update and isn't an unchanged field.

recordids

One or more record IDs for the changed records. Typically, this field contains one record ID. If in one transaction the same change occurred in multiple records of the same object type during one second, Salesforce merges the change notifications. In this case, Salesforce sends one change event for all affected records and the `recordIds` field contains the IDs for all records that have the same change.

sequencenumber

The sequence of the change within a transaction. The sequence number starts from 1.

transactionkey

A string that uniquely identifies each Salesforce transaction. You can use this key to identify and group all changes that were made in the same transaction.

changedfields

A list of the fields that were changed in an update operation, including the `LastModifiedDate` system field. This field is empty for other operations, including record creation. This property is available in Apex saved using API version 47.0 or later.

Signature

```
public List<String> changedfields {get; set;}
```

Property Value

Type: List<String>

changeorigin

Only populated for changes done by API apps or from Lightning Experience; empty otherwise. The Salesforce API and the API client ID that initiated the change, if set by the client. Use this field to detect whether your app initiated the change to not process the change again and potentially avoid a deep cycle of changes.

Signature

```
public String changeorigin {get; set;}
```

Property Value

Type: String

The format of the `changeOrigin` field value is:

```
com/salesforce/api/<API_Name>/<API_Version>;client=<Client_ID>
```

- `<API_Name>` is the name of the Salesforce API used to make the data change. It can take one of these values: soap, rest, bulkapi, xmlrpc, oldsoap, toolingsoap, toolingrest, apex, apexdebuggerrest.
- `<API_Version>` is the version of the API call that made the change and is in the format *XX.X*.
- `<Client_ID>` is a string that contains the client ID of the app that initiated the change. If the client ID is not set in the API call, `client=<Client_ID>` is not appended to the `changeOrigin` field.

Example:

```
com/salesforce/api/soap/49.0;client=Astro
```

The client ID is set in the Call Options header of an API call. For an example on how to set the Call Options header, see:

- REST API: Sforce-Call-Options Header. (Bulk API also uses the Sforce-Call-Options header.)
- SOAP API: CallOptions Header. (Apex API also uses the CallOptions element.)

changetype

The operation that caused the change.

Signature

```
public String changetype {get; set;}
```

Property Value

Type: String

Can be one of the following values:

- CREATE
- UPDATE
- DELETE
- UNDELETE
- SNAPSHOT (reserved for future use)

For gap events, the change type starts with the GAP_ prefix.

- GAP_CREATE
- GAP_UPDATE
- GAP_DELETE
- GAP_UNDELETE

For overflow events, the change type is GAP_OVERFLOW.

commitnumber

The system change number (SCN) of a committed transaction, which increases sequentially. This field is provided for diagnostic purposes. The field value is not guaranteed to be unique in Salesforce—it is unique only in a single database instance. If your Salesforce org migrates to another database instance, the commit number might not be unique or sequential.

Signature

```
public Long commitnumber {get; set;}
```

Property Value

Type: Long

committimestamp

The date and time when the change occurred, represented as the number of milliseconds since January 1, 1970 00:00:00 GMT.

Signature

```
public Long committimestamp {get; set;}
```

Property Value

Type: Long

commituser

The ID of the user that ran the change operation.

Signature

```
public String commituser {get; set;}
```

Property Value

Type: String

difffields

Contains the names of fields whose values are sent as a unified diff because they contain large text values.

Signature

```
public List<String> difffields {get; set;}
```

Property Value

Type: List<String>

SEE ALSO:

Change Data Capture Developer Guide: Sending Data Differences for Fields of Updated Records

entityname

The API name of the standard or custom object that the change pertains to. For example, Account or MyObject__c.

Signature

```
public String entityname {get; set;}
```

Property Value

Type: String

nulledfields

Contains the names of fields whose values were changed to null in an update operation. Use this field in Apex change event messages to determine if a field was changed to null in an update and isn't an unchanged field.

Signature

```
public List<String> nulledfields {get; set;}
```

Property Value

Type: List<String>

recordids

One or more record IDs for the changed records. Typically, this field contains one record ID. If in one transaction the same change occurred in multiple records of the same object type during one second, Salesforce merges the change notifications. In this case, Salesforce sends one change event for all affected records and the `recordIds` field contains the IDs for all records that have the same change.

Signature

```
public List<String> recordids {get; set;}
```

Property Value

Type: List<String>

Examples of operations with same changes are:

- Update of fieldA to valueA in Account records.
- Deletion of Account records.
- Renaming or replacing a picklist value that results in updating the field value in all affected records.

The `recordIds` field can contain a wildcard value when a change event message is generated for custom field type conversions that cause data loss. In this case, the `recordIds` value is the three-character prefix of the object, followed by the wildcard character `*`. For example, for accounts, the value is `001*`.

sequencenumber

The sequence of the change within a transaction. The sequence number starts from 1.

Signature

```
public Integer sequencenumber {get; set;}
```

Property Value

Type: Integer

A lead conversion is an example of a transaction that can have multiple changes. A lead conversion results in the following sequence of changes, all within the same transaction.

1. Create an account
2. Create a contact
3. Create an opportunity
4. Update a lead

transactionkey

A string that uniquely identifies each Salesforce transaction. You can use this key to identify and group all changes that were made in the same transaction.

Signature

```
public String transactionkey {get; set;}
```

Property Value

Type: String

EventPublishFailureCallback Interface

Implement this interface to track platform event messages that failed to publish. The `onFailure()` method in this interface is called when the final result of the asynchronous publish operation becomes available.

Namespace

EventBus

Usage

For more information, see Get the Result of Asynchronous Platform Event Publishing with Apex Publish Callbacks in the *Platform Events Developer Guide*.

IN THIS SECTION:

EventPublishFailureCallback Methods

EventPublishFailureCallback Example Implementation

EventPublishFailureCallback Methods

The following are methods for `EventPublishFailureCallback`.

IN THIS SECTION:

onFailure(result)
The system invokes this method when the final result of `EventBus.publish` is available and the publishing of the platform event message failed.

onFailure(result)

The system invokes this method when the final result of `EventBus.publish` is available and the publishing of the platform event message failed.

Signature

```
public void onFailure(eventbus.FailureResult result)
```

Parameters

result
Type: EventBus.FailureResult

The final result of `EventBus.publish`.

Return Value

Type: void

EventPublishFailureCallback Example Implementation

For an example implementation and a test class, see Get the Result of Asynchronous Platform Event Publishing with Apex Publish Callbacks in the *Platform Events Developer Guide*.

EventPublishSuccessCallback Interface

Implement this interface to track platform event messages that were published successfully. The `onSuccess()` method in this interface is called when the final result of the asynchronous publish operation becomes available.

Namespace

EventBus

Usage

For more information, see Get the Result of Asynchronous Platform Event Publishing with Apex Publish Callbacks in the *Platform Events Developer Guide*.

IN THIS SECTION:

EventPublishSuccessCallback Methods

EventPublishSuccessCallback Example Implementation

EventPublishSuccessCallback Methods

The following are methods for `EventPublishSuccessCallback`.

IN THIS SECTION:

onSuccess(result)
The system invokes this method when the final result of `EventBus.publish` is available and the publishing of the platform event message succeeded.

`onSuccess(result)`

The system invokes this method when the final result of `EventBus.publish` is available and the publishing of the platform event message succeeded.

Signature

```
public void onSuccess(eventbus.SuccessResult result)
```

Parameters

`result`
Type: EventBus.SuccessResult

The final result of `EventBus.publish`.

Return Value

Type: void

EventPublishSuccessCallback Example Implementation

For an example implementation and a test class, see Get the Result of Asynchronous Platform Event Publishing with Apex Publish Callbacks in the *Platform Events Developer Guide*.

FailureResult Interface

Contains the result of an Apex publish callback when the event publishing failed. This interface is used as a parameter in the `onFailure` method of the `EventPublishFailureCallback` interface.

Namespace

EventBus

IN THIS SECTION:

FailureResult Methods

FailureResult Methods

The following are methods for `FailureResult`.

IN THIS SECTION:

getEventUuids()
Returns a list of `EventUuid` field values of each platform event that is included in `EventBus.EventPublishFailureCallback`.

`getEventUuids()`

Returns a list of `EventUuid` field values of each platform event that is included in `EventBus.EventPublishFailureCallback`.

Signature

```
public List<String> getEventUuids()
```

Return Value

Type: List<String>

SuccessResult Interface

Contains the result of an Apex publish callback when the event publishing succeeded. This interface is used as a parameter in the `onSuccess` method of the `EventPublishSuccessCallback` interface.

Namespace

EventBus

IN THIS SECTION:

SuccessResult Methods

SuccessResult Methods

The following are methods for `SuccessResult`.

IN THIS SECTION:

getEventUuids()

Returns a list of `EventUuid` field values of each platform event that is included in the `EventBus.EventPublishSuccessCallback`.

`getEventUuids()`

Returns a list of `EventUuid` field values of each platform event that is included in the `EventBus.EventPublishSuccessCallback`.

Signature

```
public List<String> getEventUuids()
```

Return Value

Type: List<String>

TestBroker Class

Contains methods that simulate the successful delivery or failed publishing of platform event or change event messages in an Apex test.

Namespace

EventBus

IN THIS SECTION:

TestBroker Methods

TestBroker Methods

The following are methods for `TestBroker`.

IN THIS SECTION:

deliver()
Delivers platform event messages to the test event bus. Use this method to deliver test event messages multiple times and verify that event subscribers have processed the test events each step of the way.

fail()
Causes the publishing of platform event messages to fail in the test event bus. Use this method to test Apex publish callbacks.

`deliver()`

Delivers platform event messages to the test event bus. Use this method to deliver test event messages multiple times and verify that event subscribers have processed the test events each step of the way.

Signature

```
public void deliver()
```

Return Value

Type: void

Usage

Enclose `Test.getEventBus().deliver()` within the `Test.startTest()` and `Test.stopTest()` statement block.

```
Test.startTest();
// Create test events
// ...
// Publish test events with EventBus.publish()
// ...
// Deliver test events
Test.getEventBus().deliver();
// Perform validation
```

```
// ...
Test.stopTest();
```

SEE ALSO:

Platform Events Developer Guide

`fail()`

Causes the publishing of platform event messages to fail in the test event bus. Use this method to test Apex publish callbacks.

Signature

```
public void fail()
```

Return Value

Type: void

Usage

```
// Create test events
// ...
// Publish test events with EventBus.publish()
// ...
// Fail publishing of test events
Test.getEventBus().fail();
// Perform validation
// ...
```

For more information, see <link>Get the Result of Asynchronous Platform Event Publishing with Apex Publish Callbacks<link/> in the *Platform Events Developer Guide*.

TriggerContext Class

Provides information about the platform event or change event trigger that's currently executing, such as how many times the trigger was retried due to the `EventBus.RetryableException`. Also, provides a method to resume trigger executions.

Namespace

EventBus

IN THIS SECTION:

TriggerContext Properties

TriggerContext Methods

TriggerContext Properties

The following are properties for `TriggerContext`.

IN THIS SECTION:

lastError
Read-only. The error message that the last thrown `EventBus.RetryableException` contains.

retries
Read-only. The number of times the trigger was retried due to throwing the `EventBus.RetryableException`.

`lastError`

Read-only. The error message that the last thrown `EventBus.RetryableException` contains.

Signature

```
public String lastError {get;}
```

Property Value

Type: String

Usage

The error message that this property returns is the message that was passed in when creating the `EventBus.RetryableException` exception, as follows.

```
throw new EventBus.RetryableException(
             'Condition is not met, so retrying the trigger again.');
```

`retries`

Read-only. The number of times the trigger was retried due to throwing the `EventBus.RetryableException`.

Signature

```
public Integer retries {get;}
```

Property Value

Type: Integer

TriggerContext Methods

The following are methods for `TriggerContext`.

IN THIS SECTION:

currentContext()
Returns an instance of the `EventBus.TriggerContext` class containing information about the currently executing trigger.

getResumeCheckpoint()
Returns the replay ID that was set by `setResumeCheckpoint()`. The returned value is the replay ID of the event message after which trigger processing resumes in a new trigger invocation.

setResumeCheckpoint(resumeReplayId)
Sets a checkpoint in the event stream where the platform event trigger resumes execution in a new invocation. Use this method to recover from limit and uncaught exceptions, or to control the number of events processed in one trigger execution. When calling this method, pass in the replay ID of the last successfully processed event message. When the trigger stops execution before all events in `Trigger.New` are processed, either because of an uncaught exception or intentionally, the trigger is invoked again. The new execution starts with the event message in the stream after the one with the checkpointed Replay ID.

`currentContext()`

Returns an instance of the `EventBus.TriggerContext` class containing information about the currently executing trigger.

Signature

```
public static eventbus.TriggerContext currentContext()
```

Return Value

Type: EventBus.TriggerContext

Information about the currently executing trigger.

`getResumeCheckpoint()`

Returns the replay ID that was set by `setResumeCheckpoint()`. The returned value is the replay ID of the event message after which trigger processing resumes in a new trigger invocation.

Signature

```
public String getResumeCheckpoint()
```

Return Value

Type: String

`setResumeCheckpoint(resumeReplayId)`

Sets a checkpoint in the event stream where the platform event trigger resumes execution in a new invocation. Use this method to recover from limit and uncaught exceptions, or to control the number of events processed in one trigger execution. When calling this method, pass in the replay ID of the last successfully processed event message. When the trigger stops execution before all events in `Trigger.New` are processed, either because of an uncaught exception or intentionally, the trigger is invoked again. The new execution starts with the event message in the stream after the one with the checkpointed Replay ID.

Signature

```
public void setResumeCheckpoint(String resumeReplayId)
```

Parameters

resumeReplayId
Type: String

The replay ID of the last successfully processed platform event message, after which to resume processing in a new trigger execution context.

Return Value

Type: void

Usage

The method throws an `EventBus.InvalidReplayIdException` if the supplied Replay ID is not valid—the replay ID is not in the current trigger batch of events, in the `Trigger.new` list.

Example

This snippet shows how to call the method and pass in the replayId property of an event instance.

```
EventBus.TriggerContext.currentContext().setResumeCheckpoint(event.replayId);
```

ExternalService Namespace

The `ExternalService` namespace provides dynamically generated Apex service interfaces and Apex classes for complex object data types.

The `ExternalService` namespace doesn't define a fixed set of classes. The namespace reflects OpenAPI-compatible external service registrations with active operations for type-safe outbound calls. The object schema, in the API specification that is associated with the registered external service, maps to Apex types.

SEE ALSO:

Salesforce Help: Invoke External Service Callouts Using Apex

Flow Namespace

The `Flow` namespace provides a class for advanced access to flows from Apex such as from Visualforce controllers and asynchronous Apex.

The following is the class in the `Flow` namespace.

IN THIS SECTION:

Interview Class

The `Flow.Interview` class provides advanced controller access to flows and the ability to start a flow.

Interview Class

The `Flow.Interview` class provides advanced controller access to flows and the ability to start a flow.

Namespace

Flow

Usage

SOQL and DML limits apply during flow execution. See Per-Transaction Flow Limits in the *Salesforce Help*.

To create an Interview object, you have two options.

- Create the object directly in your class by using:
  - No namespace: `Flow.Interview.flowName`
  - Namespace: `Flow.Interview.namespace.flowName`
- Create the object dynamically by using `createInterview()`

Note: We recommend only using `createInterview()` if you need to reuse your method or class. Using `createInterview()` has these drawbacks.

- If you package a class that uses `createInterview()`, you have to add the associated flow manually.
- If you delete a flow, Salesforce doesn't check if it's referenced with `createInterview()`.

Examples: Starting Flow Interviews

The following examples are all sample controllers that start an interview for the flow from the Build a Discount Calculator project on Trailhead. Each shows a different permutation, based on:

- Whether the interview is created statically, with `Flow.Interview.myFlow`, or dynamically, with `createInterview()`.
- Whether the flow is managed or local.

Interview Created Statically for a Local Flow

```
{
  Map<String, Object> inputs = new Map<String, Object>();
  inputs.put('AccountID', myAccount);
  inputs.put('OpportunityID', myOppty);

  Flow.Interview.Calculate_discounts myFlow =
    new Flow.Interview.Calculate_discounts(inputs);
  myFlow.start();
}
```

Interview Created Dynamically for a Local Flow

```
public void callFlow(String flowName, Map <String, Object> inputs) {
  Flow.Interview myFlow = Flow.Interview.createInterview(flowName, inputs);
  myFlow.start();
}
```

Interview Created Statically for a Managed Flow

```
{
  Map<String, Object> inputs = new Map<String, Object>();
  inputs.put('AccountID', myAccount);
  inputs.put('OpportunityID', myOppty);

  Flow.Interview.myNamespace.Calculate_discounts myFlow =
    new Flow.Interview.myNamespace.Calculate_discounts(inputs);
  myFlow.start();
}
```

Interview Created Dynamically for a Managed Flow

```
public void callFlow(String namespace, String flowName, Map <String, Object> inputs) {
  Flow.Interview myFlow = Flow.Interview.createInterview(namespace, flowName, inputs);
  myFlow.start();
}
```

Example: Getting Variable Values

This sample uses the `getVariableValue` method to obtain breadcrumb (navigation) information from a flow. If that flow contains subflow elements, and each of the referenced flows also contains a *`vaBreadCrumb`* variable, you can provide users with breadcrumbs regardless of which flow the interview is running.

```
public class SampleController {

   //Instance of the flow
   public Flow.Interview.Flow_Template_Gallery myFlow {get; set;}

   public String getBreadCrumb() {
      String aBreadCrumb;
      if (myFlow==null) { return 'Home';}
      else aBreadCrumb = (String) myFlow.getVariableValue('vaBreadCrumb');

      return(aBreadCrumb==null ? 'Home': aBreadCrumb);

   }
}
```

SEE ALSO:

Tooling API Objects: FlowTestCoverage

Interview Methods

The following are instance methods for `Interview`.

`createInterview(namespace, flowName, inputVariables)`

Creates an interview for a namespaced flow.

Signature

```
public static Flow.Interview createInterview(String namespace, String flowName,
Map<String,ANY> inputVariables)
```

Parameters

namespace
Type: String

The flow's namespace.

flowName
Type: String

The flow's API name.

inputVariables
Type: Map<String,Object>

Initial values for the flow's input variables.

Return Value

Type: Flow.Interview

Usage

Use this method to dynamically create a Flow.Interview object for the `start()` method.

How you get output variable values from an interview depends on the type of the Apex variable where you're storing the interview.

- If the variable is cast to a specific flow, you can use ***myFlow.myVar*** to access a variable, where ***myVar*** is the name of the variable.

```
system.debug('My Output Variable: ' + myFlow.varName);
```

- If the variable is of type Flow.Interview but not cast to a specific flow, you must use getVariableValue() to access the flow's variables.

```
system.debug('My Output Variable: ' + myFlow.getVariableValue('varName'));
```

If the flow doesn't exist in the current org, a TypeException is thrown.

createInterview(flowName, inputVariables)

Creates an interview for a flow.

Signature

```
public static Flow.Interview createInterview(String flowName, Map<String,Object>
inputVariables)
```

Parameters

flowName
Type: String

The flow's API name.

inputVariables
Type: Map<String,Object>

Initial values for the flow's input variables.

Return Value

Type: Flow.Interview

Usage

Use this method to dynamically create a Flow.Interview object for the `start()` method.

How you get output variable values from an interview depends on the type of the Apex variable where you're storing the interview.

- If the variable is cast to a specific flow, you can use ***myFlow.myVar*** to access a variable, where ***myVar*** is the name of the variable.

```
system.debug('My Output Variable: ' + myFlow.varName);
```

- If the variable is of type Flow.Interview but not cast to a specific flow, you must use getVariableValue() to access the flow's variables.

```
system.debug('My Output Variable: ' + myFlow.getVariableValue('varName'));
```

If the flow doesn't exist in the current org, a TypeException is thrown.

`getVariableValue(variableName)`

Returns the value of the specified flow variable. The flow variable can be in the flow embedded in the Visualforce page, or in a separate flow that is called by a subflow element.

Signature

```
public Object getVariableValue(String variableName)
```

Parameters

variableName
Type: String

Specifies the unique name of the flow variable.

Return Value

Type: Object

Usage

The returned variable value comes from whichever flow the interview is running. If the specified variable can't be found in that flow, the method returns `null`.

This method checks for the existence of the variable at run time only, not at compile time.

`start()`

Starts an instance (interview) for an autolaunched or user provisioning flow.

Signature

```
public Void start()
```

Return Value

Type: Void

Usage

This method can be used only with flows that have one of these types.

- Autolaunched Flow
- User Provisioning Flow

For details, see "Flow Types" in Salesforce Help.

When a flow user invokes an autolaunched flow, the active flow version runs. If there's no active version, the latest version runs. When a flow admin invokes a flow, the latest version always runs.

FormulaEval Namespace (Developer Preview)

The FormulaEval namespace provides classes and methods to evaluate user-defined dynamic formulas for Apex objects and SObjects. Use the methods to avoid unnecessary DML statements to recalculate formula field values or evaluate dynamic formula expressions. All class methods must be called within the context of a global Apex class.

Note: Feature is available as a developer preview. Feature isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. All commands, parameters, and other features are subject to change or deprecation at any time, with or without notice. Don't implement functionality developed with these commands or tools in a production environment.

The following are the classes and enums in the `FormulaEval` namespace.

IN THIS SECTION:

FormulaBuilder Class
Contains methods to build and validate user-defined formulas.

FormulaGlobal Enum
Specifies a global variable that references data in your organization in the `withGlobalVariables(formulaGlobals)` method.

FormulaInstance Class
Contains a method to evaluate the formula instance.

FormulaReturnType Enum
Specifies the return type for the `withReturnType(returnType)` method.

FormulaBuilder Class

Contains methods to build and validate user-defined formulas.

Namespace

FormulaEval

Usage

For Developer Preview, all formula functions that you can include in validation rules are available to use with formulas in Apex. For details, see Formula Operators and Functions by Context.

The `withType` context type must be a global, user-defined Apex class. Any fields or properties that the formula references must also be global.

IN THIS SECTION:

FormulaBuilder Methods

FormulaBuilder Methods

The following are methods for `FormulaBuilder`.

IN THIS SECTION:

build()
Validates and returns the formula instance created using the `FormulaBuilder` methods.

builder()
Creates an instance of the `FormulaBuilder` for configuring the formula, with input from the `withFormula(formulaText)`, `withReturnType(returnType)`, and `withType(contextType)` methods.

treatNumericNullAsZero(isNumericNullZero)
Optional. Indicates whether a null for a numeric data type is treated as zero while evaluating the formula with the `build()` method.

withFormula(formulaText)
Required. Sets the formula expression that the `build()` method uses to create the formula instance.

withGlobalVariables(formulaGlobals)
Optional. Sets the list of global variables that can be referenced in the formula expression created with the `build()` method.

withReturnType(returnType)
Required. Sets the formula output data type for the formula instance created with the `build()` method.

withType(contextType)
Required. Sets the Apex type that corresponds to the Apex class used with the `build()` method.

`build()`

Validates and returns the formula instance created using the `FormulaBuilder` methods.

Signature

```
public FormulaEval.FormulaInstance build()
```

Return Value

Type: FormulaEval.FormulaInstance

Returns an instance of the `FormulaInstance` object. If the formula validation such as field references, functions, or syntax, fails, the method throws a `FormulaValidationException` exception.

`builder()`

Creates an instance of the `FormulaBuilder` for configuring the formula, with input from the `withFormula(formulaText)`, `withReturnType(returnType)`, and `withType(contextType)` methods.

Signature

```
public static FormulaEval.FormulaBuilder builder()
```

Return Value

Type: FormulaEval.FormulaBuilder

`treatNumericNullAsZero(isNumericNullZero)`

Optional. Indicates whether a null for a numeric data type is treated as zero while evaluating the formula with the `build()` method.

Signature

```
public FormulaEval.FormulaBuilder treatNumericNullAsZero(Boolean isNumericNullZero)
```

Parameters

`isNumericNullZero`
Type: Boolean

If `true`, null for numeric is treated as zero. The default value is `false`.

Return Value

Type: FormulaEval.FormulaBuilder

`withFormula(formulaText)`

Required. Sets the formula expression that the `build()` method uses to create the formula instance.

Signature

```
public FormulaEval.FormulaBuilder withFormula(String formulaText)
```

Parameters

`formulaText`
Type: String

Return Value

Type: FormulaEval.FormulaBuilder

withGlobalVariables(formulaGlobals)

Optional. Sets the list of global variables that can be referenced in the formula expression created with the `build()` method.

Signature

```
public FormulaEval.FormulaBuilder withGlobalVariables(List<formulaeval.FormulaGlobal>
formulaGlobals)
```

Parameters

formulaGlobals
Type: List<FormulaEval.FormulaGlobal>

Uses values from the `FormulaGlobal` enum.

Return Value

Type: FormulaEval.FormulaBuilder

withReturnType(returnType)

Required. Sets the formula output data type for the formula instance created with the `build()` method.

Signature

```
public FormulaEval.FormulaBuilder withReturnType(formulaeval.FormulaReturnType
returnType)
```

Parameters

returnType
Type: FormulaEval.FormulaReturnType

Uses values from the `FormulaReturnType` enum.

Return Value

Type: FormulaEval.FormulaBuilder

withType(contextType)

Required. Sets the Apex type that corresponds to the Apex class used with the `build()` method.

Signature

```
public FormulaEval.FormulaBuilder withType(System.Type contextType)
```

Parameters

contextType
Type: System.Type

An instance of the Apex class defined against an Apex object or SObject.

Return Value

Type: FormulaEval.FormulaBuilder

FormulaGlobal Enum

Specifies a global variable that references data in your organization in the `withGlobalVariables(formulaGlobals)` method.

Enum Values

The following are the values of the `FormulaEval.FormulaGlobal` enum.

Value	Description
`LABEL`	A global variable to use when referencing a custom label.
`ORGANIZATION`	A global variable to use when referencing information about your company profile, such as organization's city, fax, ID, or other details.
`PERMISSION`	A global variable to use when referencing information about the current user's custom permission access.
`PROFILE`	A global variable to use when referencing information about the current user's profile, such as license type or name.
`SETUP`	A global variable to use when referencing a custom setting of type `hierarchy`.
`SYSTEM`	A global variable that exposes *`OriginDateTime`* and represents the literal value of 1900-01-01 00:00:00. Use this global variable when performing date/time offset calculations, or to assign a literal value to a date/time field.
`USER`	A global variable to use when referencing information about the current user, such as alias, title, and ID.
`USERROLE`	A global variable to use when referencing information about the current user's role, such as role name, description, and ID.

FormulaInstance Class

Contains a method to evaluate the formula instance.

Namespace

FormulaEval

Example

```
global class MotorYacht {
   global Integer lengthInYards;
   global Integer numOfGuestCabins;
   global String name;
   global Account owner;
}

MotorYacht aBoat = new MotorYacht();
aBoat.lengthInYards = 52;
aBoat.numOfGuestCabins = 4;
aBoat.name = 'RV Foo';
FormulaEval.FormulaInstance isItSuper = FormulaEval.FormulaBuilder.builder()
                            .withReturnType(FormulaEval.FormulaReturnType.STRING)
                            .withType(MotorYacht.class)
                            .withFormula('IF(lengthInYards < 100, "Not Super", "Super")')

                            .build();
isItSuper.evaluate(aBoat); //=> "Not Super"

aBoat.owner = new Account(Name='Acme Watercraft', Site='New York');
FormulaEval.FormulaInstance ownerDetails = FormulaEval.FormulaBuilder.builder()
                            .withReturnType(FormulaEval.FormulaReturnType.STRING)
                            .withType(MotorYacht.class)
                            .withFormula('owner.Name & " (" & owner.Site & ")"')
                            .build();
ownerDetails.evaluate(aBoat); //=> "Acme Watercraft (New York)"
```

Usage

The `withType` context type must be a global, user-defined Apex class. Any fields or properties that the formula references must also be global.

IN THIS SECTION:

FormulaInstance Methods

FormulaInstance Methods

The following are methods for `FormulaInstance`.

IN THIS SECTION:

evaluate(contextObject)
Calculates the formula expression and returns the formula output.

`evaluate(contextObject)`

Calculates the formula expression and returns the formula output.

Signature

```
public Object evaluate(Object contextObject)
```

Parameters

contextObject
Type: Object

An instance of the Apex class as generated with the `FormulaBuilder.builder()` method.

Return Value

Type: Object

Apex type that corresponds to the Apex class as configured by the `withType()` method in the `FormulaBuilder` class.

FormulaReturnType Enum

Specifies the return type for the `withReturnType(returnType)` method.

Enum Values

The following are the values of the `FormulaEval.FormulaReturnType` enum.

Value	Description
`BOOLEAN`	A value that can only be assigned `true`, `false`, or `null`.
`DATE`	A value that indicates a particular day.
`DATETIME`	A value that indicates a particular day and time, such as a timestamp.
`DECIMAL`	A number that includes a decimal point. Decimal is an arbitrary precision number.
`DOUBLE`	A 64-bit number that includes a decimal point.
`ID`	Any valid 18-character Lightning Platform record identifier.
`INTEGER`	A 32-bit number that doesn't include a decimal point.
`LONG`	A 64-bit number that doesn't include a decimal point.
`STRING`	Any set of characters surrounded by single quotes.
`TIME`	A value that indicates a particular time.

Functions Namespace

The Functions namespace provides classes and methods used to invoke and manage Salesforce Functions.

Salesforce Functions is your code, run on demand, in the Salesforce Functions trusted elastic compute cloud. Upload your complex business logic code, written using your preferred languages and frameworks, and Salesforce Functions takes care of everything else

necessary to invoke your code in a secure, multi-tenant aware, and self-scaling environment. For more details on Salesforce Functions, see Salesforce Functions.

The following are the classes in the `functions` namespace.

IN THIS SECTION:

Function Class
Use the Function class to access deployed Salesforce Functions, and invoke them synchronously or asynchronously.

FunctionCallback Interface
Represents the callback Salesforce calls when an asynchronous, queued Function invocation has completed.

FunctionErrorType Enum
Represents the error type of FunctionInvocationError.

FunctionInvocation Interface
Use FunctionInvocation to get the status and results of a synchronous or asynchronous Function invocation.

FunctionInvocationError Interface
Use FunctionInvocationError to get detailed error information about a failed Function invocation.

FunctionInvocationStatus Enum
Represents the status of a Function invocation.

FunctionInvokeMock Interface
Use the `FunctionInvokeMock` interface to mock Salesforce Functions responses during testing.

MockFunctionInvocationFactory Class
Use the `MockFunctionInvocationFactory` methods to generate appropriate mock responses for testing Salesforce Functions.

Function Class

Use the Function class to access deployed Salesforce Functions, and invoke them synchronously or asynchronously.

Namespace

functions

Usage

The Function class represents an instance of a deployed Function you can invoke from your org. You can invoke Functions synchronously, or asynchronously using asynchronous Apex.

If your Function takes longer than 2 minutes to return, the request times out. To avoid timing out, consider using asynchronous invocation. Invoking a Function asynchronously doesn't count against asynchronous Apex limits, such as Apex Queueable limits.

Before synchronously invoking a Function, commit any pending data operations in Apex, otherwise you get a CalloutException. For asynchronous invocations, the queued invocation doesn't happen if the Apex transaction isn't committed. Any data operations that happen in the Function itself aren't considered part of the Apex transaction.

Functions can't be invoked in an Apex test. A "Function invocations from Apex tests are not supported" CalloutException is thrown if Apex determines that a Function is being invoked during a test. If you must run tests against code that invokes Functions, mock your

Function invocations during the tests. See FunctionInvocation Example Implementation for an example of a mocked FunctionInvocation that you can use in testing.

Example

The following example synchronously invokes a deployed "accountfunction" Function:

```
functions.Function accountFunction = functions.Function.get('MyProject.accountfunction');
functions.FunctionInvocation invocation = accountFunction.invoke('{ "accountName" : "Acct",
 "contactName" : "MyContact", "opportunityName" : "Oppty" }');
String jsonResponse = invocation.getResponse();
```

The following example asynchronously invokes a deployed "AccountFunction" Function, using the provided callback:

```
functions.Function accountFunction = functions.Function.get('MyProject.accountfunction');
accountFunction.invoke('{ "accountName" : "Acct", "contactName" : "MyContact",
"opportunityName" : "Oppty" }', new MyCallback());

public class MyCallback
  implements functions.FunctionCallback {
    public void handleResponse(functions.FunctionInvocation result) {
      // Handle result of function invocation
      // ...
    }
}
```

IN THIS SECTION:

Function Methods

Function Methods

The following are methods for `Function`.

IN THIS SECTION:

get(functionName)

Returns the Function instance for the named Function and Project. The Function must be properly deployed and have appropriate permissions to work with the org running your Apex code.

get(namespace, functionName)

Returns the Function instance for the named Function, Project, and Namespace. The Function must be properly deployed and have appropriate permissions to work with the org running your Apex code.

invoke(payload, callback)

Invokes the Function asynchronously.

invoke(payload)

Invokes the Function synchronously.

`get(functionName)`

Returns the Function instance for the named Function and Project. The Function must be properly deployed and have appropriate permissions to work with the org running your Apex code.

Signature

```
public static functions.Function get(String functionName)
```

Parameters

`functionName`
Type: String

The name of the Salesforce Function and the Functions Project that the Function is part of. The format of the parameter string is "*`project name.function name`*". For example, to retrieve the `generatepdf` Function in the `Onboarding` Function Project, use `Onboarding.generatepdf`. The Function and Project must be deployed to a compute environment connected to the org.

Return Value

Type: functions.Function

Returns a Function instance that you can invoke.

Usage

The `Function.get()` method can throw the following exceptions:

- `InvalidParameterValueException` — The *`functionName`* parameter doesn't have the correct *`project name.function name`* format.
- `NoDataFoundException` — The project or Function name provided in the *`functionName`* parameter couldn't be found. Make sure the project and Function name are spelled correctly and that the project and Function have been properly deployed.

get(namespace, functionName)

Returns the Function instance for the named Function, Project, and Namespace. The Function must be properly deployed and have appropriate permissions to work with the org running your Apex code.

Signature

```
public static functions.Function get(String namespace, String functionName)
```

Parameters

`namespace`
Type: String

The name of the Namespace that both the Salesforce Function and the Functions Project are part of. The org the Function is in must be `global` to access across namespaces. Default value is the same org where the method is being called.

`functionName`
Type: String

The name of the Salesforce Function and the Functions Project that the Function is part of. The format of the parameter string is "*project name*.*function name*". For example, to retrieve the `generatepdf` Function in the `Onboarding` Function Project, use `Onboarding.generatepdf`. The Function and Project must be deployed to a compute environment connected to the org.

Return Value

Type: functions.Function

Returns a Function instance that you can invoke.

Usage

The `Function.get()` method can throw the following exceptions:

- `InvalidParameterValueException` — The *`functionName`* parameter doesn't have the correct *`project name.function name`* format.
- `NoDataFoundException` — The project or Function name provided in the *`functionName`* parameter couldn't be found. Make sure the project and Function name are spelled correctly and that the project and Function have been properly deployed.
- `RuntimeException` — The function is `public` yet references a function across namespaces. Make sure to retrieve references across namespaces only in a `global` org.

`invoke(payload, callback)`

Invokes the Function asynchronously.

Signature

```
public functions.FunctionInvocation invoke(String payload, functions.FunctionCallback callback)
```

Parameters

`payload`
Type: String

The payload data that gets passed to the Function. Specify your payload data in a JSON-format string.

`callback`
Type: functions.FunctionCallback

A FunctionCallback implementation that gets called when your Function is invoked asynchronously.

Return Value

Type: functions.FunctionInvocation

Returns a FunctionInvocation that contains information about the results of the invocation, such as the Function response, or error results.

Usage

The `Function.invoke(payload, callback)` method can throw the following exceptions:

- `CalloutException` — One of the following conditions causes this exception to be thrown:
  - Salesforce Functions isn't enabled on the current org. For more details on enabling Functions, see Configure Orgs for Functions in the Functions Developer Guide.
  - The Function is being invoked in an Apex test. Functions can't be invoked in tests.
  - The "Functions" permission set is missing or has incorrect permissions for `FunctionInvocationRequest`. For more details on the correct permissions for `FunctionInvocationRequest` see Function Permissions in the Functions Developer Guide.
  - The provided payload isn't valid JSON.
  - The Function hasn't completed deployment to a compute environment or invocation request returns a 404 HTTP error.
- `InvalidParameterValueException` — The *`callback`* parameter is null or references a class that doesn't implement `functions.FunctionCallback`.
- `NoDataFoundException` — A reference for the Function couldn't be found in the current org. Make sure the project and Function have been properly deployed.

`invoke(payload)`

Invokes the Function synchronously.

Signature

```
public functions.FunctionInvocation invoke(String payload)
```

Parameters

`payload`
Type: String

The payload data that gets passed to the Function. Specify your payload data in a JSON-format string.

Return Value

Type: functions.FunctionInvocation

Returns a FunctionInvocation that contains information about the results of the invocation, such as the Function response, or error results.

Usage

The `Function.invoke(payload)` method can throw the following exceptions:

- `CalloutException` — One of the following conditions causes this exception to be thrown:
  - Salesforce Functions isn't enabled on the current org. For more details on enabling Functions, see Configure Orgs for Functions in the Functions Developer Guide.
  - The Function is being invoked in an Apex test. Functions can't be invoked in tests.
  - The provided payload isn't valid JSON.
  - There are pending DML operations.
  - The Function is being synchronously invoked from an Apex trigger.
  - The Function hasn't completed deployment to a compute environment or invocation request returns a 404 HTTP error.

  - The Function request returns a 5xx HTTP error.
  - The Function invocation has exceeded the time limit for synchronous invocations. For details on the time limit and work-arounds, see Limits in the Functions Developer Guide.
- `NoDataFoundException` — A reference for the Function couldn't be found in the current org. Make sure the project and Function have been properly deployed.

FunctionCallback Interface

Represents the callback Salesforce calls when an asynchronous, queued Function invocation has completed.

Namespace

functions

Usage

When invoking Functions asynchronously via `Function.invoke(payload, callback)`, you provide your own class that implements FunctionCallback.

IN THIS SECTION:

FunctionCallback Methods

FunctionCallback Example Implementation

FunctionCallback Methods

The following are methods for `FunctionCallback`.

IN THIS SECTION:

handleResponse(var1)
Called when an asynchronous Function invocation has completed.

`handleResponse(var1)`

Called when an asynchronous Function invocation has completed.

Signature

```
public void handleResponse(functions.FunctionInvocation var1)
```

Parameters

`var1`
Type: functions.FunctionInvocation

The result parameter contains JSON response information and error information.

Return Value

Type: void

FunctionCallback Example Implementation

This is an example implementation of the `functions.FunctionCallback` interface.

```
public class MyCallback
  implements functions.FunctionCallback {
    public void handleResponse(functions.FunctionInvocation result) {
      // Handle result of function invocation
      String jsonResponse = result.getResponse();
      System.debug('Got response ' + jsonResponse);
      JSONParser parser = JSON.createParser(jsonResponse);
      // Process JSON using your own data class...
    }
}
```

The following example uses this implementation when invoking a Function asynchronously:

```
myFunction.invoke('{ "accountName" : "Acct", "contactName" : "MyContact", "opportunityName"
 : "Oppty" }', new MyCallback());
```

FunctionErrorType Enum

Represents the error type of FunctionInvocationError.

Enum Values

These are the values of the `functions.FunctionErrorType` enum.

Value	Description
`FUNCTION_EXCEPTION`	A known exception resulting from the Function logic itself. Examples include an exception thrown from the Function code, or an exception thrown from a library or framework the Function uses.
`RUNTIME_EXCEPTION`	A known exception resulting from the Salesforce Functions runtime. For example, a malformed payload passed to the Function when invoked results in this error type.
`UNEXPECTED_FUNCTION_EXCEPTION`	An unknown exception. For example, a network or system-level issue within the Salesforce Functions infrastructure results in this error type.

FunctionInvocation Interface

Use FunctionInvocation to get the status and results of a synchronous or asynchronous Function invocation.

Namespace

functions

Usage

The results of a Function invocation are passed back via FunctionInvocation. Use this instance to determine if the invocation was successful, and any results from the Function invocation.

You can also implement your own FunctionInvocation interface if you run Apex tests with your Function invocation code. Your test code can create and use your own FunctionInvocation instance in place of using the results from a call to `Function.invoke()`.

IN THIS SECTION:

FunctionInvocation Methods

FunctionInvocation Example Implementation

FunctionInvocation Methods

The following are methods for `FunctionInvocation`.

IN THIS SECTION:

getError()
Returns error information for a Function invocation.

getInvocationId()
Returns the invocation ID of the Function invocation.

getResponse()
Returns the response string of the Function invocation.

getStatus()
Returns the status of the Function invocation.

`getError()`

Returns error information for a Function invocation.

Signature

```
public functions.FunctionInvocationError getError()
```

Return Value

Type: functions.FunctionInvocationError

Contains a `FunctionInvocationError` instance that you can use to get information about any invocation errors. If the Function was invoked successfully, the returned instance is null.

`getInvocationId()`

Returns the invocation ID of the Function invocation.

Signature

```
public String getInvocationId()
```

Return Value

Type: String

This ID is available after a call to either the synchronous or asynchronous `Function.invoke()` methods. For asynchronous invocations, this ID can be used to check the status of the queued invocation.

`getResponse()`

Returns the response string of the Function invocation.

Signature

```
public String getResponse()
```

Return Value

Type: String

The response string is the raw request JSON response, which can be parsed using the JSONParser Class.

`getStatus()`

Returns the status of the Function invocation.

Signature

```
public functions.FunctionInvocationStatus getStatus()
```

Return Value

Type: functions.FunctionInvocationStatus

The result of the invocation, such as `FunctionInvocationStatus.SUCCESS` or `FunctionInvocationStatus.ERROR`.

FunctionInvocation Example Implementation

This is an example implementation of the `functions.FunctionInvocation` interface.

```
public class MyFunctionInvocationError
  implements functions.FunctionInvocationError {
    public String getMessage() {
      return 'Mock error message for testing';
    }
    public functions.FunctionErrorType getType() {
      return functions.FunctionErrorType.FUNCTION_EXCEPTION;
    }
}

public class MyFunctionInvocation
  implements functions.FunctionInvocation {
    public functions.FunctionInvocationStatus getStatus() {
      return functions.FunctionInvocationStatus.ERROR;
    }
```

```
    public String getResponse() {
      return 'Mock response for testing';
    }
    public String getInvocationId() {
      return 'MOCKTESTID';
    }
    public functions.FunctionInvocationError getError() {
      functions.FunctionInvocationError testError = new MyFunctionInvocationError();
      return testError;
    }
}
```

The following example tests the implementation:

```
functions.FunctionInvocation testInvocation = new MyFunctionInvocation();
if (testInvocation.getStatus() == functions.FunctionInvocationStatus.ERROR) {
    System.debug('Error: ' + (testInvocation.getError() != null ?
testInvocation.getError().getMessage() : 'UNKNOWN'));
    return;
}
```

FunctionInvocationError Interface

Use FunctionInvocationError to get detailed error information about a failed Function invocation.

Namespace

functions

Usage

FunctionInvocationError contains various error information such as the error message at the time of the error.

IN THIS SECTION:

FunctionInvocationError Methods

FunctionInvocationError Example Implementation

FunctionInvocationError Methods

The following are methods for `FunctionInvocationError`.

IN THIS SECTION:

getMessage()

Returns the error message from a Function invocation error.

getType()

Returns the error type for FunctionInvocationError.

`getMessage()`

Returns the error message from a Function invocation error.

Signature

```
public String getMessage()
```

Return Value

Type: String

`getType()`

Returns the error type for FunctionInvocationError.

Signature

```
public functions.FunctionErrorType getType()
```

Return Value

Type: functions.FunctionErrorType

FunctionInvocationError Example Implementation

This is an example implementation of the `functions.FunctionInvocationError` interface.

```
public class MyFunctionInvocationError
  implements functions.FunctionInvocationError {
      public String getMessage() {
          return 'Mock error message for testing';
      }
      public functions.FunctionErrorType getType() {
          return functions.FunctionErrorType.FUNCTION_EXCEPTION;
      }
}
```

This example tests the implementation.

```
functions.FunctionInvocationError testError = new MyFunctionInvocationError();
System.debug('Error: ' + testError.getMessage() + ' Type: ' + testError.getType());
```

FunctionInvocationStatus Enum

Represents the status of a Function invocation.

Enum Values

The following are the values of the `functions.FunctionInvocationStatus` enum.

Value	Description
`ERROR`	The invocation failed. Check the FunctionInvocation and FunctionInvocationError returned by the invoke call to debug the issue.
`PENDING`	The invocation is pending. If the Function is being invoked asynchronously, the invocation is still in the asynch queue.
`SUCCESS`	The invocation succeeded. Use `FunctionInvocation.getResponse()` with the FunctionInvocation instance returned by the invoke call to get any response returned by the Function.

FunctionInvokeMock Interface

Use the `FunctionInvokeMock` interface to mock Salesforce Functions responses during testing.

Namespace

functions

Usage

To mock Salesforce Functions testing, implement an appropriate mock response in the `respond(functionName,payload)` method of the `FunctionInvokeMock` interface. During mock testing of a Salesforce Functions, Apex runtime sends the response specified in the `respond()` method, rather than invoking the function itself. Appropriate success and error messages can be configured with the `createSuccessResponse(invocationId,message)` and `createErrorResponse(invocationId,functionsErrorType,errorMsg)` methods in `Functions.MockFunctionInvocationFactory`.

IN THIS SECTION:

FunctionInvokeMock Methods

FunctionInvokeMock Example Implementation

FunctionInvokeMock Methods

The following are methods for `FunctionInvokeMock`.

IN THIS SECTION:

respond(functionName, payload)

The mock response implemented in the `Functions.FunctionInvokeMock` interface. The response is sent by Apex runtime when the `Test.setMock()` method is called.

`respond(functionName, payload)`

The mock response implemented in the `Functions.FunctionInvokeMock` interface. The response is sent by Apex runtime when the `Test.setMock()` method is called.

Signature

```
public functions.FunctionInvocation respond(String functionName, String payload)
```

Parameters

functionName
Type: String

The name of the Salesforce Function and the Functions Project that the Function is part of. The format of the parameter string is "*project name.function name*".

payload
Type: String

The JSON-format payload data that is passed to the Function.

Return Value

Type: FunctionInvocation Interface

The result of the mock call to Salesforce Functions. Appropriate responses can be generated by using the `createSuccessResponse()` and `createErrorResponse()` methods in the `Functions.MockFunctionInvocationFactory` class.

FunctionInvokeMock Example Implementation

This is sample implementation of the `functions.FunctionInvokeMock` interface.

```
@isTest
public class FunctionsInvokeMockImpl implements functions.FunctionInvokeMock {
    public functions.FunctionInvocation respond(String functionName, String payload) {
       // return mock success response
       String invocationId = '000000000000000';
       String response = 'mockResponse';
       return functions.MockFunctionInvocationFactory.createSuccessResponse(invocationId,
 response);
    }
}
```

This example shows the minimal setup required for testing synchronous and asynchronous functions and is simplified to include both function invocations and the `FunctionCallback` class.

```
@isTest
public class FunctionTest {
    @isTest
    static void testSyncFunctionCall() {
            // Set mock class to respond to function invocations
        Test.setMock( functions.FunctionInvokeMock.class, new FunctionsInvokeMockInner());

          functions.Function mockedFunction = functions.Function.get('example.function');

            Test.startTest();
            // Synchronous function call
```

```
            functions.FunctionInvocation invokeResult = mockedFunction.invoke('{}');
            Test.stopTest();

            // Verify that the received response contains expected mock values
            System.assertEquals(functions.FunctionInvocationStatus.SUCCESS,
invokeResult.getStatus());
            System.assertEquals('mockResponse', invokeResult.getResponse());
            System.assertEquals('000000000000000', invokeResult.getInvocationId());

        }

        @isTest
        static void testAsyncFunctionCall() {
            // Set mock class to respond to function invocations
            Test.setMock( functions.FunctionInvokeMock.class, new
FunctionsInvokeMockInner());

          functions.Function mockedFunction = functions.Function.get('example.function2');

            Test.startTest();
            //Asynchronous function invocation with callback
            mockedFunction.invoke('{}', new DemoCallback());
            Test.stopTest();
            // Include assertions here about the expected callback processing
        }

         public class DemoCallback implements functions.FunctionCallback {
            public void handleResponse(functions.FunctionInvocation invokeResult) {
                // Handle result of function invocation
                // The callback is included in the example here for convenience
                // It would normally be defined in the classes being tested

                // Verify that the received response contains expected mock values
                System.assertEquals(invokeResult.getStatus(),
functions.FunctionInvocationStatus.ERROR);
                functions.FunctionInvocationError resultError = invokeResult.getError();
             System.assertEquals('bang', invokeResult.getError().getMessage());
             System.assertEquals('000000000000000', invokeResult.getInvocationId());

            }
        }

        public class FunctionsInvokeMockInner implements functions.FunctionInvokeMock {
          public functions.FunctionInvocation respond(String functionName, String payload)
 {
                // return mock success response
                String invocationId = '000000000000000';

                if(functionName == 'example.function2') {
                    return functions.MockFunctionInvocationFactory.createErrorResponse(
                        invocationId,
                        functions.FunctionErrorType.FUNCTION_EXCEPTION,
```

```
                        'bang');
                }

                String response = 'mockResponse';
                return
functions.MockFunctionInvocationFactory.createSuccessResponse(invocationId, response);

            }
        }

    }
```

MockFunctionInvocationFactory Class

Use the `MockFunctionInvocationFactory` methods to generate appropriate mock responses for testing Salesforce Functions.

Namespace

functions

Usage

To mock Salesforce Functions testing, implement an appropriate mock response in the `respond(functionName,payload)` method of the `FunctionInvokeMock` interface. During mock testing of a Salesforce Functions, the Apex runtime sends the response specified in the `respond()` method, rather than invoking the function itself. Appropriate success and error messages can be configured with the `createSuccessResponse(invocationId,message)` and `createErrorResponse(invocationId,functionsErrorType,errorMsg)` methods.

See FunctionInvokeMock Example Implementation.

IN THIS SECTION:

MockFunctionInvocationFactory Methods

MockFunctionInvocationFactory Methods

The following are methods for `MockFunctionInvocationFactory`.

IN THIS SECTION:

createErrorResponse(invocationId, functionsErrorType, errMsg)
Generate a response for an error condition during mock testing of Salesforce Functions.

createSuccessResponse(invocationId, response)
Generate a response for a successful mock test of Salesforce Functions.

`createErrorResponse(invocationId, functionsErrorType, errMsg)`

Generate a response for an error condition during mock testing of Salesforce Functions.

Signature

```
public static functions.FunctionInvocation createErrorResponse(String invocationId,
functions.FunctionErrorType functionsErrorType, String errMsg)
```

Parameters

invocationId
Type: String

The ID associated with a call to either the synchronous or asynchronous `Function.invoke()` method.

functionsErrorType
Type: FunctionErrorType Enum

The error type of `FunctionInvocationError`.

errMsg
Type: String

The error message.

Return Value

Type: FunctionInvocation Interface

createSuccessResponse(invocationId, response)

Generate a response for a successful mock test of Salesforce Functions.

Signature

```
public static functions.FunctionInvocation createSuccessResponse(String invocationId,
String response)
```

Parameters

invocationId
Type: String

The ID associated with a call to either the synchronous or asynchronous `Function.invoke()` method.

response
Type: String

The message indicating success.

Return Value

Type: FunctionInvocation Interface

Invocable Namespace

The `Invocable` namespace provides classes for calling invocable actions from Apex.

These classes are in the `Invocable` namespace.

IN THIS SECTION:

Action Class
Contains methods to create, update, and retrieve information about invocable actions.

Action.Error Class
Contains methods to retrieve errors returned by invocable actions.

Action.Result Class
Contains methods to retrieve results from invocable actions called from Apex code.

Action Class

Contains methods to create, update, and retrieve information about invocable actions.

Namespace

Invocable

IN THIS SECTION:

Action Methods

SEE ALSO:

Apex Developer Guide: InvocableMethod Annotation

Action Methods

These methods are for `Action`.

IN THIS SECTION:

addInvocation()
Creates an empty invocation in preparation for calling an invocable action. After you create the invocation, you can add parameters to the invocation.

clearInvocations()
Clears the existing invocations from the action.

clone()
Creates a copy of the `Invocable.Action`.

createCustomAction(type, namespace, name)
Creates a wrapper for a custom invocable action in a specified package namespace.

createCustomAction(type, name)
Creates a wrapper for a custom invocable action.

createStandardAction(type)
Creates a wrapper for a standard invocable action.

getName()
Gets the name of an invocable action.

getNamespace()
Gets the namespace of a custom invocable action.

getType()
Gets the type of an invocable action.

invoke()
Invokes an invocable action from Apex code.

isStandard()
Determines whether an invocable action is a standard invocable action.

setInvocationParameter(parameterName, parameterValue)
Sets a value for an invocable action parameter.

setInvocations(invocations)
Initializes the invocations for an action from a pre-existing list of invocations.

addInvocation()

Creates an empty invocation in preparation for calling an invocable action. After you create the invocation, you can add parameters to the invocation.

Signature

```
public Invocable.Action addInvocation()
```

Return Value

Type: Invocable.Action on page 2452

clearInvocations()

Clears the existing invocations from the action.

Signature

```
public Invocable.Action clearInvocations()
```

Return Value

Type: Invocable.Action on page 2452

clone()

Creates a copy of the `Invocable.Action`.

Signature

```
public Object clone()
```

Return Value

Type: Object

createCustomAction(type, namespace, name)

Creates a wrapper for a custom invocable action in a specified package namespace.

Signature

```
public static Invocable.Action createCustomAction(String type, String namespace, String name)
```

Parameters

type
Type: String

Type of invocable action.

namespace
Type: String

Namespace where the invocable action is located.

name
Type: String

Name for the custom invocable action.

Return Value

Type: Invocable.Action

createCustomAction(type, name)

Creates a wrapper for a custom invocable action.

Signature

```
public static Invocable.Action createCustomAction(String type, String name)
```

Parameters

type
Type: String

Type of invocable action.

name
Type: String

Name for the custom invocable action.

Return Value

Type: Invocable.Action

`createStandardAction(type)`

Creates a wrapper for a standard invocable action.

Signature

```
public static Invocable.Action createStandardAction(String type)
```

Parameters

type
Type: String

Type of invocable action.

Return Value

Type: Invocable.Action

`getName()`

Gets the name of an invocable action.

Signature

```
public String getName()
```

Return Value

Type: String

Name of the invocable action.

`getNamespace()`

Gets the namespace of a custom invocable action.

Signature

```
public String getNamespace()
```

Return Value

Type: String

Namespace of the custom invocable action.

`getType()`

Gets the type of an invocable action.

Signature

```
public String getType()
```

Return Value

Type: String

Type of invocable action.

`invoke()`

Invokes an invocable action from Apex code.

Signature

```
public List<Invocable.Action.Result> invoke()
```

Return Value

Type: List<Invocable.Action.Result>

`isStandard()`

Determines whether an invocable action is a standard invocable action.

Signature

```
public Boolean isStandard()
```

Return Value

Type: Boolean

This method returns `true` if the invocable action is a standard invocable action.

`setInvocationParameter(parameterName, parameterValue)`

Sets a value for an invocable action parameter.

Signature

```
public Invocable.Action setInvocationParameter(String parameterName, Object
parameterValue)
```

Parameters

`parameterName`
Type: String

Name of the invocable action parameter to set.

parameterValue
Type: Object

Value to set the invocable action parameter to.

Return Value

Type: Invocable.Action on page 2452

setInvocations(invocations)

Initializes the invocations for an action from a pre-existing list of invocations.

Signature

```
public Invocable.Action setInvocations(List<Map<String,ANY>> invocations)
```

Parameters

invocations
Type: List on page 3405<Map on page 3426<String on page 3630,ANY>>

List of invocations for the invocable action.

Return Value

Type: Invocable.Action on page 2452

Action.Error Class

Contains methods to retrieve errors returned by invocable actions.

Namespace

Invocable

IN THIS SECTION:

Action.Error Methods

Action.Error Methods

These methods are for `Action.Error`.

IN THIS SECTION:

clone()
Creates a copy of the `Invocable.Action.Error`.

getCode()
Gets the error code returned by an invocable action.

getMessage()
Gets the error message returned by an invocable action.

clone()

Creates a copy of the `Invocable.Action.Error`.

Signature

```
public Object clone()
```

Return Value

Type: Object

getCode()

Gets the error code returned by an invocable action.

Signature

```
public String getCode()
```

Return Value

Type: String

getMessage()

Gets the error message returned by an invocable action.

Signature

```
public String getMessage()
```

Return Value

Type: String

Action.Result Class

Contains methods to retrieve results from invocable actions called from Apex code.

Namespace

Invocable

IN THIS SECTION:

Action.Result Methods

Action.Result Methods

The methods are for `Action.Result`.

IN THIS SECTION:

clone()
Creates a copy of the `Invocable.Action.Result`.

getAction()
Gets the invocable action that was invoked and caused a result to be returned.

getErrors()
Gets a list of errors that were returned by an invocable action.

getInvocationParameters()
Gets a list of the parameter values set for an invocable action. This method returns a list that contains the input parameter values for each invocation of an action. Each map in the list contains a key for the name of each input parameter.

getOutputParameters()
Gets a list of the parameter values returned by an invocable action. This method returns a list that contains the result for each invocation of an action. Each map in the list contains a key for the name of each output parameter.

isSuccess()
Determines if an invocable action ran without errors.

`clone()`

Creates a copy of the `Invocable.Action.Result`.

Signature

```
public Object clone()
```

Return Value

Type: Object

`getAction()`

Gets the invocable action that was invoked and caused a result to be returned.

Signature

```
public Invocable.Action getAction()
```

Return Value

Type: Invocable.Action on page 2452

getErrors()

Gets a list of errors that were returned by an invocable action.

Signature

```
public List on page 3630<Invocable.Action.Error on page 2457> getErrors()
```

Return Value

Type: List on page 3630<Invocable.Action.Error on page 2457>

getInvocationParameters()

Gets a list of the parameter values set for an invocable action. This method returns a list that contains the input parameter values for each invocation of an action. Each map in the list contains a key for the name of each input parameter.

Signature

```
public Map<String,Object> getInvocationParameters()
```

Return Value

Type: Map on page 3426<String on page 3630,Object>

getOutputParameters()

Gets a list of the parameter values returned by an invocable action. This method returns a list that contains the result for each invocation of an action. Each map in the list contains a key for the name of each output parameter.

Signature

```
public Map<String,Object> getOutputParameters()
```

Return Value

Type: Map on page 3426<String on page 3630,Object>

isSuccess()

Determines if an invocable action ran without errors.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

This method returns `true` if the invocable action ran successfully.

IsvPartners Namespace

The `IsvPartners` namespace provides a class associated with Salesforce ISV partner use cases, such as optimizing code, providing great customer trial experiences, and driving feature adoption.

These are the classes in the `IsvPartners` namespace.

IN THIS SECTION:

AppAnalytics Class
Contains methods to help with AppExchange App Analytics use cases, such as minimizing subscriber attrition and obtaining product insights.

AppAnalytics Class

Contains methods to help with AppExchange App Analytics use cases, such as minimizing subscriber attrition and obtaining product insights.

Namespace

IsvPartners

Usage

Use `AppAnalytics` and its methods to log App Analytics custom interactions.

Example

```
public void submitClicked() {
        Id jobId = System.enqueueJob(new MyQueueable(colorValue));
        IsvPartners.AppAnalytics.logCustomInteraction(
             MyPageInteractions.SUBMIT_CLICKED, jobId);
```

IN THIS SECTION:

AppAnalytics Methods

AppAnalytics Methods

These are methods for `AppAnalytics`.

IN THIS SECTION:

logCustomInteraction(interactionLabel, interactionId)
Logs the custom interaction using a label that you provide as an enum value and an interaction ID.

logCustomInteraction(interactionLabel, interactionUuid)
Logs the custom interaction using a label that you provide as an enum value and an interaction ID that you provide as an Apex UUID.

logCustomInteraction(interactionLabel)

Logs the custom interaction using a label that you provide as an enum value.

logCustomInteraction(interactionLabel, interactionId)

Logs the custom interaction using a label that you provide as an enum value and an interaction ID.

Signature

```
public static void logCustomInteraction(Object interactionLabel, Id interactionId)
```

Parameters

interactionLabel

Type: Object

A value used to label the custom interaction. The value of *interactionLabel* must be an enum with the same namespace as the code that calls the `logCustomInteraction` method.

interactionId

Type: Id

An Apex ID that is associated with the custom interaction. The `interactionId` that you provide is hashed and tokenized before it's included in AppExchange App Analytics package usage logs.

Return Value

Type: Void

logCustomInteraction(interactionLabel, interactionUuid)

Logs the custom interaction using a label that you provide as an enum value and an interaction ID that you provide as an Apex UUID.

Signature

```
public static void logCustomInteraction(Object interactionLabel, System.UUID
interactionUuid)
```

Parameters

interactionLabel

Type: Object

A value used to label the custom interaction. The value of *interactionLabel* must be an enum with the same namespace as the code that calls the `logCustomInteraction` method.

interactionUuid

Type: System.UUID

An Apex UUID that is associated with the custom interaction. The `interactionId` that you provide is hashed and tokenized before being included in AppExchange App Analytics package usage logs.

Return Value

Type: Void

`logCustomInteraction(interactionLabel)`

Logs the custom interaction using a label that you provide as an enum value.

Signature

```
public static void logCustomInteraction(Object interactionLabel)
```

Parameters

`interactionLabel`
Type: Object

A value used to label the custom interaction. The value of *`interactionLabel`* must be an enum with the same namespace as the code that calls the `logCustomInteraction` method.

Return Value

Type: Void

KbManagement Namespace

The `KbManagement` namespace provides a class for managing knowledge articles.

The following is the class in the `KbManagement` namespace.

IN THIS SECTION:

PublishingService Class
Use the methods in the `KbManagement.PublishingService` class to manage the lifecycle of an article and its translations.

PublishingService Class

Use the methods in the `KbManagement.PublishingService` class to manage the lifecycle of an article and its translations.

Namespace

KbManagement

Usage

Use the methods in the `KbManagement.PublishingService` class to manage the following parts of the lifecycle of an article and its translations:

- Publishing
- Updating

- Retrieving
- Deleting
- Submitting for translation
- Setting a translation to complete or incomplete status
- Archiving
- Assigning review tasks for draft articles or translations

Note: Date values are based on GMT.

To use the methods in this class, you must enable Salesforce Knowledge. See Salesforce Knowledge Implementation Guide for more information on setting up Salesforce Knowledge.

PublishingService Methods

The following are methods for `PublishingService`. All methods are static.

IN THIS SECTION:

archiveOnlineArticle(articleId, scheduledDate)

Archives an online version of an article. If the specified scheduledDate is null, the article is archived immediately. Otherwise, it archives the article on the scheduled date.

assignDraftArticleTask(articleId, assigneeId, instructions, dueDate, sendEmailNotification)

Assigns a review task related to a draft article.

assignDraftTranslationTask(articleVersionId, assigneeId, instructions, dueDate, sendEmailNotification)

Assigns a review task related to a draft translation.

cancelScheduledArchivingOfArticle(articleId)

Cancels the scheduled archiving of an online article.

cancelScheduledPublicationOfArticle(articleId)

Cancels the scheduled publication of a draft article.

completeTranslation(articleVersionId)

Puts a translation in a completed state that is ready to publish.

deleteArchivedArticle(articleId)

Deletes an archived article.

deleteArchivedArticleVersion(articleId, versionNumber)

Deletes a specific archived version of a published article.

deleteDraftArticle(articleId)

Deletes a draft article.

deleteDraftTranslation(articleVersionId)

Deletes a draft translation.

editArchivedArticle(articleId)

Creates a draft article from the archived primary version and returns the new draft primary version ID of the article.

editOnlineArticle(articleId, unpublish)

Creates a draft article from the online version and returns the new draft primary version ID of the article. Also, unpublishes the online article, if *`unpublish`* is set to `true`.

editPublishedTranslation(articleId, language, unpublish)

Creates a draft version of the online translation for a specific language and returns the new draft primary version ID of the article. Also, unpublishes the article, if set to `true`.

publishArticle(articleId, flagAsNew)

Publishes an article. If *`flagAsNew`* is set to `true`, the article is published as a major version.

restoreOldVersion(articleId, versionNumber)

Creates a draft article from an existing online article based on the specified archived version of the article and returns the article version ID.

scheduleForPublication(articleId, scheduledDate)

Schedules the article for publication as a major version. If the specified date is null, the article is published immediately.

setTranslationToIncomplete(articleVersionId)

Sets a draft translation that is ready for publication back to "in progress" status.

submitForTranslation(articleId, language, assigneeId, dueDate)

Submits an article for translation to the specified language. Also assigns the specified user and due date to the submittal and returns new ID of the draft translation.

archiveOnlineArticle(articleId, scheduledDate)

Archives an online version of an article. If the specified scheduledDate is null, the article is archived immediately. Otherwise, it archives the article on the scheduled date.

Signature

```
public static Void archiveOnlineArticle(String articleId, Datetime scheduledDate)
```

Parameters

articleId
Type: String

scheduledDate
Type: Datetime

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
Datetime scheduledDate = Datetime.newInstanceGmt(2012, 12,1,13,30,0);
KbManagement.PublishingService.archiveOnlineArticle(articleId, scheduledDate);
```

assignDraftArticleTask(articleId, assigneeId, instructions, dueDate, sendEmailNotification)

Assigns a review task related to a draft article.

Signature

```
public static Void assignDraftArticleTask(String articleId, String assigneeId, String
instructions, Datetime dueDate, Boolean sendEmailNotification)
```

Parameters

articleId
Type: String

assigneeId
Type: String

instructions
Type: String

dueDate
Type: Datetime

sendEmailNotification
Type: Boolean

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
String assigneeId = '';
String instructions = 'Please review this draft.';
Datetime dueDate = Datetime.newInstanceGmt(2012, 12, 1);
KbManagement.PublishingService.assignDraftArticleTask(articleId, assigneeId, instructions,
 dueDate, true);
```

assignDraftTranslationTask(articleVersionId, assigneeId, instructions, dueDate, sendEmailNotification)

Assigns a review task related to a draft translation.

Signature

```
public static Void assignDraftTranslationTask(String articleVersionId, String assigneeId,
String instructions, Datetime dueDate, Boolean sendEmailNotification)
```

Parameters

articleVersionId
Type: String

assigneeId
Type: String

instructions
Type: String

dueDate
Type: Datetime

sendEmailNotification
Type: Boolean

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
String assigneeId = 'Insert assignee ID';
String instructions = 'Please review this draft.';
Datetime dueDate = Datetime.newInstanceGmt(2012, 12, 1);
KbManagement.PublishingService.assignDraftTranslationTask(articleId, assigneeId,
instructions, dueDate, true);
```

cancelScheduledArchivingOfArticle(articleId)

Cancels the scheduled archiving of an online article.

Signature

```
public static Void cancelScheduledArchivingOfArticle(String articleId)
```

Parameters

articleId
Type: String

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.cancelScheduledArchivingOfArticle (articleId);
```

cancelScheduledPublicationOfArticle(articleId)

Cancels the scheduled publication of a draft article.

Signature

```
public static Void cancelScheduledPublicationOfArticle(String articleId)
```

Parameters

articleId
Type: String

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.cancelScheduledPublicationOfArticle (articleId);
```

completeTranslation(articleVersionId)

Puts a translation in a completed state that is ready to publish.

Signature

```
public static Void completeTranslation(String articleVersionId)
```

Parameters

articleVersionId
Type: String

Return Value

Type: Void

Example

```
String articleVersionId = 'Insert article ID';
KbManagement.PublishingService.completeTranslation(articleVersionId);
```

deleteArchivedArticle(articleId)

Deletes an archived article.

Signature

```
public static Void deleteArchivedArticle(String articleId)
```

Parameters

articleId
Type: String

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.deleteArchivedArticle(articleId);
```

deleteArchivedArticleVersion(articleId, versionNumber)

Deletes a specific archived version of a published article.

Signature

```
public static Void deleteArchivedArticleVersion(String articleId, Integer versionNumber)
```

Parameters

articleId
Type: String

versionNumber
Type: Integer

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
Integer versionNumber = 1;
KbManagement.PublishingService.deleteArchivedArticleVersion(articleId, versionNumber);
```

deleteDraftArticle(articleId)

Deletes a draft article.

Signature

```
public static Void deleteDraftArticle(String articleId)
```

Parameters

articleId
Type: String

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.deleteDraftArticle(articleId);
```

deleteDraftTranslation(articleVersionId)

Deletes a draft translation.

Signature

```
public static Void deleteDraftTranslation(String articleVersionId)
```

Parameters

articleVersionId
Type: String

Return Value

Type: Void

Example

```
String articleVersionId = 'Insert article ID';
KbManagement.PublishingService.deleteDraftTranslation (articleVersionId);
```

editArchivedArticle(articleId)

Creates a draft article from the archived primary version and returns the new draft primary version ID of the article.

Signature

```
public static String editArchivedArticle(String articleId)
```

Parameters

articleId
Type: String

Return Value

Type: String

Example

```
String articleId = 'Insert article ID';
String id = KbManagement.PublishingService.editArchivedArticle(articleId);
```

editOnlineArticle(articleId, unpublish)

Creates a draft article from the online version and returns the new draft primary version ID of the article. Also, unpublishes the online article, if *unpublish* is set to `true`.

Signature

```
public static String editOnlineArticle(String articleId, Boolean unpublish)
```

Parameters

articleId
Type: String

unpublish
Type: Boolean

Return Value

Type: String

Example

```
String articleId = 'Insert article ID';
String id = KbManagement.PublishingService.editOnlineArticle (articleId, true);
```

editPublishedTranslation(articleId, language, unpublish)

Creates a draft version of the online translation for a specific language and returns the new draft primary version ID of the article. Also, unpublishes the article, if set to `true`.

Signature

```
public static String editPublishedTranslation(String articleId, String language, Boolean
unpublish)
```

Parameters

articleId
Type: String

language
Type: String

unpublish
Type: Boolean

Return Value

Type: String

Example

```
String articleId = 'Insert article ID';
String language = 'fr';
String id = KbManagement.PublishingService.editPublishedTranslation(articleId, language,
true);
```

publishArticle(articleId, flagAsNew)

Publishes an article. If *flagAsNew* is set to `true`, the article is published as a major version.

Signature

```
public static Void publishArticle(String articleId, Boolean flagAsNew)
```

Parameters

articleId
Type: String

flagAsNew
Type: Boolean

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.publishArticle(articleId, true);
```

restoreOldVersion(articleId, versionNumber)

Creates a draft article from an existing online article based on the specified archived version of the article and returns the article version ID.

Signature

```
public static String restoreOldVersion(String articleId, Integer versionNumber)
```

Parameters

articleId
Type: String

versionNumber
Type: Integer

Return Value

Type: String

Example

```
String articleId = 'Insert article ID';
String id = KbManagement.PublishingService.restoreOldVersion (articleId, 1);
```

scheduleForPublication(articleId, scheduledDate)

Schedules the article for publication as a major version. If the specified date is null, the article is published immediately.

Signature

```
public static Void scheduleForPublication(String articleId, Datetime scheduledDate)
```

Parameters

articleId
Type: String

scheduledDate
Type: Datetime

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
Datetime scheduledDate = Datetime.newInstanceGmt(2012, 12,1,13,30,0);
KbManagement.PublishingService.scheduleForPublication(articleId, scheduledDate);
```

setTranslationToIncomplete(articleVersionId)

Sets a draft translation that is ready for publication back to “in progress” status.

Signature

```
public static Void setTranslationToIncomplete(String articleVersionId)
```

Parameters

articleVersionId
Type: String

Return Value

Type: Void

Example

```
String articleVersionId = 'Insert article ID';
KbManagement.PublishingService.setTranslationToIncomplete(articleVersionId);
```

submitForTranslation(articleId, language, assigneeId, dueDate)

Submits an article for translation to the specified language. Also assigns the specified user and due date to the submittal and returns new ID of the draft translation.

Signature

```
public static String submitForTranslation(String articleId, String language, String
assigneeId, Datetime dueDate)
```

Parameters

articleId
Type: String

language
Type: String

assigneeId
Type: String

dueDate
Type: Datetime

Return Value

Type: String

Example

```
String articleId = 'Insert article ID';
String language = 'fr';
String assigneeId = 'Insert assignee ID';
Datetime dueDate = Datetime.newInstanceGmt(2012, 12,1);
String id = KbManagement.PublishingService.submitForTranslation(articleId, language,
assigneeId, dueDate);
```

LxScheduler Namespace

The `LxScheduler` namespace provides an interface and classes for integrating Salesforce Scheduler with external calendars.

The following are the classes and the interface in the `LxScheduler` namespace.

IN THIS SECTION:

GetAppointmentCandidatesInput Class
Contains information about the available service resources (appointment candidates) based on work type group and service territories.

GetAppointmentCandidatesInputBuilder Class

Contains methods to build an instance of the `lxscheduler.GetAppointmentCandidatesInput` class.

GetAppointmentSlotsInput Class

Contains information about the available appointment time slots for a resource based on given work type group and territories.

GetAppointmentSlotsInputBuilder Class

Contains methods to build an instance of the `lxscheduler.GetAppointmentSlotsInput` class.

SchedulerResources Class

Contains methods that holds the business logic to get resources availability.

SkillRequirement Class

Contains information about the set of skills that are required to complete a particular task for a work type.

SkillRequirementBuilder Class

Contains methods to build an instance of the `lxscheduler.SkillRequirement` class.

WorkType Class

Contains information about the type of work to be performed.

WorkTypeBuilder Class

Contains methods to build an instance of the `lxscheduler.WorkType` class.

ServiceResourceScheduleHandler Interface

Allows an implementing class to check external calendar events to find already booked time slots for the requested service resources. This interface is part of Salesforce Scheduler.

ServiceAppointmentRequestInfo Class

Represents the list of parameters that are passed to the ServiceResourceScheduleHandler interface. This class is implemented internally by Apex.

ServiceResourceInfo Class

Contains information about a service resource.

ServiceResourceSchedule Class

Use this class to pass results from your implemented Apex class to the ServiceResourceScheduleHandler interface methods.

UnavailableTimeslot Class

Use this class to pass the unavailable time slots to the lxscheduler.ServiceResourceSchedule class.

SEE ALSO:

Apex Interface Implementation Limitations and Error Codes

GetAppointmentCandidatesInput Class

Contains information about the available service resources (appointment candidates) based on work type group and service territories.

Set up Salesforce Scheduler before making requests. This setup includes creating or configuring Service Resources, Service Territory Members, Work Type Groups, Work Types, Work Type Group Members, and Service Territory Work Types. See Set Up Salesforce Scheduler for more information.

The appointment time slots are determined based on multiple factors, such as field values, scheduled appointments, absences, Scheduler Settings, and Scheduling Policies to determine available time slots. See How Salesforce Scheduler Determines Available Time Slots for more information.

The following factors are considered for returning start time and end time of resources.

Resource Availability
Determined using service territory member, service territory, work type, and account operating hours fields.

Resource Unavailability
Determined by resource absences, existing appointments that the resource is assigned to. The resource must be marked as a required resource for the appointment with a status that isn't in closed, canceled, or completed.

Appointment Start Time Interval in the Scheduling Policy
Appointment start time interval field in the Scheduling Policy is used to determine when the appointment can start. This interval can be 5, 10, 15, 20, 30, or 60. By default, it's set to 15.

Work Type Duration
The end time is calculated as start time + duration of the work type.

Note: If asset scheduling is enabled, the response also includes asset-based candidates.

Namespace

LxScheduler

Usage

The constructor for this class can't be called directly. Create an instance of this class using the GetAppointmentCandidatesInputBuilder.build() method.

This example shows how to get a list of available appointment candidates based on `workTypeGroupId`:

```
//Build input for GetAppointmentCandidates API
   lxscheduler.GetAppointmentCandidatesInput input = new
lxscheduler.GetAppointmentCandidatesInputBuilder()
     .setWorkTypeGroupId('0VSRM0000000ABc4AM')
     .setTerritoryIds(new List<String>{'0HhRM0000000FXd0AM'})
     .setStartTime(System.now().format('yyyy-MM-dd\'T\'HH:mm:ssZ','America/New_York'))

.setEndTime(System.now().addDays(5).format('yyyy-MM-dd\'T\'HH:mm:ssZ','America/New_York'))

     .setAccountId('001RM0000053iQgYAI')
     .setSchedulingPolicyId('0VrRM00000000Bx')
     .setApiVersion(Double.valueOf('50.0'))
     .build();

   String response = lxscheduler.SchedulerResources.getAppointmentCandidates(input);
```

This example shows how to get a list of available appointment candidates based on `workType`:

```
//Build WorkType
   lxscheduler.WorkType workType = new lxscheduler.WorkTypeBuilder()
     .setId('08qRM0000000G9RYAU')
     .build();

   lxscheduler.GetAppointmentCandidatesInput input = new
lxscheduler.GetAppointmentCandidatesInputBuilder()
     .setWorkType(workType)
     .setTerritoryIds(new List<String>{'0HhRM0000000FXd0AM'})
     .setStartTime(System.now().format('yyyy-MM-dd\'T\'HH:mm:ssZ','America/New_York'))
```

```
.setEndTime(System.now().addDays(5).format('yyyy-MM-dd\'T\'HH:mm:ssZ','America/New_York'))

     .setAccountId('001RM0000053iQgYAI')
     .setSchedulingPolicyId('0VrRM00000000Bx')
     .setApiVersion(Double.valueOf('50.0'))
     .build();

   String response = lxscheduler.SchedulerResources.getAppointmentCandidates(input);
```

This example shows how to get a list of available candidate appointments based on `durationInMinutes` and without the `workTypeGroupId` or `workType` fields:

```
//Build SkillRequirement
   lxscheduler.SkillRequirement skillReq = new lxscheduler.SkillRequirementBuilder()
     .setSkillId('0C5RM0000004EZS0A2')
     .setSkillLevel(90)
     .build();

//Build WorkType
   lxscheduler.WorkType workType = new lxscheduler.WorkTypeBuilder()
     .setDurationInMinutes(15)
     .setBlockTimeBeforeAppointmentInMinutes(5)
     .setBlockTimeAfterAppointmentInMinutes(5)
     .setTimeFrameStartInMinutes(10080)
     .setTimeFrameEndInMinutes(40320)
     .setOperatingHoursId('0OHRM0000000FmG4AU')
     .setSkillRequirements(new List<lxscheduler.SkillRequirement>{skillReq})
     .build();

   lxscheduler.GetAppointmentCandidatesInput input = new
lxscheduler.GetAppointmentCandidatesInputBuilder()
     .setWorkType(workType)
     .setTerritoryIds(new List<String>{'0HhRM0000000FXd0AM'})
     .setSchedulingPolicyId('0VrRM00000000Bx')
     .setApiVersion(Double.valueOf('50.0'))
     .build();

   String response = lxscheduler.SchedulerResources.getAppointmentCandidates(input);
```

This example shows a sample response of a list of available candidates:

```
[
   {
      "startTime": "2021-02-16T16:15:00.000+0000",
      "endTime": "2021-02-16T16:16:00.000+0000",
      "resources": [
         "0Hnxx0000004C9BCAU"
      ],
      "territoryId": "0Hhxx0000004C92CAE"
   },
   {
      "startTime": "2021-02-16T16:30:00.000+0000",
      "endTime": "2021-02-16T16:31:00.000+0000",
```

```
      "resources": [
        "0Hnxx0000004C9BCAU"
      ],
      "territoryId": "0Hhxx0000004C92CAE"
    },
]
```

GetAppointmentCandidatesInputBuilder Class

Contains methods to build an instance of the `lxscheduler.GetAppointmentCandidatesInput` class.

A Builder object is obtained by invoking one of the `GetAppointmentCandidatesInputBuilder` methods defined by the `GetAppointmentCandidatesInput` class.

Namespace

LxScheduler

IN THIS SECTION:

GetAppointmentCandidatesInputBuilder Methods

GetAppointmentCandidatesInputBuilder Methods

The following are methods for `GetAppointmentCandidatesInputBuilder`.

IN THIS SECTION:

build()
Returns an instance of the `lxscheduler.GetAppointmentCandidatesInput` object.

setAccountId(accountId)
Sets the ID of the associated account for which you want to create the appointments.

setAllowConcurrent(allowConcurrent)
Allows the scheduling of concurrent appointments.

setApiVersion(apiVersion)
Sets the API version of the business logic for the `getAppointmentCandidates` method.

setCorrelationId(correlationId)
Sets the correlation ID.

setEndTime(endTime)
Sets the scheduling end time.

setEngagementChannelTypeIds(engagementChannelTypeIds)
Sets an engagement channel type.

setFilterByResources(filterByResources)
Enables filtering resources using a comma-separated list of service resource IDs.

setResourceLimitApptDistribution(resourceLimitApptDistribution)
Sets the number of service resources to show during appointment scheduling.

setSchedulingPolicyId(schedulingPolicyId)
Sets the ID of the AppointmentSchedulingPolicy object.

setStartTime(startTime)
Sets the scheduling start time to the specified time.

setTerritoryIds(territoryIds)
Sets the service territory IDs.

setWorkType(workType)
Sets the type of work to be performed.

setWorkTypeGroupId(workTypeGroupId)
Sets the ID of the work type group.

`build()`

Returns an instance of the `lxscheduler.GetAppointmentCandidatesInput` object.

Signature

```
public lxscheduler.GetAppointmentCandidatesInput build()
```

Return Value

Type: lxscheduler.GetAppointmentCandidatesInput

`setAccountId(accountId)`

Sets the ID of the associated account for which you want to create the appointments.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setAccountId(String accountId)
```

Parameters

`accountId`
Type: String

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

`setAllowConcurrent(allowConcurrent)`

Allows the scheduling of concurrent appointments.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setAllowConcurrent(Boolean
allowConcurrent)
```

Parameters

allowConcurrent
Type: Boolean

If true, allows scheduling of concurrent appointments in a time slot. The default is false.

Available in API version 47.0 and later.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

setApiVersion(apiVersion)

Sets the API version of the business logic for the `getAppointmentCandidates` method.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setApiVersion(Double apiVersion)
```

Parameters

apiVersion
Type: Double

Usage

The specified parameter must use the correct API version. For example, if API version is set to 45.0 and *filterByResources* is set (which is available in API version 51.0 and later), then this field is ignored. If no API version or incorrect API version is passed in the request body, by default the latest version is used.

Note: The API is available since version 45.0.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

setCorrelationId(correlationId)

Sets the correlation ID.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setCorrelationId(String
correlationId)
```

Parameters

correlationId
Type: String

ID to pass custom information to the `ServiceResourceScheduleHandler` Apex interface. For example, you can use the correlation ID to identify the app, website, or any other external system that calls this Apex interface implementation. If you don't pass a custom value, a randomly generated identifier is passed. Available in API version 53.0 and later.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

`setEndTime(endTime)`

Sets the scheduling end time.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setEndTime(String endTime)
```

Parameters

`endTime`
Type: String

The latest time that a time slot can end (inclusive).

Note: If end time is not specified, it defaults to 31 days.

Usage

The specified string should use the standard date format "['yyyy-MM-dd\'T\'HH:mm:ssZ']" in the local time zone. Defaults to the user's time zone.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

`setEngagementChannelTypeIds(engagementChannelTypeIds)`

Sets an engagement channel type.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder
setEngagementChannelTypeIds(List<String> engagementChannelTypeIds)
```

Parameters

`engagementChannelTypeIds`
Type: List<String>

The ID of the engagement channel type record. The availability of service resources is filtered based on the engagement channel type selected. This field is available in API version 56.0 and later.

Note: This field supports only one engagement channel type ID.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

Usage

You can use engagement channel types only in these cases:

- The **Schedule Appointments Using Engagement Channels** setting is enabled in Salesforce Scheduler Settings in your Salesforce org.
- Shifts are defined in the scheduling policy. For more information on setting up shifts in scheduling policy, see Define Shift Rules in Scheduling Policy.

  Note: Engagement channel types are not supported with operating-hours rules in the scheduling policy.

`setFilterByResources(filterByResources)`

Enables filtering resources using a comma-separated list of service resource IDs.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setFilterByResources(List<String>
filterByResources)
```

Parameters

`filterByResources`
Type: List<String>

Gets only eligible resources that are both in the list and in the selected service territory sorted by the order in which the resource IDs are passed. This field is available in API version 51.0 and later.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

`setResourceLimitApptDistribution(resourceLimitApptDistribution)`

Sets the number of service resources to show during appointment scheduling.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder
setResourceLimitApptDistribution(Integer resourceLimitApptDistribution)
```

Parameters

`resourceLimitApptDistribution`
Type: Integer

Specify the maximum number of service resources that you want to show during appointment scheduling when appointment distribution is enabled. Available in API version 53.0 and later.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

`setSchedulingPolicyId(schedulingPolicyId)`

Sets the ID of the AppointmentSchedulingPolicy object.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setSchedulingPolicyId(String schedulingPolicyId)
```

Parameters

`schedulingPolicyId`
Type: String

The ID of the `AppointmentSchedulingPolicy` object. If no scheduling policy is passed in the request body, the default configurations are used.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

`setStartTime(startTime)`

Sets the scheduling start time to the specified time.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setStartTime(String startTime)
```

Parameters

`startTime`
Type: String

The earliest time that a time slot can begin (inclusive). You can also use a time from the past.

Usage

The specified string should use the standard date format "['yyyy-MM-dd\'T\'HH:mm:ssZ']" in the local time zone. Defaults to the user's time zone.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

`setTerritoryIds(territoryIds)`

Sets the service territory IDs.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setTerritoryIds(List<String>
territoryIds)
```

Parameters

territoryIds
Type: List<String>

List of service territory IDs, where the work that is being requested is performed. This is a required field.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

setWorkType(workType)

Sets the type of work to be performed.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setWorkType(lxscheduler.WorkType
workType)
```

Parameters

workType
Type: lxscheduler.WorkType

This method takes input as an instance of the `lxscheduler.WorkType` class. Build the instance of the input class using the `lxscheduler.WorkTypeBuilder` class.

Required if *`workTypeGroupId`* is not given. If id of the *`workType`* is given, the rest of *`workType`* fields are optional.

Usage

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

setWorkTypeGroupId(workTypeGroupId)

Sets the ID of the work type group.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setWorkTypeGroupId(String
workTypeGroupId)
```

Parameters

workTypeGroupId
Type: String

The ID of the work type group containing the work types that are being performed. Required if *workType* is not given. If *workType* is given, then you must provide either *id* or *durationInMinutes*, but not both.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

GetAppointmentSlotsInput Class

Contains information about the available appointment time slots for a resource based on given work type group and territories.

The appointment time slots are determined based on your Salesforce Scheduler data model configurations. Here are some prerequisites that you can consider while setting up data.

- Set up Salesforce Scheduler before making your requests. The setup includes creating or configuring Service Resources, Service Territory Members, Work Type Groups, Work Types, Work Type Group Members, and Service Territory Work Types. See Manage Business Information in Salesforce Scheduler for more information.
- Configure a work type mapped for each territory in the request body via Service Territory Work Type. Map the same work type to the work type group, via work type group member.

The following factors affect how time slots are calculated and returned.

- Timezones that differ across operating hours are handled and results are always returned in UTC.
- The resource must be marked as a required resource on the assigned resource object.
- The resource is considered unavailable If the status categories of the resource assigned to service appointments are other than `Canceled`, `Cannot Complete`, and `Completed`.
- Resource Absences of all types are considered unavailable from start to end.
- The following fields of Work Type records, if configured, are used to fine-tune time slot requirements. For more information, see Create Work Types in Salesforce Scheduler.

Parameter	Description
`Timeframe Start`	Time slots sooner than `current time +` ***`Timeframe Start`*** aren't returned.
`Timeframe End`	Time slots later than `current time +` ***`Timeframe End`*** aren't returned.
`Block Time Before Appointment`	The time period before the appointment is considered as unavailable.
`Block Time After Appointment`	The time period after the appointment is considered as unavailable.
`Operating Hours`	The overlap of all operating hours from the account, work type, service territory, and service territory member are considered while determining time slots. For more information, see Set Up Operating Hours in Salesforce Scheduler.

- Only the time slots within the period of 31 days from the start date are returned.

- Salesforce Scheduler uses multiple factors, such as field values, scheduled appointments, absences, Scheduler Settings, and Scheduling Policies to determine available time slots, including the earliest and latest appointment slots. See How Does Salesforce Scheduler Determine Available Time Slots.

  Note: If asset scheduling is enabled, you can provide an asset-based service resource in `requiredResourceIds` to retrieve available timeslots for the asset resource.

Namespace

LxScheduler

Usage

The constructor for this class can't be called directly. Create an instance of this class using the GetAppointmentSlotsInputBuilder.build() method.

This example shows how to get a list of available time slots based on `workTypeGroupId`:

```
//Build input for GetAppointmentSlots API
   lxscheduler.GetAppointmentSlotsInput input = new
lxscheduler.GetAppointmentSlotsInputBuilder()
      .setWorkTypeGroupId('0VSxx0000004C92GAE')
      .setTerritoryIds(new List<String>{'0Hhxx0000004C92CAE'})
      .setStartTime(System.now().format('yyyy-MM-dd\'T\'HH:mm:ssZ'))
      .setEndTime(System.now().addDays(1).format('yyyy-MM-dd\'T\'HH:mm:ssZ'))
      .setAccountId('001xx000003GYK0AAO')
      .setRequiredResourceIds(new List<String>{'0Hnxx0000004C92CAE'})
      .setSchedulingPolicyId('0Vrxx0000004CAe')
      .setApiVersion(Double.valueOf('48.0'))
      .build();

String response = lxscheduler.SchedulerResources.getAppointmentSlots(input);
```

This example shows how to get a list of available time slots based on `workType`:

```
//Build WorkType
   lxscheduler.WorkType workType = new lxscheduler.WorkTypeBuilder()
      .setId('08qxx0000004C92AAE')
      .build();

   lxscheduler.GetAppointmentSlotsInput input = new
lxscheduler.GetAppointmentSlotsInputBuilder()
      .setWorkType(workType)
      .setTerritoryIds(new List<String>{'0Hhxx0000004C92CAE'})
      .setStartTime(System.now().format('yyyy-MM-dd\'T\'HH:mm:ssZ'))
      .setEndTime(System.now().addDays(1).format('yyyy-MM-dd\'T\'HH:mm:ssZ'))
      .setAccountId('001xx000003GYK0AAO')
      .setRequiredResourceIds(new List<String>{'0Hnxx0000004C92CAE'})
      .setSchedulingPolicyId('0Vrxx0000004CAe')
      .setApiVersion(Double.valueOf('48.0'))
      .build();

String response = lxscheduler.SchedulerResources.getAppointmentSlots(input);
```

This example shows how to get a list of available time slots based on `durationInMinutes` and without `workTypeGroupId` or `workType` fields:

```
//Build WorkType
   lxscheduler.WorkType workType = new lxscheduler.WorkTypeBuilder()
      .setDurationInMinutes(60)
      .build();

   lxscheduler.GetAppointmentSlotsInput input = new
lxscheduler.GetAppointmentSlotsInputBuilder()
      .setWorkType(workType)
      .setTerritoryIds(new List<String>{'0Hhxx0000004C92CAE'})
      .setRequiredResourceIds(new List<String>{'0Hnxx0000004C92CAE'})
      .setApiVersion(Double.valueOf('48.0'))
      .build();

   String response = lxscheduler.SchedulerResources.getAppointmentSlots(input);
```

This example shows a sample response of a list of available time slots:

```
[
   {
     "territoryId": "0Hhxx0000004C92CAE",
     "startTime": "2021-02-10T16:00:00.000+0000",
     "endTime": "2021-02-10T16:15:00.000+0000",
     "remainingAppointments": 1
   },
   {
     "territoryId": "0Hhxx0000004C92CAE",
     "startTime": "2021-02-10T16:15:00.000+0000",
     "endTime": "2021-02-10T16:30:00.000+0000",
     "remainingAppointments": 1
   },
]
```

GetAppointmentSlotsInputBuilder Class

Contains methods to build an instance of the `lxscheduler.GetAppointmentSlotsInput` class.

A Builder object is obtained by invoking one of the `GetAppointmentSlotsInputBuilder` methods defined by the `GetAppointmentSlotsInput` class.

Namespace

LxScheduler

IN THIS SECTION:

GetAppointmentSlotsInputBuilder Methods

GetAppointmentSlotsInputBuilder Methods

The following are methods for `GetAppointmentSlotsInputBuilder`.

IN THIS SECTION:

build()
Returns an instance of the `lxscheduler.GetAppointmentSlotsInput` object.

setAccountId(accountId)
Sets the ID of the associated account for which you want to create appointments.

setAllowConcurrentScheduling(allowConcurrentScheduling)
Allows the scheduling of concurrent appointments.

setApiVersion(apiVersion)
Sets the API version of the business logic for the `getAppointmentSlots` method.

setCorrelationId(correlationId)
Sets the correlation ID.

setEndTime(endTime)
Sets the scheduling end time.

setEngagementChannelTypeIds(engagementChannelTypeIds)
Sets an engagement channel type.

setPrimaryResourceId(primaryResourceId)
Sets the ID of the primary resource.

setRequiredResourceIds(requiredResourceIds)
Sets the resource IDs.

setSchedulingPolicyId(schedulingPolicyId)
Sets the ID of the `AppointmentSchedulingPolicy` object.

setStartTime(startTime)
Sets the scheduling start time.

setTerritoryIds(territoryIds)
Sets the IDs of service territories.

setWorkType(workType)
Sets the type of work to be performed.

setWorkTypeGroupId(workTypeGroupId)
Sets the ID of the work type group.

build()

Returns an instance of the `lxscheduler.GetAppointmentSlotsInput` object.

Signature

```
public lxscheduler.GetAppointmentSlotsInput build()
```

Return Value

Type: lxscheduler.GetAppointmentSlotsInput

`setAccountId(accountId)`

Sets the ID of the associated account for which you want to create appointments.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setAccountId(String accountId)
```

Parameters

`accountId`
Type: String

The ID of the associated account.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

`setAllowConcurrentScheduling(allowConcurrentScheduling)`

Allows the scheduling of concurrent appointments.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setAllowConcurrentScheduling(Boolean
allowConcurrentScheduling)
```

Parameters

`allowConcurrentScheduling`
Type: Boolean

If true, allows scheduling of concurrent appointments in a time slot. If false, concurrent appointments are not allowed. The default is false. Available in API version 47.0 and later.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

`setApiVersion(apiVersion)`

Sets the API version of the business logic for the `getAppointmentSlots` method.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setApiVersion(Double apiVersion)
```

Parameters

`apiVersion`
Type: Double

Usage

The specified parameter must use the correct API version. For example, if API version is set to 45.0 and *primaryResourceId* is set (which is available in API version 48.0 and later), then this field is ignored. If no API version or incorrect API version is passed in the request body, by default the latest version is used.

Note: The API is available since version 45.0.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

setCorrelationId(correlationId)

Sets the correlation ID.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setCorrelationId(String correlationId)
```

Parameters

correlationId
Type: String

ID to pass custom information to the `ServiceResourceScheduleHandler` Apex interface. For example, you can use the correlation ID to identify the app, website, or any other external system that calls this Apex interface implementation. If you don't pass a custom value, a randomly generated identifier is passed. Available in API version 53.0 and later.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

setEndTime(endTime)

Sets the scheduling end time.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setEndTime(String endTime)
```

Parameters

endTime
Type: String

The latest time that a time slot can end (inclusive). If end time is not specified, it defaults to 31 days.

Usage

The specified string should use the standard date format "['yyyy-MM-dd\'T\'HH:mm:ssZ']" in the local time zone. Defaults to the user's time zone.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

setEngagementChannelTypeIds(engagementChannelTypeIds)

Sets an engagement channel type.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder
setEngagementChannelTypeIds(List<String> engagementChannelTypeIds)
```

Parameters

engagementChannelTypeIds
Type: List<String>

The ID of the engagement channel type record. The availability of time slots is filtered based on the engagement channel type selected. This field is available in API version 56.0 and later.

Note: This field supports only one engagement channel type ID.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

Usage

You can use engagement channel types only in these cases:

- The **Schedule Appointments Using Engagement Channels** setting is enabled in Salesforce Scheduler Settings in your Salesforce org.
- Shifts are defined in the scheduling policy. For more information on setting up shifts in scheduling policy, see Define Shift Rules in Scheduling Policy.

Note: Engagement channel types are not supported with operating-hours rules in the scheduling policy.

setPrimaryResourceId(primaryResourceId)

Sets the ID of the primary resource.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setPrimaryResourceId(String
primaryResourceId)
```

Parameters

primaryResourceId
Type: String

The ID of the primary resource in multi-resource scheduling. Required only when multi-resource scheduling is enabled. Available in API version 48.0 and later.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

setRequiredResourceIds(requiredResourceIds)

Sets the resource IDs.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setRequiredResourceIds(List<String>
requiredResourceIds)
```

Parameters

requiredResourceIds
Type: List<String>

List of resource IDs that must be available during the time slot. This is a required field.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

setSchedulingPolicyId(schedulingPolicyId)

Sets the ID of the `AppointmentSchedulingPolicy` object.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setSchedulingPolicyId(String
schedulingPolicyId)
```

Parameters

schedulingPolicyId
Type: String

If no scheduling policy is passed in the request body, the default configurations are used.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

setStartTime(startTime)

Sets the scheduling start time.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setStartTime(String startTime)
```

Parameters

startTime
Type: String

The earliest time that a time slot can begin (inclusive). Defaults to the current time of the request, if empty.

Usage

The specified string should use the standard date format "['yyyy-MM-dd\'T\'HH:mm:ssZ']" in the local time zone. Defaults to the user's time zone.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

setTerritoryIds(territoryIds)

Sets the IDs of service territories.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setTerritoryIds(List<String>
territoryIds)
```

Parameters

territoryIds
Type: List<String>

List of IDs of service territories, where the work that is being requested is performed. This is a required field.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

setWorkType(workType)

Sets the type of work to be performed.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setWorkType(lxscheduler.WorkType
workType)
```

Parameters

workType
Type: lxscheduler.WorkType

This method takes input as an instance of the `lxscheduler.WorkType` class. Build the instance of the input class using the `lxscheduler.WorkTypeBuilder` class.

Required if *`workTypeGroupId`* is not given.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

`setWorkTypeGroupId(workTypeGroupId)`

Sets the ID of the work type group.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setWorkTypeGroupId(String
workTypeGroupId)
```

Parameters

`workTypeGroupId`
Type: String

The ID of the work type group containing the work types that are being performed.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

SchedulerResources Class

Contains methods that holds the business logic to get resources availability.

Namespace

LxScheduler

Implementation Considerations

Apex implementation of the methods in the `SchedulerResources` class should adhere to Apex Governor Limits. It includes synchronous heap size limit, synchronous CPU time limit, and synchronous concurrent transactions for long running transactions. To avoid governor limits, you must tune the input by reducing the time frame, limiting number of service resources, or limiting number or territories at a time. This will reduce the overall transaction time and response size of the implementation. For more information on standard Apex Governer Limits, see Salesforce Developer Limits and Allocations Quick Reference.

Example

To get list of available service resources (appointment candidates):

```
String response = lxscheduler.SchedulerResources.getAppointmentCandidates(input);
```

To get a list of available appointment time slots for a resource:

```
String response = lxscheduler.SchedulerResources.getAppointmentSlots(input);
```

IN THIS SECTION:

SchedulerResources Methods

SchedulerResources Methods

The following are methods for `SchedulerResources`.

IN THIS SECTION:

getAppointmentCandidates(getAppointmentCandidatesInput)
Returns a list of service resources based on work type group or work type and service territories.

getAppointmentSlots(getAppointmentSlotsInput)
Returns a list of available appointment time slots for a resource based on given work type group or work type and service territories.

setAppointmentCandidatesMock(expectedResponse)
Sets a mock object when running tests for the `getAppointmentCandidates` method.

setAppointmentSlotsMock(expectedResponse)
Sets a mock object when running tests for the `getAppointmentSlots` method.

`getAppointmentCandidates(getAppointmentCandidatesInput)`

Returns a list of service resources based on work type group or work type and service territories.

Set up Salesforce Scheduler before making requests. This setup includes creating or configuring Service Resources, Service Territory Members, Work Type Groups, Work Types, Work Type Group Members, and Service Territory Work Types. See Set Up Salesforce Scheduler for more information.

The appointment time slots are determined based on multiple factors, such as field values, scheduled appointments, absences, Scheduler Settings, and Scheduling Policies to determine available time slots. See How Salesforce Scheduler Determines Available Time Slots for more information.

The following factors are considered for returning start time and end time of resources.

Resource Availability
Determined using service territory member, service territory, work type, and account operating hours fields.

Resource Unavailability
Determined by resource absences, existing appointments that the resource is assigned to. The resource must be marked as a required resource for the appointment with a status that isn't in closed, canceled, or completed.

Appointment Start Time Interval in the Scheduling Policy
Appointment start time interval field in the Scheduling Policy is used to determine when the appointment can start. This interval can be 5, 10, 15, 20, 30, or 60. By default, it's set to 15.

Work Type Duration
The end time is calculated as start time + duration of the work type.

Note: If asset scheduling is enabled, the response also includes asset-based candidates.

Signature

```
public static String getAppointmentCandidates(lxscheduler.GetAppointmentCandidatesInput
getAppointmentCandidatesInput)
```

Parameters

getAppointmentCandidatesInput
Type: lxscheduler.GetAppointmentCandidatesInput

This method takes input as an instance of the `lxscheduler.GetAppointmentCandidatesInput` class. Build the instance of the input class using the `lxscheduler.GetAppointmentCandidatesInputBuilder` class.

Return Value

Type: String

`getAppointmentSlots(getAppointmentSlotsInput)`

Returns a list of available appointment time slots for a resource based on given work type group or work type and service territories.

The appointment time slots are determined based on your Salesforce Scheduler data model configurations. Here are some prerequisites that you can consider while setting up data.

- Set up Salesforce Scheduler before making your requests. The setup includes creating or configuring Service Resources, Service Territory Members, Work Type Groups, Work Types, Work Type Group Members, and Service Territory Work Types. See Manage Business Information in Salesforce Scheduler for more information.
- Configure a work type mapped for each territory in the request body via Service Territory Work Type. Map the same work type to the work type group, via work type group member.

The following factors affect how time slots are calculated and returned.

- Timezones that differ across operating hours are handled and results are always returned in UTC.
- The resource must be marked as a required resource on the assigned resource object.
- The resource is considered unavailable If the status categories of the resource assigned to service appointments are other than `Canceled`, `Cannot Complete`, and `Completed`.
- Resource Absences of all types are considered unavailable from start to end.
- The following fields of Work Type records, if configured, are used to fine-tune time slot requirements. For more information, see Create Work Types in Salesforce Scheduler.

Parameter	Description
`Timeframe Start`	Time slots sooner than `current time + Timeframe Start` aren't returned.
`Timeframe End`	Time slots later than `current time + Timeframe End` aren't returned.
`Block Time Before Appointment`	The time period before the appointment is considered as unavailable.
`Block Time After Appointment`	The time period after the appointment is considered as unavailable.
`Operating Hours`	The overlap of all operating hours from the account, work type, service territory, and service territory member are considered while determining time slots. For more information, see Set Up Operating Hours in Salesforce Scheduler.

- Only the time slots within the period of 31 days from the start date are returned.
- Salesforce Scheduler uses multiple factors, such as field values, scheduled appointments, absences, Scheduler Settings, and Scheduling Policies to determine available time slots, including the earliest and latest appointment slots. See How Does Salesforce Scheduler Determine Available Time Slots.

  Note: If asset scheduling is enabled, you can provide an asset-based service resource in `requiredResourceIds` to retrieve available timeslots for the asset resource.

Signature

```
public static String getAppointmentSlots(lxscheduler.GetAppointmentSlotsInput
getAppointmentSlotsInput)
```

Parameters

`getAppointmentSlotsInput`
Type: lxscheduler.GetAppointmentSlotsInput

This method takes input as an instance of the `lxscheduler.GetAppointmentSlotsInput` class. Build the instance of the input class using the `lxscheduler.GetAppointmentSlotsInputBuilder` class.

Return Value

Type: String

`setAppointmentCandidatesMock(expectedResponse)`

Sets a mock object when running tests for the `getAppointmentCandidates` method.

This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
public static void setAppointmentCandidatesMock(String expectedResponse)
```

Parameters

`expectedResponse`
Type: String

Return Value

Type: void

This example shows a sample implementation of the `GetAppointmentCandidates` class:

```
public class AppointmentCandidateService {
   //Instance members for parsing
   public String startTime;
   public String endTime;
   public List<String> resources;
   public String territoryId;
```

```
   public static List<AppointmentCandidateService> getAppointmentCandidates(){
      //Build input for GetAppointmentCandidates API
      lxscheduler.GetAppointmentCandidatesInput input = new
lxscheduler.GetAppointmentCandidatesInputBuilder()
         .setWorkTypeGroupId('0VSRM0000000AGT4A2')
         .setTerritoryIds(new List<String>{'0HhRM0000000G8W0AU'})
        .setStartTime(System.now().format('yyyy-MM-dd\'T\'HH:mm:ssZ','America/Los_Angeles'))

.setEndTime(System.now().addDays(2).format('yyyy-MM-dd\'T\'HH:mm:ssZ','America/Los_Angeles'))

         .setSchedulingPolicyId('0VrRM00000000D0')
         .setApiVersion(Double.valueOf('50.0'))
         .build();
      List<AppointmentCandidateService> vList =
parse(lxscheduler.SchedulerResources.getAppointmentCandidates(input));
      return vList;
   }
   private static List<AppointmentCandidateService> parse(String json) {
      return (List<AppointmentCandidateService>) System.JSON.deserialize(json,
List<AppointmentCandidateService>.class);
   }
}
```

This example shows how to set a sample mock using the `setAppointmentCandidatesMock` method:

```
@isTest
private class GetAppointmentCandidatesTest {
   static testMethod void getAppCandidatesTest() {
      String expectedResponse = '[' +
                                      '  {' +
                                     '    \"startTime\": \"2021-03-18T16:00:00.000+0000\",'
 +
                                      '    \"endTime\": \"2021-03-18T17:00:00.000+0000\",'
+
                                      '    \"resources\": [' +
                                      '      \"0HnRM0000000Fxv0AE\"' +
                                      '    ],' +
                                      '    \"territoryId\": \"0HhRM0000000G8W0AU\"' +
                                      '  },' +
                                      '  {' +
                                     '    \"startTime\": \"2021-03-18T19:00:00.000+0000\",'
 +
                                      '    \"endTime\": \"2021-03-18T20:00:00.000+0000\",'
+
                                      '    \"resources\": [' +
                                      '      \"0HnRM0000000Fxv0AE\"' +
                                      '    ],' +
                                      '    \"territoryId\": \"0HhRM0000000G8W0AU\"' +
                                      '  }' +
                                     ']';
      lxscheduler.SchedulerResources.setAppointmentCandidatesMock(expectedResponse);

      Test.startTest();
```

```
        List<AppointmentCandidateService> candidateList =
AppointmentCandidateService.getAppointmentCandidates();
        System.assertEquals(2, candidateList.size(), 'Should return only 2 records!');
      Test.stopTest();
   }
}
```

`setAppointmentSlotsMock(expectedResponse)`

Sets a mock object when running tests for the `getAppointmentSlots` method.

This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
public static void setAppointmentSlotsMock(String expectedResponse)
```

Parameters

`expectedResponse`
Type: String

Return Value

Type: void

SkillRequirement Class

Contains information about the set of skills that are required to complete a particular task for a work type.

Namespace

LxScheduler

Usage

The constructor for this class can't be called directly. Create an instance of this class using the SkillRequirementBuilder.build() method.

SkillRequirementBuilder Class

Contains methods to build an instance of the `lxscheduler.SkillRequirement` class.

A Builder object is obtained by invoking one of the `SkillRequirementBuilder` methods defined by the `SkillRequirement` class.

Namespace

LxScheduler

IN THIS SECTION:

SkillRequirementBuilder Methods

SkillRequirementBuilder Methods

The following are methods for `SkillRequirementBuilder`.

IN THIS SECTION:

build()
Returns an instance of the `lxscheduler.SkillRequirement` object.

setSkillId(skillId)
Sets the skill that is required to complete a particular task for a work type. This is a required field.

setSkillLevel(skillLevel)
Sets the level of the skill that is required to complete a particular task for a work type

`build()`

Returns an instance of the `lxscheduler.SkillRequirement` object.

Signature

```
public lxscheduler.SkillRequirement build()
```

Return Value

Type: lxscheduler.SkillRequirement

`setSkillId(skillId)`

Sets the skill that is required to complete a particular task for a work type. This is a required field.

Signature

```
public lxscheduler.SkillRequirementBuilder setSkillId(String skillId)
```

Parameters

`skillId`
Type: String

Return Value

Type: lxscheduler.SkillRequirementBuilder

`setSkillLevel(skillLevel)`

Sets the level of the skill that is required to complete a particular task for a work type

Signature

```
public lxscheduler.SkillRequirementBuilder setSkillLevel(Double skillLevel)
```

Parameters

skillLevel
Type: Double

The skill levels can range from zero to 99.99. Depending on your business needs, you might want the skill level to reflect years of experience, certification levels, or license classes.

Return Value

Type: lxscheduler.SkillRequirementBuilder

WorkType Class

Contains information about the type of work to be performed.

Namespace

LxScheduler

Usage

The constructor for this class can't be called directly. Create an instance of this class using the WorkTypeBuilder.build() method.

WorkTypeBuilder Class

Contains methods to build an instance of the `lxscheduler.WorkType` class.

A Builder object is obtained by invoking one of the `WorkTypeBuilder` methods defined by the `WorkType` class.

Namespace

LxScheduler

IN THIS SECTION:

WorkTypeBuilder Methods

WorkTypeBuilder Methods

The following are methods for `WorkTypeBuilder`.

IN THIS SECTION:

build()
Returns an instance of the `lxscheduler.WorkType` object.

setBlockTimeAfterAppointmentInMinutes(blockTimeAfterAppointmentInMinutes)
Sets the time period, in minutes.

setBlockTimeBeforeAppointmentInMinutes(blockTimeBeforeAppointmentInMinutes)
Sets the time period, in minutes.

setDurationInMinutes(durationInMinutes)
Sets the event length.

setId(id)
Sets the ID of the work type to the specified ID.

setOperatingHoursId(operatingHoursId)
Sets the overlap of operating hours.

setSkillRequirements(skillRequirements)
Sets the skills that are required to complete a particular task for a work type.

setTimeFrameEndInMinutes(timeFrameEndInMinutes)
Sets the end of the timeframe.

setTimeFrameStartInMinutes(timeFrameStartInMinutes)
Sets the beginning of the timeframe.

`build()`

Returns an instance of the `lxscheduler.WorkType` object.

Signature

```
public lxscheduler.WorkType build()
```

Return Value

Type: lxscheduler.WorkType

`setBlockTimeAfterAppointmentInMinutes(blockTimeAfterAppointmentInMinutes)`

Sets the time period, in minutes.

Signature

```
public lxscheduler.WorkTypeBuilder setBlockTimeAfterAppointmentInMinutes(Integer
blockTimeAfterAppointmentInMinutes)
```

Parameters

`blockTimeAfterAppointmentInMinutes`
Type: Integer

The time period after the appointment is considered unavailable.

Return Value

Type: lxscheduler.WorkTypeBuilder

`setBlockTimeBeforeAppointmentInMinutes(blockTimeBeforeAppointmentInMinutes)`

Sets the time period, in minutes.

Signature

```
public lxscheduler.WorkTypeBuilder setBlockTimeBeforeAppointmentInMinutes(Integer
blockTimeBeforeAppointmentInMinutes)
```

Parameters

`blockTimeBeforeAppointmentInMinutes`
Type: Integer

The time period before the appointment is considered as unavailable.

Return Value

Type: lxscheduler.WorkTypeBuilder

`setDurationInMinutes(durationInMinutes)`

Sets the event length.

Signature

```
public lxscheduler.WorkTypeBuilder setDurationInMinutes(Integer durationInMinutes)
```

Parameters

`durationInMinutes`
Type: Integer

Contains the event length, in minutes. Required if *`id`* is not given.

Return Value

Type: lxscheduler.WorkTypeBuilder

`setId(id)`

Sets the ID of the work type to the specified ID.

Signature

```
public lxscheduler.WorkTypeBuilder setId(String id)
```

Parameters

id
Type: String

The ID of the work type. Required if *durationInMinutes* is not given.

Return Value

Type: lxscheduler.WorkTypeBuilder

setOperatingHoursId(operatingHoursId)

Sets the overlap of operating hours.

Signature

```
public lxscheduler.WorkTypeBuilder setOperatingHoursId(String operatingHoursId)
```

Parameters

operatingHoursId
Type: String

The overlap of all operating hours from the account, work type, service territory, and service territory member are considered while determining time slots.

Return Value

Type: lxscheduler.WorkTypeBuilder

setSkillRequirements(skillRequirements)

Sets the skills that are required to complete a particular task for a work type.

Signature

```
public lxscheduler.WorkTypeBuilder
setSkillRequirements(List<lxscheduler.SkillRequirement> skillRequirements)
```

Parameters

skillRequirements
Type: List<lxscheduler.SkillRequirement>

This method takes input as an instance of the `lxscheduler.SkillRequirement` class. Build the instance of the input class using the `lxscheduler.SkillRequirementBuilder` class.

Return Value

Type: lxscheduler.WorkTypeBuilder

`setTimeFrameEndInMinutes(timeFrameEndInMinutes)`

Sets the end of the timeframe.

Signature

```
public lxscheduler.WorkTypeBuilder setTimeFrameEndInMinutes(Integer
timeFrameEndInMinutes)
```

Parameters

`timeFrameEndInMinutes`
Type: Integer

Return Value

Type: lxscheduler.WorkTypeBuilder

`setTimeFrameStartInMinutes(timeFrameStartInMinutes)`

Sets the beginning of the timeframe.

Signature

```
public lxscheduler.WorkTypeBuilder setTimeFrameStartInMinutes(Integer
timeFrameStartInMinutes)
```

Parameters

`timeFrameStartInMinutes`
Type: Integer

Return Value

Type: lxscheduler.WorkTypeBuilder

ServiceResourceScheduleHandler Interface

Allows an implementing class to check external calendar events to find already booked time slots for the requested service resources. This interface is part of Salesforce Scheduler.

Namespace

LxScheduler

Usage

The `lxscheduler.ServiceResourceScheduleHandler` interface is called by Salesforce Scheduler APIs.

To implement this interface, you must first declare a class with the `implements` keyword as follows:

```
public class ServiceResourceScheduleHandlerImpl implements
LxScheduler.ServiceResourceScheduleHandler{}
```

Next, your class must provide an implementation for the following method:

```
public static List<LxScheduler.ServiceResourceSchedule>
getUnavailableTimeslots(LxScheduler.ServiceAppointmentRequestInfo requestInfo){
      //Your code here
}
```

The implemented method must be declared as `global` or `public`.

IN THIS SECTION:

ServiceResourceScheduleHandler Methods

ServiceResourceScheduleHandler Example Implementation

ServiceResourceScheduleHandler Methods

The following are methods for `ServiceResourceScheduleHandler`.

IN THIS SECTION:

getUnavailableTimeslots(var1)

Passes the required information to get unavailable time slots from an external system. The implementation of this method returns the `lxscheduler.ServiceResourceSchedule` class.

`getUnavailableTimeslots(var1)`

Passes the required information to get unavailable time slots from an external system. The implementation of this method returns the `lxscheduler.ServiceResourceSchedule` class.

Signature

```
public List<lxscheduler.ServiceResourceSchedule>
getUnavailableTimeslots(lxscheduler.ServiceAppointmentRequestInfo var1)
```

Parameters

var1

Type: lxscheduler.ServiceAppointmentRequestInfo

Represents the list of parameters that are passed to the ServiceResourceScheduleHandler interface.

Return Value

Type: List<lxscheduler.ServiceResourceSchedule>

ServiceResourceScheduleHandler Example Implementation

This is an example implementation of the `lxscheduler.ServiceResourceScheduleHandler` interface.

```
/**
 * Implement interface lxscheduler.ServiceResourceScheduleHandler
 * This class is called when fetching service resources and time slots through Salesforce
 Scheduler API.*/
   Public class ServiceResourceScheduleHandlerImpl implements
lxscheduler.ServiceResourceScheduleHandler{

    // The main interface method.
    public static List<lxscheduler.ServiceResourceSchedule>
getUnavailableTimeslots(lxscheduler.ServiceAppointmentRequestInfo requestInfo){
        //Request info values.
        List<lxscheduler.ServiceResourceInfo>
serviceResources=requestInfo.getServiceResources();
        DateTime startDate=requestInfo.getStartDate();
        DateTime endDate=requestInfo.getEndDate();

        List<lxscheduler.ServiceResourceSchedule> resourceUnavailability = new
List<lxscheduler.ServiceResourceSchedule>();
        Set<lxscheduler.UnavailableTimeslot> unavailabilityIntervals = new
Set<lxscheduler.UnavailableTimeslot>();

        //This is a dummy response. Implement your own business logic to connect to your
internal or external systems.
        for (Integer i = 0; i < 5; i++) {
             //Set the unavailability intervals of a service resource.
            unavailabilityIntervals.add(new
lxscheduler.UnavailableTimeslot(startDate.addMinutes(15*i),startDate.addMinutes(15*(i+1))));

        }

       for (lxscheduler.ServiceResourceInfo ServiceResource:serviceResources) {
            //Set the unavailability of Service resource.
        resourceUnavailability.add(new
lxscheduler.ServiceResourceSchedule(serviceResource.getServiceResourceId(),unavailabilityIntervals));

       }

        return resourceUnavailability;
    }
}
```

This example shows how to set a sample test mock using the `lxscheduler.ServiceResourceScheduleHandler` interface.

```
@isTest
private class ServiceResourceScheduleHandlerImplTest {
   static testMethod void getUnavailableTimeslotsTest() {

      //Initializing the test execution with mock values. Change it according to the
```

```
implementation.
      //In case of non-test execution, the lxscheduler.ServiceAppointmentRequestInfo
instance will automatically initialize.

      //Mock values for lxscheduler.ServiceResourceInfo
      String userId = '005D2000000I1N6IAK';
      String userName = 'someuser@example.com';
      String email = 'someuser@example.com';
      String serviceResourceId = '0HnD20000004C9bKAE';
      List<String> territoryIds = new List<String>();
      String resourceType = 'T';
      lxscheduler.ServiceResourceInfo serviceResInfo = new
lxscheduler.ServiceResourceInfo(userId, userName, email,
                                                      serviceResourceId, territoryIds,
resourceType);

      //Mock values for lxscheduler.ServiceAppointmentRequestInfo
      DateTime startDate = System.now();
      DateTime endDate = System.now();
      List<lxscheduler.ServiceResourceInfo> serviceResources = new
List<lxscheduler.ServiceResourceInfo>();
      serviceResources.add(serviceResInfo);
      String schedulingPolicyId = '0VrD20000004C9S';
      String workTypeGroupId = '0VSD20000004C93OAE';
      String accountId = '001D2000002pkXwIAI';
      String primaryResourceId = '0HnD20000004C9bKAE';
      String workTypeId = '08qD20000004C9XIAU';
      String correlationId = 'SOME_ID';

      lxscheduler.ServiceAppointmentRequestInfo mockRequestInfo = new
lxscheduler.ServiceAppointmentRequestInfo(startDate, endDate, serviceResources,
                                                                  schedulingPolicyId,
workTypeGroupId, accountId,
                                                                  primaryResourceId,
workTypeId, correlationId);

      ServiceResourceScheduleHandlerImpl.getUnavailableTimeslots(mockRequestInfo);
   }
}
```

ServiceAppointmentRequestInfo Class

Represents the list of parameters that are passed to the ServiceResourceScheduleHandler interface. This class is implemented internally by Apex.

Namespace

LxScheduler

IN THIS SECTION:

- ServiceAppointmentRequestInfo Constructors

ServiceAppointmentRequestInfo Methods

ServiceAppointmentRequestInfo Constructors

The following are constructors for `ServiceAppointmentRequestInfo`.

IN THIS SECTION:

ServiceAppointmentRequestInfo(startDate, endDate, ServiceResources, SchedulingPolicyId, workTypeGroupId, accountId, primaryResourceId, workTypeId, correlationId)

Creates a new instance of the `lxscheduler.ServiceAppointmentRequestInfo` class using the specified start date, end date, service resources, scheduling policy, work type group, accound ID, primary resource, work type, and correlation.

`ServiceAppointmentRequestInfo(startDate, endDate, ServiceResources, SchedulingPolicyId, workTypeGroupId, accountId, primaryResourceId, workTypeId, correlationId)`

Creates a new instance of the `lxscheduler.ServiceAppointmentRequestInfo` class using the specified start date, end date, service resources, scheduling policy, work type group, accound ID, primary resource, work type, and correlation.

Signature

```
public ServiceAppointmentRequestInfo(Datetime startDate, Datetime endDate,
List<lxscheduler.ServiceResourceInfo> ServiceResources, String SchedulingPolicyId,
String workTypeGroupId, String accountId, String primaryResourceId, String workTypeId,
String correlationId)
```

Parameters

`startDate`
Type: Datetime

The start date and time for which unavailable time slots are requested.

`endDate`
Type: Datetime

The end date and time for which unavailable time slots are requested.

`ServiceResources`
Type: List<lxscheduler.ServiceResourceInfo>

The list of requested service resources for the unavailable time slots.

`SchedulingPolicyId`
Type: String

The ID of the scheduling policy .

`workTypeGroupId`
Type: String

The work type group ID.

`accountId`
Type: String

The account ID of an existing user.

primaryResourceId
Type: String

The ID of the primary service resource.

workTypeId
Type: String

The work type ID.

correlationId
Type: String

A unique identifier for a service appointment request.

ServiceAppointmentRequestInfo Methods

The following are methods for `ServiceAppointmentRequestInfo`.

IN THIS SECTION:

getAccountId()
Returns the account ID of the customer if the API request contains one.

getCorrelationId()
Returns a unique identifier for a request.

getEndDate()
Returns the end date and time for which unavailable time slots are requested.

getPrimaryResourceId()
Returns the ID of the primary service resource.

getSchedulingPolicyId()
Returns the ID of the scheduling policy that the API request contains.

getServiceResources()
Returns the list of requested service resources for the unavailable time slots.

getStartDate()
Returns the start date and time for which unavailable time slots are requested.

getWorkTypeGroupId()
Returns the work type group ID if the API request contains one.

getWorkTypeId()
Returns the work type ID if the API request contains one.

`getAccountId()`

Returns the account ID of the customer if the API request contains one.

Signature

```
public String getAccountId()
```

Return Value

Type: String

getCorrelationId()

Returns a unique identifier for a request.

Signature

```
public String getCorrelationId()
```

Return Value

Type: String

getEndDate()

Returns the end date and time for which unavailable time slots are requested.

Signature

```
public Datetime getEndDate()
```

Return Value

Type: Datetime

getPrimaryResourceId()

Returns the ID of the primary service resource.

Signature

```
public String getPrimaryResourceId()
```

Return Value

Type: String

getSchedulingPolicyId()

Returns the ID of the scheduling policy that the API request contains.

Signature

```
public String getSchedulingPolicyId()
```

Return Value

Type: String

getServiceResources()

Returns the list of requested service resources for the unavailable time slots.

Signature

```
public List<lxscheduler.ServiceResourceInfo> getServiceResources()
```

Return Value

Type: List<lxscheduler.ServiceResourceInfo>

getStartDate()

Returns the start date and time for which unavailable time slots are requested.

Signature

```
public Datetime getStartDate()
```

Return Value

Type: Datetime

getWorkTypeGroupId()

Returns the work type group ID if the API request contains one.

Signature

```
public String getWorkTypeGroupId()
```

Return Value

Type: String

getWorkTypeId()

Returns the work type ID if the API request contains one.

Signature

```
public String getWorkTypeId()
```

Return Value

Type: String

ServiceResourceInfo Class

Contains information about a service resource.

Namespace

LxScheduler

IN THIS SECTION:

ServiceResourceInfo Constructors

ServiceResourceInfo Methods

ServiceResourceInfo Constructors

The following are constructors for `ServiceResourceInfo`.

IN THIS SECTION:

ServiceResourceInfo(userId, userName, email, serviceResourceId, territoryIds, resourceType)
Creates a new instance of the `lxscheduler.ServiceResourceInfo` class using the specified service resource details.

`ServiceResourceInfo(userId, userName, email, serviceResourceId, territoryIds, resourceType)`

Creates a new instance of the `lxscheduler.ServiceResourceInfo` class using the specified service resource details.

Signature

```
public ServiceResourceInfo(String userId, String userName, String email, String
serviceResourceId, List<String> territoryIds, String resourceType)
```

Parameters

`userId`
Type: String

The user ID of the service resource.

`userName`
Type: String

The user name of the service resource.

`email`
Type: String

The email ID of the service resource.

`serviceResourceId`
Type: String

The ID of the service resource.

`territoryIds`
Type: List<String>

A list of requested service territories for the service resource.

resourceType
Type: String

The type of the service resource such as Technician or Asset.

ServiceResourceInfo Methods

The following are methods for `ServiceResourceInfo`.

IN THIS SECTION:

getEmail()
Returns the email ID of the service resource.

getResourceType()
Returns the type of the service resource such as Technician or Asset.

getServiceResourceId()
Returns the ID of the service resource.

getTerritoryIds()
Returns a list of requested service territories for the service resource.

getUserId()
Returns the user ID of the service resource.

getUserName()
Returns the user name of the service resource.

`getEmail()`

Returns the email ID of the service resource.

Signature

```
public String getEmail()
```

Return Value

Type: String

`getResourceType()`

Returns the type of the service resource such as Technician or Asset.

Signature

```
public String getResourceType()
```

Return Value

Type: String

`getServiceResourceId()`

Returns the ID of the service resource.

Signature

```
public String getServiceResourceId()
```

Return Value

Type: String

`getTerritoryIds()`

Returns a list of requested service territories for the service resource.

Signature

```
public List<String> getTerritoryIds()
```

Return Value

Type: List<String>

`getUserId()`

Returns the user ID of the service resource.

Signature

```
public String getUserId()
```

Return Value

Type: String

`getUserName()`

Returns the user name of the service resource.

Signature

```
public String getUserName()
```

Return Value

Type: String

ServiceResourceSchedule Class

Use this class to pass results from your implemented Apex class to the ServiceResourceScheduleHandler interface methods.

Namespace

LxScheduler

IN THIS SECTION:

ServiceResourceSchedule Constructors

ServiceResourceSchedule Properties

ServiceResourceSchedule Constructors

The following are constructors for `ServiceResourceSchedule`.

IN THIS SECTION:

ServiceResourceSchedule(serviceResourceId, unavailableTimeslots)
Creates a new instance of lxscheduler.ServiceResourceSchedule class.

`ServiceResourceSchedule(serviceResourceId, unavailableTimeslots)`

Creates a new instance of lxscheduler.ServiceResourceSchedule class.

Signature

```
public ServiceResourceSchedule(String serviceResourceId,
Set<lxscheduler.UnavailableTimeslot> unavailableTimeslots)
```

Parameters

`serviceResourceId`
Type: String

Record ID of the service resource.

`unavailableTimeslots`
Type: Set<lxscheduler.UnavailableTimeslot>

An instance of lxscheduler.UnavailableTimeslot class.

ServiceResourceSchedule Properties

The following are properties for `ServiceResourceSchedule`.

IN THIS SECTION:

serviceResourceId
Record ID of the service resource.

unavailableTimeslots
An instance of lxscheduler.UnavailableTimeslot class.

serviceResourceId

Record ID of the service resource.

Signature

```
public String serviceResourceId {get; set;}
```

Property Value

Type: String

unavailableTimeslots

An instance of lxscheduler.UnavailableTimeslot class.

Signature

```
public Set<lxscheduler.UnavailableTimeslot> unavailableTimeslots {get; set;}
```

Property Value

Type: Set<lxscheduler.UnavailableTimeslot>

UnavailableTimeslot Class

Use this class to pass the unavailable time slots to the lxscheduler.ServiceResourceSchedule class.

Namespace

LxScheduler

IN THIS SECTION:

UnavailableTimeslot Constructors

UnavailableTimeslot Properties

UnavailableTimeslot Constructors

The following are constructors for `UnavailableTimeslot`.

IN THIS SECTION:

UnavailableTimeslot(timeMin, timeMax)

Creates an instance of lxscheduler.UnavailableTimeslot class.

UnavailableTimeslot(timeMin, timeMax)

Creates an instance of lxscheduler.UnavailableTimeslot class.

Signature

```
public UnavailableTimeslot(Datetime timeMin, Datetime timeMax)
```

Parameters

timeMin
Type: Datetime

Start time of an unavailable time slot.

timeMax
Type: Datetime

End time of an unavailable time slot.

UnavailableTimeslot Properties

The following are properties for `UnavailableTimeslot`.

IN THIS SECTION:

timeMax
End time of an unavailable time slot.

timeMin
Start time of an unavailable time slot.

`timeMax`

End time of an unavailable time slot.

Signature

```
public Datetime timeMax {get; set;}
```

Property Value

Type: Datetime

`timeMin`

Start time of an unavailable time slot.

Signature

```
public Datetime timeMin {get; set;}
```

Property Value

Type: Datetime

Messaging Namespace

The `Messaging` namespace provides classes and methods for Salesforce outbound and inbound email functionality.

The following are the classes in the `Messaging` namespace.

IN THIS SECTION:

AttachmentRetrievalOption Enum

Provides options for including attachment metadata only, attachment metadata and content, or excluding attachments.

Email Class (Base Email Methods)

Contains base email methods common to both single and mass email.

EmailFileAttachment Class

EmailFileAttachment is used in SingleEmailMessage to specify attachments passed in as part of the request, as opposed to existing documents in Salesforce.

InboundEmail Class

Represents an inbound email object.

InboundEmail.AuthenticationResult Class

Contains the authentication type and response for inbound emails.

InboundEmail.AuthenticationResultField Class

Contains field data from the authentication result response for inbound emails.

InboundEmail.BinaryAttachment Class

An InboundEmail object stores binary attachments in an InboundEmail.BinaryAttachment object.

InboundEmail.TextAttachment Class

An InboundEmail object stores text attachments in an InboundEmail.TextAttachment object.

InboundEmailResult Class

The InboundEmailResult object is used to return the result of the email service. If this object is null, the result is assumed to be successful.

InboundEnvelope Class

The InboundEnvelope object stores the envelope information associated with the inbound email, and has the following fields.

MassEmailMessage Class

Contains methods for sending mass email.

InboundEmail.Header Class

An InboundEmail object stores RFC 2822 email header information in an InboundEmail.Header object with the following properties.

PushNotification Class

`PushNotification` is used to configure push notifications and send them from an Apex trigger.

PushNotificationPayload Class

Contains methods to create the notification message payload for an Apple device.

CustomNotification Class

`CustomNotification` is used to create, configure, and send custom notifications from Apex code.

RenderEmailTemplateBodyResult Class

Contains the results for rendering email templates.

RenderEmailTemplateError Class
Represents an error that the `RenderEmailTemplateBodyResult` object can contain.

SendEmailError Class
Represents an error that the SendEmailResult object may contain.

SendEmailResult Class
Contains the result of sending an email message.

SingleEmailMessage Methods
Contains methods for sending single email messages.

AttachmentRetrievalOption Enum

Provides options for including attachment metadata only, attachment metadata and content, or excluding attachments.

Namespace

Messaging

Usage

Use these enum values with the renderStoredEmailTemplate(templateId, whoId, whatId, attachmentRetrievalOption) method.

Enum Values

The following are the values of the `Messaging.AttachmentRetrievalOption` enum.

Value	Description
`METADATA_ONLY`	Includes only the file name, content type, and the object ID in the `fileAttachments` property of `Messaging.SingleEmailMessage`. **Note:** When the template is rendered from a Visualforce template (and not from a static file attached to the template), the object ID is not available.
`METADATA_WITH_BODY`	Includes the attachment content, in addition to the file name, content type, and the object ID in the `fileAttachments` property of `Messaging.SingleEmailMessage`.
`NONE`	Doesn't include any attachments in `Messaging.SingleEmailMessage`.

Email Class (Base Email Methods)

Contains base email methods common to both single and mass email.

Namespace

Messaging

Usage

Note: If templates are not being used, all email content must be in plain text, HTML, or both.Visualforce email templates cannot be used for mass email.

Email Methods

The following are methods for `Email`. All are instance methods.

IN THIS SECTION:

setBccSender(bcc)
Indicates whether the email sender receives a copy of the email that is sent. For a mass mail, the sender is only copied on the first email sent.

setReplyTo(replyAddress)
Optional. The email address that receives the message when a recipient replies.

setTemplateID(templateId)
The ID of the template to be merged to create this email. Specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

setSaveAsActivity(saveAsActivity)
Optional. The default value is `true`, meaning the email is saved as an activity. This argument only applies if the recipient list is based on `targetObjectId` or `targetObjectIds`. If HTML email tracking is enabled for the organization, you will be able to track open rates.

setSenderDisplayName(displayName)
Optional. The name that appears on the From line of the email. This cannot be set if the object associated with a `setOrgWideEmailAddressId` for a SingleEmailMessage has defined its `DisplayName` field.

setUseSignature(useSignature)
Indicates whether the email includes an email signature if the user has one configured. The default is `true`, meaning if the user has a signature it is included in the email unless you specify `false`.

`setBccSender(bcc)`

Indicates whether the email sender receives a copy of the email that is sent. For a mass mail, the sender is only copied on the first email sent.

Signature

```
public Void setBccSender(Boolean bcc)
```

Parameters

bcc
Type: Boolean

Return Value

Type: Void

Usage

Note: If the BCC compliance option is set at the organization level, the user cannot add BCC addresses on standard messages. The following error code is returned: `BCC_NOT_ALLOWED_IF_BCC_ COMPLIANCE_ENABLED`. Contact your Salesforce representative for information on BCC compliance.

`setReplyTo(replyAddress)`

Optional. The email address that receives the message when a recipient replies.

Signature

```
public Void setReplyTo(String replyAddress)
```

Parameters

`replyAddress`
Type: String

Return Value

Type: Void

`setTemplateID(templateId)`

The ID of the template to be merged to create this email. Specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

Signature

```
public Void setTemplateID(ID templateId)
```

Parameters

`templateId`
Type: ID

Return Value

Type: Void

Usage

Note: `setHtmlBody` and `setPlainTextBody` apply only to single email methods, not to mass email methods.

`setSaveAsActivity(saveAsActivity)`

Optional. The default value is `true`, meaning the email is saved as an activity. This argument only applies if the recipient list is based on `targetObjectId` or `targetObjectIds`. If HTML email tracking is enabled for the organization, you will be able to track open rates.

Signature

```
public Void setSaveAsActivity(Boolean saveAsActivity)
```

Parameters

saveAsActivity
Type: Boolean

Return Value

Type: Void

setSenderDisplayName(displayName)

Optional. The name that appears on the From line of the email. This cannot be set if the object associated with a `setOrgWideEmailAddressId` for a SingleEmailMessage has defined its `DisplayName` field.

Signature

```
public Void setSenderDisplayName(String displayName)
```

Parameters

displayName
Type: String

Return Value

Type: Void

setUseSignature(useSignature)

Indicates whether the email includes an email signature if the user has one configured. The default is `true`, meaning if the user has a signature it is included in the email unless you specify `false`.

Signature

```
public Void setUseSignature(Boolean useSignature)
```

Parameters

useSignature
Type: Boolean

Return Value

Type: Void

EmailFileAttachment Class

EmailFileAttachment is used in SingleEmailMessage to specify attachments passed in as part of the request, as opposed to existing documents in Salesforce.

Namespace

Messaging

IN THIS SECTION:

EmailFileAttachment Constructors

EmailFileAttachment Properties

EmailFileAttachment Constructors

The following are constructors for `EmailFileAttachment`.

IN THIS SECTION:

EmailFileAttachment()
Creates a new instance of the `Messaging.EmailFileAttachment` class.

`EmailFileAttachment()`

Creates a new instance of the `Messaging.EmailFileAttachment` class.

Signature

```
public EmailFileAttachment()
```

EmailFileAttachment Properties

The following are properties for `EmailFileAttachment`.

IN THIS SECTION:

body
Gets or sets the attachment itself.

contenttype
Gets or sets the attachment's Content-Type.

filename
Gets or sets the name of the file to attach.

id
Read-Only. Gets the attachment ID.

inline
Specifies a Content-Disposition of inline (`true`) or attachment (`false`).

body

Gets or sets the attachment itself.

Signature

```
public Blob body {get; set;}
```

Property Value

Type: Blob

contenttype

Gets or sets the attachment's Content-Type.

Signature

```
public String contenttype {get; set;}
```

Property Value

Type: String

filename

Gets or sets the name of the file to attach.

Signature

```
public String filename {get; set;}
```

Property Value

Type: String

id

Read-Only. Gets the attachment ID.

Signature

```
public Id id {get;}
```

Property Value

Type: Id

inline

Specifies a Content-Disposition of inline (`true`) or attachment (`false`).

Signature

```
public Boolean inline {get; set;}
```

Property Value

Type: Boolean

InboundEmail Class

Represents an inbound email object.

Namespace

Messaging

IN THIS SECTION:

InboundEmail Constructors

InboundEmail Properties

InboundEmail Constructors

The following are constructors for `InboundEmail`.

IN THIS SECTION:

InboundEmail()
Creates a new instance of the `Messaging.InboundEmail` class.

`InboundEmail()`

Creates a new instance of the `Messaging.InboundEmail` class.

Signature

```
public InboundEmail()
```

InboundEmail Properties

The following are properties for `InboundEmail`.

IN THIS SECTION:

authenticationResults
A list of authentication results received with the email, if any.

binaryAttachments
A list of binary attachments received with the email, if any.

ccAddresses

A list of carbon copy (CC) addresses, if any.

fromAddress

The email address that appears in the From field.

fromName

The name that appears in the From field, if any.

headers

A list of the RFC 2822 headers in the email.

htmlBody

The HTML version of the email, if specified by the sender.

htmlBodyIsTruncated

Indicates whether the HTML body text is truncated (`true`) or not (`false`.)

inReplyTo

The In-Reply-To field of the incoming email. Identifies the email or emails to which this one is a reply (parent emails). Contains the parent email or emails' message-IDs.

messageId

The Message-ID—the incoming email's unique identifier.

plainTextBody

The plain text version of the email, if specified by the sender.

plainTextBodyIsTruncated

Indicates whether the plain body text is truncated (`true`) or not (`false`.)

references

The References field of the incoming email. Identifies an email thread. Contains a list of the parent emails' References and message IDs, and possibly the In-Reply-To fields.

replyTo

The email address that appears in the reply-to header.

subject

The subject line of the email, if any.

textAttachments

A list of text attachments received with the email, if any.

toAddresses

The email address that appears in the `To` field.

`authenticationResults`

A list of authentication results received with the email, if any.

Signature

```
public InboundEmail.AuthenticationResult[] authenticationResults {get; set;}
```

Property Value

Type: InboundEmail.AuthenticationResult[]

Usage

Examples of authentication results include `dkim`, `dmarc`, and `spf`.

binaryAttachments

A list of binary attachments received with the email, if any.

Signature

```
public InboundEmail.BinaryAttachment[] binaryAttachments {get; set;}
```

Property Value

Type: InboundEmail.BinaryAttachment[]

Usage

Examples of binary attachments include image, audio, application, and video files.

ccAddresses

A list of carbon copy (CC) addresses, if any.

Signature

```
public String[] ccAddresses {get; set;}
```

Property Value

Type: String[]

fromAddress

The email address that appears in the From field.

Signature

```
public String fromAddress {get; set;}
```

Property Value

Type: String

fromName

The name that appears in the From field, if any.

Signature

```
public String fromName {get; set;}
```

Property Value

Type: String

headers

A list of the RFC 2822 headers in the email.

Signature

```
public InboundEmail.Header[] headers {get; set;}
```

Property Value

Type: InboundEmail.Header[]

Usage

The list of the RFC 2822 headers includes:

- Recieved from
- Custom headers
- Message-ID
- Date

htmlBody

The HTML version of the email, if specified by the sender.

Signature

```
public String htmlBody {get; set;}
```

Property Value

Type: String

htmlBodyIsTruncated

Indicates whether the HTML body text is truncated (`true`) or not (`false`.)

Signature

```
public Boolean htmlBodyIsTruncated {get; set;}
```

Property Value

Type: Boolean

inReplyTo

The In-Reply-To field of the incoming email. Identifies the email or emails to which this one is a reply (parent emails). Contains the parent email or emails' message-IDs.

Signature

```
public String inReplyTo {get; set;}
```

Property Value

Type: String

messageId

The Message-ID—the incoming email's unique identifier.

Signature

```
public String messageId {get; set;}
```

Property Value

Type: String

plainTextBody

The plain text version of the email, if specified by the sender.

Signature

```
public String plainTextBody {get; set;}
```

Property Value

Type: String

plainTextBodyIsTruncated

Indicates whether the plain body text is truncated (`true`) or not (`false`.)

Signature

```
public Boolean plainTextBodyIsTruncated {get; set;}
```

Property Value

Type: Boolean

`references`

The References field of the incoming email. Identifies an email thread. Contains a list of the parent emails' References and message IDs, and possibly the In-Reply-To fields.

Signature

```
public String[] references {get; set;}
```

Property Value

Type: String[]

`replyTo`

The email address that appears in the reply-to header.

Signature

```
public String replyTo {get; set;}
```

Property Value

Type: String

Usage

If there is no reply-to header, this field is identical to the `fromAddress` field.

`subject`

The subject line of the email, if any.

Signature

```
public String subject {get; set;}
```

Property Value

Type: String

`textAttachments`

A list of text attachments received with the email, if any.

Signature

```
public InboundEmail.TextAttachment[] textAttachments {get; set;}
```

Property Value

Type: InboundEmail.TextAttachment[]

Usage

The text attachments can be any of the following:

- Attachments with a Multipurpose Internet Mail Extension (MIME) type of `text`
- Attachments with a MIME type of `application/octet-stream` and a file name that ends with either a `.vcf` or `.vcs` extension. These are saved as `text/x-vcard` and `text/calendar` MIME types, respectively.

`toAddresses`

The email address that appears in the `To` field.

Signature

```
public String[] toAddresses {get; set;}
```

Property Value

Type: String[]

InboundEmail.AuthenticationResult Class

Contains the authentication type and response for inbound emails.

Namespace

Messaging

IN THIS SECTION:

InboundEmail.AuthenticationResult Constructors

InboundEmail.AuthenticationResult Properties

InboundEmail.AuthenticationResult Constructors

The following are constructors for `InboundEmail.AuthenticationResult`.

IN THIS SECTION:

InboundEmail.AuthenticationResult()

Creates a new instance of the `Messaging.InboundEmail.AuthenticationResult` class.

`InboundEmail.AuthenticationResult()`

Creates a new instance of the `Messaging.InboundEmail.AuthenticationResult` class.

Signature

```
public InboundEmail.AuthenticationResult()
```

InboundEmail.AuthenticationResult Properties

The following are properties for `InboundEmail.AuthenticationResult`.

IN THIS SECTION:

authenticationResultFields
Additional information in authentication result headers. Examples include: `name: smtp.mailfrom` and `value: example.com`.

method
The authentication method used for the security check. Possible values include `dkim`, `dmarc`, or `spf`.

result
The result of the authentication check. When the email service is configured to verify the legitimacy of the sending server before processing a message, possible values include `pass` or `fail`. Otherwise, the value returned is `none`.

`authenticationResultFields`

Additional information in authentication result headers. Examples include: `name: smtp.mailfrom` and `value: example.com`.

Signature

```
public InboundEmail.AuthenticationResultField[] authenticationResultFields {get; set;}
```

Property Value

Type: InboundEmail.AuthenticationResultField[]

`method`

The authentication method used for the security check. Possible values include `dkim`, `dmarc`, or `spf`.

Signature

```
public String method {get; set;}
```

Property Value

Type: String

result

The result of the authentication check. When the email service is configured to verify the legitimacy of the sending server before processing a message, possible values include `pass` or `fail`. Otherwise, the value returned is `none`.

Signature

```
public String result {get; set;}
```

Property Value

Type: String

InboundEmail.AuthenticationResultField Class

Contains field data from the authentication result response for inbound emails.

Namespace

Messaging

IN THIS SECTION:

- InboundEmail.AuthenticationResultField Constructors
- InboundEmail.AuthenticationResultField Properties

InboundEmail.AuthenticationResultField Constructors

The following are constructors for `InboundEmail.AuthenticationResultField`.

IN THIS SECTION:

- InboundEmail.AuthenticationResultField()
  Creates a new instance of the `Messaging.InboundEmail.AuthenticationResultField` class.

InboundEmail.AuthenticationResultField()

Creates a new instance of the `Messaging.InboundEmail.AuthenticationResultField` class.

Signature

```
public InboundEmail.AuthenticationResultField()
```

InboundEmail.AuthenticationResultField Properties

The following are properties for `InboundEmail.AuthenticationResultField`.

IN THIS SECTION:

name
The authentication result field name. For example: `smtp.mailfrom`.

value
The authentication result field value. For example: `example.com`.

name

The authentication result field name. For example: `smtp.mailfrom`.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

value

The authentication result field value. For example: `example.com`.

Signature

```
public String value {get; set;}
```

Property Value

Type: String

InboundEmail.BinaryAttachment Class

An InboundEmail object stores binary attachments in an InboundEmail.BinaryAttachment object.

Namespace

Messaging

Usage

Examples of binary attachments include image, audio, application, and video files.

IN THIS SECTION:

InboundEmail.BinaryAttachment Constructors

InboundEmail.BinaryAttachment Properties

InboundEmail.BinaryAttachment Constructors

The following are constructors for `InboundEmail.BinaryAttachment`.

IN THIS SECTION:

InboundEmail.BinaryAttachment()
Creates a new instance of the `Messaging.InboundEmail.BinaryAttachment` class.

`InboundEmail.BinaryAttachment()`

Creates a new instance of the `Messaging.InboundEmail.BinaryAttachment` class.

Signature

```
public InboundEmail.BinaryAttachment()
```

InboundEmail.BinaryAttachment Properties

The following are properties for `InboundEmail.BinaryAttachment`.

IN THIS SECTION:

body
The body of the attachment.

fileName
The name of the attached file.

headers
Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

mimeTypeSubType
The primary and sub MIME-type.

`body`

The body of the attachment.

Signature

```
public Blob body {get; set;}
```

Property Value

Type: Blob

`fileName`

The name of the attached file.

Signature

```
public String fileName {get; set;}
```

Property Value

Type: String

`headers`

Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

Signature

```
public List<Messaging.InboundEmail.Header> headers {get; set;}
```

Property Value

Type: List<Messaging.InboundEmail.Header>

`mimeTypeSubType`

The primary and sub MIME-type.

Signature

```
public String mimeTypeSubType {get; set;}
```

Property Value

Type: String

InboundEmail.TextAttachment Class

An InboundEmail object stores text attachments in an InboundEmail.TextAttachment object.

Namespace

Messaging

Usage

The text attachments can be any of the following:

- Attachments with a Multipurpose Internet Mail Extension (MIME) type of `text`
- Attachments with a MIME type of `application/octet-stream` and a file name that ends with either a `.vcf` or `.vcs` extension. These are saved as `text/x-vcard` and `text/calendar` MIME types, respectively.

IN THIS SECTION:

InboundEmail.TextAttachment Constructors

InboundEmail.TextAttachment Properties

InboundEmail.TextAttachment Constructors

The following are constructors for `InboundEmail.TextAttachment`.

IN THIS SECTION:

InboundEmail.TextAttachment()
Creates a new instance of the `Messaging.InboundEmail.TextAttachment` class.

`InboundEmail.TextAttachment()`

Creates a new instance of the `Messaging.InboundEmail.TextAttachment` class.

Signature

```
public InboundEmail.TextAttachment()
```

InboundEmail.TextAttachment Properties

The following are properties for `InboundEmail.TextAttachment`.

IN THIS SECTION:

body
The body of the attachment.

bodyIsTruncated
Indicates whether the attachment body text is truncated (`true`) or not (`false`.)

charset
The original character set of the body field. The body is re-encoded as UTF-8 as input to the Apex method.

fileName
The name of the attached file.

headers
Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

mimeTypeSubType
The primary and sub MIME-type.

`body`

The body of the attachment.

Signature

```
public String body {get; set;}
```

Property Value

Type: String

bodyIsTruncated

Indicates whether the attachment body text is truncated (`true`) or not (`false`.)

Signature

```
public Boolean bodyIsTruncated {get; set;}
```

Property Value

Type: Boolean

charset

The original character set of the body field. The body is re-encoded as UTF-8 as input to the Apex method.

Signature

```
public String charset {get; set;}
```

Property Value

Type: String

fileName

The name of the attached file.

Signature

```
public String fileName {get; set;}
```

Property Value

Type: String

headers

Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

Signature

```
public List<Messaging.InboundEmail.Header> headers {get; set;}
```

Property Value

Type: List<Messaging.InboundEmail.Header>

`mimeTypeSubType`

The primary and sub MIME-type.

Signature

```
public String mimeTypeSubType {get; set;}
```

Property Value

Type: String

InboundEmailResult Class

The InboundEmailResult object is used to return the result of the email service. If this object is null, the result is assumed to be successful.

Namespace

Messaging

InboundEmailResult Properties

The following are properties for `InboundEmailResult`.

IN THIS SECTION:

message
A message that Salesforce returns in the body of a reply email. This field can be populated with text irrespective of the value returned by the `Success` field.

success
A value that indicates whether the email was successfully processed.

`message`

A message that Salesforce returns in the body of a reply email. This field can be populated with text irrespective of the value returned by the `Success` field.

Signature

```
public String message {get; set;}
```

Property Value

Type: String

success

A value that indicates whether the email was successfully processed.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

Usage

If `false`, Salesforce rejects the inbound email and sends a reply email to the original sender containing the message specified in the `Message` field.

InboundEnvelope Class

The InboundEnvelope object stores the envelope information associated with the inbound email, and has the following fields.

Namespace

Messaging

InboundEnvelope Properties

The following are properties for `InboundEnvelope`.

IN THIS SECTION:

fromAddress
The name that appears in the `From` field of the envelope, if any.

toAddress
The name that appears in the `To` field of the envelope, if any.

fromAddress

The name that appears in the `From` field of the envelope, if any.

Signature

```
public String fromAddress {get; set;}
```

Property Value

Type: String

`toAddress`

The name that appears in the `To` field of the envelope, if any.

Signature

```
public String toAddress {get; set;}
```

Property Value

Type: String

MassEmailMessage Class

Contains methods for sending mass email.

Namespace

Messaging

Usage

MassEmailMessage extends Email and inherits all of its methods. All base email (`Email` class) methods are also available to the `MassEmailMessage` objects.

IN THIS SECTION:

MassEmailMessage Constructors

MassEmailMessage Methods

SEE ALSO:

Email Class (Base Email Methods)

MassEmailMessage Constructors

The following are constructors for `MassEmailMessage`.

IN THIS SECTION:

MassEmailMessage()
Creates a new instance of the `Messaging.MassEmailMessage` class.

`MassEmailMessage()`

Creates a new instance of the `Messaging.MassEmailMessage` class.

Signature

```
public MassEmailMessage()
```

MassEmailMessage Methods

The following are methods for `MassEmailMessage`. All are instance methods. All base email (`Email` class) methods are also available to the `MassEmailMessage` objects. These methods are described in Email Class (Base Email Methods).

IN THIS SECTION:

setDescription(description)
The description of the email.

setTargetObjectIds(targetObjectIds)
A list of IDs of the contacts, leads, or users to which the email will be sent. The IDs you specify set the context and ensure that merge fields in the template contain the correct data. The objects must be of the same type (all contacts, all leads, or all users).

setWhatIds(whatIds)
Optional. If you specify a list of contacts for the `targetObjectIds` field, you can specify a list of `whatIds` as well. This helps to further ensure that merge fields in the template contain the correct data.

`setDescription(description)`

The description of the email.

Signature

```
public Void setDescription(String description)
```

Parameters

`description`
Type: String

Return Value

Type: Void

`setTargetObjectIds(targetObjectIds)`

A list of IDs of the contacts, leads, or users to which the email will be sent. The IDs you specify set the context and ensure that merge fields in the template contain the correct data. The objects must be of the same type (all contacts, all leads, or all users).

Signature

```
public Void setTargetObjectIds(ID[] targetObjectIds)
```

Parameters

`targetObjectIds`
Type: ID[]

Return Value

Type: Void

Usage

You can list multiple IDs per email. If you specify a value for the `targetObjectIds` field, optionally specify a `whatId` as well to set the email context to a user, contact, or lead. This ensures that merge fields in the template contain the correct data. Each ID counts against the sending organization's daily mass email limit.

Do not specify the IDs of records that have the `Email Opt Out` option selected.

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

`setWhatIds(whatIds)`

Optional. If you specify a list of contacts for the `targetObjectIds` field, you can specify a list of `whatIds` as well. This helps to further ensure that merge fields in the template contain the correct data.

Signature

```
public Void setWhatIds(ID[] whatIds)
```

Parameters

`whatIds`
Type: ID[]

Return Value

Type: Void

Usage

The values must be one of the following types:

- Contract
- Case
- Opportunity
- Product

Note: If you specify `whatIds`, specify one for each `targetObjectId`; otherwise, you will receive an `INVALID_ID_FIELD` error.

InboundEmail.Header Class

An InboundEmail object stores RFC 2822 email header information in an InboundEmail.Header object with the following properties.

Namespace

Messaging

InboundEmail.Header Properties

The following are properties for `InboundEmail.Header`.

IN THIS SECTION:

name
The name of the header parameter, such as `Date` or `Message-ID`.

value
The value of the header.

name

The name of the header parameter, such as `Date` or `Message-ID`.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

value

The value of the header.

Signature

```
public String value {get; set;}
```

Property Value

Type: String

PushNotification Class

`PushNotification` is used to configure push notifications and send them from an Apex trigger.

Namespace

Messaging

Example

This sample Apex trigger sends push notifications to the connected app named *Test_App*, which corresponds to a mobile app on iOS mobile clients. The trigger fires after cases have been updated and sends the push notification to two users: the case owner and the user who last modified the case.

```
trigger caseAlert on Case (after update) {

    for(Case cs : Trigger.New)
    {
        // Instantiating a notification
        Messaging.PushNotification msg =
            new Messaging.PushNotification();

        // Assembling the necessary payload parameters for Apple.
        // Apple params are:
        // (<alert text>,<alert sound>,<badge count>,
        // <free-form data>)
        // This example doesn't use badge count or free-form data.
        // The number of notifications that haven't been acted
        // upon by the intended recipient is best calculated
        // at the time of the push. This timing helps
        // ensure accuracy across multiple target devices.
        Map<String, Object> payload =
            Messaging.PushNotificationPayload.apple(
                'Case ' + cs.CaseNumber + ' status changed to: '
                + cs.Status, '', null, null);

        // Adding the assembled payload to the notification
        msg.setPayload(payload);

        // Getting recipient users
        String userId1 = cs.OwnerId;
        String userId2 = cs.LastModifiedById;

        // Adding recipient users to list
        Set<String> users = new Set<String>();
        users.add(userId1);
        users.add(userId2);

        // Sending the notification to the specified app and users.
        // Here we specify the API name of the connected app.
        msg.send('Test_App', users);
    }
}
```

IN THIS SECTION:

PushNotification Constructors

PushNotification Methods

PushNotification Constructors

The following are the constructors for `PushNotification`.

IN THIS SECTION:

PushNotification()
Creates a new instance of the `Messaging.PushNotification` class.

PushNotification(payload)
Creates a new instance of the `Messaging.PushNotification` class using the specified payload parameters as key-value pairs. When you use this constructor, you don't need to call `setPayload` to set the payload.

`PushNotification()`

Creates a new instance of the `Messaging.PushNotification` class.

Signature

```
public PushNotification()
```

`PushNotification(payload)`

Creates a new instance of the `Messaging.PushNotification` class using the specified payload parameters as key-value pairs. When you use this constructor, you don't need to call `setPayload` to set the payload.

Signature

```
public PushNotification(Map<String,Object> payload)
```

Parameters

payload
Type:Map<String, Object>

The payload, expressed as a map of key-value pairs.

PushNotification Methods

The following are the methods for `PushNotification`. All are global methods.

IN THIS SECTION:

send(application, users)
Sends a push notification message to the specified users.

setPayload(payload)
Sets the payload of the push notification message.

setTtl(ttl)
Reserved for future use.

send(application, users)

Sends a push notification message to the specified users.

Signature

```
public void send(String application, Set<String> users)
```

Parameters

application
Type: String

The connected app API name. This corresponds to the mobile client app the notification should be sent to.

users
Type: Set

A set of user IDs that correspond to the users the notification should be sent to.

Example

See the Push Notification Example.

setPayload(payload)

Sets the payload of the push notification message.

Signature

```
public void setPayload(Map<String,Object> payload)
```

Parameters

payload
Type: Map<String, Object>

The payload, expressed as a map of key-value pairs.

Payload parameters can be different for each mobile OS vendor. For more information on Apple's payload parameters, search for "Apple Push Notification Service" at https://developer.apple.com/library/mac/documentation/.

To create the payload for an Apple device, see the PushNotificationPayload Class.

Example

See the Push Notification Example.

setTtl(ttl)

Reserved for future use.

Signature

```
public void setTtl(Integer ttl)
```

Parameters

ttl
Type: Integer

Reserved for future use.

PushNotificationPayload Class

Contains methods to create the notification message payload for an Apple device.

Namespace

Messaging

Usage

Apple has specific requirements for the notification payload. and this class has helper methods to create the payload. For more information on Apple's payload parameters, search for "Apple Push Notification Service" at https://developer.apple.com/library/mac/documentation/.

Example

See the Push Notification Example.

IN THIS SECTION:

PushNotificationPayload Methods

PushNotificationPayload Methods

The following are the methods for `PushNotificationPayload`. All are global static methods.

IN THIS SECTION:

apple(alert, sound, badgeCount, userData)
Helper method that creates a valid Apple payload from the specified arguments.

apple(alertBody, actionLocKey, locKey, locArgs, launchImage, sound, badgeCount, userData)
Helper method that creates a valid Apple payload from the specified arguments.

apple(alert, sound, badgeCount, userData)

Helper method that creates a valid Apple payload from the specified arguments.

Signature

```
public static Map<String,Object> apple(String alert, String sound, Integer badgeCount,
Map<String,Object> userData)
```

Parameters

alert
Type: String

Notification message to be sent to the mobile client.

sound
Type: String

Name of a sound file to be played as an alert. This sound file should be in the mobile application bundle.

badgeCount
Type: Integer

Number to display as the badge of the application icon.

userData
Type: Map<String, Object>

Map of key-value pairs that contains any additional data used to provide context for the notification. For example, it can contain IDs of the records that caused the notification to be sent. The mobile client app can use these IDs to display these records.

Return Value

Type:Map<String, Object>

Returns a formatted payload that includes all of the specified arguments.

Usage

To generate a valid payload, you must provide a value for at least one of the following parameters: `alert`, `sound`, `badgeCount`.

Example

See the Push Notification Example.

apple(alertBody, actionLocKey, locKey, locArgs, launchImage, sound, badgeCount, userData)

Helper method that creates a valid Apple payload from the specified arguments.

Signature

```
public static Map<String,Object> apple(String alertBody, String actionLocKey, String
locKey, String[] locArgs, String launchImage, String sound, Integer badgeCount,
Map<String,Object> userData)
```

Parameters

alertBody
Type: String

Text of the alert message.

actionLocKey
Type: String

If a value is specified for the *actionLocKey* argument, an alert with two buttons is displayed. The value is a key to get a localized string in a `Localizable.strings` file to use for the right button's title.

locKey
Type: String

Key to an alert-message string in a `Localizable.strings` file for the current localization.

locArgs
Type: List<String>

Variable string values to appear in place of the format specifiers in *locKey*.

launchImage
Type: String

File name of an image file in the application bundle.

sound
Type: String

Name of a sound file to be played as an alert. This sound file should be in the mobile application bundle.

badgeCount
Type: Integer

Number to display as the badge of the application icon.

userData
Type: Map<String, Object>

Map of key-value pairs that contains any additional data used to provide context for the notification. For example, it can contain IDs of the records that caused the notification to be sent. The mobile client app can use these IDs to display these records.

Return Value

Type: Map<String, Object>

Returns a formatted payload that includes all of the specified arguments.

Usage

To generate a valid payload, you must provide a value for at least one of the following parameters: `alert`, `sound`, `badgeCount`.

CustomNotification Class

`CustomNotification` is used to create, configure, and send custom notifications from Apex code.

Namespace

Messaging

Usage

`CustomNotification` allows two approaches to creating and configuring a custom notification.

- Create an instance with the default constructor, and then set notification attributes using the various setter methods.
- Create an instance and configure notification parameters at the same time using the parameterized constructor.

Once the custom notification is configured, call `send()` to send the notification.

Notification Target

The *notification target* is used by the receiving client application to navigate to an appropriate record or page when a user responds to a notification. For example, when a user is notified that a record was updated, responding to the notification can open the relevant record.

You must specify a target for a notification. The target can be specified using either the `targetID` or the `targetPageRef` attribute. Neither attribute is required, but if both are omitted, `send()` throws an exception. If there's no natural target for a notification, set the `targetID` to a dummy value, such as *`000000000000000AAA`*. A dummy value prevents the exception, and also prevents automatic navigation when responding to the notification in the client app.

You can set both `targetID` and `targetPageRef` in the same notification. The client app that receives the notification determines which target, if any, to use when responding to the notification.

Important: Before Winter '21 you could set only a target record (`targetID`) for a notification. Most client applications expect to find a `targetID` in the notification payload. If you can't update a client app to handle notifications that include only a `targetPageRef`, set the `targetID` to a dummy value.

Execution Context and Notification Permissions

By default Apex code executes in system mode, and doesn't require user permissions to send notifications with `CustomNotification`. However, if your Apex code runs in a user context—for example, by executing anonymous Apex in the Developer Console—the Send Custom Notifications user permission is checked, and `send()` fails if you don't have the required permission.

Example

This example Apex class provides a static method for sending a custom notification to a recipient list. Call this method from a trigger, flow, or wherever you want to send a custom notification from Apex.

```
public without sharing class CustomNotificationFromApex {

    public static void notifyUsers(Set<String> recipientsIds, String targetId) {

        // Get the Id for our custom notification type
        CustomNotificationType notificationType =
            [SELECT Id, DeveloperName
             FROM CustomNotificationType
             WHERE DeveloperName='Custom_Notification'];

        // Create a new custom notification
        Messaging.CustomNotification notification = new Messaging.CustomNotification();

        // Set the contents for the notification
        notification.setTitle('Apex Custom Notification');
        notification.setBody('The notifications are coming from INSIDE the Apex!');

        // Set the notification type and target
        notification.setNotificationTypeId(notificationType.Id);
        notification.setTargetId(targetId);

        // Actually send the notification
        try {
            notification.send(recipientsIds);
        }
```

```
        catch (Exception e) {
            System.debug('Problem sending notification: ' + e.getMessage());
        }
    }
}
```

Note: This example uses a hard-coded string, `Custom_Notification`, as the `DeveloperName` (also known as the API Name) of a Custom Notification Type. Use your custom notification types in your own code.

`CustomNotification.send()` can throw an exception, which is handled minimally in this example. Add more substantial error handling to code you plan to use in production.

Salesforce Help: Send Custom Notifications

Actions Developer Guide: Custom Notification Actions

Metadata API Developer Guide: CustomNotificationType

CustomNotification Constructors

The following are constructors for `CustomNotification`.

IN THIS SECTION:

CustomNotification()

Creates a new instance of the `Messaging.CustomNotification` class.

CustomNotification(typeId, sender, title, body, targetId, targetPageRef)

Creates an instance of the `Messaging.CustomNotification` class using the specified parameters. When you use this constructor, you don't need to call the various setter methods to define the custom notification attributes.

`CustomNotification()`

Creates a new instance of the `Messaging.CustomNotification` class.

Signature

```
public CustomNotification()
```

`CustomNotification(typeId, sender, title, body, targetId, targetPageRef)`

Creates an instance of the `Messaging.CustomNotification` class using the specified parameters. When you use this constructor, you don't need to call the various setter methods to define the custom notification attributes.

Signature

```
public CustomNotification(String typeId, String sender, String title, String body,
String targetId, String targetPageRef)
```

Parameters

typeId
Type: String

The ID of the Custom Notification Type being used for the notification.

sender
Type: String

The User ID of the sender of the notification.

title
Type: String

The title of the notification. Maximum characters: 250.

body
Type: String

The body of the notification. Maximum characters: 750.

targetId
Type: String

The Record ID for the target record of the notification.

You must specify either a `targetID` or a `targetPageRef`. See Custom Notification Usage.

targetPageRef
Type: String

The `PageReference` for the navigation target of the notification. To see how to specify the target using JSON, see pageReference Types.

You must specify either a `targetID` or a `targetPageRe`. See Custom Notification Usage.

Usage

A client may see a truncated notification title or body depending on the delivery channel or app, and how the Connect API notification parameters are configured. For more information on the `trimMessages` query parameter, see Notification .

CustomNotification Methods

The following are methods for `CustomNotification`.

IN THIS SECTION:

send(users)
Sends a custom notification to the specified users.

setNotificationTypeId(id)
Sets the type of the custom notification.

setTitle(title)
Sets the title of the custom notification.

setBody(body)
Sets the body of the custom notification.

setSenderId(id)
Sets the sender of the custom notification.

setTargetId(targetId)
Sets the target record of the custom notification.

setTargetPageRef(pageRef)
Sets the target page of the custom notification.

`send(users)`

Sends a custom notification to the specified users.

Signature

```
public void send(Set<String> users)
```

Parameters

`users`
Type: Set<String>

Required. A set of recipient IDs. Each recipient ID corresponds to a recipient or recipient type that the notification should be sent to. Valid recipient or recipient type values are:

- `UserId` — The notification is sent to this user, if this user is active.
- `AccountId` — The notification is sent to all active users who are members of this account's Account Team.

  Note: This recipient type is valid if account teams are enabled for your org.

- `OpportunityId` — The notification is sent to all active users who are members of this opportunity's Opportunity Team.

  Note: This recipient type is valid if team selling is enabled for your org.

- `GroupId` — The notification is sent to all active users who are members of this group.
- `QueueId` — The notification is sent to all active users who are members of this queue.

Values can be combined in a set, up to the maximum of 500 values.

Return Value

Type: void

Example

See the Custom Notification Example.

`setNotificationTypeId(id)`

Sets the type of the custom notification.

Signature

```
public void setNotificationTypeId(String id)
```

Parameters

id
Type: String

The ID of the Custom Notification Type being used for the notification.

A notification type is required to send a custom notification. See Custom Notification Usage.

Return Value

Type: void

Example

See the Custom Notification Example.

`setTitle(title)`

Sets the title of the custom notification.

Signature

```
public void setTitle(String title)
```

Parameters

title
Type: String

The title of the notification, as it will be seen by recipients. Maximum characters: 250.

A title is required to send a custom notification. See Custom Notification Usage.

Return Value

Type: void

Example

See the Custom Notification Example.

`setBody(body)`

Sets the body of the custom notification.

Signature

```
public void setBody(String body)
```

Parameters

body
Type: String

The body of the notification, as it will be seen by recipients. Maximum characters: 750.

A body is required to send a custom notification. See Custom Notification Usage.

Return Value

Type: void

Example

See the Custom Notification Example.

setSenderId(id)

Sets the sender of the custom notification.

Signature

```
public void setSenderId(String id)
```

Parameters

id
Type: String

The User ID of the sender of the notification.

Setting a sender is optional. See Custom Notification Usage.

Return Value

Type: void

Example

See the Custom Notification Example.

setTargetId(targetId)

Sets the target record of the custom notification.

Signature

```
public void setTargetId(String targetId)
```

Parameters

targetId
Type: String

The Record ID for the target record of the notification.

Either a `targetID` or a `targetPageRef` is required to send a custom notification. See Custom Notification Usage.

Return Value

Type: void

Example

See the Custom Notification Example.

`setTargetPageRef(pageRef)`

Sets the target page of the custom notification.

Signature

```
public void setTargetPageRef(String pageRef)
```

Parameters

pageRef
Type: String

The `PageReference` for the navigation target of the notification.

Either a `targetID` or a `targetPageRef` is required to send a custom notification. See Custom Notification Usage.

Return Value

Type: void

Example

See the Custom Notification Example.

RenderEmailTemplateBodyResult Class

Contains the results for rendering email templates.

Namespace

Messaging

IN THIS SECTION:

RenderEmailTemplateBodyResult Methods

RenderEmailTemplateBodyResult Methods

The following are methods for `RenderEmailTemplateBodyResult`.

IN THIS SECTION:

getErrors()
If an error occurred during the `renderEmailTemplate` method, a `RenderEmailTemplateError` object is returned.

getMergedBody()
Returns the rendered body text with merge field references replaced with the corresponding record data.

getSuccess()
Indicates whether the operation was successful.

`getErrors()`

If an error occurred during the `renderEmailTemplate` method, a `RenderEmailTemplateError` object is returned.

Signature

```
public List<Messaging.RenderEmailTemplateError> getErrors()
```

Return Value

Type: List<Messaging.RenderEmailTemplateError>

`getMergedBody()`

Returns the rendered body text with merge field references replaced with the corresponding record data.

Signature

```
public String getMergedBody()
```

Return Value

Type: String

`getSuccess()`

Indicates whether the operation was successful.

Signature

```
public Boolean getSuccess()
```

Return Value

Type: Boolean

RenderEmailTemplateError Class

Represents an error that the `RenderEmailTemplateBodyResult` object can contain.

Namespace

Messaging

IN THIS SECTION:

RenderEmailTemplateError Methods

RenderEmailTemplateError Methods

The following are methods for `RenderEmailTemplateError`.

IN THIS SECTION:

getFieldName()
Returns the name of the merge field in the error.

getMessage()
Returns a message describing the error.

getOffset()
Returns the offset within the supplied body text where the error was discovered. If the offset cannot be determined, -1 is returned.

getStatusCode()
Returns a Salesforce API status code.

`getFieldName()`

Returns the name of the merge field in the error.

Signature

```
public String getFieldName()
```

Return Value

Type: String

`getMessage()`

Returns a message describing the error.

Signature

```
public String getMessage()
```

Return Value

Type: String

`getOffset()`

Returns the offset within the supplied body text where the error was discovered. If the offset cannot be determined, -1 is returned.

Signature

```
public Integer getOffset()
```

Return Value

Type: Integer

`getStatusCode()`

Returns a Salesforce API status code.

Signature

```
public System.StatusCode getStatusCode()
```

Return Value

Type: System.StatusCode

SendEmailError Class

Represents an error that the SendEmailResult object may contain.

Namespace

Messaging

SendEmailError Methods

The following are methods for `SendEmailError`. All are instance methods.

IN THIS SECTION:

getFields()
A list of one or more field names. Identifies which fields in the object, if any, affected the error condition.

getMessage()
The text of the error message.

getStatusCode()
Returns a code that characterizes the error.

getTargetObjectId()
The ID of the target record for which the error occurred.

getFields()

A list of one or more field names. Identifies which fields in the object, if any, affected the error condition.

Signature

```
public String[] getFields()
```

Return Value

Type: String[]

getMessage()

The text of the error message.

Signature

```
public String getMessage()
```

Return Value

Type: String

getStatusCode()

Returns a code that characterizes the error.

Signature

```
public System.StatusCode getStatusCode()
```

Return Value

Type: System.StatusCode

Usage

The full list of status codes is available in the WSDL file for your organization. For more information about accessing the WSDL file for your organization, see *Downloading Salesforce WSDLs and Client Authentication Certificates* in the Salesforce online help.

getTargetObjectId()

The ID of the target record for which the error occurred.

Signature

```
public String getTargetObjectId()
```

Return Value

Type: String

SendEmailResult Class

Contains the result of sending an email message.

Namespace

Messaging

SendEmailResult Methods

The following are methods for `SendEmailResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred during the `sendEmail` method, a `SendEmailError` object is returned.

isSuccess()
Indicates whether the email was successfully submitted for delivery (`true`) or not (`false`). Even if `isSuccess` is true, it does not mean the intended recipients received the email, as there could have been a problem with the email address or it could have bounced or been blocked by a spam blocker.

`getErrors()`

If an error occurred during the `sendEmail` method, a `SendEmailError` object is returned.

Signature

```
public SendEmailError[] getErrors()
```

Return Value

Type: Messaging.SendEmailError[]

`isSuccess()`

Indicates whether the email was successfully submitted for delivery (`true`) or not (`false`). Even if `isSuccess` is true, it does not mean the intended recipients received the email, as there could have been a problem with the email address or it could have bounced or been blocked by a spam blocker.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

SingleEmailMessage Methods

Contains methods for sending single email messages.

Namespace

Messaging

Usage

SingleEmailMessage extends Email and inherits all of its methods. All base email (`Email` class) methods are also available to the `SingleEmailMessage` objects. Emails sent via SingleEmailMessage count against the sending organization's daily single email limit.

Email properties are readable and writable. Each property has corresponding setter and getter methods. For example, the `toAddresses()` property is equivalent to the `setToAddresses()` and `getToAddresses()` methods. Only the setter methods are documented. However, the `getTemplateName()` method doesn't have an equivalent setter method; use `setTemplateId()` to specify a template name.

IN THIS SECTION:

SingleEmailMessage Constructors

SingleEmailMessage Methods

SEE ALSO:

Email Class (Base Email Methods)

SingleEmailMessage Constructors

The following are constructors for `SingleEmailMessage`.

IN THIS SECTION:

SingleEmailMessage()

Creates a new instance of the `Messaging.SingleEmailMessage` class.

`SingleEmailMessage()`

Creates a new instance of the `Messaging.SingleEmailMessage` class.

Signature

```
public SingleEmailMessage()
```

SingleEmailMessage Methods

The following are methods for `SingleEmailMessage`. All are instance methods. All base email (`Email` class) methods are also available to the `SingleEmailMessage` objects. These methods are described in Email Class (Base Email Methods).

IN THIS SECTION:

getTemplateName()

The name of the template used to create the email.

setBccAddresses(bccAddresses)

Optional. A list of blind carbon copy (BCC) addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of `toAddresses`, `ccAddresses`, and `bccAddresses` per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

setCcAddresses(ccAddresses)

Optional. A list of carbon copy (CC) addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of `toAddresses`, `ccAddresses`, and `bccAddresses` per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

setCharset(characterSet)

Optional. The character set for the email. If this value is null, the user's default value is used.

setDocumentAttachments(documentIds)

(Deprecated. Use `setEntityAttachments()` instead.) Optional. A list containing the ID of each document object you want to attach to the email.

setEntityAttachments(ids)

Optional. Array of IDs of Document, ContentVersion, or Attachment items to attach to the email.

setFileAttachments(fileNames)

Optional. A list containing the file names of the binary and text files you want to attach to the email.

setHtmlBody(htmlBody)

Optional. The HTML version of the email, specified by the sender. The value is encoded according to the specification associated with the organization. Specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

setInReplyTo(parentMessageIds)

Sets the optional In-Reply-To field of the outgoing email. This field identifies the email or emails to which this email is a reply (parent emails).

setOptOutPolicy(emailOptOutPolicy)

Optional. If you added recipients by ID instead of email address and the `Email Opt Out` option is set, this method determines the behavior of the `sendEmail()` call. If you add recipients by their email addresses, the opt-out settings for those recipients aren't checked and those recipients always receive the email.

setPlainTextBody(plainTextBody)

Optional. The text version of the email, specified by the sender. Specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

setOrgWideEmailAddressId(emailAddressId)

Optional. The ID of the organization-wide email address associated with the outgoing email. If you're using Apex to send emails from the guest user, set the sender to the verified org-wide email address or the emails are blocked. The object's `DisplayName` field cannot be set if the `setSenderDisplayName` field is already set.

setReferences(references)

Optional. The References field of the outgoing email. Identifies an email thread. Contains the parent emails' References and message IDs, and possibly the In-Reply-To fields.

setSubject(subject)

Optional. The email subject line. If you are using an email template, the subject line of the template overrides this value.

setTargetObjectId(targetObjectId)

Required if using a template, optional otherwise. The ID of the contact, lead, or user to which the email will be sent. The ID you specify sets the context and ensures that merge fields in the template contain the correct data.

setTemplateId(templateId)

Required if using a template, optional otherwise. The ID of the template used to create the email.

setToAddresses(toAddresses)

Optional. A list of email addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of `toAddresses`, `ccAddresses`, and `bccAddresses` per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

setTreatBodiesAsTemplate(treatAsTemplate)

Optional. If set to `true`, the subject, plain text, and HTML text bodies of the email are treated as template data. The merge fields are resolved using the `renderEmailTemplate` method. Default is `false`.

setTreatTargetObjectAsRecipient(treatAsRecipient)

Optional. If set to `true`, the `targetObjectId` (a contact, lead, or user) is the recipient of the email. If set to `false`, the `targetObjectId` is supplied as the `WhoId` field for template rendering but isn't a recipient of the email. The default is `true`.

setWhatId(whatId)

If you specify a contact for the `targetObjectId` field, you can specify an optional `whatId` as well. This helps to further ensure that merge fields in the template contain the correct data.

`getTemplateName()`

The name of the template used to create the email.

Signature

```
public STRING getTemplateName()
```

Return Value

Type: String

Usage

There is no equivalent setter method for `getTemplateName()`. If the email didn't use a template, `getTemplateName()` returns nothing. If you use `setTemplateId()`, and then call `getTemplateName()`, the template name associated to the template ID is returned.

`setBccAddresses(bccAddresses)`

Optional. A list of blind carbon copy (BCC) addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of `toAddresses`, `ccAddresses`, and `bccAddresses` per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

Signature

```
public Void setBccAddresses(String[] bccAddresses)
```

Parameters

bccAddresses
Type: String[]

Return Value

Type: Void

Usage

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

If the BCC compliance option is set at the organization level, the user cannot add BCC addresses on standard messages. The following error code is returned: `BCC_NOT_ALLOWED_IF_BCC_ COMPLIANCE_ENABLED`. Contact your Salesforce representative for information on BCC compliance.

`setCcAddresses(ccAddresses)`

Optional. A list of carbon copy (CC) addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of `toAddresses`, `ccAddresses`, and `bccAddresses` per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

Signature

```
public Void setCcAddresses(String[] ccAddresses)
```

Parameters

ccAddresses
Type: String[]

Return Value

Type: Void

Usage

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

`setCharset(characterSet)`

Optional. The character set for the email. If this value is null, the user's default value is used.

Signature

```
public Void setCharset(String characterSet)
```

Parameters

characterSet
Type: String

Return Value

Type: Void

`setDocumentAttachments(documentIds)`

(Deprecated. Use `setEntityAttachments()` instead.) Optional. A list containing the ID of each document object you want to attach to the email.

Signature

```
public Void setDocumentAttachments(ID[] documentIds)
```

Parameters

documentIds
Type: ID[]

Return Value

Type: Void

Usage

You can attach multiple documents as long as the total size of all attachments does not exceed 10 MB.

`setEntityAttachments(ids)`

Optional. Array of IDs of Document, ContentVersion, or Attachment items to attach to the email.

Signature

```
public void setEntityAttachments(List<String> ids)
```

Parameters

ids
Type: List<String>

Return Value

Type: void

`setFileAttachments(fileNames)`

Optional. A list containing the file names of the binary and text files you want to attach to the email.

Signature

```
public Void setFileAttachments(EmailFileAttachment[] fileNames)
```

Parameters

`fileNames`
Type: Messaging.EmailFileAttachment[]

Return Value

Type: Void

Usage

You can attach multiple files as long as the total size of all attachments does not exceed 10 MB.

`setHtmlBody(htmlBody)`

Optional. The HTML version of the email, specified by the sender. The value is encoded according to the specification associated with the organization. Specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

Signature

```
public Void setHtmlBody(String htmlBody)
```

Parameters

`htmlBody`
Type: String

Return Value

Type: Void

`setInReplyTo(parentMessageIds)`

Sets the optional In-Reply-To field of the outgoing email. This field identifies the email or emails to which this email is a reply (parent emails).

Signature

```
public Void setInReplyTo(String parentMessageIds)
```

Parameters

parentMessageIds
Type: String

Contains one or more parent email message IDs.

Return Value

Type: Void

setOptOutPolicy(emailOptOutPolicy)

Optional. If you added recipients by ID instead of email address and the `Email Opt Out` option is set, this method determines the behavior of the `sendEmail()` call. If you add recipients by their email addresses, the opt-out settings for those recipients aren't checked and those recipients always receive the email.

Signature

```
public void setOptOutPolicy(String emailOptOutPolicy)
```

Parameters

emailOptOutPolicy
Type: String

Possible values of the *emailOptOutPolicy* parameter are:

- `SEND` (default)—The email is sent to all recipients. The recipients' `Email Opt Out` setting is ignored. The setting Enforce email privacy settings is ignored.
- `FILTER`—No email is sent to recipients that have the `Email Opt Out` option set. Emails are sent to the other recipients. The setting Enforce email privacy settings is ignored.
- `REJECT`—If any of the recipients have the `Email Opt Out` option set, `sendEmail()` throws an error and no email is sent. The setting Enforce email privacy settings is respected, as are the selections in the data privacy record based on the Individual object. If any of the recipients have Don't Market, Don't Process, or Forget This Individual selected, `sendEmail()` throws an error and no email is sent.

Return Value

Type: void

Example

This example shows how to send an email with the opt-out setting enforced. Recipients are specified by their IDs. The `FILTER` option causes the email to be sent only to recipients that haven't opted out from email. This example uses dot notation of the email properties, which is equivalent to using the set methods.

```
Messaging.SingleEmailMessage message = new Messaging.SingleEmailMessage();
// Set recipients to two contact IDs.
```

```
// Replace IDs with valid record IDs in your org.
message.toAddresses = new String[] { '003D000000QDexS', '003D000000QDfW5' };
message.optOutPolicy = 'FILTER';
message.subject = 'Opt Out Test Message';
message.plainTextBody = 'This is the message body.';
Messaging.SingleEmailMessage[] messages =
    new List<Messaging.SingleEmailMessage> {message};
         Messaging.SendEmailResult[] results = Messaging.sendEmail(messages);
if (results[0].success) {
    System.debug('The email was sent successfully.');
} else {
    System.debug('The email failed to send: '
          + results[0].errors[0].message);
}
```

setPlainTextBody(plainTextBody)

Optional. The text version of the email, specified by the sender. Specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

Signature

```
public Void setPlainTextBody(String plainTextBody)
```

Parameters

plainTextBody
Type: String

Return Value

Type: Void

setOrgWideEmailAddressId(emailAddressId)

Optional. The ID of the organization-wide email address associated with the outgoing email. If you're using Apex to send emails from the guest user, set the sender to the verified org-wide email address or the emails are blocked. The object's `DisplayName` field cannot be set if the `setSenderDisplayName` field is already set.

Signature

```
public Void setOrgWideEmailAddressId(ID emailAddressId)
```

Parameters

emailAddressId
Type: ID

Usage

After you create an org-wide email address, you're sent a confirmation email to verify it. Copy the Id from the URL and use the *setOrgWideEmailAddressId(Id)* method on your instance of *Messaging.SingleEmailMessage*.

To avoid hard-coding an ID, after creating your org-wide email address, you can query them.

```
OrgWideEmailAddress[] owea = [select Id from OrgWideEmailAddress where Address =
'doNotReply@<somedomain>.com'];
Messaging.SingleEmailMessage mail = new Messaging.SingleEmailMessage();
if ( owea.size() > 0 ) {
    mail.setOrgWideEmailAddressId(owea.get(0).Id);
}
```

Return Value

Type: Void

setReferences(references)

Optional. The References field of the outgoing email. Identifies an email thread. Contains the parent emails' References and message IDs, and possibly the In-Reply-To fields.

Signature

```
public Void setReferences(String references)
```

Parameters

references
Type: String

Return Value

Type: Void

setSubject(subject)

Optional. The email subject line. If you are using an email template, the subject line of the template overrides this value.

Signature

```
public Void setSubject(String subject)
```

Parameters

subject
Type: String

Return Value

Type: Void

setTargetObjectId(targetObjectId)

Required if using a template, optional otherwise. The ID of the contact, lead, or user to which the email will be sent. The ID you specify sets the context and ensures that merge fields in the template contain the correct data.

Signature

```
public Void setTargetObjectId(ID targetObjectId)
```

Parameters

targetObjectId
Type: ID

Return Value

Type: Void

Usage

Do not specify the IDs of records that have the `Email Opt Out` option selected.

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

setTemplateId(templateId)

Required if using a template, optional otherwise. The ID of the template used to create the email.

Signature

```
public Void setTemplateId(ID templateId)
```

Parameters

templateId
Type: ID

Return Value

Type: Void

setToAddresses(toAddresses)

Optional. A list of email addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of `toAddresses`, `ccAddresses`, and `bccAddresses` per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

Signature

```
public Void setToAddresses(String[] toAddresses)
```

Parameters

toAddresses
Type: String[]

Return Value

Type: Void

Usage

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

setTreatBodiesAsTemplate(treatAsTemplate)

Optional. If set to `true`, the subject, plain text, and HTML text bodies of the email are treated as template data. The merge fields are resolved using the `renderEmailTemplate` method. Default is `false`.

Signature

```
public void setTreatBodiesAsTemplate(Boolean treatAsTemplate)
```

Parameters

treatAsTemplate
Type: Boolean

Return Value

Type: void

setTreatTargetObjectAsRecipient(treatAsRecipient)

Optional. If set to `true`, the `targetObjectId` (a contact, lead, or user) is the recipient of the email. If set to `false`, the `targetObjectId` is supplied as the `WhoId` field for template rendering but isn't a recipient of the email. The default is `true`.

Signature

```
public void setTreatTargetObjectAsRecipient(Boolean treatAsRecipient)
```

Parameters

treatAsRecipient
Type: Boolean

Return Value

Type: void

Usage

Note: You can set TO, CC, and BCC addresses using the email messaging methods regardless of whether a template is used for the email or the target object is a recipient.

setWhatId(whatId)

If you specify a contact for the `targetObjectId` field, you can specify an optional `whatId` as well. This helps to further ensure that merge fields in the template contain the correct data.

Signature

```
public Void setWhatId(ID whatId)
```

Parameters

whatId
Type: ID

Return Value

Type: Void

Usage

The value must be one of the following types:

- Account
- Asset
- Campaign
- Case
- Contract
- Opportunity
- Order
- Product
- Solution
- Custom

Metadata Namespace

The `Metadata` namespace provides classes and methods for working with custom metadata in Salesforce

Salesforce uses metadata types and components to represent org configuration and customization. Metadata is used for org settings that admins control or configuration information applied by installed apps and packages. Use the classes in the `Metadata` namespace to access metadata from within Apex code.

Metadata access in Apex is available for Apex classes using API version 40.0 and later.

For more information, see Metadata.

The following are the classes in the `Metadata` namespace.

IN THIS SECTION:

AnalyticsCloudComponentLayoutItem Class
Represents the settings for a Wave Analytics dashboard on a standard or custom page.

ConsoleComponent Class
Represents a custom console component on a section of a page layout.

Container Class
Represents a location and style in which to display more than one custom console component in the sidebars of the console.

CustomConsoleComponents Class
Represents custom console components (Visualforce pages, lookup fields, or related lists) on a page layout.

CustomMetadata Class
Represents records of custom metadata types.

CustomMetadataValue Class
Represents custom metadata values for a custom metadata component.

DeployCallback Interface
An interface for metadata deployment callback classes.

DeployCallbackContext Class
Represents context information for a deployment job.

DeployContainer Class
Represents a container for custom metadata components to be deployed.

DeployDetails Class
Contains detailed information on deployed components.

DeployMessage Class
Represents result information for the deployment of a metadata component.

DeployProblemType Enum
Describes the problem type for an unsuccessful component deploy.

DeployResult Class
Represents the results of a metadata deployment.

DeployStatus Enum
The result status of a deployment.

FeedItemTypeEnum Enum

The type of feed item in a feed-based page layout.

FeedLayout Class

Represents the values that define the feed view of a feed-based page layout. Feed-based layouts are available on Account, Case, Contact, Lead, Opportunity, custom, and external objects. They include a feed view and a detail view.

FeedLayoutComponent Class

Represents a component in the feed view of a feed-based page layout.

FeedLayoutComponentType Enum

Indicates the type of feed layout component.

FeedLayoutFilter Class

Represents a feed filter option in the feed view of a feed-based page layout. A filter can have only `standardFilter` or `feedItemType` set.

FeedLayoutFilterPosition Enum

Describes where the feed filters list is included in the layout.

FeedLayoutFilterType Enum

The type of feed layout filter.

Layout Class

Represents the metadata associated with a page layout.

LayoutColumn Class

Represents the items in a column within a layout section.

LayoutHeader Enum

Represents tagging types used for `Metadata.Layout.headers`

LayoutItem Class

Represents the valid values that define a layout item.

LayoutSection Class

Represents a section of a page layout, such as the Custom Links section.

LayoutSectionStyle Enum

Describes the possible styles for a layout section.

Metadata Class

An abstract base class that represents a custom metadata component.

MetadataType Enum

Represents the custom metadata components available in Apex.

MetadataValue Class

An abstract base class that represents a custom metadata component field.

MiniLayout Class

Represents a mini view of a record in the Console tab, hover details, and event overlays.

Operations Class

Represents a class to execute metadata operations, such as retrieving or deploying custom metadata.

PlatformActionList Class

Represents the list of actions, and their order, that display in the Salesforce mobile action bar for the layout.

PlatformActionListContextEnum Enum

Describes the different contexts of action lists.

PlatformActionListItem Class

Represents an action in the platform action list for a layout.

PlatformActionTypeEnum Enum

The type of action for a `PlatformActionListItem`.

PrimaryTabComponents Class

Represents custom console components on primary tabs in the Salesforce console.

QuickActionList Class

Represents the list of actions associated with the page layout.

QuickActionListItem Class

Represents an action in the `QuickActionList`.

RelatedContent Class

Represents the Mobile Cards section of the page layout.

RelatedContentItem Class

Represents an individual item in the `RelatedContent` list.

RelatedList Class

Represents related list custom components on the sidebars of the Salesforce console.

RelatedListItem Class

Represents an item in the related list in a page layout.

ReportChartComponentLayoutItem Class

Represents the settings for a report chart on a standard or custom page.

ReportChartComponentSize Enum

Describes the size of the displayed report chart component.

SidebarComponent Class

Represents a specific custom console component to display in a container that hosts multiple components in one of the sidebars of the Salesforce console.

SortOrder Enum

Describes the sort order of a related list.

StatusCode Enum

Describes the status code for an unsuccessful component deploy.

SubtabComponents Class

Represents custom console components on subtabs in the Salesforce console.

SummaryLayoutStyleEnum Enum

Describes the highlights panel style for a `SummaryLayout`.

SummaryLayout Class

Controls the appearance of the highlights panel, which summarizes key fields in a grid at the top of a page layout, when Case Feed is enabled.

SummaryLayoutItem Class

Controls the appearance of an individual field and its column and row position within the highlights panel grid, when Case Feed is enabled. You can have two fields per each grid in a highlights panel.

UiBehavior Enum

Describes the behavior for a layout item on a layout page.

AnalyticsCloudComponentLayoutItem Class

Represents the settings for a Wave Analytics dashboard on a standard or custom page.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "AnalyticsCloudComponentLayoutItem" in the *Metadata API Developer Guide*.

IN THIS SECTION:

AnalyticsCloudComponentLayoutItem Properties

AnalyticsCloudComponentLayoutItem Methods

AnalyticsCloudComponentLayoutItem Properties

The following are properties for `AnalyticsCloudComponentLayoutItem`.

IN THIS SECTION:

assetType

Specifies the type of Wave Analytics asset.

devName

Unique development name of the dashboard to add.

error

An error string that is populated only when an error occurred in the underlying dashboard.

filter

Dashboard filters for mapping data fields in the dashboard to the object's fields.

height

Specifies the height of the dashboard, in pixels.

hideOnError

Controls whether users see a dashboard that has an error.

showHeader

If `true`, includes the dashboard's header bar. If `false`, the dashboard appears without a header bar.

showSharing

If set to true, and the dashboard is shareable the dashboard shows the Share icon. If set to false, the dashboard doesn't show the Share icon.

showTitle
If true, includes the dashboard's title above the dashboard. If false, the dashboard appears without a title.

width
Specifies the width of the dashboard, in pixels or percentage.

assetType

Specifies the type of Wave Analytics asset.

Signature

```
public String assetType {get; set;}
```

Property Value

Type: String

devName

Unique development name of the dashboard to add.

Signature

```
public String devName {get; set;}
```

Property Value

Type: String

error

An error string that is populated only when an error occurred in the underlying dashboard.

Signature

```
public String error {get; set;}
```

Property Value

Type: String

filter

Dashboard filters for mapping data fields in the dashboard to the object's fields.

Signature

```
public String filter {get; set;}
```

Property Value

Type: String

`height`

Specifies the height of the dashboard, in pixels.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: Integer

`hideOnError`

Controls whether users see a dashboard that has an error.

Signature

```
public Boolean hideOnError {get; set;}
```

Property Value

Type: Boolean

`showHeader`

If `true`, includes the dashboard's header bar. If `false`, the dashboard appears without a header bar.

Signature

```
public Boolean showHeader {get; set;}
```

Property Value

Type: Boolean

`showSharing`

If set to true, and the dashboard is shareable the dashboard shows the Share icon. If set to false, the dashboard doesn't show the Share icon.

Signature

```
public Boolean showSharing {get; set;}
```

Property Value

Type: Boolean

showTitle

If true, includes the dashboard's title above the dashboard. If false, the dashboard appears without a title.

Signature

```
public Boolean showTitle {get; set;}
```

Property Value

Type: Boolean

width

Specifies the width of the dashboard, in pixels or percentage.

Signature

```
public String width {get; set;}
```

Property Value

Type: String

AnalyticsCloudComponentLayoutItem Methods

The following are methods for `AnalyticsCloudComponentLayoutItem`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.AnalyticsCloudComponentLayoutItem`.

clone()

Makes a duplicate copy of the `Metadata.AnalyticsCloudComponentLayoutItem`.

Signature

```
public Object clone()
```

Return Value

Type: Object

ConsoleComponent Class

Represents a custom console component on a section of a page layout.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "ConsoleComponent" in the *Metadata API Developer Guide*.

IN THIS SECTION:

ConsoleComponent Properties

ConsoleComponent Methods

ConsoleComponent Properties

The following are properties for `ConsoleComponent`.

IN THIS SECTION:

height
The height of the custom console component in pixels.

location
The location of the custom console component on the page layout. Valid values are right, left, top, and bottom.

visualforcePage
The unique name of the custom console component.

width
The width of the custom console component in pixels.

`height`

The height of the custom console component in pixels.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: Integer

`location`

The location of the custom console component on the page layout. Valid values are right, left, top, and bottom.

Signature

```
public String location {get; set;}
```

Property Value

Type: String

`visualforcePage`

The unique name of the custom console component.

Signature

```
public String visualforcePage {get; set;}
```

Property Value

Type: String

`width`

The width of the custom console component in pixels.

Signature

```
public Integer width {get; set;}
```

Property Value

Type: Integer

ConsoleComponent Methods

The following are methods for `ConsoleComponent`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.ConsoleComponent`.

`clone()`

Makes a duplicate copy of the `Metadata.ConsoleComponent`.

Signature

```
public Object clone()
```

Return Value

Type: Object

Container Class

Represents a location and style in which to display more than one custom console component in the sidebars of the console.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "Container" in the *Metadata API Developer Guide*.

IN THIS SECTION:

Container Properties

Container Methods

Container Properties

The following are properties for `Container`.

IN THIS SECTION:

height

The height of the component's container. The `unit` property determines the unit of measurement, in pixels or percent.

isContainerAutoSizeEnabled

If set to true, stacked console components in the sidebars autosize vertically.

region

The location of the component's container (right, left, bottom, top).

sidebarComponents

Represents a specific custom console component to display in the components' container.

style

The style of the container in which to display multiple components (stack, tab, accordion).

unit

The unit of measurement, in pixels or percent, for the height or width of the components' container.

width

The width of the component's container. The `unit` property determines the unit of measurement, in pixels or percent.

`height`

The height of the component's container. The `unit` property determines the unit of measurement, in pixels or percent.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: Integer

`isContainerAutoSizeEnabled`

If set to true, stacked console components in the sidebars autosize vertically.

Signature

```
public Boolean isContainerAutoSizeEnabled {get; set;}
```

Property Value

Type: Boolean

`region`

The location of the component's container (right, left, bottom, top).

Signature

```
public String region {get; set;}
```

Property Value

Type: String

`sidebarComponents`

Represents a specific custom console component to display in the components' container.

Signature

```
public List<Metadata.SidebarComponent> sidebarComponents {get; set;}
```

Property Value

Type: List<Metadata.SidebarComponent>

`style`

The style of the container in which to display multiple components (stack, tab, accordion).

Signature

```
public String style {get; set;}
```

Property Value

Type: String

`unit`

The unit of measurement, in pixels or percent, for the height or width of the components' container.

Signature

```
public String unit {get; set;}
```

Property Value

Type: String

`width`

The width of the component's container. The `unit` property determines the unit of measurement, in pixels or percent.

Signature

```
public Integer width {get; set;}
```

Property Value

Type: Integer

Container Methods

The following are methods for `Container`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.Container`.

`clone()`

Makes a duplicate copy of the `Metadata.Container`.

Signature

```
public Object clone()
```

Return Value

Type: Object

CustomConsoleComponents Class

Represents custom console components (Visualforce pages, lookup fields, or related lists) on a page layout.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "CustomConsoleComponents" in the *Metadata API Developer Guide*.

IN THIS SECTION:

CustomConsoleComponents Properties

CustomConsoleComponents Methods

CustomConsoleComponents Properties

The following are properties for `CustomConsoleComponents`.

IN THIS SECTION:

primaryTabComponents
Represents custom console components on primary tabs in the Salesforce console.

subtabComponents
Represents custom console components on subtabs in the Salesforce console.

`primaryTabComponents`

Represents custom console components on primary tabs in the Salesforce console.

Signature

```
public Metadata.PrimaryTabComponents primaryTabComponents {get; set;}
```

Property Value

Type: Metadata.PrimaryTabComponents

`subtabComponents`

Represents custom console components on subtabs in the Salesforce console.

Signature

```
public Metadata.SubtabComponents subtabComponents {get; set;}
```

Property Value

Type: Metadata.SubtabComponents

CustomConsoleComponents Methods

The following are methods for `CustomConsoleComponents`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.CustomConsoleComponents`.

`clone()`

Makes a duplicate copy of the `Metadata.CustomConsoleComponents`.

Signature

```
public Object clone()
```

Return Value

Type: Object

CustomMetadata Class

Represents records of custom metadata types.

Warning: Protected custom metadata types behave like public custom metadata types when they are outside of a managed package. Public custom metadata types are readable for all profiles, including the guest user. Do not store secrets, personally identifying information, or any private data in these records. Use protected custom metadata types only in managed packages. Outside of a managed package, use named credentials or encrypted custom fields to store secrets like OAuth tokens, passwords, and other confidential material.

Namespace

Metadata

Usage

Use `Metadata.CustomMetadata` to represent records of custom metadata types in Apex. For more information, see Custom Metadata Types in the *Metadata API Developer Guide*.

Example

```
// Set up custom metadata to be created in the subscriber org.
    Metadata.CustomMetadata customMetadata =  new Metadata.CustomMetadata();
    customMetadata.fullName = 'ISVNamespace__MetadataTypeName.MetadataRecordName';
```

```
Metadata.CustomMetadataValue customField = new Metadata.CustomMetadataValue();
customField.field = 'customField__c';
customField.value = 'New value';

customMetadata.values.add(customField);
```

Note: When you assign namespaces to records, provide full, qualified record names to the app. If both the type and the record are in *Namespace*, use something like: `customMetadata.fullName = 'Namespace__MetadataTypeName.Namespace__MetadataRecordName'`

IN THIS SECTION:

CustomMetadata Properties

CustomMetadata Methods

CustomMetadata Properties

The following are properties for `CustomMetadata`.

IN THIS SECTION:

description
The description of the custom metadata.

label
The label of the custom metadata record.

protected_x
Property that describes whether the custom metadata record is a protected component.

values
A list of custom metadata values, such as custom fields, for the custom metadata record.

description

The description of the custom metadata.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

label

The label of the custom metadata record.

Signature

```
public String label {get; set;}
```

Property Value

Type: String

protected_x

Property that describes whether the custom metadata record is a protected component.

Signature

```
public Boolean protected_x {get; set;}
```

Property Value

Type: Boolean

values

A list of custom metadata values, such as custom fields, for the custom metadata record.

Signature

```
public List<Metadata.CustomMetadataValue> values {get; set;}
```

Property Value

Type: List<Metadata.CustomMetadataValue>

CustomMetadata Methods

The following are methods for `CustomMetadata`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.CustomMetadata`.

clone()

Makes a duplicate copy of the `Metadata.CustomMetadata`.

Signature

```
public Object clone()
```

Return Value

Type: Object

CustomMetadataValue Class

Represents custom metadata values for a custom metadata component.

Namespace

Metadata

Usage

Use `Metadata.CustomMetadataValue` to access values for custom fields of custom metadata records.

Supported Apex primitive types are:

- Boolean
- Date
- DateTime
- Decimal
- Double
- Integer
- Long
- String

Example

```
// Set a custom field value for a custom metadata record
Metadata.CustomMetadataValue customField = new Metadata.CustomMetadataValue();
customField.field = 'CustomField1__c';
customField.value = 'New Value';
customMetadata.values.add(customField);
```

IN THIS SECTION:

CustomMetadataValue Properties

CustomMetadataValue Methods

CustomMetadataValue Properties

The following are properties for `CustomMetadataValue`.

IN THIS SECTION:

field

The field name for the custom metadata value.

value

The field value for the custom metadata value.

field

The field name for the custom metadata value.

Signature

```
public String field {get; set;}
```

Property Value

Type: String

value

The field value for the custom metadata value.

Signature

```
public Object value {get; set;}
```

Property Value

Type: Object

Supported Apex primitive types are:

- Boolean
- Date
- DateTime
- Decimal
- Double
- Integer
- Long
- String

When setting the value for relationship fields, use the qualified API name of the related metadata, not the ID.

For more information, see Primitive Data Types.

CustomMetadataValue Methods

The following are methods for `CustomMetadataValue`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.CustomMetadataValue`.

clone()

Makes a duplicate copy of the `Metadata.CustomMetadataValue`.

Signature

```
public Object clone()
```

Return Value

Type: Object

DeployCallback Interface

An interface for metadata deployment callback classes.

Namespace

Metadata

Usage

You must provide a callback class for the asynchronous deployment of custom metadata through Apex. This class must implement the `Metadata.DeployCallback` interface.

Salesforce calls your `DeployCallback.handleResult()` method asynchronously once the queued deployment completes. Because the callback is called as asynchronous Apex after deployment, there may be a brief period where the deploy has completed, but your callback has not been called yet.

IN THIS SECTION:

DeployCallback Methods

DeployCallback Example Implementation

DeployCallback Methods

The following are methods for `DeployCallback`.

IN THIS SECTION:

handleResult(var1, var2)

Method that is called when the asynchronous deployment of custom metadata completes.

`handleResult(var1, var2)`

Method that is called when the asynchronous deployment of custom metadata completes.

Signature

```
public void handleResult(Metadata.DeployResult var1, Metadata.DeployCallbackContext
var2)
```

Parameters

var1
Type: Metadata.DeployResult

The results of the asynchronous deployment.

var2
Type: Metadata.DeployCallbackContext

The context for the queued asynchronous deployment job.

Return Value

Type: void

DeployCallback Example Implementation

This is an example implementation of the `Metadata.DeployCallback` interface.

```
public class MyCallback implements Metadata.DeployCallback {
    public void handleResult(Metadata.DeployResult result,
                             Metadata.DeployCallbackContext context) {
        if (result.status == Metadata.DeployStatus.Succeeded) {
            // Deployment was successful
        } else {
            // Deployment was not successful
        }
    }
}
```

The following example uses this implementation for a deployment.

```
// Setup callback and deploy
MyCallback callback = new MyCallback();
Metadata.Operations.enqueueDeployment(mdContainer, callback);
```

DeployCallbackContext Class

Represents context information for a deployment job.

Namespace

Metadata

Usage

After an asynchronous metadata deployment finishes, Salesforce provides an instance of`Metadata.DeployCallbackContext` in an asynchronous call to your implementation of `handleResult()` in your `Metadata.DeployCallback` class.

Example

```
public void handleResult(Metadata.DeployResult result,
                         Metadata.DeployCallbackContext context) {
  // Check the callback job ID for the deployment
  Id jobId = context.getCallbackJobId();
  // ...process the results...
}
```

IN THIS SECTION:

DeployCallbackContext Methods

DeployCallbackContext Methods

The following are methods for `DeployCallbackContext`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.DeployCallbackContext`.
getCallbackJobId()
Gets the asynchronous Apex job ID for the callback job.

`clone()`

Makes a duplicate copy of the `Metadata.DeployCallbackContext`.

Signature

```
public Object clone()
```

Return Value

Type: Object

`getCallbackJobId()`

Gets the asynchronous Apex job ID for the callback job.

Signature

```
public Id getCallbackJobId()
```

Return Value

Type: Id

DeployContainer Class

Represents a container for custom metadata components to be deployed.

Namespace

Metadata

Usage

Use `Metadata.DeployContainer` to manage custom metadata components for deployment. A container must have one or more components before being deployed.

Example

```
// Use DeployContainer for deployment
Metadata.DeployContainer mdContainer = new Metadata.DeployContainer();
mdContainer.addMetadata(customMetadata);

...

// Enqueue deploy
Metadata.Operations.enqueueDeployment(mdContainer, callback);
```

IN THIS SECTION:

DeployContainer Methods

DeployContainer Methods

The following are methods for `DeployContainer`.

IN THIS SECTION:

addMetadata(md)
Add a custom metadata component to the container.

clone()
Makes a duplicate copy of the `Metadata.DeployContainer`.

getMetadata()
Retrieves a list of custom metadata components from the container.

removeMetadata(md)
Removes a metadata component from the container.

removeMetadataByFullName(fullName)
Removes a metadata component from the container using the component's full name.

`addMetadata(md)`

Add a custom metadata component to the container.

Signature

```
public void addMetadata(Metadata.Metadata md)
```

Parameters

md

Type: Metadata.Metadata

A custom metadata component class that derives from `Metadata.Metadata`. Avoid adding components to a `Metadata.DeployContainer`that have the same `Metadata.Metadata.fullName` because it causes deployment errors.

Return Value

Type: void

clone()

Makes a duplicate copy of the `Metadata.DeployContainer`.

Signature

```
public Object clone()
```

Return Value

Type: Object

getMetadata()

Retrieves a list of custom metadata components from the container.

Signature

```
public List<Metadata.Metadata> getMetadata()
```

Return Value

Type: List<Metadata.Metadata>

removeMetadata(md)

Removes a metadata component from the container.

Signature

```
public Boolean removeMetadata(Metadata.Metadata md)
```

Parameters

md
Type: Metadata.Metadata

Metadata component to remove.

Return Value

Type: Boolean

Returns `true` if the container changed as a result of the call.

`removeMetadataByFullName(fullName)`

Removes a metadata component from the container using the component's full name.

Signature

```
public Boolean removeMetadataByFullName(String fullName)
```

Parameters

fullName
Type: String

Full name of the component to remove.

Return Value

Type: Boolean

Returns `true` if the container changed as a result of the call.

DeployDetails Class

Contains detailed information on deployed components.

Namespace

Metadata

Usage

Use this class to obtain a list of the successfully and unsuccessfully deployed components after a completed deployment by Salesforce in your `Metadata.DeployCallback` results.

IN THIS SECTION:

DeployDetails Properties

DeployDetails Methods

DeployDetails Properties

The following are properties for `DeployDetails`.

IN THIS SECTION:

componentFailures
Contains a list of information about components that failed to deploy.

componentSuccesses
Contains a list of information about components that deployed successfully.

componentFailures

Contains a list of information about components that failed to deploy.

Signature

```
public List<Metadata.DeployMessage> componentFailures {get; set;}
```

Property Value

Type: List<Metadata.DeployMessage>

componentSuccesses

Contains a list of information about components that deployed successfully.

Signature

```
public List<Metadata.DeployMessage> componentSuccesses {get; set;}
```

Property Value

Type: List<Metadata.DeployMessage>

DeployDetails Methods

The following are methods for `DeployDetails`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.DeployDetails`.

clone()

Makes a duplicate copy of the `Metadata.DeployDetails`.

Signature

```
public Object clone()
```

Return Value

Type: Object

DeployMessage Class

Represents result information for the deployment of a metadata component.

Namespace

Metadata

Usage

Use `DeployMessage` to access detailed information about component deployments. Salesforce provides a list of `DeployMessages` for a completed deployment via the `DeployDetails` and `DeployResults` instances sent in the `DeployCallback.handleResult()` callback.

IN THIS SECTION:

DeployMessage Properties

DeployMessage Methods

DeployMessage Properties

The following are properties for `DeployMessage`.

IN THIS SECTION:

changed

Determines whether the component was changed after deployment. If true, the component was changed as a result of the deployment. If false, the deployed component was the same as the corresponding component already in the org.

columnNumber

Each component is represented by a text file. If an error occurs during deployment, this property represents the column of the text file where the error occurred.

componentType

The metadata type of the component in the deployment.

created

If true, the component was created as a result of the deployment. If false, the component was modified as a result of the deployment.

createdDate

The date and time when the component was created as a result of the deployment.

deleted

If true, the component was deleted as a result of the deployment. If false, the component was either new or modified as result of the deployment.

fileName

The name of the file in the metadata archive used to deploy the component.

fullName

Full name for the custom metadata component.

id

ID of the component that was deployed.

lineNumber

Each component is represented by a text file. If an error occurs during deployment, this field represents the line number of the text file where the error occurred.

problem

If an error or warning occurred, this field contains a description of the problem that caused the deployment to fail.

problemType

Indicates the problem type, for example, an error or warning.

success

Indicates whether the component was successfully deployed (true) or not (false).

changed

Determines whether the component was changed after deployment. If true, the component was changed as a result of the deployment. If false, the deployed component was the same as the corresponding component already in the org.

Signature

```
public Boolean changed {get; set;}
```

Property Value

Type: Boolean

columnNumber

Each component is represented by a text file. If an error occurs during deployment, this property represents the column of the text file where the error occurred.

Signature

```
public Integer columnNumber {get; set;}
```

Property Value

Type: Integer

componentType

The metadata type of the component in the deployment.

Signature

```
public String componentType {get; set;}
```

Property Value

Type: String

created

If true, the component was created as a result of the deployment. If false, the component was modified as a result of the deployment.

Signature

```
public Boolean created {get; set;}
```

Property Value

Type: Boolean

createdDate

The date and time when the component was created as a result of the deployment.

Signature

```
public Datetime createdDate {get; set;}
```

Property Value

Type: Datetime

deleted

If true, the component was deleted as a result of the deployment. If false, the component was either new or modified as result of the deployment.

Signature

```
public Boolean deleted {get; set;}
```

Property Value

Type: Boolean

`fileName`

The name of the file in the metadata archive used to deploy the component.

Signature

```
public String fileName {get; set;}
```

Property Value

Type: String

`fullName`

Full name for the custom metadata component.

Signature

```
public String fullName {get; set;}
```

Property Value

Type: String

`id`

ID of the component that was deployed.

Signature

```
public Id id {get; set;}
```

Property Value

Type: Id

`lineNumber`

Each component is represented by a text file. If an error occurs during deployment, this field represents the line number of the text file where the error occurred.

Signature

```
public Integer lineNumber {get; set;}
```

Property Value

Type: Integer

problem

If an error or warning occurred, this field contains a description of the problem that caused the deployment to fail.

Signature

```
public String problem {get; set;}
```

Property Value

Type: String

problemType

Indicates the problem type, for example, an error or warning.

Signature

```
public Metadata.DeployProblemType problemType {get; set;}
```

Property Value

Type: Metadata.DeployProblemType

success

Indicates whether the component was successfully deployed (true) or not (false).

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

DeployMessage Methods

The following are methods for `DeployMessage`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.DeployMessage`.

clone()

Makes a duplicate copy of the `Metadata.DeployMessage`.

Signature

```
public Object clone()
```

Return Value

Type: Object

DeployProblemType Enum

Describes the problem type for an unsuccessful component deploy.

Enum Values

The following are the values of the `Metadata.DeployProblemType` enum.

Value	Description
`Error`	The deploy problem is an error.
`Info`	The deploy problem is of type "Info".
`Warning`	The deploy problem is a warning.

SEE ALSO:

StatusCode Enum

DeployResult Class

Represents the results of a metadata deployment.

Namespace

Metadata

Usage

After an asynchronous metadata deployment finishes, Salesforce provides an instance of `Metadata.DeployResult` in a call to your implementation of `handleResult()` in your `Metadata.DeployCallback` class.

Example

```
public void handleResult(Metadata.DeployResult result,
                         Metadata.DeployCallbackContext context) {
    if (result.status == Metadata.DeployStatus.Succeeded) {
        // Deployment was successful
    } else {
        // Deployment was not successful
```

```
        }
}
```

IN THIS SECTION:

DeployResult Properties

DeployResult Methods

DeployResult Properties

The following are properties for `DeployResult`.

IN THIS SECTION:

canceledBy

ID of the user who canceled the queued deployment.

canceledByName

Full name of the user who canceled the queued deployment.

checkOnly

Indicates whether the deployment checked only the validity of the deployed files without making changes in the org. A check-only deployment does not deploy components or change the org in any way.

completedDate

Date and time for when the deployment process ended.

createdBy

ID of the user who created the deployment job.

createdByName

Full name of the user who created the deployment job.

createdDate

Date and time the deployment job was first queued.

details

Provides the details for components in a completed deployment.

done

Indicates whether Salesforce finished processing the deployment.

errorMessage

Message corresponding to the values in the `errorStatusCode` property, if any.

errorStatusCode

If an error occurs during deployment, a status code is returned. The message corresponding to the status code is returned in the `errorMessagefield` property.

id

ID of the deployment job.

ignoreWarnings

Specifies whether a deployment continues, even if the deployment generates warnings.

lastModifiedDate

Date and time of the last update for the deployment process.

messages

A list of all the detail messages for a deployment.

numberComponentErrors

The number of components that generated errors during the deployment.

numberComponentsDeployed

The number of components deployed in the deployment process. Use this value with the `numberComponentsTotal` property to get an estimate of the deployment's progress.

numberComponentsTotal

The total number of components in the deployment. Use this value with the `numberComponentsDeployed` property to get an estimate of the deployment's progress.

rollbackOnError

Indicates whether any failure causes a complete rollback (true) or not (false) of the deployment.

startDate

Date and time the deployment process began.

stateDetail

Indicates which component is being deployed.

status

Indicates the current state of the deployment.

success

Indicates whether the deployment was successful (true) or not (false).

canceledBy

ID of the user who canceled the queued deployment.

Signature

```
public String canceledBy {get; set;}
```

Property Value

Type: String

canceledByName

Full name of the user who canceled the queued deployment.

Signature

```
public String canceledByName {get; set;}
```

Property Value

Type: String

checkOnly

Indicates whether the deployment checked only the validity of the deployed files without making changes in the org. A check-only deployment does not deploy components or change the org in any way.

Signature

```
public Boolean checkOnly {get; set;}
```

Property Value

Type: Boolean

completedDate

Date and time for when the deployment process ended.

Signature

```
public Datetime completedDate {get; set;}
```

Property Value

Type: Datetime

createdBy

ID of the user who created the deployment job.

Signature

```
public String createdBy {get; set;}
```

Property Value

Type: String

createdByName

Full name of the user who created the deployment job.

Signature

```
public String createdByName {get; set;}
```

Property Value

Type: String

createdDate

Date and time the deployment job was first queued.

Signature

```
public Datetime createdDate {get; set;}
```

Property Value

Type: Datetime

details

Provides the details for components in a completed deployment.

Signature

```
public Metadata.DeployDetails details {get; set;}
```

Property Value

Type: Metadata.DeployDetails

done

Indicates whether Salesforce finished processing the deployment.

Signature

```
public Boolean done {get; set;}
```

Property Value

Type: Boolean

errorMessage

Message corresponding to the values in the `errorStatusCode` property, if any.

Signature

```
public String errorMessage {get; set;}
```

Property Value

Type: String

errorStatusCode

If an error occurs during deployment, a status code is returned. The message corresponding to the status code is returned in the `errorMessagefield` property.

Signature

```
public String errorStatusCode {get; set;}
```

Property Value

Type: String

For a description of each status code value, see Core Data Types Used in API Calls in the *SOAP API Developer Guide*.

id

ID of the deployment job.

Signature

```
public Id id {get; set;}
```

Property Value

Type: Id

ignoreWarnings

Specifies whether a deployment continues, even if the deployment generates warnings.

Signature

```
public Boolean ignoreWarnings {get; set;}
```

Property Value

Type: Boolean

lastModifiedDate

Date and time of the last update for the deployment process.

Signature

```
public Datetime lastModifiedDate {get; set;}
```

Property Value

Type: Datetime

messages

A list of all the detail messages for a deployment.

Note: Removed in API version 29.0 and later.

Signature

```
public List<Metadata.DeployMessage> messages {get; set;}
```

Property Value

Type: List<Metadata.DeployMessage>

numberComponentErrors

The number of components that generated errors during the deployment.

Signature

```
public Integer numberComponentErrors {get; set;}
```

Property Value

Type: Integer

numberComponentsDeployed

The number of components deployed in the deployment process. Use this value with the `numberComponentsTotal` property to get an estimate of the deployment's progress.

Signature

```
public Integer numberComponentsDeployed {get; set;}
```

Property Value

Type: Integer

numberComponentsTotal

The total number of components in the deployment. Use this value with the `numberComponentsDeployed` property to get an estimate of the deployment's progress.

Signature

```
public Integer numberComponentsTotal {get; set;}
```

Property Value

Type: Integer

rollbackOnError

Indicates whether any failure causes a complete rollback (true) or not (false) of the deployment.

Signature

```
public Boolean rollbackOnError {get; set;}
```

Property Value

Type: Boolean

startDate

Date and time the deployment process began.

Signature

```
public Datetime startDate {get; set;}
```

Property Value

Type: Datetime

stateDetail

Indicates which component is being deployed.

Signature

```
public String stateDetail {get; set;}
```

Property Value

Type: String

status

Indicates the current state of the deployment.

Signature

```
public Metadata.DeployStatus status {get; set;}
```

Property Value

Type: Metadata.DeployStatus

success

Indicates whether the deployment was successful (true) or not (false).

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

DeployResult Methods

The following are methods for `DeployResult`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.DeployResult`.

`clone()`

Makes a duplicate copy of the `Metadata.DeployResult`.

Signature

```
public Object clone()
```

Return Value

Type: Object

DeployStatus Enum

The result status of a deployment.

Usage

`Metadata.DeployResult.status` uses this enum to describe the results of the deployment.

Enum Values

The following are the values of the `Metadata.DeployStatus` enum.

Value	Description
`Canceled`	The queued deployment was canceled.
`Canceling`	The queued deployment is being canceled.
`Failed`	The deployment failed.
`InProgress`	The deployment has been started and is in progress.
`Pending`	The deployment has been queued but not started.

Value	Description
`Succeeded`	The deployment succeeded.
`SucceededPartial`	The deployment succeeded, but some components might not have been successfully deployed. Check `Metadata.DeployResult` for more details.

FeedItemTypeEnum Enum

The type of feed item in a feed-based page layout.

Enum Values

The following are the values of the `Metadata.FeedItemTypeEnum` enum.

Value	Description
`ActivityEvent`	Activity on tasks and events associated with a case. Available only on Case layouts.
`AdvancedTextPost`	Group announcements posted on a feed.
`AnnouncementPost`	Not used.
`ApprovalPost`	Approvals submitted on a feed.
`AttachArticleEvent`	Activity related to attaching articles to cases.
`BasicTemplateFeedItem`	Activity from the Log a Call action. Available only on layouts for objects that support Activities (tasks and events).
`CallLogPost`	Activity from the Log a Call action. Available only on layouts for objects that support Activities (tasks and events).
`CanvasPost`	Posts a canvas app makes on a feed.
`CaseCommentPost`	Activity from the Case Note action. Available only on Case layouts.
`ChangeStatusPost`	Activity from the Change Status action. Available only on Case layouts.
`ChatTranscriptPost`	Activity related to attaching Chat transcripts to cases. Available only on Case layouts.
`CollaborationGroupCreated`	Creating a public group.
`CollaborationGroupUnarchived`	Not used.
`ContentPost`	Attaching a file to a post.
`CreateRecordEvent`	Creating a record from the publisher.
`DashboardComponentAlert`	Not used.
`DashboardComponentSnapshot`	Posting a dashboard snapshot on a feed.
`EmailMessageEvent`	Activity from the Email action. Available only on Case layouts.
`FacebookPost`	Not used.

Value	Description
`LinkPost`	Attaching a URL to a post.
`MilestoneEvent`	Changing the milestone status on a case. Available only on Case layouts.
`PollPost`	Posting a poll on a feed.
`ProfileSkillPost`	Adding skills to a user's Chatter profile.
`QuestionPost`	Posting a question on a feed.
`ReplyPost`	Activity from the Portal action. Available only on Case layouts.
`RypplePost`	Creating a Thanks badge in WDC.
`SocialPost`	Activity on Twitter from the Social Post action.
`TestItem`	Creating a text post from the publisher.
`TextPost`	Making a change or group of changes to a tracked field.
`TrackedChange`	Not used.
`Undefined`	Undefined feed item.
`UserStatus`	Not used.

FeedLayout Class

Represents the values that define the feed view of a feed-based page layout. Feed-based layouts are available on Account, Case, Contact, Lead, Opportunity, custom, and external objects. They include a feed view and a detail view.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "FeedLayout" in the *Metadata API Developer Guide*.

IN THIS SECTION:

FeedLayout Properties

FeedLayout Methods

FeedLayout Properties

The following are properties for `FeedLayout`.

IN THIS SECTION:

autocollapsePublisher
Specifies whether the publisher is collapsed when the page loads (true) or not (false).

compactFeed
Specifies whether the feed-based page layout uses a compact feed (true) or not (false). If set to true, feed items on the page are collapsed by default, and the feed view has an updated design.

feedFilterPosition
Indicates where the feed filters list is included in the layout.

feedFilters
The individual filters displayed in the feed filters list.

fullWidthFeed
Specifies whether the feed expands horizontally to take up all available space on the page (`true`) or not (`false`).

hideSidebar
Specifies whether the sidebar is hidden (`true`) or not (`false`).

highlightExternalFeedItems
Controls whether to highlight external feed items (true) or not (false).

leftComponents
The individual components displayed in the left column of the feed view.

rightComponents
Lists the individual components displayed in the right column of the feed view.

useInlineFiltersInConsole
Indicates whether to use inline filters in the Salesforce console.

`autocollapsePublisher`

Specifies whether the publisher is collapsed when the page loads (true) or not (false).

Signature

```
public Boolean autocollapsePublisher {get; set;}
```

Property Value

Type: Boolean

`compactFeed`

Specifies whether the feed-based page layout uses a compact feed (true) or not (false). If set to true, feed items on the page are collapsed by default, and the feed view has an updated design.

Signature

```
public Boolean compactFeed {get; set;}
```

Property Value

Type: Boolean

`feedFilterPosition`

Indicates where the feed filters list is included in the layout.

Signature

```
public Metadata.FeedLayoutFilterPosition feedFilterPosition {get; set;}
```

Property Value

Type: FeedLayoutFilterPosition Enum

`feedFilters`

The individual filters displayed in the feed filters list.

Signature

```
public List<Metadata.FeedLayoutFilter> feedFilters {get; set;}
```

Property Value

Type: List<FeedLayoutFilter Class>.

`fullWidthFeed`

Specifies whether the feed expands horizontally to take up all available space on the page (`true`) or not (`false`).

Signature

```
public Boolean fullWidthFeed {get; set;}
```

Property Value

Type: Boolean

`hideSidebar`

Specifies whether the sidebar is hidden (`true`) or not (`false`).

Signature

```
public Boolean hideSidebar {get; set;}
```

Property Value

Type: Boolean

highlightExternalFeedItems

Controls whether to highlight external feed items (true) or not (false).

Signature

```
public Boolean highlightExternalFeedItems {get; set;}
```

Property Value

Type: Boolean

leftComponents

The individual components displayed in the left column of the feed view.

Signature

```
public List<Metadata.FeedLayoutComponent> leftComponents {get; set;}
```

Property Value

Type: List<FeedLayoutComponent Class>

rightComponents

Lists the individual components displayed in the right column of the feed view.

Signature

```
public List<Metadata.FeedLayoutComponent> rightComponents {get; set;}
```

Property Value

Type: List<FeedLayoutComponent Class>

useInlineFiltersInConsole

Indicates whether to use inline filters in the Salesforce console.

Signature

```
public Boolean useInlineFiltersInConsole {get; set;}
```

Property Value

Type: Boolean

FeedLayout Methods

The following are methods for `FeedLayout`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.FeedLayout`.

`clone()`

Makes a duplicate copy of the `Metadata.FeedLayout`.

Signature

```
public Object clone()
```

Return Value

Type: Object

FeedLayoutComponent Class

Represents a component in the feed view of a feed-based page layout.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "FeedLayoutComponent" in the *Metadata API Developer Guide*.

IN THIS SECTION:

FeedLayoutComponent Properties
FeedLayoutComponent Methods

FeedLayoutComponent Properties

The following are properties for `FeedLayoutComponent`.

See `FeedLayoutComponent` in the *Metadata API Developer Guide*

IN THIS SECTION:

componentType
Represents a component in the feed view of a feed-based page layout. The type of component is required.
height
The height, in pixels, of the component. Doesn't apply to `standardComponents`
page_x
The name of the Visualforce page used as a custom component.

componentType

Represents a component in the feed view of a feed-based page layout. The type of component is required.

Signature

```
public Metadata.FeedLayoutComponentType componentType {get; set;}
```

Property Value

Type: Metadata.FeedLayoutComponentType on page 2622

height

The height, in pixels, of the component. Doesn't apply to `standardComponents`

Signature

```
public Integer height {get; set;}
```

Property Value

Type: Integer

page_x

The name of the Visualforce page used as a custom component.

Signature

```
public String page_x {get; set;}
```

Property Value

Type: String

FeedLayoutComponent Methods

The following are methods for `FeedLayoutComponent`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.FeedLayoutComponent`.

clone()

Makes a duplicate copy of the `Metadata.FeedLayoutComponent`.

Signature

```
public Object clone()
```

Return Value

Type: Object

FeedLayoutComponentType Enum

Indicates the type of feed layout component.

Enum Values

The following are the values of the `Metadata.FeedLayoutComponentType` enum.

Value	Description
`CaseExperts`	List of case experts.
`CaseUnifiedFiles`	List of all files attached to the case.
`CustomButtons`	Custom button.
`CustomLinks`	Custom link.
`Followers`	List of followers.
`Following`	Icon that toggles between a Follow button (if the user viewing a record doesn't already follow it) and a Following indicator (if the user viewing a record does follow it).
`HelpAndToolLinks`	Icons that link to the help topic for the page, the page layout, and, the printable view of the page. Available only on Case layouts.
`Milestones`	Milestone tracker, which lets users see the status of a milestone on a case. Available only on Case layouts.
`SimilarCases`	List of similar cases.
`Topics`	List of topics related to the record.
`Visualforce`	Custom Visualforce component.

FeedLayoutFilter Class

Represents a feed filter option in the feed view of a feed-based page layout. A filter can have only `standardFilter` or `feedItemType` set.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "FeedLayoutFilter" in the *Metadata API Developer Guide*.

IN THIS SECTION:

FeedLayoutFilter Properties

FeedLayoutFilter Methods

FeedLayoutFilter Properties

The following are properties for `FeedLayoutFilter`.

IN THIS SECTION:

feedFilterName

The name of a `CustomFeedFilter` component. Names are prefixed with the name of the parent object. For example, `Case.MyCustomFeedFilter`.

feedFilterType

The type of filter.

feedItemType

The type of feed item to display.

`feedFilterName`

The name of a `CustomFeedFilter` component. Names are prefixed with the name of the parent object. For example, `Case.MyCustomFeedFilter`.

Signature

```
public String feedFilterName {get; set;}
```

Property Value

Type: String

`feedFilterType`

The type of filter.

Signature

```
public Metadata.FeedLayoutFilterType feedFilterType {get; set;}
```

Property Value

Type: FeedLayoutFilterType Enum

`feedItemType`

The type of feed item to display.

Signature

```
public Metadata.FeedItemTypeEnum feedItemType {get; set;}
```

Property Value

Type: FeedItemTypeEnum Enum

FeedLayoutFilter Methods

The following are methods for `FeedLayoutFilter`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.FeedLayoutFilter`.

`clone()`

Makes a duplicate copy of the `Metadata.FeedLayoutFilter`.

Signature

```
public Object clone()
```

Return Value

Type: Object

FeedLayoutFilterPosition Enum

Describes where the feed filters list is included in the layout.

Enum Values

The following are the values of the `Metadata.FeedLayoutFilterPosition` enum.

Value	Description
`CenterDropDown`	As a drop-down list in the center column.
`LeftFixed`	As a fixed list in the left column.
`LeftFloat`	As a floating list in the left column.

FeedLayoutFilterType Enum

The type of feed layout filter.

Enum Values

The following are the values of the `Metadata.FeedLayoutFilterType` enum.

Value	Description
`AllUpdates`	Shows all feed items on a record.
`Custom`	Shows custom feed items.
`FeedItemType`	Shows feed items only for a particular type of activity on the record.

Layout Class

Represents the metadata associated with a page layout.

Namespace

Metadata

Usage

Use this class to access layout metadata components. For more information, see Layout in the *Metadata API Developer Guide*.

IN THIS SECTION:

Layout Properties

Layout Methods

Layout Properties

The following are properties for `Layout`.

IN THIS SECTION:

customButtons

The custom buttons for this layout.

customConsoleComponents

Represents custom console components (Visualforce pages, lookup fields, or related lists) on a page layout.

emailDefault

Default value for the email checkbox. Only relevant if the `showEmailCheckbox` property is set.

excludeButtons

List of standard buttons to exclude from this layout.

feedLayout

Represents the values that define the feed view of a feed-based page layout.

headers

Represents the layout headers used for tagging.

layoutSections

The main sections of the layout containing fields, s-controls, and custom links. The order here determines the layout order.

miniLayout

Represents a minilayout, which is used in the mini view of a record in the Console tab, hover details, and event overlays.

multilineLayoutFields

Fields for special multiline layout fields which appear in OpportunityProduct layouts.

platformActionList

The list of actions, and their order, that display in the Salesforce mobile action bar for the layout.

quickActionList

The list of quick actions that display in the full Salesforce site for the page layout.

relatedContent

The Related Content section of the page layout.

relatedLists

The related lists for the layout, listed in the order they appear in the user interface.

relatedObjects

The list of related objects that appears in the mini view of the console.

runAssignmentRulesDefault

Default value for the "run assignment rules" checkbox. Only relevant if the `showRunAssignmentRulesCheckbox` property is set.

showEmailCheckbox

Controls whether to show the email checkbox. Only allowed on Case, CaseClose, and Task layouts. The default state of checkbox is controlled by the `emailDefault` property.

showHighlightsPanel

If set, the highlights panel displays on pages in the Salesforce console.

showInteractionLogPanel

If set, the interaction log displays on pages in the Salesforce console.

showKnowledgeComponent

Only allowed on Case layouts. If set, the Knowledge sidebar displays on cases in the Salesforce console.

showRunAssignmentRulesCheckbox

Controls whether to show the Run Assignment Rules checkbox. Only allowed on Lead and Case layouts. The default state of checkbox is controlled by the `runAssignmentRulesDefault` property.

showSolutionSection

Only allowed on CaseClose layout. If set, the built-in solution information section shows up on the page.

showSubmitAndAttachButton

For Cast layouts only. If set, the Submit & Add Attachment button displays on case edit pages to portal users in the Customer Portal.

summaryLayout

The summary layout for this layout.

customButtons

The custom buttons for this layout.

Signature

```
public List<String> customButtons {get; set;}
```

Property Value

Type: List<String>

customConsoleComponents

Represents custom console components (Visualforce pages, lookup fields, or related lists) on a page layout.

Signature

```
public Metadata.CustomConsoleComponents customConsoleComponents {get; set;}
```

Property Value

Type: CustomConsoleComponents Class

emailDefault

Default value for the email checkbox. Only relevant if the `showEmailCheckbox` property is set.

Signature

```
public Boolean emailDefault {get; set;}
```

Property Value

Type: Boolean

excludeButtons

List of standard buttons to exclude from this layout.

Signature

```
public List<String> excludeButtons {get; set;}
```

Property Value

Type: List<String>

feedLayout

Represents the values that define the feed view of a feed-based page layout.

Signature

```
public Metadata.FeedLayout feedLayout {get; set;}
```

Property Value

Type: Metadata.FeedLayout

`headers`

Represents the layout headers used for tagging.

Signature

```
public List<Metadata.LayoutHeader> headers {get; set;}
```

Property Value

Type: List<Metadata.LayoutHeader>

`layoutSections`

The main sections of the layout containing fields, s-controls, and custom links. The order here determines the layout order.

Signature

```
public List<Metadata.LayoutSection> layoutSections {get; set;}
```

Property Value

Type: List<Metadata.LayoutSection>

`miniLayout`

Represents a minilayout, which is used in the mini view of a record in the Console tab, hover details, and event overlays.

Signature

```
public Metadata.MiniLayout miniLayout {get; set;}
```

Property Value

Type: Metadata.MiniLayout

`multilineLayoutFields`

Fields for special multiline layout fields which appear in OpportunityProduct layouts.

Signature

```
public List<String> multilineLayoutFields {get; set;}
```

Property Value

Type: List<String>

platformActionList

The list of actions, and their order, that display in the Salesforce mobile action bar for the layout.

Signature

```
public Metadata.PlatformActionList platformActionList {get; set;}
```

Property Value

Type: Metadata.PlatformActionList

quickActionList

The list of quick actions that display in the full Salesforce site for the page layout.

Signature

```
public Metadata.QuickActionList quickActionList {get; set;}
```

Property Value

Type: Meatadata.QuickActionL.

relatedContent

The Related Content section of the page layout.

Signature

```
public Metadata.RelatedContent relatedContent {get; set;}
```

Property Value

Type: Metadata.RelatedContent

relatedLists

The related lists for the layout, listed in the order they appear in the user interface.

Signature

```
public List<Metadata.RelatedListItem> relatedLists {get; set;}
```

Property Value

Type: List<Metadata.RelatedListItem>

relatedObjects

The list of related objects that appears in the mini view of the console.

Signature

```
public List<String> relatedObjects {get; set;}
```

Property Value

Type: List<String>

runAssignmentRulesDefault

Default value for the "run assignment rules" checkbox. Only relevant if the `showRunAssignmentRulesCheckbox` property is set.

Signature

```
public Boolean runAssignmentRulesDefault {get; set;}
```

Property Value

Type: Boolean

showEmailCheckbox

Controls whether to show the email checkbox. Only allowed on Case, CaseClose, and Task layouts. The default state of checkbox is controlled by the `emailDefault` property.

Signature

```
public Boolean showEmailCheckbox {get; set;}
```

Property Value

Type: Boolean

showHighlightsPanel

If set, the highlights panel displays on pages in the Salesforce console.

Signature

```
public Boolean showHighlightsPanel {get; set;}
```

Property Value

Type: Boolean

showInteractionLogPanel

If set, the interaction log displays on pages in the Salesforce console.

Signature

```
public Boolean showInteractionLogPanel {get; set;}
```

Property Value

Type: Boolean

showKnowledgeComponent

Only allowed on Case layouts. If set, the Knowledge sidebar displays on cases in the Salesforce console.

Signature

```
public Boolean showKnowledgeComponent {get; set;}
```

Property Value

Type: Boolean

showRunAssignmentRulesCheckbox

Controls whether to show the Run Assignment Rules checkbox. Only allowed on Lead and Case layouts. The default state of checkbox is controlled by the `runAssignmentRulesDefault` property.

Signature

```
public Boolean showRunAssignmentRulesCheckbox {get; set;}
```

Property Value

Type: Boolean

showSolutionSection

Only allowed on CaseClose layout. If set, the built-in solution information section shows up on the page.

Signature

```
public Boolean showSolutionSection {get; set;}
```

Property Value

Type: Boolean

showSubmitAndAttachButton

For Cast layouts only. If set, the Submit & Add Attachment button displays on case edit pages to portal users in the Customer Portal.

Signature

```
public Boolean showSubmitAndAttachButton {get; set;}
```

Property Value

Type: Boolean

summaryLayout

The summary layout for this layout.

Signature

```
public Metadata.SummaryLayout summaryLayout {get; set;}
```

Property Value

Type: Metadata.SummaryLayout

Layout Methods

The following are methods for `Layout`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.Layout`.

clone()

Makes a duplicate copy of the `Metadata.Layout`.

Signature

```
public Object clone()
```

Return Value

Type: Object

LayoutColumn Class

Represents the items in a column within a layout section.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "LayoutColumn" in the *Metadata API Developer Guide*.

IN THIS SECTION:

LayoutColumn Properties

LayoutColumn Methods

LayoutColumn Properties

The following are properties for `LayoutColumn`.

IN THIS SECTION:

layoutItems
The individual items within a column (ordered from top to bottom).

reserved
This field is reserved for Salesforce.

`layoutItems`

The individual items within a column (ordered from top to bottom).

Signature

```
public List<Metadata.LayoutItem> layoutItems {get; set;}
```

Property Value

Type: List<Metadata.LayoutItem>

`reserved`

This field is reserved for Salesforce.

Signature

```
public String reserved {get; set;}
```

Property Value

Type: String

LayoutColumn Methods

The following are methods for `LayoutColumn`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.LayoutColumn`.

`clone()`

Makes a duplicate copy of the `Metadata.LayoutColumn`.

Signature

```
public Object clone()
```

Return Value

Type: Object

LayoutHeader Enum

Represents tagging types used for `Metadata.Layout.headers`

Enum Values

The following are the values of the `Metadata.LayoutHeader` enum.

Value	Description
`PersonalTagging`	Tag is set to private user.
`PublicTagging`	Tag is viewable to any user who can access the record.

LayoutItem Class

Represents the valid values that define a layout item.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "LayoutItem" in the *Metadata API Developer Guide*.

IN THIS SECTION:

LayoutItem Properties

LayoutItem Methods

LayoutItem Properties

The following are properties for `LayoutItem`.

IN THIS SECTION:

analyticsCloudComponent
A Wave Analytics dashboard component on a page.

behavior
Determines the field behavior.

canvas
References a canvas app.

component
References a component.

customLink
The custom link reference.

emptySpace
Controls if this layout item is a blank space.

field
The field name reference, relative to the layout, for example “Description” or “MyField__c”.

height
For s-controls and pages only, the height in pixels.

page_x
Reference to a Visualforce page.

reportChartComponent
Refers to a report chart that you can add to a standard or custom object page.

scontrol
Reference to an s-control.

showLabel
For s-control and pages only, whether to show the label.

showScrollbars
For s-control and pages only, whether to show scrollbars.

width
For s-control and pages only, the width in pixels or percent. Pixel values are simply the number of pixels, for example, 500. Percentage values must include the percent sign, for example, 20%.

`analyticsCloudComponent`

A Wave Analytics dashboard component on a page.

Signature

```
public Metadata.AnalyticsCloudComponentLayoutItem analyticsCloudComponent {get; set;}
```

Property Value

Type: Metadata.AnalyticsCloudComponentLayoutItem

`behavior`

Determines the field behavior.

Signature

```
public Metadata.UiBehavior behavior {get; set;}
```

Property Value

Type: Metadata.UiBehavior

`canvas`

References a canvas app.

Signature

```
public String canvas {get; set;}
```

Property Value

Type: String

`component`

References a component.

Signature

```
public String component {get; set;}
```

Property Value

Type: String

`customLink`

The custom link reference.

Signature

```
public String customLink {get; set;}
```

Property Value

Type: String

emptySpace

Controls if this layout item is a blank space.

Signature

```
public Boolean emptySpace {get; set;}
```

Property Value

Type: Boolean

field

The field name reference, relative to the layout, for example “Description” or “MyField__c”.

Signature

```
public String field {get; set;}
```

Property Value

Type: String

height

For s-controls and pages only, the height in pixels.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: Integer

page_x

Reference to a Visualforce page.

Signature

```
public String page_x {get; set;}
```

Property Value

Type: String

reportChartComponent

Refers to a report chart that you can add to a standard or custom object page.

Signature

```
public Metadata.ReportChartComponentLayoutItem reportChartComponent {get; set;}
```

Property Value

Type: Metadata.ReportChartComponentLayoutItem

scontrol

Reference to an s-control.

Signature

```
public String scontrol {get; set;}
```

Property Value

Type: String

showLabel

For s-control and pages only, whether to show the label.

Signature

```
public Boolean showLabel {get; set;}
```

Property Value

Type: Boolean

showScrollbars

For s-control and pages only, whether to show scrollbars.

Signature

```
public Boolean showScrollbars {get; set;}
```

Property Value

Type: Boolean

`width`

For s-control and pages only, the width in pixels or percent. Pixel values are simply the number of pixels, for example, 500. Percentage values must include the percent sign, for example, 20%.

Signature

```
public String width {get; set;}
```

Property Value

Type: String

LayoutItem Methods

The following are methods for `LayoutItem`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.LayoutItem`.

`clone()`

Makes a duplicate copy of the `Metadata.LayoutItem`.

Signature

```
public Object clone()
```

Return Value

Type: Object

LayoutSection Class

Represents a section of a page layout, such as the Custom Links section.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "LayoutSection" in the *Metadata API Developer Guide*.

IN THIS SECTION:

LayoutSection Properties

LayoutSection Methods

LayoutSection Properties

The following are properties for `LayoutSection`.

IN THIS SECTION:

customLabel
Indicates if this section's label is custom or standard (built-in).

detailHeading
Controls if this section appears in the detail page.

editHeading
Controls if this section appears in the edit page.

label
The label; either standard or custom, based on the customLabel property.

layoutColumns
Lists the layout columns. You can have one, two, or three columns, ordered left to right, are possible.

style
The style of the layout for this section.

`customLabel`

Indicates if this section's label is custom or standard (built-in).

Signature

```
public Boolean customLabel {get; set;}
```

Property Value

Type: Boolean

`detailHeading`

Controls if this section appears in the detail page.

Signature

```
public Boolean detailHeading {get; set;}
```

Property Value

Type: Boolean

`editHeading`

Controls if this section appears in the edit page.

Signature

```
public Boolean editHeading {get; set;}
```

Property Value

Type: Boolean

`label`

The label; either standard or custom, based on the customLabel property.

Signature

```
public String label {get; set;}
```

Property Value

Type: String

`layoutColumns`

Lists the layout columns. You can have one, two, or three columns, ordered left to right, are possible.

Signature

```
public List<Metadata.LayoutColumn> layoutColumns {get; set;}
```

Property Value

Type: List<Metadata.LayoutColumn>

`style`

The style of the layout for this section.

Signature

```
public Metadata.LayoutSectionStyle style {get; set;}
```

Property Value

Type: Metadata.LayoutSectionStyle

LayoutSection Methods

The following are methods for `LayoutSection`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.LayoutSection`.

clone()

Makes a duplicate copy of the `Metadata.LayoutSection`.

Signature

```
public Object clone()
```

Return Value

Type: Object

LayoutSectionStyle Enum

Describes the possible styles for a layout section.

Enum Values

The following are the values of the `Metadata.LayoutSectionStyle` enum.

Value	Description
`CustomLinks`	Contains custom links only
`OneColumn`	One column
`TwoColumnsLeftToRight`	Two columns, tab goes left to right
`TwoColumnsTopToBottom`	Two columns, tab goes top to bottom

Metadata Class

An abstract base class that represents a custom metadata component.

Namespace

Metadata

Usage

You can't create instances of this abstract class. Instead, create an instance of a specific custom metadata component class that derives from `Metadata.Metadata`, such as `Metadata.CustomMetadata`. For more information, see Metadata in the *Metadata API Developer Guide*.

IN THIS SECTION:

Metadata Properties

Metadata Methods

Metadata Properties

The following are properties for `Metadata`.

IN THIS SECTION:

fullName
The full name of the custom metadata, which can include the namespace, type, and component name.

`fullName`

The full name of the custom metadata, which can include the namespace, type, and component name.

Signature

```
public String fullName {get; set;}
```

Property Value

Type: String

The format of the full name can include the namespace, metadata type, and metadata component name. If you're updating components in a namespace, you also need to qualify the namespace for the component in the full name. For example, the full name for a custom metadata "MDType1__mdt" component named "Component1" that is contained in the "myPackage" namespace is "myPackage__MDType1__mdt.myPackage__Component1". For more information on full name formats for different metadata types, see reference documentation on the metadata types in the *Metadata API Developer Guide*.

Metadata Methods

The following are methods for `Metadata`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.Metadata`.

`clone()`

Makes a duplicate copy of the `Metadata.Metadata`.

Signature

```
public Object clone()
```

Return Value

Type: Object

MetadataType Enum

Represents the custom metadata components available in Apex.

Enum Values

The following are the values of the `Metadata.MetadataType` enum.

Value	Description
`CustomMetadata`	Records of custom metadata types
`Layout`	Layouts

MetadataValue Class

An abstract base class that represents a custom metadata component field.

Namespace

Metadata

Usage

You can't create instances of this abstract class. Instead, create an instance of a specific custom metadata component value class that derives from `Metadata.MetadataValue`, such as `Metadata.CustomMetadataValue`.

IN THIS SECTION:

MetadataValue Methods

MetadataValue Methods

The following are methods for `MetadataValue`.

IN THIS SECTION:

clone()

Makes a duplicate copy of the `Metadata.MetadataValue`.

`clone()`

Makes a duplicate copy of the `Metadata.MetadataValue`.

Signature

```
public Object clone()
```

Return Value

Type: Object

MiniLayout Class

Represents a mini view of a record in the Console tab, hover details, and event overlays.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "MiniLayout" in the *Metadata API Developer Guide*.

IN THIS SECTION:

MiniLayout Properties

MiniLayout Methods

MiniLayout Properties

The following are properties for `MiniLayout`.

IN THIS SECTION:

fields

The fields for the mini-layout, listed in the order they appear in the UI. Fields that appear in the mini-layout must appear in the main layout.

relatedLists

The mini related lists, listed in the order they appear in the UI. You cannot set sorting on mini related lists. Fields that appear in the mini related lists must appear in the main layout.

`fields`

The fields for the mini-layout, listed in the order they appear in the UI. Fields that appear in the mini-layout must appear in the main layout.

Signature

```
public List<String> fields {get; set;}
```

Property Value

Type: List<String>

`relatedLists`

The mini related lists, listed in the order they appear in the UI. You cannot set sorting on mini related lists. Fields that appear in the mini related lists must appear in the main layout.

Signature

```
public List<Metadata.RelatedListItem> relatedLists {get; set;}
```

Property Value

Type: List<Metadata.RelatedListItem>

MiniLayout Methods

The following are methods for `MiniLayout`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.MiniLayout`.

`clone()`

Makes a duplicate copy of the `Metadata.MiniLayout`.

Signature

```
public Object clone()
```

Return Value

Type: Object

Operations Class

Represents a class to execute metadata operations, such as retrieving or deploying custom metadata.

Namespace

Metadata

Usage

Use the `Metadata.Operations` class to execute metadata operations. For more information on use cases and restrictions of metadata operations in Apex, see Metadata.

Example: Retrieve Metadata

The following example retrieves the "MyTestCustomMDType" custom metadata record from the subscriber org, and inspects the custom fields.

```
public class ReadMetadata {
  public void retrieveMetadata () {
    // List fullnames of components we want to retrieve
    List<String> componentNameList =
new List<String>{'ISVNamespace__TestCustomMDType.MyTestCustomMDType'};

    // Retrieve components that are records of custom metadata types
    // based on name
    List<Metadata.Metadata> components = Metadata.Operations.retrieve(
Metadata.MetadataType.CustomMetadata, componentNameList);
    Metadata.CustomMetadata customMetadataRecord = (Metadata.CustomMetadata)
components.get(0);

    // Check fields of retrieved component
    List<Metadata.CustomMetadataValue> values = customMetadataRecord.values;
    for (integer i = 0; i < values.size(); i++) {
      if (values.get(i).field == 'testField__c' &&
          values.get(i).value == 'desired value') {
        // ...process accordingly...
      }
    }
  }
}
```

Example: Deploy Metadata

The following example uses the Metadata API in Apex to update the customField custom field value of the MetadataRecordName custom metadata record and deploy this change into the subscriber org. Because the deployment is asynchronous, you must provide a callback class that implements the `Metadata.DeployCallback` interface, which is then used when the queued deployment completes.

```
public class CreateMetadata{
  public void updateAndDeployMetadata() {
    // Setup custom metadata to be created in the subscriber org.
    Metadata.CustomMetadata customMetadata =  new Metadata.CustomMetadata();
    customMetadata.fullName = 'ISVNamespace__MetadataTypeName.MetadataRecordName';

    Metadata.CustomMetadataValue customField = new Metadata.CustomMetadataValue();
    customField.field = 'customField__c';
    customField.value = 'New value';

    customMetadata.values.add(customField);

    Metadata.DeployContainer mdContainer = new Metadata.DeployContainer();
    mdContainer.addMetadata(customMetadata);

    // Setup deploy callback, MyDeployCallback implements
    // the Metadata.DeployCallback interface (code for
    // this class not shown in this example)
    MyDeployCallback callback = new MyDeployCallback();
```

```
    // Enqueue custom metadata deployment
    Id jobId = Metadata.Operations.enqueueDeployment(mdContainer, callback);
  }
}
```

Example: Create Two Metadata Records Synchronously

Create a metadata record along with another one that references it in the same transaction. If the parent record was installed with a namespace, prefix the developer name with *recordNs__*.

Note: No custom metadata relationship can relate records of the same type to each other.

```
public class CreateMetadata {

    public Id doCreate(
        String parentRecDevName,
        String parentRecLabel,
        String childRecDevName,
        String childRecLabel) {

        Metadata.DeployContainer mdContainer = new Metadata.DeployContainer();

        Metadata.CustomMetadata parentRecord = new Metadata.CustomMetadata();
        parentRecord.fullName = 'ParentType.' + parentRecDevName;
        parentRecord.label = parentRecLabel;
        mdContainer.addMetadata(parentRecord);

        Metadata.CustomMetadata childRecord = new Metadata.CustomMetadata();
        childRecord.fullName = 'ChildType.' + childRecDevName;
        childRecord.label = childRecLabel;
        Metadata.CustomMetadataValue relValue = new Metadata.CustomMetadataValue();
        relValue.field = 'Parent__c';
        relValue.value = parentRecDevName;
        childRecord.values.add(relValue);
        mdContainer.addMetadata(childRecord);

        Id jobId = Metadata.Operations.enqueueDeployment(mdContainer, null);
        return jobId;
    }

}
```

IN THIS SECTION:

Operations Methods

Operations Methods

The following are methods for `Operations`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.Operations`.

enqueueDeployment(container, callback)
Deploys custom metadata components asynchronously.

retrieve(type, fullNames)
Retrieves a list of custom metadata components.

clone()

Makes a duplicate copy of the `Metadata.Operations`.

Signature

```
public Object clone()
```

Return Value

Type: Object

enqueueDeployment(container, callback)

Deploys custom metadata components asynchronously.

Signature

```
public static Id enqueueDeployment(Metadata.DeployContainer container,
Metadata.DeployCallback callback)
```

Parameters

container
Type: Metadata.DeployContainer

Container that contains the set of metadata components to deploy.

callback
Type: Metadata.DeployCallback

A class that implements the `Metadata.DeployCallback` interface. Used by Salesforce to return information about the deployment results.

Return Value

Type: Id

ID of deployment request.

retrieve(type, fullNames)

Retrieves a list of custom metadata components.

Signature

```
public static List<Metadata.Metadata> retrieve(Metadata.MetadataType type, List<String>
fullNames)
```

Parameters

type
Type: Metadata.MetadataType

The metadata component type.

fullNames
Type: List<String>

A list of component names to retrieve. For information on component name formats, see Metadata.fullName().

Return Value

Type: List<Metadata.Metadata>

PlatformActionList Class

Represents the list of actions, and their order, that display in the Salesforce mobile action bar for the layout.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "PlatformActionList" in the *Metadata API Developer Guide*.

IN THIS SECTION:

PlatformActionList Properties

PlatformActionList Methods

PlatformActionList Properties

The following are properties for `PlatformActionList`.

IN THIS SECTION:

actionListContext
The context of the action list.

platformActionListItems
The actions in the platform action list.

relatedSourceEntity

When the `actionListContext` property is "RelatedList" or" "RelatedListRecord", this field represents the API name of the related list to which the action belongs.

`actionListContext`

The context of the action list.

Signature

```
public Metadata.PlatformActionListContextEnum actionListContext {get; set;}
```

Property Value

Type: Metadata.PlatformActionListContextEnum

`platformActionListItems`

The actions in the platform action list.

Signature

```
public List<Metadata.PlatformActionListItem> platformActionListItems {get; set;}
```

Property Value

Type: List<Metadata.PlatformActionListItem>

`relatedSourceEntity`

When the `actionListContext` property is "RelatedList" or" "RelatedListRecord", this field represents the API name of the related list to which the action belongs.

Signature

```
public String relatedSourceEntity {get; set;}
```

Property Value

Type: String

PlatformActionList Methods

The following are methods for `PlatformActionList`.

IN THIS SECTION:

clone()

Makes a duplicate copy of the `Metadata.PlatformActionList`.

`clone()`

Makes a duplicate copy of the `Metadata.PlatformActionList`.

Signature

```
public Object clone()
```

Return Value

Type: Object

PlatformActionListContextEnum Enum

Describes the different contexts of action lists.

Enum Values

The following are the values of the `Metadata.PlatformActionListContextEnum` enum.

Value	Description
`ActionDefinition`	Action definition context.
`Assistant`	Assistant context.
`BannerPhoto`	Banner photo context.
`Chatter`	Chatter context.
`Dockable`	Dockable context.
`FeedElement`	Feed element context.
`Flexipage`	Flexipage context.
`Global_x`	Global context.
`ListView`	Listview context.
`ListViewDefinition`	Listview definition context.
`ListViewRecord`	Listview record context.
`Lookup`	Lookup context.
`MruList`	MRU list context.
`MruRow`	MRU row context.
`ObjectHomeChart`	Object home chart context.
`Photo`	Photo context
`Record`	Record context.
`RecordEdit`	Record edit context

Value	Description
`RelatedList`	Related list context.
`RelatedListRecord`	Related list record context.

PlatformActionListItem Class

Represents an action in the platform action list for a layout.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "PlatformActionListItem" in the *Metadata API Developer Guide*.

IN THIS SECTION:

PlatformActionListItem Properties

PlatformActionListItem Methods

PlatformActionListItem Properties

The following are properties for `PlatformActionListItem`.

IN THIS SECTION:

actionName
The API name for the action in the list.

actionType
The type of action.

sortOrder
The placement of the action in the list.

subtype
The subtype of the action.

`actionName`

The API name for the action in the list.

Signature

```
public String actionName {get; set;}
```

Property Value

Type: String

`actionType`

The type of action.

Signature

```
public Metadata.PlatformActionTypeEnum actionType {get; set;}
```

Property Value

Type: Metadata.PlatformActionTypeEnum

`sortOrder`

The placement of the action in the list.

Signature

```
public Integer sortOrder {get; set;}
```

Property Value

Type: Integer

`subtype`

The subtype of the action.

Signature

```
public String subtype {get; set;}
```

Property Value

Type: String

PlatformActionListItem Methods

The following are methods for `PlatformActionListItem`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.PlatformActionListItem`.

`clone()`

Makes a duplicate copy of the `Metadata.PlatformActionListItem`.

Signature

```
public Object clone()
```

Return Value

Type: Object

PlatformActionTypeEnum Enum

The type of action for a `PlatformActionListItem`.

Enum Values

The following are the values of the `Metadata.PlatformActionTypeEnum` enum.

Value	Description
`ActionLink`	An indicator on a feed element that targets an API, a web page, or a file, represented by a button in the Salesforce Chatter feed UI.
`CustomButton`	When clicked, opens a URL or a Visualforce page in a window or executes JavaScript.
`InvocableAction`	An invocable action such as posting to Chatter.
`ProductivityAction`	Productivity actions are predefined by Salesforce and are attached to a limited set of objects. You can't edit or delete productivity actions.
`QuickAction`	A global or object-specific action.
`StandardButton`	A predefined Salesforce button such as New, Edit, and Delete.

PrimaryTabComponents Class

Represents custom console components on primary tabs in the Salesforce console.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "PrimaryTabComponents" in the *Metadata API Developer Guide*.

IN THIS SECTION:

PrimaryTabComponents Properties

PrimaryTabComponents Methods

PrimaryTabComponents Properties

The following are properties for `PrimaryTabComponents`.

IN THIS SECTION:

component

Represents a custom console component (Visualforce page, lookup field, or related lists) on a section of a page layout.

containers

Represents a location and style in which to display more than one custom console component on the sidebars of the Salesforce console.

`component`

Represents a custom console component (Visualforce page, lookup field, or related lists) on a section of a page layout.

Signature

```
public List<Metadata.ConsoleComponent> component {get; set;}
```

Property Value

Type: List<Metadata.ConsoleComponent>

`containers`

Represents a location and style in which to display more than one custom console component on the sidebars of the Salesforce console.

Signature

```
public List<Metadata.Container> containers {get; set;}
```

Property Value

Type: List<Metadata.Container>

PrimaryTabComponents Methods

The following are methods for `PrimaryTabComponents`.

IN THIS SECTION:

clone()

Makes a duplicate copy of the `Metadata.PrimaryTabComponents`.

clone()

Makes a duplicate copy of the `Metadata.PrimaryTabComponents`.

Signature

```
public Object clone()
```

Return Value

Type: Object

QuickActionList Class

Represents the list of actions associated with the page layout.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "QuickActionList" in the *Metadata API Developer Guide*.

IN THIS SECTION:

QuickActionList Properties

QuickActionList Methods

QuickActionList Properties

The following are properties for `QuickActionList`.

IN THIS SECTION:

quickActionListItems
List of `QuickActionList` objects.

quickActionListItems

List of `QuickActionList` objects.

Signature

```
public List<Metadata.QuickActionListItem> quickActionListItems {get; set;}
```

Property Value

Type: List<Metadata.QuickActionListItem>

QuickActionList Methods

The following are methods for `QuickActionList`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.QuickActionList`.

`clone()`

Makes a duplicate copy of the `Metadata.QuickActionList`.

Signature

```
public Object clone()
```

Return Value

Type: Object

QuickActionListItem Class

Represents an action in the `QuickActionList`.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "QuickActionListItem" in the *Metadata API Developer Guide*.

IN THIS SECTION:

QuickActionListItem Properties

QuickActionListItem Methods

QuickActionListItem Properties

The following are properties for `QuickActionListItem`.

IN THIS SECTION:

quickActionName
The API name of the action.

quickActionName

The API name of the action.

Signature

```
public String quickActionName {get; set;}
```

Property Value

Type: String

QuickActionListItem Methods

The following are methods for `QuickActionListItem`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.QuickActionListItem`.

clone()

Makes a duplicate copy of the `Metadata.QuickActionListItem`.

Signature

```
public Object clone()
```

Return Value

Type: Object

RelatedContent Class

Represents the Mobile Cards section of the page layout.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "RelatedContent" in the *Metadata API Developer Guide*.

IN THIS SECTION:

RelatedContent Properties

RelatedContent Methods

RelatedContent Properties

The following are properties for `RelatedContent`.

IN THIS SECTION:

relatedContentItems
A list of layout items in the Mobile Cards section of the page layout.

`relatedContentItems`

A list of layout items in the Mobile Cards section of the page layout.

Signature

```
public List<Metadata.RelatedContentItem> relatedContentItems {get; set;}
```

Property Value

Type: List<Metadata.RelatedContentItem>

RelatedContent Methods

The following are methods for `RelatedContent`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.RelatedContent`.

`clone()`

Makes a duplicate copy of the `Metadata.RelatedContent`.

Signature

```
public Object clone()
```

Return Value

Type: Object

RelatedContentItem Class

Represents an individual item in the `RelatedContent` list.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "RelatedContentItem" in the *Metadata API Developer Guide*.

IN THIS SECTION:

RelatedContentItem Properties

RelatedContentItem Methods

RelatedContentItem Properties

The following are properties for `RelatedContentItem`.

IN THIS SECTION:

layoutItem
An individual layout item in the Mobile Cards section.

`layoutItem`

An individual layout item in the Mobile Cards section.

Signature

```
public Metadata.LayoutItem layoutItem {get; set;}
```

Property Value

Type: Metadata.LayoutItem

RelatedContentItem Methods

The following are methods for `RelatedContentItem`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.RelatedContentItem`.

`clone()`

Makes a duplicate copy of the `Metadata.RelatedContentItem`.

Signature

```
public Object clone()
```

Return Value

Type: Object

RelatedList Class

Represents related list custom components on the sidebars of the Salesforce console.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "RelatedList" in the *Metadata API Developer Guide*.

IN THIS SECTION:

RelatedList Properties

RelatedList Methods

RelatedList Properties

The following are properties for `RelatedList`.

IN THIS SECTION:

hideOnDetail

When set to true, the related list is hidden from detail pages where it appears as a component to prevent duplicate information from showing.

name

The name of the component as it appears to console users.

`hideOnDetail`

When set to true, the related list is hidden from detail pages where it appears as a component to prevent duplicate information from showing.

Signature

```
public Boolean hideOnDetail {get; set;}
```

Property Value

Type: Boolean

name

The name of the component as it appears to console users.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

RelatedList Methods

The following are methods for `RelatedList`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.RelatedList`.

clone()

Makes a duplicate copy of the `Metadata.RelatedList`.

Signature

```
public Object clone()
```

Return Value

Type: Object

RelatedListItem Class

Represents an item in the related list in a page layout.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "RelatedListItem" in the *Metadata API Developer Guide*.

IN THIS SECTION:

RelatedListItem Properties

RelatedListItem Methods

RelatedListItem Properties

The following are properties for `RelatedListItem`.

IN THIS SECTION:

customButtons
A list of custom buttons used in the related list.

excludeButtons
A list of excluded related-list buttons.

fields
A list of fields displayed in the related list. Uses aliases instead of field or API names.

relatedList
The name of the related list.

sortField
The name of the field used for sorting.

sortOrder
When `sortField` is set, the `sortOrder` property determines the sort order.

customButtons

A list of custom buttons used in the related list.

Signature

```
public List<String> customButtons {get; set;}
```

Property Value

Type: List<String>

For more information, see "Define Custom Buttons and Links" in the Salesforce online help.

excludeButtons

A list of excluded related-list buttons.

Signature

```
public List<String> excludeButtons {get; set;}
```

Property Value

Type: List<String>

fields

A list of fields displayed in the related list. Uses aliases instead of field or API names.

Signature

```
public List<String> fields {get; set;}
```

Property Value

Type: List<String>

`relatedList`

The name of the related list.

Signature

```
public String relatedList {get; set;}
```

Property Value

Type: String

`sortField`

The name of the field used for sorting.

Signature

```
public String sortField {get; set;}
```

Property Value

Type: String

`sortOrder`

When `sortField` is set, the `sortOrder` property determines the sort order.

Signature

```
public Metadata.SortOrder sortOrder {get; set;}
```

Property Value

Type: Metadata.SortOrder

RelatedListItem Methods

The following are methods for `RelatedListItem`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.RelatedListItem`.

clone()

Makes a duplicate copy of the `Metadata.RelatedListItem`.

Signature

```
public Object clone()
```

Return Value

Type: Object

ReportChartComponentLayoutItem Class

Represents the settings for a report chart on a standard or custom page.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "ReportChartComponentLayoutItem" in the *Metadata API Developer Guide*.

IN THIS SECTION:

ReportChartComponentLayoutItem Properties
ReportChartComponentLayoutItem Methods

ReportChartComponentLayoutItem Properties

The following are properties for `ReportChartComponentLayoutItem`.

IN THIS SECTION:

cacheData
Indicates whether to use cached data when displaying the chart. When the attribute is set to true, data is cached for 24 hours. When the attribute is set to false, the report is run every time the page is refreshed.

contextFilterableField
Unique development name of the field by which a report chart is filtered to return data relevant to the page. If set, the ID field for the parent object of the page or report type is the chart data filter. The parent object for the report type and the page must match for a chart to return relevant data.

error

Error string that is populated only when an error occurs in the underlying report.

hideOnError

Controls whether users see a chart that has an error. When an error occurs and this attribute is not set, the chart doesn't show any data except the error. Set the attribute to true to hide the chart from a page on error.

includeContext

If true, filters the report chart to return data that's relevant to the page.

reportName

Unique development name of a report that includes a chart.

showTitle

If true, applies the title from the report to the chart.

size

Size of the displayed chart. The default is medium.

cacheData

Indicates whether to use cached data when displaying the chart. When the attribute is set to true, data is cached for 24 hours. When the attribute is set to false, the report is run every time the page is refreshed.

Signature

```
public Boolean cacheData {get; set;}
```

Property Value

Type: Boolean

contextFilterableField

Unique development name of the field by which a report chart is filtered to return data relevant to the page. If set, the ID field for the parent object of the page or report type is the chart data filter. The parent object for the report type and the page must match for a chart to return relevant data.

Signature

```
public String contextFilterableField {get; set;}
```

Property Value

Type: String

error

Error string that is populated only when an error occurs in the underlying report.

Signature

```
public String error {get; set;}
```

Property Value

Type: String

hideOnError

Controls whether users see a chart that has an error. When an error occurs and this attribute is not set, the chart doesn't show any data except the error. Set the attribute to true to hide the chart from a page on error.

Signature

```
public Boolean hideOnError {get; set;}
```

Property Value

Type: Boolean

includeContext

If true, filters the report chart to return data that's relevant to the page.

Signature

```
public Boolean includeContext {get; set;}
```

Property Value

Type: Boolean

reportName

Unique development name of a report that includes a chart.

Signature

```
public String reportName {get; set;}
```

Property Value

Type: String

showTitle

If true, applies the title from the report to the chart.

Signature

```
public Boolean showTitle {get; set;}
```

Property Value

Type: Boolean

`size`

Size of the displayed chart. The default is medium.

Signature

```
public Metadata.ReportChartComponentSize size {get; set;}
```

Property Value

Type: Metadata.ReportChartComponentSize

ReportChartComponentLayoutItem Methods

The following are methods for `ReportChartComponentLayoutItem`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.ReportChartComponentLayoutItem`.

`clone()`

Makes a duplicate copy of the `Metadata.ReportChartComponentLayoutItem`.

Signature

```
public Object clone()
```

Return Value

Type: Object

ReportChartComponentSize Enum

Describes the size of the displayed report chart component.

Enum Values

The following are the values of the `Metadata.ReportChartComponentSize` enum.

Value	Description
`LARGE`	Large chart size.
`MEDIUM`	Medium chart size.

Value	Description
SMALL	Small chart size.

SidebarComponent Class

Represents a specific custom console component to display in a container that hosts multiple components in one of the sidebars of the Salesforce console.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "SidebarComponent" in the *Metadata API Developer Guide*.

IN THIS SECTION:

SidebarComponent Properties

SidebarComponent Methods

SidebarComponent Properties

The following are properties for `SidebarComponent`.

IN THIS SECTION:

componentType

Specifies the component type. Valid values are "KnowledgeOne", "Lookup", "Milestones", "RelatedList", "Topics", "Files", and "CaseExperts".

createAction

If the component is a lookup field, the name of the quick action used to create a record.

enableLinking

If the component is a lookup field, lets users associate a record with this field.

height

The height of the component in the container. The `unit` property determines the unit of measurement, in pixels or percent.

knowledgeOneEnable

Indicates if the component is enabled for Knowledge One.

label

The name of the component as it displays to console users. Available for components in a container with the style of tabs or accordion.

lookup

If the component is a lookup field, the name of the field.

page_x
If the component is a Visualforce page, the name of the Visualforce page.

relatedLists
If the component is a related list component, the list of related list names.

unit
The unit of measurement (pixels or percent) for the height and width of the component in the container.

updateAction
If the component is a lookup field, the name of the quick action used to update a record.

width
The width of the component in the container. The `unit` property determines the unit of measurement, in pixels or percent.

componentType

Specifies the component type. Valid values are "KnowledgeOne", "Lookup", "Milestones", "RelatedList", "Topics", "Files", and "CaseExperts".

Signature

```
public String componentType {get; set;}
```

Property Value

Type: String

createAction

If the component is a lookup field, the name of the quick action used to create a record.

Signature

```
public String createAction {get; set;}
```

Property Value

Type: String

enableLinking

If the component is a lookup field, lets users associate a record with this field.

Signature

```
public Boolean enableLinking {get; set;}
```

Property Value

Type: Boolean

height

The height of the component in the container. The `unit` property determines the unit of measurement, in pixels or percent.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: Integer

knowledgeOneEnable

Indicates if the component is enabled for Knowledge One.

Signature

```
public Boolean knowledgeOneEnable {get; set;}
```

Property Value

Type: Boolean

label

The name of the component as it displays to console users. Available for components in a container with the style of tabs or accordion.

Signature

```
public String label {get; set;}
```

Property Value

Type: String

lookup

If the component is a lookup field, the name of the field.

Signature

```
public String lookup {get; set;}
```

Property Value

Type: String

page_x

If the component is a Visualforce page, the name of the Visualforce page.

Signature

```
public String page_x {get; set;}
```

Property Value

Type: String

relatedLists

If the component is a related list component, the list of related list names.

Signature

```
public List<Metadata.RelatedList> relatedLists {get; set;}
```

Property Value

Type: List<Metadata.RelatedList>

unit

The unit of measurement (pixels or percent) for the height and width of the component in the container.

Signature

```
public String unit {get; set;}
```

Property Value

Type: String

updateAction

If the component is a lookup field, the name of the quick action used to update a record.

Signature

```
public String updateAction {get; set;}
```

Property Value

Type: String

width

The width of the component in the container. The `unit` property determines the unit of measurement, in pixels or percent.

Signature

```
public Integer width {get; set;}
```

Property Value

Type: Integer

SidebarComponent Methods

The following are methods for `SidebarComponent`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.SidebarComponent`.

`clone()`

Makes a duplicate copy of the `Metadata.SidebarComponent`.

Signature

```
public Object clone()
```

Return Value

Type: Object

SortOrder Enum

Describes the sort order of a related list.

Enum Values

The following are the values of the `Metadata.SortOrder` enum.

Value	Description
`Asc_x`	Sort in ascending order.
`Desc_x`	Sort in descending order.

StatusCode Enum

Describes the status code for an unsuccessful component deploy.

Enum Values

The following are the values of the `Metadata.StatusCode` enum.

Value	Description
`INVALID_SCS_INBOUND_USER`	Log in as the RunAs user configured in your SCS setup.

Value	Description
`REQUIRE_CONNECTED_APP_SCS`	SCS Connected App is not installed.
`REQUIRE_CONNECTED_APP_SESSION_SCS`	To use the SCS connected app, the user must be authenticated.
`REQUIRE_RUNAS_USER`	A RunAs user must be configured in your org.

DeployProblemType Enum

SubtabComponents Class

Represents custom console components on subtabs in the Salesforce console.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "SubtabComponents" in the *Metadata API Developer Guide*.

IN THIS SECTION:

SubtabComponents Properties

SubtabComponents Methods

SubtabComponents Properties

The following are properties for `SubtabComponents`.

IN THIS SECTION:

component

Represents a custom console component (Visualforce page, lookup field, or related lists) on a section of a page layout.

containers

Represents a location and style in which to display more than one custom console component on the sidebars of the Salesforce console.

`component`

Represents a custom console component (Visualforce page, lookup field, or related lists) on a section of a page layout.

Signature

```
public List<Metadata.ConsoleComponent> component {get; set;}
```

Property Value

Type: List<Metadata.ConsoleComponent>

`containers`

Represents a location and style in which to display more than one custom console component on the sidebars of the Salesforce console.

Signature

```
public List<Metadata.Container> containers {get; set;}
```

Property Value

Type: List<Metadata.Container>

SubtabComponents Methods

The following are methods for `SubtabComponents`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.SubtabComponents`.

`clone()`

Makes a duplicate copy of the `Metadata.SubtabComponents`.

Signature

```
public Object clone()
```

Return Value

Type: Object

SummaryLayoutStyleEnum Enum

Describes the highlights panel style for a `SummaryLayout`.

Enum Values

The following are the values of the `Metadata.SummaryLayoutStyleEnum` enum.

Value	Description
`CaseInteraction`	Case interaction style.
`ChildServiceReportTemplateStyle`	Child service report template style.

Value	Description
`DefaultQuoteTemplate`	Default quote template style.
`DefaultServiceReportTemplate`	Default service report style
`Default_x`	Default style.
`PathAssistant`	Path assisstant style.
`QuickActionLayoutLeftRight`	Quick action left-right layout style.
`QuickActionLayoutTopDown`	Quick action top-down layout style.
`QuoteTemplate`	Quote template style.
`ServiceReportTemplate`	Service report style.

SummaryLayout Class

Controls the appearance of the highlights panel, which summarizes key fields in a grid at the top of a page layout, when Case Feed is enabled.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "SummaryLayout" in the *Metadata API Developer Guide*.

IN THIS SECTION:

SummaryLayout Properties

SummaryLayout Methods

SummaryLayout Properties

The following are properties for `SummaryLayout`.

IN THIS SECTION:

masterLabel

The name of the layout label.

sizeX

Number of columns in the highlights pane, between 1 and 4 (inclusive).

sizeY

Number of rows in each column, either 1 or 2.

sizeZ

If provided, the setting is not visible to users.

summaryLayoutItems

Controls the appearance of an individual field and its column and row position within the highlights panel grid, when Case Feed is enabled. At least one is required.

summaryLayoutStyle

Specifies the panel style.

masterLabel

The name of the layout label.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Signature

```
public String masterLabel {get; set;}
```

Property Value

Type: String

sizeX

Number of columns in the highlights pane, between 1 and 4 (inclusive).

Signature

```
public Integer sizeX {get; set;}
```

Property Value

Type: Integer

sizeY

Number of rows in each column, either 1 or 2.

Signature

```
public Integer sizeY {get; set;}
```

Property Value

Type: Integer

sizeZ

If provided, the setting is not visible to users.

Signature

```
public Integer sizeZ {get; set;}
```

Property Value

Type: Integer

summaryLayoutItems

Controls the appearance of an individual field and its column and row position within the highlights panel grid, when Case Feed is enabled. At least one is required.

Signature

```
public List<Metadata.SummaryLayoutItem> summaryLayoutItems {get; set;}
```

Property Value

Type: List<Metadata.SummaryLayoutItem>

summaryLayoutStyle

Specifies the panel style.

Signature

```
public Metadata.SummaryLayoutStyleEnum summaryLayoutStyle {get; set;}
```

Property Value

Type: Metadata.SummaryLayoutStyleEnum

SummaryLayout Methods

The following are methods for `SummaryLayout`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.SummaryLayout`.

clone()

Makes a duplicate copy of the `Metadata.SummaryLayout`.

Signature

```
public Object clone()
```

Return Value

Type: Object

SummaryLayoutItem Class

Controls the appearance of an individual field and its column and row position within the highlights panel grid, when Case Feed is enabled. You can have two fields per each grid in a highlights panel.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "SummaryLayoutItem" in the *Metadata API Developer Guide*.

IN THIS SECTION:

SummaryLayoutItem Properties

SummaryLayoutItem Methods

SummaryLayoutItem Properties

The following are properties for `SummaryLayoutItem`.

IN THIS SECTION:

customLink
The custom link reference.

field
The field name reference, relative to the page layout. Must be a standard or custom field that also exists on the detail page.

posX
The item's column position in the highlights panel grid. Must be within the range of `sizeX`.

posY
The item's row position in the highlights panel grid. Must be within the range of `sizeY`.

posZ
Reserved for future use. If provided, the setting is not visible to users.

`customLink`

The custom link reference.

Signature

```
public String customLink {get; set;}
```

Property Value

Type: String

field

The field name reference, relative to the page layout. Must be a standard or custom field that also exists on the detail page.

Signature

```
public String field {get; set;}
```

Property Value

Type: String

posX

The item's column position in the highlights panel grid. Must be within the range of `sizeX`.

Signature

```
public Integer posX {get; set;}
```

Property Value

Type: Integer

posY

The item's row position in the highlights panel grid. Must be within the range of `sizeY`.

Signature

```
public Integer posY {get; set;}
```

Property Value

Type: Integer

posZ

Reserved for future use. If provided, the setting is not visible to users.

Signature

```
public Integer posZ {get; set;}
```

Property Value

Type: Integer

SummaryLayoutItem Methods

The following are methods for `SummaryLayoutItem`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.SummaryLayoutItem`.

`clone()`

Makes a duplicate copy of the `Metadata.SummaryLayoutItem`.

Signature

```
public Object clone()
```

Return Value

Type: Object

UiBehavior Enum

Describes the behavior for a layout item on a layout page.

Enum Values

The following are the values of the `Metadata.UiBehavior` enum.

Value	Description
`Edit`	The layout field can be edited but is not required.
`Readonly`	The layout field is read-only.
`Required`	The layout field can be edited and is required.

PlaceQuote Namespace

The `PlaceQuote` namespace provides classes and methods to create or update quotes with pricing preferences and configuration options.

See PlaceQuote namespace for more information about the available classes and methods.

Pref_center Namespace

The Pref_center namespace provides an interface, classes, and methods to create and retrieve data in forms in Preference Manager. Preference Manager, previously called Preference Center, is a feature within the Privacy Center app.

The following are the classes in the `Pref_center` namespace.

IN THIS SECTION:

LoadFormData Class
Retrieve records related to the tokenized record id, and populate the values of a preference form.

LoadParameters Class
Contains methods to retrieve record Id information for parameters passed into the load-form handler.

PreferenceCenterApexHandler Interface
Pass data between your organization and a form in Preference Manager.

SubmitFormData Class
Contains methods to retrieve information on buttons and options selected in a preference form.

SubmitParameters Class
Retrieve record ID information to use with your submit-form handler.

TokenType Enum
Defines the types of values supported by the TokenUtility methods.

TokenUtility Class
Generate authentication tokens to access preference forms.

ValidationResult Class
This class is reserved for future use with Preference Manager.

LoadFormData Class

Retrieve records related to the tokenized record id, and populate the values of a preference form.

Namespace

Pref_center

Example

Use methods in the `LoadFormData` class to set available and selected values in different form components:

```
List<System.SelectOption> picklistOptions = new List<System.SelectOption>();
picklistOptions.add(new System.SelectOption('optIn', 'Opt In'));
picklistOptions.add(new System.SelectOption('optOut', 'Opt Out'));

// Set the available options for the picklist
loadFormData.setOptions('myPicklist', picklistOptions);
// Add an option to the existing options for the picklist
loadFormData.addOption('myPicklist', 'optOutAll', 'Opt Out All');
// Select the 'optIn' option in the picklist
loadFormData.setSelectedOption('myPicklist', 'optIn');

List<System.SelectOption> checkboxOptions = new List<System.SelectOption>();
checkboxOptions.add(new System.SelectOption('yes', 'Yes'));
```

```
checkboxOptions.add(new System.SelectOption('no', 'No'));

// Set available options for the checkbox group
loadFormData.setOptions('myCheckbox', checkboxOptions);
// Select the 'yes' option in the checkbox group
loadFormData.addSelectedOption('myCheckbox', 'yes');
// Also select the 'no' option in the checkbox group
loadFormData.addSelectedOption('myCheckbox', 'no');
// Another way to select both the 'yes' and 'no' options in the checkbox group
loadFormData.setSelectedOptions('myCheckbox', new List<String>{'yes', 'no'});

// Fill the value in the text input
loadFormData.setTextValue('myTextInput', 'admin@salesforce.com');
// Set the hint text for the text input
loadFormData.setTextHint('myTextInput', 'Email Address');

// Set the label for the button
loadFormData.setButtonLabel('myButton', 'Save Preferences');
```

IN THIS SECTION:

LoadFormData Constructors

LoadFormData Methods

LoadFormData Constructors

The following are constructors for `LoadFormData`.

IN THIS SECTION:

LoadFormData(data)

Creates an instance of the `LoadFormData` class for running tests on any custom Apex classes you create for Preference Manager.

`LoadFormData(data)`

Creates an instance of the `LoadFormData` class for running tests on any custom Apex classes you create for Preference Manager.

Signature

```
public LoadFormData(Map<String,pref_center.FieldProperties> data)
```

Parameters

data

Type: Map<String,pref_center.FieldProperties>Map

Maps preference form data from the field ID to the field properties.

Usage

This constructor is available in API version 56.0 and later.

LoadFormData Methods

The following are methods for `LoadFormData`.

IN THIS SECTION:

addOption(fieldId, value, label)

Add an option for a checkbox, picklist, or radio button field in a preference form using the label and value.

addOption(fieldId, option)

Add a defined, selectable option for a checkbox, picklist, or radio button field in a preference form.

addSelectedOption(fieldId, option)

Add a selected option for a checkbox field in a preference form. This requires the field on the form to have a defined option with a set value.

setButtonLabel(fieldId, label)

Set the label of a button added to the preference form.

setOptions(fieldId, options)

Add a list of selectable options for a field on a preference form.

setSelectedOption(fieldId, optionValue)

For a picklist or radio button field on a preference form that has defined values, set the value entered in the optionValue field as the selected option.

setSelectedOptions(fieldId, options)

For an existing checkbox field on a preference form that has defined values, set the values entered in the options field as the selected options. This requires the field on the form to have defined options with a set value.

setTextHint(fieldId, hintText)

Set the hint text inside a text input field. The hint text tells the user what type of information to enter, like an email address.

setTextValue(fieldId, value)

Set the value of a text field in a preference form.

`addOption(fieldId, value, label)`

Add an option for a checkbox, picklist, or radio button field in a preference form using the label and value.

Signature

```
public void addOption(String fieldId, String value, String label)
```

Parameters

`fieldId`

Type: String

Identifies a field in the preference form.

value
Type: String

Represents the selection or text entered in a preference form field.

label
Type: String

The label for the value of a field in a preference form.

Return Value

Type: void

addOption(fieldId, option)

Add a defined, selectable option for a checkbox, picklist, or radio button field in a preference form.

Signature

```
public void addOption(String fieldId, System.SelectOption option)
```

Parameters

fieldId
Type: String

Identifies a field in the preference form.

option
Type: System.SelectOption

The option selected on a field in the preference form.

Return Value

Type: void

addSelectedOption(fieldId, option)

Add a selected option for a checkbox field in a preference form. This requires the field on the form to have a defined option with a set value.

Signature

```
public void addSelectedOption(String fieldId, String option)
```

Parameters

fieldId
Type: String

Identifies a field in the preference form.

option
Type: String

The selectable option being added.

Return Value

Type: void

setButtonLabel(fieldId, label)

Set the label of a button added to the preference form.

Signature

```
public void setButtonLabel(String fieldId, String label)
```

Parameters

fieldId
Type: String

Identifies a field in the preference form.

label
Type: String

The label for a button added to the preference form.

Return Value

Type: void

setOptions(fieldId, options)

Add a list of selectable options for a field on a preference form.

Signature

```
public void setOptions(String fieldId, List<System.SelectOption> options)
```

Parameters

fieldId
Type: String

Identifies a field in the preference form.

options
Type: List<System.SelectOption>

The selectable options for a field in the preference form.

Return Value

Type: void

setSelectedOption(fieldId, optionValue)

For a picklist or radio button field on a preference form that has defined values, set the value entered in the optionValue field as the selected option.

Signature

```
public void setSelectedOption(String fieldId, String optionValue)
```

Parameters

fieldId
Type: String

Identifies a field in the preference form.

optionValue
Type: String

The value for the selected option.

Return Value

Type: void

setSelectedOptions(fieldId, options)

For an existing checkbox field on a preference form that has defined values, set the values entered in the options field as the selected options. This requires the field on the form to have defined options with a set value.

Signature

```
public void setSelectedOptions(String fieldId, List<String> options)
```

Parameters

fieldId
Type: String

Identifies the checkbox field in the preference form.

options
Type: List<String>

The selected options for a field in the preference form.

Return Value

Type: void

`setTextHint(fieldId, hintText)`

Set the hint text inside a text input field. The hint text tells the user what type of information to enter, like an email address.

Signature

```
public void setTextHint(String fieldId, String hintText)
```

Parameters

`fieldId`
Type: String

The ID of the text input field in the preference form.

`hintText`
Type: String

The hint text in the text input field.

Return Value

Type: void

`setTextValue(fieldId, value)`

Set the value of a text field in a preference form.

Signature

```
public void setTextValue(String fieldId, String value)
```

Parameters

`fieldId`
Type: String

Identifies a field in the preference form.

`value`
Type: String

Represents the value entered for the text field in a preference form.

Return Value

Type: void

LoadParameters Class

Contains methods to retrieve record Id information for parameters passed into the load-form handler.

Namespace

Pref_center

Example

```
String userId = loadParams.getRecordId();

User user = [select id, AboutMe from User where id=:userId];
```

IN THIS SECTION:

LoadParameters Methods

LoadParameters Methods

The following are methods for `LoadParameters`.

IN THIS SECTION:

getRecordId()
Returns the untokenized version of the record Id.

`getRecordId()`

Returns the untokenized version of the record Id.

Signature

```
public String getRecordId()
```

Return Value

Type: String

PreferenceCenterApexHandler Interface

Pass data between your organization and a form in Preference Manager.

Namespace

Pref_center

IN THIS SECTION:

PreferenceCenterApexHandler Methods

PreferenceCenterApexHandler Methods

The following are methods for `PreferenceCenterApexHandler`.

IN THIS SECTION:

load(loadParams, formData, validationResult)
Retrieve the record IDs and initial values from a preference form before it is edited and submitted.

submit(loadParams, formData, validationResult)
Updates the changed values of fields when the preference form is submitted.

load(loadParams, formData, validationResult)

Retrieve the record IDs and initial values from a preference form before it is edited and submitted.

Signature

```
public pref_center.LoadFormData load(pref_center.LoadParameters loadParams,
pref_center.LoadFormData formData, pref_center.ValidationResult validationResult)
```

Parameters

loadParams
Type: pref_center.LoadParameters

Retrieve the tokenized record ID.

formData
Type: pref_center.LoadFormData

Set the initial values of fields in a form before they are edited.

validationResult
Type: pref_center.ValidationResult

Reserved for future use.

Return Value

Type: pref_center.LoadFormData

submit(loadParams, formData, validationResult)

Updates the changed values of fields when the preference form is submitted.

Signature

```
public void submit(pref_center.SubmitParameters submitParams, pref_center.SubmitFormData
formData, pref_center.ValidationResult validationResult)
```

Parameters

submitParams
Type: pref_center.SubmitParameters

Retrieve the tokenized record Id.

formData
Type: pref_center.SubmitFormData

Retrieve the values of fields in a submitted form.

validationResult
Type: pref_center.ValidationResult

Reserved for future use.

Return Value

Type: void

SubmitFormData Class

Contains methods to retrieve information on buttons and options selected in a preference form.

Namespace

Pref_center

Example

Use methods in the `SubmitFormData` class to retrieve the selected values in different form components:

```
String buttonClickedId = formData.getButtonClicked();
if (buttonClickedId == 'submitButton') {
// Handle form submit
} else if (buttonClickedId == 'cancelButton') {
// Handle form cancel
}

String picklistValueOld = formData.getOldSelectedValue('myPicklist');
String picklistValueNew = formData.getSelectedValue('myPicklist');
if (picklistValueOld != picklistValueNew) {
// Do something
}

List<String> checkboxValuesOld = formData.getOldSelectedValues('myCheckbox');
List<String> checkboxValuesNew = formData.getSelectedValues('myCheckbox');
if (checkboxValuesOld != null && checkboxValuesNew != null && (checkboxValuesOld.size()
!= checkboxValuesNew.size())) {
// Do something
}

String textinputValueOld = formData.getOldStringValue('myTextinput');
String textinputValueNew = formData.getStringValue('myTextinput');
```

```
if (textinputValueOld != textinputValueNew) {
// Do something
}
```

IN THIS SECTION:

SubmitFormData Methods

SubmitFormData Methods

The following are methods for `SubmitFormData`.

IN THIS SECTION:

getButtonClicked()

Returns the field ID of the button that was clicked in the preference form. For example, use this method to determine if the clicked button was **Submit** or **Cancel**.

getOldSelectedValue(fieldId)

Returns the value that was set for the specified field when the preference form was previously edited by the user. This method is used for field types such as picklist or radio buttons.

getOldSelectedValues(fieldId)

Returns a list of the string values that were set on a checkbox field when the preference form was previously edited by the user.

getOldStringValue(fieldId)

Returns the string value that was set on a field when the preference form was loaded. This method is used for field types such as text, and throws a TypeException if used with a field that can return more than one value, like a checkbox field.

getSelectedValue(fieldId)

Returns the string value that is currently selected for a picklist or radio button field in the preference form.

getSelectedValues(fieldId)

Returns a list of string values that are currently selected on a checkbox field in the preference form.

getStringValue(fieldId)

Returns the string value that was set on a field when the preference form was loaded. This method is used for field types such as text.

`getButtonClicked()`

Returns the field ID of the button that was clicked in the preference form. For example, use this method to determine if the clicked button was **Submit** or **Cancel**.

Signature

```
public String getButtonClicked()
```

Return Value

Type: String

getOldSelectedValue(fieldId)

Returns the value that was set for the specified field when the preference form was previously edited by the user. This method is used for field types such as picklist or radio buttons.

Signature

```
public String getOldSelectedValue(String fieldId)
```

Parameters

fieldId
Type: String

Identifies a field in the preference form.

Return Value

Type: String

getOldSelectedValues(fieldId)

Returns a list of the string values that were set on a checkbox field when the preference form was previously edited by the user.

Signature

```
public List<String> getOldSelectedValues(String fieldId)
```

Parameters

fieldId
Type: String

Identifies a field in the preference form.

Return Value

Type: List<String>

getOldStringValue(fieldId)

Returns the string value that was set on a field when the preference form was loaded. This method is used for field types such as text, and throws a TypeException if used with a field that can return more than one value, like a checkbox field.

Signature

```
public String getOldStringValue(String fieldId)
```

Parameters

fieldId
Type: String

Identifies a field in the preference form.

Return Value

Type: String

`getSelectedValue(fieldId)`

Returns the string value that is currently selected for a picklist or radio button field in the preference form.

Signature

```
public String getSelectedValue(String fieldId)
```

Parameters

`fieldId`
Type: String

Identifies a field in the preference form.

Return Value

Type: String

`getSelectedValues(fieldId)`

Returns a list of string values that are currently selected on a checkbox field in the preference form.

Signature

```
public List<String> getSelectedValues(String fieldId)
```

Parameters

`fieldId`
Type: String

Identifies a field in the preference form.

Return Value

Type: List<String>

`getStringValue(fieldId)`

Returns the string value that was set on a field when the preference form was loaded. This method is used for field types such as text.

Signature

```
public String getStringValue(String fieldId)
```

Parameters

fieldId
Type: String

Identifies a field in the preference form.

Return Value

Type: String

SubmitParameters Class

Retrieve record ID information to use with your submit-form handler.

Namespace

Pref_center

Example

```
String userId = submitParams.getRecordId();

User user = [select id, AboutMe from User where id=:userId];
```

IN THIS SECTION:

SubmitParameters Methods

SubmitParameters Methods

The following are methods for `SubmitParameters`.

IN THIS SECTION:

getRecordId()
Returns the untokenized version of the record ID.

`getRecordId()`

Returns the untokenized version of the record ID.

Signature

```
public String getRecordId()
```

Return Value

Type: String

TokenType Enum

Defines the types of values supported by the TokenUtility methods.

Enum Values

The following are the values of the `pref_center.TokenType` enum.

Value	Description
`EMAIL`	Identifies the token as an email address.
`STANDARD`	Identifies the token as a Salesforce record ID. This is the default token type.

TokenUtility Class

Generate authentication tokens to access preference forms.

Namespace

Pref_center

Example

Call the `generateToken()` method to generate a single token for a specified Salesforce record ID:

```
Individual individual = [SELECT Id FROM Individual LIMIT 1];
String token = pref_center.TokenUtility.generateToken(individual.Id);
// Do something with the token
System.debug(token)
```

Call the `generateTokens()` method to generate tokens in bulk when given a list of Salesforce record IDs:

```
List<Id> individualIds = new List<Id>();
// Get Ids of Individuals who have not opted out of tracking
for (Individual individual : [SELECT Id FROM Individual WHERE HasOptedOutTracking = false])
 {
    individualIds.add(individual.Id);
}
// Generate tokens for the list of Individual record Ids
Map<String, String> tokens = pref_center.TokenUtility.generateTokens(individualIds);
String firstIndividualId = individualIds[0];
// The returned Map has the input record Id as key and the corresponding token as value
String tokenForFirstIndividual = tokens.get(firstIndividualId);
// Do something with the token
System.debug(tokenForFirstIndividual);
```

IN THIS SECTION:

TokenUtility Methods

TokenUtility Methods

The following are methods for `TokenUtility`.

IN THIS SECTION:

generateToken(tokenValue, tokenType)
Returns the authentication token for the specified token value using the given token type.

generateToken(tokenValue)
Returns the authentication token for the specified token value using the default `standard` token type.

generateTokens(tokenValues, tokenType)
Returns the authentication tokens in the form of a map, where the map key is the input value to be tokenized and the map value is the corresponding token. The given token type is used to generate the tokens.

generateTokens(tokenValues)
Returns the generated tokens in the form of a map. This method uses the default standard token type to generate the tokens.

`generateToken(tokenValue, tokenType)`

Returns the authentication token for the specified token value using the given token type.

Signature

```
public static String generateToken(String tokenValue, pref_center.TokenType tokenType)
```

Parameters

`tokenValue`
Type: String

The value passed to `LoadParameters.getRecordId()` and `SubmitParameters.getRecordId()`. Identifies the entity that the preference form is acting on.

`tokenType`
Type: pref_center.TokenType

Specifies the type of the value to be encrypted with authentication tokens.

Return Value

Type: String

`generateToken(tokenValue)`

Returns the authentication token for the specified token value using the default `standard` token type.

Signature

```
public static String generateToken(String tokenValue)
```

Parameters

tokenValue
Type: String

Identifies the entity that the preference form is acting on. The value passed to `LoadParameters.getRecordId()` and `SubmitParameters.getRecordId()`.

Return Value

Type: String

generateTokens(tokenValues, tokenType)

Returns the authentication tokens in the form of a map, where the map key is the input value to be tokenized and the map value is the corresponding token. The given token type is used to generate the tokens.

Signature

```
public static Map<String,String> generateTokens(List<String> tokenValues,
pref_center.TokenType tokenType)
```

Parameters

tokenValues
Type: List<String>

The values passed to `LoadParameters.getRecordId()` and `SubmitParameters.getRecordId()`. Identifies the entity that the preference form is acting on. Contains multiple values to be encrypted with authentication tokens.

tokenType
Type: pref_center.TokenType

Specifies the type of the value to be encrypted with authentication tokens.

Return Value

Type: Map<String,String>

generateTokens(tokenValues)

Returns the generated tokens in the form of a map. This method uses the default standard token type to generate the tokens.

Signature

```
public static Map<String,String> generateTokens(List<String> tokenValues)
```

Parameters

tokenValues
Type: List<String>

The list of string values passed to `LoadParameters.getRecordId()` and `SubmitParameters.getRecordId()`. Contains multiple values to be encrypted with authentication tokens.

Return Value

Type: Map<String,String>, where the map key is the input value to be tokenized and the map value is the corresponding token.

ValidationResult Class

This class is reserved for future use with Preference Manager.

Namespace

Pref_center

Process Namespace

The `Process` namespace provides an interface and classes for passing data between your organization and a flow.

The following are the interfaces and classes in the `Process` namespace.

IN THIS SECTION:

Plugin Interface
Allows you to pass data between your organization and a specified flow.

PluginDescribeResult Class
Describes the input and output parameters for `Process.PluginResult`.

PluginDescribeResult.InputParameter Class
Describes the input parameter for `Process.PluginResult`.

PluginDescribeResult.OutputParameter Class
Describes the output parameter for `Process.PluginResult`.

PluginRequest Class
Passes input parameters from the class that implements the `Process.Plugin` interface to the flow.

PluginResult Class
Returns output parameters from the class that implements the `Process.Plugin` interface to the flow.

Plugin Interface

Allows you to pass data between your organization and a specified flow.

Namespace

Process

Tip: We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

- The interface doesn't support Blob, Collection, sObject, and Time data types, and it doesn't support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

IN THIS SECTION:

Plugin Methods

Plugin Example Implementation

Plugin Methods

The following are instance methods for `Plugin`.

IN THIS SECTION:

describe()

Returns a `Process.PluginDescribeResult` object that describes this method call.

invoke(request)

Primary method that the system invokes when the class that implements the interface is instantiated.

`describe()`

Returns a `Process.PluginDescribeResult` object that describes this method call.

Signature

```
public Process.PluginDescribeResult describe()
```

Return Value

Type: Process.PluginDescribeResult

`invoke(request)`

Primary method that the system invokes when the class that implements the interface is instantiated.

Signature

```
public Process.PluginResult invoke(Process.PluginRequest request)
```

Parameters

`request`
Type: Process.PluginRequest

Return Value

Type: Process.PluginResult

Plugin Example Implementation

```
global class flowChat implements Process.Plugin {

// The main method to be implemented. The Flow calls this at run time.
```

```
global Process.PluginResult invoke(Process.PluginRequest request) {
        // Get the subject of the Chatter post from the flow
        String subject = (String) request.inputParameters.get('subject');

        // Use the Chatter APIs to post it to the current user's feed
        FeedItem fItem = new FeedItem();
        fItem.ParentId = UserInfo.getUserId();
        fItem.Body = 'Flow Update: ' + subject;
        insert fItem;

        // return to Flow
        Map<String,Object> result = new Map<String,Object>();
        return new Process.PluginResult(result);
    }

    // Returns the describe information for the interface
    global Process.PluginDescribeResult describe() {
        Process.PluginDescribeResult result = new Process.PluginDescribeResult();
        result.Name = 'flowchatplugin';
        result.Tag = 'chat';
        result.inputParameters = new
           List<Process.PluginDescribeResult.InputParameter>{
               new Process.PluginDescribeResult.InputParameter('subject',
               Process.PluginDescribeResult.ParameterType.STRING, true)
            };
        result.outputParameters = new
           List<Process.PluginDescribeResult.OutputParameter>{ };
        return result;
    }
}
```

Test Class

The following is a test class for the above class.

```
@isTest
private class flowChatTest {

    static testmethod void flowChatTests() {

        flowChat plugin = new flowChat();
        Map<String,Object> inputParams = new Map<String,Object>();

        string feedSubject = 'Flow is alive';
        InputParams.put('subject', feedSubject);

        Process.PluginRequest request = new Process.PluginRequest(inputParams);

        plugin.invoke(request);
    }
}
```

PluginDescribeResult Class

Describes the input and output parameters for `Process.PluginResult`.

Namespace

Process

Tip: We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

- The interface doesn't support Blob, Collection, sObject, and Time data types, and it doesn't support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

IN THIS SECTION:

PluginDescribeResult Constructors

PluginDescribeResult Properties

PluginDescribeResult Constructors

The following are constructors for `PluginDescribeResult`.

IN THIS SECTION:

PluginDescribeResult()
Creates a new instance of the `Process.PluginDescribeResult` class.

`PluginDescribeResult()`

Creates a new instance of the `Process.PluginDescribeResult` class.

Signature

```
public PluginDescribeResult()
```

PluginDescribeResult Properties

The following are properties for `PluginDescribeResult`.

IN THIS SECTION:

description
This optional field describes the purpose of the plug-in.

inputParameters
The input parameters passed by the `Process.PluginRequest` class from a flow to the class that implements the `Process.Plugin` interface.

name
Unique name of the plug-in.

outputParameters
The output parameters passed by the `Process.PluginResult` class from the class that implements the `Process.Plugin` interface to the flow.

description

This optional field describes the purpose of the plug-in.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

Usage

Size limit: 255 characters.

inputParameters

The input parameters passed by the `Process.PluginRequest` class from a flow to the class that implements the `Process.Plugin` interface.

Signature

```
public List<Process.PluginDescribeResult.InputParameter> inputParameters {get; set;}
```

Property Value

Type: List<Process.PluginDescribeResult.InputParameter>

name

Unique name of the plug-in.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

Usage

Size limit: 40 characters.

`outputParameters`

The output parameters passed by the `Process.PluginResult` class from the class that implements the `Process.Plugin` interface to the flow.

Signature

```
public List<Process.PluginDescribeResult.OutputParameter> outputParameters {get; set;}
```

Property Value

Type: List<Process.PluginDescribeResult.OutputParameter>

PluginDescribeResult.InputParameter Class

Describes the input parameter for `Process.PluginResult`.

Namespace

Process

Tip: We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

- The interface doesn't support Blob, Collection, sObject, and Time data types, and it doesn't support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

IN THIS SECTION:

PluginDescribeResult.InputParameter Constructors

PluginDescribeResult.InputParameter Properties

PluginDescribeResult.InputParameter Constructors

The following are constructors for `PluginDescribeResult.InputParameter`.

IN THIS SECTION:

PluginDescribeResult.InputParameter(name, description, parameterType, required)

Creates a new instance of the `Process.PluginDescribeResult.InputParameter` class using the specified name, description, parameter type, and required option.

PluginDescribeResult.InputParameter(name, parameterType, required)

Creates a new instance of the `Process.PluginDescribeResult.InputParameter` class using the specified name, parameter type, and required option.

PluginDescribeResult.InputParameter(name, description, parameterType, required)

Creates a new instance of the `Process.PluginDescribeResult.InputParameter` class using the specified name, description, parameter type, and required option.

Signature

```
public PluginDescribeResult.InputParameter(String name, String description,
Process.PluginDescribeResult.ParameterType parameterType, Boolean required)
```

Parameters

name
Type: String

Unique name of the plug-in.

description
Type: String

Describes the purpose of the plug-in.

parameterType
Type: Process.PluginDescribeResult.ParameterType

The data type of the input parameter.

required
Type: Boolean

Set to `true` for required and `false` otherwise.

PluginDescribeResult.InputParameter(name, parameterType, required)

Creates a new instance of the `Process.PluginDescribeResult.InputParameter` class using the specified name, parameter type, and required option.

Signature

```
public PluginDescribeResult.InputParameter(String name,
Process.PluginDescribeResult.ParameterType parameterType, Boolean required)
```

Parameters

name
Type: String

Unique name of the plug-in.

parameterType
Type: Process.PluginDescribeResult.ParameterType

The data type of the input parameter.

required
Type: Boolean

Set to `true` for required and `false` otherwise.

PluginDescribeResult.InputParameter Properties

The following are properties for `PluginDescribeResult.InputParameter`.

IN THIS SECTION:

Description
This optional field describes the purpose of the plug-in.

Name
Unique name of the plug-in.

ParameterType
The data type of the input parameter.

Required
Set to `true` for required and `false` otherwise.

`Description`

This optional field describes the purpose of the plug-in.

Signature

```
public String Description {get; set;}
```

Property Value

Type: String

Usage

Size limit: 255 characters.

`Name`

Unique name of the plug-in.

Signature

```
public String Name {get; set;}
```

Property Value

Type: String

Usage

Size limit: 40 characters.

`ParameterType`

The data type of the input parameter.

Signature

```
public Process.PluginDescribeResult.ParameterType ParameterType {get; set;}
```

Property Value

Type: Process.PluginDescribeResult.ParameterType

`Required`

Set to `true` for required and `false` otherwise.

Signature

```
public Boolean Required {get; set;}
```

Property Value

Type: Boolean

PluginDescribeResult.OutputParameter Class

Describes the output parameter for `Process.PluginResult`.

Namespace

Process

Tip: We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

- The interface doesn't support Blob, Collection, sObject, and Time data types, and it doesn't support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

IN THIS SECTION:

PluginDescribeResult.OutputParameter Constructors

PluginDescribeResult.OutputParameter Properties

PluginDescribeResult.OutputParameter Constructors

The following are constructors for `PluginDescribeResult.OutputParameter`.

IN THIS SECTION:

PluginDescribeResult.OutputParameter(name, description, parameterType)
Creates a new instance of the `Process.PluginDescribeResult.OutputParameter` class using the specified name, description, and parameter type.

PluginDescribeResult.OutputParameter(name, parameterType)
Creates a new instance of the `Process.PluginDescribeResult.OutputParameter` class using the specified name, description, and parameter type.

PluginDescribeResult.OutputParameter(name, description, parameterType)

Creates a new instance of the `Process.PluginDescribeResult.OutputParameter` class using the specified name, description, and parameter type.

Signature

```
public PluginDescribeResult.OutputParameter(String name, String description,
Process.PluginDescribeResult.ParameterType parameterType)
```

Parameters

name
Type: String

Unique name of the plug-in.

description
Type: String

Describes the purpose of the plug-in.

parameterType
Type: Process.PluginDescribeResult.ParameterType

The data type of the input parameter.

PluginDescribeResult.OutputParameter(name, parameterType)

Creates a new instance of the `Process.PluginDescribeResult.OutputParameter` class using the specified name, description, and parameter type.

Signature

```
public PluginDescribeResult.OutputParameter(String name,
Process.PluginDescribeResult.ParameterType parameterType)
```

Parameters

name
Type: String

Unique name of the plug-in.

parameterType
Type: Process.PluginDescribeResult.ParameterType

The data type of the input parameter.

PluginDescribeResult.OutputParameter Properties

The following are properties for `PluginDescribeResult.OutputParameter`.

IN THIS SECTION:

Description
This optional field describes the purpose of the plug-in.

Name
Unique name of the plug-in.

ParameterType
The data type of the input parameter.

`Description`

This optional field describes the purpose of the plug-in.

Signature

```
public String Description {get; set;}
```

Property Value

Type: String

Usage

Size limit: 255 characters.

`Name`

Unique name of the plug-in.

Signature

```
public String Name {get; set;}
```

Property Value

Type: String

Usage

Size limit: 40 characters.

`ParameterType`

The data type of the input parameter.

Signature

```
public Process.PluginDescribeResult.ParameterType ParameterType {get; set;}
```

Property Value

Type: Process.PluginDescribeResult.ParameterType

PluginRequest Class

Passes input parameters from the class that implements the `Process.Plugin` interface to the flow.

Namespace

Process

Tip: We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

- The interface doesn't support Blob, Collection, sObject, and Time data types, and it doesn't support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

PluginRequest Properties

The following are properties for `PluginRequest`.

IN THIS SECTION:

inputParameters
Input parameters that are passed from the class that implements the `Process.Plugin` interface to the flow.

`inputParameters`

Input parameters that are passed from the class that implements the `Process.Plugin` interface to the flow.

Signature

```
public MAP<String,ANY> inputParameters {get; set;}
```

Property Value

Type: Map<String, Object>

PluginResult Class

Returns output parameters from the class that implements the `Process.Plugin` interface to the flow.

Tip: We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

- The interface doesn't support Blob, Collection, sObject, and Time data types, and it doesn't support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

Namespace

Process

PluginResult Properties

The following are properties for `PluginResult`.

IN THIS SECTION:

outputParameters
Output parameters returned from the class that implements the interface to the flow.

`outputParameters`

Output parameters returned from the class that implements the interface to the flow.

Signature

```
public MAP<String, ANY> outputParameters {get; set;}
```

Property Value

Type: Map<String, Object>

QuickAction Namespace

The `QuickAction` namespace provides classes and methods for quick actions.

The following are the classes in the `QuickAction` namespace.

IN THIS SECTION:

DescribeAvailableQuickActionResult Class
Contains describe metadata information for a quick action that is available for a specified parent.

DescribeLayoutComponent Class
Represents the smallest unit in a layout—a field or a separator.

DescribeLayoutItem Class
Represents an individual item in a `QuickAction.DescribeLayoutRow`.

DescribeLayoutRow Class
Represents a row in a `QuickAction.DescribeLayoutSection`.

DescribeLayoutSection Class

Represents a section of a layout and consists of one or more columns and one or more rows (an array of `QuickAction.DescribeLayoutRow`).

DescribeQuickActionDefaultValue Class

Returns a default value for a quick action.

DescribeQuickActionResult Class

Contains describe metadata information for a quick action.

QuickActionDefaults Class

Represents an abstract Apex class that provides the context for running the standard Email Action on Case Feed and the container of the Email Message fields for the action payload. You can override the target fields before the standard Email Action is rendered.

QuickActionDefaultsHandler Interface

The `QuickAction.QuickActionDefaultsHandler` interface lets you specify the default values for the standard Email and Send Email actions in the case feed. You can use this interface to specify the From address, CC address, BCC address, subject, and email body for the Email action in the case feed. You can use the interface to pre-populate these fields based on the context where the action is displayed, such as the case origin (for example, country) and subject.

QuickActionRequest Class

Use the `QuickAction.QuickActionRequest` class for providing action information for quick actions to be performed by `QuickAction` class methods. Action information includes the action name, context record ID, and record.

QuickActionResult Class

After you initiate a quick action with the `QuickAction` class, use the `QuickActionResult` class for processing action results.

SendEmailQuickActionDefaults Class

Represents an Apex class that provides: the From address list; the original email's email message ID, provided that the reply action was invoked on the email message feed item; and methods to specify related settings on templates. You can override these fields before the standard Email Action is rendered.

DescribeAvailableQuickActionResult Class

Contains describe metadata information for a quick action that is available for a specified parent.

Namespace

QuickAction

Usage

The QuickAction `describeAvailableQuickActions` method returns an array of available quick action describe result objects (`QuickAction.DescribeAvailableQuickActionResult`).

DescribeAvailableQuickActionResult Methods

The following are methods for `DescribeAvailableQuickActionResult`. All are instance methods.

IN THIS SECTION:

getActionEnumOrId()
Returns the unique ID for the action. If the action doesn't have an ID, its API name is used.

getLabel()
The quick action label.

getName()
The quick action name.

getType()
The quick action type.

getActionEnumOrId()

Returns the unique ID for the action. If the action doesn't have an ID, its API name is used.

Signature

```
public String getActionEnumOrId()
```

Return Value

Type: String

getLabel()

The quick action label.

Signature

```
public String getLabel()
```

Return Value

Type: String

getName()

The quick action name.

Signature

```
public String getName()
```

Return Value

Type: String

getType()

The quick action type.

Signature

```
public String getType()
```

Return Value

Type: String

DescribeLayoutComponent Class

Represents the smallest unit in a layout—a field or a separator.

Namespace

QuickAction

DescribeLayoutComponent Methods

The following are methods for `DescribeLayoutComponent`. All are instance methods.

IN THIS SECTION:

getDisplayLines()
Returns the vertical lines displayed for a field. Applies to `textarea` and multi-select picklist fields.

getTabOrder()
Returns the tab order for the item in the row.

getType()
Returns the name of the `QuickAction.DescribeLayoutComponent` type for this component.

getValue()
Returns the name of the field if the type for `QuickAction.DescribeLayoutComponent` is `textarea`.

`getDisplayLines()`

Returns the vertical lines displayed for a field. Applies to `textarea` and multi-select picklist fields.

Signature

```
public Integer getDisplayLines()
```

Return Value

Type: Integer

`getTabOrder()`

Returns the tab order for the item in the row.

Signature

```
public Integer getTabOrder()
```

Return Value

Type: Integer

`getType()`

Returns the name of the `QuickAction.DescribeLayoutComponent` type for this component.

Signature

```
public String getType()
```

Return Value

Type: String

`getValue()`

Returns the name of the field if the type for `QuickAction.DescribeLayoutComponent` is `textarea`.

Signature

```
public String getValue()
```

Return Value

Type: String

DescribeLayoutItem Class

Represents an individual item in a `QuickAction.DescribeLayoutRow`.

Namespace

QuickAction

Usage

For most fields on a layout, there is only one component per layout item. However, in a display-only view, the `QuickAction.DescribeLayoutItem` might be a composite of the individual fields (for example, an address can consist of street, city, state, country, and postal code data). On the corresponding edit view, each component of the address field would be split up into separate `QuickAction.DescribeLayoutItem`s.

DescribeLayoutItem Methods

The following are methods for `DescribeLayoutItem`. All are instance methods.

IN THIS SECTION:

getLabel()
Returns the label text for this item.

getLayoutComponents()
Returns a list of `QuickAction.DescribeLayoutComponents` for this item.

isEditableForNew()
Indicates whether this item can be edited for new (`true`) or not (`false`).

isEditableForUpdate()
Indicates whether this item can be edited for update(`true`) or not (`false`).

isPlaceholder()
Indicates whether this item is a placeholder (`true`) or not (`false`). If `true`, then this item is blank.

isRequired()
Indicates whether this item is required (`true`) or not (`false`).

`getLabel()`

Returns the label text for this item.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getLayoutComponents()`

Returns a list of `QuickAction.DescribeLayoutComponents` for this item.

Signature

```
public List<QuickAction.DescribeLayoutComponent> getLayoutComponents()
```

Return Value

Type: List<QuickAction.DescribeLayoutComponent>

`isEditableForNew()`

Indicates whether this item can be edited for new (`true`) or not (`false`).

Signature

```
public Boolean isEditableForNew()
```

Return Value

Type: Boolean

`isEditableForUpdate()`

Indicates whether this item can be edited for update(`true`) or not (`false`).

Signature

```
public Boolean isEditableForUpdate()
```

Return Value

Type: Boolean

`isPlaceholder()`

Indicates whether this item is a placeholder (`true`) or not (`false`). If `true`, then this item is blank.

Signature

```
public Boolean isPlaceholder()
```

Return Value

Type: Boolean

`isRequired()`

Indicates whether this item is required (`true`) or not (`false`).

Signature

```
public Boolean isRequired()
```

Return Value

Type: Boolean

Usage

This is useful if, for example, you want to render required fields in a contrasting color.

DescribeLayoutRow Class

Represents a row in a `QuickAction.DescribeLayoutSection`.

Namespace

QuickAction

Usage

A `QuickAction.DescribeLayoutRow` consists of one or more `QuickAction.DescribeLayoutItem` objects. For each `QuickAction.DescribeLayoutRow`, a `QuickAction.DescribeLayoutItem` refers either to a specific field or to an "empty" `QuickAction.DescribeLayoutItem` (one that contains no `QuickAction.DescribeLayoutComponent` objects). An empty `QuickAction.DescribeLayoutItem` can be returned when a given `QuickAction.DescribeLayoutRow` is sparse (for example, containing more fields on the right column than on the left column).

DescribeLayoutRow Methods

The following are methods for `DescribeLayoutRow`. All are instance methods.

IN THIS SECTION:

getLayoutItems()
Returns either a specific field or an empty `QuickAction.DescribeLayoutItem` (one that contains no `QuickAction.DescribeLayoutComponent` objects).

getNumItems()
Returns the number of `QuickAction.DescribeLayoutItem`.

`getLayoutItems()`

Returns either a specific field or an empty `QuickAction.DescribeLayoutItem` (one that contains no `QuickAction.DescribeLayoutComponent` objects).

Signature

```
public List<QuickAction.DescribeLayoutItem> getLayoutItems()
```

Return Value

Type: List<QuickAction.DescribeLayoutItem>

`getNumItems()`

Returns the number of `QuickAction.DescribeLayoutItem`.

Signature

```
public Integer getNumItems()
```

Return Value

Type: Integer

DescribeLayoutSection Class

Represents a section of a layout and consists of one or more columns and one or more rows (an array of `QuickAction.DescribeLayoutRow`).

Namespace

QuickAction

DescribeLayoutSection Properties

The following are properties for `DescribeLayoutSection`.

`collapsed`

The current view of the record details section: collapsed (`true`) or expanded (`false`).

Signature

```
public Boolean collapsed {get; set;}
```

Property Value

Type: Boolean

`layoutsectionid`

The unique ID of the record details section in the layout.

Signature

```
public Id layoutsectionid {get; set;}
```

Property Value

Type: Id

DescribeLayoutSection Methods

The following are methods for `DescribeLayoutSection`.

IN THIS SECTION:

getColumns()
Returns the number of columns in the `QuickAction.DescribeLayoutSection`.

getHeading()
The heading text (label) for the `QuickAction.DescribeLayoutSection`.

getLayoutRows()
Returns an array of one or more `QuickAction.DescribeLayoutRow` objects.

getLayoutSectionId()
Returns the ID of the record details section in the layout.

getParentLayoutId()
Returns the ID of the layout upon which this `DescribeLayoutSection` resides.

getRows()

Returns the number of rows in the `QuickAction.DescribeLayoutSection`.

isCollapsed()

Indicates whether the record details section is collapsed (`true`) or expanded (`false`). If you build your own app, you can use this method to see whether the current user collapsed a section, and respect that preference in your own UI.

isUseCollapsibleSection()

Indicates whether the `QuickAction.DescribeLayoutSection` is a collapsible section (`true`) or not (`false`).

isUseHeading()

Indicates whether to use the `heading` (`true`) or not (`false`).

getColumns()

Returns the number of columns in the `QuickAction.DescribeLayoutSection`.

Signature

```
public Integer getColumns()
```

Return Value

Type: Integer

getHeading()

The heading text (label) for the `QuickAction.DescribeLayoutSection`.

Signature

```
public String getHeading()
```

Return Value

Type: String

getLayoutRows()

Returns an array of one or more `QuickAction.DescribeLayoutRow` objects.

Signature

```
public List<QuickAction.DescribeLayoutRow> getLayoutRows()
```

Return Value

Type: List<QuickAction.DescribeLayoutRow>

getLayoutSectionId()

Returns the ID of the record details section in the layout.

Signature

```
public Id getLayoutSectionId()
```

Return Value

Type: Id

`getParentLayoutId()`

Returns the ID of the layout upon which this `DescribeLayoutSection` resides.

Signature

```
public Id getParentLayoutId()
```

Return Value

Type: Id

`getRows()`

Returns the number of rows in the `QuickAction.DescribeLayoutSection`.

Signature

```
public Integer getRows()
```

Return Value

Type: Integer

`isCollapsed()`

Indicates whether the record details section is collapsed (`true`) or expanded (`false`). If you build your own app, you can use this method to see whether the current user collapsed a section, and respect that preference in your own UI.

Signature

```
public Boolean isCollapsed()
```

Return Value

Type: Boolean

`isUseCollapsibleSection()`

Indicates whether the `QuickAction.DescribeLayoutSection` is a collapsible section (`true`) or not (`false`).

Signature

```
public Boolean isUseCollapsibleSection()
```

Return Value

Type: Boolean

`isUseHeading()`

Indicates whether to use the `heading` (`true`) or not (`false`).

Signature

```
public Boolean isUseHeading()
```

Return Value

Type: Boolean

DescribeQuickActionDefaultValue Class

Returns a default value for a quick action.

Namespace

QuickAction

Usage

Represents the default values of fields to use in default layouts.

DescribeQuickActionDefaultValue Methods

The following are methods for `DescribeQuickActionDefaultValue`. All are instance methods.

IN THIS SECTION:

getDefaultValue()
Returns the default value of the quick action.

getField()
Returns the field name of the action.

`getDefaultValue()`

Returns the default value of the quick action.

Signature

```
public String getDefaultValue()
```

Return Value

Type: String

`getField()`

Returns the field name of the action.

Signature

```
public String getField()
```

Return Value

Type: String

DescribeQuickActionResult Class

Contains describe metadata information for a quick action.

Namespace

QuickAction

Usage

The QuickAction `describeQuickActions` method returns an array of quick action describe result objects (`QuickAction.DescribeQuickActionResult`).

IN THIS SECTION:

DescribeQuickActionResult Properties

DescribeQuickActionResult Methods

DescribeQuickActionResult Properties

The following are properties for `DescribeQuickActionResult`.

IN THIS SECTION:

canvasapplicationname
The name of the Canvas application invoked by the custom action.

colors
Array of color information. Each color is associated with a theme.

contextsobjecttype

The object used for the action. Was `getsourceSobjectType()` in API version 29.0 and earlier.

defaultvalues

The action's default values.

flowdevname

If the custom action invokes a flow, the fully qualified name of the flow.

flowrecordidvar

If the custom action invokes a flow, the input variable that the custom action passes the record's ID to.

height

The height in pixels of the action pane.

iconname

The name of the icon used for the action. If a custom icon is not used, this value isn't set.

icons

Array of icons. Each icon is associated with a theme.

iconurl

The URL of the icon used for the action. This icon URL corresponds to the 32x32 icon used for the current Salesforce theme, introduced in Spring '10, or the custom icon, if there is one.

layout

The section of the layout where the action resides.

lightningcomponentbundleid

If the custom action invokes an Aura component, the ID of the Aura component bundle to which the component belongs.

lightningcomponentbundlename

If the custom action invokes an Aura component, the name of the Aura component bundle to which the component belongs.

lightningcomponentqualifiedname

The fully qualified name of the Aura component invoked by the custom action.

lightningwebcomponentbundleid

If the custom action invokes a Lightning web component, the ID of the Lightning web component bundle to which the component belongs.

lightningwebcomponentbundlename

If the custom action invokes a Lightning web component, the name of the Lightning web component bundle to which the component belongs.

lightningwebcomponentqualifiedname

The fully qualified name of the Lightning web component invoked by the custom action.

miniiconurl

The icon's URL. This icon URL corresponds to the 16x16 icon used for the current Salesforce theme, introduced in Spring '10, or the custom icon, if there is one.

showquickactionlcheader

Indicates whether the Lightning component quick action header and footer are shown. If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

showquickactionvfheader

Indicates whether the Visualforce quick action header and footer should be shown. If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

targetparentfield

The parent object type of the action. Links the target object to the parent object. For example, the value is Account if the target object is Contact and the parent object is Account.

targetrecordtypeid

The record type of the target record.

targetsobjecttype

The action's target object type.

visualforcepagename

The name of the Visualforce page associated with the custom action.

visualforcepageurl

The URL of the Visualforce page associated with the action.

width

The width in pixels of the action pane, for custom actions that call Visualforce pages, Canvas apps, or Lightning components.

canvasapplicationname

The name of the Canvas application invoked by the custom action.

Signature

```
public String canvasapplicationname {get; set;}
```

Property Value

Type: String

colors

Array of color information. Each color is associated with a theme.

Signature

```
public List<Schema.DescribeColorResult> colors {get; set;}
```

Property Value

Type: List<Schema.DescribeColorResult> on page 2931

contextsobjecttype

The object used for the action. Was `getsourceSobjectType()` in API version 29.0 and earlier.

Signature

```
public String contextsobjecttype {get; set;}
```

Property Value

Type: String

`defaultvalues`

The action's default values.

Signature

```
public List<QuickAction.DescribeQuickActionDefaultValue> defaultvalues {get; set;}
```

Property Value

Type: List<QuickAction.DescribeQuickActionDefaultValue>

`flowdevname`

If the custom action invokes a flow, the fully qualified name of the flow.

Signature

```
public String flowdevname {get; set;}
```

Property Value

Type: String

`flowrecordidvar`

If the custom action invokes a flow, the input variable that the custom action passes the record's ID to.

Signature

```
public String flowrecordidvar {get; set;}
```

Property Value

Type: String

Valid values are *`null`* or *`recordId`*.

`height`

The height in pixels of the action pane.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: Integer

iconname

The name of the icon used for the action. If a custom icon is not used, this value isn't set.

Signature

```
public String iconname {get; set;}
```

Property Value

Type: String

icons

Array of icons. Each icon is associated with a theme.

Signature

```
public List<Schema.DescribeIconResult> icons {get; set;}
```

Property Value

Type: List<Schema.DescribeIconResult on page 2954>

If no custom icon was associated with the quick action and the quick action creates a specific object, the icons will correspond to the icons used for the created object. For example, if the quick action creates an Account, the icon array will contain the icons used for Account.

If a custom icon was associated with the quick action, the array will contain that custom icon.

iconurl

The URL of the icon used for the action. This icon URL corresponds to the 32x32 icon used for the current Salesforce theme, introduced in Spring '10, or the custom icon, if there is one.

Signature

```
public String iconurl {get; set;}
```

Property Value

Type: String

layout

The section of the layout where the action resides.

Signature

```
public QuickAction.DescribeLayoutSection layout {get; set;}
```

Property Value

Type: QuickAction.DescribeLayoutSection on page 2719

lightningcomponentbundleid

If the custom action invokes an Aura component, the ID of the Aura component bundle to which the component belongs.

Signature

```
public String lightningcomponentbundleid {get; set;}
```

Property Value

Type: String

lightningcomponentbundlename

If the custom action invokes an Aura component, the name of the Aura component bundle to which the component belongs.

Signature

```
public String lightningcomponentbundlename {get; set;}
```

Property Value

Type: String

lightningcomponentqualifiedname

The fully qualified name of the Aura component invoked by the custom action.

Signature

```
public String lightningcomponentqualifiedname {get; set;}
```

Property Value

Type: String

lightningwebcomponentbundleid

If the custom action invokes a Lightning web component, the ID of the Lightning web component bundle to which the component belongs.

Signature

```
public String lightningwebcomponentbundleid {get; set;}
```

Property Value

Type: String

lightningwebcomponentbundlename

If the custom action invokes a Lightning web component, the name of the Lightning web component bundle to which the component belongs.

Signature

```
public String lightningwebcomponentbundlename {get; set;}
```

Property Value

Type: String

lightningwebcomponentqualifiedname

The fully qualified name of the Lightning web component invoked by the custom action.

Signature

```
public String lightningwebcomponentqualifiedname {get; set;}
```

Property Value

Type: String

miniiconurl

The icon's URL. This icon URL corresponds to the 16x16 icon used for the current Salesforce theme, introduced in Spring '10, or the custom icon, if there is one.

Signature

```
public String miniiconurl {get; set;}
```

Property Value

Type: String

showquickactionlcheader

Indicates whether the Lightning component quick action header and footer are shown. If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

Signature

```
public Boolean showquickactionlcheader {get; set;}
```

Property Value

Type: Boolean

showquickactionvfheader

Indicates whether the Visualforce quick action header and footer should be shown. If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

Signature

```
public Boolean showquickactionvfheader {get; set;}
```

Property Value

Type: Boolean

targetparentfield

The parent object type of the action. Links the target object to the parent object. For example, the value is Account if the target object is Contact and the parent object is Account.

Signature

```
public String targetparentfield {get; set;}
```

Property Value

Type: String

targetrecordtypeid

The record type of the target record.

Signature

```
public String targetrecordtypeid {get; set;}
```

Property Value

Type: String

targetsobjecttype

The action's target object type.

Signature

```
public String targetsobjecttype {get; set;}
```

Property Value

Type: String

visualforcepagename

The name of the Visualforce page associated with the custom action.

Signature

```
public String visualforcepagename {get; set;}
```

Property Value

Type: String

visualforcepageurl

The URL of the Visualforce page associated with the action.

Signature

```
public String visualforcepageurl {get; set;}
```

Property Value

Type: String

width

The width in pixels of the action pane, for custom actions that call Visualforce pages, Canvas apps, or Lightning components.

Signature

```
public Integer width {get; set;}
```

Property Value

Type: Integer

DescribeQuickActionResult Methods

The following are methods for `DescribeQuickActionResult`. All are instance methods.

IN THIS SECTION:

getActionEnumOrId()
Returns the unique ID for the action. If the action doesn't have an ID, its API name is used.

getCanvasApplicationName()
Returns the name of the Canvas application, if used.

getColors()
Returns an array of color information. Each color is associated with a theme.

getContextSobjectType()
Returns the object used for the action. Replaces `getsourceSobjectType()` in API version 30.0 and later.

getDefaultValues()
Returns the default values for a action.

getFlowDevName()
If the custom action invokes a flow, returns the fully qualified name of the flow invoked by the custom action.

getFlowRecordIdVar()
If the custom action invokes a flow, returns the input variable that the custom action passes the record's ID to.

getHeight()
Returns the height in pixels of the action pane.

getIconName()
Returns the actions' icon name.

getIconUrl()
Returns the URL of the 32x32 icon used for the action.

getIcons()
Returns a list of `Schema.DescribeIconResult` objects that describe colors used in a tab.

getLabel()
Returns the action label.

getLayout()
Returns the layout sections that comprise an action.

getLightningComponentBundleId()
If the custom action invokes an Aura component, returns the ID of the Aura component bundle to which the component belongs.

getLightningComponentBundleName()
If the custom action invokes an Aura component, returns the name of the Aura component bundle to which the component belongs.

getLightningComponentQualifiedName()
If the custom action invokes an Aura component, returns the fully qualified name of the Aura component invoked by the custom action.

getLightningWebComponentBundleId()
If the custom action invokes a Lightning web component, returns the ID of the Lightning web component bundle to which the component belongs.

getLightningWebComponentBundleName()
If the custom action invokes a Lightning web component, returns the name of the Lightning web component bundle to which the component belongs.

getLightningWebComponentQualifiedName()
If the custom action invokes a Lightning web component, returns the fully qualified name of the Lightning web component invoked by the custom action.

getMiniIconUrl()
Returns the 16x16 icon URL.

getName()
Returns the action name.

getShowQuickActionLcHeader()
Returns an indication of whether the Lightning component quick action header and footer are shown.

getShowQuickActionVfHeader()
Returns an indication of whether the Visualforce quick action header and footer should be shown.

getSourceSobjectType()
Returns the object type used for the action.

getTargetParentField()
Returns the parent object's type for the action.

getTargetRecordTypeId()
Returns the record type of the targeted record.

getTargetSobjectType()
Returns the action's target object type.

getType()
Returns a create or custom Visualforce action.

getVisualforcePageName()
If Visualforce is used, returns the name of the associated page for the action.

getVisualforcePageUrl()
Returns the URL of the Visualforce page associated with the action.

getWidth()
If a custom action is created, returns the width in pixels of the action pane.

`getActionEnumOrId()`

Returns the unique ID for the action. If the action doesn't have an ID, its API name is used.

Signature

```
public String getActionEnumOrId()
```

Return Value

Type: String

`getCanvasApplicationName()`

Returns the name of the Canvas application, if used.

Syntax

```
public String getCanvasApplicationName()
```

Return Value

Type: String

getColors()

Returns an array of color information. Each color is associated with a theme.

Signature

```
public List<Schema.DescribeColorResult> getColors()
```

Return Value

Type: List <Schema.DescribeColorResult>

getContextSobjectType()

Returns the object used for the action. Replaces `getsourceSobjectType()` in API version 30.0 and later.

Signature

```
public String getContextSobjectType()
```

Return Value

Type: String

getDefaultValues()

Returns the default values for a action.

Signature

```
public List<QuickAction.DescribeQuickActionDefaultValue> getDefaultValues()
```

Return Value

Type: List<QuickAction.DescribeQuickActionDefaultValue>

getFlowDevName()

If the custom action invokes a flow, returns the fully qualified name of the flow invoked by the custom action.

Signature

```
public String getFlowDevName()
```

Return Value

Type: String

`getFlowRecordIdVar()`

If the custom action invokes a flow, returns the input variable that the custom action passes the record's ID to.

Signature

```
public String getFlowRecordIdVar()
```

Return Value

Type: String

`getHeight()`

Returns the height in pixels of the action pane.

Signature

```
public Integer getHeight()
```

Return Value

Type: Integer

`getIconName()`

Returns the actions' icon name.

Signature

```
public String getIconName()
```

Return Value

Type: String

`getIconUrl()`

Returns the URL of the 32x32 icon used for the action.

Signature

```
public String getIconUrl()
```

Return Value

Type: String

getIcons()

Returns a list of `Schema.DescribeIconResult` objects that describe colors used in a tab.

Signature

```
public List<Schema.DescribeIconResult> getIcons()
```

Return Value

Type: List<Schema.DescribeIconResult>

getLabel()

Returns the action label.

Signature

```
public String getLabel()
```

Return Value

Type: String

getLayout()

Returns the layout sections that comprise an action.

Signature

```
public QuickAction.DescribeLayoutSection getLayout()
```

Return Value

Type: QuickAction.DescribeLayoutSection

getLightningComponentBundleId()

If the custom action invokes an Aura component, returns the ID of the Aura component bundle to which the component belongs.

Signature

```
public String getLightningComponentBundleId()
```

Return Value

Type: String

getLightningComponentBundleName()

If the custom action invokes an Aura component, returns the name of the Aura component bundle to which the component belongs.

Signature

```
public String getLightningComponentBundleName()
```

Return Value

Type: String

`getLightningComponentQualifiedName()`

If the custom action invokes an Aura component, returns the fully qualified name of the Aura component invoked by the custom action.

Signature

```
public String getLightningComponentQualifiedName()
```

Return Value

Type: String

`getLightningWebComponentBundleId()`

If the custom action invokes a Lightning web component, returns the ID of the Lightning web component bundle to which the component belongs.

Signature

```
public String getLightningWebComponentBundleId()
```

Return Value

Type: String

`getLightningWebComponentBundleName()`

If the custom action invokes a Lightning web component, returns the name of the Lightning web component bundle to which the component belongs.

Signature

```
public String getLightningWebComponentBundleName()
```

Return Value

Type: String

`getLightningWebComponentQualifiedName()`

If the custom action invokes a Lightning web component, returns the fully qualified name of the Lightning web component invoked by the custom action.

Signature

```
public String getLightningWebComponentQualifiedName()
```

Return Value

Type: String

`getMiniIconUrl()`

Returns the 16x16 icon URL.

Signature

```
public String getMiniIconUrl()
```

Return Value

Type: String

`getName()`

Returns the action name.

Signature

```
public String getName()
```

Return Value

Type: String

`getShowQuickActionLcHeader()`

Returns an indication of whether the Lightning component quick action header and footer are shown.

Signature

```
public Boolean getShowQuickActionLcHeader()
```

Return Value

Type: Boolean

If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

`getShowQuickActionVfHeader()`

Returns an indication of whether the Visualforce quick action header and footer should be shown.

Signature

```
public Boolean getShowQuickActionVfHeader()
```

Return Value

Type: Boolean

If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

getSourceSobjectType()

Returns the object type used for the action.

Signature

```
public String getSourceSobjectType()
```

Return Value

Type: String

getTargetParentField()

Returns the parent object's type for the action.

Signature

```
public String getTargetParentField()
```

Return Value

Type: String

getTargetRecordTypeId()

Returns the record type of the targeted record.

Signature

```
public String getTargetRecordTypeId()
```

Return Value

Type: String

getTargetSobjectType()

Returns the action's target object type.

Signature

```
public String getTargetSobjectType()
```

Return Value

Type: String

getType()

Returns a create or custom Visualforce action.

Signature

```
public String getType()
```

Return Value

Type: String

getVisualforcePageName()

If Visualforce is used, returns the name of the associated page for the action.

Signature

```
public String getVisualforcePageName()
```

Return Value

Type: String

getVisualforcePageUrl()

Returns the URL of the Visualforce page associated with the action.

Signature

```
public String getVisualforcePageUrl()
```

Return Value

Type: String

getWidth()

If a custom action is created, returns the width in pixels of the action pane.

Signature

```
public Integer getWidth()
```

Return Value

Type: Integer

QuickActionDefaults Class

Represents an abstract Apex class that provides the context for running the standard Email Action on Case Feed and the container of the Email Message fields for the action payload. You can override the target fields before the standard Email Action is rendered.

Namespace

QuickAction

Usage

Note: You cannot extend this abstract class. You can use the getter methods when using it in the context of QuickAction.QuickActionDefaultsHandler. Salesforce provides a class that extends this class (See QuickAction.SendEmailQuickActionDefaults.)

IN THIS SECTION:

QuickActionDefaults Methods

QuickActionDefaults Methods

The following are methods for `QuickActionDefaults`.

IN THIS SECTION:

getActionName()
Returns the name of the standard Email Action on Case Feed (Case.Email).

getActionType()
Returns the type of the standard Email Action on Case Feed (Email).

getContextId()
The ID of the context related to the standard Email Action on Case Feed (Case ID).

getTargetSObject()
The target object of the standard Email Action on Case Feed (EmailMessage).

`getActionName()`

Returns the name of the standard Email Action on Case Feed (Case.Email).

Signature

```
public String getActionName()
```

Return Value

Type: String

`getActionType()`

Returns the type of the standard Email Action on Case Feed (Email).

Signature

```
public String getActionType()
```

Return Value

Type: String

`getContextId()`

The ID of the context related to the standard Email Action on Case Feed (Case ID).

Signature

```
public Id getContextId()
```

Return Value

Type: Id

`getTargetSObject()`

The target object of the standard Email Action on Case Feed (EmailMessage).

Signature

```
public SObject getTargetSObject()
```

Return Value

Type: SObject

QuickActionDefaultsHandler Interface

The `QuickAction.QuickActionDefaultsHandler` interface lets you specify the default values for the standard Email and Send Email actions in the case feed. You can use this interface to specify the From address, CC address, BCC address, subject, and email body for the Email action in the case feed. You can use the interface to pre-populate these fields based on the context where the action is displayed, such as the case origin (for example, country) and subject.

Namespace

QuickAction

Usage

To specify default values for the standard Email action in the case feed, create a class that implements `QuickAction.QuickActionDefaultsHandler`.

The `QuickAction.QuickActionDefaultsHandler` interface works in Salesforce Classic and Lightning Experience.

When working in Lightning Experience, keep the following things in mind:

- The interface overrides email values set up with predefined IDs.
- The interface works with the out-of-the-box Email action provided on cases. You can also use the interface with custom Email actions for the case object.
- The interface in Lightning Experience doesn't support:
  - Email attachments
  - Custom email fields
  - Visualforce email templates, which are a type of email template available in Salesforce Classic
- The From field determines the from address picklist. While you can't customize this picklist in Send Email action types via the QuickActionDefaultsHandler interface, you can customize the From Address field. To customize this field, remove the From field from the SendEmail quick action layout and add the From Address field instead. Then provide a valid and verified from address in the QuickActionDefaultsHandler code. This address must be the current user's address, an organization-wide email address that the current user has access to, or an Email-to-Case routing address.
- If your Apex interface adds content to the email body, merge fields display as unresolved. During preview and send, the merge fields resolve.

When you implement this interface, provide an empty parameterless constructor.

IN THIS SECTION:

QuickActionDefaultsHandler Methods

QuickActionDefaultsHandler Example Implementations

QuickActionDefaultsHandler Methods

The following are methods for `QuickActionDefaultsHandler`.

IN THIS SECTION:

onInitDefaults(actionDefaults)
Implement this method to provide default values for the standard Email action in the case feed.

`onInitDefaults(actionDefaults)`

Implement this method to provide default values for the standard Email action in the case feed.

Signature

```
public void onInitDefaults(QuickAction.QuickActionDefaults[] actionDefaults)
```

Parameters

actionDefaults
Type: QuickAction.QuickActionDefaults[]

This array contains only one item of type `QuickAction.SendEmailQuickActionDefaults`.

Return Value

Type: void

QuickActionDefaultsHandler Example Implementations

These examples are implementations of the `QuickAction.QuickActionDefaultsHandler` interface.

In this example, the `onInitDefaults` method checks whether the element passed in the array is for the standard Email action in the case feed. Then, it performs a query to retrieve the case that corresponds to the context ID. Next, it sets the value of the BCC address of the corresponding email message to a default value. The default value is based on the case reason. Finally, it sets the default values of the email template properties. The `onInitDefaults` method determines the default values based on two criteria: first, whether a reply action on an email message initiated the call to the method, and second, whether any previous emails attached to the case are associated with the call.

```
global class EmailPublisherLoader implements QuickAction.QuickActionDefaultsHandler {
    // Empty constructor
    global EmailPublisherLoader() {
    }

    // The main interface method
    global void onInitDefaults(QuickAction.QuickActionDefaults[] defaults) {
        QuickAction.SendEmailQuickActionDefaults sendEmailDefaults = null;

        // Check if the quick action is the standard case feed Send Email action
        for (Integer j = 0; j < defaults.size(); j++) {
            if (defaults.get(j) instanceof QuickAction.SendEmailQuickActionDefaults &&
               defaults.get(j).getTargetSObject().getSObjectType() ==
                   EmailMessage.sObjectType &&
               defaults.get(j).getActionName().equals('Case.Email') &&
               defaults.get(j).getActionType().equals('Email')) {
                   sendEmailDefaults =
                       (QuickAction.SendEmailQuickActionDefaults)defaults.get(j);
                   break;
            }
        }

        if (sendEmailDefaults != null) {
            Case c = [SELECT Status, Reason FROM Case
                      WHERE Id=:sendEmailDefaults.getContextId()];

          EmailMessage emailMessage = (EmailMessage)sendEmailDefaults.getTargetSObject();

            // Set BCC address to make sure each email goes for audit
            emailMessage.BccAddress = getBccAddress(c.Reason);

            /*
```

```
            Set Template related fields
            when the In Reply To Id field is null we know the interface
            is called on page load. Here we check if
            there are any previous emails attached to the case and load
            the 'New_Case_Created' or 'Automatic_Response' template.
            When the In Reply To Id field is not null we know that
            the interface is called on click of reply/reply all
            of an email and we load the 'Default_reply_template' template
            */
            if (sendEmailDefaults.getInReplyToId() == null) {
                Integer emailCount = [SELECT count() FROM EmailMessage
                                      WHERE ParentId=:sendEmailDefaults.getContextId()];
                if (emailCount!= null && emailCount > 0) {
                    sendEmailDefaults.setTemplateId(
                        getTemplateIdHelper('Automatic_Response'));
                } else {
                    sendEmailDefaults.setTemplateId(
                        getTemplateIdHelper('New_Case_Created'));
                }
                sendEmailDefaults.setInsertTemplateBody(false);
                sendEmailDefaults.setIgnoreTemplateSubject(false);
            } else {
                sendEmailDefaults.setTemplateId(
                    getTemplateIdHelper('Default_reply_template'));
                sendEmailDefaults.setInsertTemplateBody(false);
                sendEmailDefaults.setIgnoreTemplateSubject(true);
            }
        }
    }

    private Id getTemplateIdHelper(String templateApiName) {
        Id templateId = null;
        try {
            templateId = [select id, name from EmailTemplate
                          where developername = : templateApiName].id;
        } catch (Exception e) {
            system.debug('Unble to locate EmailTemplate using name: ' +
                templateApiName + ' refer to Setup | Communications Templates '
                    + templateApiName);
        }
        return templateId;
    }
private String getBccAddress(String reason) {
        if (reason != null && reason.equals('Technical'))
            { return 'support_technical@mycompany.com'; }
        else if (reason != null && reason.equals('Billing'))
            { return 'support_billing@mycompany.com'; }
        else { return 'support@mycompany.com'; }
    }

}
```

In this example, the `onInitDefaults` method checks whether the element passed in the array is for the standard Email action in the case feed. Then it performs a query to determine if the case Priority is set to *`High`*. If the Priority is set to *`High`*, the email address *`managers@acme.com`* is appended to the BCC field.

```
global class EmailPublisherForHighPriorityCases implements
QuickAction.QuickActionDefaultsHandler {
    // Empty constructor
    global EmailPublisherForHighPriorityCases() {
    }

    // The main interface method
    global void onInitDefaults(QuickAction.QuickActionDefaults[] defaults) {
        QuickAction.SendEmailQuickActionDefaults sendEmailDefaults =
(QuickAction.SendEmailQuickActionDefaults)defaults.get(0);
        EmailMessage emailMessage = (EmailMessage)sendEmailDefaults.getTargetSObject();

        Case c = [SELECT CaseNumber, Priority FROM Case WHERE
Id=:sendEmailDefaults.getContextId()];

        // If case severity is "High," append "managers@acme.com" to the existing (and
possibly blank) BCC field
        if (c.Priority != null && c.Priority.equals('High')) { // Priority is 'High'
            emailMessage.BccAddress = 'managers@acme.com';
        }
    }
}
```

In this example, the `onInitDefaults` method checks whether the element passed in the array is for the standard Email action in the case feed. Then it performs a query to determine if the case Type is set to *`Problem`*. If the type is set to *`Problem`*, the *`First Response`* email template is inserted into the body of the email.

```
global class EmailPublisherForCaseType implements QuickAction.QuickActionDefaultsHandler
{
    // Empty constructor
    global EmailPublisherForCaseType() {
    }

    // The main interface method
    global void onInitDefaults(QuickAction.QuickActionDefaults[] defaults) {
    QuickAction.SendEmailQuickActionDefaults sendEmailDefaults =
(QuickAction.SendEmailQuickActionDefaults)defaults.get(0);
    EmailMessage emailMessage = (EmailMessage)sendEmailDefaults.getTargetSObject();

   Case c = [SELECT CaseNumber, Type FROM Case WHERE Id=:sendEmailDefaults.getContextId()];

    // If case type is "Problem," insert the "First Response" email template
    if (c.CaseNumber != null && c.Type.equals('Problem')) {
        sendEmailDefaults.setTemplateId('Insert Email Template ID Here');   // Set the
template Id corresponding to First Response
        sendEmailDefaults.setInsertTemplateBody(true);
        sendEmailDefaults.setIgnoreTemplateSubject(false);
    }
}
```

In this example, the `onInitDefaults` method checks whether the element passed in the array is for the standard Email action in the case feed. Then it performs a query to determine if the email is a Reply or Reply All email. If email is a Reply or Reply All email, the corresponding email templates for these emails are inserted into the body of the email.

```
global class EmailPublisherForReplyAndReplyAll implements
QuickAction.QuickActionDefaultsHandler {

    // Empty constructor
    global EmailPublisherForReplyAndReplyAll() {

    }

    // The main interface method
    global void onInitDefaults(QuickAction.QuickActionDefaults[] defaults) {

    QuickAction.SendEmailQuickActionDefaults sendEmailDefaults =
(QuickAction.SendEmailQuickActionDefaults)defaults.get(0);
    EmailMessage emailMessage = (EmailMessage)sendEmailDefaults.getTargetSObject();

    // If the email is a "Reply" email, insert the "Reply Email Template" to the email
body
    if (sendEmailDefaults.getActionName().equals('EmailMessage._Reply')) {
        sendEmailDefaults.setTemplateId('Insert Reply Email Template ID Here');

        sendEmailDefaults.setInsertTemplateBody(true);
        sendEmailDefaults.setIgnoreTemplateSubject(false);

    // If the email is a "Reply All" email, insert the "Reply All Email Template" to the
email body
    } else if (sendEmailDefaults.getActionName().equals('EmailMessage._ReplyAll')) {
        sendEmailDefaults.setTemplateId('Insert Reply All Email Template ID Here');

        sendEmailDefaults.setInsertTemplateBody(true);
        sendEmailDefaults.setIgnoreTemplateSubject(false);

}
```

QuickActionRequest Class

Use the `QuickAction.QuickActionRequest` class for providing action information for quick actions to be performed by `QuickAction` class methods. Action information includes the action name, context record ID, and record.

Namespace

QuickAction

Usage

For Apex saved using Salesforce API version 28.0, a parent ID is associated with the QuickActionRequest instead of the context ID.

The constructor of this class takes no arguments:

```
QuickAction.QuickActionRequest qar = new QuickAction.QuickActionRequest();
```

Example

In this sample, a new quick action is created to create a contact and assign a record to it.

```
QuickAction.QuickActionRequest req = new QuickAction.QuickActionRequest();
// Some quick action name
req.quickActionName = Schema.Account.QuickAction.AccountCreateContact;

// Define a record for the quick action to create
Contact c = new Contact();
c.lastname = 'last name';
req.record = c;

// Provide the context ID (or parent ID). In this case, it is an Account record.
req.contextid = '001xx000003DGcO';

QuickAction.QuickActionResult res = QuickAction.performQuickAction(req);
```

IN THIS SECTION:

QuickActionRequest Constructors

QuickActionRequest Methods

SEE ALSO:

QuickAction Class

QuickActionRequest Constructors

The following are constructors for `QuickActionRequest`.

IN THIS SECTION:

QuickActionRequest()
Creates a new instance of the `QuickAction.QuickActionRequest` class.

`QuickActionRequest()`

Creates a new instance of the `QuickAction.QuickActionRequest` class.

Signature

```
public QuickActionRequest()
```

QuickActionRequest Methods

The following are methods for `QuickActionRequest`. All are instance methods.

IN THIS SECTION:

getContextId()
Returns this QuickAction's context record ID.

getQuickActionName()
Returns this QuickAction's name.

getRecord()
Returns the QuickAction's associated record.

setContextId(contextId)
Sets this QuickAction's context ID. Returned by `getContextId`.

setQuickActionName(name)
Sets this QuickAction's name. Returned by `getQuickActionName`.

setRecord(record)
Sets a record for this QuickAction. Returned by `getRecord`.

`getContextId()`

Returns this QuickAction's context record ID.

Signature

```
public Id getContextId()
```

Return Value

Type: ID

`getQuickActionName()`

Returns this QuickAction's name.

Signature

```
public String getQuickActionName()
```

Return Value

Type: String

`getRecord()`

Returns the QuickAction's associated record.

Signature

```
public SObject getRecord()
```

Return Value

Type: sObject

`setContextId(contextId)`

Sets this QuickAction's context ID. Returned by `getContextId`.

Signature

```
public Void setContextId(Id contextId)
```

Parameters

`contextId`
Type: ID

Return Value

Type: Void

Usage

For Apex saved using Salesforce API version 28.0, sets this QuickAction's parent ID and is returned by `getParentId`.

`setQuickActionName(name)`

Sets this QuickAction's name. Returned by `getQuickActionName`.

Signature

```
public Void setQuickActionName(String name)
```

Parameters

`name`
Type: String

Return Value

Type: Void

`setRecord(record)`

Sets a record for this QuickAction. Returned by `getRecord`.

Signature

```
public Void setRecord(SObject record)
```

Parameters

record
Type: sObject

Return Value

Type: Void

QuickActionResult Class

After you initiate a quick action with the `QuickAction` class, use the `QuickActionResult` class for processing action results.

Namespace

QuickAction

SEE ALSO:

QuickAction Class

QuickActionResult Methods

The following are methods for `QuickActionResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurs, an array of one or more database error objects, along with error codes and descriptions, is returned.

getIds()
The IDs of the QuickActions being processed.

getSuccessMessage()
Returns the success message associated with the quick action.

isCreated()
Returns `true` if the action is created; otherwise, `false`.

isSuccess()
Returns `true` if the action completes successfully; otherwise, `false`.

`getErrors()`

If an error occurs, an array of one or more database error objects, along with error codes and descriptions, is returned.

Signature

```
public List<Database.Error> getErrors()
```

Return Value

Type: List<Database.Error>

`getIds()`

The IDs of the QuickActions being processed.

Signature

```
public List<Id> getIds()
```

Return Value

Type: List<Id>

`getSuccessMessage()`

Returns the success message associated with the quick action.

Signature

```
public String getSuccessMessage()
```

Return Value

Type: String

`isCreated()`

Returns `true` if the action is created; otherwise, `false`.

Signature

```
public Boolean isCreated()
```

Return Value

Type: Boolean

`isSuccess()`

Returns `true` if the action completes successfully; otherwise, `false`.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

SendEmailQuickActionDefaults Class

Represents an Apex class that provides: the From address list; the original email's email message ID, provided that the reply action was invoked on the email message feed item; and methods to specify related settings on templates. You can override these fields before the standard Email Action is rendered.

Namespace

QuickAction

Usage

Note: You cannot instantiate this class. One can use the getters/setters when using it in the context of `QuickAction.QuickActionDefaultsHandler`.

IN THIS SECTION:

SendEmailQuickActionDefaults Methods

SendEmailQuickActionDefaults Methods

The following are methods for `SendEmailQuickActionDefaults`.

IN THIS SECTION:

getFromAddressList()
Returns a list of email addresses that are available in the From: address drop-down menu for the standard Email Action.

getInReplyToId()
Returns the email message ID of the email to which the reply/reply all action has been invoked.

setIgnoreTemplateSubject(useOriginalSubject)
Specifies whether the template subject should be ignored (true), thus using the original subject, or whether the template subject should replace the original subject (false).

setInsertTemplateBody(keepOriginalBodyContent)
Specifies whether the template body should be inserted above the original body content (true) or whether it should replace the entire content with the template body (false).

setTemplateId(templateId)
Sets the email template ID to load into the email body.

`getFromAddressList()`

Returns a list of email addresses that are available in the From: address drop-down menu for the standard Email Action.

Signature

```
public List<String> getFromAddressList()
```

Return Value

Type: List<String>

getInReplyToId()

Returns the email message ID of the email to which the reply/reply all action has been invoked.

Signature

```
public Id getInReplyToId()
```

Return Value

Type: Id

setIgnoreTemplateSubject(useOriginalSubject)

Specifies whether the template subject should be ignored (true), thus using the original subject, or whether the template subject should replace the original subject (false).

Signature

```
public void setIgnoreTemplateSubject(Boolean useOriginalSubject)
```

Parameters

useOriginalSubject
Type: Boolean

Return Value

Type: void

setInsertTemplateBody(keepOriginalBodyContent)

Specifies whether the template body should be inserted above the original body content (true) or whether it should replace the entire content with the template body (false).

Signature

```
public void setInsertTemplateBody(Boolean keepOriginalBodyContent)
```

Parameters

keepOriginalBodyContent
Type: Boolean

Return Value

Type: void

`setTemplateId(templateId)`

Sets the email template ID to load into the email body.

Signature

```
public void setTemplateId(Id templateId)
```

Parameters

`templateId`
Type: Id

The template ID.

Return Value

Type: void

Reports Namespace

The `Reports` namespace provides classes for accessing the same data as is available in the Salesforce Reports and Dashboards REST API.

The following are the classes in the `Reports` namespace.

IN THIS SECTION:

AggregateColumn Class
Contains methods for describing summary fields such as Record Count, Sum, Average, Max, Min, and custom summary formulas. Includes name, label, data type, and grouping context.

BucketField Class
Contains methods and constructors to work with information about a bucket field, including bucket type, name, and bucketed values.

BucketFieldValue Class
Contains information about the report values included in a bucket field.

BucketType Enum
The types of values included in a bucket.

ColumnDataType Enum
The `Reports.ColumnDataType` enum describes the type of data in a column. It is returned by the `getDataType` method.

ColumnSortOrder Enum
The `Reports.ColumnSortOrder` enum describes the order that the grouping column uses to sort data.

CrossFilter Class
Contains methods and constructors used to work with information about a cross filter.

CsfGroupType Enum
The group level at which the custom summary format aggregate is displayed in a report.

DateGranularity Enum

The `Reports.DateGranularity` enum describes the date interval that is used for grouping.

DetailColumn Class

Contains methods for describing fields that contain detailed data. Detailed data fields are also listed in the report metadata.

Dimension Class

Contains information for each row or column grouping.

EvaluatedCondition Class

Contains the individual components of an evaluated condition for a report notification, such as the aggregate name and label, the operator, and the value that the aggregate is compared to.

EvaluatedConditionOperator Enum

The `Reports.EvaluatedConditionOperator` enum describes the type of operator used to compare an aggregate to a value. It is returned by the `getOperator` method.

FilterOperator Class

Contains information about a filter operator, such as display name and API name.

FilterValue Class

Contains information about a filter value, such as the display name and API name.

FormulaType Enum

The format of the numbers in a custom summary formula.

GroupingColumn Class

Contains methods for describing fields that are used for column grouping.

GroupingInfo Class

Contains methods for describing fields that are used for grouping.

GroupingValue Class

Contains grouping values for a row or column, including the key, label, and value.

NotificationAction Interface

Implement this interface to trigger a custom Apex class when the conditions for a report notification are met.

NotificationActionContext Class

Contains information about the report instance and condition threshold for a report notification.

ReportCsf Class

Contains methods and constructors for working with information about a custom summary formula (CSF).

ReportCurrency Class

Contains information about a currency value, including the amount and currency code.

ReportDataCell Class

Contains the data for a cell in the report, including the display label and value.

ReportDescribeResult Class

Contains report, report type, and extended metadata for a tabular, summary, or matrix report.

ReportDetailRow Class

Contains data cells for a detail row of a report.

ReportDivisionInfo Class

Contains information about the divisions that can be used to filter a report.

ReportExtendedMetadata Class

Contains report extended metadata for a tabular, summary, or matrix report.

ReportFact Class

Contains the fact map for the report, which represents the report's data values.

ReportFactWithDetails Class

Contains the detailed fact map for the report, which represents the report's data values.

ReportFactWithSummaries Class

Contains the fact map for the report, which represents the report's data values, and includes summarized fields.

ReportFilter Class

Contains information about a report filter, including column, operator, and value.

ReportFormat Enum

Contains the possible report format types.

ReportFilterType Enum

The types of values included in a report filter type.

ReportInstance Class

Returns an instance of a report that was run asynchronously. Retrieves the results for that instance.

ReportManager Class

Runs a report synchronously or asynchronously and with or without details.

ReportMetadata Class

Contains report metadata for a tabular, summary, or matrix report.

ReportResults Class

Contains the results of running a report.

ReportScopeInfo Class

Contains information about possible scope values that you can choose. Scope values depend on the report type. For example, you can set the scope for opportunity reports to `All opportunities`, `My team's opportunities`, or `My opportunities`.

ReportScopeValue Class

Contains information about a possible scope value. Scope values depend on the report type. For example, you can set the scope for opportunity reports to `All opportunities`, `My team's opportunities`, or `My opportunities`.

ReportType Class

Contains the unique API name and display name for the report type.

ReportTypeColumn Class

Contains detailed report type metadata about a field, including data type, display name, and filter values.

ReportTypeColumnCategory Class

Information about categories of fields in a report type.

ReportTypeMetadata Class

Contains report type metadata, which gives you information about the fields that are available in each section of the report type, plus filter information for those fields.

SortColumn Class

Contains information about the sort column used in the report.

StandardDateFilter Class

Contains information about standard date filter available in the report—for example, the API name, start date, and end date of the standard date filter duration as well as the API name of the date field on which the filter is placed.

StandardDateFilterDuration Class

Contains information about each standard date filter—also referred to as a relative date filter. It contains the API name and display label of the standard date filter duration as well as the start and end dates.

StandardDateFilterDurationGroup Class

Contains information about the standard date filter groupings, such as the grouping display label and all standard date filters that fall under the grouping. Groupings include `Calendar Year`, `Calendar Quarter`, `Calendar Month`, `Calendar Week`, `Fiscal Year`, `Fiscal Quarter`, `Day`, and custom values based on user-defined date ranges.

StandardFilter Class

Contains information about the standard filter defined in the report, such as the filter field API name and filter value.

StandardFilterInfo Class

Is an abstract base class for an object that provides standard filter information.

StandardFilterInfoPicklist Class

Contains information about the standard filter picklist, such as the display name and type of the filter field, the default picklist value, and a list of all possible picklist values.

StandardFilterType Enum

The `StandardFilterType` enum describes the type of standard filters in a report. The `getType()` method returns a `Reports.StandardFilterType` enum value.

SummaryValue Class

Contains summary data for a cell of the report.

ThresholdInformation Class

Contains a list of evaluated conditions for a report notification.

TopRows Class

Contains methods and constructors for working with information about a row limit filter.

Reports Exceptions

The `Reports` namespace contains exception classes.

AggregateColumn Class

Contains methods for describing summary fields such as Record Count, Sum, Average, Max, Min, and custom summary formulas. Includes name, label, data type, and grouping context.

Namespace

Reports

AggregateColumn Methods

The following are methods for `AggregateColumn`. All are instance methods.

IN THIS SECTION:

getName()
Returns the unique API name of the summary field.

getLabel()
Returns the localized display name for the summarized or custom summary formula field.

getDataType()
Returns the data type of the summarized or custom summary formula field.

getAcrossGroupingContext()
Returns the column grouping in the report where the summary field is displayed.

getDownGroupingContext()
Returns the row grouping in the report where the summary field is displayed.

getName()

Returns the unique API name of the summary field.

Syntax

```
public String getName()
```

Return Value

Type: String

getLabel()

Returns the localized display name for the summarized or custom summary formula field.

Syntax

```
public String getLabel()
```

Return Value

Type: String

getDataType()

Returns the data type of the summarized or custom summary formula field.

Syntax

```
public Reports.ColumnDataType getDataType()
```

Return Value

Type: Reports.ColumnDataType

`getAcrossGroupingContext()`

Returns the column grouping in the report where the summary field is displayed.

Syntax

```
public String getAcrossGroupingContext()
```

Return Value

Type: String

`getDownGroupingContext()`

Returns the row grouping in the report where the summary field is displayed.

Syntax

```
public String getDownGroupingContext()
```

Return Value

Type: String

BucketField Class

Contains methods and constructors to work with information about a bucket field, including bucket type, name, and bucketed values.

Namespace

Reports

IN THIS SECTION:

BucketField Constructors

BucketField Methods

BucketField Constructors

The following are constructors for `BucketField`.

IN THIS SECTION:

BucketField(bucketType, devloperName, label, nullTreatedAsZero, otherBucketLabel, sourceColumnName, values)
Creates an instance of the `Reports.BucketField` class using the specified parameters.

BucketField()
Creates an instance of the `Reports.BucketField` class. You can then set values by using the class's `set` methods.

BucketField(bucketType, devloperName, label, nullTreatedAsZero, otherBucketLabel, sourceColumnName, values)

Creates an instance of the `Reports.BucketField` class using the specified parameters.

Signature

```
public BucketField(Reports.BucketType bucketType, String devloperName, String label,
Boolean nullTreatedAsZero, String otherBucketLabel, String sourceColumnName,
List<Reports.BucketFieldValue> values)
```

Parameters

bucketType
Type: Reports.BucketType

The type of bucket.

devloperName
Type: String

API name of the bucket.

label
Type: String

User-facing name of the bucket.

nullTreatedAsZero
Type: Boolean

Specifies whether null values are converted to zero (`true`) or not (`false`).

otherBucketLabel
Type: String

Name of the fields grouped as `Other` (in buckets of `BucketType PICKLIST`).

sourceColumnName
Type: String

Name of the bucketed field.

values
Type: List<Reports.BucketType>

Types of the values included in the bucket.

BucketField()

Creates an instance of the `Reports.BucketField` class. You can then set values by using the class's `set` methods.

Signature

```
public BucketField()
```

BucketField Methods

The following are methods for `BucketField`.

IN THIS SECTION:

getBucketType()
Returns the bucket type.

getDevloperName()
Returns the bucket's API name.

getLabel()
Returns the user-facing name of the bucket.

getNullTreatedAsZero()
Returns `true` if null values are converted to the number zero, otherwise returns `false`.

getOtherBucketLabel()
Returns the name of fields grouped as `Other` in buckets of type `PICKLIST`.

getSourceColumnName()
Returns the API name of the bucketed field.

getValues()
Returns the report values grouped by the bucket field.

setBucketType(value)
Sets the `BucketType` of the bucket.

setBucketType(bucketType)
Sets the `BucketType` of the bucket.

setDevloperName(devloperName)
Sets the API name of the bucket.

setLabel(label)
Sets the user-facing name of the bucket.

setNullTreatedAsZero(nullTreatedAsZero)
Specifies whether null values in the bucket are converted to zero (`true`) or not (`false`).

setOtherBucketLabel(otherBucketLabel)
Sets the name of the fields grouped as `Other` (in buckets of `BucketType` `PICKLIST`).

setSourceColumnName(sourceColumnName)
Specifies the name of the bucketed field.

setValues(values)
Specifies which type of values are included in the bucket.

toString()
Returns a string.

`getBucketType()`

Returns the bucket type.

Signature

```
public Reports.BucketType getBucketType()
```

Return Value

Type: Reports.BucketType

`getDevloperName()`

Returns the bucket's API name.

Signature

```
public String getDevloperName()
```

Return Value

Type: String

`getLabel()`

Returns the user-facing name of the bucket.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getNullTreatedAsZero()`

Returns `true` if null values are converted to the number zero, otherwise returns `false`.

Signature

```
public Boolean getNullTreatedAsZero()
```

Return Value

Type: Boolean

`getOtherBucketLabel()`

Returns the name of fields grouped as `Other` in buckets of type `PICKLIST`.

Signature

```
public String getOtherBucketLabel()
```

Return Value

Type: String

getSourceColumnName()

Returns the API name of the bucketed field.

Signature

```
public String getSourceColumnName()
```

Return Value

Type: String

getValues()

Returns the report values grouped by the bucket field.

Signature

```
public List<Reports.BucketFieldValue> getValues()
```

Return Value

Type: List on page 3405<Reports.BucketFieldValue>

setBucketType(value)

Sets the `BucketType` of the bucket.

Signature

```
public void setBucketType(String value)
```

Parameters

value
Type: String

See the Reports.BucketType enum for valid values.

Return Value

Type: void

setBucketType(bucketType)

Sets the `BucketType` of the bucket.

Signature

```
public void setBucketType(Reports.BucketType bucketType)
```

Parameters

bucketType
Type: Reports.BucketType

Return Value

Type: void

setDevloperName(devloperName)

Sets the API name of the bucket.

Signature

```
public void setDevloperName(String devloperName)
```

Parameters

devloperName
Type: String

The API name to assign to the bucket.

Return Value

Type: void

setLabel(label)

Sets the user-facing name of the bucket.

Signature

```
public void setLabel(String label)
```

Parameters

label
Type: String

Return Value

Type: void

setNullTreatedAsZero(nullTreatedAsZero)

Specifies whether null values in the bucket are converted to zero (`true`) or not (`false`).

Signature

```
public void setNullTreatedAsZero(Boolean nullTreatedAsZero)
```

Parameters

nullTreatedAsZero
Type: Boolean

Return Value

Type: void

setOtherBucketLabel(otherBucketLabel)

Sets the name of the fields grouped as `Other` (in buckets of `BucketType PICKLIST`).

Signature

```
public void setOtherBucketLabel(String otherBucketLabel)
```

Parameters

otherBucketLabel
Type: String

Return Value

Type: void

setSourceColumnName(sourceColumnName)

Specifies the name of the bucketed field.

Signature

```
public void setSourceColumnName(String sourceColumnName)
```

Parameters

sourceColumnName
Type: String

Return Value

Type: void

setValues(values)

Specifies which type of values are included in the bucket.

Signature

```
public void setValues(List<Reports.BucketFieldValue> values)
```

Parameters

values
Type: List on page 3405<Reports.BucketFieldValue>

Return Value

Type: void

`toString()`

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: String

BucketFieldValue Class

Contains information about the report values included in a bucket field.

Namespace

Reports

IN THIS SECTION:

BucketFieldValue Constructors

BucketFieldValue Methods

BucketFieldValue Constructors

The following are constructors for `BucketFieldValue`.

IN THIS SECTION:

BucketFieldValue(label, sourceDimensionValues, rangeUpperBound)
Creates an instance of the `Reports.BucketFieldValue` class using the specified parameters.

BucketFieldValue()
Creates an instance of the `Reports.BucketFieldValue` class. You can then set values by using the class's `set` methods.

`BucketFieldValue(label, sourceDimensionValues, rangeUpperBound)`

Creates an instance of the `Reports.BucketFieldValue` class using the specified parameters.

Signature

```
public BucketFieldValue(String label, List<String> sourceDimensionValues, Double
rangeUpperBound)
```

Parameters

`label`
Type: String

The user-facing name of the bucket.

`sourceDimensionValues`
Type: List on page 3405<String>

A list of the values from the source field included in this bucket category (in buckets of type `PICKLIST` and buckets of type `TEXT`).

`rangeUpperBound`
Type: Double

The greatest range limit under which values are included in this bucket category (in buckets of type `NUMBER`).

`BucketFieldValue()`

Creates an instance of the `Reports.BucketFieldValue` class. You can then set values by using the class's `set` methods.

Signature

```
public BucketFieldValue()
```

BucketFieldValue Methods

The following are methods for `BucketFieldValue`.

IN THIS SECTION:

getLabel()
Returns the user-facing name of the bucket category.

getRangeUpperBound()
Returns the greatest range limit under which values are included in this bucket category (in buckets of type `NUMBER`).

getSourceDimensionValues()
Returns a list of the values from the source field included in this bucket category (in buckets of type `PICKLIST` and buckets of type `TEXT`).

setLabel(label)
Set the user-facing name of the bucket category.

setRangeUpperBound(rangeUpperBound)
Sets the greatest limit of a range under which values are included in this bucket category (in buckets of type `NUMBER`).

setSourceDimensionValues(sourceDimensionValues)
Specifies the values from the source field included in this bucket category (in buckets of type `PICKLIST` and buckets of type `TEXT`).

toString()
Returns a string.

getLabel()

Returns the user-facing name of the bucket category.

Signature

```
public String getLabel()
```

Return Value

Type: String

getRangeUpperBound()

Returns the greatest range limit under which values are included in this bucket category (in buckets of type `NUMBER`).

Signature

```
public Double getRangeUpperBound()
```

Return Value

Type: Double

getSourceDimensionValues()

Returns a list of the values from the source field included in this bucket category (in buckets of type `PICKLIST` and buckets of type `TEXT`).

Signature

```
public List<String> getSourceDimensionValues()
```

Return Value

Type: List<String>

setLabel(label)

Set the user-facing name of the bucket category.

Signature

```
public void setLabel(String label)
```

Parameters

label
Type: String

Return Value

Type: void

setRangeUpperBound(rangeUpperBound)

Sets the greatest limit of a range under which values are included in this bucket category (in buckets of type `NUMBER`).

Signature

```
public void setRangeUpperBound(Double rangeUpperBound)
```

Parameters

rangeUpperBound
Type: Double

Return Value

Type: void

setSourceDimensionValues(sourceDimensionValues)

Specifies the values from the source field included in this bucket category (in buckets of type `PICKLIST` and buckets of type `TEXT`).

Signature

```
public void setSourceDimensionValues(List<String> sourceDimensionValues)
```

Parameters

sourceDimensionValues
Type: List<String>

Return Value

Type: void

toString()

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: String

BucketType Enum

The types of values included in a bucket.

Enum Values

The following are the values of the `Reports.BucketType` enum.

Value	Description
`NUMBER`	Numeric values
`PICKLIST`	Picklist values
`TEXT`	String values

ColumnDataType Enum

The `Reports.ColumnDataType` enum describes the type of data in a column. It is returned by the `getDataType` method.

Namespace

Reports

Enum Values

The following are the values of the `Reports.ColumnDataType` enum.

Value	Description
`BOOLEAN_DATA`	Boolean (`true` or `false`) values
`COMBOBOX_DATA`	Comboboxes, which provide a set of enumerated values and enable the user to specify a value that is not in the list
`CURRENCY_DATA`	Currency values
`DATETIME_DATA`	DateTime values
`DATE_DATA`	Date values
`DOUBLE_DATA`	Double values
`EMAIL_DATA`	Email addresses
`ID_DATA`	An object's Salesforce ID
`INT_DATA`	Integer values

Value	Description
MULTIPICKLIST_DATA	Multi-select picklists, which provide a set of enumerated values from which multiple values can be selected
PERCENT_DATA	Percent values
PHONE_DATA	Phone numbers. Values can include alphabetic characters. Client applications are responsible for phone number formatting.
PICKLIST_DATA	Single-select picklists, which provide a set of enumerated values from which only one value can be selected
REFERENCE_DATA	Cross-references to another object, analogous to a foreign key field
STRING_DATA	String values
TEXTAREA_DATA	String values that are displayed as multiline text fields
TIME_DATA	Time values
URL_DATA	URL values that are displayed as hyperlinks

ColumnSortOrder Enum

The `Reports.ColumnSortOrder` enum describes the order that the grouping column uses to sort data.

Namespace

Reports

Usage

The `GroupingInfo.getColumnSortOrder()` method returns a `Reports.ColumnSortOrder` enum value. The `GroupingInfo.setColumnSortOrder()` method takes the enum value as an argument.

Enum Values

The following are the values of the `Reports.ColumnSortOrder` enum.

Value	Description
ASCENDING	Sort data in ascending order (A–Z)
DESCENDING	Sort data in descending order (Z–A)

CrossFilter Class

Contains methods and constructors used to work with information about a cross filter.

Namespace

Reports

IN THIS SECTION:

CrossFilter Constructors

CrossFilter Methods

CrossFilter Constructors

The following are constructors for `CrossFilter`.

IN THIS SECTION:

CrossFilter(criteria, includesObject, primaryEntityField, relatedEntity, relatedEntityJoinField)

Creates an instance of the `Reports.CrossFilter` class using the specified parameters.

CrossFilter()

Creates an instance of the `Reports.CrossFilter` class. You can then set values by using the class's `set` methods.

`CrossFilter(criteria, includesObject, primaryEntityField, relatedEntity, relatedEntityJoinField)`

Creates an instance of the `Reports.CrossFilter` class using the specified parameters.

Signature

```
public CrossFilter(List<Reports.ReportFilter> criteria, Boolean includesObject, String primaryEntityField, String relatedEntity, String relatedEntityJoinField)
```

Parameters

`criteria`
Type: List<Reports.ReportFilter>

Information about how to filter the `relatedEntity`. Relates the primary entity with a subset of the `relatedEntity`.

`includesObject`
Type: Boolean

Specifies whether objects returned have a relationship with the `relatedEntity` (`true`) or not (`false`).

`primaryEntityField`
Type: String

The name of the object on which the cross filter is evaluated.

`relatedEntity`
Type: String

The name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

`relatedEntityJoinField`
Type: String

The name of the field used to join the `primaryEntityField` and `relatedEntity`.

`CrossFilter()`

Creates an instance of the `Reports.CrossFilter` class. You can then set values by using the class's `set` methods.

Signature

```
public CrossFilter()
```

CrossFilter Methods

The following are methods for `CrossFilter`.

IN THIS SECTION:

getCriteria()
Returns information about how to filter the `relatedEntity`. Describes the subset of the `relatedEntity` which the primary entity is evaluated against.

getIncludesObject()
Returns `true` if primary object has a relationship with the `relatedEntity`, otherwise returns `false`.

getPrimaryEntityField()
Returns the name of the object on which the cross filter is evaluated.

getRelatedEntity()
Returns name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

getRelatedEntityJoinField()
Returns the name of the field used to join the `primaryEntityField` and `relatedEntity`.

setCriteria(criteria)
Specifis how to filter the `relatedEntity`. Relates the primary entity with a subset of the `relatedEntity`.

setIncludesObject(includesObject)
Specifies whether objects returned have a relationship with the `relatedEntity` (`true`) or not (`false`).

setPrimaryEntityField(primaryEntityField)
Specifies the name of the object on which the cross filter is evaluated.

setRelatedEntity(relatedEntity)
Specifies the name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

setRelatedEntityJoinField(relatedEntityJoinField)
Specifies the name of the field used to join the `primaryEntityField` and `relatedEntity`.

toString()
Returns a string.

`getCriteria()`

Returns information about how to filter the `relatedEntity`. Describes the subset of the `relatedEntity` which the primary entity is evaluated against.

Signature

```
public List<Reports.ReportFilter> getCriteria()
```

Return Value

Type: List<Reports.ReportFilter>

`getIncludesObject()`

Returns `true` if primary object has a relationship with the `relatedEntity`, otherwise returns `false`.

Signature

```
public Boolean getIncludesObject()
```

Return Value

Type: Boolean

`getPrimaryEntityField()`

Returns the name of the object on which the cross filter is evaluated.

Signature

```
public String getPrimaryEntityField()
```

Return Value

Type: String

`getRelatedEntity()`

Returns name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

Signature

```
public String getRelatedEntity()
```

Return Value

Type: String

`getRelatedEntityJoinField()`

Returns the name of the field used to join the `primaryEntityField` and `relatedEntity`.

Signature

```
public String getRelatedEntityJoinField()
```

Return Value

Type: String

setCriteria(criteria)

Specifis how to filter the `relatedEntity`. Relates the primary entity with a subset of the `relatedEntity`.

Signature

```
public void setCriteria(List<Reports.ReportFilter> criteria)
```

Parameters

criteria
Type: List<Reports.ReportFilter>

Return Value

Type: void

setIncludesObject(includesObject)

Specifies whether objects returned have a relationship with the `relatedEntity` (`true`) or not (`false`).

Signature

```
public void setIncludesObject(Boolean includesObject)
```

Parameters

includesObject
Type: Boolean

Return Value

Type: void

setPrimaryEntityField(primaryEntityField)

Specifies the name of the object on which the cross filter is evaluated.

Signature

```
public void setPrimaryEntityField(String primaryEntityField)
```

Parameters

primaryEntityField
Type: String

Return Value

Type: void

`setRelatedEntity(relatedEntity)`

Specifies the name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

Signature

```
public void setRelatedEntity(String relatedEntity)
```

Parameters

`relatedEntity`
Type: String

Return Value

Type: void

`setRelatedEntityJoinField(relatedEntityJoinField)`

Specifies the name of the field used to join the `primaryEntityField` and `relatedEntity`.

Signature

```
public void setRelatedEntityJoinField(String relatedEntityJoinField)
```

Parameters

`relatedEntityJoinField`
Type: String

Return Value

Type: void

`toString()`

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: String

CsfGroupType Enum

The group level at which the custom summary format aggregate is displayed in a report.

Enum Values

The following are the values of the `Reports.CsfGroupType` enum.

Value	Description
`ALL`	The aggregate is displayed at the end of every summary row.
`CUSTOM`	The aggregate is displayed at specified grouping levels.
`GRAND_TOTAL`	The aggregate is displayed only at the grand total level.

DateGranularity Enum

The `Reports.DateGranularity` enum describes the date interval that is used for grouping.

Namespace

Reports

Usage

The `GroupingInfo.getDateGranularity` method returns a `Reports.DateGranularity` enum value. The `GroupingInfo.setDateGranularity` method takes the enum value as an argument.

Enum Values

The following are the values of the `Reports.DateGranularity` enum.

Value	Description
`DAY`	The day of the week (Monday–Sunday)
`DAY_IN_MONTH`	The day of the month (1–31)
`FISCAL_PERIOD`	The fiscal period
`FISCAL_QUARTER`	The fiscal quarter
`FISCAL_WEEK`	The fiscal week
`FISCAL_YEAR`	The fiscal year
`MONTH`	The month (January–December)
`MONTH_IN_YEAR`	The month number (1–12)
`NONE`	No date grouping

Value	Description
`QUARTER`	The quarter number (1–4)
`WEEK`	The week number (1–52)
`YEAR`	The year number (####)

DetailColumn Class

Contains methods for describing fields that contain detailed data. Detailed data fields are also listed in the report metadata.

Namespace

Reports

DetailColumn Instance Methods

The following are instance methods for `DetailColumn`. All are instance methods.

IN THIS SECTION:

getName()
Returns the unique API name of the detail column field.

getLabel()
Returns the localized display name of a standard field, the ID of a custom field, or the API name of a bucket field that has detailed data.

getDataType()
Returns the data type of a detail column field.

`getName()`

Returns the unique API name of the detail column field.

Syntax

```
public String getName()
```

Return Value

Type: String

`getLabel()`

Returns the localized display name of a standard field, the ID of a custom field, or the API name of a bucket field that has detailed data.

Syntax

```
public String getLabel()
```

Return Value

Type: String

`getDataType()`

Returns the data type of a detail column field.

Syntax

```
public Reports.ColumnDataType getDataType()
```

Return Value

Type: Reports.ColumnDataType

Dimension Class

Contains information for each row or column grouping.

Namespace

Reports

Dimension Methods

The following are methods for `Dimension`. All are instance methods.

IN THIS SECTION:

getGroupings()
Returns information for each row or column grouping as a list.

`getGroupings()`

Returns information for each row or column grouping as a list.

Syntax

```
public List<Reports.GroupingValue> getGroupings()
```

Return Value

Type: List<Reports.GroupingValue>

EvaluatedCondition Class

Contains the individual components of an evaluated condition for a report notification, such as the aggregate name and label, the operator, and the value that the aggregate is compared to.

Namespace

Reports

IN THIS SECTION:

EvaluatedCondition Constructors

EvaluatedCondition Methods

EvaluatedCondition Constructors

The following are constructors for `EvaluatedCondition`.

IN THIS SECTION:

EvaluatedCondition(aggregateName, aggregateLabel, compareToValue, aggregateValue, displayCompareTo, displayValue, operator)
Creates a new instance of the `Reports.EvaluatedConditions` class using the specified parameters.

`EvaluatedCondition(aggregateName, aggregateLabel, compareToValue, aggregateValue, displayCompareTo, displayValue, operator)`

Creates a new instance of the `Reports.EvaluatedConditions` class using the specified parameters.

Signature

```
public EvaluatedCondition(String aggregateName, String aggregateLabel, Double
compareToValue, Double aggregateValue, String displayCompareTo, String displayValue,
Reports.EvaluatedConditionOperator operator)
```

Parameters

`aggregateName`
Type: String

The unique API name of the aggregate.

`aggregateLabel`
Type: String

The localized display name of the aggregate.

`compareToValue`
Type: Double

The value that the aggregate is compared to in the condition.

`aggregateValue`
Type: Double

The actual value of the aggregate when the report is run.

`displayCompareTo`
Type: String

The value that the aggregate is compared to in the condition, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

displayValue
Type: String

The value of the aggregate when the report is run, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

operator
Type: Reports.EvaluatedConditionOperator

The operator used in the condition.

EvaluatedCondition Methods

The following are methods for `EvaluatedCondition`.

IN THIS SECTION:

getAggregateLabel()
Returns the localized display name of the aggregate.

getAggregateName()
Returns the unique API name of the aggregate.

getCompareTo()
Returns the value that the aggregate is compared to in the condition.

getDisplayCompareTo()
Returns the value that the aggregate is compared to in the condition, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

getDisplayValue()
Returns the value of the aggregate when the report is run, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

getOperator()
Returns the operator used in the condition.

getValue()
Returns the actual value of the aggregate when the report is run.

`getAggregateLabel()`

Returns the localized display name of the aggregate.

Signature

```
public String getAggregateLabel()
```

Return Value

Type: String

getAggregateName()

Returns the unique API name of the aggregate.

Signature

```
public String getAggregateName()
```

Return Value

Type: String

getCompareTo()

Returns the value that the aggregate is compared to in the condition.

Signature

```
public Double getCompareTo()
```

Return Value

Type: Double

getDisplayCompareTo()

Returns the value that the aggregate is compared to in the condition, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

Signature

```
public String getDisplayCompareTo()
```

Return Value

Type: String

getDisplayValue()

Returns the value of the aggregate when the report is run, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

Signature

```
public String getDisplayValue()
```

Return Value

Type: String

`getOperator()`

Returns the operator used in the condition.

Signature

```
public Reports.EvaluatedConditionOperator getOperator()
```

Return Value

Type: Reports.EvaluatedConditionOperator

`getValue()`

Returns the actual value of the aggregate when the report is run.

Signature

```
public Double getValue()
```

Return Value

Type: Double

EvaluatedConditionOperator Enum

The `Reports.EvaluatedConditionOperator` enum describes the type of operator used to compare an aggregate to a value. It is returned by the `getOperator` method.

Namespace

Reports

Enum Values

The following are the values of the `Reports.EvaluatedConditionOperator` enum.

Value	Description
`EQUAL`	Equality operator.
`GREATER_THAN`	Greater than operator.
`GREATER_THAN_EQUAL`	Greater than or equal to operator.
`LESS_THAN`	Less than operator.
`LESS_THAN_EQUAL`	Less than or equal to operator.
`NOT_EQUAL`	Inequality operator.

FilterOperator Class

Contains information about a filter operator, such as display name and API name.

Namespace

Reports

FilterOperator Methods

The following are methods for `FilterOperator`. All are instance methods.

IN THIS SECTION:

getLabel()
Returns the localized display name of the filter operator. Possible values for this name are restricted based on the data type of the column being filtered.

getName()
Returns the unique API name of the filter operator. Possible values for this name are restricted based on the data type of the column being filtered. For example `multipicklist` fields can use the following filter operators: "equals," "not equal to," "includes," and "excludes." Bucket fields are considered to be of the `String` type.

`getLabel()`

Returns the localized display name of the filter operator. Possible values for this name are restricted based on the data type of the column being filtered.

Syntax

```
public String getLabel()
```

Return Value

Type: String

`getName()`

Returns the unique API name of the filter operator. Possible values for this name are restricted based on the data type of the column being filtered. For example `multipicklist` fields can use the following filter operators: "equals," "not equal to," "includes," and "excludes." Bucket fields are considered to be of the `String` type.

Syntax

```
public String getName()
```

Return Value

Type: String

FilterValue Class

Contains information about a filter value, such as the display name and API name.

Namespace

Reports

FilterValue Methods

The following are methods for `FilterValue`. All are instance methods.

IN THIS SECTION:

getLabel()
Returns the localized display name of the filter value. Possible values for this name are restricted based on the data type of the column being filtered.

getName()
Returns the unique API name of the filter value. Possible values for this name are restricted based on the data type of the column being filtered.

`getLabel()`

Returns the localized display name of the filter value. Possible values for this name are restricted based on the data type of the column being filtered.

Syntax

```
public String getLabel()
```

Return Value

Type: String

`getName()`

Returns the unique API name of the filter value. Possible values for this name are restricted based on the data type of the column being filtered.

Syntax

```
public String getName()
```

Return Value

Type: String

FormulaType Enum

The format of the numbers in a custom summary formula.

Enum Values

The following are the values of the `Reports.FormulaType` enum.

Value	Description
`CURRENCY`	Formatted as currency. For example, $100.00.
`NUMBER`	Formatted as numbers. For example, 100.
`PERCENT`	Formatted as percentages. For example, 100%.

GroupingColumn Class

Contains methods for describing fields that are used for column grouping.

Namespace

Reports

The `GroupingColumn` class provides basic information about column grouping fields. The `GroupingInfo` class includes additional methods for describing and updating grouping fields.

GroupingColumn Methods

The following are methods for `GroupingColumn`. All are instance methods.

IN THIS SECTION:

getName()
Returns the unique API name of the field or bucket field that is used for column grouping.

getLabel()
Returns the localized display name of the field that is used for column grouping.

getDataType()
Returns the data type of the field that is used for column grouping.

getGroupingLevel()
Returns the level of grouping for the column.

`getName()`

Returns the unique API name of the field or bucket field that is used for column grouping.

Syntax

```
public String getName()
```

Return Value

Type: String

`getLabel()`

Returns the localized display name of the field that is used for column grouping.

Syntax

```
public String getLabel()
```

Return Value

Type: String

`getDataType()`

Returns the data type of the field that is used for column grouping.

Syntax

```
public Reports.ColumnDataType getDataType()
```

Return Value

Type: Reports.ColumnDataType

`getGroupingLevel()`

Returns the level of grouping for the column.

Syntax

```
public Integer getGroupingLevel()
```

Return Value

Type: Integer

Usage

- In a summary report, 0, 1, or 2 indicates grouping at the first, second, or third row level.
- In a matrix report, 0 or 1 indicates grouping at the first or second row or column level.

GroupingInfo Class

Contains methods for describing fields that are used for grouping.

Namespace

Reports

GroupingInfo Methods

The following are methods for `GroupingInfo`. All are instance methods.

IN THIS SECTION:

getName()
Returns the unique API name of the field or bucket field that is used for row or column grouping.

getSortOrder()
Returns the order that is used to sort data in a row or column grouping (`ASCENDING` or `DESCENDING`).

getDateGranularity()
Returns the date interval that is used for row or column grouping.

getSortAggregate()
Returns the summary field that is used to sort data within a grouping in a summary report. The value is null when data within a grouping is not sorted by a summary field.

`getName()`

Returns the unique API name of the field or bucket field that is used for row or column grouping.

Syntax

```
public String getName()
```

Return Value

Type: String

`getSortOrder()`

Returns the order that is used to sort data in a row or column grouping (`ASCENDING` or `DESCENDING`).

Syntax

```
public Reports.ColumnSortOrder getSortOrder()
```

Return Value

Type: Reports.ColumnSortOrder

`getDateGranularity()`

Returns the date interval that is used for row or column grouping.

Syntax

```
public Reports.DateGranularity getDateGranularity()
```

Return Value

Type: Reports.DateGranularity

`getSortAggregate()`

Returns the summary field that is used to sort data within a grouping in a summary report. The value is null when data within a grouping is not sorted by a summary field.

Syntax

```
public String getSortAggregate()
```

Return Value

Type: String

GroupingValue Class

Contains grouping values for a row or column, including the key, label, and value.

Namespace

Reports

GroupingValue Methods

The following are methods for `GroupingValue`. All are instance methods.

IN THIS SECTION:

getGroupings()
Returns a list of second- or third-level row or column groupings. If there are none, the value is an empty array.

getKey()
Returns the unique identifier for a row or column grouping. The identifier is used by the fact map to specify data values within each grouping.

getLabel()
Returns the localized display name of a row or column grouping. For date and time fields, the label is the localized date or time.

getValue()
Returns the value of the field that is used as a row or column grouping.

`getGroupings()`

Returns a list of second- or third-level row or column groupings. If there are none, the value is an empty array.

Syntax

```
public LIST<Reports.GroupingValue> getGroupings()
```

Return Value

Type: List<Reports.GroupingValue>

`getKey()`

Returns the unique identifier for a row or column grouping. The identifier is used by the fact map to specify data values within each grouping.

Syntax

```
public String getKey()
```

Return Value

Type: String

`getLabel()`

Returns the localized display name of a row or column grouping. For date and time fields, the label is the localized date or time.

Syntax

```
public String getLabel()
```

Return Value

Type: String

`getValue()`

Returns the value of the field that is used as a row or column grouping.

Syntax

```
public Object getValue()
```

Return Value

Type: Object

Usage

The value depends on the field's data type.

- Currency fields:
  - `amount`: Of type currency. A data cell's value.

  - `currency`: Of type picklist. The ISO 4217 currency code, if available; for example, USD for US dollars or CNY for Chinese yuan. (If the grouping is on the converted currency, this value is the currency code for the report and not for the record.)
- Picklist fields: API name. For example, a custom picklist field—`Type of Business` with values 1, 2, and 3 for Consulting, Services, and Add-On Business respectively—has `1`, `2`, or `3` as the grouping value.
- ID fields: API name.
- Record type fields: API name.
- Date and time fields: Date or time in ISO-8601 format.
- Lookup fields: Unique API name. For example, for the `Opportunity Owner` lookup field, the ID of each opportunity owner's Chatter profile page can be a grouping value.

NotificationAction Interface

Implement this interface to trigger a custom Apex class when the conditions for a report notification are met.

Namespace

Reports

Usage

Report notifications for reports that users have subscribed to can trigger a custom Apex class, which must implement the `Reports.NotificationAction` interface. The `execute` method in this interface receives a `NotificationActionContext` object as a parameter, which contains information about the report instance and the conditions that must be met for a notification to be triggered.

IN THIS SECTION:

NotificationAction Methods

NotificationAction Example Implementation

NotificationAction Methods

The following are methods for `NotificationAction`.

IN THIS SECTION:

execute(context)

Executes the custom Apex action specified in the `context` parameter of the context object, `NotificationActionContext`. The object contains information about the report instance and the conditions that must be met for a notification to be triggered. The method executes whenever the specified conditions are met.

`execute(context)`

Executes the custom Apex action specified in the `context` parameter of the context object, `NotificationActionContext`. The object contains information about the report instance and the conditions that must be met for a notification to be triggered. The method executes whenever the specified conditions are met.

Signature

```
public void execute(Reports.NotificationActionContext context)
```

Parameters

context
Type: Reports.NotificationActionContext

Return Value

Type: Void

NotificationAction Example Implementation

This is an example implementation of the `Reports.NotificationAction` interface.

```
public class AlertOwners implements Reports.NotificationAction {

    public void execute(Reports.NotificationActionContext context) {
        Reports.ReportResults results = context.getReportInstance().getReportResults();
        for(Reports.GroupingValue g: results.getGroupingsDown().getGroupings()) {
            FeedItem t = new FeedItem();
            t.ParentId = (Id)g.getValue();
            t.Body = 'This record needs attention. Please view the report.';
            t.Title = 'Needs Attention: '+ results.getReportMetadata().getName();
            t.LinkUrl = '/' + results.getReportMetadata().getId();
            insert t;
        }
    }
}
```

NotificationActionContext Class

Contains information about the report instance and condition threshold for a report notification.

Namespace

Reports

IN THIS SECTION:

NotificationActionContext Constructors

NotificationActionContext Methods

NotificationActionContext Constructors

The following are constructors for `NotificationActionContext`.

IN THIS SECTION:

NotificationActionContext(reportInstance, thresholdInformation)
Creates a new instance of the `Reports.NotificationActionContext` class using the specified parameters.

NotificationActionContext(reportInstance, thresholdInformation)

Creates a new instance of the `Reports.NotificationActionContext` class using the specified parameters.

Signature

```
public NotificationActionContext(Reports.ReportInstance reportInstance,
Reports.ThresholdInformation thresholdInformation)
```

Parameters

reportInstance
Type: Reports.ReportInstance

An instance of a report.

thresholdInformation
Type: Reports.ThresholdInformation

The evaluated conditions for the notification.

NotificationActionContext Methods

The following are methods for `NotificationActionContext`.

IN THIS SECTION:

getReportInstance()
Returns the report instance associated with the notification.

getThresholdInformation()
Returns the threshold information associated with the notification.

getReportInstance()

Returns the report instance associated with the notification.

Signature

```
public Reports.ReportInstance getReportInstance()
```

Return Value

Type: Reports.ReportInstance

getThresholdInformation()

Returns the threshold information associated with the notification.

Signature

```
public Reports.ThresholdInformation getThresholdInformation()
```

Return Value

Type: Reports.ThresholdInformation

ReportCsf Class

Contains methods and constructors for working with information about a custom summary formula (CSF).

Namespace

Reports

IN THIS SECTION:

ReportCsf Constructors

ReportCsf Methods

ReportCsf Constructors

The following are constructors for `ReportCsf`.

IN THIS SECTION:

ReportCsf(label, description, formulaType, decimalPlaces, downGroup, downGroupType, acrossGroup, acrossGroupType, formula)
Creates an instance of the `Reports.ReportCsf` class using the specified parameters.

ReportCsf()
Creates an instance of the `Reports.ReportCsf` class. You can then set values by using the class's `set` methods.

`ReportCsf(label, description, formulaType, decimalPlaces, downGroup, downGroupType, acrossGroup, acrossGroupType, formula)`

Creates an instance of the `Reports.ReportCsf` class using the specified parameters.

Signature

```
public ReportCsf(String label, String description, Reports.FormulaType formulaType,
Integer decimalPlaces, String downGroup, Reports.CsfGroupType downGroupType, String
acrossGroup, Reports.CsfGroupType acrossGroupType, String formula)
```

Parameters

label
Type: String

The user-facing name of the custom summary formula.

description
Type: String

The user-facing description of the custom summary formula.

formulaType
Type: Reports.FormulaType

The format of the numbers in the custom summary formula.

decimalPlaces
Type: Integer

The number of decimal places to include in numbers.

downGroup
Type: String

The name of a row grouping when the `downGroupType` is `CUSTOM`; `null` otherwise.

downGroupType
Type: Reports.CsfGroupType

Where to display the aggregate of the custom summary formula.

acrossGroup
Type: String

The name of a column grouping when the `accrossGroupType` is `CUSTOM`; `null` otherwise.

acrossGroupType
Type: Reports.CsfGroupType

Where to display the aggregate of the custom summary formula.

formula
Type: String

The operations performed on values in the custom summary formula.

`ReportCsf()`

Creates an instance of the `Reports.ReportCsf` class. You can then set values by using the class's `set` methods.

Signature

```
public ReportCsf()
```

ReportCsf Methods

The following are methods for `ReportCsf`.

IN THIS SECTION:

getAcrossGroup()
Returns the name of a column grouping when the `acrossGroupType` is `CUSTOM`. Otherwise, returns `null`.

getAcrossGroupType()
Returns where to display the aggregate.

getDecimalPlaces()
Returns the number of decimal places that numbers in the custom summary formula have.

getDescription()
Returns the user-facing description of a custom summary formula.

getDownGroup()
Returns the name of a row grouping when the `downGroupType` is `CUSTOM`. Otherwise, returns `null`.

getDownGroupType()
Returns where to display the aggregate of the custom summary formula.

getFormula()
Returns the operations performed on values in the custom summary formula.

getFormulaType()
Returns the formula type.

getLabel()
Returns the user-facing name of the custom summary formula.

setAcrossGroup(acrossGroup)
Specifies the column for the across grouping.

setAcrossGroupType(value)
Sets where to display the aggregate.

setAcrossGroupType(acrossGroupType)
Sets where to display the aggregate.

setDecimalPlaces(decimalPlaces)
Sets the number of decimal places in numbers.

setDescription(description)
Sets the user-facing description of the custom summary formula.

setDownGroup(downGroup)
Sets the name of a row grouping when the `downGroupType` is `CUSTOM`.

setDownGroupType(value)
Sets where to display the aggregate.

setDownGroupType(downGroupType)
Sets where to display the aggregate.

setFormula(formula)
Sets the operations to perform on values in the custom summary formula.

setFormulaType(value)
Sets the format of the numbers in the custom summary formula.

setFormulaType(formulaType)
Sets the format of numbers used in the custom summary formula.

setLabel(label)
Sets the user-facing name of the custom summary formula.

toString()
Returns a string.

getAcrossGroup()

Returns the name of a column grouping when the `acrossGroupType` is `CUSTOM`. Otherwise, returns `null`.

Signature

```
public String getAcrossGroup()
```

Return Value

Type: String

getAcrossGroupType()

Returns where to display the aggregate.

Signature

```
public Reports.CsfGroupType getAcrossGroupType()
```

Return Value

Type: Reports.CsfGroupType

getDecimalPlaces()

Returns the number of decimal places that numbers in the custom summary formula have.

Signature

```
public Integer getDecimalPlaces()
```

Return Value

Type: Integer

getDescription()

Returns the user-facing description of a custom summary formula.

Signature

```
public String getDescription()
```

Return Value

Type: String

getDownGroup()

Returns the name of a row grouping when the `downGroupType` is `CUSTOM`. Otherwise, returns `null`.

Signature

```
public String getDownGroup()
```

Return Value

Type: String

`getDownGroupType()`

Returns where to display the aggregate of the custom summary formula.

Signature

```
public Reports.CsfGroupType getDownGroupType()
```

Return Value

Type: Reports.CsfGroupType

`getFormula()`

Returns the operations performed on values in the custom summary formula.

Signature

```
public String getFormula()
```

Return Value

Type: String

`getFormulaType()`

Returns the formula type.

Signature

```
public Reports.FormulaType getFormulaType()
```

Return Value

Type: Reports.FormulaType

`getLabel()`

Returns the user-facing name of the custom summary formula.

Signature

```
public String getLabel()
```

Return Value

Type: String

setAcrossGroup(acrossGroup)

Specifies the column for the across grouping.

Signature

```
public void setAcrossGroup(String acrossGroup)
```

Parameters

acrossGroup
Type: String

Return Value

Type: void

setAcrossGroupType(value)

Sets where to display the aggregate.

Signature

```
public void setAcrossGroupType(String value)
```

Parameters

value
Type: String

For possible values, see Reports.CsfGroupType.

Return Value

Type: void

setAcrossGroupType(acrossGroupType)

Sets where to display the aggregate.

Signature

```
public void setAcrossGroupType(Reports.CsfGroupType acrossGroupType)
```

Parameters

acrossGroupType
Type: Reports.CsfGroupType

Return Value

Type: void

`setDecimalPlaces(decimalPlaces)`

Sets the number of decimal places in numbers.

Signature

```
public void setDecimalPlaces(Integer decimalPlaces)
```

Parameters

decimalPlaces
Type: Integer

Return Value

Type: void

`setDescription(description)`

Sets the user-facing description of the custom summary formula.

Signature

```
public void setDescription(String description)
```

Parameters

description
Type: String

Return Value

Type: void

`setDownGroup(downGroup)`

Sets the name of a row grouping when the `downGroupType` is `CUSTOM`.

Signature

```
public void setDownGroup(String downGroup)
```

Parameters

downGroup
Type: String

Return Value

Type: void

`setDownGroupType(value)`

Sets where to display the aggregate.

Signature

```
public void setDownGroupType(String value)
```

Parameters

value
Type: String

For valid values, see Reports.CsfGroupType.

Return Value

Type: void

`setDownGroupType(downGroupType)`

Sets where to display the aggregate.

Signature

```
public void setDownGroupType(Reports.CsfGroupType downGroupType)
```

Parameters

downGroupType
Type: Reports.CsfGroupType

Return Value

Type: void

`setFormula(formula)`

Sets the operations to perform on values in the custom summary formula.

Signature

```
public void setFormula(String formula)
```

Parameters

formula
Type: String

Return Value

Type: void

setFormulaType(value)

Sets the format of the numbers in the custom summary formula.

Signature

```
public void setFormulaType(String value)
```

Parameters

value
Type: String

For valid values, see Reports.FormulaType.

Return Value

Type: void

setFormulaType(formulaType)

Sets the format of numbers used in the custom summary formula.

Signature

```
public void setFormulaType(Reports.FormulaType formulaType)
```

Parameters

formulaType
Type: Reports.FormulaType

Return Value

Type: void

setLabel(label)

Sets the user-facing name of the custom summary formula.

Signature

```
public void setLabel(String label)
```

Parameters

label
Type: String

Return Value

Type: void

`toString()`

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: String

ReportCurrency Class

Contains information about a currency value, including the amount and currency code.

Namespace

Reports

ReportCurrency Methods

The following are methods for `ReportCurrency`. All are instance methods.

IN THIS SECTION:

getAmount()
Returns the amount of the currency value.

getCurrencyCode()
Returns the report currency code, such as USD, EUR, or GBP, for an organization that has multicurrency enabled. The value is `null` if the organization does not have multicurrency enabled.

`getAmount()`

Returns the amount of the currency value.

Syntax

```
public Decimal getAmount()
```

Return Value

Type: Decimal

getCurrencyCode()

Returns the report currency code, such as USD, EUR, or GBP, for an organization that has multicurrency enabled. The value is `null` if the organization does not have multicurrency enabled.

Syntax

```
public String getCurrencyCode()
```

Return Value

Type: String

ReportDataCell Class

Contains the data for a cell in the report, including the display label and value.

Namespace

Reports

ReportDataCell Methods

The following are methods for `ReportDataCell`. All are instance methods.

IN THIS SECTION:

getLabel()
Returns the localized display name of the value of a specified cell in the report.

getValue()
Returns the value of a specified cell of a detail row of a report.

getLabel()

Returns the localized display name of the value of a specified cell in the report.

Syntax

```
public String getLabel()
```

Return Value

Type: String

getValue()

Returns the value of a specified cell of a detail row of a report.

Syntax

```
public Object getValue()
```

Return Value

Type: Object

ReportDescribeResult Class

Contains report, report type, and extended metadata for a tabular, summary, or matrix report.

Namespace

Reports

ReportDescribeResult Methods

The following are methods for `ReportDescribeResult`. All are instance methods.

IN THIS SECTION:

getReportExtendedMetadata()
Returns additional information about grouping and summaries.

getReportMetadata()
Returns unique identifiers for groupings and summaries.

getReportTypeMetadata()
Returns the fields in each section of a report type, plus filtering information for those fields.

`getReportExtendedMetadata()`

Returns additional information about grouping and summaries.

Syntax

```
public Reports.ReportExtendedMetadata getReportExtendedMetadata()
```

Return Value

Type: Reports.ReportExtendedMetadata

`getReportMetadata()`

Returns unique identifiers for groupings and summaries.

Syntax

```
public Reports.ReportMetadata getReportMetadata()
```

Return Value

Type: Reports.ReportMetadata

`getReportTypeMetadata()`

Returns the fields in each section of a report type, plus filtering information for those fields.

Syntax

```
public Reports.ReportTypeMetadata getReportTypeMetadata()
```

Return Value

Type: Reports.ReportTypeMetadata

ReportDetailRow Class

Contains data cells for a detail row of a report.

Namespace

Reports

ReportDetailRow Methods

The following are methods for `ReportDetailRow`. All are instance methods.

IN THIS SECTION:

getDataCells()
Returns a list of data cells for a detail row.

`getDataCells()`

Returns a list of data cells for a detail row.

Syntax

```
public LIST<Reports.ReportDataCell> getDataCells()
```

Return Value

Type: List<Reports.ReportDataCell>

ReportDivisionInfo Class

Contains information about the divisions that can be used to filter a report.

Available only if your organization uses divisions to segment data and you have the "Affected by Divisions" permission. If you do not have the "Affected by Divisions" permission, your reports include records in all divisions.

Namespace

Reports

Usage

Use to filter records in the report based on a division, like West Coast and East Coast.

ReportDivisionInfo Methods

The following are methods for `ReportDivisionInfo`.

`getDefaultValue()`

Returns the default division for the report.

Signature

```
public String getDefaultValue()
```

Return Value

Type: String

`getValues()`

Returns a list of all possible divisions for the report.

Signature

```
public List<Reports.FilterValue> getValues()
```

Return Value

Type: List<Reports.FilterValue>

ReportExtendedMetadata Class

Contains report extended metadata for a tabular, summary, or matrix report.

Namespace

Reports

Report extended metadata provides additional, detailed metadata about summary and grouping fields, including data type and label information.

ReportExtendedMetadata Methods

The following are methods for `ReportExtendedMetadata`. All are instance methods.

IN THIS SECTION:

getAggregateColumnInfo()
Returns all report summaries such as `Record Count`, `Sum`, `Average`, `Max`, `Min`, and custom summary formulas. Contains values for each summary that is listed in the report metadata.

getDetailColumnInfo()
Returns a map of two properties for each field that has detailed data identified by its unique API name. The detailed data fields are also listed in the report metadata.

getGroupingColumnInfo()
Returns a map of each row or column grouping to its metadata. Contains values for each grouping that is identified in the groupingsDown and groupingsAcross lists.

`getAggregateColumnInfo()`

Returns all report summaries such as `Record Count`, `Sum`, `Average`, `Max`, `Min`, and custom summary formulas. Contains values for each summary that is listed in the report metadata.

Syntax

```
public MAP<String,Reports.AggregateColumn> getAggregateColumnInfo()
```

Return Value

Type: Map<String,Reports.AggregateColumn>

`getDetailColumnInfo()`

Returns a map of two properties for each field that has detailed data identified by its unique API name. The detailed data fields are also listed in the report metadata.

Syntax

```
public MAP<String,Reports.DetailColumn> getDetailColumnInfo()
```

Return Value

Type: Map<String,Reports.DetailColumn>

`getGroupingColumnInfo()`

Returns a map of each row or column grouping to its metadata. Contains values for each grouping that is identified in the groupingsDown and groupingsAcross lists.

Syntax

```
public MAP<String,Reports.GroupingColumn> getGroupingColumnInfo()
```

Return Value

Type: Map<String,Reports.GroupingColumn>

ReportFact Class

Contains the fact map for the report, which represents the report's data values.

Namespace

Reports

Usage

`ReportFact` is the parent class of `ReportFactWithDetails` and `ReportFactWithSummaries`. If `includeDetails` is `true` when the report is run, the fact map is a `ReportFactWithDetails` object. If `includeDetails` is `false` when the report is run, the fact map is a `ReportFactWithSummaries` object.

ReportFact Methods

The following are methods for `ReportFact`. All are instance methods.

IN THIS SECTION:

getAggregates()
Returns summary-level data for a report, including the record count.

getKey()
Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

`getAggregates()`

Returns summary-level data for a report, including the record count.

Syntax

```
public LIST<Reports.SummaryValue> getAggregates()
```

Return Value

Type: List<Reports.SummaryValue>

`getKey()`

Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

Syntax

```
public String getKey()
```

Return Value

Type: String

ReportFactWithDetails Class

Contains the detailed fact map for the report, which represents the report's data values.

Namespace

Reports

Usage

The `ReportFactWithDetails` class extends the `ReportFact` class. A `ReportFactWithDetails` object is returned if `includeDetails` is set to `true` when the report is run. To access the detail values, you'll need to cast the return value of the `ReportResults.getFactMap` method to a `ReportFactWithDetails` object.

ReportFactWithDetails Methods

The following are methods for `ReportFactWithDetails`. All are instance methods.

IN THIS SECTION:

getAggregates()
Returns summary-level data for a report, including the record count.

getKey()
Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

getRows()
Returns a list of detailed report data in the order of the detail columns that are provided by the report metadata.

`getAggregates()`

Returns summary-level data for a report, including the record count.

Syntax

```
public LIST<Reports.SummaryValue> getAggregates()
```

Return Value

Type: List<Reports.SummaryValue>

`getKey()`

Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

Syntax

```
public String getKey()
```

Return Value

Type: String

`getRows()`

Returns a list of detailed report data in the order of the detail columns that are provided by the report metadata.

Syntax

```
public LIST<Reports.ReportDetailRow> getRows()
```

Return Value

Type: List<Reports.ReportDetailRow>

ReportFactWithSummaries Class

Contains the fact map for the report, which represents the report's data values, and includes summarized fields.

Namespace

Reports

Usage

The `ReportFactWithSummaries` class extends the `ReportFact` class. A `ReportFactWithSummaries` object is returned if `includeDetails` is set to `false` when the report is run.

ReportFactWithSummaries Methods

The following are methods for `ReportFactWithSummaries`. All are instance methods.

IN THIS SECTION:

getAggregates()
Returns summary-level data for a report, including the record count.

getKey()
Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

toString()
Returns a string.

`getAggregates()`

Returns summary-level data for a report, including the record count.

Syntax

```
public LIST<Reports.SummaryValue> getAggregates()
```

Return Value

Type: List<Reports.SummaryValue>

`getKey()`

Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

Syntax

```
public String getKey()
```

Return Value

Type: String

`toString()`

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: String

ReportFilter Class

Contains information about a report filter, including column, operator, and value.

Namespace

Reports

IN THIS SECTION:

ReportFilter Constructors

ReportFilter Methods

ReportFilter Constructors

The following are constructors for `ReportFilter`.

IN THIS SECTION:

ReportFilter()
Creates a new instance of the `Reports.ReportFilter` class. You can then set values by using the "set" methods.

ReportFilter(column, operator, value)
Creates a new instance of the `Reports.ReportFilter` class by using the specified parameters.

ReportFilter(column, operator, value, filterType)
Creates a new instance of the `Reports.ReportFilter` class by using the specified parameters.

ReportFilter()

Creates a new instance of the `Reports.ReportFilter` class. You can then set values by using the "set" methods.

Signature

```
public ReportFilter()
```

ReportFilter(column, operator, value)

Creates a new instance of the `Reports.ReportFilter` class by using the specified parameters.

Signature

```
public ReportFilter(String column, String operator, String value)
```

Parameters

column
Type: String

operator
Type: String

value
Type: String

ReportFilter(column, operator, value, filterType)

Creates a new instance of the `Reports.ReportFilter` class by using the specified parameters.

Syntax

```
public ReportFilterType(String column, String operator, String value,
Reports.ReportFilterType filterType)
```

Parameters

column
Type: String

operator
Type: String

value
Type: String

filterType
Type: ReportFilterType Enum on page 2819

ReportFilter Methods

The following are methods for `ReportFilter`. All are instance methods.

IN THIS SECTION:

getColumn()
Returns the unique API name for the field that's being filtered.

getFilterType()
Returns the type of report filter.

getOperator()
Returns the unique API name for the condition that is used to filter a field, such as "greater than" or "not equal to." Filter conditions depend on the data type of the field.

getValue()
Returns the value that the field is being filtered by. For example, the field `Age` can be filtered by a numeric value.

setColumn(column)
Sets the unique API name for the field that's being filtered.

setFilterType()
Sets the type of report filter.

setOperator(operator)
Sets the unique API name for the condition that is used to filter a field, such as "greater than" or "not equal to." Filter conditions depend on the data type of the field.

setValue(value)
Sets the value by which a field can be filtered. For example, the field `Age` can be filtered by a numeric value.

toString(column)
Returns a string representation of the filter.

`getColumn()`

Returns the unique API name for the field that's being filtered.

Syntax

```
public String getColumn()
```

Return Value

Type: String

`getFilterType()`

Returns the type of report filter.

Syntax

```
public String getFilterType()
```

Return Value

Type: ReportFilterType Enum on page 2819

`getOperator()`

Returns the unique API name for the condition that is used to filter a field, such as “greater than” or “not equal to.” Filter conditions depend on the data type of the field.

Syntax

```
public String getOperator()
```

Return Value

Type: String

`getValue()`

Returns the value that the field is being filtered by. For example, the field `Age` can be filtered by a numeric value.

Syntax

```
public String getValue()
```

Return Value

Type: String

`setColumn(column)`

Sets the unique API name for the field that’s being filtered.

Syntax

```
public Void setColumn(String column)
```

Parameters

column
Type: String

Return Value

Type: Void

setFilterType()

Sets the type of report filter.

Syntax

```
public Void setFilterType(String column)
```

Parameters

column
Type: String

Return Value

Type: Void

setOperator(operator)

Sets the unique API name for the condition that is used to filter a field, such as “greater than” or “not equal to.” Filter conditions depend on the data type of the field.

Syntax

```
public Void setOperator(String operator)
```

Parameters

operator
Type: String

Return Value

Type: Void

setValue(value)

Sets the value by which a field can be filtered. For example, the field `Age` can be filtered by a numeric value.

Syntax

```
public Void setValue(String value)
```

Parameters

value
Type: String

Return Value

Type: Void

`toString(column)`

Returns a string representation of the filter.

Signature

```
public String toString()
```

Return Value

Type: String

ReportFormat Enum

Contains the possible report format types.

Namespace

Reports

Enum Values

The following are the values of the `Reports.ReportFormat` enum.

Value	Description
`MATRIX`	Matrix report format
`SUMMARY`	Summary report format
`TABULAR`	Tabular report format

ReportFilterType Enum

The types of values included in a report filter type.

Enum Values

The following are the values of the `Reports.ReportFilterType` enum.

Value	Description
`fieldToField`	Field-to-field filter
`fieldValue`	Field-to-value filter

ReportInstance Class

Returns an instance of a report that was run asynchronously. Retrieves the results for that instance.

Namespace

Reports

ReportInstance Methods

The following are methods for `ReportInstance`. All are instance methods.

IN THIS SECTION:

getCompletionDate()
Returns the date and time when the instance of the report finished running. The completion date is available only if the report instance ran successfully or couldn't be run because of an error. Date and time information is in ISO-8601 format.

getId()
Returns the unique ID for an instance of a report that was run asynchronously.

getOwnerId()
Returns the ID of the user who created the report instance.

getReportId()
Returns the unique ID of the report this instance is based on.

getReportResults()
Retrieves results for an instance of an asynchronous report. When you request your report, you can specify whether to summarize data or include details.

getRequestDate()
Returns the date and time when an instance of the report was run. Date and time information is in ISO-8601 format.

getStatus()
Returns the status of a report.

`getCompletionDate()`

Returns the date and time when the instance of the report finished running. The completion date is available only if the report instance ran successfully or couldn't be run because of an error. Date and time information is in ISO-8601 format.

Syntax

```
public Datetime getCompletionDate()
```

Return Value

Type: Datetime

getId()

Returns the unique ID for an instance of a report that was run asynchronously.

Syntax

```
public Id getId()
```

Return Value

Type: Id

getOwnerId()

Returns the ID of the user who created the report instance.

Syntax

```
public Id getOwnerId()
```

Return Value

Type: Id

getReportId()

Returns the unique ID of the report this instance is based on.

Syntax

```
public Id getReportId()
```

Return Value

Type: Id

getReportResults()

Retrieves results for an instance of an asynchronous report. When you request your report, you can specify whether to summarize data or include details.

Syntax

```
public Reports.ReportResults getReportResults()
```

Return Value

Type: Reports.ReportResults

`getRequestDate()`

Returns the date and time when an instance of the report was run. Date and time information is in ISO-8601 format.

Syntax

```
public Datetime getRequestDate()
```

Return Value

Type: Datetime

`getStatus()`

Returns the status of a report.

Syntax

```
public String getStatus()
```

Return Value

Type: String

Usage

- `New` if the report run was recently triggered through a request.
- `Success` if the report ran.
- `Running` if the report is being run.
- `Error` if the report run failed. The instance of a report run can return an error if, for example, your permission to access the report was removed after you requested the run.

ReportManager Class

Runs a report synchronously or asynchronously and with or without details.

Namespace

Reports

Usage

Gets instances of reports and describes the metadata of Reports.

ReportManager Methods

The following are methods for `ReportManager`. All methods are static.

IN THIS SECTION:

describeReport(reportId)

Retrieves report, report type, and extended metadata for a tabular, summary, or matrix report.

getDatatypeFilterOperatorMap()

Lists the field data types that you can use to filter the report.

getReportInstance(instanceId)

Retrieves results for an instance of a report that has been run asynchronously. The settings you use when you run your asynchronous report determine whether you can retrieve summary data or detailed data.

getReportInstances(reportId)

Returns a list of instances for a report that was run asynchronously. Each item in the list represents a separate instance of the report, with metadata for the time at which the report was run.

runAsyncReport(reportId, reportMetadata, includeDetails)

Runs a report asynchronously with the report ID. Includes details if *`includeDetails`* is set to `true`. Filters the report based on the report metadata in *`reportMetadata`*.

runAsyncReport(reportId, includeDetails)

Runs a report asynchronously with the report ID. Includes details if *`includeDetails`* is set to `true`.

runAsyncReport(reportId, reportMetadata)

Runs a report asynchronously with the report ID. Filters the results based on the report metadata in *`reportMetadata`*.

runAsyncReport(reportId)

Runs a report asynchronously with the report ID.

runReport(reportId, reportMetadata, includeDetails)

Runs a report immediately with the report ID. Includes details if *`includeDetails`* is set to `true`. Filters the results based on the report metadata in *`reportMetadata`*.

runReport(reportId, includeDetails)

Runs a report immediately with the report ID. Includes details if *`includeDetails`* is set to `true`.

runReport(reportId, reportMetadata)

Runs a report immediately with the report ID. Filters the results based on the report metadata in *`rmData`*.

runReport(reportId)

Runs a report immediately with the report ID.

`describeReport(reportId)`

Retrieves report, report type, and extended metadata for a tabular, summary, or matrix report.

Syntax

```
public static Reports.ReportDescribeResult describeReport(Id reportId)
```

Parameters

reportId
Type: Id

Return Value

Type: Reports.ReportDescribeResult

getDatatypeFilterOperatorMap()

Lists the field data types that you can use to filter the report.

Syntax

```
public static MAP<String,LIST<Reports.FilterOperator>> getDatatypeFilterOperatorMap()
```

Return Value

Type: Map<String, List<Reports.FilterOperator>>

getReportInstance(instanceId)

Retrieves results for an instance of a report that has been run asynchronously. The settings you use when you run your asynchronous report determine whether you can retrieve summary data or detailed data.

Syntax

```
public static Reports.ReportInstance getReportInstance(Id instanceId)
```

Parameters

instanceId
Type: Id

Return Value

Type: Reports.ReportInstance

getReportInstances(reportId)

Returns a list of instances for a report that was run asynchronously. Each item in the list represents a separate instance of the report, with metadata for the time at which the report was run.

Syntax

```
public static LIST<Reports.ReportInstance> getReportInstances(Id reportId)
```

Parameters

reportId
Type: Id

Return Value

Type: List<Reports.ReportInstance>

runAsyncReport(reportId, reportMetadata, includeDetails)

Runs a report asynchronously with the report ID. Includes details if *includeDetails* is set to `true`. Filters the report based on the report metadata in *reportMetadata*.

Syntax

```
public static Reports.ReportInstance runAsyncReport(Id reportId, Reports.ReportMetadata reportMetadata, Boolean includeDetails)
```

Parameters

reportId
Type: Id

reportMetadata
Type: Reports.ReportMetadata

includeDetails
Type: Boolean

Return Value

Type: Reports.ReportInstance

runAsyncReport(reportId, includeDetails)

Runs a report asynchronously with the report ID. Includes details if *includeDetails* is set to `true`.

Syntax

```
public static Reports.ReportInstance runAsyncReport(Id reportId, Boolean includeDetails)
```

Parameters

reportId
Type: Id

includeDetails
Type: Boolean

Return Value

Type: Reports.ReportInstance

runAsyncReport(reportId, reportMetadata)

Runs a report asynchronously with the report ID. Filters the results based on the report metadata in *reportMetadata*.

Syntax

```
public static Reports.ReportInstance runAsyncReport(Id reportId, Reports.ReportMetadata
reportMetadata)
```

Parameters

reportId
Type: Id

reportMetadata
Type: Reports.ReportMetadata

Return Value

Type: Reports.ReportInstance

runAsyncReport(reportId)

Runs a report asynchronously with the report ID.

Syntax

```
public static Reports.ReportInstance runAsyncReport(Id reportId)
```

Parameters

reportId
Type: Id

Return Value

Type: Reports.ReportInstance

runReport(reportId, reportMetadata, includeDetails)

Runs a report immediately with the report ID. Includes details if *includeDetails* is set to `true`. Filters the results based on the report metadata in *reportMetadata*.

Syntax

```
public static Reports.ReportResults runReport(Id reportId, Reports.ReportMetadata
reportMetadata, Boolean includeDetails)
```

Parameters

reportId
Type: Id

reportMetadata
Type: Reports.ReportMetadata

includeDetails
Type: Boolean

Return Value

Type: Reports.ReportResults

runReport(reportId, includeDetails)

Runs a report immediately with the report ID. Includes details if *includeDetails* is set to `true`.

Syntax

```
public static Reports.ReportResults runReport(Id reportId, Boolean includeDetails)
```

Parameters

reportId
Type: Id

includeDetails
Type: Boolean

Return Value

Type: Reports.ReportResults

runReport(reportId, reportMetadata)

Runs a report immediately with the report ID. Filters the results based on the report metadata in *rmData*.

Syntax

```
public static Reports.ReportResults runReport(Id reportId, Reports.ReportMetadata
reportMetadata)
```

Parameters

reportId
Type: Id

reportMetadata
Type: Reports.ReportMetadata Reports.ReportMetadata

Return Value

Type: Reports.ReportResults

`runReport(reportId)`

Runs a report immediately with the report ID.

Syntax

```
public static Reports.ReportResults runReport(Id reportId)
```

Parameters

`reportId`
Type: Id

Return Value

Type: Reports.ReportResults

ReportMetadata Class

Contains report metadata for a tabular, summary, or matrix report.

Namespace

Reports

Usage

Report metadata gives information about the report as a whole, such as the report type, format, summary fields, row or column groupings, and filters that are saved to the report. You can use the `ReportMetadata` class to retrieve report metadata and to set metadata that can be used to filter a report.

ReportMetadata Methods

The following are methods for `ReportMetadata`. All are instance methods.

IN THIS SECTION:

getAggregates()
Returns unique identifiers for summary or custom summary formula fields in the report.

getBuckets()
Returns a list of bucket fields in the report.

getCrossFilters()
Returns information about cross filters applied to a report.

getCurrencyCode()
Returns report currency, such as USD, EUR, or GBP, for an organization that has multicurrency enabled. The value is `null` if the organization does not have multicurrency enabled.

getCustomSummaryFormula()
Returns information about custom summary formulas in a report.

getDescription()

Returns the description of the report.

getDetailColumns()

Returns unique API names (column names) for the fields that contain detailed data. For example, the method might return the following values: "OPPORTUNITY_NAME, TYPE, LEAD_SOURCE, AMOUNT."

getDeveloperName()

Returns the report API name. For example, the method might return the following value: "Closed_Sales_This_Quarter."

getDivision()

Returns the division specified in the report.

getGroupingsAcross()

Returns column groupings in a report.

getGroupingsDown()

Returns row groupings for a report.

getHasDetailRows()

Indicates whether the report has detail rows.

getHasRecordCount()

Indicates whether the report shows the total number of records.

getHistoricalSnapshotDates()

Returns a list of historical snapshot dates.

getId()

Returns the unique report ID.

getName()

Returns the report name.

getReportBooleanFilter()

Returns logic to parse custom field filters. The value is `null` when filter logic is not specified.

getReportFilters()

Returns a list of each custom filter in the report along with the field name, filter operator, and filter value.

getReportFormat()

Returns the format of the report.

getReportType()

Returns the unique API name and display name for the report type.

getScope()

Returns the API name for the scope defined for the report. Scope values depend on the report type.

getShowGrandTotal()

Indicates whether the report shows the grand total.

getShowSubtotals()

Indicates whether the report shows subtotals, such as column or row totals.

getSortBy()

Returns the list of columns on which the report is sorted. Currently, you can sort on only one column.

getStandardDateFilter()

Returns information about the standard date filter for the report, such as the start date, end date, date range, and date field API name.

getStandardFilters()

Returns a list of standard filters for the report.

getTopRows()

Returns information about a row limit filter, including the number of rows returned and the sort order.

setAggregates(aggregates)

Sets unique identifiers for standard or custom summary formula fields in the report.

setBuckets(buckets)

Creates bucket fields in a report.

setCrossFilters(crossFilters)

Applies cross filters to a report.

setCurrencyCode(currencyCode)

Sets the currency, such as USD, EUR, or GBP, for report summary fields in an organization that has multicurrency enabled.

setCustomSummaryFormula(customSummaryFormula)

Adds a custom summary formula to a report.

setDescription(description)

Sets the description of the report.

setDetailColumns(detailColumns)

Sets the unique API names for the fields that contain detailed data—for example, `OPPORTUNITY_NAME`, `TYPE`, `LEAD_SOURCE`, or `AMOUNT`.

setDeveloperName(developerName)

Sets the report API name—for example, `Closed_Sales_This_Quarter`.

setDivision(division)

Sets the division of the report.

setGroupingsAcross(groupingInfo)

Sets column groupings in a report.

setGroupingsDown(groupingInfo)

Sets row groupings for a report.

setHasDetailRows(hasDetailRows)

Specifies whether the report has detail rows.

setHasRecordCount(hasRecordCount)

Specifies whether the report is configured to show the total number of records.

setHistoricalSnapshotDates(historicalSnapshot)

Sets a list of historical snapshot dates.

setId(id)

Sets the unique report ID.

setName(name)

Sets the report name.

setReportBooleanFilter(reportBooleanFilter)
Sets logic to parse custom field filters.

setReportFilters(reportFilters)
Sets a list of each custom filter in the report along with the field name, filter operator, and filter value.

setReportFormat(format)
Sets the format of the report.

setReportType(reportType)
Sets the unique API name and display name for the report type.

setScope(scopeName)
Sets the API name for the scope defined for the report. Scope values depend on the report type.

setShowGrandTotal(showGrandTotal)
Specifies whether the report shows the grand total.

setShowSubtotals(showSubtotals)
Specifies whether the report shows subtotals, such as column or row totals.

setSortBy(column)
Sets the list of columns on which the report is sorted. Currently, you can only sort on one column.

setStandardDateFilter(dateFilter)
Sets the standard date filter—which includes the start date, end date, date range, and date field API name—for the report.

setStandardFilters(filters)
Sets one or more standard filters on the report.

setTopRows(topRows)
Applies a row limit filter to a report.

`getAggregates()`

Returns unique identifiers for summary or custom summary formula fields in the report.

Syntax

```
public LIST<String> getAggregates()
```

Return Value

Type: List<String>

Usage

For example:

- `a!Amount` represents the average for the `Amount` column.
- `s!Amount` represents the sum of the `Amount` column.
- `m!Amount` represents the minimum value of the `Amount` column.
- `x!Amount` represents the maximum value of the `Amount` column.
- `s!<customfieldID>` represents the sum of a custom field column. For custom fields and custom report types, the identifier is a combination of the summary type and the field ID.

getBuckets()

Returns a list of bucket fields in the report.

Signature

```
public List<Reports.BucketField> getBuckets()
```

Return Value

Type: List<Reports.BucketField>

getCrossFilters()

Returns information about cross filters applied to a report.

Signature

```
public Reports.CrossFilter getCrossFilters()
```

Return Value

Type: List<Reports.CrossFilter>

getCurrencyCode()

Returns report currency, such as USD, EUR, or GBP, for an organization that has multicurrency enabled. The value is `null` if the organization does not have multicurrency enabled.

Syntax

```
public String getCurrencyCode()
```

Return Value

Type: String

getCustomSummaryFormula()

Returns information about custom summary formulas in a report.

Signature

```
public Map<String,Reports.ReportCsf> getCustomSummaryFormula()
```

Return Value

Type: Map<String,Reports.ReportCsf>

getDescription()

Returns the description of the report.

Signature

```
public String getDescription()
```

Return Value

Type: String

getDetailColumns()

Returns unique API names (column names) for the fields that contain detailed data. For example, the method might return the following values: "OPPORTUNITY_NAME, TYPE, LEAD_SOURCE, AMOUNT."

Syntax

```
public LIST<String> getDetailColumns()
```

Return Value

Type: List<String>

getDeveloperName()

Returns the report API name. For example, the method might return the following value: "Closed_Sales_This_Quarter."

Syntax

```
public String getDeveloperName()
```

Return Value

Type: String

getDivision()

Returns the division specified in the report.

Note: Reports that use standard filters (such as My Cases or My Team's Accounts) show records in all divisions. These reports can't be further limited to a specific division.

Signature

```
public String getDivision()
```

Return Value

Type: String

getGroupingsAcross()

Returns column groupings in a report.

Syntax

```
public LIST<Reports.GroupingInfo> getGroupingsAcross()
```

Return Value

Type: List<Reports.GroupingInfo>

Usage

The identifier is:

- An empty array for reports in summary format, because summary reports don't include column groupings
- `BucketField_(ID)` for bucket fields
- The ID of a custom field when the custom field is used for a column grouping

getGroupingsDown()

Returns row groupings for a report.

Syntax

```
public LIST<Reports.GroupingInfo> getGroupingsDown()
```

Return Value

Type: List<Reports.GroupingInfo>

Usage

The identifier is:

- `BucketField_(ID)` for bucket fields
- The ID of a custom field when the custom field is used for grouping

getHasDetailRows()

Indicates whether the report has detail rows.

Signature

```
public Boolean getHasDetailRows()
```

Return Value

Type: Boolean

getHasRecordCount()

Indicates whether the report shows the total number of records.

Signature

```
public Boolean getHasRecordCount()
```

Return Value

Type: Boolean

getHistoricalSnapshotDates()

Returns a list of historical snapshot dates.

Syntax

```
public LIST<String> getHistoricalSnapshotDates()
```

Return Value

Type: List<String>

getId()

Returns the unique report ID.

Syntax

```
public Id getId()
```

Return Value

Type: Id

getName()

Returns the report name.

Syntax

```
public String getName()
```

Return Value

Type: String

getReportBooleanFilter()

Returns logic to parse custom field filters. The value is `null` when filter logic is not specified.

Syntax

```
public String getReportBooleanFilter()
```

Return Value

Type: String

getReportFilters()

Returns a list of each custom filter in the report along with the field name, filter operator, and filter value.

Syntax

```
public LIST<Reports.ReportFilter> getReportFilters()
```

Return Value

Type: List<Reports.ReportFilter>

getReportFormat()

Returns the format of the report.

Syntax

```
public Reports.ReportFormat getReportFormat()
```

Return Value

Type: Reports.ReportFormat

Usage

This value can be:

- `TABULAR`
- `SUMMARY`
- `MATRIX`

getReportType()

Returns the unique API name and display name for the report type.

Syntax

```
public Reports.ReportType getReportType()
```

Return Value

Type: Reports.ReportType

getScope()

Returns the API name for the scope defined for the report. Scope values depend on the report type.

Signature

```
public String getScope()
```

Return Value

Type: String

getShowGrandTotal()

Indicates whether the report shows the grand total.

Signature

```
public Boolean getShowGrandTotal()
```

Return Value

Type: Boolean

getShowSubtotals()

Indicates whether the report shows subtotals, such as column or row totals.

Signature

```
public Boolean getShowSubtotals()
```

Return Value

Type: Boolean

getSortBy()

Returns the list of columns on which the report is sorted. Currently, you can sort on only one column.

Signature

```
public List<Reports.SortColumn> getSortBy()
```

Return Value

Type: List<Reports.SortColumn>

getStandardDateFilter()

Returns information about the standard date filter for the report, such as the start date, end date, date range, and date field API name.

Signature

```
public Reports.StandardDateFilter getStandardDateFilter()
```

Return Value

Type: Reports.StandardDateFilter

getStandardFilters()

Returns a list of standard filters for the report.

Signature

```
public List<Reports.StandardFilter> getStandardFilters()
```

Return Value

Type: List<Reports.StandardFilter>

getTopRows()

Returns information about a row limit filter, including the number of rows returned and the sort order.

Signature

```
public Reports.TopRows getTopRows()
```

Return Value

Type: Reports.TopRows

setAggregates(aggregates)

Sets unique identifiers for standard or custom summary formula fields in the report.

Signature

```
public void setAggregates(List<String> aggregates)
```

Parameters

aggregates
Type: List<String>

Return Value

Type: void

setBuckets(buckets)

Creates bucket fields in a report.

Signature

```
public void setBuckets(List<Reports.BucketField> buckets)
```

Parameters

buckets
Type: List<Reports.BucketField>

Return Value

Type: void

setCrossFilters(crossFilters)

Applies cross filters to a report.

Signature

```
public void setCrossFilters(List<Reports.CrossFilter> crossFilters)
```

Parameters

crossFilter
Type: List<Reports.CrossFilter>

Return Value

Type: void

setCurrencyCode(currencyCode)

Sets the currency, such as USD, EUR, or GBP, for report summary fields in an organization that has multicurrency enabled.

Signature

```
public void setCurrencyCode(String currencyCode)
```

Parameters

currencyCode
Type: String

Return Value

Type: void

setCustomSummaryFormula(customSummaryFormula)

Adds a custom summary formula to a report.

Signature

```
public void setCustomSummaryFormula(MAP<String,Reports.ReportCsf> customSummaryFormula)
```

Parameters

customSummaryFormula
Type: Map<String, Reports.ReportCsf>

Return Value

Type: void

setDescription(description)

Sets the description of the report.

Signature

```
public void setDescription(String description)
```

Parameters

description
Type: String

Return Value

Type: void

setDetailColumns(detailColumns)

Sets the unique API names for the fields that contain detailed data—for example, `OPPORTUNITY_NAME`, `TYPE`, `LEAD_SOURCE`, or `AMOUNT`.

Signature

```
public void setDetailColumns(List<String> detailColumns)
```

Parameters

detailColumns
Type: List<String>

Return Value

Type: void

setDeveloperName(developerName)

Sets the report API name—for example, `Closed_Sales_This_Quarter`.

Signature

```
public void setDeveloperName(String developerName)
```

Parameters

developerName
Type: String

Return Value

Type: void

setDivision(division)

Sets the division of the report.

Note: Reports that use standard filters (such as My Cases or My Team's Accounts) show records in all divisions. These reports can't be further limited to a specific division.

Signature

```
public void setDivision(String division)
```

Parameters

division
Type: String

Return Value

Type: void

setGroupingsAcross(groupingInfo)

Sets column groupings in a report.

Signature

```
public void setGroupingsAcross(List<Reports.GroupingInfo> groupingInfo)
```

Parameters

groupingInfo
Type: List<Reports.GroupingInfo>

Return Value

Type: void

setGroupingsDown(groupingInfo)

Sets row groupings for a report.

Signature

```
public void setGroupingsDown(List<Reports.GroupingInfo> groupingInfo)
```

Parameters

groupingInfo
Type: List<Reports.GroupingInfo>

Return Value

Type: void

setHasDetailRows(hasDetailRows)

Specifies whether the report has detail rows.

Signature

```
public void setHasDetailRows(Boolean hasDetailRows)
```

Parameters

hasDetailRows
Type: Boolean

Return Value

Type: void

setHasRecordCount(hasRecordCount)

Specifies whether the report is configured to show the total number of records.

Signature

```
public void setHasRecordCount(Boolean hasRecordCount)
```

Parameters

hasRecordCount
Type: Boolean

Return Value

Type: void

setHistoricalSnapshotDates(historicalSnapshot)

Sets a list of historical snapshot dates.

Syntax

```
public Void setHistoricalSnapshotDates(LIST<String> historicalSnapshot)
```

Parameters

historicalSnapshot
Type: List<String>

Return Value

Type: Void

setId(id)

Sets the unique report ID.

Signature

```
public void setId(Id id)
```

Parameters

id
Type: Id

Return Value

Type: void

setName(name)

Sets the report name.

Signature

```
public void setName(String name)
```

Parameters

name
Type: String

Return Value

Type: void

setReportBooleanFilter(reportBooleanFilter)

Sets logic to parse custom field filters.

Syntax

```
public Void setReportBooleanFilter(String reportBooleanFilter)
```

Parameters

reportBooleanFilter
Type: String

Return Value

Type: Void

setReportFilters(reportFilters)

Sets a list of each custom filter in the report along with the field name, filter operator, and filter value.

Syntax

```
public Void setReportFilters(LIST<Reports.ReportFilter> reportFilters)
```

Parameters

reportFilters
Type: List<Reports.ReportFilter>

Return Value

Type: Void

setReportFormat(format)

Sets the format of the report.

Signature

```
public void setReportFormat(Reports.ReportFormat format)
```

Parameters

format
Type: Reports.ReportFormat

Return Value

Type: void

setReportType(reportType)

Sets the unique API name and display name for the report type.

Signature

```
public void setReportType(Reports.ReportType reportType)
```

Parameters

reportType
Type: Reports.ReportType

Return Value

Type: void

setScope(scopeName)

Sets the API name for the scope defined for the report. Scope values depend on the report type.

Signature

```
public void setScope(String scopeName)
```

Parameters

scopeName
Type: String

Return Value

Type: void

setShowGrandTotal(showGrandTotal)

Specifies whether the report shows the grand total.

Signature

```
public void setShowGrandTotal(Boolean showGrandTotal)
```

Parameters

showGrandTotal
Type: Boolean

Return Value

Type: void

setShowSubtotals(showSubtotals)

Specifies whether the report shows subtotals, such as column or row totals.

Signature

```
public void setShowSubtotals(Boolean showSubtotals)
```

Parameters

showSubtotals
Type: Boolean

Return Value

Type: void

setSortBy(column)

Sets the list of columns on which the report is sorted. Currently, you can only sort on one column.

Signature

```
public void setSortBy(List<Reports.SortColumn> column)
```

Parameters

column
Type: List<Reports.SortColumn>

Return Value

Type: void

setStandardDateFilter(dateFilter)

Sets the standard date filter—which includes the start date, end date, date range, and date field API name—for the report.

Signature

```
public void setStandardDateFilter(Reports.StandardDateFilter dateFilter)
```

Parameters

dateFilter
Type: Reports.StandardDateFilter

Return Value

Type: void

`setStandardFilters(filters)`

Sets one or more standard filters on the report.

Signature

```
public void setStandardFilters(List<Reports.StandardFilter> filters)
```

Parameters

`filters`
Type: List<Reports.StandardFilter>

Return Value

Type: void

`setTopRows(topRows)`

Applies a row limit filter to a report.

Signature

```
public Reports.TopRows setTopRows(Reports.TopRows topRows)
```

Parameters

`topRows`
Type: Reports.TopRows

Return Value

Type: void

ReportResults Class

Contains the results of running a report.

Namespace

Reports

ReportResults Methods

The following are methods for `ReportResults`. All are instance methods.

IN THIS SECTION:

getAllData()
Returns all report data.

getFactMap()
Returns summary-level data or summary and detailed data for each row or column grouping. Detailed data is available if the `includeDetails` parameter is set to `true` when the report is run.

getGroupingsAcross()
Returns a collection of column groupings, keys, and values.

getGroupingsDown()
Returns a collection of row groupings, keys, and values.

getHasDetailRows()
Returns information about whether the fact map has detail rows.

getReportExtendedMetadata()
Returns additional, detailed metadata about the report, including data type and label information for groupings and summaries.

getReportMetadata()
Returns metadata about the report, including grouping and summary information.

`getAllData()`

Returns all report data.

Syntax

```
public Boolean getAllData()
```

Return Value

Type: Boolean

Usage

When `true`, indicates that all report results are returned.

When `false`, indicates that results are returned for the same number of rows as in a report run in Salesforce.

Note: For reports that contain too many records, use filters to refine results.

`getFactMap()`

Returns summary-level data or summary and detailed data for each row or column grouping. Detailed data is available if the `includeDetails` parameter is set to `true` when the report is run.

Syntax

```
public MAP<String,Reports.ReportFact> getFactMap()
```

Return Value

Type: Map<String,Reports.ReportFact>

`getGroupingsAcross()`

Returns a collection of column groupings, keys, and values.

Syntax

```
public Reports.Dimension getGroupingsAcross()
```

Return Value

Type: Reports.Dimension

`getGroupingsDown()`

Returns a collection of row groupings, keys, and values.

Syntax

```
public Reports.Dimension getGroupingsDown()
```

Return Value

Type: Reports.Dimension

`getHasDetailRows()`

Returns information about whether the fact map has detail rows.

Syntax

```
public Boolean getHasDetailRows()
```

Return Value

Type: Boolean

Usage

- When `true`, indicates that the fact map returns values for summary-level and record-level data.
- When `false`, indicates that the fact map returns summary values.

`getReportExtendedMetadata()`

Returns additional, detailed metadata about the report, including data type and label information for groupings and summaries.

Syntax

```
public Reports.ReportExtendedMetadata getReportExtendedMetadata()
```

Return Value

Type: Reports.ReportExtendedMetadata

`getReportMetadata()`

Returns metadata about the report, including grouping and summary information.

Syntax

```
public Reports.ReportMetadata getReportMetadata()
```

Return Value

Type: Reports.ReportMetadata

ReportScopeInfo Class

Contains information about possible scope values that you can choose. Scope values depend on the report type. For example, you can set the scope for opportunity reports to `All opportunities`, `My team's opportunities`, or `My opportunities`.

Namespace

Reports

IN THIS SECTION:

ReportScopeInfo Methods

ReportScopeInfo Methods

The following are methods for `ReportScopeInfo`.

IN THIS SECTION:

getDefaultValue()
Returns the default scope of the data to display in the report.

getValues()
Returns a list of scope values specified for the report.

`getDefaultValue()`

Returns the default scope of the data to display in the report.

Signature

```
public String getDefaultValue()
```

Return Value

Type: String

`getValues()`

Returns a list of scope values specified for the report.

Signature

```
public List<Reports.ReportScopeValue> getValues()
```

Return Value

Type: List<Reports.ReportScopeValue>

ReportScopeValue Class
