		<p>Engine. This value is available in API version 51.0 and later.</p> <ul style="list-style-type: none"> <li>• <code>processProgramRebateTypeProducts</code>—Insert or delete records in the Program Rebate Type Product object. This value is available in API version 53.0 and later.</li> <li>• <code>rebatesProcessCSV</code>—Processes an uploaded CSV file using Bulk API 2.0 and converts the file's data into records in the target object. This value is available in API version 51.0 and later.</li> <li>• <code>upsertCustomRebatePayout</code>—Upserts the custom calculated rebate payout for the specified aggregate record. This value is available in API version 51.0 and later.</li> </ul> <p>For values used in Referral Marketing, see Flow for Referral Marketing.</p> <p>These values are used in Loyalty Management.</p> <ul style="list-style-type: none"> <li>• <code>adjustPoints</code>—Adjusts loyalty points for a specified program member or journal transaction. This value is available in API version 51.0 and later.</li> <li>• <code>assignTierBenefits</code>—Assigns Member Benefits to a member tier for benefits that are associated with a Benefit Action. This value is available in API version 51.0 and later.</li> <li>• <code>cancelAccrual</code>—Cancels a specific set of accrual transactions.</li> <li>• <code>creditPoints</code>—Credits loyalty points to a specified program member's balance. This value is available in API version 51.0 and later.</li> <li>• <code>cancelRedemption</code>—Reverts a specific set of redemption transactions. This value is available in API version 51.0 and later.</li> <li>• <code>changeTier</code>—Changes the tier for a specified program member. This value is available in API version 51.0 and later.</li> <li>• <code>changeTierWhenNoErrors</code>—Changes tier for a specified loyalty program member only when all the input parameters meet the criteria. This value is available in API version 51.0 and later.</li> <li>• <code>debitPoints</code>—Debits loyalty points to a specified program member's balance. This value is available in API version 51.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>executeMemberBenefit</code>—Processes the benefit action associated with the benefit, which is assigned to a loyalty program member. This value is available in API version 51.0 and later.</li> <li>• <code>generateMemberReferralCode</code>—Generates a unique 8-character referral code for a loyalty program member. This value is available in API version 57.0 and later.</li> <li>• <code>getMemberActiveSegments</code>—Retrieve active Data Cloud market segments that a loyalty program member is a part of.</li> <li>• <code>getTier</code>—Gets the current tier for a specified program member. This value is available in API version 51.0 and later.</li> <li>• <code>getPointsBalance</code>—Gets the loyalty points balance for a specified program member. This value is available in API version 51.0 and later.</li> <li>• <code>getLoyaltyPromotion</code>—Gets active loyalty promotions based on a transaction journal. This value is available in API version 53.0 and later.</li> <li>• <code>getLoyaltyPromotionBasedOnSalesforceCDP</code>—Gets promotions for a member based on the market segment the member belongs to. This value is available in API version 53.0 and later.</li> <li>• <code>issueVoucher</code>—Issues a voucher for a member or contract. This value is available in API version 51.0 and later.</li> <li>• <code>mergeLoyaltyProgramMembership</code>—Merges two active loyalty program member records that both belong to the same loyalty program. This value is available in API version 56.0 and later.</li> <li>• <code>transferMemberPointsToGroups</code>—Transfers points from an individual member or a corporate member to the member's associated group. This value is available in API version 53.0 and later.</li> <li>• <code>updateProgressForCumulativePromotionUsage</code>—Updates the progress a member has made towards attaining a cumulative type promotion. This value is available in API version 53.0 and later.</li> <li>• <code>unmergeLoyaltyProgramMembership</code>—Unmerges loyalty program member records that have a Merged status. The action unmerges memberships in the Merged status from the previously merged membership. This value is available in API version 56.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>runProgramProcess</code>—Triggers an active loyalty program process. This value is available in API version 56.0 and later.</li> <li>• <code>runProgramProcessForTransactionJournal</code>—Triggers an active loyalty program process whose process type is <code>TransactionJournal</code>. This value is available in API version 54.0 and later.</li> </ul> <p>These values are for Decision Table.</p> <ul style="list-style-type: none"> <li>• <code>decisionTableAction</code>—Runs an active decision table definition. This value is available in API version 51.0 and later.</li> <li>• <code>refreshDecisionTable</code>—Refreshes the decision table cache. This value is available in API version 51.0 and later.</li> </ul> <p>These values are for the Batch Management jobs.</p> <ul style="list-style-type: none"> <li>• <code>batchJobAction</code>—Runs the batch management jobs definitions. This value is available in API version 51.0 and later.</li> <li>• <code>submitFailedRecordsBatchJob</code>—Resubmits an existing batch job with failed records for processing. This value is available in API version 52.0 and later.</li> </ul> <p>This value is for Data Processing Engine.</p> <ul style="list-style-type: none"> <li>• <code>dataProcessingEngineAction</code>—Runs the data processing engine definitions. This value is available in API version 51.0 and later.</li> </ul> <p>This value is used for Einstein Visit Recommendation.</p> <ul style="list-style-type: none"> <li>• <code>saveRecommendationDecision</code>—Save visit and task recommendation decisions. If no version is specified, the value is available in API version 52.0 and later.</p> <ul style="list-style-type: none"> <li>• <code>addWorkPlans</code>—Creates work plan and work step objects from the work plan library.</li> <li>• <code>addWorkSteps</code>—Creates work step objects from the work plan library.</li> <li>• <code>deleteWorkPlans</code>—Deletes all the work plans and work steps associated with a work order or work order line item.</li> <li>• <code>generateWorkPlans</code>—Generates work plans based off rules defined in the work plan library.</li> </ul> <p>For values used in Intelligent Form Reader, see Flow for Intelligent Form Reader.</p>

Field Name	Field Type	Description
		<p>For values used in Intelligent Document Reader, see <a href="#">Flow for Intelligent Document Reader</a>.</p> <p>This value is used in Public Sector Solutions.</p> <ul style="list-style-type: none"> <li><code>createBenefitDisbursement</code>—Creates a benefit disbursement for an eligible benefit assignment. This value is available in API version 57.0 and later.</li> <li><code>runRecordAggrBatchProcDef</code>—Runs a Data Processing Engine definition to process an asynchronous batch job that creates or updates record aggregation results. This value is available in API version 59.0 and later.</li> </ul> <p>For values used in Net Zero Cloud, see <a href="#">Flow for Net Zero Cloud</a>.</p> <p>For values used in Asset Lifecycle, see <a href="#">Flow for Asset Lifecycle</a>.</p> <p>For values used in Salesforce Pricing, see <a href="#">Flow for Salesforce Pricing</a>.</p> <p>For values used in Dynamic Revenue Orchestrator, see <a href="#">Flow for Dynamic Revenue Orchestrator</a>.</p> <p>For values used in Product Discovery, see <a href="#">Flow for Product Discovery</a>.</p> <p>For values used in Rate Management, see <a href="#">Flow for Rate Management</a>.</p> <p>For values used in Quote and Order Capture, see <a href="#">Flow for Quote and Order Capture</a>.</p> <p>For values used in Billing, see <a href="#">Flow for Billing</a>.</p> <p>This value is used in Einstein generative AI features.</p> <ul style="list-style-type: none"> <li><code>generatePromptResponse</code>—Generates a response based on the large language model (LLM) response for the specified prompt template and inputs. This value is available in API version 60.0 and later.</li> </ul> <p>These values are used in Einstein Bots. If no version is specified, the value is available in API version 56.0 and later.</p> <ul style="list-style-type: none"> <li><code>getDataCategoryDetails</code>—Gets the labels and API names for a specified data category associated with the Knowledge object and its child categories.</li> <li><code>getDataCategoryGroups</code>—Gets the labels and API names of the active data category groups associated with the Knowledge object that's visible to the current user.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>searchKnowledgeArticles</code>—Searches for knowledge articles with specified search terms, language, data category group, and data category.</li> </ul> <p>These values are reserved for future use.</p> <ul style="list-style-type: none"> <li>• <code>thanks</code></li> <li>• <code>metricRefresh</code></li> <li>• <code>exportSurveyResponses</code></li> </ul> <p>This value is used for Einstein Initiate Language Processing Action.</p> <ul style="list-style-type: none"> <li>• <code>initiateNaturalLangProcessing</code>—Create a record for the AI natural language processing result and initiate text processing by using the service specified in the related record. This value is available in API version 60.0 and later.</li> </ul> <p>This value is used in Media Cloud.</p> <ul style="list-style-type: none"> <li>• <code>velocity_cmt_MediaIntegrationProcedureInvocable</code>—Call an Integration Procedure from a Salesforce Flow to process media content. This value is available in API version 60.0 and later.</li> </ul> <p>These values are used in the Get Forecast Guidance flow.</p> <ul style="list-style-type: none"> <li>• <code>getForecastContext</code>—Gets the forecast context for a specified user. This value is available in API version 61.0 and later.</li> <li>• <code>getForecastOpportunities</code> — Gets forecast opportunities for a user that matches the specified criteria. This value is available in API version 61.0 and later.</li> </ul> <p>This value is used in the Get Opportunity Details flow.</p> <ul style="list-style-type: none"> <li>• <code>getRecPrioData</code>— Gets the record data and field metadata required to prioritize records. This value is available in API version 62.0 and later.</li> </ul> <p>This value is used in Einstein Case Classification flow.</p> <ul style="list-style-type: none"> <li>• <code>applyCaseClassificationRecommendations</code>—takes a Case ID as input and outputs a case SObject with recommendations applied. This value is available in API version 57.0 and later.</li> </ul>
<code>connector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute after this action call.
<code>dataTypeMappings</code>	Array of <a href="#">FlowDataTypeMapping</a> objects	An array of data type mappings for input and output values that have the generic sObject data type. This field is available in API version 48.0 and later.

Field Name	Field Type	Description
<code>faultConnector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute if the action call results in an error.
<code>flowTransactionModel</code>	FlowTransactionModel (enumeration of type string)	<p>Required. Specifies the transactional model for flows that execute invocable actions. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Automatic</code>—Creates a transaction if the invocable action supports it and there's pending DML.</li> <li>• <code>CurrentTransaction</code>—Keeps the invocable action running in the same transaction.</li> <li>• <code>NewTransaction</code>—Creates a transaction before the invocable action is executed.</li> </ul> <p>This field is available in API version 51.0 and later.</p>
<code>inputParameters</code>	Array of <a href="#">FlowActionCallInputParameter</a> objects	An array of input parameters from the flow to the action.
<code>isWaitUntilCompleted</code>	boolean	Specifies whether to pause the flow until the action is completed. This field is available in API version 61.0 and later.
<code>nameSegment</code>	string	Specifies the name of the versioned action. Supported only when <code>nameSegment</code> is specified. This field is available in API version 58.0 to 61.0. This field is deprecated in API version 62.0 and later.
<code>offset</code>	int	Specify the number of months, days, hours, or minutes to pause the flow while it waits for the action to be completed. This field is available in API version 61.0 and later.
<code>offsetUnit</code>	FlowScheduledPathOffsetUnit (enumeration of type string)	<p>Specify the time unit used to wait when the async action executes. Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>Months</code></li> <li>• <code>Days</code></li> <li>• <code>Hours</code></li> <li>• <code>Minutes</code></li> </ul> <p>This field is available in API version 61.0 and later.</p>
<code>outputParameters</code>	Array of <a href="#">FlowActionCallOutputParameter</a> objects	An array of output parameters from the action to the flow.
<code>storeOutputAutomatically</code>	boolean	<p>Indicates whether the action's output parameters are automatically available in the flow without creating any variables. When the value is <code>true</code>, you can reference an output parameter by specifying the API name of the Action element in the flow. The default value is <code>false</code>. When the value is <code>false</code>, create variables manually to store output values from the action.</p> <p>This field is available in API version 48.0 and later.</p>

Field Name	Field Type	Description
<code>timeoutConnector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute if an async action execution is timed out. This field is available in API version 62.0 and later.
<code>versionSegment</code>	int	Specifies the version of the versioned action. By default, the value is 1. Supported only when <code>versionSegment</code> is specified. This field is available in API version 58.0 to 61.0. This field is deprecated in API version 62.0 and later.
<code>versionString</code>	string	Reserved for future use.

## FlowActionCallInputParameter

Defines an input parameter from the flow to the action. It extends [FlowBaseElement](#) and inherits all its fields. This metadata type is available in API version 31.0 and later.

Field Name	Field Type	Description
<code>name</code>	string	Required. Unique name for the input parameter.
<code>value</code>	<a href="#">FlowElementReferenceOrValue</a>	Defines the value of the input parameter.

## FlowActionCallOutputParameter

Defines an output parameter from the action to the flow. It extends [FlowBaseElement](#) and inherits all its fields. This metadata type is available in API version 31.0 and later.

Field Name	Field Type	Description
<code>assignToReference</code>	string	Required. Specifies the variable to which you want to assign the output parameter value.
<code>name</code>	string	Required. Unique name for the output parameter.

## FlowApexPluginCall

Defines a call to an Apex plug-in from the flow. It extends [FlowNode](#) and inherits all its fields.

Field Name	Field Type	Description
<code>apexClass</code>	string	Required. The name of the Apex class.
<code>connector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute after this Apex plug-in call.
<code>faultConnector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute if the Apex plug-in call results in an error.
<code>inputParameters</code>	Array of <a href="#">FlowApexPluginCallInputParameter</a> objects	An array of input parameters from the flow to the Apex plug-in.

Field Name	Field Type	Description
outputParameters	Array of <a href="#">FlowApexPluginCallOutputParameter</a> objects	An array of output parameters from the Apex plug-in to the flow.

## FlowApexPluginCallInputParameter

Defines an input parameter from the flow to the Apex plug-in. It extends [FlowBaseElement](#) and inherits all its fields.

Field Name	Field Type	Description
name	string	Required. Unique name for the input parameter.
value	<a href="#">FlowElementReferenceOrValue</a>	Defines the value of the input parameter.

## FlowApexPluginCallOutputParameter

Defines an output parameter from the Apex plug-in to the flow. It extends [FlowBaseElement](#) and inherits all its fields.

Field Name	Field Type	Description
assignToReference	string	Required. Specifies the variable to which you want to assign the output parameter value.
name	string	Required. Unique name for the output parameter.

## FlowAssignment

Defines an assignment node that can dynamically change the value of a variable in the flow. It extends [FlowNode](#) and inherits all of its fields.

Field Name	Field Type	Description
assignmentItems	Array of <a href="#">FlowAssignmentItem</a> objects	An array of assignment operations that's executed in the given order, starting from the index 0.
connector	<a href="#">FlowConnector</a>	Specifies which node to execute after this assignment node.

## FlowAssignmentItem

Defines an operation to apply to a variable. It extends [FlowBaseElement](#) and inherits all its fields.

Field Name	Field Type	Description
assignToReference	string	Reference to the variable to which you want to apply the specified operator.

Field Name	Field Type	Description
operator	<a href="#">FlowAssignmentOperator</a> (enumeration of type string)	Operation to apply to the variable reference in the <code>assignToReference</code> field. For valid values, see <a href="#">FlowAssignmentOperator</a> .
value	<a href="#">FlowElementReferenceOrValue</a>	Defines the value that you want the operator to apply to the variable reference in the <code>assignToReference</code> field.

## FlowAssignmentOperator

An enumeration of type string that specifies the operation to apply to the variable in the `assignToReference` field. See “[Flow Operators in Assignment Elements](#)” in Salesforce Help.

These values are valid.

Enumeration Value	Description
Add	<p>When the <code>assignToReference</code> field is a variable of type number or currency, this operator adds the <code>value</code> to the variable.</p> <p>When the <code>assignToReference</code> field is a variable of type date, this operator adds the <code>value</code> in days to the variable.</p> <p>When the <code>assignToReference</code> field is a variable of type string, this operator appends the <code>value</code> to the end of the string.</p> <p>When the <code>assignToReference</code> field is a variable of type picklist, this operator appends the <code>value</code> to the end of the last item in the picklist.</p> <p>When the <code>assignToReference</code> field is a variable of type multipicklist, this operator appends the <code>value</code> to the end of the last item in the multi-select picklist. To instead add an item to the end of the multi-select picklist, use the <code>AddItem</code> operator.</p> <p>When the <code>assignToReference</code> field is the <code>\$Flow.ActiveStages</code> global variable, this operator appends the <code>value</code> as a new item at the end of <code>\$Flow.ActiveStages</code>.</p> <p>When the <code>assignToReference</code> field is a collection variable, this operator appends the <code>value</code> to the end of the collection. Support for a collection variable as the <code>value</code> is available in API version 43.0 and later, but only via Metadata API. From Flow Builder, you can't save an Assignment element that contains a collection variable in the Value column for the <code>Add</code> operator.</p> <p>The <code>Add</code> operator isn't supported when the <code>assignToReference</code> field is a variable of type boolean, <code>dateTime</code>, or <code>sObject</code>.</p>
AddAtStart	Supported only when the <code>assignToReference</code> field is a collection variable or the <code>\$Flow.ActiveStages</code> global variable. Adds the <code>value</code> as a new item at the beginning of the collection. When the <code>value</code> is a collection variable, the operator adds all items at the beginning of the collection. This operator is available in API version 43.0 and later.
AddItem	Supported only when the <code>assignToReference</code> field is a variable of type multipicklist. Adds the <code>value</code> to the picklist, including the semicolon that's required to mark a <code>value</code> as a separate item. This operator is available in API version 34.0 and later.

Enumeration Value	Description
Assign	Assigns the <code>value</code> to the variable in the <code>assignToReference</code> field.
AssignCount	Supported only when the <code>value</code> is a collection variable or the <code>\$Flow.ActiveStages</code> global variable. Counts the number of stages or items in the collection, and assigns that number to the variable in the <code>assignToReference</code> field. Corresponds to <code>equals count</code> in the user interface. This operator is available in API version 43.0 and later.
RemoveAfterFirst	Supported only when the <code>assignToReference</code> field is a collection variable or the <code>\$Flow.ActiveStages</code> global variable. Finds the first instance of the <code>value</code> within the variable in the <code>assignToReference</code> field. Removes everything after that first instance from the variable. This operator is available in API version 43.0 and later.
RemoveAll	Supported only when the <code>assignToReference</code> field is a collection variable or the <code>\$Flow.ActiveStages</code> global variable. Removes all instances of the <code>value</code> from the variable in the <code>assignToReference</code> field. When the <code>value</code> is a collection variable, the operator removes all instances of each item from the variable in the <code>assignToReference</code> field. This operator is available in API version 43.0 and later.
RemoveBeforeFirst	Supported only when the <code>assignToReference</code> field is a collection variable or the <code>\$Flow.ActiveStages</code> global variable. Finds the first instance of the <code>value</code> within the variable in the <code>assignToReference</code> field. Removes everything before that first instance from the variable. This operator is available in API version 43.0 and later.
RemoveFirst	Supported only when the <code>assignToReference</code> field is a collection variable or the <code>\$Flow.ActiveStages</code> global variable. Removes the first instance of the <code>value</code> from the variable in the <code>assignToReference</code> field. This operator is available in API version 43.0 and later.
RemovePosition	Supported only when the <code>assignToReference</code> field is a collection variable or the <code>\$Flow.ActiveStages</code> global variable. Removes the item at the specified position. For example, if the collection contains three items, such as Red, Green, and Blue, and the <code>value</code> is 2, the second item, Green, is removed from the collection variable. This operator is available in API version 43.0 and later.  Make sure that the <code>value</code> at run time is a positive integer within the range of the number of items in the collection variable.
RemoveUncommon	Supported only when <code>assignToReference</code> and <code>value</code> are both collection variables. Keeps items that are in both collections and removes the rest from the collection variable in the <code>assignToReference</code> field. This operator is available in API version 43.0 and later.
Subtract	Supported only when the <code>assignToReference</code> field is a variable of type currency, date, or number.  When the <code>assignToReference</code> field is a variable of type number or currency, this operator subtracts the <code>value</code> from the variable.  When the <code>assignToReference</code> field is a variable of type date, this operator subtracts the <code>value</code> in days from the variable.

## FlowBaseElement

Base class for all flow elements that require contextual information in metadata values. This class is an abstract class. FlowBaseElement is available in API version 32.0 and later.

Field Name	Field Type	Description
processMetadataValues	Array of <a href="#">FlowMetadataValue</a> objects	Contextual information for the element.

## FlowChoice

A choice resource is a standalone choice option that you can reference or reuse throughout the flow. It extends [FlowElement](#) and inherits all of its fields.

Field Name	Field Type	Description
choiceText	string	Required. Choice label to display in the screen.
dataType	FlowDataType (enumeration of type string)	Required. Valid types are: <ul style="list-style-type: none"> <li>• Currency</li> <li>• Date</li> <li>• Number</li> <li>• String</li> <li>• Boolean</li> </ul>
userInput	<a href="#">FlowChoiceUserInput</a>	Enables the choice to allow user input when the choice is selected. Not supported for choices in multi-select fields.
value	<a href="#">FlowElementReferenceOrValue</a>	Actual value that's used during flow execution, for example, in assignments, calls to Apex plug-ins, and record elements. If null, this choice always has the value of null.

## FlowChoiceUserInput

Allows the choice to include a user input field that appears when the user selects a choice. User input isn't supported for choices in multi-select fields. It extends [FlowBaseElement](#) and inherits all its fields.

Field Name	Field Type	Description
isRequired	boolean	Indicates whether users are required to enter something into the field when they select the choice.
promptText	string	Text that's displayed to prompt the user for input at runtime. Supports merge fields.
validationRule	<a href="#">FlowInputValidationRule</a>	A rule used at runtime to validate the user input.

## FlowCollectionProcessor

Defines a node that processes the contents of a collection, depending on the `collectionProcessorType`. `FlowCollectionProcessor` is available in API version 50.0 and later. `FlowCollectionProcessor` extends `FlowNode` and inherits all its fields.

Field Name	Field Type	Description
<code>assignNextValueToReference</code>	string	The name of the variable that's assigned to the next value of the collection.
<code>collectionProcessorType</code>	<code>FlowCollectionProcessorType</code>	The type of the collection processor. Valid values are: <ul style="list-style-type: none"> <li><code>SortCollectionProcessor</code>—This value is available in API version 50.0 and later.</li> <li><code>RecommendationMapCollectionProcessor</code>—This value is available in API version 53.0 and later.</li> <li><code>FilterCollectionProcessor</code>— This value is available in API version 53.0 and later.</li> </ul>
<code>collectionReference</code>	string	The collection being sorted, filtered, or assigned to recommendations.
<code>conditionLogic</code>	string	Defines how the filtering conditions are evaluated. Valid values are: <ul style="list-style-type: none"> <li>And</li> <li>Or</li> <li>Custom logic, such as (1 AND (2 OR 3))</li> <li>Formula</li> </ul>
<code>conditions</code>	Array of <a href="#">FlowCondition</a> objects	An array of conditions for the input collection.
<code>connector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute after processing the collection.
<code>formula</code>	string	The formula expression that filters the input collection. If the formula evaluates to <code>true</code> , the record is added to the output collection.
<code>limit</code>	int	The maximum number of records to include in the generated collection. There's no default value. All items of the collection are kept if it's greater than the size of the collection.  If <code>sortField</code> and <code>sortOrder</code> are also specified, the records are sorted before the limit takes effect.  This field is available in API version 51.0 and later.  This field is nillable in API version 51.0 and later.
<code>mapItems</code>	Array of <a href="#">FlowCollectionMapItem</a> objects	The rules to map each field of the collection variable.
<code>outputObjectType</code>	string	The sObject type of the output collection.

Field Name	Field Type	Description
<code>sortOptions</code>	Array of <a href="#">FlowCollectionSortOption</a> objects	An array of options to sort the items in the collection. This field is available in API version 51.0 and later.

## FlowCollectionSortOption

Sets the sorting field, sort order, and placement of empty or null values in the sorted collection. This metadata type is available in API version 51.0 and later.

Field Name	Field Type	Description
<code>desPlaceEmptyStringAndNullFirst</code>	boolean	Place empty or null values first in the sorted list by setting this value to <code>true</code> . The default value is <code>false</code> .
<code>sortField</code>	string	Determines the sorting of records that meet the filter criteria. Required for record collections and collections of Apex-defined variables.  If the collection is a primitive data type, such as a list of string or integer values, <code>sortField</code> isn't supported.
<code>sortOrder</code>	SortOrder (enumeration of type string)	The order that the collection is sorted in. Valid values are: <ul style="list-style-type: none"> <li>• <code>Asc</code>—Ascending</li> <li>• <code>Desc</code>—Descending</li> </ul>

## FlowCondition

Defines a condition for a rule. It extends [FlowBaseElement](#) and inherits all its fields.

Field Name	Field Type	Description
<code>aggregationOperator</code>	string	Operation to apply to the variable reference in the <code>assignToReference</code> field. The valid value is: <ul style="list-style-type: none"> <li>• <code>Count</code></li> </ul>
<code>conditionLogic</code>	string	Specifies logic for the conditions. Value can be: <ul style="list-style-type: none"> <li>• <code>and</code>—Evaluates to <code>true</code> only if all its conditions evaluate to true</li> <li>• <code>or</code>—Evaluates to <code>true</code> if any of its conditions evaluate to true</li> </ul>
<code>conditionType</code>	FlowWaitConditionType (enumeration of type string)	The type of condition that a requirement in an automation is used for. Valid values are: <ul style="list-style-type: none"> <li>• <code>Container</code></li> <li>• <code>EntryCondition</code></li> <li>• <code>ExitCondition</code></li> </ul>

Field Name	Field Type	Description
conditions	Array of <a href="#">FlowCondition</a> objects	An array of conditions that must be <code>true</code> for the flow to execute the rule.
leftValueReference	string	Required. Unique name of the element that serves as the left side of the condition expression.
operator	<a href="#">FlowComparisonOperator</a> (enumeration of type string)	Required. Comparison operators in conditions for flow elements and resources. Valid values are: <ul style="list-style-type: none"> <li>• <code>Contains</code></li> <li>• <code>EndsWith</code></li> <li>• <code>EqualTo</code></li> <li>• <code>GreaterThan</code></li> <li>• <code>GreaterThanOrEqualTo</code></li> <li>• <code>In</code>— This value is available in API version 56.0 and later.</li> <li>• <code>IsBlank</code>—A text value with zero characters or with only whitespace. Use to determine whether a text field or variable is blank. For other data type values, use to determine whether a field or variable is null. This value is available in API version 61.0 and later.</li> <li>• <code>IsChanged</code>— This value is available in API version 52.0 and later.</li> <li>• <code>IsEmpty</code>—An empty collection. This value is available in API version 61.0 and later.</li> <li>• <code>IsNull</code>—A value that is either not set or references no value. Use to determine whether a field or variable value is set to no value.</li> <li>• <code>LessThan</code></li> <li>• <code>LessThanOrEqualTo</code></li> <li>• <code>None</code>— Save a flow with an incomplete condition, so you can finish building the flow later. This value is available in API version 58.0 and later.</li> <li>• <code>NotEqualTo</code></li> <li>• <code>NotIn</code>— This value is available in API version 56.0 and later.</li> <li>• <code>StartsWith</code></li> <li>• <code>WasSelected</code>— Requires a choice on the left side.</li> <li>• <code>WasSet</code>— This value is available in API version 30.0 and later.</li> <li>• <code>WasVisited</code>— Requires a node on the left side.</li> </ul>
rightValue	<a href="#">FlowElementReferenceOrValue</a>	Unique name of an element or the actual value, such as text or a number, for the right side of the condition expression.

## FlowConnector

Connectors determine the order in which the nodes of the flow are executed. A connector defines and links to the subsequent node. It extends [FlowBaseElement](#) and inherits all its fields.

Field Name	Field Type	Description
<code>isGoTo</code>	boolean	Make the connector a Go To Connector by setting this value to <code>true</code> . The default value is <code>false</code> . This value is available in API version 53.0 and later. See <a href="#">Flow Connectors</a> .
<code>targetReference</code>	string	Required. Which node to execute after completing the current node.

## FlowCollectionMapItem

Defines the rule to assign a value to the field reference. This metadata type is available in API version 51.0 and later.

Field Name	Field Type	Description
<code>assignToFieldReference</code>	string	Required. Specifies the reference to the field to which the specified operator is applied.
<code>operator</code>	<a href="#">FlowAssignmentOperator</a> (enumeration of type string)	Required. Applies to the variable reference in the <code>assignToFieldReference</code> field.
<code>value</code>	<a href="#">FlowElementReferenceOrValue</a>	Required. Defines the value that the operator applies to the variable reference in the <code>assignToFieldReference</code> field.

## FlowDataTypeMapping

This data type mapping defines the specific sObject data type for input and out values that have the generic sObject data type. It extends [FlowBaseElement](#) and inherits all its fields. This metadata type is available in API version 48.0 and later.

Field Name	Field Type	Description
<code>apexClass</code>	string	The name of the Apex class. This field is available in API version 61.0 and later.
<code>typeName</code>	string	Required. API name of the input or output variable. The <code>T__</code> prefix is required for input variables. The <code>U__</code> prefix is required for output variables. For example, <code>T__inputCollection</code> represents the API name of the input variable <code>inputCollection</code> .
<code>typeValue</code>	string	API name of the specific sObject data type that this value maps to. For example, <code>Account</code> .

## FlowConstant

A constant resource defines a fixed value that can be used throughout your flow. It extends [FlowElement](#) and inherits all its fields.

Field Name	Field Type	Description
<code>dataType</code>	<code>FlowDataType</code> (enumeration of type string)	Required. Valid types are: <ul style="list-style-type: none"> <li>• Currency</li> <li>• Date</li> <li>• Number</li> <li>• String</li> <li>• Boolean</li> </ul>
<code>value</code>	<a href="#">FlowElementReferenceOrValue</a>	Default value of the constant. This field can't have merge fields, nor can it reference another resource besides <code>\$GlobalConstant.EmptyString</code> .

## FlowDecision

A node that evaluates a set of rules and routes the flow execution based on the first rule that evaluates to true. It extends [FlowNode](#) and inherits all its fields.

Field Name	Field Type	Description
<code>defaultConnector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute if none of the rules evaluate to true.
<code>defaultConnectorLabel</code>	string	Label for the default connector.
<code>rules</code>	Array of <a href="#">FlowRule</a> objects	An array of rules for the decision. The rules are evaluated in the order that they're listed, and the connector of the first true rule is used. If no rules are true, then the default connector is used. In Flow Builder, rules are referred to as decision outcomes.

## FlowDynamicChoiceSet

Retrieves data or metadata from an object and dynamically generates a set of choices at run time. It extends [FlowElement](#) and inherits all its fields. Depending on the fields that are set, this element represents a record choice or a picklist choice.

- A *record choice* dynamically generates choices based on records that meet specified filter criteria. If a dynamic choice doesn't have the `picklistField` and `picklistObject` parameters set, it's a record choice and it can't have a data type of `Picklist` or `Multipicklist`.
- A *picklist choice* dynamically generates choices based on the available values for a picklist or multi-select picklist field. If a dynamic choice has the `picklistField` and `picklistObject` parameters set, it's a picklist choice and it must have a data type of `Picklist` or `Multipicklist`.

Field Name	Field Type	Description
<code>collectionReference</code>	string	The collection that's used to generate choices. This field is available in API version 54.0 and later.
<code>dataType</code>	FlowDataType (enumeration of type string)	<p>Required. Valid types are:</p> <ul style="list-style-type: none"> <li>• Boolean</li> <li>• Currency</li> <li>• Date</li> <li>• Multipicklist—Picklist choices only</li> <li>• Number</li> <li>• Picklist—Picklist choices only</li> <li>• Record</li> <li>• String</li> </ul> <p>Picklist and Multipicklist are available in API version 35.0 and later. Record is available in API version 54.0 and later.</p>
<code>displayField</code>	string	<p>Required for record choices. Specifies the object field. The values of the object field are displayed to the user as choice labels for selecting a record.</p> <p>For example, for an account, if you want the dynamically generated choices to be displayed as the account names from the records that are retrieved from the database, specify Name in <code>displayField</code>.</p> <p>Not supported for picklist choices. Picklist choices always display the labels for the retrieved picklist values.</p>
<code>filters</code>	Array of <a href="#">FlowRecordFilter</a> objects	<p>An array of filters to apply to the records retrieved from the database. For example, filter accounts to include only the accounts that were created in the past three months.</p> <p>Not supported for picklist choices.</p>
<code>limit</code>	int	<p>Maximum number of choices to include in the generated set of choices. Maximum and default: 200.</p> <p>If <code>sortField</code> and <code>sortOrder</code> are also specified, the records are sorted before the <code>limit</code> takes effect.</p> <p>This field is available in API version 25.0 and later.</p> <p>This field is nillable in API version 45.0 and later.</p>
<code>object</code>	string	Required for record choices. The object whose fields you want to retrieve from the database and use to generate the set of choices. For example, use "Account" to dynamically generate choices from the information in account records in the database.

Field Name	Field Type	Description
		Not supported for picklist choices.
<code>outputAssignments</code>	Array of <a href="#">FlowOutputFieldAssignment</a> objects	An array that assigns fields from the user-selected record to variables that can be used elsewhere in the flow. For example, when the user selects an account name from the dynamically generated list of choice options, <code>outputAssignments</code> can assign the ID and <code>AnnualRevenue</code> from the user-selected account to variables that you specify.  Not supported for picklist choices.
<code>picklistField</code>	string	Required for picklist choices. The field whose available values you want to retrieve from the database and use to generate the picklist choice. For example, use "Industry" to dynamically generate one choice for each available value on the Industry picklist field.  Not supported for record choices.  This field is available in API version 35.0 and later.
<code>picklistObject</code>	string	Required for picklist choices. The object whose field metadata you want to retrieve from the database and use to generate the picklist choice. For example, use "Account" to dynamically generate choices from a picklist field on the Account object.  Not supported for record choices.  This field is available in API version 35.0 and later.
<code>sortField</code>	string	Field that's used for sorting records that meet the filter criteria. If this field isn't specified, the returned records aren't sorted.  You can only sort records by fields that have the <code>Sort</code> API field property, as specified in <a href="#">SOAP API</a> .  Not supported for picklist choices.  This field is available in API version 25.0 and later.
<code>sortOrder</code>	SortOrder (enumeration of type string)	Order in which to sort the records. If this field isn't specified, then the results aren't sorted.  Valid values are: <ul style="list-style-type: none"> <li>• <code>Asc</code>—Ascending</li> <li>• <code>Desc</code>—Descending</li> </ul> Not supported for picklist choices.  This field is available in API version 25.0 and later.

Field Name	Field Type	Description
valueField	string	<p>Stored value for the choice, which can differ from what is displayed to the user as the choice options (<code>displayField</code>). For example, the <code>displayField</code> could be the account "Name" while the <code>valueField</code> is the account "Id."</p> <p>Not supported for picklist choices. Picklist choices always store the API value for the retrieved picklist values.</p>

## FlowElement

Base class for all flow elements. This class is an abstract class. It extends [FlowBaseElement](#) and inherits all its fields.

Field Name	Field Type	Description
description	string	Description of the flow element.
name	string	Unique name of the flow element.

## FlowElementReferenceOrValue

Defines a reference to an existing element or a particular value that you specify. Make sure that you specify only *one* of the fields.

Field Name	Field Type	Description
apexValue	string	Use this field to specify a JSON response value of an Apex-defined record. Use this field only for <code>FlowScreenFieldInputParameter</code> and <code>FlowActionCallInputParameter</code> . If you want to specify a different data type or element reference, don't use this field.
booleanValue	boolean	Use this field to specify a boolean value. If you want to specify a different data type or element reference, don't use this field.
dateTimeValue	dateTime	Use this field to specify a dateTime value. If you want to specify a different data type or element reference, don't use this field. This field is available in API version 30.0 and later.
dateValue	date	Use this field to specify a date value. If you want to specify a different data type or element reference, don't use this field.
elementReference	string	Use this field to specify the name of an existing flow resource. If you want to specify a value instead of an element reference, don't use this field.
formulaDataType	FlowDataType (enumeration of string)	<p>Use this field to specify the formula result's data type of the transformed data. Corresponds to the target data field in Flow Builder. This field requires the <code>formulaExpression</code> field. This field is available in API version 59.0 and later. See <a href="#">FlowTransform</a></p> <p>Valid values are:</p>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• Apex</li> <li>• Boolean</li> <li>• Currency</li> <li>• Date</li> <li>• DateTime</li> <li>• Number</li> <li>• String</li> <li>• sObject—This value corresponds to a record variable.</li> </ul>
<code>formulaExpression</code>	string	Use this field to specify the formula expression that transforms the data in the flow. In Flow Builder, it corresponds to the target data field in the Transform element. This field requires the <code>formulaDataType</code> field. This field is available in API version 59.0 and later. See <a href="#">FlowTransform</a> .
<code>numberValue</code>	double	Use this field to specify a double value. If you want to specify a different data type or element reference, don't use this field.
<code>setupReference</code>	string	Use this field to specify the name of an existing setup reference. Required for Omni-Channel elements. If you want to specify a value instead of a setup reference, don't use this field. Required when <code>setupReferenceType</code> is specified.
<code>setupReferenceType</code>	string	Use this field to specify the type of setup reference. Required when <code>setupReference</code> is specified.
<code>sobjectValue</code>	string	Use this field to specify a JSON response value of an sObject record. Use this field only for <code>FlowScreenFieldInputParameter</code> and <code>FlowActionCallInputParameter</code> . If you want to specify a different data type or element reference, don't use this field.
<code>stringValue</code>	string	Use this field to specify a string value. If you want to specify a different data type or element reference, don't use this field.  When the <a href="#">FlowMetadataValue</a> 's <code>name</code> field is set to <code>BuilderType</code> or <code>OriginalBuilderType</code> , the valid value is <code>LightningFlowBuilder</code> . The value is reserved for internal use.
<code>transformValueReference</code>	string	Reserved for future use.

## FlowExitRule

Defines the conditions and logic that enables an exit rule to evaluate to true. It extends [FlowElement](#) and inherits all of its fields.

Field Name	Field Type	Description
<code>conditions</code>	Array of <a href="#">FlowCondition</a> objects	An array of conditions for the exit rule.

Field Name	Field Type	Description
label	string	Required. Label for the exit rule.
logicalOperator	string	Required. Logical operator in conditions for the exit rule. Valid values are: <ul style="list-style-type: none"> <li>and—Evaluates to <code>true</code> only if all its conditions evaluate to <code>true</code></li> <li>or—Evaluates to <code>true</code> if any of its conditions evaluate to <code>true</code></li> </ul>
ruleOrder	int	Indicates how the exit rule is ordered against other exit rules. The <code>ruleOrder</code> value must be unique within the flow.

## FlowExperiment

A node that routes the flow execution based on a specified experiment distribution percentage. It extends [FlowNode](#) and inherits all its fields. This metadata type is available in API version 61.0 and later.

Field Name	Field Type	Description
paths	<a href="#">FlowExperimentPath</a> []	An array of flow experiment paths.
type	FlowExperimentType	Required. The type of experiment. Valid value is: <ul style="list-style-type: none"> <li>Random</li> </ul>

## FlowExperimentPath

Defines an experiment path. It extends [FlowElement](#) and inherits all its fields. This metadata type is available in API version 61.0 and later.

Field Name	Field Type	Description
connector	<a href="#">FlowConnector</a>	Specifies which node to execute after this experiment path.
label	string	Required. Label for the path.
percentage	int	Required. The distribution percentage for this path.

## FlowFormula

Calculates a value using functions and elements in the flow. It extends [FlowElement](#) and inherits all its fields.

Field Name	Field Type	Description
dataType	FlowDataType (enumeration of type string)	The data type for the formula. Valid values are: <ul style="list-style-type: none"> <li>Boolean</li> <li>Currency</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>Date</li> <li>DateTime</li> <li>Number</li> <li>String</li> </ul> <p><code>dataType</code> defaults to <code>Number</code> if it isn't defined in a formula.</p> <p>This field is available in API version 31.0 and later.</p>
<code>expression</code>	string	Required. Salesforce formula expression. The return value must match the data type. For API version 30.0 and earlier, the return value must be numeric.
<code>scale</code>	int	Scale of the return value, specifically, the number of digits to the right of the decimal point. Available only when the data type is <code>Number</code> or <code>Currency</code> . Corresponds to the <code>Decimal Places</code> field in Flow Builder.

## FlowInputFieldAssignment

Assigns the value for a record field based on a resource or static value. It extends [FlowBaseElement](#) and inherits all its fields.

Field Name	Field Type	Description
<code>field</code>	string	Required. The name of the field to assign a value to when a record is created or updated.
<code>value</code>	<a href="#">FlowElementReferenceOrValue</a>	The value to assign to the field.

## FlowInputValidationRule

Validation rules verify that the data entered by the user meets the specified requirements. If the validation rule evaluates to false, then the specified error message is displayed.

Field Name	Field Type	Description
<code>errorMessage</code>	string	Required. The error message to display when <code>formulaExpression</code> is false.
<code>formulaExpression</code>	string	Required. A formula that's used to validate the user input.

## FlowLoop

A construct for iterating through a collection. It extends [FlowNode](#) and inherits all its fields. `FlowLoop` is available in API version 30.0 and later.

Field Name	Field Type	Description
<code>assignNextValueToReference</code>	string	The variable that's assigned to the current value in the collection before navigating to the target of <code>nextValueConnector</code> .
<code>collectionReference</code>	string	The collection being looped through.
<code>iterationOrder</code>	iterationOrder (enumeration of type string)	Valid values are: <ul style="list-style-type: none"> <li>• <code>Asc</code>—Iterate through the collection in the order the values are listed (first to last).</li> <li>• <code>Desc</code>—Iterate through the collection in the reverse order the values are listed (last to first).</li> </ul>
<code>nextValueConnector</code>	<a href="#">FlowConnector</a>	A reference to the next element in the collection.
<code>noMoreValuesConnector</code>	<a href="#">FlowConnector</a>	The element to navigate to when all entries in the collection have been iterated through.

## FlowMetadataValue

Defines contextual information that can be passed between elements in a flow. Flow metadata values can be used in an application that produces or consumes flows. `FlowMetadataValue` is available in API version 31.0 and later.

Field Name	Field Type	Description
<code>name</code>	string	Required. Name for the metadata value. This name doesn't need to be unique across all elements.
<code>value</code>	<a href="#">FlowElementReferenceOrValue</a>	Reference or value for the metadata value.

## FlowNode

A node is a type of element that's visible in the flow diagram. It extends [FlowElement](#) and inherits all its fields.

Field Name	Field Type	Description
<code>elementSubtype</code>	FlowElementSubtype (enumeration of type string)	Reserved for internal use.
<code>label</code>	string	Name of the node. This non-unique label is different from the unique name of the node, which is inherited from <a href="#">FlowElement</a> .
<code>locationX</code>	int	Required. Horizontal location of the node, in pixels from the left.
<code>locationY</code>	int	Required. Vertical location of the node, in pixels from the top.

## FlowOrchestratedStage

A stage node that contains steps in an orchestration. It extends [FlowNode](#) and inherits all its fields. This metadata type is available in API version 53.0 and later.

Field Name	Field Type	Description
<code>connector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute after this stage.
<code>exitActionInputParameters</code>	Array of <a href="#">FlowStageStepExitActionInputParameter</a> objects	An array of input parameters from the stage to the evaluation flow. These parameters specify an exit condition for the stage.
<code>exitActionName</code>	string	The name of the evaluation flow used as an exit condition for the stage.
<code>exitActionOutputParameters</code>	Array of <a href="#">FlowStageStepExitActionOutputParameter</a> objects	An array of output parameters from the evaluation flow to the stage. These parameters specify an exit condition for the stage.
<code>exitActionType</code>	InvocableActionType (enumeration of type string)	The type of the evaluation flow for the custom exit condition. Valid values are: <ul style="list-style-type: none"> <li>• <code>EvaluationFlow</code></li> <li>• <code>createFieldGnrnPromptTplResp</code></li> </ul>
<code>exitConditionLogic</code>	string	Defines how the stage exit conditions are evaluated. Valid values are: <ul style="list-style-type: none"> <li>• <code>And</code></li> <li>• <code>Or</code></li> <li>• Custom logic, such as <code>(1 AND (2 OR 3))</code></li> <li>• <code>Formula</code></li> </ul>
<code>exitConditions</code>	Array of <a href="#">FlowCondition</a> objects	An array of requirements that must be met to exit the stage.
<code>faultConnector</code>	<a href="#">FlowConnector</a>	Not used.
<code>runAsUser</code>	boolean	Indicates whether an asynchronous background step is run in the context of the user who completed the most recently completed interactive step.
<code>stageSteps</code>	Array of <a href="#">FlowStageStep</a> objects	An array of stage step resources.

## FlowOutputFieldAssignment

Assigns a record field's value to a variable that can be used elsewhere in the flow. It extends [FlowBaseElement](#) and inherits all its fields.

Field Name	Field Type	Description
<code>assignToReference</code>	string	Required. Reference to the variable where you want to store the value of the record field.
<code>field</code>	string	Required. Name of the field whose value is to be assigned after a record lookup.

## FlowRecordCreate

Create a record in the database using values from the flow. It extends [FlowNode](#) and inherits all its properties.

 **Note:** The flow record `create`, `lookup`, `update`, and `delete` operations are different from the CRUD-based metadata calls `create()`, `retrieve()`, `update()`, and `delete()`. The flow record methods apply to record operations from within a flow, which aren't the same as doing any metadata calls to CRUD setup entities.

Field Name	Field Type	Description
<code>assignRecordIdToReference</code>	string	Reference to the variable where you want to store the ID after the record is created.
<code>connector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute after creating the record.
<code>doesUpsert</code>	boolean	Indicates whether the element creates or updates records. The default value is <code>false</code> , indicating that the element only creates records. This field is available in API version 62.0 and later.
<code>doesUpsertAllOrNone</code>	boolean	Indicates whether the element creates or updates records only if all records are created or updated successfully. If set to <code>true</code> and a record fails, then the transaction rolls back and no records are created or updated.  If set to <code>false</code> , the transaction creates or updates only the records that are successful. The default value is <code>true</code> . This field is available in API version 62.0 and later.
<code>faultConnector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute if the attempt to create a record results in an error.
<code>filterLogic</code>	string	The filter logic applied to the filter condition requirements. To require all conditions, use <code>AND</code> . To require any conditions, use <code>OR</code> . For custom condition logic, enter the entire logic string. For example, <code>1 AND 2 OR (3 AND 4)</code> .  This field is available in API version 61.0 and later.
<code>filters</code>	Array of <a href="#">FlowRecordFilter</a> objects	An array that specifies the criteria to select which records to create or update in the database.  This field is available in API version 61.0 and later.

Field Name	Field Type	Description
<code>inputAssignments</code>	Array of <a href="#">FlowInputFieldAssignment</a> objects	An array that assigns values to the specified fields of the record being created.
<code>inputReference</code>	string	Specifies the record variable whose field values are used to populate the new record's fields.
<code>object</code>	string	Required. The object type that the element creates.
<code>operationMultMatchingRecords</code>	string	<p>The operation to perform if multiple matching records are found. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>None</code></li> <li>• <code>UpdateAllRecords</code></li> <li>• <code>UpdateLatestRecord</code></li> </ul> <p>This field is available in API version 61.0 and later.</p>
<code>operationOneMatchingRecord</code>	string	<p>The operation to perform if one matching record is found. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>None</code></li> <li>• <code>UpdateAllRecords</code></li> </ul> <p>This field is available in API version 61.0 and later.</p>
<code>operationZeroMatchingRecords</code>	string	<p>The operation to perform if no matching records are found. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>None</code></li> </ul> <p>This field is available in API version 61.0 and later.</p>
<code>storeOutputAutomatically</code>	boolean	<p>Indicates whether the record ID is automatically available in the flow without creating any variables. When the value is <code>true</code>, you can reference the record ID by specifying the API name of the Create Records element in the flow. The default value is <code>false</code>. When the value is <code>false</code>, create a variable to store the record ID.</p> <p>This field is available in API version 48.0 and later.</p>
<code>upsertExternalIdField</code>	string	<p>If <code>doesUpsert</code> is <code>true</code>, specifies the external ID field on the record. You can provide a value for this property or for the Upsert Standard ID Field property, but not both. This field is available in API version 62.0 and later.</p>
<code>upsertStandardIdField</code>	string	<p>If <code>doesUpsert</code> is <code>true</code>, specifies the standard ID field like Account ID on the object. You can provide a value for this property or for the Upsert External ID Field property, but not both. This field is available in API version 62.0 and later.</p>

## FlowRecordDelete

Deletes one or more records in the database. It extends [FlowNode](#) and inherits all its fields.

 **Note:** The flow record `create`, `lookup`, `update`, and `delete` operations are different from the CRUD-based metadata calls `create()`, `retrieve()`, `update()`, and `delete()`. The flow record methods apply to record operations from within a flow, which aren't the same as doing any metadata calls to CRUD setup entities.

Field Name	Field Type	Description
<code>connector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute after deleting the record.
<code>faultConnector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute if the attempt to delete a record results in an error.
<code>filters</code>	Array of <a href="#">FlowRecordFilter</a> objects	An array that specifies the criteria used to select which records to delete from the database. For example, delete accounts whose last activity was older than a specified date.
<code>inputReference</code>	string	Specifies the record variable whose record ID is used to identify which record to delete in the database.
<code>object</code>	string	Required. The name of the object whose records are deleted.

## FlowRecordFilter

Sets the criteria for searching records in the database. It extends [FlowBaseElement](#) and inherits all its fields.

Field Name	Field Type	Description
<code>field</code>	string	Required. The field to be used for filtering records.
<code>operator</code>	<a href="#">FlowRecordFilterOperator</a> (enumeration of type string)	Required. Valid values are: <ul style="list-style-type: none"> <li>• <code>EqualTo</code></li> <li>• <code>NotEqualTo</code></li> <li>• <code>GreaterThan</code></li> <li>• <code>LessThan</code></li> <li>• <code>GreaterThanOrEqualTo</code></li> <li>• <code>LessThanOrEqualTo</code></li> <li>• <code>StartsWith</code></li> <li>• <code>EndsWith</code></li> <li>• <code>Contains</code></li> <li>• <code>IsNull</code></li> </ul>
<code>value</code>	<a href="#">FlowElementReferenceOrValue</a>	Reference or value used with the field and operator to filter records.

## FlowRecordLookup

Finds records in the database and stores their field values in the flow. Corresponds to a Get Records element in Flow Builder. It extends [FlowNode](#) and inherits all its fields.

 **Note:** The flow record `create`, `lookup`, `update`, and `delete` operations are different from the CRUD-based metadata calls `create()`, `retrieve()`, `update()`, and `delete()`. The flow record methods apply to record operations from within a flow, which aren't the same as doing any metadata calls to CRUD setup entities.

Field Name	Field Type	Description
<code>assignNullValuesIfNoRecordsFound</code>	boolean	Specifies that all values are set to <code>null</code> when no record is found. Supported only when <code>storeOutputAutomatically</code> is <code>false</code> .  This field is available in API version 30.0 and later.
<code>connector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute after getting records from the database.
<code>faultConnector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute if the attempt to get records results in an error.
<code>filterLogic</code>	string	The filter logic that's applied to the filter condition requirements. To require all conditions, use <code>AND</code> . To require any conditions, use <code>OR</code> . For custom condition logic, enter the entire logic string. For example, <code>1 AND 2 OR (3 AND 4)</code> . This field is available in API version 50.0 and later.
<code>filters</code>	Array of <a href="#">FlowRecordFilter</a> objects	An array that specifies the criteria used to select the record from the database.  If the filters return more than one record, they're sorted according to the specified <code>sortField</code> and <code>sortOrder</code> . If <code>outputReference</code> specifies a non-collection record variable or if <code>getFirstRecordOnly</code> is <code>true</code> , only the first record in the sorted list is selected.  If <code>sortField</code> or <code>sortOrder</code> isn't specified, records aren't returned in any particular order. If <code>outputReference</code> specifies a

Field Name	Field Type	Description
		non-collection record variable or if <code>getFirstRecordOnly</code> is <code>true</code> , only the first record in the unsorted list is selected.
<code>getFirstRecordOnly</code>	boolean	Indicates whether to store field values for only one record, even when multiple records meet the filter criteria. Supported only when <code>storeOutputAutomatically</code> is <code>true</code> . When <code>storeOutputAutomatically</code> is <code>false</code> , what determines whether one or multiple records are stored is whether <code>outputReference</code> specifies a record variable or a record collection variable.  This field is available in API version 47.0 and later.
<code>object</code>	string	Name of the object from which to select the record.
<code>outputAssignments</code>	Array of <a href="#">FlowOutputFieldAssignment</a> objects	An array that assigns fields from the selected record to variables that can be used elsewhere in the flow. Supported only when <code>storeOutputAutomatically</code> is <code>false</code> .
<code>outputReference</code>	string	Specifies the record variable or record collection variable that stores the queried fields' values. Supported only when <code>storeOutputAutomatically</code> is <code>false</code> .
<code>queriedFields</code>	Array of strings	An array that specifies which fields from the selected record are saved to the specified record variable.
<code>sortField</code>	string	The field that's used for sorting the records that meet the filter criteria. If this field isn't specified, the returned records aren't sorted.  You can only sort records by fields that have the <code>Sort</code> API field property, as specified in <a href="#">SOAP API</a> .

Field Name	Field Type	Description
		This field is available in API version 25.0 and later.
<code>sortOrder</code>	SortOrder (enumeration of type string)	Order in which to sort the records. If this field isn't specified, then the results aren't sorted.  Valid values are: <ul style="list-style-type: none"> <li>• <code>Asc</code>—Ascending</li> <li>• <code>Desc</code>—Descending</li> </ul> This field is available in API version 25.0 and later.
<code>storeOutputAutomatically</code>	boolean	Indicates whether the returned records' field values are automatically available in the flow without creating any variables. When the value is <code>true</code> , the flow can reference a field by specifying the <code>name</code> of the Get Records element and the record field, such as <code>Get_Contacts.AccountId</code> . Supported only when <code>processType</code> is <code>Flow</code> or <code>AutoLaunchedFlow</code> .  This field is available in API version 47.0 and later.

## FlowRecordRollback

Rolls back the current transaction and cancels its pending record changes. Corresponds to the Roll Back Records element in Flow Builder. Available only in screen flows.

FlowRecordRollback extends [FlowNode](#) and inherits all its fields. This metadata type is available in API version 52.0 and later.

Field Name	Field Type	Description
<code>connector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute after rolling back the current transaction.

## FlowRecordUpdate

Finds records in the database and updates them with values from the flow. It extends [FlowNode](#) and inherits all its fields.

 **Note:** The flow record `create`, `lookup`, `update`, and `delete` operations are different from the CRUD-based metadata calls `create()`, `retrieve()`, `update()`, and `delete()`. The flow record methods apply to record operations from within a flow, which aren't the same as doing any metadata calls to CRUD setup entities.

Field Name	Field Type	Description
<code>connector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute after completing the record update.
<code>faultConnector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute if the attempt to update a record results in an error.
<code>filters</code>	Array of <a href="#">FlowRecordFilter</a> objects	An array that specifies the criteria used to select the records to update in the database.
<code>inputAssignments</code>	Array of <a href="#">FlowInputFieldAssignment</a> objects	An array that assigns values to the specified fields of the record being updated.
<code>inputReference</code>	string	Specifies the record variable whose field values are used to update the record's fields.
<code>object</code>	string	Required. Name of the object whose records are updated.

## FlowRule

Defines the conditions and logic that enables a rule to evaluate to true. It extends [FlowElement](#) and inherits all of its fields.

Field Name	Field Type	Description
<code>conditionLogic</code>	string	Specifies logic for the conditions. Value can be: <ul style="list-style-type: none"> <li><code>and</code>—Evaluates to <code>true</code> if all of its conditions are true.</li> <li><code>or</code>—Evaluates to <code>true</code> if any conditions are true.</li> <li>Advanced logic like <code>1 AND (2 OR 3)</code>—Evaluates to <code>true</code> if the first condition is <code>true</code> and either the second or third condition is <code>true</code>.</li> </ul> <p>When you use advanced logic, the string can contain up to 1,000 characters.</p>
<code>conditions</code>	Array of <a href="#">FlowCondition</a> objects	An array of conditions for the rule.
<code>connector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute if this rule evaluates to <code>true</code> in a decision first.
<code>doesRequireRecordChangeToMetCriteria</code>	boolean	If set to <code>true</code> , conditions evaluate to <code>true</code> only if the record didn't meet the required conditions before the triggering update but now meets the conditions after the update. This field is available in API version 50.0 and later.
<code>label</code>	string	Required. Label for the connector.

## FlowSchedule

Specifies when and how frequently to run the flow. This metadata type is available in API version 47.0 and later.

Field Name	Field Type	Description
frequency	FlowStartFrequency (enumeration of type string)	Specifies how frequently to run the flow. Valid values are: <ul style="list-style-type: none"> <li>Once</li> <li>Daily</li> <li>Weekly</li> <li>OnActivate—This value is available in API version 49.0 and later.</li> </ul>
startDate	date	The date when the flow runs, or when the flow's run schedule starts recurring.
startTime	time	The time of day when the flow runs, based on the org's default time zone.

## FlowScheduledPath

Defines a scheduled path. It extends [FlowElement](#) and inherits all its fields. This metadata type is available in API version 51.0 and later.

Field Name	Field Type	Description
connector	<a href="#">FlowConnector</a>	Specifies which node to execute after this scheduled path.
label	string	Label for the scheduled path.
maxBatchSize	int	The maximum number of scheduled path interviews to execute in a single batch, from 1 to 200. Default is 200.
offsetNumber	int	Number of months, days, hours, or minutes to offset the time that the scheduled path executes. Negative values offset the time to execute before the provided time. Positive values offset the time to execute after the provided time.
offsetUnit	FlowScheduledPathOffsetUnit (enumeration of type string)	Specify the time unit used to offset when the scheduled path executes. Possible values are: <ul style="list-style-type: none"> <li>Months—This value is available in API version 56.0 and later.</li> <li>Days</li> <li>Hours</li> <li>Minutes</li> </ul>
pathType	FlowScheduledPathType (enumeration of type string)	The type of scheduled path. <code>null</code> is used for time-triggered and record-triggered paths. The default value is <code>null</code> . <ul style="list-style-type: none"> <li>AsyncAfterCommit—The scheduled path runs asynchronously after a save.</li> </ul>

Field Name	Field Type	Description
<code>recordField</code>	string	Field used to determine when the scheduled path executes. The field's object is defined in <a href="#">FlowStart</a> .
<code>timeSource</code>	FlowScheduledPathTimeSource (enumeration of type string)	Specify if a field or event is used to determine when the scheduled path executes. Possible values are: <ul style="list-style-type: none"> <li>• <code>RecordField</code></li> <li>• <code>RecordTriggerEvent</code></li> </ul>

## FlowScreen

Screens capture information from users and display information to users. It extends [FlowNode](#) and inherits all its fields.

Field Name	Field Type	Description
<code>allowBack</code>	boolean	Indicates whether to show ( <code>true</code> ) or hide ( <code>false</code> ) the <b>Previous</b> button on the screen at runtime. When <code>true</code> , the <b>Previous</b> button appears only if the user visited a previous screen in the flow path and if <code>showFooter</code> for the screen is set to <code>true</code> . Set this field to <code>false</code> when revisiting the previous screen triggers an action that you don't want repeated, such as a credit card transaction.  This field is available in API version 26.0 and later.  Default: <code>true</code>  You can set either <code>allowBack</code> or <code>allowFinish</code> to <code>false</code> , but not both.
<code>allowFinish</code>	boolean	Indicates whether to show ( <code>true</code> ) or hide ( <code>false</code> ) the <b>Finish</b> button on the screen at runtime. When <code>true</code> , the <b>Finish</b> button appears only if the screen element is the end of a flow path, and if <code>showFooter</code> for the screen is set to <code>true</code> . The default value is <code>true</code> .  Set to <code>false</code> if user is required to go back to a previous screen to continue or complete the flow. For example, don't include a <b>Finish</b> button on a screen that tells the user to go back and make corrections on a previous screen.  You can set <code>allowBack</code> or <code>allowFinish</code> to <code>false</code> , but not both.  This field is available in API version 26.0 and later.
<code>allowPause</code>	boolean	Indicates whether to show ( <code>true</code> ) or hide ( <code>false</code> ) the <b>Pause</b> button on the screen at runtime. The default value is <code>true</code> .  A flow screen displays the <b>Pause</b> button if all these conditions are <code>true</code> .

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <b>Let users pause flows</b> is enabled in the organization's process automation settings.</li> <li>• <code>allowPause</code> for the screen is set to <code>true</code>.</li> <li>• If the flow is embedded in a Visualforce page, the <code>&lt;flow:interview&gt;</code> component has its <code>showAllowPause</code> attribute set to <code>true</code>.</li> <li>• The <code>showFooter</code> field for the screen is set to <code>true</code>.</li> </ul> <p>This field is available in API version 33.0 and later.</p>
<code>backButtonLabel</code>	string	A label for the Back button.
<code>connector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute after the screen node.
<code>fields</code>	Array of <a href="#">FlowScreenField</a> objects	An array of fields to display on the screen.
<code>helpText</code>	string	Text that appears if the end user clicks a link for help text. Supports merge fields in API version 26.0 and later.
<code>nextOrFinishButtonLabel</code>	string	A label for the Next or Finish button.
<code>pauseButtonLabel</code>	string	A label for the Pause button.
<code>pausedText</code>	string	A confirmation message that appears when an end user clicks <b>Pause</b> . This field is available in API version 33.0 and later.
<code>rules</code>		Reserved for future use.
<code>showFooter</code>	boolean	Indicates whether to show ( <code>true</code> ) or hide ( <code>false</code> ) the screen's footer at Lightning runtime. Classic runtime isn't supported. The default value is <code>true</code> .  The footer includes navigation actions for the screen. If <code>showFooter</code> is hidden, use Lightning components on the screen to show navigation actions.  This field is available in API version 42.0 and later.
<code>showHeader</code>	boolean	Indicates whether to show ( <code>true</code> ) or hide ( <code>false</code> ) the screen's header at Lightning runtime. Classic runtime isn't supported. The default value is <code>true</code> .  The header includes access to help text for the screen. If <code>showHeader</code> is hidden, use Lightning components on the screen to show help text.  This field is available in API version 42.0 and later.

## FlowScreenField

Represents a screen component. FlowScreenField extends [FlowElement](#) and inherits all its fields.

Field Name	Field Type	Description
<code>choiceReferences</code>	Array of strings	<p>An array of references to FlowChoices or FlowDynamicChoiceSets. The resulting choice options appear in the order specified in this array, where the element at index 0 provides the top-most choice option. Supported for these types of screen components.</p> <ul style="list-style-type: none"> <li>• RadioButtons</li> <li>• DropDownBox</li> <li>• MultiSelectCheckboxes</li> <li>• MultiSelectPicklist</li> </ul> <p>Multi-select checkboxes and multi-select picklist fields are available in API version 26.0 and later.</p>
<code>dataType</code>	FlowDataType (enumeration of type string)	<p>Data type of the screen component. Only supported for the InputField, RadioButtons, and DropDownBox types of screen components. Valid data types are:</p> <ul style="list-style-type: none"> <li>• Boolean</li> <li>• Currency</li> <li>• Date</li> <li>• DateTime</li> <li>• Number</li> <li>• String</li> </ul> <p>Boolean input fields, which appear as checkbox fields at runtime, are available in API version 26.0 and later.</p> <p>Only the string data type is supported for multi-select checkboxes and multi-select picklist fields. Multi-select fields are available in API version 26.0 and later.</p> <p>Date/time input fields are available in API version 43.0 and later.</p>
<code>dataTypeMappings</code>	Array of <a href="#">FlowDataTypeMapping</a> objects	Reserved for future use.
<code>defaultSelectedChoiceReference</code>	string	The name of the FlowChoice element to use as the default value for the screen component.

Field Name	Field Type	Description
		<p>Supported for these types of screen components.</p> <ul style="list-style-type: none"> <li>• RadioButtons</li> <li>• DropDownBox</li> <li>• MultiSelectCheckboxes</li> <li>• MultiSelectPicklist</li> </ul> <p>For DropDownBox field types only, if <code>defaultSelectedChoiceReference</code> is empty or null, the reference at index 0 of <code>choiceReferences</code> is used as the default value.</p> <p>You can specify only one FlowChoice element as the default value for multi-select checkboxes and multi-select picklist fields. Multi-select fields are available in API version 26.0 and later.</p>
<code>defaultValue</code>	<a href="#">FlowElementReferenceOrValue</a>	The value that is used by default when the screen component requires users to provide input. Only supported for InputField, LargeTextArea, and PasswordField.
<code>extensionName</code>	string	The name of the Lightning component to display. This field is available in API version 42.0 and later.
<code>fields</code>	Array of <a href="#">FlowScreenField</a> objects	An array of columns to display in a section, or an array of fields to display in a column. This field is available in API version 49.0 and later.
<code>fieldText</code>	string	Field label that is displayed on the screen. Supports merge fields.
<code>fieldType</code>	FlowScreenFieldType (enumeration of type string)	<p>Required. The type of field to display on a flow screen. Valid values are:</p> <ul style="list-style-type: none"> <li>• DisplayText</li> <li>• InputField</li> <li>• LargeTextArea</li> <li>• PasswordField</li> <li>• RadioButtons</li> <li>• DropDownBox</li> <li>• MultiSelectCheckboxes—This value is available in API version 26.0 and later.</li> <li>• MultiSelectPicklist—This value is available in API version 26.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li><code>ComponentInstance</code>—This value is available in API version 42.0 and later.</li> <li><code>ComponentChoice</code> and <code>ComponentInput</code>—This value is available in API version 48.0 and later for the <code>Survey processType</code> value only.</li> <li><code>Region</code>— Specifies that a screen field in a section is a column. This value is available in API version 51.0 and later.</li> <li><code>RegionContainer</code>—Specifies that a screen field is a section. This value is available in API version 51.0 and later.</li> <li><code>ObjectProvided</code>—Specifies that a screen field is a field from a Salesforce object. This value is available in API version 51.0 and later.</li> </ul> <p>At runtime, each multi-select field stores its field value as a concatenation of the user-selected choice values, separated by semicolons. Any semicolons in the selected choice values are removed when added to the multi-select field value.</p>
<code>helpText</code>	string	<p>Text that appears if the end user clicks the help icon () for the screen component.</p> <p>Supports merge fields in API version 26.0 and later.</p>
<code>inputParameters</code>	Array of <code>FlowScreenFieldInputParameter</code> objects	<p>An array of input parameters. Supported only when <code>fieldType</code> is <code>ComponentInstance</code>.</p> <p>This field is available in API version 42.0 and later.</p>
<code>inputsOnNextNavToAssocScrn</code>	<code>FlowScreenFieldInputsRevisited</code> (enumeration of type string)	<p>Controls whether the flow remembers the input value if the user moves to any screen and then returns to the screen component. Valid values are:</p> <ul style="list-style-type: none"> <li><code>UseStoredValues</code>—Uses values from when the user last visited this screen.</li> <li><code>ResetValues</code>—Refreshes inputs to incorporate changes elsewhere in the flow.</li> </ul> <p>The default value is <code>UseStoredValues</code>.</p>

Field Name	Field Type	Description
		This property applies to screen components in API version 51.0 and later and to record fields on flow screens in API version 57.0 and later.
<code>isRequired</code>	boolean	Indicates whether the user must select a choice or provide input. Not supported for <code>DisplayText</code> or <code>boolean inputField</code> .
<code>isVisible</code>	boolean	Reserved for future use.
<code>objectFieldReference</code>	string	Specifies the Salesforce object field for an <code>ObjectProvided</code> field.
<code>outputParameters</code>	Array of <code>FlowScreenFieldOutputParameter</code> objects	An array of output parameters. Supported only when <code>fieldType</code> is <code>ComponentInstance</code> and when <code>storeOutputAutomatically</code> is <code>false</code> .  This field is available in API version 42.0 and later.
<code>regionContainerType</code>	<code>FlowRegionContainerType</code> (enumeration of type string)	Stores information about a section component header. Possible values include: <ul style="list-style-type: none"> <li><code>SectionWithHeader</code></li> <li><code>SectionWithoutHeader</code></li> </ul> Available only when the component type is <code>Section</code> . This field is available in API version 55.0 and later.
<code>scale</code>	int	Controls the number of digits to the right of the decimal point up to 17 places. If you leave this field blank or set it to zero, only whole numbers appear when your flow runs.  Available only when the data type is <code>Number</code> or <code>Currency</code> . Corresponds to the <code>Decimal Places</code> field in Flow Builder.
<code>sourceTemplateApiName (beta)</code>	string	The API name of the template specified by the provider. This field is available in API version 62.0 and later.
<code>sourceTemplateProviderType (beta)</code>	string	The API name of the source that provides the template. This field is available in API version 62.0 and later.
<code>storeOutputAutomatically</code>	boolean	Indicates whether the screen component's output parameters are automatically available in the flow without creating any variables.

Field Name	Field Type	Description
		<p>When the value is <code>true</code>, you can reference an output parameter by specifying the <code>name</code> of the screen component and the output parameter, such as <code>Mailing_Address.City</code>.</p> <p>Supported only when <code>fieldType</code> is <code>ComponentInstance</code>.</p> <p>This field is available in API version 47.0 and later.</p>
<code>validationRule</code>	<a href="#">FlowInputValidationRule</a>	A rule that's used to validate the user input when the screen component is of type <code>InputField</code> , <code>LargeTextArea</code> , or <code>PasswordField</code> .
<code>visibilityRule</code>	<a href="#">FlowVisibilityRule</a>	<p>A condition-based rule that's used to render or hide the screen component.</p> <p>This field is available in API version 47.0 and later.</p>

## FlowScreenFieldInputParameter

Defines an input parameter from the flow to the extension. It extends [FlowBaseElement](#) and inherits all its fields. `FlowScreenFieldInputParameter` is available in API version 42.0.

Field Name	Field Type	Description
<code>name</code>	string	Required. Unique name for the input parameter.
<code>value</code>	<a href="#">FlowElementReferenceOrValue</a>	Defines the value of the input parameter.

## FlowScreenFieldOutputParameter

Defines an output parameter from the extension to the flow. It extends [FlowBaseElement](#) and inherits all its fields. `FlowScreenFieldOutputParameter` is available in API version 42.0.

Field Name	Field Type	Description
<code>assignToReference</code>	string	Required. Specifies the variable to which you want to assign the output parameter value.
<code>name</code>	string	Required. Unique name for the output parameter.

## FlowStage

A section of your flow that can be represented in the UI, such as with breadcrumbs. It extends [FlowElement](#) and inherits all its fields.

When an interview starts, any stages where `isActive` is `true` are added to the `$Flow.ActiveStages` global variable, which holds a collection of stages. Each stage's `stageOrder` determines the order they're added in. The stage with the lowest `stageOrder` is assigned to the `$Flow.CurrentStage` global variable.

Field Name	Field Type	Description
<code>isActive</code>	boolean	Indicates whether the stage is active by default.
<code>label</code>	string	A user-friendly label for this stage.
<code>stageOrder</code>	int	Indicates how the stage is ordered against other stages. The <code>stageOrder</code> value must be unique within the flow.

## FlowStageStep

A step resource defines a step within a stage node. This metadata type is available in API version 53.0 and later.

Field Name	Field Type	Description
<code>actionName</code>	string	Required. Name of the flow associated with the step.
<code>actionType</code>	InvokableActionType (enumeration of type string)	Required. The type of the step. Valid values are: <ul style="list-style-type: none"> <li><code>createFieldGnmPromptTplResp</code>—This value is available in API version 62.0 and later.</li> <li><code>stepBackground</code></li> <li><code>stepInteractive</code></li> <li><code>stepMuleSoft</code></li> </ul>
<code>assignees</code>	<a href="#">FlowStageStepAssignee</a>	An array of users, groups, or queues that are assigned to complete the interactive step.
<code>canAssigneeEdit</code>	boolean	Reserved for future use.
<code>entryActionInputParameters</code>	<a href="#">FlowStageStepEntryActionInputParameter</a>	An array of input parameters from the step to the evaluation flow that are used as an entry condition for the step.
<code>entryActionName</code>	string	The name of the evaluation flow used as an entry condition for the step.
<code>entryActionOutputParameters</code>	Array of <a href="#">FlowStageStepEntryActionOutputParameter</a> objects	An array of output parameters from the evaluation flow to the step used to determine if the step can be started.

Field Name	Field Type	Description
<code>entryActionType</code>	InvocableActionType (enumeration of type string)	The type of the evaluation flow used as a custom entry condition for the step. Valid values are: <ul style="list-style-type: none"> <li>• <code>EvaluationFlow</code></li> </ul>
<code>entryConditionLogic</code>	string	Defines how the entry requirements for a step are evaluated. Valid values are: <ul style="list-style-type: none"> <li>• <code>And</code></li> <li>• <code>Or</code></li> <li>• Custom logic, such as (1 AND (2 OR 3))</li> <li>• <code>Formula</code></li> </ul>
<code>entryConditions</code>	Array of <a href="#">FlowCondition</a> objects	An array of requirements that must be met to start the step.
<code>exitActionInputParameters</code>	Array of <a href="#">FlowStageStepExitActionInputParameter</a> objects	An array of input parameters from the step to the evaluation flow. These parameters specify an exit condition for the step.
<code>exitActionName</code>	string	The name of the step exit evaluation flow.
<code>exitActionOutputParameters</code>	Array of <a href="#">FlowStageStepExitActionOutputParameter</a> objects	An array of output parameters from the evaluation flow to the step. These parameters specify an exit condition for the step.
<code>exitActionType</code>	InvocableActionType (enumeration of type string)	The type of the evaluation flow used as a custom exit condition for the step. The only possible value is <code>EvaluationFlow</code> .
<code>exitConditionLogic</code>	string	Defines how the exit requirements for an interactive step are evaluated. Valid values are: <ul style="list-style-type: none"> <li>• <code>And</code></li> <li>• <code>Or</code></li> <li>• Custom logic, such as (1 AND (2 OR 3))</li> <li>• <code>Formula</code></li> </ul>
<code>exitConditions</code>	Array of <a href="#">FlowCondition</a> objects	An array of requirements to be met for exiting an interactive step.
<code>inputParameters</code>	Array of <a href="#">FlowStageStepInputParameter</a> objects	An array of input parameters from the step to its associated flow.
<code>label</code>	string	Required. The label for the step.

Field Name	Field Type	Description
<code>outputParameters</code>	Array of <a href="#">FlowStageStepOutputParameter</a> objects	An array of output parameters from a flow to its associated step.
<code>requiresAsyncProcessing</code>	boolean	Indicates whether the background step is processed asynchronously.
<code>shouldLock</code>	boolean	Reserved for future use.
<code>stepSubtype</code>	FlowElementSubtype (enumeration of type string)	Reserved for internal use.

## FlowStageStepAssignee

An assignee associated with an Interactive step. Applicable only for interactive steps. This metadata type is available in API version 53.0 and later.

Field Name	Field Type	Description
<code>assignee</code>	<a href="#">FlowElementReferenceOrValue</a>	Names of the user, group, or queue assigned to the interactive step.
<code>assigneeType</code>	FlowStageStepAssigneeType (enumeration of type string)	Required. The type of the assignee associated with the interactive step. Valid values are: <ul style="list-style-type: none"> <li>• <code>Group</code></li> <li>• <code>Queue</code></li> <li>• <code>User</code></li> <li>• <code>invalid</code>— This value is available in API version 61.0 and later.</li> </ul>

## FlowStageStepEntryActionInputParameter

Defines an input parameter from the step to its associated evaluation flow. It extends [FlowBaseElement](#) and inherits all its fields. This metadata type is available in API version 53.0 and later.

Field Name	Field Type	Description
<code>name</code>	string	Required. The unique name for the input parameter of the evaluation flow used by a step as an entry condition.
<code>value</code>	<a href="#">FlowElementReferenceOrValue</a>	Defines the value of the input parameter of the evaluation flow used by a step as an entry condition.

## FlowStageStepEntryActionOutputParameter

Defines an output parameter from an evaluation flow used to determine if the step meets entry criteria. It extends [FlowBaseElement](#) and inherits all its fields. This metadata type is available in API version 53.0 and later.

Field Name	Field Type	Description
<code>assignToReference</code>	string	Reserved for future use.
<code>name</code>	string	Required. A unique name for the output parameter of the evaluation flow used by a step as an entry condition. Valid values are: <ul style="list-style-type: none"> <li><code>isOrchestrationConditionMet</code></li> </ul>

## FlowStageStepExitActionInputParameter

Defines an input parameter from the stage or step to its associated evaluation flow. It extends [FlowBaseElement](#) and inherits all its fields. This metadata type is available in API version 53.0 and later.

Field Name	Field Type	Description
<code>name</code>	string	Required. A unique name for the input parameter of the evaluation flow used by a stage or step as an exit condition.
<code>value</code>	<a href="#">FlowElementReferenceOrValue</a>	Defines the value of the input parameter of the evaluation flow used by a stage or step as an exit condition.

## FlowStageStepExitActionOutputParameter

Defines an output parameter from an evaluation flow used to determine if the stage or step meets exit criteria. It extends [FlowBaseElement](#) and inherits all its fields. This metadata type is available in API version 53.0 and later.

Field Name	Field Type	Description
<code>assignToReference</code>	string	Reserved for future use.
<code>name</code>	string	Required. A unique name for the output parameter of the evaluation flow used by a stage or step as an exit condition. The only possible value is <code>isOrchestrationConditionMet</code> .

## FlowStageStepInputParameter

Defines an input parameter from the step to the flow. It extends [FlowBaseElement](#) and inherits all its fields. This metadata type is available in API version 53.0 and later.

Field Name	Field Type	Description
<code>name</code>	string	Required. Unique name for the input parameter for a flow associated with the step.
<code>value</code>	<a href="#">FlowElementReferenceOrValue</a>	Defines the value of the input parameter of the flow associated with a step.

## FlowStageStepOutputParameter

Defines an output parameter from the step to the flow. It extends [FlowBaseElement](#) and inherits all its fields. This metadata type is available in API version 53.0 and later.

Field Name	Field Type	Description
<code>assignToReference</code>	string	Reserved for future use.
<code>name</code>	string	Required. Unique name for the output parameter for a flow associated with the step.

## FlowStart

Represents the flow's Start element, which specifies how the flow starts. In an autolaunched flow, the Start element also defines when and how frequently to run the flow. To run the flow only for specific records, the Start element can define filter criteria.

FlowStart extends [FlowNode](#) and inherits all its fields except `name` and `label`. This metadata type is available in API version 47.0 and later.

Field Name	Field Type	Description
<code>capabilityTypes</code>	Array of <a href="#">FlowCapability</a> objects	An array of capabilities that can pass data with the flow. Only one capability is supported in API version 60.0 and later. This field is available in API version 60.0 and later.
<code>connector</code>	<a href="#">FlowConnector</a>	Specifies which element to execute first.
<code>dataGraph</code>	string	The data graph associated with the flow. This field is available in API version 61.0 and later.
<code>doesRequireRecordChangeToMeetCriteria</code>	boolean	If set to <code>true</code> , conditions evaluate to <code>true</code> only if the record didn't meet the required conditions before the triggering update but now meets the conditions after the update. This field is available in API version 50.0 and later.
<code>entryType</code>	FlowEntryType (enumeration of type string)	Specifies when a unified individual can join a flow. Valid values are: <ul style="list-style-type: none"> <li><code>AfterCompletion</code>—Unified individuals can join the flow only after they complete all previous flow runs of the same flow definition.</li> <li><code>Always</code>—Unified individuals can always join the flow.</li> </ul> This field is available in API version 60.0 and later.
<code>eventName</code>	string	The name of the automation event that triggers the automation event-triggered flow. Valid values are: <ul style="list-style-type: none"> <li><code>trgrOnSmsSubscription</code></li> <li><code>trgrOnEmailSubscription</code></li> <li><code>trgrOnOrderPlacement</code></li> <li>The API name of a form</li> <li>The API name of an external service</li> </ul>

Field Name	Field Type	Description
		This field is available in API version 61.0 and later.
<code>eventType</code>	InvokableActionType (enumeration of type string)	The type of the automation event that triggers the automation event-triggered flow. Valid values are: <ul style="list-style-type: none"> <li><code>trgrOnSmsSubscription</code></li> <li><code>trgrOnEmailSubscription</code></li> <li><code>trgrOnOrderPlacement</code></li> <li><code>trgrOnFormSubmission</code></li> <li><code>externalEvent</code></li> </ul>
<code>filterFormula</code>	string	A formula that's used to filter what records execute the flow during a save. Available only in record-triggered flows. This field is available in API version 55.0 and later.
<code>filterLogic</code>	string	The filter logic that's applied to the filter condition requirements. To require all conditions, use <code>AND</code> . To require any conditions, use <code>OR</code> . For custom condition logic, enter the entire logic string, for example <code>1 AND 2 OR (3 AND 4)</code> . This field is available in API version 50.0 and later.
<code>filters</code>	Array of <a href="#">FlowRecordFilter</a> objects	An array of filters to apply when retrieving records from the database. For example, filter accounts to include only the records that haven't been updated in the last 4 weeks.
<code>flowRunAsUser</code>	string	Specifies who to run the flow as. Possible values are: <ul style="list-style-type: none"> <li><code>TriggeringUser</code>—Run the flow as the user that triggered the flow.</li> <li><code>DefaultWorkflowUser</code>—Run the flow as the default workflow user.</li> </ul> This field is available in API version 60.0 and later.
<code>form</code>	string	Required only for form-triggered flows. The content key value for the form used to trigger the flow. This field is available in API version 59.0 and later.
<code>inputs</code>	Array of <a href="#">FlowStartInputParameter</a> objects	An array of inputs to the Start element.
<code>object</code>	string	The object whose records you want to retrieve from the database. A flow interview starts for each record that meets the filter conditions.
<code>publishSegment</code>	boolean	Indicates whether to republish the segment and update segment membership before the flow runs or on the segment's Data Cloud publish schedule. When the value is <code>true</code> , the segment is immediately republished before the flow runs, and ignores the segment's publish schedule. When the value is <code>false</code> , the

Field Name	Field Type	Description
		<p>segment is republished on the segment's Data Cloud publish schedule, but the segment isn't republished if the schedule is set to <code>Do not refresh</code>.</p> <p>The default value is <code>false</code>.</p> <p>This field is available in API version 60.0 and later.</p>
<code>recordTriggerType</code>	RecordTriggerType (enumeration of type string)	<p>Specifies what type of record changes can start the flow. Possible values are:</p> <ul style="list-style-type: none"> <li><code>Create</code>—When a record is created.</li> <li><code>Update</code>—When a record is updated.</li> <li><code>CreateAndUpdate</code>—When a record is created and updated.</li> <li><code>Delete</code>—When a record is deleted. This value is available in API version 50.0 and later.</li> <li><code>None</code>—For flows that aren't record-triggered flows. This value is available in API version 55.0 and later.</li> </ul> <p>Available only when <code>triggerType</code> is <code>RecordBeforeSave</code> or <code>DataCloudDataChange</code>. This field is available in API version 48.0 and later.</p>
<code>schedule</code>	<a href="#">FlowSchedule</a>	Required when <code>triggerType</code> is <code>Scheduled</code> . Specifies when and how frequently the flow runs.
<code>scheduledPaths</code>	Array of <a href="#">FlowScheduledPath</a> objects	Specifies the flow's scheduled paths. This field is available in API version 51.0 and later.
<code>segment</code>	string	The segment used to trigger the flow. This field is available in API version 56.0 and later.
<code>TimeZoneSidKey</code>	string	Reserved for future use.
<code>triggerType</code>	FlowTriggerType (enumeration of type string)	<p>Specifies what causes the flow to run. If you exclude this field, the flow has no trigger and starts only when a user or app launches the flow. Possible values are:</p> <ul style="list-style-type: none"> <li><code>AutomationEvent</code>—The flow starts when an automation event such as an SMS subscription occurs. This value is available in API version 62.0 and later.</li> <li><code>Capability</code>—When <code>capabilityTypes</code> is set, the flow starts when the capability is run. This value is available in API version 60.0 and later.</li> <li><code>DataCloudDataChange</code>—The flow starts when data model object (DMO) or calculated insight object (CIO) conditions are met. This value is available in API version 59.0 and later.</li> <li><code>EventDrivenJourney</code>—Reserved for internal use.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li><code>PlatformEvent</code>—The flow starts when a platform event message is received. This value is available in API version 49.0 and later.</li> <li><code>RecordAfterSave</code>—The flow starts after a record is saved. This value is available in API version 49.0 and later.</li> <li><code>RecordBeforeDelete</code>—Deleting a record triggers an autolaunched flow before the record is deleted from the database. This value is available in API version 50.0 and later.</li> <li><code>RecordBeforeSave</code>—Creating and/or updating a record triggers an autolaunched flow to make more updates to that record before it's saved to the database. This value is available in API version 48.0 and later.</li> <li><code>Scheduled</code>—The flow starts at the scheduled time. This value is available in API version 47.0 and later.</li> <li><code>ScheduledJourney</code>— The flow starts only at the scheduled time and frequency. This value is available in API version 49.0 and later.</li> <li><code>Segment</code>— At the scheduled time, the flow send emails to individuals included in the chosen segment. This value is available in API version 56.0 and later.</li> </ul> <p>Available only when <code>processType</code> is <code>AutoLaunchedFlow</code> or <code>PromptFlow</code>. This field is available in API version 47.0 and later.</p>

## FlowCapability

Defines the data structure of a capability. When the capability is invoked, it triggers the flow to run and data is passed between the flow and capability. It extends [FlowElement](#) and inherits all of its fields. This metadata type is available in API version 60.0 and later.

Field Name	Field Type	Description
<code>capabilityName</code>	string	Required. The specified capability that the flow integrates with. The valid format is <code>Name://Name</code> , for example, <code>PromptBuilder://SalesEmail</code>
<code>inputs</code>	Array of <a href="#">FlowCapabilityInput</a> objects	An array of capability inputs. The flow sets the input values and passes the data to the capability.

## FlowCapabilityInput

Defines the data structure of a capability input. It extends [FlowElement](#) and inherits all of its fields. This metadata type is available in API version 60.0 and later.

Field Name	Field Type	Description
capabilityInputName	string	Required. The input name is the same for the capability and the flow.
dataType	string	The data type of the capability input. Valid types are: <ul style="list-style-type: none"> <li><code>sObject</code>—This value corresponds to a record variable. This value is available in API version 60.0 and later.</li> <li><code>String</code>—This value is available in API version 61.0 and later.</li> </ul>
isCollection	boolean	Required. Indicates whether the input is a collection of values. The default value is <code>false</code> .

## FlowStartInputParameter

Defines an input parameter to the flow Start element. It extends [FlowBaseElement](#) and inherits all its fields. This metadata type is available in API version 62.0 and later.

Field Name	Field Type	Description
name	string	Required. The unique name for the input parameter to the Start element.
value	<a href="#">FlowElementReferenceOrValue</a>	Defines the value of the input parameter to the Start element.

## FlowStep

Steps function as placeholders when you're building a flow. It extends [FlowNode](#) and inherits all its fields.

Field Name	Field Type	Description
connectors	Array of <a href="#">FlowConnector</a> objects	Specifies which node to execute after the step node.

## FlowSubflow

A subflow element references another flow, which it calls at run time. The flow that contains the subflow element is referred to as the parent flow. [FlowSubflow](#) extends [FlowNode](#) and inherits all its fields. It's available in API version 25.0 and later.

Field Name	Field Type	Description
connector	<a href="#">FlowConnector</a>	Specifies which node to execute after the subflow.
flowName	string	References the flow to call at runtime. The value must be an API name of a flow and it can't contain an appended hyphen and version number.
inputAssignments	Array of <a href="#">FlowSubflowInputAssignment</a> objects	An array of input variable assignments that are set at the start of the flow.

Field Name	Field Type	Description
outputAssignments	Array of <a href="#">FlowSubflowOutputAssignment</a> objects	An array of output variable assignments that are set at the end of the flow.
storeOutputAutomatically	boolean	Indicates whether the subflow's output parameters are automatically available in the flow without creating any variables. When the value is <code>true</code> , you can reference an output parameter by specifying the API name of the subflow in the flow. When the value is <code>false</code> , create variables manually to store output values from the subflow. The default value is <code>false</code> .  This field is available in API version 49.0 and later.

## FlowSubflowInputAssignment

Assigns an element or value from the parent flow to a variable in the referenced flow. Input assignments occur when the subflow calls the referenced flow. It extends [FlowBaseElement](#) and inherits all its fields. It's available in API version 25.0 and later.

Field Name	Field Type	Description
name	string	Required. Unique name for the variable in the referenced flow.
value	<a href="#">FlowElementReferenceOrValue</a>	Defines the value to assign to the variable.

## FlowSubflowOutputAssignment

Assigns the value of a variable from the referenced flow to a variable in the parent flow. Output assignments occur when the referenced flow is finished running. It extends [FlowBaseElement](#) and inherits all its fields. It's available in API version 25.0 and later.

Field Name	Field Type	Description
assignToReference	string	Unique name for the variable in the parent flow.
name	string	Required. Unique name for the variable in the referenced flow.

## FlowTransform

Defines a node that can dynamically transform the value of source data to target data in the flow. It extends [FlowNode](#) and inherits all of its fields. This metadata type is available in API version 59.0 and later.

Field Name	Field Type	Description
apexClass	string	The Apex class of the target data after transformation if its data type is <code>Apex</code> .
connector	Array of <a href="#">FlowConnector</a> objects	Specifies which node to execute after this data transformation.

Field Name	Field Type	Description
<code>dataType</code>	FlowDataType (enumeration of type string)	Required. Specifies the data type of the transformed data. In Flow Builder, it corresponds to the target data in the Transform element. Valid types are: <ul style="list-style-type: none"> <li>• <code>Apex</code></li> <li>• <code>Boolean</code>—This value is available in API version 62.0.</li> <li>• <code>Currency</code>—This value is available in API version 62.0.</li> <li>• <code>Date</code>—This value is available in API version 62.0.</li> <li>• <code>DateTime</code>—This value is available in API version 62.0.</li> <li>• <code>Number</code>—This value is available in API version 62.0.</li> <li>• <code>String</code>—This value is available in API version 62.0.</li> <li>• <code>sObject</code>—This value corresponds to a record variable.</li> </ul>
<code>isCollection</code>	boolean	Indicates whether the variable is a collection of values. The default value is <code>false</code> .
<code>objectType</code>	string	Object type of this variable resource if its data type is <code>sObject</code> .
<code>scale</code>	int	Controls the number of digits to the right of the decimal point up to 17 places. If you leave this field blank or set it to zero, only whole numbers appear when your flow runs.  Corresponds to the Decimal Places field in Flow Builder.
<code>storeOutputAutomatically</code>	boolean	Reserved for future use.
<code>transformValues</code>	Array of <a href="#">FlowTransformValue</a> objects	An array of values for data transformation

## FlowTransformValue

Defines the values for transforming specific data in the flow. It extends [FlowBaseElement](#) and inherits all its fields. This metadata type is available in API version 59.0 and later.

Field Name	Field Type	Description
<code>transformValueActions</code>	Array of <a href="#">FlowTransformValueAction</a> objects	An array of actions for data transformation
<code>transformValueName</code>	string	Reserved for future use.
<code>transformValueLabel</code>	string	Reserved for future use.
<code>transformValueDescription</code>	string	Reserved for future use.

## FlowTransformValueAction

Defines the data and actions to transform in the flow. It extends [FlowBaseElement](#) and inherits all its fields. This metadata type is available in API version 59.0 and later.

Field Name	Field Type	Description
<code>assignToReference</code>	string	Reserved for future use.
<code>inputParameters</code>	Array of <a href="#">FlowTransformValueActionInputParameter</a> objects	An array of input parameters for data transformation. This field is available in API version 60.0 and later.
<code>outputFieldApiName</code>	string	The API name of the field for transformed data in a data transformation mapping. In Flow Builder, it corresponds to the target data field in the Transform element.
<code>transformType</code>	FlowTransformValueActionType (enumeration of type string)	Required. The type of transformation from source data to target data. Valid types are: <ul style="list-style-type: none"> <li>• <code>Count</code>—Calculates the number of items in a source collection.</li> <li>• <code>InnerJoin</code>—Reserved for future use.</li> <li>• <code>Map</code>—Specifies a mapping between the datasets in flows. In Flow Builder, it corresponds to the mapping between source data fields and target data fields.</li> <li>• <code>Sum</code>—Adds the numeric values of a field on each item in a collection.</li> </ul>
<code>value</code>	<a href="#">FlowElementReferenceOrValue</a>	Defines the value of the transformed data. In Flow Builder, the value of this field corresponds to the result of the target data field in the Transform element.

## FlowTransformValueActionInputParameter

Defines the input parameters of the source data for data transformation. This metadata type is available in API version 60.0 and later.

Field Name	Field Type	API
<code>name</code>	string	A yek tat efe ent oof f o pi sep rof slt ata

Field Name	Field Type	
		dleif n o h c a e me t i n i a ec ruos i tel l e s ' t a t d e s u o t e t a l u c l a c e h t . e u l a v ec ruos i tel l e s ' t a t d e s u o t e t a l u c l a c e h t . e u l a v
value	FlowElementReferenceOrValue	e h t e l a f o e h t d f p y e k

Field Name	Field Type	
		 n i .com

## FlowTextTemplate

Defines a text template that can be used throughout the flow. It extends [FlowElement](#) and inherits all its fields.

Field Name	Field Type	Description
<code>isViewedAsPlainText</code>	boolean	If set to <code>true</code> , the flow resource remembers the View as Plain Text setting used for the text template after the flow resource is saved. If set to <code>false</code> , the flow resource uses the View as Rich Text setting.  The default value is <code>false</code> .
<code>text</code>	string	Actual text of the template. Supports merge fields.

## FlowVariable

With variables, creates updatable values to use in the flow. [FlowVariable](#) extends [FlowElement](#) and inherits all its fields.

Field Name	Field Type	Description
<code>apexClass</code>	string	The Apex class of this variable if its data type is <code>Apex</code> . This field is available in API version 46.0 and later.
<code>dataType</code>	FlowDataType (enumeration of type string)	Required. Valid types are: <ul style="list-style-type: none"> <li>• <code>Apex</code>—This value is available in API version 46.0 and later.</li> <li>• <code>Boolean</code></li> <li>• <code>Currency</code></li> <li>• <code>Date</code></li> <li>• <code>DateTime</code>—This value is available in API version 30.0 and later.</li> <li>• <code>Number</code></li> <li>• <code>Multipicklist</code>—This value is available in API version 34.0 and later.</li> <li>• <code>Picklist</code>—This value is available in API version 34.0 and later.</li> <li>• <code>String</code></li> <li>• <code>sObject</code>—This value corresponds to a record variable.</li> </ul>

Field Name	Field Type	Description
<code>isCollection</code>	boolean	<p>Indicates whether the variable is a collection of values. This field is available in API version 30.0 and later. In API version 32.0 and later, a collection variable can be of any data type.</p> <p>The default value is <code>False</code>.</p>
<code>isInput</code>	boolean	<p>Indicates whether the variable can be set at the start of the flow using URL parameters, Visualforce controllers, or subflow inputs. This field is available in API version 25.0 and later.</p> <p>Default value:</p> <ul style="list-style-type: none"> <li><code>False</code> for a variable created in API version 25.0 and later or in the Flow Builder in Summer '12 and later.</li> <li><code>True</code> for a variable created in API version 24.0 or in Flow Builder in Spring '12 and earlier.</li> </ul> <p>Disabling input or output access for an existing variable can break the functionality of applications and pages that call the flow and access the variable. For example, you can access variables from URL parameters, processes, and other flows.</p>
<code>isOutput</code>	boolean	<p>Indicates whether the variable's value can be accessed from Visualforce controllers and other flows. This field is available in API version 25.0 and later.</p> <p>Default value:</p> <ul style="list-style-type: none"> <li><code>False</code> for a variable created in API version 25.0 and later or in the Flow Builder in Summer '12 and later.</li> <li><code>True</code> for a variable created in API version 24.0 or in Flow Builder in Spring '12 and earlier.</li> </ul> <p>Disabling input or output access for an existing variable can break the functionality of applications and pages that call the flow and access the variable. For example, you can access variables from URL parameters, processes, and other flows.</p>
<code>objectType</code>	string	<p>Object type of this variable if its data type is <code>sObject</code>.</p>

Field Name	Field Type	Description
scale	int	Controls the number of digits to the right of the decimal point up to 17 places. If you leave this field blank or set it to zero, only whole numbers appear when your flow runs.  Corresponds to the Decimal Places field in Flow Builder.
value	<a href="#">FlowElementReferenceOrValue</a>	Default value of this variable.  Default values aren't supported if the variable's data type is <code>Picklist</code> or <code>Multipicklist</code> .

## FlowVisibilityRule

Visibility rules render a flow screen component when visibility rule conditions are met. Hides a flow screen component when visibility rule conditions aren't met. This metadata type is available in API version 47.0 and later.

Field Name	Field Type	Description
conditionLogic	string	Specifies logic for the conditions. Value can be: <ul style="list-style-type: none"> <li><code>and</code>—Evaluates to <code>true</code> only if all its conditions evaluate to <code>true</code>.</li> <li><code>or</code>—Evaluates to <code>true</code> if any of its conditions evaluate to <code>true</code>.</li> <li>Advanced logic like <code>1 AND (2 OR 3)</code>—Evaluates to <code>true</code> if the first condition is <code>true</code> and either the second or third condition is <code>true</code>.  When you use advanced logic, the string must consist of 1,000 or fewer characters.</li> </ul>
conditions	Array of <a href="#">FlowCondition</a> objects	An array of conditions that must be true for the flow to wait for this event.

## FlowWait

Waits for one or more defined events to occur. `FlowWait` extends [FlowNode](#) and inherits all its fields. `FlowWait` is available in API version 32.0 and later.

Field Name	Field Type	Description
defaultConnector	<a href="#">FlowConnector</a>	Specifies which node to execute if the conditions are false for every event in the Wait element.

Field Name	Field Type	Description
<code>defaultConnectorLabel</code>	string	Label for the default connector.
<code>faultConnector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute if the attempt to wait results in an error. If any of the wait events fail, the flow takes the fault connector.
<code>timeZoneId</code>	string	Reserved for future use.
<code>waitEvents</code>	Array of <a href="#">FlowWaitEvent</a> objects	An array of events that the Wait element is waiting for.  If the conditions for every event evaluate to <code>false</code> , the <code>defaultConnector</code> is used.

## FlowWaitEvent

An event that a FlowWait element is waiting for. FlowWaitEvent extends [FlowElement](#) and inherits all its fields. FlowWaitEvent is available in API version 32.0 and later.

Field Name	Field Type	Description
<code>conditionLogic</code>	string	Specifies logic for the conditions. Value can be: <ul style="list-style-type: none"> <li><code>and</code>—Evaluates to <code>true</code> only if all its conditions evaluate to <code>true</code></li> <li><code>or</code>—Evaluates to <code>true</code> if any of its conditions evaluate to <code>true</code></li> <li>Advanced logic like <code>1 AND (2 OR 3)</code>—Evaluates to <code>true</code> if the first condition is <code>true</code> and either the second or third condition is <code>true</code></li> </ul> <p>When you use advanced logic, the string must consist of 1,000 or fewer characters.</p>
<code>associatedElement</code>	string	The API name of the event that resumes the flow. This field is available in API version 60.0 and later.
<code>conditions</code>	Array of <a href="#">FlowCondition</a> objects	An array of conditions that must be <code>true</code> for the flow to wait for this event.
<code>connector</code>	<a href="#">FlowConnector</a>	Specifies which node to execute if this event is the first event that occurs.

Field Name	Field Type	Description
eventType	string	Required. The event's type. The type determines which input parameters are available to define this event. Valid values are: <ul style="list-style-type: none"> <li>AlarmEvent—This event is an alarm based off an absolute date/time value.</li> <li>DateRefAlarmEvent—This event is an alarm based off a date/time field on a record.</li> </ul>
extendUntil	Time	Reserved for future use.
filters	FlowRecordFilter XREF ME	An array of filters to apply when retrieving records from the database. For example, filter accounts to include only the records that haven't been updated in the last 4 weeks. This field is available in API version 60.0 and later.
filterlogic	string	The filter logic that's applied to the filter condition requirements. To require all conditions, use AND. To require any conditions, use OR. For custom condition logic, enter the entire logic string, for example 1 AND 2 OR (3 AND 4). This field is available in API version 60.0 and later.
inputParameters	Array of <a href="#">FlowWaitEventInputParameter</a> objects	An array of the event's input parameters. The parameter values are set by using values from the flow.
interactionType	FlowWaitInteractionType	Specifies what type of event can resume the flow. Possible values are: <ul style="list-style-type: none"> <li>SmsResponse—An SMS response event</li> <li>WhatsappResponse—A WhatsApp response event</li> </ul> This field is available in API version 62.0 and later.
label	string	Required. Label for the wait event.
object	string	The object that contains the event you want to use to resume the flow. This field is available in API version 60.0 and later.
offset	int	Reserved for future use.

Field Name	Field Type	Description
<code>offsetUnit</code>	FlowScheduledPathOffsetUnit (enumeration of type string)	Reserved for future use.
<code>outputParameters</code>	Array of <a href="#">FlowWaitEventOutputParameter</a> objects	An array of the event's output parameters. The parameter values are assigned from the event to variables in the flow.
<code>recordTriggerType</code>	RecordTriggerType	Specifies what type of record changes can resume the flow. Possible values are: <ul style="list-style-type: none"> <li>• <code>Create</code>—When a related record is created</li> <li>• <code>Update</code>—When a related record is updated</li> <li>• <code>CreateAndUpdate</code>—When a related record is created and updated</li> </ul> This field is available in API version 60.0 and later.

## FlowWaitEventInputParameter

An input parameter for FlowWaitEvent. The parameter's value is set by using values from the flow. It extends [FlowBaseElement](#) and inherits all its fields. FlowWaitEventInputParameter is available in API version 32.0 and later.

Field Name	Field Type	Description
<code>name</code>	string	Unique name for the input parameter.
<code>value</code>	<a href="#">FlowElementReferenceOrValue</a>	Defines the value of the input parameter.

## FlowWaitEventOutputParameter

An output parameter for FlowWaitEvent. The parameter's value is assigned to a variable in the flow so that it can be referenced in another part of the flow. It extends [FlowBaseElement](#) and inherits all its fields. FlowWaitEventOutputParameter is available in API version 32.0 and later.

Field Name	Field Type	Description
<code>assignToReference</code>	string	Required. Specifies the variable to which you want to assign the output parameter value.
<code>name</code>	string	Required. Unique name for the output parameter.

## Upgrade Flow Files to API Version 44.0 or Later

In API version 43.0 and earlier, the Flow object's `fullName` field included the flow's version number. Starting in API version 44, the field no longer includes the version number. Before you deploy using API version 44.0 via Metadata API or Salesforce CLI, make sure that:

- The `flows` directory doesn't include any unused flow versions.
- For each active flow, the `status` field is `Active`. Any flow without a `status` value is deployed or retrieved with a `status` value of `Draft`.
- The `flowDefinitions` directory is empty.

For Metadata API only.

- The `package.xml` file is set to API version 44.0.
- For the latest version of each flow, the file name doesn't include a version number. For example, change `myflow-3.flow` to `myflow.flow`.

For Salesforce CLI only.

- The `sfdx-project.json` file is set to `"sourceApiVersion": "44.0"`.
- For the latest version of each flow, the file name doesn't include a version number. For example, change `myflow-1.flow-meta.xml` to `myflow.flow-meta.xml`.

As part of this upgrade, flow definitions are no longer necessary when you deploy or retrieve via Metadata API. If you deploy with flow definitions, the active version numbers in the flow definitions override the `status` fields in the flows. For example, the active version number in the flow definition is version 3, and the latest version of the flow is version 4 with the `status` field as `Active`. After you deploy your flow, the active version is version 3.

After you finished this upgrade, you can integrate with a version control system without worrying about flow file names changing. To reduce deployment issues when you push the source code into a scratch org, make sure that you don't reuse an existing scratch org.

For more information, see [Deploy Processes and Flows as Active](#) in *Salesforce Help*.

## Declarative Metadata Sample Definition

Here's a sample XML definition of a flow.

```
<?xml version="1.0" encoding="UTF-8"?>
<Flow xmlns="http://soap.sforce.com/2006/04/metadata">
  <actionCalls>
    <name>Get_Info</name>
    <label>Get Info</label>

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Salesforce Help: Deploy Processes and Flows as Active](#)

## FlowCategory

Represents a list of flows that are grouped by category. Flows aren't added directly to a Lightning Bolt Solution. Instead, add the category the flows are in to the Lightning Bolt Solution. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

FlowCategory components have the suffix `.flowCategory` and are stored in the `flowCategories` folder.

## Version

FlowCategory components are available in API version 43.0 and later.

## Fields

Field Name	Field Type	Description
<code>description</code>	string	The description of this flow category.
<code>flowCategoryItems</code>	<a href="#">FlowCategoryItems[]</a>	The list of flows in this flow category.
<code>masterLabel</code>	string	Required. The label for this flow category, which appears in Setup.

## FlowCategoryItems

Represents the list of flows in a flow category.

Field Name	Field Type	Description
<code>flow</code>	string	Required. The name of the flow.

## Declarative Metadata Sample Definition

The following is an example of a FlowCategory component.

```
<?xml version="1.0" encoding="UTF-8"?>
<FlowCategory xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <flowCategoryItems>
    <flow>PausableFlow</flow>
  </flowCategoryItems>
  <flowCategoryItems>
    <flow>BankingFlow</flow>
  </flowCategoryItems>
  <masterLabel>updateBenefits</masterLabel>
  <description>All the update benefits.</description>
</FlowCategory>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>updateBenefits</members>
    <name>FlowCategory</name>
  </types>
  <version>43.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## FlowDefinition

---

Represents the flow definition's description and active flow version number.

-  **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.
-  **Important:** In API version 44.0, we recommend upgrading your flows to flow metadata file names without version numbers and discontinue using the FlowDefinition object to activate or deactivate a flow. Then use the Flow object to activate or deactivate a flow. For more information, see [Upgrade Flow Files to API Version 44.0](#) on page 1099.

If you deploy with flow definitions, the active version numbers in the flow definitions override the `status` fields in the flows. For example, the active version number in the flow definition is version 3, and the latest version of the flow is version 4 with the `status` field as `Active`. After you deploy your flow, the active version is version 3.

## Declarative Metadata File Suffix and Directory Location

FlowDefinitions are stored in the `flowDefinitions` directory of the corresponding package directory. The file name matches the flow definition's unique full name, and the extension is `.flowDefinition`.

## Version

[FlowDefinition](#) on page 1107 is available in API version 34.0 and later.

Field Name	Field Type	Description
<code>activeVersionNumber</code>	int	The version number of the active flow.
<code>apiVersion</code>	int	Reserved for internal use.
<code>description</code>	string	Description of the flow definition.
<code>masterLabel</code>	string	Label for the flow definition. In managed packages, this field inherits the flow's active version name. To change this label from a subscriber's org, edit the packaged flow name.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## FlowTest

---

Represents the metadata associated with a flow test. Before you activate a record-triggered flow, you can test it to verify its expected results and identify flow run-time failures.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

FlowTest components have the suffix `.flowtest` and are stored in the `flowtests` folder.

### Version

FlowTest components are available in API version 55.0 and later.

### Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
description	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of the flow test, such as what it does or how it works.</p>
flowApiName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The API name of the flow associated with the flow test.</p>
label	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The label of the flow test.</p>
testPoints	<p><b>Field Type</b> <a href="#">FlowTestPoint[]</a></p> <p><b>Description</b> An array of test points for the test.</p>

## FlowTestPoint

Defines a flow test point that is evaluated when a flow test runs. Each test point is evaluated in the order that it's listed.

Field Name	Description
assertions	<p><b>Field Type</b> <a href="#">FlowTestAssertion[]</a></p> <p><b>Description</b> An array of assertions for the test.</p>
elementApiName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The element API names for the start of the flow and the end of the flow.</p>

Field Name	Description
	<p>Possible values are:</p> <ul style="list-style-type: none"> <li>• Start</li> <li>• Finish</li> </ul>
parameters	<p><b>Field Type</b> FlowTestParameter[]</p> <p><b>Description</b> An array of parameters for the test.</p>

## FlowTestAssertion

Defines an assertion for a test point that is evaluated when a flow test runs. If one assertion evaluates to false, the test run fails.

Field Name	Description
conditions	<p><b>Field Type</b> FlowTestCondition[]</p> <p><b>Description</b> An array of conditions for an assertion.</p>
errorMessage	<p><b>Field Type</b> string</p> <p><b>Description</b> The custom message that appears in Flow Builder if its associated condition evaluates to false.</p>

## FlowTestCondition

Defines a condition for an assertion that is evaluated when a flow test runs. If one condition evaluates to false, the assertion fails.

Field Name	Description
leftValueReference	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The reference to the flow resource that the specified operator applies to.</p>
operator	<p><b>Field Type</b> FlowComparisonOperator (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>The operation that is applied to the resource reference in the <code>leftValueReference</code> field.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>Contains</code></li> <li>• <code>EndsWith</code></li> <li>• <code>EqualTo</code></li> <li>• <code>GreaterThan</code></li> <li>• <code>GreaterThanOrEqualTo</code></li> <li>• <code>In</code>—This value is available in API version 56.0 and later.</li> <li>• <code>IsBlank</code>—This value is available in API version 61.0 and later.</li> <li>• <code>IsChanged</code></li> <li>• <code>IsEmpty</code>—This value is available in API version 61.0 and later.</li> <li>• <code>IsNull</code></li> <li>• <code>LessThan</code></li> <li>• <code>LessThanOrEqualTo</code></li> <li>• <code>NotEqualTo</code></li> <li>• <code>NotIn</code>—This value is available in API version 56.0 and later.</li> <li>• <code>StartsWith</code></li> <li>• <code>WasSelected</code></li> <li>• <code>WasSet</code></li> <li>• <code>WasVisited</code></li> </ul>
<code>rightValue</code>	<p><b>Field Type</b></p> <p><a href="#">FlowTestReferenceOrValue</a> on page 1111</p> <p><b>Description</b></p> <p>The value that the operator applies to the resource reference in the <code>leftValueReference</code> field.</p>

## FlowTestReferenceOrValue

Defines a specific value that the operator applies to the resource reference in flow test assertions and conditions.

Field Name	Description
<code>booleanValue</code>	<p><b>Field Type</b></p> <p>boolean</p>

Field Name	Description
	<p><b>Description</b> Specifies a boolean value.</p>
dateTimeValue	<p><b>Field Type</b> dateTime</p> <p><b>Description</b> Specifies a dateTime value.</p>
dateValue	<p><b>Field Type</b> date</p> <p><b>Description</b> Specifies a dateValue value.</p>
numberValue	<p><b>Field Type</b> double</p> <p><b>Description</b> Specifies a number value.</p>
sobjectValue	<p><b>Field Type</b> string</p> <p><b>Description</b> Specifies an sObject value.</p>
stringValue	<p><b>Field Type</b> string</p> <p><b>Description</b> Specifies a string value.</p>

## FlowTestParameter

Defines parameters for the triggering record in the Start test point.

Field Name	Description
leftValueReference	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  The name of the parameter. When <code>type</code> is <code>InputTriggeringRecordInitial</code> or <code>InputTriggeringRecordUpdated</code>, the value for <code>leftValueReference</code></p>

Field Name	Description
	must be \$Record. When type is ScheduledPath, the value for leftValueReference must be ScheduledPathApiName.
type	<p><b>Field Type</b> FlowTestParameterType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>The type of parameter.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• InputTriggeringRecordInitial</li> <li>• InputTriggeringRecordUpdated</li> <li>• ScheduledPath—Available in API version 56.0 and later.</li> </ul>
value	<p><b>Field Type</b> <a href="#">FlowTestReferenceOrValue</a></p> <p><b>Description</b></p> <p>Required.</p> <p>The value that the operator applies to the resource reference in the leftValueReference field.</p>

## Declarative Metadata Sample Definition

The following is an example of a FlowTest component.

```
<?xml version="1.0" encoding="UTF-8"?>
<FlowTest xmlns="http://soap.sforce.com/2006/04/metadata">
  <flowApiName>Example_Test</flowApiName>
  <label>Test Two</label>
  <testPoints>
    <elementApiName>Start</elementApiName>
    <parameters>
      <leftValueReference>$Record</leftValueReference>
      <type>InputTriggeringRecordInitial</type>
      <value>
<subjectValue>{'&quot;AnnualRevenue&quot;;:100000,&quot;BillingCity&quot;;:&quot;New
York&quot;;}&lt;/subjectValue>
      </value>
    </parameters>
  </parameters>
  <leftValueReference>ScheduledPathApiName</leftValueReference>
  <type>ScheduledPath</type>
  <value>Every_Monday</value>
</parameters>
</parameters>
```

```

        <leftValueReference>$Record</leftValueReference>
        <type>InputTriggeringRecordUpdated</type>
        <value>

<subjectValue>{&quot;AnnualRevenue&quot;;:100000,&quot;BillingCity&quot;;:&quot;New
York&quot;};}</subjectValue>
        </value>
        </parameters>
    </testPoints>
    <testPoints>
        <assertions>
            <conditions>
                <leftValueReference>$Record.Industry</leftValueReference>
                <operator>EqualTo</operator>
                <rightValue>
                    <stringValue>Other</stringValue>
                </rightValue>
            </conditions>
            <errorMessage>Industry was not set.</errorMessage>
        </assertions>
        <elementApiName>Finish</elementApiName>
    </testPoints>
</FlowTest>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Test_Two</members>
    <name>FlowTest</name>
  </types>
  <version>55.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Folder

---

Represents a folder. This type extends the Metadata metadata type and inherits its `fullName` field.

Five folder types currently exist in Salesforce:

- Document folder
- Email folder (available for Salesforce Classic email templates only)
- Email Template folder
- Report folder
- Dashboard folder

Folder type names end with the “Folder” suffix. For example, the type name of a document folder is “DocumentFolder”.

## File Suffix and Directory Location

Folders are stored in the corresponding component directory of the package. These directories are named `documents`, `email`, `emailTemplates`, `reports`, and `dashboards`. Folders don’t have a text file representation—they’re containers for files. For each folder, an accompanying metadata file named `FolderName.folderType-meta.xml` is created at the same directory level. The `FolderName.folderType-meta.xml` metadata file contains the metadata information for that folder, such as the `accessType`. For example, for a documents folder named `sampleFolder`, there’s a `sampleFolder.documentFolder-meta.xml` within the `documents` folder of the package.

## Version

Folders are available in API version 11.0 and later.

## Fields

This metadata type contains the following fields:

Field Name	Field Type	Description
<code>accessType</code>	FolderAccessTypes (enumeration of type string)	Required. The type of access for this folder. Valid values are: <ul style="list-style-type: none"> <li><code>Shared</code>. This folder is accessible only by the specified set of users.</li> <li><code>Public</code>. This folder is accessible by all users, including portal users.</li> <li><code>PublicInternal</code>. This folder is accessible by all users, excluding portal users. This setting is available for report and dashboard folders in organizations with a partner portal or Customer Portal enabled.</li> <li><code>Hidden</code>. This folder is hidden from all users.</li> </ul>
<code>fullName</code>	string	The name used as a unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component.
<code>name</code>	string	Required. The name of the document folder.
<code>publicFolderAccess</code>	PublicFolderAccess (enumeration of type string)	If <code>Public</code> is the value for <code>accessType</code> , this field indicates the type of access all users have to the contents of the folder. Valid values include: <ul style="list-style-type: none"> <li><code>ReadOnly</code>. All users can read the contents of the folder, but no user can change the contents.</li> <li><code>ReadWrite</code>. All users can read or change the contents of the folder.</li> </ul>
<code>sharedTo</code>	<a href="#">SharedTo</a>	Sharing access for the folder. See <a href="#">Sharing Considerations</a> in Salesforce Help.

## Declarative Metadata Sample Definition

The following is the package manifest definition of a document folder that contains a document:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>basic</fullName>
  <types>
    <members>sampleFolder</members>
    <members>sampleFolder/TestDocument.txt</members>
    <name>Document</name>
  </types>
  <version>62.0</version>
</Package>
```

The following is an example of the `sampleFolder-meta.xml` metadata file for the `sampleFolder` document folder:

```
<?xml version="1.0" encoding="UTF-8"?>
<DocumentFolder xmlns="http://soap.sforce.com/2006/04/metadata">
  <accessType>Public</accessType>
  <name>sampleFolder</name>
  <publicFolderAccess>ReadWrite</publicFolderAccess>
</DocumentFolder>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

### 1. FolderShare

Represents the settings for enhanced analytics folder sharing. Users can control access to reports or dashboards by giving others Viewer, Editor, or Manager access to the folder that contains the report or dashboard.

SEE ALSO:

- [Dashboard](#)
- [Document](#)
- [EmailTemplate](#)
- [Report](#)

## FolderShare

Represents the settings for enhanced analytics folder sharing. Users can control access to reports or dashboards by giving others Viewer, Editor, or Manager access to the folder that contains the report or dashboard.

 **Important:** During package installation, FolderShare for DashboardFolder and ReportFolder is ignored.

## File Suffix and Directory Location

FolderShare objects are stored in the `reports` and `dashboards` directories. For each report or dashboard folder it contains, there's a metadata file named `FolderName-meta.xml`. The `FolderName-meta.xml` metadata file contains the metadata information for that folder, such as the `accessLevel`. For example, if the `reports` directory contains a reports folder named `myReportsFolder`, it also has a `myReportsFolder-meta.xml` file at the same level as `myReportsFolder`.

## Version

FolderShare components are available in API version 28 and later.

## Fields

Field Name	Field Type	Description
<code>accessLevel</code>	FolderShareAccessLevel ( <a href="#">enumeration</a> of type string)	Required. Specifies the combination of actions that can be taken on the folder. Valid values are: <ul style="list-style-type: none"> <li><code>view</code>. User can run a report or refresh a dashboard, but can't edit them. All users have at least Viewer access to report and dashboard folders that have been shared with them. (Some users can have administrative permissions that give them greater access.)</li> <li><code>EditAllContents</code>. Users can view and modify the reports or dashboards in the folder, and move them to and from any other folders that they have equivalent access to.</li> <li><code>Manage</code>. Users can do everything Viewers and Editors can do, plus control other users' access to a folder.</li> </ul>
<code>sharedTo</code>	string	Required. Specifies the user, group, or role that has the specified access level to the folder.
<code>sharedToType</code>	FolderSharedToType ( <a href="#">enumeration</a> of type string)	Required. Specifies the type of entity that the folder is shared with. Valid values are: <ul style="list-style-type: none"> <li><code>Group</code>. Users in a specified public group have the specified access level to the folder.</li> <li><code>Manager</code>. Available in API version 29.0 and later.</li> <li><code>ManagerAndSubordinatesInternal</code>. Available in API version 29.0 and later.</li> <li><code>Role</code>. Users with a specified role have the specified access level to the folder.</li> <li><code>RoleAndSubordinates</code>. Users with a specified role, and users with a role subordinate to that role, have the specified access level to the folder. In production orgs created before February 8, 2024 and in non-preview sandboxes, this value is available by default. In orgs created on February 8, 2024 or later and in preview sandboxes, this value is only available after digital experiences is enabled.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>RoleAndSubordinatesInternal</code>. Users with a specified role and users with a role subordinate to that role, except public portal users, have the specified access level to the folder. In orgs created on February 8, 2024 or later and in preview sandboxes, this value is available by default. In production orgs created before February 8, 2024 and in non-preview sandboxes, this value is available after digital experiences or portals are enabled.</li> <li>• <code>Organization</code>. All internal users have the specified access level to the folder.</li> <li>• <code>Territory</code>. Users in a specified territory have the specified access level to the folder.</li> <li>• <code>TerritoryAndSubordinates</code>. Users in a specified territory, and users in territories subordinate to the specified territory, have the specified access level to the folder.</li> <li>• <code>AllPrmUsers</code>. All PRM Portal users have the specified level of access to the folder.</li> <li>• <code>User</code>. The specified individual user has the specified level of access to the folder.</li> <li>• <code>PartnerUser</code>. The specified individual user of a partner portal has the specified level of access to the folder.</li> <li>• <code>AllCspUsers</code>. All Customer Success Portal users have the specified level of access to the folder.</li> <li>• <code>CustomerPortalUser</code>. The specified individual user of a customer portal has the specified level of access to the folder.</li> <li>• <code>PortalRole</code>. Users with a specified role in a portal have the specified access level to the folder.</li> <li>• <code>PortalRoleAndSubordinates</code>. Portal users with a specified role, and portal users with a role subordinate to that role, have the specified access level to the folder.</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a FolderShare component for a dashboard folder:

```
<?xml version="1.0" encoding="UTF-8"?>
<DashboardFolder xmlns="http://soap.sforce.com/2006/04/metadata">
  <folderShares>
    <accessLevel>View</accessLevel>
    <sharedTo>R1</sharedTo>
    <sharedToType>Role</sharedToType>
  </folderShares>
</DashboardFolder>
```

Here's an example of a FolderShare component for a report folder:

```
<?xml version="1.0" encoding="UTF-8"?>
<ReportFolder xmlns="http://soap.sforce.com/2006/04/metadata">
  <folderShares>
    <accessLevel>View</accessLevel>
    <sharedTo>R1</sharedTo>
    <sharedToType>Role</sharedToType>
  </folderShares>
</ReportFolder>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ForecastingFilter

---

Represents the custom filter for including or excluding data from opportunity forecasts.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

ForecastingFilter components have the suffix `.forecastingFilter` and are stored in the `forecastingFilters` folder.

## Version

ForecastingFilter components are available in API version 55.0 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
<code>filterLogic</code>	<b>Field Type</b> string

Field Name	Description
	<p><b>Description</b></p> <p>The logic that controls the evaluation of conditions. Only AND is supported. For example, 1 AND 2 AND 3.</p>
forecastingType	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The ID of the forecast type. Can be linked only to forecast types created in Summer '21 and later.</p>
forecastingTypeSource	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The ID of the forecast type source. Can be linked only to forecast type sources created in Summer '21 or later and with a forecast source definition with source object of 'Opportunity.'</p>
masterLabel	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The label for this object, which displays in Setup. The label is in the default language locale for the organization. If there's no default language locale, the label is in en_US.</p>

## Declarative Metadata Sample Definition

The following is an example of a ForecastingFilter component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ForecastingFilter xmlns="http://soap.sforce.com/2006/04/metadata">
  <filterLogic>1 AND 2</filterLogic>
  <forecastingType>d</forecastingType>
  <forecastingTypeSource>d7</forecastingTypeSource>
  <masterLabel>FF_OpportunityLineItem</masterLabel>
</ForecastingFilter>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ForecastingFilter</name>
  </types>
  <version>55.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ForecastingFilterCondition

---

Represents the custom filter condition logic for including or excluding data from opportunity forecasts.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

ForecastingFilterCondition components have the suffix `.ForecastingFilterCondition` and are stored in the `ForecastingFilterConditions` folder.

### Version

ForecastingFilterCondition components are available in API version 55.0 and later.

### Special Access Rules

There are no additional access requirements that are specific to this type.

### Fields

Field Name	Description
<code>fieldName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the opportunity field to be filtered.</p>
<code>forecastingFilter</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The ID of the forecast filter.</p>
<code>forecastingSourceDefinition</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>The ID of the forecasting source definition.</p>
masterLabel	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The label for this object, which displays in Setup. The label is in the default language locale for the organization. If there's no default language locale, the label is in en_US.</p>
operation	<p><b>Field Type</b></p> <p>FilterOperation (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. The operator in the filter condition. Possible values are:</p> <ul style="list-style-type: none"> <li>• equals</li> <li>• greaterOrEqual—greater than or equal to</li> <li>• greaterThan</li> <li>• lessOrEqual—less than or equal to</li> <li>• lessThan</li> <li>• notEqual—not equal to</li> </ul>
sortOrder	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Required. The index value for the condition. This value represents the condition in the <code>FilterLogic</code> field on the <code>ForecastingFilter</code> object. For example, 1.</p>
value	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The value of the filter condition. If multiple values are specified, they must be separated by a comma delimiter.</p> <p> <b>Note:</b> If you have multiple currencies enabled, and add a custom filter on a currency field as part of your forecast type definition, the corporate currency at the time the filter was created is used. If you have a single currency enabled, the absolute value is used in your filter condition.</p>

## Declarative Metadata Sample Definition

The following is an example of a `ForecastingFilterCondition` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ForecastingFilterCondition xmlns="http://soap.sforce.com/2006/04/metadata">
```

```

    <colName>mostlikely</colName>
    <fieldName>Amount</fieldName>
    <forecastingFilter>d</forecastingFilter>
    <forecastingSourceDefinition>d7</forecastingSourceDefinition>
    <masterLabel>FFC_Opportunity</masterLabel>
    <operation>greaterThan</masterLabel>
    <sortOrder>1</masterLabel>
    <value>100000</value>
  </ForecastingFilterCondition>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ForecastingFilterCondition</name>
  </types>
  <version>55.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Usage

A forecast type can contain up to three filter conditions.

## ForecastingSourceDefinition

---

Represents the object, measure, date type, and hierarchy that a forecast uses to project sales.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`ForecastingSourceDefinition` components have the suffix `.forecastingSourceDefinition` and are stored in the `forecastingSourceDefinitions` folder.

## Version

`ForecastingSourceDefinition` components are available in API version 52.0 and later.

## Fields

Field Name	Field Type	Description
categoryField	string	Name of the forecast category that is associated with the forecast type. Possible values are: <ul style="list-style-type: none"> <li>• <code>Opportunity.ForecastCategoryName</code></li> </ul>
dateField	string	Field that is used for the forecast type's date type. For example, the <code>CloseDate</code> field on Opportunity is used for opportunity close date-based forecast types. Possible values are: <ul style="list-style-type: none"> <li>• <code>Opportunity.CloseDate</code></li> <li>• <code>OpportunityLineItem.ServiceDate</code></li> <li>• <code>OpportunityLineItemSchedule.ScheduleDate</code></li> </ul>
familyField	string	Use this field to group forecasts by product family. Possible values are: <ul style="list-style-type: none"> <li>• <code>Product2.Family</code></li> </ul>
masterLabel	string	Required. Controlling label for this forecasting source definition.
measureField	string	Field that is used for the forecast type's measure. For example, the <code>Amount</code> field on Opportunity is associated with revenue-based forecast types. Possible values are*: <ul style="list-style-type: none"> <li>• <code>Opportunity.Amount</code></li> <li>• <code>Opportunity.<b>Custom</b></code></li> <li>• <code>Opportunity.TotalOpportunityQuantity</code></li> <li>• <code>OpportunityLineItem.<b>Custom</b></code></li> <li>• <code>OpportunityLineItem.Quantity</code></li> <li>• <code>OpportunityLineItem.TotalPrice</code></li> <li>• <code>OpportunityLineItemSchedule.<b>Custom</b></code></li> <li>• <code>OpportunityLineItemSchedule.Quantity</code></li> <li>• <code>OpportunityLineItemSchedule.Revenue</code></li> <li>• <code>OpportunitySplit.<b>Custom</b></code></li> <li>• <code>OpportunitySplit.SplitAmount</code></li> </ul> <p>*Where <i>Custom</i> represents the name of the custom field that a forecast type's measure is based on. Example: Use <code>Megawatts__c</code> to forecast energy consumption.</p>
sourceObject	string	Required. Object associated with this forecasting source definition. Possible values are: <ul style="list-style-type: none"> <li>• <code>Opportunity</code></li> <li>• <code>OpportunityLineItem</code></li> <li>• <code>OpportunityLineItemSchedule</code></li> <li>• <code>OpportunitySplit</code></li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>Product2</li> </ul>
territory2Field	string	<p>For a territory-based forecast type, indicates the field that is used for territory information. Possible values are:</p> <ul style="list-style-type: none"> <li>Opportunity.Territory2Id</li> </ul> <p>For user role-based forecast types, this value is null.</p>
userField	string	<p>Specifies who owns the forecast. Possible values are:</p> <ul style="list-style-type: none"> <li>Opportunity.OwnerId</li> <li>OpportunitySplit.SplitOwnerId</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a ForecastingSourceDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ForecastingSourceDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>TestFsd</masterLabel>
  <sourceObject>Opportunity</sourceObject>
  <measureField>Opportunity.Amount</measureField>
  <dateField>Opportunity.CloseDate</dateField>
  <userField>Opportunity.OwnerId</userField>
  <categoryField>Opportunity.ForecastCategoryName</categoryField>
</ForecastingSourceDefinition>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ForecastingSourceDefinition</name>
  </types>
  <version>52.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Usage

- Forecast types that were available before API version 52.0 can be activated, deactivated, and deleted but not created. To enable an existing forecast type, update the active flag.

- Forecast types that are available only in API version 52.0 and later can be created, activated, deactivated, and deleted. If the forecast type doesn't exist, it is created in the inactive state. If the forecast type exists, the active flag is updated. Deploy the zip file twice to create and activate the forecast type.
- Deploy Metadata API types in the following sequence: ForecastingSettings, ForecastingType, ForecastingSourceDefinition, and then ForecastingTypeSource. If all are specified in the package file, the sequence is followed automatically.

## ForecastingType

---

Represents a forecast type.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`ForecastingType` components have the suffix `.forecastingType` and are stored in the `forecastingTypes` folder.

### Version

ForecastingType components are available in API version 52.0 and later.

### Fields

Field Name	Field Type	Description
<code>active</code>	boolean	Required. If <code>true</code> , the forecast type is active. If <code>false</code> , the forecast type isn't active. The default value is <code>false</code> .
<code>amount</code>	boolean	Required. If <code>true</code> , the forecast type is based on a revenue measure. If <code>false</code> , the forecast type is based on a quantity measure. The default value is <code>true</code> .
<code>dateType</code>	string	<p>Required. The date type that forecast amounts are based on.</p> <ul style="list-style-type: none"> <li><code>OpportunityCloseDate</code>: Base forecasts on opportunity close dates.</li> <li><code>ProductDate</code>: Base forecasts on opportunity product line item dates, if available.</li> <li><code>ScheduleDate</code>: Base forecasts on opportunity product schedule dates, if available.</li> </ul> <p>The following values are available in API version 52.0 and later, in Performance Edition and in Unlimited Edition with Sales Cloud.</p>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>OLIMeasureCloseDateOnly</code>: Base forecasts on opportunity close dates.</li> <li>• <code>ProductDateOnly</code>: Base forecasts on opportunity product line item dates, if available.</li> <li>• <code>ScheduleDateOnly</code>: Base forecasts on opportunity product schedule dates, if available.</li> </ul>
<code>developerName</code>	string	Required. The name of the forecasting type. The <code>DeveloperName</code> is called <code>name</code> in <a href="#">ForecastingSettings</a> on page 1806 and Forecasting Type in custom reports.
<code>forecastingGroupDeveloperName</code>	string	Indicates the forecast group assigned to the forecast type. Required if <code>hasCustomGroup</code> is <code>true</code> .
<code>hasCustomGroup</code>	boolean	Indicates whether the forecasting type has a forecast group, based on a custom picklist assigned. Use <code>ForecastingGroup</code> and <code>ForecastingGroupItems</code> subtypes in <a href="#">ForecastingSettings</a> to identify the group and the values.
<code>hasProductFamily</code>	boolean	Required. If <code>true</code> , the forecast type includes product families. If <code>false</code> , the forecast type doesn't include product families. The default value is <code>false</code> .
<code>masterLabel</code>	string	Required. Controlling label for this <code>ForecastingType</code> value. This display value is the internal label that doesn't get translated.
<code>opportunitySplitType</code>	string	Indicates whether the forecasting type has a split type and, if so, the name of the split type.
<code>opptyLineItemSplitType</code>	string	Indicates whether the forecasting type has an opportunity line item (product) split type and, if so, the name of the line item split type. Available in API version 58.0 and later.
<code>quantity</code>	boolean	Required. If <code>true</code> , the forecast type is based on a quantity measure. If <code>false</code> , the forecast type is based on a revenue measure. The default value is <code>false</code> .
<code>roleType</code>	string	Required. Indicates whether the role type has a <code>ForecastingType</code> , and if so, which <code>ForecastingType</code> . Possible values are <code>R</code> (user role-based forecast type) and <code>Y</code> (Territory2-based forecast type).
<code>territory2Model</code>	string	Indicates whether the <code>ForecastingType</code> has a <code>Territory2</code> model and, if so, the name of the <code>Territory2</code> model.

## Declarative Metadata Sample Definition

The following is an example of a `ForecastingType` component using the role hierarchy.

```
<?xml version="1.0" encoding="UTF-8"?>
<ForecastingType xmlns="http://soap.sforce.com/2006/04/metadata">
```

```

    <active>false</active>
    <amount>true</amount>
    <dateType>0</dateType>
    <developerName>qqw</developerName>
    <hasProductFamily>false</hasProductFamily>
    <masterLabel>qqw</masterLabel>
    <quantity>false</quantity>
    <roleType>R</roleType>
  </ForecastingType>

```

The following is an example of a ForecastingType component using the territory hierarchy.

```

<?xml version="1.0" encoding="UTF-8"?>
<ForecastingType xmlns="http://soap.sforce.com/2006/04/metadata">
  <active>false</active>
  <amount>false</amount>
  <dateType>0</dateType>
  <developerName>New_Model6</developerName>
  <hasProductFamily>false</hasProductFamily>
  <masterLabel>Opportunity Quantity by Territory</masterLabel>
  <quantity>true</quantity>
  <roleType>Y</roleType>
  <territory2Model>New_Model6</territory2Model>
</ForecastingType>

```

The following is an example of a ForecastingType component using an opportunity split type.

```

<?xml version="1.0" encoding="UTF-8"?>
<ForecastingType xmlns="http://soap.sforce.com/2006/04/metadata">
  <active>false</active>
  <amount>true</amount>
  <dateType>0</dateType>
  <developerName>split12</developerName>
  <hasProductFamily>false</hasProductFamily>
  <masterLabel>split12</masterLabel>
  <opportunitySplitType>Custom_Revenue</opportunitySplitType>
  <quantity>false</quantity>
  <roleType>R</roleType>
</ForecastingType>

```

The following is an example of a ForecastingType component using an opportunity line item split type.

```

<?xml version="1.0" encoding="UTF-8"?>
<ForecastingType xmlns="http://soap.sforce.com/2006/04/metadata">
  <active>true</active>
  <amount>true</amount>
  <dateType>0</dateType>
  <developerName>productrevenuesplit</developerName>
  <hasProductFamily>true</hasProductFamily>
  <masterLabel>productrevenuesplit</masterLabel>
  <opportunitySplitType>Revenue</opportunitySplitType>
  <opptyLineItemSplitType>Revenue</opptyLineItemSplitType>
  <quantity>false</quantity>
  <roleType>R</roleType>
</ForecastingType>

```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ForecastingType</name>
  </types>
  <version>52.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Usage

- Legacy forecast types that were available before API version 52.0 can be deactivated but not activated, created, or deleted.
- Forecast types that are available only in API version 52.0 and later can be created, activated, deactivated, and deleted. If the forecast type doesn't exist, it's created in the inactive state. If the forecast type exists, the active flag is updated. Deploy the zip file twice to create and activate the forecast type.
- Deploy Metadata API types in this sequence: ForecastingSettings, ForecastingType, ForecastingSourceDefinition, and then ForecastingTypeSource. If all are specified in the package file, the sequence is followed automatically.

## ForecastingTypeSource

---

Represents the mapping of a forecasting source definition to a forecast type.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`ForecastingTypeSource` components have the suffix `.forecastingTypeSource` and are stored in the `ForecastingTypeSources` folder.

## Version

`ForecastingTypeSource` components are available in API version 52.0 and later.

## Fields

Field Name	Field Type	Description
forecastingSourceDefinition	string	Required. ID of the forecasting source definition.
forecastingType	string	Required. ID of the forecast type. Can be linked only to forecast types created in Summer '21 and later.
masterLabel	string	Required. Controlling label for this forecasting type source.
parentSourceDefinition	string	For forecast types not based on the Opportunity object and not based on a custom measure, this value represents the parent ForecastingSourceDefinition of the linked ForecastingSourceDefinition. <ul style="list-style-type: none"> <li>Opportunity Product is the parent of Opportunity.</li> <li>Opportunity Split is the parent of Opportunity.</li> <li>Line Item Schedule is the parent of Opportunity Product.</li> </ul>
relationField	string	Represents the field that links the source objects of the parent ForecastingSourceDefinition to the child ForecastingSourceDefinition. Possible values are: <ul style="list-style-type: none"> <li>OpportunityLineItem.OpportunityId</li> <li>OpportunityLineItem.Product2Id</li> <li>OpportunityLineItemSchedule.OpportunityLineItemId</li> <li>OpportunitySplit.OpportunityId</li> </ul>
sourceGroup	int	Required. Represents a grouping of forecasting source definitions.

## Declarative Metadata Sample Definition

The following are two examples of a ForecastingTypeSource component. The first bases forecasts on the Opportunity Product object. The second bases forecasts on the Line Item Schedule object.

```
<?xml version="1.0" encoding="UTF-8"?>
<ForecastingTypeSource xmlns="http://soap.sforce.com/2006/04/metadata">
  <forecastingSourceDefinition>FSD_OpportunityLineItem</forecastingSourceDefinition>
  <forecastingType>d</forecastingType>
  <masterLabel>ForecastingTypeSource_d7</masterLabel>
  <parentSourceDefinition>FSD_OpportunityLineItemSchedule1</parentSourceDefinition>
  <relationField>OpportunityLineItemSchedule.OpportunityLineItemId</relationField>
  <sourceGroup>1</sourceGroup>
</ForecastingTypeSource>
```

```
<?xml version="1.0" encoding="UTF-8"?>
<ForecastingTypeSource xmlns="http://soap.sforce.com/2006/04/metadata">
<forecastingSourceDefinition>FSDOpportunityLineItemSchedule</forecastingSourceDefinition>

  <forecastingType>c3</forecastingType>
  <masterLabel>ForecastingTypeSource_c37syR</masterLabel>
```

```
<sourceGroup>1</sourceGroup>
</ForecastingTypeSource>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ForecastingTypeSource</name>
  </types>
  <version>52.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Usage

- Forecast types that were available before API version 52.0 can be activated, deactivated, and deleted but not created. To enable an existing forecast type, update the active flag.
- Forecast types that are available only in API version 52.0 and later can be created, activated, deactivated, and deleted. If the forecast type doesn't exist, it is created in the inactive state. If the forecast type exists, the active flag is updated. Deploy the zip file twice to create and activate the forecast type.
- Deploy Metadata API types in the following sequence: `ForecastingSettings`, `ForecastingType`, `ForecastingSourceDefinition`, and then `ForecastingTypeSource`. If all are specified in the package file, the sequence is followed automatically.

## FuelType

---

Represents a custom fuel type in an org.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

FuelType components have the suffix `.fuelType` and are stored in the `fuelTypes` folder.

## Version

FuelType components are available in API version 57.0 and later.

## Special Access Rules

The Net Zero Cloud permission set license is required to access this object along with the user access for carbon accounting and org access for custom fuels and unit of measures (UOMs).

## Fields

Field Name	Description
<code>description</code>	<b>Field Type</b> string <b>Description</b> Description about the fuel type.
<code>isActive</code>	<b>Field Type</b> boolean <b>Description</b> Indicates whether the fuel type is active ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>isProtected</code>	<b>Field Type</b> boolean <b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type. The default value is <code>false</code> .
<code>isStationaryAssetFuel</code>	<b>Field Type</b> boolean <b>Description</b> Indicates whether the fuel type is used in stationary assets ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>isVehicleAssetFuel</code>	<b>Field Type</b> boolean <b>Description</b> Indicates whether the fuel type is used in a vehicle asset ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>masterLabel</code>	<b>Field Type</b> string <b>Description</b> Required.

Field Name	Description
	A user-friendly name for FuelType, which is defined when the FuelType is created.

## Declarative Metadata Sample Definition

The following is an example of a FuelType component.

```
<?xml version="1.0" encoding="UTF-8"?>
<FuelType xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>This is Petrol Fuel Type</description>
  <isProtected>true</isProtected>
  <isActive>true</isActive>
  <isStationaryAssetFuel>true</isStationaryAssetFuel>
  <isVehicleAssetFuel>true</isVehicleAssetFuel>
  <masterLabel>Petrol</masterLabel>
</FuelType>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Petrol</members>
    <members>Diesel</members>
    <members>Kerosine</members>
    <name>FuelType</name>
  </types>
  <version>57.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## FuelTypeSustnUom

Represents a mapping between the custom fuel types and their corresponding unit of measure (UOM) values defined by a customer in an org.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

FuelTypeSustnUom components have the suffix `.fuelTypeSustnUom` and are stored in the `fuelTypeSustnUoms` folder.

## Version

FuelTypeSustnUom components are available in API version 57.0 and later.

## Special Access Rules

The Net Zero Cloud permission set license is required to access this object along with the user access for carbon accounting and org access for custom fuels and UOMs.

## Fields

Field Name	Description
<code>fuelType</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the fuel type that's mapped to the unit of measure. Possible values are:</p> <ul style="list-style-type: none"> <li>• AutogasLPG</li> <li>• Biodiesel</li> <li>• Biomass</li> <li>• CityGas</li> <li>• CompressedNaturalGasCNG</li> <li>• Cooling</li> <li>• Diesel</li> <li>• Electricity</li> <li>• Ethanol</li> <li>• FuelOil</li> <li>• Gasoline</li> <li>• Heat</li> <li>• HeavyOil</li> <li>• ITElectricity</li> <li>• JetFuel</li> <li>• Kerosene</li> <li>• LightOil</li> <li>• LiquidNaturalGasLNG</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• MobileDiesel</li> <li>• NaturalGas</li> <li>• Propane</li> <li>• Refrigerant</li> <li>• Steam</li> </ul>
isProtected	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type. The default value is <code>false</code>.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> A user-friendly name for FuelTypeSustnUom, which is defined when the FuelTypeSustnUom is created.</p>
unitOfMeasure	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The unit of measure that's mapped to the fuel type. Possible values are:</p> <ul style="list-style-type: none"> <li>• 1000m3</li> <li>• GJ</li> <li>• GWh</li> <li>• Kiloliters</li> <li>• Liters</li> <li>• MJ</li> <li>• MMBtu</li> <li>• MWh</li> <li>• Therms</li> <li>• Tonnes</li> <li>• UkGallons</li> <li>• UsGallons</li> <li>• ccf</li> <li>• kG</li> <li>• kWh</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• kcal</li> <li>• lbs</li> <li>• longTons</li> <li>• m3</li> <li>• shortTons</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a FuelTypeSustnUom component.

```
<?xml version="1.0" encoding="UTF-8"?>
<FuelTypeSustnUom xmlns="http://soap.sforce.com/2006/04/metadata">
  <fuelType>FuelOil</fuelType>
  <isProtected>>false</isProtected>
  <masterLabel>FuelOil_Liters</masterLabel>
  <unitOfMeasure>Liters</unitOfMeasure>
</FuelTypeSustnUom>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>Pkg</fullName>
  <types>
    <members>FuelOil_Liters</members>
    <members>Gas_1000m3</members>
    <members>Heat_kWh</members>
    <name>FuelTypeSustnUom</name>
  </types>
  <version>57.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## FunctionReference

Represents information about a deployed Salesforce Function that can be invoked from the org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

FunctionReference does not support direct access and should be managed using Salesforce CLI commands associated with Functions. A FunctionReference component file has the suffix `.functions` and is stored in the `functions` directory.

## Version

FunctionReference components are available in API version 52.0 and later.

## Special Access Rules

FunctionReference components can't be used directly. Always use Salesforce CLI commands associated with Functions to properly deploy Functions and associate Functions with orgs. Attempting to manipulate FunctionReference components directly without using Functions CLI commands is not supported.

## Fields

Field Name	Field Type	Description
description	string	Represents the description of the Salesforce Function.
label	string	Represents the label for the Salesforce Function.
permissionSet	string	Represents a set of permissions that's used to control org resources that the Function has access to.

## FundraisingConfig

---

Represents a collection of settings to configure the fundraising product.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

FundraisingConfig components have the suffix `.fundraisingConfig` and are stored in the `fundraisingConfigs` folder.

## Version

FundraisingConfig components are available in API version 58.0 and later.

## Special Access Rules

Your org must have Fundraising Access license as a part of the Nonprofit Cloud to access this object.

## Fields

Field Name	Description
donorMatchingMethod	<p><b>Field Type</b> DonorMatchingMethod (enumeration of type string)</p> <p><b>Description</b> Reserved for future use.</p>
failedTransactionCount	<p><b>Field Type</b> int</p> <p><b>Description</b> The count of consecutive failed past transactions before the gift commitment status is changed to Failing. If set to 0, the status is never auto-changed to Failing.</p>
householdSoftCreditRole	<p><b>Field Type</b> string</p> <p><b>Description</b> Reserved for future use.</p>
installmentExtDayCount	<p><b>Field Type</b> int</p> <p><b>Description</b> The duration in the number of days before or after an unpaid transaction in a gift commitment is marked as another installment in the gift commitment schedule. The unpaid transaction within the grace period is considered a gift transaction.</p>
isHshldSoftCrAutoCrea	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Reserved for future use.</p>
lapsedUnpaidTrxnCount	<p><b>Field Type</b> int</p> <p><b>Description</b> The count of consecutive unpaid past transactions before the gift commitment status is changed to Lapsed. If set to 0, the status is never auto-changed to Lapsed.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> A user-friendly name for FundraisingConfig, which is defined when the FundraisingConfig is created.</p>

Field Name	Description
shouldClosePaidRcrCmt	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to automatically close a recurring gift commitment when it has no ongoing or future schedule and no unpaid transaction (<code>true</code>) or not (<code>false</code>).  The default value is <code>false</code>. Available in API version 59.0 and later.</p>
shouldCreateRcrSchdTrxn	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the next transaction in a recurring schedule is automatically created (<code>true</code>) or not (<code>false</code>).  The default value is <code>true</code>. Available in API version 59.0 and later.</p>

## Declarative Metadata Sample Definition

The following is an example of a FundraisingConfig component.

```
<?xml version="1.0" encoding="UTF-8"?>
<FundraisingConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <lapsedUnpaidTrxnCount>5</lapsedUnpaidTrxnCount>
  <householdSoftCreditRole>Admin</householdSoftCreditRole>
  <isHshldSoftCrAutoCrea>true</isHshldSoftCrAutoCrea>
  <installmentExtDayCount>7</installmentExtDayCount>
  <donorMatchingMethod>No_Matching</donorMatchingMethod>
  <failedTransactionCount>12</failedTransactionCount>
  <shouldCreateRcrSchdTrxn>true</shouldCreateRcrSchdTrxn>
  <shouldClosePaidRcrCmt>false</shouldClosePaidRcrCmt>
  <masterLabel>MasterLabel</masterLabel>
</FundraisingConfig>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>FundraisingConfig</name>
  </types>
  <version>59.0</version>
</Package>
```

# GatewayProviderPaymentMethodType

---

Represents an entity that allows integrators and payment providers to choose an active payment to receive an order's payment data rather than allowing the Salesforce Order Management platform to select a default payment method. This object is available in API version 51 and later.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Version

gatewayProviderPaymentMethodType components are available in API version 51 and later.

## Special Access Rules

## Fields

Field Name	Description
comment	<p><b>Field Type</b> textarea</p> <p><b>Description</b> Additional details about the gateway provider payment method type record. Max length is 1000 characters.</p>
gtwyProvPaymentMethodType	<p><b>Field Type</b> string</p> <p><b>Description</b> Links the Salesforce payment method to the payment method used in the Salesforce Order Management storefront. Your payment gateway integration uses this field when finding a payment method to link to a payment.</p> <p>The value of <code>GtwyProviderPaymentMethodType</code> must match the payment method value sent to the order's Payment Instrument in Salesforce Order Management.</p> <p>Here are examples of payment method values that Salesforce could receive from Salesforce Order Management.</p> <ul style="list-style-type: none"> <li>• CREDIT_CARD</li> <li>• BASIC_CREDIT</li> <li>• CreditCard</li> <li>• GooglePay</li> <li>• ApplePay</li> </ul>
masterLabel	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. The gateway provider payment method type name that appears in the user interface.</p>
paymentGatewayProvider	<p><b>Field Type</b></p> <p>reference</p> <p><b>Description</b></p> <p>Specifies the payment gateway provider that Salesforce Order Management should use when processing payments. One payment gateway provider can be related to multiple payment method types.</p>
paymentMethodType	<p><b>Field Type</b></p> <p>picklist</p> <p><b>Description</b></p> <p>Specifies the type of payment method used on an order in Salesforce Order Management.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• AlternativePaymentMethod</li> <li>• CardPaymentMethod</li> <li>• DigitalWallet</li> </ul>
recordType	<p><b>Field Type</b></p> <p>reference</p> <p><b>Description</b></p> <p>ID of the record type entity related to the gateway provider payment method type. This is a relationship field.</p>

## Declarative Metadata Sample Definition

The following is an example of a GatewayProviderPaymentMethodType component.

```
<?xml version="1.0" encoding="UTF-8"?>
<GatewayProviderPaymentMethodType xmlns="http://soap.sforce.com/2006/04/metadata">
  <gtwyProviderPaymentMethodType>Klarna</gtwyProviderPaymentMethodType>
  <masterLabel>Test</masterLabel>
  <paymentGatewayProvider>adyen__Adyen</paymentGatewayProvider>
  <paymentMethodType>AlternativePaymentMethod</paymentMethodType>
  <recordType>AlternativePaymentMethod.Klarna</recordType>
</GatewayProviderPaymentMethodType>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
```

```
<types>
  <members>*</members>
  <name>GatewayProviderPaymentMethodType</name>
</types>
<version>51.0</version>
</Package>
```

## GenAiFunction

---

Represents an agent action that can be added to an AI agent.

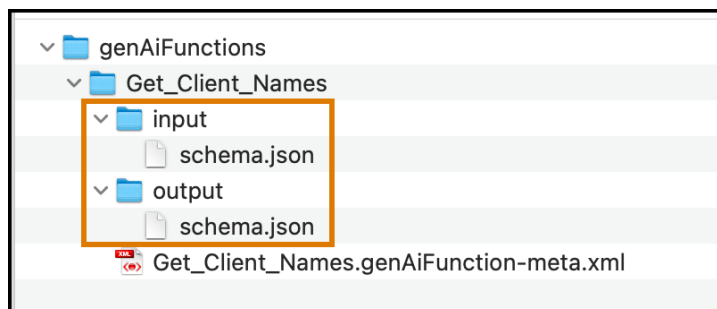

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

GenAiFunction components have the suffix `.genAiFunction` and are stored in the `genAiFunctions` folder.

GenAiFunction components can contain folders for the [input](#) on page 1143 and [output](#) on page 1146 schemas. Here's an example component, showing the schema folders.

See the [Input Folder](#) on page 1143 and [Output Folder](#) on page 1146 sections for more information.

### Version

GenAiFunction components are available in API version 60.0 and later.

### Special Access Rules

GenAiFunction is available only if Einstein Copilot is enabled in your org.

## Fields

Field Name	Description
description	<p><b>Field Type</b> string</p> <p><b>Description</b> A description explaining the general purpose and domain of the action.</p>
invocationTarget	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Target invocation used by invocation operations.</p>
invocationTargetType	<p><b>Field Type</b> PlannerFunctionInvocableTargetType (enumeration of type string)</p> <p><b>Description</b> Required. Invocable action type used by invocation operations. Values are:</p> <ul style="list-style-type: none"> <li>• apex</li> <li>• flow</li> <li>• generatePromptResponse</li> <li>• externalService</li> </ul>
isConfirmationRequired	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether confirmation is required for this action.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The master label for the generative AI action.</p>

## Input Folder

The `input` folder contains a `schema.json` file with the action inputs. Here's a sample input schema file.

```
{
  "required" : ["OwnerId", "Status"],
  "properties" : {
    "OwnerId" : {
      "title" : "Owner Id",
```

```

    "description" : "ID of the Salesforce record that owns the request.",
    "lightning:type" : "lightning__textType",
    "lightning:isPII" : false,
    "copilotAction:isUserInput" : true
  },
  "Status" : {
    "title" : "Request Status",
    "description" : "The status of the contact request.",
    "lightning:type" : "lightning__textType",
    "lightning:isPII" : false,
    "copilotAction:isUserInput" : true
  }
},
"lightning:type" : "lightning__objectType"
}

```

This table describes the properties that you can specify in this JSON file.

Field Name	Description
required	<p><b>Field Type</b> array of strings</p> <p><b>Description</b> A list of all the required properties in the input list.</p>
properties	<p><b>Field Type</b> object</p> <p><b>Description</b> The parent object for all the properties associated with the input.</p>
{ PROPERTY_NAME } (child of properties field)	<p><b>Field Type</b> object</p> <p><b>Description</b> Required. Each property in the <code>properties</code> object must contain the API value corresponding to the input parameter.</p>
title (child of properties.PROPERTY_NAME field)	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The label for the property.</p>
description (child of properties.PROPERTY_NAME field)	<p><b>Field Type</b> string</p> <p><b>Description</b> The description for the property.</p>

Field Name	Description
<p><code>lightning:type</code> (child of <code>properties.PROPERTY_NAME</code> field)</p>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Describes the type of property.</p> <p>Some of the possible values include:</p> <ul style="list-style-type: none"> <li>• <code>lightning__booleanType</code>—Boolean type.</li> <li>• <code>lightning__dateType</code>—Date type.</li> <li>• <code>lightning__dateTimeType</code>—Date and time type. When using this value, you must provide a <code>dateTime</code> string. This field is specified in the format <code>yyyy-MM-dd'T'HH:mm:ss.SSSZ</code>. You can also provide a <code>timeZone</code> string. Use the <code>timeZone</code> attribute to specify a time zone in the IANA time zone database format.</li> <li>• <code>lightning__integerType</code>—Integer type. When using this value, you can also provide <code>maximum</code> and <code>minimum</code> numbers for this property.</li> <li>• <code>lightning__listType</code>—List type.</li> <li>• <code>lightning__multilineTextType</code>—Multi-line text type. When using this value, you can also provide <code>maxLength</code> and <code>minLength</code> numbers for this property.</li> <li>• <code>lightning__numberType</code>—Number type. When using this value, you can also provide <code>maximum</code> and <code>minimum</code> numbers for this property.</li> <li>• <code>lightning__objectType</code>—Object type. When using this value, you must also provide a <code>properties</code> object that contains the list of subproperties within it.</li> <li>• <code>lightning__recordIdType</code>—Record ID type.</li> <li>• <code>lightning__richTextType</code>—Rich text type. When using this value, you can also provide <code>maxLength</code> and <code>minLength</code> numbers for this property.</li> <li>• <code>lightning__textType</code>—Text type. When using this value, you can also provide <code>maxLength</code> and <code>minLength</code> numbers for this property. The maximum text type length is 250 characters.</li> <li>• <code>lightning__urlType</code>—URL type. When using this value, you can also provide an array of strings in a <code>lightning:allowedURLSchemes</code> field to specify the list of allowed URL schemes.</li> </ul>
<p><code>lightning:isPII</code> (child of <code>properties.PROPERTY_NAME</code> field)</p>	<p><b>Field Type</b> boolean</p>

Field Name	Description
	<p><b>Description</b></p> <p>Indicates whether the property contains personally identifiable information.</p>
<p>copilotAction:isUserInput (child of properties.PROPERTY_NAME field)</p>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the property is presented as user input.</p>
<p>lightning:type</p>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. Describes the type of input. This value should always be lightning__objectType.</p>

## Output Folder

The output folder contains a schema.json file with the action output. Here's a sample output schema file.

```
{
  "properties" : {
    "Id" : {
      "title" : "Contact Request Id",
      "description" : "ID of the Salesforce contact request record.",
      "lightning:type" : "lightning__recordIdType",
      "lightning:isPII" : false,
      "copilotAction:isDisplayable" : true,
      "copilotAction:isUsedByPlanner" : true
    }
  },
  "lightning:type" : "lightning__objectType"
}
```

This table describes the properties that you can specify in this JSON file.

Field Name	Description
<p>properties</p>	<p><b>Field Type</b></p> <p>object</p> <p><b>Description</b></p> <p>The parent object for all the properties associated with the output.</p>
<p>{ PROPERTY_NAME } (child of properties field)</p>	<p><b>Field Type</b></p> <p>object</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. Each property in the <code>properties</code> object must contain the API value corresponding to the output parameter.</p>
<p><code>title</code> (child of <code>properties.PROPERTY_NAME</code> field)</p>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The label for the property.</p>
<p><code>description</code> (child of <code>properties.PROPERTY_NAME</code> field)</p>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The description for the property.</p>
<p><code>lightning:type</code> (child of <code>properties.PROPERTY_NAME</code> field)</p>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. Describes the type of output.</p> <p>Some of the possible values include:</p> <ul style="list-style-type: none"> <li>• <code>lightning__booleanType</code>—Boolean type.</li> <li>• <code>lightning__dateType</code>—Date type.</li> <li>• <code>lightning__dateTimeType</code>—Date and time type. When using this value, you must provide a <code>dateTime</code> string. This field is specified in the format <code>yyyy-MM-dd'T'HH:mm:ss.SSSZ</code>. You can also provide a <code>timeZone</code> string. Use the <code>timeZone</code> attribute to specify a time zone in the IANA time zone database format.</li> <li>• <code>lightning__integerType</code>—Integer type. When using this value, you can also provide <code>maximum</code> and <code>minimum</code> numbers for this property.</li> <li>• <code>lightning__listType</code>—List type.</li> <li>• <code>lightning__multilineTextType</code>—Multi-line text type. When using this value, you can also provide <code>maxLength</code> and <code>minLength</code> numbers for this property.</li> <li>• <code>lightning__numberType</code>—Number type. When using this value, you can also provide <code>maximum</code> and <code>minimum</code> numbers for this property.</li> <li>• <code>lightning__objectType</code>—Object type. When using this value, you must also provide a <code>properties</code> object that contains the list of subproperties within it.</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• <code>lightning__recordIdType</code>—Record ID type.</li> <li>• <code>lightning__richTextType</code>—Rich text type. When using this value, you can also provide <code>maxLength</code> and <code>minLength</code> numbers for this property.</li> <li>• <code>lightning__textType</code>—Text type. When using this value, you can also provide <code>maxLength</code> and <code>minLength</code> numbers for this property. The maximum text type length is 250 characters.</li> <li>• <code>lightning__urlType</code>—URL type. When using this value, you can also provide an array of strings in a <code>lightning:allowedUrlSchemes</code> field to specify the list of allowed URL schemes.</li> </ul>
<p><code>lightning:isPII</code> (child of <code>properties.PROPERTY_NAME</code> field)</p>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the property contains personally identifiable information.</p>
<p><code>copilotAction:isDisplayable</code> (child of <code>properties.PROPERTY_NAME</code> field)</p>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the property is displayable as output.</p>
<p><code>copilotAction:isUsedByPlanner</code> (child of <code>properties.PROPERTY_NAME</code> field)</p>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the property is used by the Einstein Copilot planner. At least one output property must have this value as true or else the planner returns random responses.</p>
<p><code>lightning:type</code></p>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Describes the type of output. This value should always be <code>lightning__objectType</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of a GenAiFunction component.

```
<?xml version="1.0" encoding="UTF-8"?>
<GenAiFunction xmlns="http://soap.sforce.com/2006/04/metadata">
```

```

<description>get tracking information</description>
<invocationTarget>TrackShipment</invocationTarget>
<invocationTargetType>apex</invocationTargetType>
<isConfirmationRequired>>false</isConfirmationRequired>
<masterLabel>get_tracking_info</masterLabel>
</GenAiFunction>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>GenAiFunction</name>
  </types>
  <version>60.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## GenAiPlanner

---

Represents an agent planner service that uses a large language model (LLM) and a reasoning strategy to decompose a given task into smaller subtasks, identify the most suitable actions for each subtask, and invoke them.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

GenAiPlanner components have the suffix `.genAiPlanner` and are stored in the `genAiPlanners` folder.

### Version

GenAiPlanner components are available in API version 60.0 and later.

### Special Access Rules

GenAiPlanner is available only if Einstein Copilot is enabled in your org.

## Fields

Field Name	Description
capabilities	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A set of tags associated with the copilot planner service definition.</p>
description	<p><b>Field Type</b> string</p> <p><b>Description</b> A description explaining the general purpose and domain of the copilot planner service definition.</p>
genAiFunctions	<p><b>Field Type</b> <a href="#">GenAiPlannerFunctionDef[]</a></p> <p><b>Description</b> A list of copilot action definitions.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The master label of the copilot planner service definition.</p>
plannerType	<p><b>Field Type</b> PlannerType (enumeration of type string)</p> <p><b>Description</b> Required. A particular approach to problem solving that is given as prompt instructions to a large language model (LLM). Values are:</p> <ul style="list-style-type: none"> <li>• <code>AiCopilot__ReAct</code>—Uses a reactive planning strategy to solve problems with the LLM. This strategy consists of prompting the LLM to generate the next step in response to an event and the current context. It differs from a sequential planner in that it doesn't plan more than one step ahead of time.</li> <li>• <code>AiCopilot__SequentialPlannerIntentClassifier</code>—Uses an intent classifier prompt and a sequential planner prompt. With each text input, the planner asks the LLM to generate a step-by-step plan to finish the goal. It plans first, then executes.</li> </ul>

## GenAiPlannerFunctionDef

Represents a copilot action definition.

Field Name	Description
genAiFunctionName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The name of the copilot action.</p>

## Declarative Metadata Sample Definition

The following is an example of a GenAiPlanner component.

```
<?xml version="1.0" encoding="UTF-8"?>
<GenAiPlanner xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>Copilot planner description</description>
  <masterLabel>EmployeeCopilotPlanner</masterLabel>
  <plannerType>AiCopilot__SequentialPlannerIntentClassifier</plannerType>
</GenAiPlanner>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>GenAiPlanner</name>
  </types>
  <version>60.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## GenAiPlugin

Represents an agent topic, which is a category of actions related to a particular job to be done by AI agents.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

GenAiPlugin components have the suffix `.genAiPlugin` and are stored in the `genAiPlugins` folder.

## Version

GenAiPlugin components are available in API version 62.0 and later.

## Special Access Rules

GenAiPlugin is available only if Einstein Copilot is enabled in your org.

## Fields

Field Name	Description
description	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of the topic.</p>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  Represents the API name of the topic. Can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
genAiFunctions	<p><b>Field Type</b> <a href="#">GenAiPluginFunctionDef[]</a></p> <p><b>Description</b> A list of functions in the topic.</p>
genAiPluginInstructions	<p><b>Field Type</b> <a href="#">GenAiPluginInstructionDef[]</a></p> <p><b>Description</b> A list of instructions in the topic.</p>
language	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  The language of the topic.</p>
masterLabel	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>The master label for the topic.</p>
pluginType	<p><b>Field Type</b></p> <p>PluginType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• Topic</li> </ul>
scope	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>A specific job description for a topic.</p>

## GenAiPluginFunctionDef

A function in the topic.

Field Name	Description
functionName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The API name of the function.</p>

## Declarative Metadata Sample Definition

The following is an example of a GenAiPlugin component.

```

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>GenAiPlugin</name>
  </types>
  <version>62.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## GenAiPluginInstructionDef

---

Represents a topic instruction.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`GenAiPluginInstructionDef` components are part of a `GenAiPlugin` component and aren't used separately.

### Version

`GenAiPluginInstructionDef` components are available in API version 62.0 and later.

## Special Access Rules

GenAiPluginInstructionDef is available only if Einstein Copilot is enabled in your org.

### Fields

Field Name	Description
description	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Description of the topic instruction.</p>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Represents the API name of the topic instruction. Can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
language	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The language of the topic instruction.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The master label for the topic instruction.</p>

### Declarative Metadata Sample Definition

See [GenAiPlugin](#) on page 1151.

# GenAiPromptTemplate

---

Represents the definition of a prompt template, including its related objects and fields.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`GenAiPromptTemplate` components have the suffix `.genAiPromptTemplate` and are stored in the `genAiPromptTemplates` folder.

## Version

`GenAiPromptTemplate` components are available in API version 60.0 and later.

## Special Access Rules

`GenAiPromptTemplate` is available only if Prompt Builder is enabled in your org and you have the Prompt Template Manager permission. To send `GenAiPromptTemplate` components from one Salesforce org to another, you must use change sets.

## Fields

Field Name	Description
<code>activeVersion</code>	<p><b>Field Type</b> int</p> <p><b>Description</b> Specifies the version number of the active prompt template version.</p>
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> A description of the prompt template.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> A user-friendly name for <code>GenAiPromptTemplate</code>, which is defined when the <code>GenAiPromptTemplate</code> is created.</p>

Field Name	Description
relatedEntity	<p><b>Field Type</b> string</p> <p><b>Description</b> The Salesforce record type that the prompt template is associated with.</p>
relatedField	<p><b>Field Type</b> string</p> <p><b>Description</b> The Salesforce field that the prompt template is associated with.</p>
templateVersions	<p><b>Field Type</b> <a href="#">GenAiPromptTemplateVersion</a> on page 1160[]</p> <p><b>Description</b> An array of prompt template versions.</p>
type	<p><b>Field Type</b> string</p> <p><b>Description</b> Represents the template type that the prompt template is based on. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>einstein_gpt__fieldCompletion</code></li> <li>• <code>einstein_gpt__salesEmail</code></li> <li>• <code>einstein_gpt__recordSummary</code></li> <li>• <code>einstein_gpt__flex</code></li> <li>• <code>einstein_gpt__caseEmailDraft</code></li> </ul>
visibility	<p><b>Field Type</b> GenAiPromptTemplateVisibilityType (<a href="#">enumeration</a> of type string)</p> <p><b>Description</b> Indicates the scope of visibility for the prompt template. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>API</code></li> <li>• <code>Global</code></li> </ul>

## GenAiPromptTemplateVersion

Represents a version of a prompt template.

Field Name	Description
content	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b> Text of the prompt template version.</p>
description	<p><b>Field Type</b> string</p> <p><b>Description</b> Description of the prompt template version.</p>
inputs	<p><b>Field Type</b> <a href="#">GenAiPromptTemplateInput</a> on page 1162[]</p> <p><b>Description</b> An array of prompt template inputs associated with the prompt template version.</p>
primaryModel	<p><b>Field Type</b> string</p> <p><b>Description</b> The model associated with the prompt template version.</p>
status	<p><b>Field Type</b> GenAiPromptTemplateStatus (<a href="#">enumeration</a> of type string)</p> <p><b>Description</b> Indicates the activation status of the prompt template in Prompt Builder. Valid values are:</p> <ul style="list-style-type: none"> <li>• <b>Published</b>—Prompt template appears as Active in Prompt Builder. Published prompt templates can't be edited in Salesforce, but are currently editable from the Metadata API. We recommend that you don't edit published prompt templates from the API.</li> <li>• <b>Draft</b>—Prompt Template appears as Inactive in Prompt Builder.</li> </ul>
templateDataProviders	<p><b>Field Type</b> <a href="#">GenAiPromptTemplateDataProvider</a> on page 1162[]</p> <p><b>Description</b> An array of prompt template data providers associated with the prompt template version.</p>
versionNumber	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. Version number of the prompt template version. Versions are counted sequentially from 1.</p>

## GenAiPromptTemplateInput

Represents an input for a prompt template, such as a Salesforce record, field, or Apex primitive data type.

Field Name	Description
<code>apiName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the prompt template input parameter.</p>
<code>definition</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The URI definition of the input parameter. For example, <code>SOBJECT://Account</code> and <code>SOBJECT://Account/Description</code>.</p>
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Description of the prompt template input parameter.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> A user-friendly name for <code>GenAiPromptTemplateInput</code>, which is defined when the <code>GenAiPromptTemplateInput</code> is created.</p>
<code>referenceName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the prompt template input to use in expressions. For example, <code>Input:Recipient</code> and <code>Input:Sender&lt;/referenceName&gt;</code>.</p>
<code>required</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Specifies whether this input parameter is required (<code>true</code>) or optional (<code>false</code>).</p>

## GenAiPromptTemplateDataProvider

Represents a source of data for a prompt template version, such as an invocable action, flow, or Apex method.

Field Name	Description
definition	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The URI definition of the data provider, such as <code>flow://ns__CallToActionFlow</code>.</p>
parameters	<p><b>Field Type</b> <a href="#">GenAiPromptTemplateDataProviderParam</a> on page 1163</p> <p><b>Description</b> An array of parameters associated with the data provider.</p>
referenceName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the data provider to use in expressions.</p>

## GenAiPromptTemplateDataProviderParam

Represents a parameter that a data provider uses to retrieve information.

Field Name	Description
definition	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. URI definition of the parameter. For example, <code>SUBJECT://User&lt;/definition&gt;</code>.</p>
isRequired	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Specifies whether the parameter is required (<code>true</code>) or optional (<code>false</code>).</p>
parameterName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the parameter.</p>
valueExpression	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Value or expression of the parameter to use in prompt template text. For example, <code>{!\$Input:Recipient}</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of a GenAiPromptTemplate component.

```
<?xml version="1.0" encoding="UTF-8"?>
<GenAiPromptTemplate xmlns="http://soap.sforce.com/2006/04/metadata">
  <activeVersion>1</activeVersion>
  <description>Recommend relevant financial products to client based on their needs and
goals</description>
  <masterLabel>Recommend Relevant Products</masterLabel>
  <relatedEntity>Contact</relatedEntity>
  <templateVersions>
    <content>You are a financial advisor at {!$Input:Sender.CompanyName} and your name
is {!$Input:Sender.Name}. You are writing an email to a prospective client recommending
relevant financial products based on their data and goals. Reference the data below to
generate your email, recommending only relevant products for the customer that match our
recommendation criteria for each product.
Client name: {!$Input:Recipient.Name}
Client age: {!$Input:Recipient.Age__c}
Client occupation: {!$Input:Recipient.Occupation__c}
Client income: {!$Input:Recipient.Income__c}
Client financial goals: {!$Input:Recipient.Financial_Goals__c}

{!$Flow:Fetch_Products.Prompt}

Generate a subject line that can increase the open rate using words and content that is
related to the email body content. It must be no more than 10 words.
Start the opening message of the email with an ice-breaker talking about relevant challenges
or opportunities with personal finance and how you can help.
Indirectly allude to a point of common interest, shared background, or relevant experience
with {!$Input:Recipient.Name}. You aim to subtly reference or highlight this connection
to establish rapport, demonstrate relevance, and foster a sense of familiarity.
Indirectly encourage the lead {!$Input:Recipient.Name} to respond to your email by showing
that you are willing to discuss opportunities for working together and answer any questions
they may have.
Be concise in your email.</content>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>GenAiPromptTemplate</name>
  </types>
  <version>60.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## GenAiPromptTemplateActv

---

Represents the activation status of a Salesforce-provided prompt template.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

GenAiPromptTemplateActv components have the suffix `.genAiPromptTemplateActivation` and are stored in the `genAiPromptTemplateActivations` folder.

## Version

GenAiPromptTemplateActv components are available in API version 60.0 and later.

## Special Access Rules

GenAiPromptTemplate is available only if Prompt Builder is enabled in your org and you have the Prompt Template Manager permission. To send GenAiPromptTemplateActv components from one Salesforce org to another, you must use change sets.

## Fields

Field Name	Description
<code>accessLevel</code>	<p><b>Field Type</b> GenAiPromptTemplateActvAccessLevel (enumeration of type string)</p> <p><b>Description</b> Indicates which users can access the Salesforce-provided prompt template. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Allowed</code>—Users with access to Prompt Builder can see the prompt template.</li> <li>• <code>Blocked</code>—Only admin users with access to Prompt Builder can see the prompt template.</li> </ul>
<code>developerName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the activation record. This name can contain only underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> A user-friendly name for GenAiPromptTemplateActv, which is defined when the GenAiPromptTemplateActv is created.</p>
<code>templateDeveloperName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the Salesforce-provided prompt template that the activation record is associated with.</p>

## Declarative Metadata Sample Definition

The following is an example of a `GenAiPromptTemplateActv` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<GenAiPromptTemplateActv xmlns="http://soap.sforce.com/2006/04/metadata">
  <MasterLabel> Activation Record for Prompt Template </MasterLabel>
  <PromptTemplateDeveloperName>einstein_gpt__introductionLeadEmail
</PromptTemplateDeveloperName>
  <DeveloperName>HideIntroductionLeadEmail</DeveloperName>
  <Description>Status of template </Description>
  <AccessLevel>BLOCKED</AccessLevel>
</GenAiPromptTemplateActv>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <name>GenAiPromptTemplateActv</name>
    <members>HideIntroductionLeadEmail.genAiPromptTemplateActivation</members>
  </types>
  <version>60.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## GlobalPicklist

---

Represents a global picklist, or the set of shared picklist values that custom picklist fields can use. In contrast, the custom picklist fields that are based on a global picklist are of type `CustomValue`. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

`GlobalPicklist` components have the suffix `.globalPicklist` and are stored in the `globalPicklist` folder.

## Version

`GlobalPicklist` components are available in API version 37.0 only. In API version 38.0 and later, `GlobalPicklist` is replaced by the [GlobalValueSet](#) type.

## Fields

Field Name	Field Type	Description
description	string	It's useful to state the global picklist's purpose, and which objects it's intended for. Limit: 255 characters.
globalPicklistValues	<a href="#">GlobalPicklistValue</a> []	Requires at least one value. The list of values, or "picklist value set," that's defined for a global picklist. The picklist value set is inherited by any custom picklist field that's based on that global picklist. Each value is of type <code>GlobalPicklistValue</code> . A global picklist can have up to 1,000 total values, including inactive values.
masterLabel	string	Required. A global picklist's name, which is defined when the global picklist is created. Appears as Label in the user interface.
sorted	string	Indicates whether a global picklist's value set is sorted in alphabetical order. By default this value is <code>false</code> .

## Declarative Metadata Sample Definition

This `Territories.globalPicklist` is an example of a `GlobalPicklist` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<GlobalPicklist xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>Updated:This is a basic global picklist</description>
  <globalPicklistValues>
    <fullName>Northwest</fullName>
    <default>>false</default>
  </globalPicklistValues>
  <globalPicklistValues>
    <fullName>Northeast</fullName>
    <default>>false</default>
  </globalPicklistValues>
  <globalPicklistValues>
    <fullName>South</fullName>
    <default>>true</default>
  </globalPicklistValues>
  <globalPicklistValues>
    <fullName>Southwest</fullName>
    <default>>false</default>
    <isActive>>false</isActive>
  </globalPicklistValues>
  <masterLabel>Territories</masterLabel>
  <sorted>>true</sorted>
</GlobalPicklist>
```

This example `package.xml` references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Territories</members>
    <name>GlobalPicklist</name>
```

```

</types>
<version>37.0</version>
</Package>

```

## GlobalPicklistValue

Represents the definition of a value used in a global picklist. Custom picklist fields can inherit the picklist value set from a global picklist. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

**Note:** GlobalPicklistValue components don't have file suffixes or directories because they're lists of values and not custom fields. For file-based operations they can be accessed through GlobalPicklist (which is in API v37.0 only).

## Version

GlobalPicklistValue components are available in API version 37.0 only. In API version 38.0 and later, GlobalPicklistValue is replaced by [CustomValue](#) on page 695.

## Fields

Field Name	Field Type	Description
<code>color</code>	string	The color assigned to the picklist value when it's used in charts on reports and dashboards. The color is in hexadecimal format; for example, #FF6600. If a color is not specified, it's assigned dynamically upon chart generation.
<code>default</code>	boolean	Required. Indicates whether this value is the default selection for the global picklist and the custom picklists that share its picklist value set. This field is set to <code>true</code> by default.
<code>description</code>	string	The global picklist value's description. It's useful to include a description for a global picklist value so the reason for creating it can be tracked. Limit: 255 characters.
<code>isActive</code>	boolean	Indicates whether this value is currently active or inactive. The default value is <code>true</code> . Users can select only active values from a picklist. An API retrieve operation for global picklist values returns all active and inactive values in the picklist. (Meanwhile, retrieving the values of a non-global, unrestricted picklist returns only the active values.)

## PicklistValue

This metadata type defines a value in the picklist and specifies whether this value is the default value. This type extends the GlobalPicklistValue metadata type and inherits all its fields. In API version 36.0 and earlier, PicklistValue extends the [Metadata](#) type and inherits its `fullName` field.

Note the following when working with picklist values:

- When you retrieve a standard object, all picklist values are retrieved, not just the customized picklist values.

- When you deploy changes to standard picklist fields, picklist values are added as needed.
- To deactivate a global picklist value, you can invoke an `update()` call on `GlobalPicklist` with the value omitted, or with the value's `isActive` field set to `false`. Or, you can invoke an `update()` call directly on `GlobalPicklistValue` with the `isActive` field set to `false`.
- If picklist values are missing from a component definition, they get deactivated when deployed. Deactivation occurs for picklist values of both standard and custom fields.

Field Name	Field Type	Description
<code>allowEmail</code>	boolean	Indicates whether this value lets users email a quote PDF ( <code>true</code> ), or not ( <code>false</code> ). This field is only relevant for the <code>Status</code> field in quotes. This field is available in API version 18.0 and later.
<code>closed</code>	boolean	Indicates whether this value is associated with a closed status ( <code>true</code> ), or not ( <code>false</code> ). This field is only relevant for the standard <code>Status</code> field in cases and tasks. This field is available in API version 16.0 and up to version 36.0. In version 37.0, this field is in <code>GlobalPicklistValue</code> .
<code>controllingFieldValues</code>	string[]	<p>A list of values in the controlling field that are linked to this picklist value. The controlling field can be a checkbox or a picklist. This field is available in API version 14.0 and later. The values in the list depend on the field type:</p> <ul style="list-style-type: none"> <li>• <b>Checkbox:</b> <code>checked</code> or <code>unchecked</code>.</li> <li>• <b>Picklist:</b> The <code>fullname</code> of the picklist value in the controlling field.</li> </ul>
<code>converted</code>	boolean	Indicates whether this value is associated with a converted status ( <code>true</code> ), or not ( <code>false</code> ). This field is relevant for only the standard <code>Lead Status</code> field in leads. Your organization can set its own guidelines for determining when a lead is qualified, but typically, you want to convert a lead as soon as it becomes a real opportunity that you want to forecast. For more information, see “Convert Qualified Leads” in the Salesforce online help. This field is available in API version 16.0 and later.
<code>cssExposed</code>	boolean	<p>Indicates whether this value is available in your Self-Service Portal (<code>true</code>), or not (<code>false</code>). This field is only relevant for the standard <code>Case Reason</code> field in cases.</p> <p>Self-Service provides an online support channel for your customers - allowing them to resolve their inquiries without contacting a customer service representative. For more information about Self-Service, see “Setting Up Your Self-Service Portal” in the Salesforce online help.</p> <p> <b>Note:</b> Starting with Spring '12, the Self-Service portal isn't available for new Salesforce orgs. Existing orgs continue to have access to the Self-Service portal.</p> <p>This field is available in API version 16.0 and later.</p>

Field Name	Field Type	Description
<code>forecastCategory</code>	ForecastCategories (enumeration of type string)	<p>Indicates whether this value is associated with a forecast category (<code>true</code>), or not (<code>false</code>). This field is only relevant for the standard <code>Stage</code> field in opportunities.</p> <ul style="list-style-type: none"> <li>• Omitted</li> <li>• Pipeline</li> <li>• BestCase</li> <li>• Forecast</li> <li>• Closed</li> </ul> <p>This field is available in API version 16.0 and later.</p>
<code>highPriority</code>	boolean	<p>Indicates whether this value is a high priority item (<code>true</code>), or not (<code>false</code>). This field is only relevant for the standard <code>Priority</code> field in tasks. For more information about tasks, see “Start Using Tasks” in the Salesforce online help. This field is available in API version 16.0 and later.</p>
<code>probability</code>	int	<p>Indicates whether this value is a probability percentage (<code>true</code>), or not (<code>false</code>). This field is only relevant for the standard <code>Stage</code> field in opportunities. This field is available in API version 16.0 and later.</p>
<code>reverseRole</code>	string	<p>A picklist value corresponding to a reverse role name for a partner. If the role is “subcontractor”, then the reverse role might be “general contractor”. Assigning a partner role to an account in Salesforce creates a reverse partner relationship so that both accounts list the other as a partner. This field is only relevant for partner roles.</p> <p>For more information, see “Partner Fields” in the Salesforce online help.</p> <p>This field is available in API version 18.0 and later.</p>
<code>reviewed</code>	boolean	<p>Indicates whether this value is associated with a reviewed status (<code>true</code>), or not (<code>false</code>). This field is only relevant for the standard <code>Status</code> field in solutions. For more information about opportunities, see “Creating Solutions” in the Salesforce online help. This field is available in API version 16.0 and later.</p>
<code>won</code>	boolean	<p>Indicates whether this value is associated with a closed or won status (<code>true</code>), or not (<code>false</code>). This field is only relevant for the standard <code>Stage</code> field in opportunities. This field is available in API version 16.0 and later.</p>

## Declarative Metadata Sample Definition

For an example of `GlobalPicklistValue` components with a `package.xml` that references them, see [GlobalPicklist](#).

## Wildcard Support in the Manifest File

This metadata type doesn’t support the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## GlobalValueSet

Represents the metadata for a global picklist value set, which is the set of shared values that custom picklist fields can use. A global value set isn't a field itself. In contrast, the custom picklist fields that are based on a global picklist are of type `ValueSet`. This type extends the `Metadata` metadata type and inherits its `fullName` field.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

`GlobalValueSet` components have the suffix `.globalValueSet` and are stored in the `globalValueSets` folder.

## Version

`GlobalValueSet` components are available in API version 38.0 and later. In API version 37.0, this component is the `GlobalPicklist` type.

## Fields

Field Name	Field Type	Description
<code>customValue</code>	<code>CustomValue[]</code>	Requires at least one value. The list of values, or "global value set," that's defined for a global picklist. The global value set is inherited by any custom picklist field that uses that value set. Each value is of type <code>customValue</code> . A global value set can have up to 1,000 total values, including inactive values.
<code>description</code>	<code>string</code>	It's useful to state the global value set's purpose and which objects it's intended for. Limit: 255 characters.
<code>masterLabel</code>	<code>string</code>	Required. A global value set's name, which is defined when the global value set is created. Appears as <code>Label</code> in the user interface.
<code>sorted</code>	<code>boolean</code>	Required. Indicates whether a global value set is sorted in alphabetical order. By default this value is <code>false</code> .

## Declarative Metadata Sample Definition

This `UpsellGlobal.globalValueSet` is an example of a `GlobalValueSet` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<GlobalValueSet xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>Updated:This is a basic global value set.</description>
  <masterLabel>UpsellGlobal</masterLabel>
  <customValue>
    <fullName>Maybe</fullName>
    <default>false</default>
    <label>Maybe</label>
  </customValue>
  <customValue>
```

```

    <fullName>No</fullName>
    <default>>false</default>
    <label>No</label>
  </customValue>
  <customValue>
    <fullName>Yes</fullName>
    <default>>false</default>
    <label>Yes</label>
  </customValue>
  <sorted>>false</sorted>
</GlobalValueSet>

```

This example `package.xml` references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>UpsellGlobal</members>
    <name>GlobalValueSet</name>
  </types>
  <version>40.0</version>
</Package>

```

Any global value set created in API version 57.0 or later automatically has the `__gvs` suffix appended to the developer name. When you make any CRUD-based call with the `GlobalValueSet` type, you must append the suffix to the `fullName` field when you reference the type.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## GlobalValueSetTranslation

---

Contains details for a global value set translation. Global value sets are lists of values that can be shared by multiple custom picklist fields, optionally across objects. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

`GlobalValueSetTranslation` components have the suffix `.globalValueSetTranslation` and are stored in the `globalValueSetTranslations` folder.

Translations are stored in a file with a format of `ValueSetName-lang.globalValueSetTranslation`, where `ValueSetName` is the global value set's name, and `Lang` is the translation language.

## Version

`GlobalValueSetTranslation` components are available in API version 38.0 and later.

## Fields

Field	Field Type	Description
valueTranslation	<a href="#">ValueTranslation</a> []	The translated name of a value in a translated global value set. Each valueTranslation is paired with a masterLabel, which is the original (untranslated) name of the value.

## ValueTranslation

The original value name and the translated value name in a translated global value set.

Field	Field Type	Description
masterLabel	string	Required. The original (untranslated) name of a value in a global value set. Each valueTranslation has a masterLabel paired with its translation.
translation	string	The translated name of a value in a translated global value set.

## Declarative Metadata Sample Definition

This example shows a GlobalValueSetTranslation component. When a value isn't translated, its translation becomes a comment that's paired with its masterLabel.

```
<?xml version="1.0" encoding="UTF-8"?>
<GlobalValueSetTranslation xmlns="http://soap.sforce.com/2006/04/metadata">
  <valueTranslation>
    <masterLabel>Three</masterLabel>
    <translation>Trois</translation>
  </valueTranslation>
  <valueTranslation>
    <masterLabel>Four</masterLabel>
    <translation>Quatre</translation>
  </valueTranslation>
  <valueTranslation>
    <masterLabel>Five</masterLabel>
    <translation><!-- Five --></translation>
  </valueTranslation>
</GlobalValueSetTranslation>
```

This example is a package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Numbers-fr</members>
    <name>GlobalValueSetTranslation</name>
  </types>
  <version>38.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Translations](#)

## Group

---

Represents a set of public groups, which can have users, roles, and other groups.

### Declarative Metadata File Suffix and Directory Location

The file suffix for group components is `.group` and components are stored in the `groups` directory of the corresponding package directory.

### Version

Group components are available in API version 24.0 and later.

### Special Access Rules

As of Spring '20 and later, only authenticated internal and external users can access this type.

### Fields

**Note:** Members of the public group are not migrated when you deploy the group type.

This metadata type represents the valid values that define a group:

Field Name	Field Type	Description
<code>description</code>	string	The description for the group. Available in API version 62.0 and later.
<code>doesIncludeBosses</code>	boolean	Indicates whether records shared with users in this group are also shared with users higher in the role hierarchy ( <code>true</code> ) or not ( <code>false</code> ). This field is only available for public groups. This field corresponds to the Grant Access Using Hierarchies checkbox in Setup.
<code>fullName</code>	string	The unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component. Corresponds to <b>Group Name</b> in the user interface.
<code>name</code>	string	Required. The name of the group. Corresponds to <b>Label</b> in the user interface.

## Declarative Metadata Sample Definition

The following is the definition of a group.

```
<?xml version="1.0" encoding="UTF-8"?>
<Group xmlns="http://soap.sforce.com/2006/04/metadata">
  <doesIncludeBosses>true</doesIncludeBosses>
  <fullName>admin</fullName>
  <name>test</name>
</Group>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## HomePageComponent

---

Represents the metadata associated with a home page component. You can customize the Home tab in Salesforce Classic to include components such as sidebar links, a company logo, a dashboard snapshot, or custom components that you create. Use to create, update, or delete home page component definitions.

For more information, see “[Salesforce Classic Home Tab Page Layouts](#)” in the Salesforce Help.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Declarative Metadata File Suffix and Directory Location

The file suffix for home page components is `.homePageComponent` and components are stored in the `homepagecomponents` directory of the corresponding package directory.

## Version

Home page components are available in API version 12.0 and later.

## HomePageComponent

This metadata type represents the valid values that define a home page component:

Field Name	Field Type	Description
<code>body</code>	string	The text body inside the HTML page component.
<code>fullName</code>	string	The name can only contain characters, letters, and the underscore ( <code>_</code> ) character. The name must start with a letter, and can't end with an underscore or contain two consecutive underscore characters.  Inherited from the <a href="#">Metadata</a> component, this field isn't defined in the WSDL for this component. It must be specified when creating, updating, or deleting. See <a href="#">create()</a> to see an example of this field specified for a call.

Field Name	Field Type	Description
height	int	Required for Visualforce Area components. Indicates the height (in pixels) of the component.  This field is available in API version 31.0 and later.
links	string[]	If the <code>pageComponentType</code> is <code>links</code> , then zero or more names of custom page links can be specified. <ul style="list-style-type: none"> <li>• <code>ObjectWebLink</code></li> <li>• <code>CustomPageWebLink</code></li> </ul>
page	string	This field is only available for Visualforce Area components and indicates the API name of the Visualforce page that is associated with the component.  This field is available in API version 31.0 and later.
pageComponentType	PageComponentType (enumeration of type string)	Required. Valid values are: <ul style="list-style-type: none"> <li>• <code>links</code></li> <li>• <code>htmlArea</code></li> <li>• <code>imageOrNote</code></li> <li>• <code>visualforcePage</code> (This value is available in API version 31.0 and later.)</li> </ul>
showLabel	boolean	This field is only available for Visualforce Area components and specifies whether the component displays with a label ( <code>true</code> ) or not ( <code>false</code> ).  This field is available in API version 31.0 and later.
showScrollbars	boolean	This field is only available for Visualforce Area components and specifies whether the component displays with scrollbars ( <code>true</code> ) or not ( <code>false</code> ).  This field is available in API version 31.0 and later.
width	PageComponentWidth (enumeration of type string)	This field is only available for HTML and Visualforce Area components, and indicates whether it's a narrow or wide home page component. Valid values are: <ul style="list-style-type: none"> <li>• <code>narrowComponents</code></li> <li>• <code>wideComponents</code></li> </ul>

## Declarative Metadata Sample Definition

The following is the definition of a home page component. See [Declarative Metadata Sample Definition](#) and [Declarative Metadata Sample Definition](#) for related samples.

```
<?xml version="1.0" encoding="UTF-8"?>
<HomePageComponent xmlns="http://soap.sforce.com/2006/04/metadata">
  <height>200</height>
```

```
<page>MyVisualforcePage</page>
<pageComponentType>visualforcePage</pageComponentType>
<showLabel>true</showLabel>
<showScrollbars>true</showScrollbars>
<width>wideComponents</width>
</HomePageComponent>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[HomePageLayout](#)

[WebLink](#)

## HomePageLayout

---

Represents the metadata associated with a home page layout. You can customize home page layouts and assign the layouts to users based on their user profile.

### File Suffix and Directory Location

Home page layouts are stored in the `homePageLayouts` directory of the corresponding package directory. The extension is `.homePageLayout`.

### Version

Home page components are available in API version 12.0 and later. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### Fields

This metadata type represents the valid values that define a home page layout:

Field Name	Field Type	Description
<code>fullName</code>	string	The name can only contain characters, letters, and the underscore ( <code>_</code> ) character. The name must start with a letter, and can't end with an underscore or contain two consecutive underscore characters.  Inherited from the <a href="#">Metadata</a> component, this field isn't defined in the WSDL for this component. It must be specified when creating, updating, or deleting. See <a href="#">create()</a> to see an example of this field specified for a call.
<code>narrowComponents</code>	string[]	The list of elements in the narrow column on the left side of the home page.

Field Name	Field Type	Description
wideComponents	string[]	The list of elements in the wide column on the right side of the home page.

## Declarative Metadata Sample Definition

The following is the definition of a home page layout. See [Declarative Metadata Sample Definition](#) on page 1177 and [Declarative Metadata Sample Definition](#) on page 663 for related samples.

```
<?xml version="1.0" encoding="UTF-8"?>
<HomePageLayout xmlns="http://soap.sforce.com/2006/04/metadata">
  <narrowComponents>google</narrowComponents>
</HomePageLayout>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[HomePageComponent](#)

[WebLink](#)

## IdentityVerificationProcDef

Represents the definition of the identity verification process.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

IdentityVerificationProcDef components have the suffix `.IdentityVerificationProcDef` and are stored in the `IdentityVerificationProcDefs` folder.

## Version

IdentityVerificationProcDef components are available in API version 54.0 and later.

## Special Access Rules

The Health Cloud permission set license is required to use this metadata type.

### Fields

Field Name	Description
identityVerificationProcDtls	<p><b>Field Type</b> IdentityVerificationProcDtl[]</p> <p><b>Description</b> A list of Identity Verification Process Detail elements.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The label of the Identity Verification Process Definition record.</p>
searchLayoutType	<p><b>Field Type</b> IdentityVerificationSearchLayoutType (enumeration of type string)</p> <p><b>Description</b> Required. The display layout of the search component. Valid values are:</p> <ul style="list-style-type: none"> <li>• Stack</li> <li>• Tab</li> </ul>

## IdentityVerificationProcDtl

Represents the verification-related details such as search criteria, verification criteria, or the custom apex class.

Field Name	Description
apexClass	<p><b>Field Type</b> string</p> <p><b>Description</b> The Apex class that is used to search and verify data in an external system.</p>
dataSourceType	<p><b>Field Type</b> IdentityVerificationDataSourceType (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>The source type of the data.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• External</li> <li>• Salesforce</li> </ul>
developerName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The developer name of Identity verification process detail. Can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
displayRecordFieldName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The name of the field that contains information about the record that's shown to the user after identity verification is successful. Available in API version 58.0 and later.</p>
identityVerificationProcFlds	<p><b>Field Type</b></p> <p><a href="#">IdentityVerificationProcFld[]</a></p> <p><b>Description</b></p> <p>A list of Identity Verification Process Field elements.</p>
isActive	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the record is active (<code>true</code>) or not (<code>false</code>).</p>
isRetryAllowedAfterLimit	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>For internal use only.</p>
linkedIdVerfProcessDet	<p><b>Field Type</b></p> <p>string</p>

Field Name	Description
	<p><b>Description</b></p> <p>The record containing the details of the linked identity verification process. Available in API version 58.0 and later.</p>
masterLabel	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The label of the Identity Verification Process Detail record.</p>
objectName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The name of the object on which the search is performed and data is verified.</p>
optionalVerifiersMinVerfCount	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>The number of optional verifiers that must be checked.</p>
retryLimit	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>For internal use only.</p>
searchFilter	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>A comma-separated list of predefined filter conditions that are used to refine the scope of the search.</p>
searchRecordUniqueIdField	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The field storing the unique identifier of a record displayed in the search results.</p>
searchResultSortBy	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The values that are used to sort the search results.</p>

Field Name	Description
searchSequenceNumber	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. The sequence in which the search is performed and the search result is displayed.</p>
searchType	<p><b>Field Type</b> IdentityVerificationSearchType (enumeration of type string)</p> <p><b>Description</b> Required. The type of search being performed. Valid values are:</p> <ul style="list-style-type: none"> <li>• Object-Based</li> <li>• Text-Based</li> </ul>

## IdentityVerificationProcFld

Represents a set of fields necessary to configure the questions that CCA asks the caller before providing them with the information they need.

Field Name	Description
customFieldLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> The custom label for the field that contains the verification data.</p>
dataSourceType	<p><b>Field Type</b> IdentityVerificationProcFldDataSourceType (enumeration of type string)</p> <p><b>Description</b> Required. The source type of the data. Valid values are:</p> <ul style="list-style-type: none"> <li>• External</li> <li>• Salesforce</li> </ul>
developerName	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>The developer name of Identity Verification Process Field. Can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p> <p>Available in API version 58.0 and later.</p>
fieldDataType	<p><b>Field Type</b></p> <p>IdentityVerificationProcFldFieldType (enumeration of type string)</p> <p><b>Description</b></p> <p>The data type of the field in the external data source that's defined in the identity verification process detail. Available in API version 58.0 and later.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• address</li> <li>• checkbox</li> <li>• currency</li> <li>• dateonly</li> <li>• datetime</li> <li>• email</li> <li>• number</li> <li>• other</li> <li>• percent</li> <li>• phone</li> <li>• picklist</li> <li>• reference</li> <li>• text</li> <li>• timeonly</li> <li>• url</li> </ul>
fieldName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The label of the field that contains the verification data based on the selected field type. Available in API version 58.0 and later.</p>
fieldType	<p><b>Field Type</b></p> <p>IdentityVerificationProcFldFieldType (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>Indicates the type of field.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>additionalResultField</code></li> <li>• <code>optionalVerifier</code></li> <li>• <code>requiredVerifier</code></li> <li>• <code>resultField</code></li> <li>• <code>searchField</code></li> <li>• <code>searchFilter</code></li> </ul>
<code>fieldValueFormula</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Stores the formula that is applied to the field value.</p>
<code>isActive</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the record is active (<code>true</code>) or not (<code>false</code>).</p>
<code>isManualInput</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the user can manually enter the identity verification details (<code>true</code>) or not (<code>false</code>).</p> <p>The default value of this field is <code>false</code>.</p> <p>Available in API version 58.0 and later.</p>
<code>masterLabel</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>A user-friendly name for Identity Verification Process Field.</p>
<code>sequenceNumber</code>	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Required.</p>

Field Name	Description
	The sequence number of the field.

## Declarative Metadata Sample Definition

This is an example of an IdentityVerificationProcDef component.

```
<?xml version="1.0" encoding="UTF-8"?>
<IdentityVerificationProcDef xmlns="http://soap.sforce.com/2006/04/metadata">
  <identityVerificationProcDtls>
    <fullName>Sample93AccountSearch</fullName>
    <dataSourceType>Salesforce</dataSourceType>
    <developerName>Sample93AccountSearch</developerName>
    <identityVerificationProcFlds>
      <fullName>Sample93AccountName</fullName>
      <dataSourceType>Salesforce</dataSourceType>
      <developerName>Sample93AccountName</developerName>
      <fieldName>Name</fieldName>
      <fieldType>requiredVerifier</fieldType>
      <isActive>false</isActive>
      <masterLabel>Sample93 Account Name</masterLabel>
      <fieldValueFormula>abcd</fieldValueFormula>
      <customFieldLabel>Name</customFieldLabel>
      <sequenceNumber>1</sequenceNumber>
      <isManualInput>false</isManualInput>
    </identityVerificationProcFlds>
    <identityVerificationProcFlds>
      <fullName>Sample93Phone</fullName>
      <dataSourceType>Salesforce</dataSourceType>
      <developerName>Sample93Phone</developerName>
      <fieldName>phone</fieldName>
      <fieldType>optionalVerifier</fieldType>
      <isActive>false</isActive>
      <masterLabel>Sample93 Phone</masterLabel>
      <sequenceNumber>93</sequenceNumber>
      <isManualInput>false</isManualInput>

</IdentityVerificationProcDef>

```

This is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>IdentityVerificationProcDef</name>
  </types>
  <version>54.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## IdentityVerificationProcDtl

Represents the search functionality configuration and the minimum number of optional verifiers for identity verification. This type extends the `Metadata` metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

IdentityVerificationProcDtl components have the suffix `.IdentityVerificationProcDtl` and are stored in the `IdentityVerificationProcDtls` folder.

## Version

IdentityVerificationProcDtl components are available in API version 54.0 and later.

## Special Access Rules

The Health Cloud permission set license is required to use this metadata type.

## Fields

Field Name	Description
<code>apexClass</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Reserved for future use.</p>
<code>dataSourceType</code>	<p><b>Field Type</b> IdentityVerificationDataSourceType (enumeration of type string)</p> <p><b>Description</b> Required. The source type of the data. Valid values are:</p> <ul style="list-style-type: none"> <li>• External—Reserved for future use.</li> <li>• Salesforce</li> </ul>
<code>identityVerificationProcFlds</code>	<p><b>Field Type</b> <a href="#">IdentityVerificationProcFld[]</a></p> <p><b>Description</b> A list of Identity Verification Process Field elements.</p>
<code>isActive</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the record is active (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>

Field Name	Description
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The label of the Identity Verification Process Detail record.</p>
objectName	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the object on which the search is performed and data is verified.</p>
optionalVerifiersMinVerfCount	<p><b>Field Type</b> int</p> <p><b>Description</b> The minimum number of optional verifiers that must be checked.</p>
searchFilter	<p><b>Field Type</b> string</p> <p><b>Description</b> Conditions on which to filter the search results. For example, if you want to perform the search only on Person Account records, enter <code>isPersonAccount = true</code>.</p>
searchRecordUniqueIdField	<p><b>Field Type</b> string</p> <p><b>Description</b> The field that stores the unique identifier of the records that are displayed in the search results.</p>
searchResultSortBy	<p><b>Field Type</b> string</p> <p><b>Description</b> The values that are used to sort the search results. For example, if you want to sort the results by policy date, enter <code>PolicyDate__c Desc</code>.</p>
searchSequenceNumber	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. Enter 1 as the search sequence number.</p>

Field Name	Description
	 <b>Note:</b> In API version 54.0 and later, this field is reserved for future use, and the value you enter doesn't affect sequencing.
searchType	<p><b>Field Type</b> IdentityVerificationSearchType (enumeration of type string)</p> <p><b>Description</b> Required. The type of search being performed. Valid values are:</p> <ul style="list-style-type: none"> <li>• Object-Based—Reserved for future use.</li> <li>• Text-Based</li> </ul>

## IdentityVerificationProcFld

Represents a set of fields necessary to configure the questions that CCA asks the caller before providing them with the information they need.

Field Name	Description
customFieldLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> The custom label for the field that contains the verification data.</p>
dataSourceType	<p><b>Field Type</b> IdentityVerificationProcFldDataSourceType (enumeration of type string)</p> <p><b>Description</b> Required. The source type of the data. Valid values are:</p> <ul style="list-style-type: none"> <li>• External</li> <li>• Salesforce</li> </ul>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The developer name of Identity Verification Process Field. Can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a</p>

Field Name	Description
	<p>letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p> <p>Available in API version 58.0 and later.</p>
fieldDataType	<p><b>Field Type</b> IdentityVerificationProcFldFieldType (enumeration of type string)</p> <p><b>Description</b> The data type of the field in the external data source that's defined in the identity verification process detail. Available in API version 58.0 and later.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• address</li> <li>• checkbox</li> <li>• currency</li> <li>• dateonly</li> <li>• datetime</li> <li>• email</li> <li>• number</li> <li>• other</li> <li>• percent</li> <li>• phone</li> <li>• picklist</li> <li>• reference</li> <li>• text</li> <li>• timeonly</li> <li>• url</li> </ul>
fieldName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>The label of the field that contains the verification data based on the selected field type. Available in API version 58.0 and later.</p>
fieldType	<p><b>Field Type</b> IdentityVerificationProcFldFieldType (enumeration of type string)</p> <p><b>Description</b> Required.</p> <p>Indicates the type of field.</p> <p>Valid values are:</p>

Field Name	Description
	<ul style="list-style-type: none"> <li>• <code>additionalResultField</code></li> <li>• <code>optionalVerifier</code></li> <li>• <code>requiredVerifier</code></li> <li>• <code>resultField</code></li> <li>• <code>searchField</code></li> <li>• <code>searchFilter</code></li> </ul>
<code>fieldValueFormula</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Stores the formula that is applied to the field value.</p>
<code>isActive</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the record is active (<code>true</code>) or not (<code>false</code>).</p>
<code>isManualInput</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the user can manually enter the identity verification details (<code>true</code>) or not (<code>false</code>). The default value of this field is <code>false</code>. Available in API version 58.0 and later.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for Identity Verification Process Field.</p>
<code>sequenceNumber</code>	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. The sequence number of the field.</p>

## Declarative Metadata Sample Definition

The following is an example of an identityVerificationProcDtl component.

```
<?xml version="1.0" encoding="UTF-8"?>
<IdentityVerificationProcDtl xmlns="http://soap.sforce.com/2006/04/metadata">
  <dataSourceType>Salesforce</dataSourceType>
  <isActive>true</isActive>    <developerName>Sample93AccountSearch</developerName>
  <identityVerificationProcFlds>
    <fullName>Sample93AccountName</fullName>
    <dataSourceType>Salesforce</dataSourceType>
    <developerName>Sample93AccountName</developerName>
    <fieldName>Name</fieldName>
    <fieldType>requiredVerifier</fieldType>
    <isActive>false</isActive>
    <masterLabel>Sample93 Account Name</masterLabel>
    <fieldValueFormula>abcd</fieldValueFormula>
    <customFieldLabel>Name</customFieldLabel>
    <sequenceNumber>1</sequenceNumber>
    <isManualInput>false</isManualInput>
  </identityVerificationProcFlds>
  <identityVerificationProcFlds>
    <fullName>Sample93Phone</fullName>
    <dataSourceType>Salesforce</dataSourceType>
    <developerName>Sample93Phone</developerName>
    <fieldName>phone</fieldName>
    <fieldType>optionalVerifier</fieldType>
    <isActive>false</isActive>
    <masterLabel>Sample93 Phone</masterLabel>
    <sequenceNumber>93</sequenceNumber>
    <isManualInput>false</isManualInput>
  </identityVerificationProcFlds>
  <masterLabel>detail1</masterLabel>
  <fullName>detail1</fullName>
  <objectName>Account</objectName>
  <optionalVerifiersMinVerfCount>11</optionalVerifiersMinVerfCount>
  <searchFilter>asd</searchFilter>
  <searchRecordUniqueIdField>Id</searchRecordUniqueIdField>
  <searchResultSortBy>asd</searchResultSortBy>
  <searchSequenceNumber>1</searchSequenceNumber>
  <searchType>Text-Based</searchType>
</IdentityVerificationProcDtl>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>IdentityVerificationProcDtl</name>
  </types>
  <version>54.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## IdentityVerificationProcFld

---

Represents the search and verification fields used in identity verification. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

IdentityVerificationProcFld components have the suffix `.IdentityVerificationProcFld` and are stored in the `IdentityVerificationProcFlds` folder.

## Version

IdentityVerificationProcFld components are available in API version 54.0 and later.

## Special Access Rules

The Health Cloud permission set license is required to use this metadata type.

## Fields

Field Name	Description
<code>customFieldLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The custom label for the field that contains the verification data.</p> <p> <b>Note:</b> Translation of custom field labels isn't supported in API version 54.0.</p>
<code>dataSourceType</code>	<p><b>Field Type</b> IdentityVerificationProcFldDataSourceType (enumeration of type string)</p> <p><b>Description</b> Required. The source type of the data. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>External</code></li> </ul>

Field Name	Description
	<p> <b>Note:</b> An external data source isn't supported in API version 54.0.</p> <ul style="list-style-type: none"> <li>• Salesforce</li> </ul>
fieldDataType	<p><b>Type</b> picklist</p> <p><b>Properties</b> Filter, Group, Nillable, Restricted picklist, Sort</p> <p><b>Description</b> The type of data stored in an external data source field. Possible values are:</p> <ul style="list-style-type: none"> <li>• address</li> <li>• checkbox</li> <li>• currency</li> <li>• dateonly</li> <li>• datetime</li> <li>• email</li> <li>• number</li> <li>• other</li> <li>• percent</li> <li>• phone</li> <li>• picklist</li> <li>• reference</li> <li>• text</li> <li>• timeonly</li> <li>• url</li> </ul>
fieldName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The label of the field that contains the verification data based on the selected field type.</p>
fieldType	<p><b>Field Type</b> IdentityVerificationProcFldFieldType (enumeration of type string)</p> <p><b>Description</b> Required. Indicates the type of field.</p>

Field Name	Description
	<p>Possible values are:</p> <ul style="list-style-type: none"> <li><code>additionalResultField</code>—Fetches data as part of the search query, but the data isn't displayed in search results. Use this value if, for example, you want to fetch the policy number and the age of the policy owner as a result of the search, but the agent isn't supposed to see this data. You can write custom logic to process this additional data.</li> <li><code>optionalVerifier</code>—Optional verifier.</li> <li><code>requiredVerifier</code>—Required verifier.</li> <li><code>resultField</code>—Displays field type in search results. Use this value if, for example, when an agent searches for a caller, you'd like the search results to include the account name, phone number, and email ID.</li> <li><code>searchField</code>—Reserved for future use.</li> <li><code>searchFilter</code>—A comma-separated list of predefined filter conditions that are used to refine the scope of the search.</li> </ul>
<code>fieldValueFormula</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Reserved for future use.</p>
<code>isActive</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the record is active (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>isManualInput</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the user can manually enter the identity verification details (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>. This field is available in API version 58.0 and later.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The label of the Identity Verification Process Field record.</p>

Field Name	Description
sequenceNumber	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Required.</p> <p>The sequence number of the field.</p>

## Declarative Metadata Sample Definition

The following is an example of an IdentityVerificationProcFld component.

```
<?xml version="1.0" encoding="UTF-8"?>
<IdentityVerificationProcFld xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <customFieldLabel>field1</customFieldLabel>
  <dataSourceType>External</dataSourceType>
  <fieldName>sasa</fieldName>
  <fieldType>requiredVerifier</fieldType>
  <fullName>field1</fullName>

  <isActive>false</isActive>
  <masterLabel>field1</masterLabel>
  <sequenceNumber>1</sequenceNumber>
</IdentityVerificationProcFld>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>IdentityVerificationProcFld</name>
  </types>
  <version>54.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## InboundCertificate

Represents a mutual authentication certificate that is imported to your Salesforce org.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

InboundCertificate components have the suffix `.inboundCertificate` and are stored in the `inboundCertificates` folder.

## Special Access Rules

InboundCertificate is available when the MutualAuthentication permission is enabled in your org.

## Version

InboundCertificate components are available in API version 49.0 and later.

## Fields

This metadata type contains the following fields:

Field Name	Field Type	Description
<code>expirationDate</code>	date	Required. The date on which the certificate expires.
<code>issuer</code>	string	Required. The certificate's issuer.
<code>masterLabel</code>	string	Required. A friendly name that you create for the certificate. Limited to 64 characters.
<code>serialId</code>	string	Required. The serial number for the certificate.

## Declarative Metadata Sample Definition

The following is an example of an InboundCertificate component.

```
<InboundCertificate xmlns="http://soap.sforce.com/2006/04/metadata">
  <expirationDate>2021-02-04</expirationDate>
  <issuer>C=USA, ST=CA, L=San
  Francisco, O=Salesforce.com, OU=00Dxx0000006Jm7, CN=newTestCert</issuer>
  <masterLabel>TestMutualAuthCert2</masterLabel>
  <serialId>29161320252531323757470546071624</serialId>
</InboundCertificate>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>InboundCertificate</name>
  </types>
```

```
<version>49.0</version>
</Package>
```

## Usage

To prevent simple impersonation from compromising security, you can require clients and servers to prove their identity to each other with a mutual authentication certificate.

## InboundNetworkConnection

Represents a private connection between a third-party data service and a Salesforce org. The connection is inbound because the callouts are coming *into* Salesforce. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`InboundNetworkConnection` components have the suffix `.inboundNetworkConnection` and are stored in the `inboundNetworkConnections` folder.

## Version

`InboundNetworkConnection` components are available in API version 49.0 and later.

## Fields

Field Name	Field Type	Description
<code>connectionType</code>	<code>ExternalConnectionType</code> (enumeration of type string)	Required. Specifies the cloud provider of the connection. The only valid value is <code>AwsPrivateLink</code> .
<code>description</code>	string	Required. A description of the connection. Maximum of 255 characters.
<code>inboundNetworkConnProperties</code>	<code>InboundNetworkConnProperty</code>	Name-value pairs that describe the properties of the inbound network connection. Specify a name-value pair for each of the properties.
<code>isActive</code>	boolean	Required. Specifies whether the connection is active ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>label</code>	string	Required. A user-friendly label for the connection.
<code>status</code>	<code>ExternalConnectionStatus</code> (enumeration of type string)	Required. Connection status. The connection is initially <code>Unprovisioned</code> and moves through the other states automatically after an admin performs a <code>Provision</code> , <code>Sync</code> , or <code>Teardown</code> action. The valid values are: <ul style="list-style-type: none"> <li><code>Unprovisioned</code></li> <li><code>Allocating</code></li> <li><code>PendingAcceptance</code></li> <li><code>PendingActivation</code></li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>RejectedRemotely</li> <li>DeletedRemotely</li> <li>TeardownInProgress</li> <li>Ready</li> </ul>

## InboundNetworkConnProperty

Represents a name-value pair that describes the properties of the inbound network connection.

Field Name	Field Type	Description
propertyName	InboundConnPropertyName (enumeration of type string)	<p>Required. The name of a property used to establish an InboundNetworkConnection. Valid values are:</p> <ul style="list-style-type: none"> <li>AwsVpcEndpointId—The unique endpoint ID for connections to an AWS Virtual Private Cloud (VPC). The value is read-only when the <code>status</code> is <code>Ready</code>.</li> <li>Region—The region in which the VPC is hosted.</li> <li>SourceIpRanges—The ranges of source IP address allocated to this inbound connection by the Salesforce-managed VPC in your cloud provider.</li> </ul>
propertyValue	string	<p>Required. The value of InboundConnPropertyName. An example of the <code>propertyValue</code> of <code>Region</code> is <code>us-west-2</code>.</p> <p>The <code>propertyValue</code> of <code>SourceIpRanges</code> is a JSON string that lists the start and end IP address for each range. This example shows two IP address ranges.</p> <pre>[   {     "startIp": "10.10.10.0",     "endIp": "10.10.10.3"   },   {     "startIp": "100.100.100.0",     "endIp": "100.100.100.15"   } ]</pre>

## Declarative Metadata Sample Definition

The following sample definition has the suffix `.inboundNetworkConnection`.

```
<?xml version="1.0" encoding="UTF-8"?>
<InboundNetworkConnection xmlns="http://soap.sforce.com/2006/04/metadata">
  <connectionType>AwsPrivateLink</connectionType>
  <description>This is an Inbound Connection to make API calls into
```

```

Salesforce</description>
  <inboundNetworkConnProperties>
    <propertyName>Region</propertyName>
    <propertyValue>us-west-2</propertyValue>
  </inboundNetworkConnProperties>
  <inboundNetworkConnProperties>
    <propertyName>AwsVpcEndpointId</propertyName>
    <propertyValue>vpce-02ccb5fac2bacaceb</propertyValue>
  </inboundNetworkConnProperties>
  <inboundNetworkConnProperties>
    <propertyName>SourceIpRanges</propertyName>
    <propertyValue>[ { "startIp":"10.10.10.0", "endIp":"10.10.10.3" }, {
"startIp":"100.100.100.0", "endIp":"100.100.100.15" } ]</propertyValue>
  </inboundNetworkConnProperties>
  <isActive>true</isActive>
  <label>MyInboundConnection</label>
  <status>Unprovisioned</status>
</InboundNetworkConnection>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>sampleInboundConnection</fullName>
  <types>
    <members>MyInboundConnection</members>
    <name>InboundNetworkConnection</name>
  </types>
  <version>49.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## IndustriesPricingSettings

---

Represents the settings for Salesforce Pricing.

### Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See [Settings](#) for more details.

### File Suffix and Directory Location

`IndustriesPricingSettings` values are stored in the `IndustriesPricing.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there's only one settings file for each settings component.

## Version

IndustriesPricingSettings components are available in API version 60.0 and later.

## Special Access Rules

This metadata type is available with Salesforce Pricing.

## Fields

Field Name	Description
<code>enableHighAvailability</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Reserved for internal use.</p>
<code>enablePricingWaterfall</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to enable Price Waterfall (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>. Price Waterfall provides insights that include price breakups and reasons for every step of the pricing process.</p>
<code>enablePricingWaterfallPersistence</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to enable Price Waterfall Persistence (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>. Price Waterfall Persistence stores the process logs that provide insights into the internal pricing processes.</p>
<code>enableSalesforcePricing</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to enable Salesforce Pricing (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>

## Declarative Metadata Sample Definition

This example shows a sample IndustriesPricingSettings component.

```
<IndustriesPricingSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableHighAvailability>true</enableHighAvailability>
  <enablePricingWaterfall>true</enablePricingWaterfall>
  <enablePricingWaterfallPersistence>true</enablePricingWaterfallPersistence>
</IndustriesPricingSettings>
```

```
<enableSalesforcePricing>true</enableSalesforcePricing>
</IndustriesPricingSettings>
```

This example shows a sample `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>IndustriesPricing</members>
    <name>Settings</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## IndustriesRatingSettings

---

Represents the settings for Rate Management.

### Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See [Settings](#) for more details.

### File Suffix and Directory Location

The `IndustriesRatingSettings` values are stored in the `IndustriesRating.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there's only one settings file for each settings component.

### Version

`IndustriesRatingSettings` components are available in API version 62.0 and later.

### Special Access Rules

This metadata type is available with Rate Management.

## Fields

Field Name	Description
enableRating	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to enable Rate Management (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
enableRatingWaterfall	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to enable Rating Waterfall (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>. Rating Waterfall provides insights into the rating data, which you can synchronize with your rating lookup tables.</p>
enableRatingWaterfallPersistence	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to enable Rating Waterfall Persistence (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>. Rating Waterfall Persistence stores rating data, which you can use to enhance the internal processes and increase efficiency.</p>

## Declarative Metadata Sample Definition

The following is an example of an IndustriesRatingSettings component.

```
<IndustriesRatingSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableRating>true</enableRating>
  <enableRatingWaterfall>true</enableRatingWaterfall>
  <enableRatingWaterfallPersistence>true</enableRatingWaterfallPersistence>
</IndustriesRatingSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>IndustriesRating</members>
    <name>Settings</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## InstalledPackage

---

Represents a first-generation managed package to be installed or uninstalled. Deploying a newer version of a currently installed package upgrades the package. To install an unlocked or second-generation managed package, use the `sf package install` Salesforce CLI command.

**Note:** You can't deploy a package along with other metadata types. When you deploy `InstalledPackage`, it must be the only metadata type specified in the manifest file.

## File Suffix and Directory Location

The package is specified in the `installedPackages` directory, in a file named after the package's namespace prefix. The file extension is `.installedPackage`.

## Version

`InstalledPackage` is available in API version 28.0 and later.

## Fields

Field Name	Field Type	Description
<code>activateRSS</code>	boolean	<p>Required. Determines the state of Remote Site Settings (RSS) and Content Security Policy (CSP) at the time of installing the package and must be set to either of these values.</p> <p><b>true</b> Keep the <code>isActive</code> state of any RSS or CSP in the package.</p> <p><b>false</b> Override the <code>isActive</code> state of any RSS or CSP in the package and set it to <code>false</code>.</p> <p>The default value is <code>false</code>. Available in API version 43.0 and later.</p>
<code>password</code>	string	Specifies the package password.
<code>securityType</code>	string	<p>Determines user access for the installed package.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li><code>AdminsOnly</code></li> <li><code>AllUsers</code></li> </ul> <p>The default value is <code>AllUsers</code>. Available in API version 57.0 and later.</p>

Field Name	Field Type	Description
versionNumber	string	Required. The version number of the package. The version number has the format <i>majorNumber.minorNumber.patchNumber</i> (for example, 2.1.3).

## Declarative Metadata Sample Definition

The following example specifies a sample package to be installed or uninstalled.

```
<?xml version="1.0" encoding="UTF-8"?>
  <InstalledPackage xmlns="http://soap.sforce.com/2006/04/metadata">
    <versionNumber>1.0</versionNumber>
    <password>optional_password</password>
    <securityType>AdminsOnly</securityType>
    <activateRSS>true</activateRSS>
  </InstalledPackage>
```

The `securityType` field is optional. If it's not specified, the default security type is `AllUsers`.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## IntegrationProviderDef

Represents an integration definition associated with a service process. Stores data for the Industries: Send Apex Async Request and Industries: Send External Async Request invocable actions.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`IntegrationProviderDef` components have the suffix `.integrationProviderDefinition` and are stored in the `.integrationProviderDefinition` folder.

### Version

`IntegrationProviderDef` components are available in API version 57.0 and later.

### Special Access Rules

Access to the `IntegrationProviderDef` type requires the `AccessToServiceProcess` permission.

## Fields

Field Name	Description
active	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Specifies whether this Integration Definition is active. The default is <code>false</code>.</p>
apexClass	<p><b>Field Type</b> string</p> <p><b>Description</b> The custom Apex class that the related Industries: Send Apex Async Request invocable action invokes. Specify either <code>apexClass</code> or <code>fileBasedApexClass</code> but not both. Applies only if the type is <code>Apex</code>.</p>
description	<p><b>Field Type</b> string</p> <p><b>Description</b> A meaningful explanation of the Integration Definition.</p>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A system name for the Integration Definition.</p>
externalServiceOperationName	<p><b>Field Type</b> string</p> <p><b>Description</b> The external service operation that the related Industries: Send External Async Request invocable action invokes. Applies only if the type is <code>LowCode</code>.</p>
externalServiceRegistration	<p><b>Field Type</b> string</p> <p><b>Description</b> The external service that the related Industries: Send External Async Request invocable action invokes. Applies only if the type is <code>LowCode</code>.</p>
fileBasedApexClass	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>The Salesforce-provided Apex class that the related Industries: Send Apex Async Request invocable action invokes. Specify either <code>apexClass</code> or <code>fileBasedApexClass</code> but not both. Applies only if the type is <code>Apex</code>.</p>
<code>inputDataProcessor</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The optional Integration Procedure that processes the sent data. Applies only if the type is <code>LowCode</code>.</p>
<code>integrationProviderAttributes</code>	<p><b>Field Type</b></p> <p><a href="#">IntegrationProviderAttr[]</a></p> <p><b>Description</b></p> <p>Custom attributes that store data associated with an Integration Definition.</p>
<code>outputDataProcessor</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The optional Integration Procedure that processes the returned data. Applies only if the type is <code>LowCode</code>.</p>
<code>providerLabel</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>A meaningful name for the Integration Definition.</p>
<code>type</code>	<p><b>Field Type</b></p> <p>DefinitionType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>What the Integration Definition calls, either an Apex class or an external service.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• <code>Apex</code></li> <li>• <code>LowCode</code></li> </ul>

## IntegrationProviderAttr

A custom attribute that stores data associated with an Integration Definition.

Field Name	Description
dataType	<p><b>Field Type</b> AttrDataType (enumeration of type string)</p> <p><b>Description</b> Required. The data type of the attribute. Values are:</p> <ul style="list-style-type: none"><li>• Date</li><li>• DateTime</li><li>• Double</li><li>• Integer</li><li>• Percentage</li><li>• String</li><li>• Boolean</li></ul>
dateTimeValue	<p><b>Field Type</b> dateTime</p> <p><b>Description</b> The value of the attribute if the <code>dataType</code> is <code>DateTime</code>.</p>
dateValue	<p><b>Field Type</b> date</p> <p><b>Description</b> The value of the attribute if the <code>dataType</code> is <code>Date</code>.</p>
description	<p><b>Field Type</b> string</p> <p><b>Description</b> A meaningful explanation of the attribute.</p>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A system name for the attribute.</p>
doubleValue	<p><b>Field Type</b> double</p> <p><b>Description</b> The value of the attribute if the <code>dataType</code> is <code>Double</code>.</p>

Field Name	Description
integerValue	<p><b>Field Type</b> int</p> <p><b>Description</b> The value of the attribute if the <code>dataType</code> is Integer.</p>
label	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A meaningful name for the attribute.</p>
percentageValue	<p><b>Field Type</b> double</p> <p><b>Description</b> The value of the attribute if the <code>dataType</code> is Percentage.</p>
required	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Specifies whether the attribute is required.</p>
stringValue	<p><b>Field Type</b> string</p> <p><b>Description</b> The value of the attribute if the <code>dataType</code> is String.</p>
trueOrFalseValue	<p><b>Field Type</b> boolean</p> <p><b>Description</b> The value of the attribute if the <code>dataType</code> is Boolean.</p>

## Declarative Metadata Sample Definition

The following is an example of an IntegrationProviderDef component.

```
<?xml version="1.0" encoding="UTF-8"?>
<IntegrationProviderDef xmlns="http://soap.sforce.com/2006/04/metadata">
  <developerName>EmailUpdate</developerName>
  <providerLabel>EmailUpdate</providerLabel>
  <type>Apex</type>
  <apexClass>SendEmailUpdate</apexClass>
</IntegrationProviderDef>
```

```

<integrationProviderAttributes>
  <developerName>EmailAddress</developerName>
  <label>EmailAddress</label>
  <dataType>String</dataType>
  <stringValue>person@example.com</stringValue>
  <required>>true</required>
</integrationProviderAttributes>
</IntegrationProviderDef>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>IntegrationProviderDef</name>
  </types>
  <version>57.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## IPAddressRange

---

Represents a range of IP addresses to include in or exclude from the specified feature.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

IP Address Range components have the suffix `.IPAddressRange` and are stored in the `IPAddressRanges` folder.

### Version

IPAddressRange components are available in API version 52.0 and later.

### Special Access Rules

To access `IpAddressRange`, enable the `HtmlEmail` permission in your org.

## Fields

Field Name	Description
Description	<p><b>Field Type</b> string</p> <p><b>Description</b> Not required. The description of the IP address range. For example, the name of the company that owns the IP address range.</p>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Not required. Gives you a way to distinguish ipAddressRange entries among developers in your org.</p>
endIpAddress	<p><b>Field Type</b> string</p> <p><b>Description</b> The end of the IP address range. Must be an IPv4 or IPv6 Internet address and equal to or greater than the <code>startIpAddress</code>.</p>
ipAddressFeature	<p><b>Field Type</b> picklist</p> <p><b>Description</b> The feature that uses the range of IP addresses. Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>EmailIpFiltering</code> (default) —Filter email engagement activities such as email opens and email clicks.</li> </ul>
ipAddressUsageScope	<p><b>Field Type</b> picklist</p> <p><b>Description</b> Whether the specified IP addresses are included or excluded. Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>Exclusion</code></li> <li>• <code>Inclusion</code></li> </ul>
isProtected	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Whether the specified IP address range is protected. The default is <code>false</code>.</p>
masterLabel	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Master label for the IP address range. This internal label doesn't get translated.</p>
startIpAddress	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The start of the IP address range. Must be an IPv4 or IPv6 Internet address and equal to or smaller than the endIpAddress.</p>

## Declarative Metadata Sample Definition

The following is an example of an `ipAddressName` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<IPAddressRange xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>Filter emails from google.com</description>
  <endIpAddress>221.224.222.158</endIpAddress>
  <ipAddressFeature>EmailIpFiltering</ipAddressFeature>
  <ipAddressUsageScope>Exclusion</ipAddressUsageScope>
  <masterLabel>MasterLabelValue</masterLabel>
  <startIpAddress>221.224.0.158</startIpAddress>
  <isProtected>>false</isProtected>
</IPAddressRange>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>IPAddressRange</name>
  </types>
  <version>1.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## KeywordList

Represents a list of keywords used in Experience Cloud site moderation. This keyword list is a type of moderation criteria that defines offensive language or inappropriate content that you don't want in your site.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

Keep the following things in mind when creating keyword list criteria:

- Your org can have up to 30 keyword list criteria. This limit is per org, not per Experience Cloud site.
- A keyword list can have up to 2,000 keywords.
- Capitalization and trailing punctuation are ignored when matching your keywords to user-generated content. For example, if your criteria includes *BadWord*, it's matched when a user types *BADWORD* or *badword*.

## File Suffix and Directory Location

KeywordList components have the suffix `.keywords` and are stored in the `moderation` directory of the corresponding package directory. The file name format follows `site_name.keyword_list_developer_name.keywords`.

## Version

KeywordList components are available in API version 36.0 and later.

## Special Access Rules

To view, create, edit, and delete a keyword list, you need the Manage Experiences or Create and Set Up Experiences permission. As of Spring '20 and later, only users with permission to edit moderation rules can access this object.

## Fields

Field Name	Field Type	Description
<code>Description</code>	string	A description of the keyword list.
<code>keywords</code>	<a href="#">Keyword[]</a>	The keywords you want moderate in your Experience Cloud site.
<code>masterLabel</code>	string	Required. Label for the keyword list.

## Keyword

Keywords in the keyword list.

Field Name	Field Type	Description
<code>keyword</code>	string	Required. Keywords you want to moderate. <ul style="list-style-type: none"> <li>• Keywords can only be up to 100 characters and can include letters, numbers, spaces, and special characters.</li> <li>• Wildcard characters aren't supported.</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a KeywordList component.

```
<?xml version="1.0" encoding="UTF-8"?>
<KeywordList xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>Bad Word List</masterLabel>
  <description>List of bad words updated by Joe in Nov 2015.</description>
  <keywords>
    <keyword>bad-word</keyword>
  </keywords>
  <keywords>
    <keyword>b a d w o r d</keyword>
  </keywords>
  <keywords>
    <keyword>b@dword</keyword>
  </keywords>
</KeywordList>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <name>KeywordList</name>
    <members>site1.badword_list</members>
  </types>
  <version>36.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Layout

---

Represents the metadata associated with a page layout. For more information, see [Page Layouts in Salesforce Help](#).

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

**Note:** To edit the Ideas layout, specify it by name in the `package.xml` file. In `package.xml`, use this code to retrieve the Ideas layout.

```
<types>
  <members>Idea-Idea Layout</members>
  <name>Layout</name>
</types>
```

## File Suffix and Directory Location

Layouts are stored in the `layouts` directory of the corresponding package directory. The extension is `.layout`.

 **Note:** Retrieving a component of this metadata type in a project makes the component appear in any Profile and PermissionSet components that are retrieved in the same package.

## Version

Layouts are available in API version 13.0 and later.

## Fields

This metadata type represents the valid values that define a page layout.

Field Name	Field Type	Description
<code>customButtons</code>	<code>string[]</code>	The custom buttons for this layout. Each button is a reference to a <a href="#">WebLink</a> on the same object. For example, a <code>ButtonLink</code> refers to a Weblink on the same standard or custom object named <code>ButtonLink</code> .
<code>customConsoleComponents</code>	<a href="#">CustomConsoleComponents</a>	Represents custom console components (Visualforce pages, lookup fields, or related lists; Canvas apps not available) on a page layout. Custom console components only display in the Salesforce console.
<code>emailDefault</code>	<code>boolean</code>	Only relevant if <code>showEmailCheckbox</code> is set; indicates the default value of that checkbox.
<code>excludeButtons</code>	<code>string[]</code>	List of standard buttons to exclude from this layout. For example, <code>&lt;excludeButtons&gt;Delete&lt;/excludeButtons&gt;</code> excludes the <b>Delete</b> button from this layout.
<code>feedLayout</code>	<a href="#">FeedLayout</a>	Represents the values that define the feed view of a feed-based page layout. Feed-based layouts are available on Account, Case, Contact, Lead, Opportunity, custom, and external objects. They include a feed view and a detail view.
<code>headers</code>	<code>LayoutHeader[]</code> ( <a href="#">enumeration</a> of type <code>string</code> )	Layout headers are currently only used for tagging, and only appear in the UI if tagging is enabled. Valid string values are: <ul style="list-style-type: none"> <li><code>PersonalTagging</code>—tag is private to user.</li> <li><code>PublicTagging</code>—tag is viewable any other user who can access the record.</li> </ul>
<code>layoutSections</code>	<a href="#">LayoutSection[]</a>	The main sections of the layout containing fields, s-controls, and custom links. The order here determines the layout order.

Field Name	Field Type	Description
<code>miniLayout</code>	<a href="#">MiniLayout</a>	A mini layout is used in the mini view of a record in the Console tab, hover details, and event overlays.
<code>multilineLayoutFields</code>	<code>string[]</code>	Fields for the special multiline layout fields that appear in OpportunityProduct layouts. These fields are otherwise similar to <code>miniLayoutFields</code> .
<code>platformActionList</code>	<a href="#">PlatformActionList</a>	The list of actions and their order that appear in the Salesforce mobile app action bar for the layout.  This field is available in API version 34.0 and later.
<code>quickActionList</code>	<a href="#">QuickActionList</a>	The list of quick actions that display in the full Salesforce site for the page layout. This field is available in API version 28.0 and later.
<code>relatedContent</code>	<a href="#">RelatedContent</a>	The Related Content section of the page layout. This field is available in API version 29.0 and later.
<code>relatedLists</code>	<a href="#">RelatedListItem[]</a>	The related lists for the layout, listed in the order they appear in the user interface.
<code>relatedObjects</code>	<code>string[]</code>	The list of related objects that appears in the mini view of the console. In database terms, these objects are foreign key fields on the object for the layout. For more information, see Choose Related Objects for the Agent Console's Mini View in Salesforce Help.
<code>runAssignmentRulesDefault</code>	<code>boolean</code>	Only relevant if <a href="#">showRunAssignmentRulesCheckbox</a> is set; indicates the default value of that checkbox.
<code>showEmailCheckbox</code>	<code>boolean</code>	Only allowed on Case, CaseClose, and Task layouts. If set, a checkbox appears to show email.
<code>showHighlightsPanel</code>	<code>boolean</code>	If set, the highlights panel displays on pages in the Salesforce console. This field is available in API version 22.0 and later.
<code>showInteractionLogPanel</code>	<code>boolean</code>	If set, the interaction log displays on pages in the Salesforce console. This field is available in API version 22.0 and later.
<code>showKnowledgeComponent</code>	<code>boolean</code>	Only allowed on Case layouts. If set, the Knowledge sidebar displays on cases in the Salesforce console. This field is available in API version 20.0 and later.
<code>showRunAssignmentRulesCheckbox</code>	<code>boolean</code>	Only allowed on Case, Lead, and Account objects. If set, a checkbox appears on the page to show assignment rules.
<code>showSolutionSection</code>	<code>boolean</code>	Only allowed on CaseClose layout. If set, the built-in solution information section shows up on the page.

Field Name	Field Type	Description
showSubmitAndAttachButton	boolean	Only allowed on Case layout. If set, the <b>Submit &amp; Add Attachment</b> button displays on case edit pages to portal users in the Customer Portal.
summaryLayout	<a href="#">SummaryLayout</a>	Controls the appearance of the highlights panel in Salesforce Classic, which summarizes key fields in a grid at the top of a page layout, when Case Feed is enabled. This field is available in API version 18.0 and later.

## CustomConsoleComponents

Represents custom console components (Visualforce pages, lookup fields, or related lists; Canvas apps not available) on a page layout. Custom console components only appear in the Salesforce console. Available in API version 25.0 and later.

Field Name	Field Type	Description
primaryTabComponents	<a href="#">PrimaryTabComponents</a>	Represents custom console components on primary tabs in the Salesforce console. Available in API version 25.0 and later.
subtabComponents	<a href="#">SubtabComponents</a>	Represents custom console components on subtabs in the Salesforce console. Available in API version 25.0 and later.

## PrimaryTabComponents

Represents custom console components on primary tabs in the Salesforce console. Available in API version 25.0 and later.

Field Name	Field Type	Description
component	<a href="#">ConsoleComponent[]</a>	Represents a custom console component (Visualforce page, lookup field, or related lists; Canvas apps not available) on a section of a page layout. Custom console components only appear in the Salesforce console. This field is available in API version 29.0 and earlier.
containers	<a href="#">Container[]</a>	Represents a location and style to display more than one custom console component on the sidebars of the Salesforce console. You can specify up to five components for each of the four locations (left, right, top, and bottom). This field is available in API version 30.0 and later.

## ConsoleComponent

Represents a custom console component (Visualforce page, lookup field, or related lists; Canvas apps not available) on a section of a page layout. Custom console components only appear in the Salesforce console. Available in API version 25.0 and later.

Field Name	Field Type	Description
<code>height</code>	<code>int</code>	Required for components with a location of top or bottom. The height of the custom console component. The value must be specified in pixels and be greater than 0 but less than 999.
<code>location</code>	<code>string</code>	Required. The location of the custom console component on the page layout. Valid values are <code>right</code> , <code>left</code> , <code>top</code> , and <code>bottom</code> . A component can have one location for each page layout.
<code>visualforcePage</code>	<code>string</code>	Required. The unique name of the custom console component. For example, <code>ConsoleComponentPage</code> .
<code>width</code>	<code>int</code>	Required for components with a location of left or right. The width of the custom console component. The value must be specified in pixels and be greater than 0 but less than 999.

## Container

Represents a location and style to display more than one custom console component in the sidebars of the Salesforce console. For example, you can show multiple components in the right sidebar of the console with a style of either `stack`, `tabs`, or `accordion`. Available in API version 30.0 and later.

Field Name	Field Type	Description
<code>height</code>	<code>int</code>	Required for components with a location of top or bottom. The height of the components' container. The <code>unit</code> field determines the unit of measurement, in pixels or percent.
<code>isContainerAutoSizeEnabled</code>	<code>boolean</code>	Required. If set to <code>true</code> , stacked console components in the sidebars autosize vertically. Set to <code>true</code> by default for newly created console components. Available in API version 32.0 and later.
<code>region</code>	<code>string</code>	Required. The location of the components' container. Valid values include: <ul style="list-style-type: none"> <li><code>right</code></li> <li><code>left</code></li> <li><code>top</code></li> <li><code>bottom</code></li> </ul>
<code>sidebarComponents</code>	<a href="#">SidebarComponent[]</a>	Represents a specific custom console component to display in the components' container.
<code>style</code>	<code>string</code>	Required. The style of the container to display multiple components. Valid values include: <ul style="list-style-type: none"> <li><code>stack</code>—a content area with multiple frames.</li> <li><code>tabs</code>—a single content area with a list of multiple panels.</li> <li><code>accordion</code>—a collapsible content area.</li> </ul>

Field Name	Field Type	Description
<code>unit</code>	string	Required. The unit of measurement, in pixels or percent, for the height or width of the components' container.  Pixel values are simply the number of pixels, for example, 500, and must be greater than 0 but less than 999. Percentage values must include the percent sign, for example, 20%, and must be greater than 0 but less than 100.
<code>width</code>	int	Required for components with a location of right or left. The width of the components' container. The <code>unit</code> field determines the unit of measurement, in pixels or percent.

## SidebarComponent

Represents a specific custom console component to display in a container that hosts multiple components in one of the sidebars of the Salesforce console. You can specify up to five components for each of the four container locations (left, right, top, and bottom). Available in API version 30.0 and later.

Field Name	Field Type	Description
<code>componentType</code>	string	Specifies the component type. Valid values are <code>KnowledgeOne</code> , <code>Lookup</code> , <code>Milestones</code> , <code>RelatedList</code> , <code>Topics</code> , <code>Files</code> , and <code>CaseExperts</code> . This field is available in API version 31.0 and later. The <code>Files</code> and <code>CaseExperts</code> values are available in API version 32.0 and later.  Case Experts is available through a pilot program.
<code>createAction</code>	string	If the component is a lookup field, the name of the quick action used to create a record. This field is available in API version 42.0 and later.
<code>enableLinking</code>	boolean	If the component is a lookup field, lets users associate a record with this field. This field is available in API version 42.0 and later.  If false, the <code>createAction</code> and <code>updateAction</code> can't be retrieved.
<code>height</code>	int	Required for components with a location of top or bottom. The height of the component in the container. The <code>unit</code> field determines the unit of measurement, in pixels or percent.
<code>label</code>	string	The name of the component as it appears to console users. Available for components in a container with the style of tabs or accordion.
<code>lookup</code>	string	If the component is a lookup field, the name of the field.
<code>page</code>	string	If the component is a Visualforce page, the name of the Visualforce page.
<code>relatedlists</code>	<a href="#">RelatedList[]</a>	If the component is a related list, the name of the list. This field is available in API version 31.0 and later.

Field Name	Field Type	Description
<code>unit</code>	string	The unit of measurement, in pixels or percent, for the height or width of the component in the container.  Pixel values are simply the number of pixels, for example, 500, and must be greater than 0 but less than 999. Percentage values must include the percent sign, for example, 20%, and must be greater than 0 but less than 100.
<code>updateAction</code>	string	If the component is a lookup field, the name of the quick action used to update a record. This field is available in API version 42.0 and later.
<code>width</code>	int	Required for components with a location of right or left. The width of the component in the container. The <code>unit</code> field determines the unit of measurement, in pixels or percent.

## RelatedList

Represents related list custom components on the sidebars of the Salesforce console. Available in API version 31.0 and later.

Field Name	Field Type	Description
<code>hideOnDetail</code>	boolean	If set to <code>true</code> , the related list is hidden from detail pages where it appears as a component to prevent duplicate information from showing.
<code>name</code>	string	The name of the component as it appears to console users.

## SubtabComponents

Represents custom console components on subtabs in the Salesforce console. Available in API version 25.0 and later.

Field Name	Field Type	Description
<code>component</code>	<a href="#">ConsoleComponent[]</a>	Represents a custom console component (Visualforce page, lookup field, or related lists; Canvas apps not available) on a section of a page layout. Custom console components only appear in the Salesforce console. This field is available in API version 29.0 and earlier.
<code>containers</code>	<a href="#">Container[]</a>	Represents a location and style to display more than one custom console component on the sidebars of the Salesforce console. You can specify up to five components for each of the four locations (left, right, top, and bottom). This field is available in API version 30.0 and later.

## FeedLayout

Represents the values that define the feed view of a feed-based page layout. Feed-based layouts are available on Account, Case, Contact, Lead, Opportunity, custom, and external objects. They include a feed view and a detail view. Available in API version 30.0 and later.

Field Name	Field Type	Description
<code>autocollapsePublisher</code>	boolean	Specifies whether the publisher is automatically collapsed when the page loads ( <code>true</code> ) or not ( <code>false</code> ).
<code>compactFeed</code>	boolean	Specifies whether the feed-based page layout uses a compact feed ( <code>true</code> ) or not ( <code>false</code> ). If set to <code>true</code> , feed items on the page are collapsed by default, and the feed view has an updated design.
<code>feedFilterPosition</code>	FeedLayoutFilterPosition (enumeration of type string)	Where the feed filters list is included in the layout. Valid values are: <ul style="list-style-type: none"> <li><code>centerDropDown</code>—as a dropdown list in the center column.</li> <li><code>leftFixed</code>—as a fixed list in the left column.</li> <li><code>leftFloat</code>—as a floating list in the left column.</li> </ul>
<code>feedFilters</code>	FeedLayoutFilter[]	The individual filters displayed in the feed filters list.
<code>fullWidthFeed</code>	boolean	Specifies whether the feed expands horizontally to take up all available space on the page ( <code>true</code> ) or not ( <code>false</code> ).
<code>hideSidebar</code>	boolean	Specifies whether the sidebar is hidden ( <code>true</code> ) or not ( <code>false</code> ).
<code>leftComponents</code>	FeedLayoutComponent[]	The individual components displayed in the left column of the feed view.
<code>rightComponents</code>	FeedLayoutComponent[]	The individual components displayed in the right column of the feed view.

## FeedLayoutComponent

Represents a component in the feed view of a feed-based page layout. Available in API version 30.0 and later.

Field Name	Field Type	Description
<code>componentType</code>	FeedLayoutComponentType (enumeration of type string)	Required. The type of component. Valid values are: <ul style="list-style-type: none"> <li><code>HelpAndToolLinks</code>—icons that link to the help topic for the page, the page layout, and, the printable view of the page. Available only on Case layouts.</li> <li><code>CustomButtons</code>—a custom button.</li> <li><code>Following</code>—an icon that toggles between a Follow button (if the user viewing a record doesn't already follow it) and a Following indicator (if the user viewing a record does follow it).</li> <li><code>Followers</code>—a list of users who follow the record.</li> <li><code>CustomLinks</code>—a custom link.</li> <li><code>Milestones</code>—the milestone tracker, which lets users see the status of a milestone on a case. Available only on Case layouts.</li> <li><code>Topics</code>—a list of topics related to the record.</li> <li><code>CaseUnifiedFiles</code>—a list of all files that are attached to the case.</li> <li><code>Visualforce</code>—a custom Visualforce component.</li> </ul>

Field Name	Field Type	Description
height	int	The height, in pixels, of the component. Doesn't apply to <code>standardComponents</code>
page	string	The name of a Visualforce page being used as a custom component.

## FeedLayoutFilter

Represents a feed filter option in the feed view of a feed-based page layout. A filter must have only `standardFilter` or `feedItemType` set. Available in API version 30.0 and later.

Field Name	Field Type	Description
feedFilterName	string	The name of a CustomFeedFilter component. Names are prefixed with the name of the parent object. For example, <i>Case.MyCustomFeedFilter</i> .
feedFilterType	FeedLayoutFilterType (enumeration of type string)	The type of filter. Valid values are: <ul style="list-style-type: none"> <li>• <code>AllUpdates</code>—shows all feed items on a record.</li> <li>• <code>FeedItemType</code>—shows feed items only for a particular type of activity on the record.</li> </ul>
feedItemType	FeedItemType (enumeration of type string)	The type of feed item to display. Valid values are: <ul style="list-style-type: none"> <li>• <code>ActivityEvent</code>—feed items related to activity on tasks and events associated with a case. Available only on Case layouts.</li> <li>• <code>AdvancedTextPost</code>—feed items related to group announcements posted on a feed. This value is available in API version 31.0 and later.</li> <li>• <code>AnnouncementPost</code>—Not used.</li> <li>• <code>ApprovalPost</code>—feed items related to approvals that are submitted on a feed.</li> <li>• <code>AttachArticleEvent</code>—feed items for activity related to attaching articles to cases. Available only on Case layouts.</li> <li>• <code>BasicTemplateFeedItem</code>—Not used.</li> <li>• <code>CallLogPost</code>—feed items for activity from the Log a Call action. Available only on layouts for objects that support Activities (tasks and events).</li> <li>• <code>CanvasPost</code>—feed items related to posts that a canvas app makes on a feed.</li> <li>• <code>CaseCommentPost</code>—feed items for activity from the Case Note action. Available only on Case layouts.</li> <li>• <code>ChangeStatusPost</code>—feed items for activity from the Change Status action. Available only on Case layouts.</li> <li>• <code>ChatTranscriptPost</code>—feed items for activity related to attaching Chat transcripts to cases. Available only on Case layouts.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>CollaborationGroupCreated</code>—feed items related to creating a public group.</li> <li>• <code>CollaborationGroupUnarchived</code>—Not used.</li> <li>• <code>ContentPost</code>—feed items related to attaching a file to a post.</li> <li>• <code>CreatedRecordEvent</code>—feed items related to creating a record from the publisher.</li> <li>• <code>DashboardComponentSnapshot</code>—feed items related to posting a dashboard snapshot on a feed.</li> <li>• <code>EmailMessageEvent</code>—feed items for activity from the Email action. Available only on Case layouts.</li> <li>• <code>FacebookPost</code>—Not used.</li> <li>• <code>LinkPost</code>—feed items related to attaching a URL to a post.</li> <li>• <code>MilestoneEvent</code>—feed items for changes to the milestone status on a case. Available only on Case layouts.</li> <li>• <code>PollPost</code>—feed items related to posting a poll on a feed.</li> <li>• <code>ProfileSkillPost</code>—feed items related to skills added to a user's Chatter profile. This value is available in API version 31.0 and later.</li> <li>• <code>QuestionPost</code>—feed items related to posting a question on a feed. This value is available in API version 31.0 and later.</li> <li>• <code>ReplyPost</code>—feed items for activity from the Portal action. Available only on Case layouts.</li> <li>• <code>RypplePost</code>—feed items related to creating a Thanks badge in WDC.</li> <li>• <code>SocialPost</code>—feed items for activity on Twitter from the Social Post action.</li> <li>• <code>TextPost</code>—feed items for creating a text post from the publisher.</li> <li>• <code>TrackedChange</code>—feed items related to a change or group of changes to a tracked field.</li> <li>• <code>UserStatus</code>—Not used.</li> </ul>

&gt;

## MiniLayout

Represents a mini view of a record in the Console tab, hover details, and event overlays.

Field Name	Field Type	Description
<code>fields</code>	<code>string[]</code>	The fields for the mini-layout, listed in the order they appear in the UI. Fields that appear here must appear in the main layout.

Field Name	Field Type	Description
<code>relatedLists</code>	<a href="#">RelatedListItem</a> []	The mini related list, listed in the order they appear in the UI. You can't set sorting on mini related lists. Fields that appear here must appear in the main layout.

## LayoutSection

LayoutSection represents a section of a page layout, such as the Custom Links section.

Field Name	Field Type	Description
<code>customLabel</code>	boolean	Indicates if this section's label is custom or standard (built-in). Custom labels can be any text, but must be translated. Standard labels have a predefined set of valid values, for example System Information, which are automatically translated.
<code>detailHeading</code>	boolean	Controls if this section appears in the detail page. In the UI, this setting corresponds to the checkbox in the section details dialog.
<code>editHeading</code>	boolean	Controls if this section appears in the edit page.
<code>label</code>	string	The label; either standard or custom, based on the <code>customLabel</code> flag.
<code>layoutColumns</code>	<a href="#">LayoutColumn</a> []	The columns of the layout, depending on the style. 1, 2, or 3 columns, ordered left to right, are possible.
<code>style</code>	LayoutSectionStyle (enumeration of type string)	The style of the layout: <ul style="list-style-type: none"> <li>• <code>TwoColumnsTopToBottom</code> - Two columns, tab goes top to bottom</li> <li>• <code>TwoColumnsLeftToRight</code> - Two columns, tab goes left to right</li> <li>• <code>OneColumn</code> - One column</li> <li>• <code>CustomLinks</code> - Contains custom links only</li> </ul>

## LayoutColumn

LayoutColumn represents the items in a column within a layout section.

Field Name	Field Type	Description
<code>layoutItems</code>	<a href="#">LayoutItem</a> []	The individual items within a column (ordered from top to bottom).
<code>reserved</code>	string	This field is reserved for Salesforce. The field resolves an issue with some SOAP libraries. Any value entered in the field is ignored.

## LayoutItem

LayoutItem represents the valid values that define a layout item. An item must have only one of the following values set: component, customLink, field, s-control, page, analyticsCloudComponent, or reportChartComponent.

Field Name	Field Type	Description
behavior	UiBehavior (enumeration of type string)	Determines the field behavior. <b>Note:</b> KAVs, attempting to explicitly specify UiBehavior results in an exception. UiBehavior must not be specified. Valid string values: <ul style="list-style-type: none"> <li>• <code>Edit</code>—The layout field can be edited but isn't required</li> <li>• <code>Required</code>—The layout field can be edited and is required</li> <li>• <code>ReadOnly</code>—The layout field is read-only</li> </ul>
canvas	string	Reference to a canvas app. This field is available in API version 31.0 and later.
component	string	Reference to a component. Value must be <code>sfa:socialCard</code> . This field is available in API version 30.0 and later. This field is allowed only inside a <code>RelatedContentItem</code> . <code>sfa:socialCard</code> is supported only on page layouts for contacts, accounts, and leads.
customLink	string	The <code>customLink</code> reference. This field is allowed only inside a <code>CustomLink layoutSection</code> .
emptySpace	boolean	Controls if this layout item is a blank space.
field	string	The field name reference, relative to the layout object, for example <code>Description</code> or <code>MyField__c</code> .
height	int	For s-control and pages only, the height in pixels.
page	string	Reference to a Visualforce page.
analyticsCloudComponent	<a href="#">AnalyticsCloudComponentLayoutItem</a>	Refers to a CRM Analytics dashboard that you can add to a standard or custom object page. This field is available in API version 34.0 and later.
reportChartComponent	<a href="#">ReportChartComponentLayoutItem</a>	Refers to a report chart that you can add to a standard or custom object page.
scontrol	string	Reference to an s-control.
showLabel	boolean	For s-control and pages only, whether to show the label.
showScrollbars	boolean	For s-control and pages only, whether to show scrollbars.

Field Name	Field Type	Description
<code>width</code>	string	For s-control and pages only, the width in pixels or percent. Pixel values are simply the number of pixels, for example, 500. Percentage values must include the percent sign, for example, 20%.

## AnalyticsCloudComponentLayoutItem

Represents the settings for a CRM Analytics dashboard on a standard or custom page. Available in API version 34.0 and later.

Field Name	Field Type	Description
<code>assetType</code>	string	Required. Specifies the type of CRM Analytics asset to add. The available asset type is <code>dashboard</code> .
<code>devName</code>	string	Required. Unique development name of the dashboard to add.
<code>error</code>	string	Error string; only populated if an error occurred in the underlying dashboard.
<code>filter</code>	string	Communicates initial dashboard filters for mapping data fields in the dashboard to the object's fields, so that the dashboard shows only the data that's relevant for the record being viewed.
<code>height</code>	int	Specifies the height of the dashboard, in pixels. The default is 400.
<code>hideOnError</code>	boolean	Controls whether users see a dashboard that has an error. When this attribute is set to <code>true</code> , if the dashboard has an error, the dashboard doesn't appear on the page. When set to <code>false</code> , the dashboard appears but doesn't show any data except the error. An error can happen when a user doesn't have access to CRM Analytics or to the dashboard. The default is <code>true</code> .
<code>showSharing</code>	boolean	If set to <code>true</code> , and the dashboard is shareable, then the dashboard shows the Share icon. Users can click the icon to open the Share dialog and post or download from the dashboard. If set to <code>false</code> , the dashboard doesn't show the Share icon. This field is available in API version 37.0 and later.
<code>showTitle</code>	boolean	If <code>true</code> , includes the dashboard's title above the dashboard. If <code>false</code> , the dashboard appears without a title. The default is <code>true</code> .
<code>width</code>	string	Specifies the width of the dashboard, in pixels or percent. Pixel values are simply the number of pixels, for example, 500. Percentage values must include the percent sign, for example, 20%. The default is 100%.

## ReportChartComponentLayoutItem

Represents the settings for a report chart on a standard or custom page.

Field Name	Field Type	Description
cacheData	boolean	Indicates whether to use cached data when displaying the chart. When the attribute is set to <code>true</code> , data is cached for 24 hours. If the attribute is set to <code>false</code> , the report isn't run every time the page is refreshed.  This field is available in API version 29.0 and later.
contextFilterableField	string	Unique development name of the field by which a report chart is filtered to return data relevant to the page. If set, the ID field for the parent object of the page or report type is the chart data filter. The parent object for the report type and the page must match for a chart to return relevant data.
error	string	Error string; only populated if an error occurred in the underlying report.  This field is available in API version 31.0 and later.
hideOnError	boolean	Controls whether users see a chart that has an error. When there's an error and this attribute is set, the chart doesn't show any data except the error. An error can happen for many reasons, such as when a user doesn't have access to fields used by the chart or a chart has been removed from the report. Set the attribute to <code>true</code> to hide the chart from a page on error.  This field is available in API version 29.0 and later.
includeContext	boolean	If <code>true</code> , filters the report chart to return data that's relevant to the page.
reportName	string	Unique development name of a report that includes a chart.
showTitle	boolean	If <code>true</code> , applies the title from the report to the chart.
size	ReportChartComponentSize (enumeration of type string)	The chart size is medium when no value is specified. Valid values: <ul style="list-style-type: none"> <li>• SMALL</li> <li>• MEDIUM</li> <li>• LARGE</li> </ul>

## PlatformActionList

PlatformActionList represents the list of actions and their order that appear in the Salesforce mobile app action bar for the layout. Available in API version 34.0 and later.

Field Name	Field Type	Description
actionListContext	PlatformActionListContext (enumeration of type string)	Required. The context of the action list. Valid values are: <ul style="list-style-type: none"> <li>• Assistant</li> <li>• BannerPhoto</li> <li>• Chatter</li> <li>• Dockable</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• FeedElement</li> <li>• Flexipage</li> <li>• Global</li> <li>• ListView</li> <li>• ListViewDefinition</li> <li>• ListViewRecord</li> <li>• Lookup</li> <li>• MruList</li> <li>• MruRow</li> <li>• ObjectHomeChart</li> <li>• Photo</li> <li>• Record</li> <li>• RecordEdit</li> <li>• RelatedList</li> <li>• RelatedListRecord</li> </ul>
platformActionListItems	<a href="#">PlatformActionListItem</a> []	The actions in the PlatformActionList.
relatedSourceEntity	string	When the <code>ActionListContext</code> is <code>RelatedList</code> or <code>RelatedListRecord</code> , this field represents the API name of the related list to which the action belongs.

## PlatformActionListItem

PlatformActionListItem represents an action in the PlatformActionList. Available in API version 34.0 and later.

Field Name	Field Type	Description
actionName	string	The API name for the action in the list.
actionType	PlatformActionType (enumeration of type string)	<p>The type of action. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>ActionLink</code>—An indicator on a feed element that targets an API, a web page, or a file, represented by a button in the Salesforce Chatter feed UI.</li> <li>• <code>CustomButton</code>—When clicked, opens a URL or a Visualforce page in a window or executes JavaScript.</li> <li>• <code>InvocableAction</code></li> <li>• <code>ProductivityAction</code>—Productivity actions are predefined and attached to a limited set of objects. Productivity actions include Send Email, Call, Map, View Website, and Read News. Except for the Call action, you can't edit productivity actions.</li> <li>• <code>QuickAction</code>—A global or object-specific action.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li><code>StandardButton</code>—A predefined Salesforce button such as New, Edit, and Delete.</li> </ul>
<code>sortOrder</code>	<code>int</code>	The placement of the action in the list.
<code>subtype</code>	<code>string</code>	The subtype of the action. For quick actions, the subtype is <code>QuickActionType</code> . For custom buttons, the subtype is <code>WebLinkTypeEnum</code> . For action links, subtypes are <code>Api</code> , <code>ApiAsync</code> , <code>Download</code> , and <code>Ui</code> . Standard buttons and productivity actions have no subtype.

## QuickActionList

`QuickActionList` represents the list of actions associated with the page layout. Available in API version 28.0 and later.

Field Name	Field Type	Description
<code>quickActionListItems</code>	<a href="#">QuickActionListItem</a> []	Array of zero or more <code>QuickActionList</code> objects.

## QuickActionListItem

`QuickActionListItem` represents an action in the `QuickActionList`. Available in API version 28.0 and later.

Field Name	Field Type	Description
<code>quickActionName</code>	<code>string</code>	The API name of the action.

## RelatedContent

`RelatedContent` represents the Mobile Cards section of the page layout. Available in API version 29.0 and later.

Field Name	Field Type	Description
<code>relatedContentItems</code>	<a href="#">RelatedContentItem</a> []	A list of layout items in the Mobile Cards section of the page layout.

## RelatedContentItem

`RelatedContentItem` represents an individual item in the [RelatedContentItem](#) list. Available in API version 29.0 and later.

Field Name	Field Type	Description
<code>layoutItem</code>	<a href="#">LayoutItem</a>	An individual <a href="#">LayoutItem</a> in the Mobile Cards section.

## RelatedListItem

RelatedListItem represents a related list in a page layout.

Field Name	Field Type	Description
customButtons	string[]	A list of custom buttons that are used on the related list.
excludeButtons	string[]	A list of buttons that are excluded from the related list.
fields	string[]	A list of fields that are displayed in the related list.  Retrieval of standard fields on related lists uses aliases instead of field or API names. For example, the <code>Fax</code> , <code>Mobile</code> , and <code>Home Phone</code> fields are retrieved as <code>Phone2</code> , <code>Phone3</code> , and <code>Phone4</code> , respectively.
quickActions	string[]	A list of quick actions that are used on the related list.
relatedList	string	Required. The name of the related list.
sortField	string	The name of the field that is used for sorting.
sortOrder	SortOrder (enumeration of type string)	If the <code>sortField</code> is set, the <code>sortOrder</code> field determines the sort order. <ul style="list-style-type: none"> <li>• <code>Asc</code> - Sort in ascending order</li> <li>• <code>Desc</code> - Sort in descending order</li> </ul>

## SummaryLayout

When Case Feed is enabled, controls the appearance of the highlights panel in Salesforce Classic, which summarizes key fields in a grid at the top of a page layout. Available in API version 25.0 and later.

Field Name	Field Type	Description
masterLabel	string	Required. The name of the layout label.
sizeX	int	Required. Number of columns in the highlights pane, from 1 through 4 (inclusive).
sizeY	int	Required. Number of rows in each column, either 1 or 2.
sizeZ	int	Reserved for future use. If provided, the setting is visible to users.
summaryLayoutItems	SummaryLayoutItem[]	Controls the appearance of an individual field and its column and row position within the highlights panel grid, when Case Feed is enabled. At least one is required.
summaryLayoutStyle	SummaryLayoutStyle (enumeration of type string)	Highlights panel style. Valid string values are: <ul style="list-style-type: none"> <li>• <code>Default</code></li> <li>• <code>QuoteTemplate</code></li> <li>• <code>DefaultQuoteTemplate</code></li> <li>• <code>CaseInteraction</code></li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>QuickActionLayoutLeftRight (Available in API version 28.0 and later.)</li> <li>QuickActionLayoutTopDown (Available in API version 28.0 and later.)</li> </ul>

## SummaryLayoutItem

Controls the appearance of an individual field and its column and row position within the highlights panel grid, when Case Feed is enabled. You can have two fields per each grid in a highlights panel. Available in API version 25.0 and later.

Field Name	Field Type	Description
customLink	string	The <code>customLink</code> reference, if the item is a custom link.
field	string	The field name reference, relative to the page layout. Must be a standard or custom field that also exists on the detail page.
posX	int	Required. The item's column position in the highlights panel grid. Must be within the range of <code>sizeX</code> .
posY	int	Required. The item's row position in the highlights panel grid. Must be within the range of <code>sizeY</code> .
posZ	int	Reserved for future use. If provided, the setting is visible to users.

## Declarative Metadata Sample Definition

This sample defines a page layout.

```
<?xml version="1.0" encoding="UTF-8"?>
<Layout xmlns="http://soap.sforce.com/2006/04/metadata">
  <customConsoleComponents>
    <primaryTabComponents>
      <container>
        <region>left</region>
        <style>Stack</style>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## LearningItemType

Represents a custom exercise type that an Enablement user takes in an Enablement program in the Guidance Center. A custom exercise type also requires a corresponding LearningItem record for the Guidance Center and corresponding EnblProgramTaskDefinition and EnblProgramTaskSubCategory records for when admins create a program in Program Builder.

-  **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

LearningItemType components have the suffix `.learningItemType` and are stored in the `learningItemTypes` folder.

## Version

LearningItemType components are available in API version 62.0 and later.

## Special Access Rules

- For Enablement admins to create, update, and delete Enablement programs, the Design and Deliver Enablement Programs permission is required. This permission is enabled by default as part of the Manage Enablement Essentials permission set, which comes with the Enablement add-on license.
- For users who take Enablement programs, the Take Enablement Programs permission is required. This permission is enabled by default as part of the Use Enablement Programs permission set, which comes with the Enablement add-on license.

-  **Important:** Custom exercises aren't compatible with Partner Enablement programs.

## Fields

Field Name	Description
<code>apexEvaluationHandler</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The ID of the Apex class that specifies how progress and completion of the custom exercise is assessed when users take the program in the Guidance Center.</p>
<code>apexSerializerDeserializer</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The ID of the Apex class that specifies how data related to the custom exercise type is retrieved and deployed with change sets or managed packages.</p>
<code>customField</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. The programmatic name of a custom lookup field on the <a href="#">LearningItem object</a> that references the custom object used with this custom exercise.</p> <p>For example, if a custom exercise type shows a screen flow, maybe the custom object's name is <code>ScreenFlow_Object__c</code> and the custom field on LearningItem is named <code>ScreenFlow_Field__c</code>. For details, see <a href="#">Implement Custom Exercise Types for Enablement Programs</a> in the <i>Sales Programs and Partner Tracks with Enablement Developer Guide</i>.</p> <p>This field is unique within your organization.</p>
<code>customObject</code>	<p><b>Field Type</b> string</p> <p><b>Description</b></p> <p>Required. The programmatic name of the custom object used with this custom exercise.</p> <p>For example, if a custom exercise type shows a screen flow, maybe the custom object's name is <code>ScreenFlow_Field__c</code>. For details, see <a href="#">Implement Custom Exercise Types for Enablement Programs</a> in the <i>Sales Programs and Partner Tracks with Enablement Developer Guide</i>.</p> <p>This field is unique within your organization.</p>
<code>developerName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b></p> <p>Required. The unique programmatic name for the LearningItem record.</p>
<code>icon</code>	<p><b>Field Type</b> string</p> <p><b>Description</b></p> <p>Required. The icon to use for the custom exercise type in the Guidance Center.</p> <p>Use the format <b><i>iconType: iconName</i></b>, where the values correspond to icon categories and names from the <a href="#">Salesforce Lightning Design System</a>.</p> <ul style="list-style-type: none"> <li>• <b><i>iconType</i></b> is the type of icon, such as <code>standard</code> or <code>doctype</code>.</li> <li>• <b><i>iconName</i></b> is the icon name, such as <code>flow</code> or <code>slide</code>.</li> </ul> <p>For example, to use the Standard type Flow icon, this value is <code>standard:flow</code>.</p>
<code>lightningComponentDefinition</code>	<p><b>Field Type</b> string</p> <p><b>Description</b></p> <p>Required. The ID of the Lightning Web Component used to show the custom exercise's content when a user opens the exercise in the Guidance Center.</p>

Field Name	Description
	This field sets the value of the <code>LightningComponentName</code> field on the <a href="#">LearningItemType</a> object.
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for the <code>LearningItemType</code>, which is defined when it's created.</p>

## Declarative Metadata Sample Definition

The following is an example of a `LearningItemType` component for a custom exercise type that shows a screen flow.

```
<?xml version="1.0" encoding="UTF-8"?>
<LearningItemType xmlns="http://soap.sforce.com/2006/04/metadata">
  <apexEvaluationHandler>ScreenFlowEvaluationHandler</apexEvaluationHandler>
  <apexSerializerDeserializer>ScreenFlowSerializerDeserializer</apexSerializerDeserializer>

  <customField>ScreenFlow_Field__c</customField>
  <customObject>ScreenFlow_Object__c</customObject>
  <developerName>ScreenFlowLearningItemType</developerName>
  <icon>standard:flow</icon>
  <lightningComponentDefinition>screenFlowViewer</lightningComponentDef>
  <masterLabel>Screen Flow Exercise</masterLabel>
</LearningItemType>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>ScreenFlowLearningItemType</members>
    <name>LearningItemType</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Letterhead

Represents formatting options for the letterhead in an email template. A letterhead defines the logo, page color, and text settings for your HTML email templates. Use letterheads to ensure a consistent look and feel in your company's emails.

For more information, see “Create Classic Letterheads for Email Templates” in the Salesforce online help. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

The file suffix for letterheads is `.letter` and components are stored in the `letterhead` directory of the corresponding package directory.

## Version

Letterheads are available in API version 12.0 and later.

## Fields

With the exception of logo, and horizontal and vertical alignment, all of these fields are required.

Field Name	Field Type	Description
<code>available</code>	boolean	Required. Indicates whether this letterhead can be used ( <code>true</code> ) or not ( <code>false</code> ), for example, in an email template.
<code>backgroundColor</code>	string	Required. The background color, in hexadecimal, for example <code>#FF6600</code> .
<code>bodyColor</code>	string	Required. The body color in hexadecimal.
<code>bottomLine</code>	LetterheadLine (enumeration of type string)	Required. The style for the bottom line. Valid style values include: <ul style="list-style-type: none"> <li><code>color</code>. The color of the line in hexadecimal, as a string value.</li> <li><code>height</code>. The height of the line, as an int value.</li> </ul>
<code>description</code>	string	Text description of how this letterhead differs from other letterheads.
<code>fullName</code>	string	The internal name of the letterhead, based on the <code>name</code> , but with white spaces and special characters escaped out for validity.
<code>footer</code>	<a href="#">LetterheadHeaderFooter</a>	Required. The style for the footer.
<code>header</code>	<a href="#">LetterheadHeaderFooter</a>	Required. The style for the header.
<code>middleLine</code>	<a href="#">LetterheadLine</a>	Required. The style for the middle border line in your letterhead. Valid style values include: <ul style="list-style-type: none"> <li><code>color</code>. The color of the line in hexadecimal, as a string value.</li> <li><code>height</code>. The height of the line, as an int value.</li> </ul>
<code>name</code>	string	Required. The name of the letterhead.

Field Name	Field Type	Description
topLine	<a href="#">LetterheadLine</a>	Required. The style for the top horizontal line below the header. Valid style values include: <ul style="list-style-type: none"> <li>• <code>color</code>. The color of the line in hexadecimal, as a string value.</li> <li>• <code>height</code>. The height of the line, as an int value.</li> </ul>

## LetterheadHeaderFooter

LetterheadHeaderFooter represents the properties of a header or footer.

Field	Field Type	Description
backgroundColor	string	Required. The background color of the header or footer in hexadecimal format.
height	<a href="#">DashboardComponent[]</a>	Required. The height of the header or footer.
horizontalAlignment	LetterheadHorizontalAlignment (enumeration of type string)	The horizontal alignment of the header or footer. Valid values are: <ul style="list-style-type: none"> <li>• None</li> <li>• Left</li> <li>• Center</li> <li>• Right</li> </ul>
logo	string	The logo which is a reference to a document, for example <code>MyFolder/MyDocument.gif</code> .
verticalAlignment	LetterheadVerticalAlignment (enumeration of type string)	The vertical alignment of the header or footer. Valid values are: <ul style="list-style-type: none"> <li>• None</li> <li>• Top</li> <li>• Middle</li> <li>• Bottom</li> </ul>

## LetterheadLine

LetterheadLine represents the properties of a line.

Field	Field Type	Description
color	string	Required. The color of the line in hexadecimal format.
height	int	Required. The height of the line.

## Declarative Metadata Sample Definition

```
<?xml version="1.0" encoding="UTF-8"?>
<Letterhead xmlns="http://soap.sforce.com/2006/04/metadata">
  <available>true</available>
  <backgroundColor>#CCCCCC</backgroundColor>
  <bodyColor>#33FF33</bodyColor>
  <bottomLine>
    <color>#3333FF</color>
    <height>5</height>
  </bottomLine>
  <description>INITIAL</description>
  <footer>
    <backgroundColor>#FFFFFF</backgroundColor>
    <height>100</height>
    <horizontalAlignment>Left</horizontalAlignment>
    <verticalAlignment>Top</verticalAlignment>
  </footer>
  <header>
    <backgroundColor>#FFFFFF</backgroundColor>
    <height>100</height>
    <horizontalAlignment>Left</horizontalAlignment>
    <verticalAlignment>Top</verticalAlignment>
  </header>
  <middleLine>
    <color>#AAAAFF</color>
    <height>5</height>
  </middleLine>
  <name>SimpleLetterheadLabel</name>
  <topLine>
    <color>#FF99FF</color>
    <height>5</height>
  </topLine>
</Letterhead>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## LightningBolt

---

Represents the definition of a Lightning Bolt Solution, which can include custom apps, flow categories, and Experience Builder templates. This type extends the Metadata metadata type and inherits its `fullName` field.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

LightningBolt components have the suffix `.lightningBolt` and are stored in the `lightningBolts` folder.

## Version

LightningBolt components are available in API version 43.0 and later.

## Special Access Rules

To add Experience Builder templates to a Lightning Bolt Solution, enable digital experiences in your org.

## Fields

Field Name	Field Type	Description
category	LightningBoltCategory (enumeration of type string)	Required. The primary industry that the Lightning Bolt Solution is aimed at. Valid values are: <ul style="list-style-type: none"> <li>• Communications</li> <li>• Education</li> <li>• FinancialServices</li> <li>• GeneralBusiness</li> <li>• Government</li> <li>• HealthcareLifeSciences</li> <li>• HighTech</li> <li>• Manufacturing</li> <li>• Media</li> <li>• Nonprofits</li> <li>• ProfessionalServices</li> <li>• RealEstate</li> <li>• Retail</li> <li>• TravelTransportationHospitality</li> </ul>
lightningBoltFeatures	<a href="#">LightningBoltFeatures</a> []	The list of feature descriptions of this Lightning Bolt Solution.
lightningBoltImages	<a href="#">LightningBoltImages</a> []	The list of images of this Lightning Bolt Solution.
lightningBoltItems	<a href="#">LightningBoltItems</a> []	The list of items (custom apps, flow categories, and Experience Builder templates) that comprise this Lightning Bolt Solution.
masterLabel	string	Required. The label of the Lightning Bolt Solution, which appears on the solution detail page.
publisher	string	Required. The name of the partner org associated with this Lightning Bolt Solution.
summary	string	Required. The summary description of the Lightning Bolt Solution.

## LightningBoltFeatures

Represents the list of feature descriptions of a Lightning Bolt Solution.

Field Name	Field Type	Description
description	string	A description of the feature of the Lightning Bolt Solution.
order	int	Required. An integer specifying the position of this feature relative to others in the list. 1 is the first position, and 4 is the max position.
title	string	Required. The title of the feature, which appears on the solution detail page.

## LightningBoltImages

Represents the list of images of a Lightning Bolt Solution.

Field Name	Field Type	Description
image	string	Required. The developer name of the <a href="#">ContentAsset</a> type, which is used as a preview image for this Lightning Bolt Solution.
order	int	Required. An integer specifying the position of this image relative to others in the list. 1 is the first position, and 3 is the max position.

## LightningBoltItems

Represents the list of items (custom apps, flow categories, and Experience Builder templates) that comprise a Lightning Bolt Solution.

Field Name	Field Type	Description
name	string	Required. The name of the item, which appears on the solution detail page.
type	string	Required. The type of the item included in the Lightning Bolt Solution. Valid values are: <ul style="list-style-type: none"> <li>• <code>CommunityTemplateDefinition</code></li> <li>• <code>CustomApplication</code></li> <li>• <code>FlowCategory</code></li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a LightningBolt component.

```
<?xml version="1.0" encoding="UTF-8"?>
<LightningBolt xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <category>Sales</category>
  <lightningBoltFeatures>
    <description>bb</description>
```

```

        <order>1</order>
        <title>aa</title>
    </lightningBoltFeatures>
    <lightningBoltImages>
        <image>prml</image>
        <order>1</order>
    </lightningBoltImages>
    <lightningBoltItems>
        <name>PolaConsole</name>
        <type>CustomApplication</type>
    </lightningBoltItems>
    <lightningBoltItems>
        <name>Banking_Service_Console</name>
        <type>CustomApplication</type>
    </lightningBoltItems>
    <lightningBoltItems>
        <name>Banking_Service_Portal</name>
        <type>CommunityTemplateDefinition</type>
    </lightningBoltItems>
    <lightningBoltItems>
        <name>Banking_Sales_Portal</name>
        <type>CommunityTemplateDefinition</type>
    </lightningBoltItems>
    <lightningBoltItems>
        <name>myorgdev__updatebenefits</name>
        <type>FlowCategory</type>
    </lightningBoltItems>
    <masterLabel>BoltTe</masterLabel>
    <publisher>aaaa</publisher>
    <summary>This is a summary.</summary>
</LightningBolt>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>BoltTe</members>
        <name>LightningBolt</name>
    </types>
    <version>43.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## LightningComponentBundle

---

Represents a Lightning web component bundle. A bundle contains Lightning web component resources.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Special Access Rules

LightningComponentBundle components can be created only in orgs with defined namespaces.

As of Summer '20 and later, only your Salesforce org's internal users can access this type.

For more information on packaging a Lightning web component bundle, see the [Second-Generation Managed Packaging Developer Guide](#).

## Fields

Field Name	Field Type	Description
apiVersion	double	A double value that binds the component to a Salesforce API version.
capabilities	<a href="#">Capabilities</a> []	A list of capabilities. A capability is something that a component can do, as opposed to a target, which defines where you can use a component. Available in API version 48.0 and later.
description	string	A description of the Lightning web component.
isExplicitImport	boolean	Indicates whether imports between files are done explicitly by the developer ( <code>true</code> ) or implicitly by the framework ( <code>false</code> ).
isExposed	boolean	If <code>true</code> , the component is available to other namespaces. If <code>true</code> and a <code>targets</code> value is also provided, the component is available to Salesforce builders such as Lightning App Builder and Experience Builder. If <code>false</code> , the component isn't available to builders and other namespaces.
lwcResources	<a href="#">LwcResources</a> []	A list of resources inside a bundle.
masterLabel	string	The component title that appears in the list view.
targetConfigs	base64Binary	Configurations for each target. Each target is a Lightning page type. For example, this configuration allows a Lightning web component to be used on a Contact record page in Lightning App Builder. <div data-bbox="699 1438 1446 1675" data-label="Code-Block"> <pre>&lt;targetConfigs&gt;   &lt;targetConfig targets="lightning__RecordPage"&gt;     &lt;objects&gt;       &lt;object&gt;Contact&lt;/object&gt;     &lt;/objects&gt;   &lt;/targetConfig&gt; &lt;/targetConfigs&gt;</pre> </div>
targets	<a href="#">Targets</a> []	A list of targets where the Lightning web component is supported. Each target is a Lightning page type that can be configured in Lightning App Builder.

## Capabilities

Represents a list of capabilities. A capability is something that a component can do, as opposed to a target, which defines where you can use a component. Available in API version 48.0 and later. For more information, see [XML Configuration File Elements](#).

Field	Field Type	Description
capability	string	Specifies something that a component can do. Valid values are: <ul style="list-style-type: none"> <li>lightningCommunity__RelaxedCSP</li> <li>lightning__dynamicComponent</li> <li>lightning__ServerRenderable</li> <li>lightning__ServerRenderableWithHydration</li> <li>lightning__ServiceCloudVoiceToolkitApi</li> </ul>

## LwcResources

Represents a list of resources inside a LightningComponentBundle.

Field	Field Type	Description
lwcResource	<a href="#">LwcResource</a>	A resource inside a LightningComponentBundle.

## LwcResource

Represents a resource inside a LightningComponentBundle.

Field	Field Type	Description
filePath	string	Required. The file path of a resource.
source	base64Binary	Required. The content of a resource.

## Targets

Represents a list of supported containers for a Lightning web component. For more information, see [XML Configuration File Elements](#).

Field	Field Type	Description
target	string	Specifies the type of Lightning page the component can be added to in the builders, such as in Lightning App Builder, Experience Builder, Flow Builder, or Document Builder. <p>Valid values are:</p> <ul style="list-style-type: none"> <li>analytics__Dashboard</li> <li>lightningCommunity__Default</li> <li>lightningCommunity__Page</li> </ul>

Field	Field Type	Description
		<ul style="list-style-type: none"> <li>• lightningCommunity__Page_Layout</li> <li>• lightningCommunity__Theme_Layout</li> <li>• lightningSnapin__ChatHeader</li> <li>• lightningSnapin__ChatMessage</li> <li>• lightningSnapin__MessagingPreChat</li> <li>• lightningSnapin__MessagingHeader</li> <li>• lightningSnapin__Minimized</li> <li>• lightningSnapin__PreChat</li> <li>• lightningStatic__Email</li> <li>• lightning__AppPage</li> <li>• lightning__GlobalAction</li> <li>• lightning__ECSFSApp</li> <li>• lightning__EnablementProgram</li> <li>• lightning__FlowScreen</li> <li>• lightning__HomePage</li> <li>• lightning__Inbox</li> <li>• lightning__RecordAction</li> <li>• lightning__RecordPage</li> <li>• lightning__ServiceDocument</li> <li>• lightning__Tab</li> <li>• lightning__UtilityBar</li> <li>• lightning__VoiceExtension</li> </ul>

## Declarative Metadata Sample Definition

This `package.xml` file retrieves all the LightningComponentBundle components in an org.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>LightningComponentBundle</name>
  </types>
  <version>45.0</version>
</Package>
```

In the retrieved `zip` file, each Lightning web component is nested under an `lwc` folder.

This example shows the directory structure in the `zip` file of one component with a name of `hello`.

```
lwc
  hello
    hello.html
```

```
hello.js
hello.js-meta.xml
```

Here are the contents of the files in the `hello` directory.

Content of `hello.html`:

```
<template>

  <lightning-card title="Hello" icon-name="custom:custom14">
    <div class="slds-m-around_medium">
      Hello, {greeting}!
    </div>
  </lightning-card>

</template>
```

Content of `hello.js`:

```
import { LightningElement } from 'lwc';

export default class Hello extends LightningElement {
  greeting = 'World';
}
```

Content of `hello.js-meta.xml`.

```
<?xml version="1.0" encoding="UTF-8"?>
<LightningComponentBundle xmlns="http://soap.sforce.com/2006/04/metadata">

  </targets>
</LightningComponentBundle>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## LightningExperienceTheme

Represents the details of a custom theme, including the [BrandingSet](#). Themes enable admins to specify configurable attributes, such as three colors and five images. The colors and some of the images override SLDS token values and influence the generation of `app.css`.

To activate a custom theme with Metadata API, set the `activeThemeField` on the [LightningExperienceSettings](#) component to the API name of the `LightningExperienceTheme`.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

LightningExperienceTheme components have the suffix `.lightningExperienceTheme` and are stored in the `lightningExperienceThemes` folder.

## Version

LightningExperienceTheme components are available in API version 42.0 and later.

## Special Access Rules

The LightningExperienceTheme type is available when the S1DesktopAllowed permission is enabled in your org.

## Fields

Field Name	Field Type	Description
defaultBrandingSet	string	Required. The ID of the <a href="#">BrandingSet</a> properties associated with this LightningExperienceTheme.
description	string	The optional description text of this LightningExperienceTheme. Limited to 1000 characters.
masterLabel	string	Required. The label for this LightningExperienceTheme, which displays in Setup. Limited to 70 characters.
shouldOverrideLoadingImage	boolean	If <code>true</code> , the LightningExperienceTheme overrides the splash screen image.

## Declarative Metadata Sample Definition

The following is an example of a LightningExperienceTheme component. See [BrandingSet](#) on page 420 for an example of the BrandingSet component.

```
<?xml version="1.0" encoding="UTF-8"?>
<LightningExperienceTheme xmlns="http://soap.sforce.com/2006/04/metadata">
  <defaultBrandingSet>SummerCelebrationBrand</defaultBrandingSet>
  <description>Theme for summer celebration week.</description>
  <masterLabel>Summer Celebration</masterLabel>
  <shouldOverrideLoadingImage>false</shouldOverrideLoadingImage>
</LightningExperienceTheme>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>LEXTHEMINGThemeName</members>
    <name>BrandingSet</name>
  </types>
</Package>
```

```
<members>Summer Celebration</members>
<name>LightningExperienceTheme</name>
</types>
<version>42.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## LightningMessageChannel

Represents the metadata associated with a Lightning Message Channel. A Lightning Message Channel represents a secure channel to communicate across UI technologies, such as Lightning Web Components, Aura Components, and Visualforce.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

 **Note:** Before you include a Lightning Message Channel in a managed package, review these considerations.

- To pass the [AppExchange Security Review](#), you must set the `isExposed` field to `false`.
- If you set the `isExposed` field to `true`, you can't change the value to `false` at a later time. This consideration applies to Lightning Message Channels in managed packages and Lightning Message Channels that other components reference.
- Visualforce supports only Lightning Message Channels where `isExposed` is `true`, so managed packages with a Lightning Message Channel in Visualforce can't pass the AppExchange Security Review. See [Considerations and Limitations](#) in the *Visualforce Developer Guide*.
- You can't remove Lightning Message Channel metadata from a managed package.

## File Suffix and Directory Location

LightningMessageChannel components have the suffix `.messageChannel` and are stored in the `messageChannels` folder.

## Version

LightningMessageChannel components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>description</code>	string	The description of the Lightning Message Channel.
<code>isExposed</code>	boolean	Indicates whether a Lightning Message Channel is exposed to components in other namespaces ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .

Field Name	Field Type	Description
lightningMessageFields	<a href="#">LightningMessageField</a> on page 1252[]	A list of message payload fields for a given Lightning Message Channel.
masterLabel	string	Required. The label for a Lightning Message Channel.

## LightningMessageField

Represents a message payload field for a given Lightning Message Channel.

Field Name	Field Type	Description
description	string	The description for a Lightning Message Field.
fieldName	string	Required. Unique identifier of the Lightning Message Field.

## Declarative Metadata Sample Definition

Here's a simple example of a LightningMessageChannel component.

```
<?xml version="1.0" encoding="UTF-8"?>
<LightningMessageChannel xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>SampleMessageChannel</masterLabel>
  <isExposed>true</isExposed>
  <description>This is a sample Lightning Message Channel.</description>
</LightningMessageChannel>
```

Here's an example of a LightningMessageChannel component with LightningMessageFields.

```
<?xml version="1.0" encoding="UTF-8"?>
<LightningMessageChannel xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>SampleMessageChannel</masterLabel>
  <isExposed>true</isExposed>
  <description>This is a sample Lightning Message Channel.</description>
  <lightningMessageFields>
    <fieldName>recordId</fieldName>
    <description>This is the record Id that changed</description>
  </lightningMessageFields>
  <lightningMessageFields>
    <fieldName>recordData</fieldName>
    <description>The current data representing the record that changed</description>
  </lightningMessageFields>
</LightningMessageChannel>
```

Here's an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>LightningMessageChannel</name>
  </types>
```

```
<version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## LightningOnboardingConfig

Represents the feedback provided when users switch from Lightning Experience to Salesforce Classic. Admins can customize the question, how frequently the form appears, and where the feedback is stored in Chatter from the Adoption Assistance page in Lightning Experience Setup. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

LightningOnboardingConfig components have the suffix `.lightningOnboardingConfig` and are stored in the `LightningOnboardingConfigs` folder.

## Version

LightningOnboardingConfig components are available in API version 49.0 and later.

## Special Access Rules

See [Switch to Salesforce Classic Feedback Form](#) in Salesforce Help for details.

## Fields

Field Name	Field Type	Description
<code>collaborationGroup</code>	string	Required. The ID of the Chatter Group where the user feedback is posted.
<code>customQuestion</code>	string	Text of the custom question added by the admin. Maximum of 1,000 characters.
<code>feedbackFormDaysFrequency</code>	int	Required. The number of days between showing the feedback form when a user switches between Lightning Experience and Salesforce

Field Name	Field Type	Description
		Classic. A value of 0 indicates that the form is shown for every switch. Maximum of 30.
isCustom	boolean	Required. Indicates if a feedback form includes a custom question ( <code>true</code> ) or not ( <code>false</code> ).
masterLabel	string	Required. The label of the in-app guidance. Maximum of 80 characters.
promptDelayTime	int	Required. Indicates the amount of time, in seconds, to delay between instances of all in-app content, both custom content created by org and standard content created by Salesforce. Minimum of 0 hours and 0 minutes. Maximum of 99 hours and 59 minutes.
sendFeedbackToSalesforce	boolean	Required. Indicates if the user feedback can be shared with Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Even if the feedback isn't shared with Salesforce, the feedback is shared in the Chatter Group chosen when customizing the feedback form. The default is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of a `LightningOnboardingConfig` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<LightningOnboardingConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <collaborationGroup>{Org ID}</collaborationGroup>
  <customQuestion>Please take a minute to tell us why you're switching.</customQuestion>

  <feedbackFormDaysFrequency>0</feedbackFormDaysFrequency>
  <isCustom>true</isCustom>
  <masterLabel>Feedback Form</masterLabel>
  <promptDelayTime>3600</promptDelayTime>
  <sendFeedbackToSalesforce>true</sendFeedbackToSalesforce>
</LightningOnboardingConfig>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## LiveChatAgentConfig

Represents the configuration of an organization's Chat deployment, such as how many chats can be assigned to an agent and whether chat sounds are enabled.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

LiveChatAgentConfig configurations are referenced in the `<developer_name>.liveChatAgentConfig` file in the `liveChatAgentConfigs` directory.

## Version

LiveChatAgentConfig is available in API version 28.0 and later.

## Fields

Field Name	Field Type	Description
<code>assignments</code>	<a href="#">AgentConfigAssignments</a>	Specifies how agent configurations are assigned to Chat users. Agent configurations can be assigned to sets of users or sets of profiles.
<code>autoGreeting</code>	string	Specifies the greeting that displays when a customer begins a chat with an agent.
<code>capacity</code>	int	Specifies the maximum number of chats in which an agent can be engaged at a time.
<code>criticalWaitTime</code>	int	Specifies the number of seconds an agent can wait to answer an engaged chat before the chat tab flashes to alert the agent to answer it.
<code>customAgentName</code>	string	Specifies the custom name for an agent, if one has been set. Available in API version 29.0 and later.
<code>disableTransferConferenceGreeting</code>	boolean	Indicates whether the greeting is disabled for agents during chat transfer and chat conferencing ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 53.0 and later.
<code>enableAgentFileTransfer</code>	boolean	Indicates whether file transfer is enabled for agents ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 31.0 and later.
<code>enableAgentSneakPeek</code>	boolean	Specifies whether a supervisor can see the content of an agent's message before they send it to a customer ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableAssistanceFlag</code>	boolean	Indicates whether agents can raise an assistance flag to notify a supervisor that they need help. Available in API version 35.0 and later.
<code>enableAutoAwayOnDecline</code>	boolean	Indicates whether an agent appears as "away" ( <code>true</code> ) or not ( <code>false</code> ) when an agent declines a chat with a customer.
<code>enableAutoAwayOnPushTimeout</code>	boolean	Indicates whether an agent appears as "away" ( <code>true</code> ) or not ( <code>false</code> ) when a chat request that's been pushed to the agent times out. Available in API version 34.0 and later.

Field Name	Field Type	Description
enableChatConferencing	boolean	Indicates whether chat conferencing is enabled for agents ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 34.0 and later.
enableChatMonitoring	boolean	Indicates whether chat monitoring is enabled for support supervisors ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 29.0 and later.
enableChatTransferToAgent	boolean	Indicates whether agents can transfer a chat to another agent ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 36.0 and later.
enableChatTransferToButton	boolean	Indicates whether agents can transfer a chat to a button ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 36.0 and later.
enableChatTransferToSkill	boolean	Indicates whether agents can transfer a chat to a skill group ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 36.0 and later.
enableLogoutSound	boolean	Indicates whether a sound plays ( <code>true</code> ) or not ( <code>false</code> ) when an agent logs out of Chat.
enableNotifications	boolean	Indicates whether notifications of incoming chats appear for agents ( <code>true</code> ) or not ( <code>false</code> ).
enableRequestSound	boolean	Indicates whether a sound plays ( <code>true</code> ) or not ( <code>false</code> ) when a customer requests to chat with an agent.
enableSneakPeek	boolean	Indicates whether previews of customers' messages are displayed as customers type ( <code>true</code> ) or not ( <code>false</code> ) in the agent's Chat window. Available in API version 29.0 and later.
enableVisitorBlocking	boolean	Indicates whether an agent can block a visitor by IP address ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 34.0 and later.
enableWhisperMessage	boolean	Indicates whether support supervisors can send whisper messages to agents during a chat ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 29.0 and later.
label	string	Required. Specifies the name of the configuration for agents' default chat settings.
supervisorDefaultAgentStatusFilter	SupervisorAgentStatusFilter (enumeration of type string)	Specifies the Chat status for filtering the Agent Status list in the Supervisor Panel. Valid values are: <ul style="list-style-type: none"> <li>• Online</li> <li>• Away</li> <li>• Offline</li> </ul> Available in API version 29.0 and later.

Field Name	Field Type	Description
<code>supervisorDefaultButtonFilter</code>	string	Specifies the default button for filtering the Agent Status list in the Supervisor Panel. Available in API version 29.0 and later.
<code>supervisorDefaultSkillFilter</code>	string	Specifies the default skill for filtering the Agent Status list in the Supervisor Panel. Available in API version 29.0 and later.
<code>supervisorSkills</code>	<a href="#">SupervisorAgentConfigSkills</a>	Specifies the list of agent skills that are assigned to a supervisor, as specified in their assigned Chat configuration. Available in API version 29.0 and later.
<code>transferableButtons</code>	<a href="#">AgentConfigButtons</a>	Specifies the list of chat buttons that agents can transfer chats to. Available in API version 31.0 and later.
<code>transferableSkills</code>	<a href="#">AgentConfigSkills</a>	Specifies the list of skill groups that agents can transfer chats to. Available in API version 31.0 and later.

## AgentConfigAssignments

Represents the assignments of an organization's profiles and users to a Chat configuration.

Field Name	Field Type	Description
<code>profiles</code>	<a href="#">AgentConfigProfileAssignments</a>	Specifies the profiles that are associated with a specific agent configuration.
<code>users</code>	<a href="#">AgentConfigUserAssignments</a>	Specifies the users that are associated with a specific agent configuration.

## AgentConfigButtons

Represents the chat buttons that agents who are associated with the Chat configuration can transfer chats to.

Field Name	Field Type	Description
<code>button</code>	string[]	Specifies the chat buttons that agents can transfer chats to.

## AgentConfigProfileAssignments

Represents the profiles associated with a specific Chat configuration.

Field Name	Field Type	Description
<code>profile</code>	string	Specifies the custom name of the profile associated with a specific agent configuration.

## AgentConfigSkills

Represents the skill groups that agents who are associated with the Chat configuration can transfer chats to.

Field Name	Field Type	Description
skill	string[]	Specifies the skill groups that agents can transfer chats to.

## AgentConfigUserAssignments

Represents the users associated with a specific Chat configuration.

Field Name	Field Type	Description
user	string	Specifies the username of the user associated with a specific agent configuration.

## SupervisorAgentConfigSkills

Represents the agent skills associated with a supervisor's Chat configuration. Available in API version 29.0 and later.

Field Name	Field Type	Description
skill	string	Specifies the agent skills available for filtering the Agent Status list in the Supervisor Panel.

## Declarative Metadata Sample Definition

This is a sample of a `liveChatAgentConfig` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<LiveChatAgentConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>My Agent Configuration 1</label>
  <autoGreeting>Hi, how can I help you?</autoGreeting>
  <capacity>5</capacity>
  <enableAutoAwayOnDecline>true</enableAutoAwayOnDecline>
  <enableLogoutSound>true</enableLogoutSound>
  <enableNotifications>true</enableNotifications>
  <enableRequestSound>true</enableRequestSound>
  <enableSneakPeek>true</enableSneakPeek>
  <enableWhisperMessage>true</enableWhisperMessage>
  <assignments>
    <profiles>
      <profile>standard</profile>
    </profiles>
    <users>
      <user>jdoe@acme.com</user>
    </users>
  </assignments>
</LiveChatAgentConfig>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## LiveChatButton

---

Represents a Chat deployment's settings for the button that customers click to chat with an agent and the chat window, such as the label that appears on the button and the pre-chat form that appears before a chat begins. This type extends the Metadata metadata type and inherits its `fullName` field.

Chats routed with Omni-Channel aren't supported in the Metadata API.

## File Suffix and Directory Location

[LiveChatButton](#) on page 1259 configurations are stored in the `<developer_name>.liveChatButton` file in the `liveChatButtons` directory.

## Version

[LiveChatButton](#) on page 1259 is available in API version 28.0 and later.

## Fields

Field Name	Field Type	Description
<code>animation</code>	LiveChatButtonPresentation (enumeration of type string)	The type of animation for a chat invitation. Valid values are: <ul style="list-style-type: none"> <li>• Slide</li> <li>• Fade</li> <li>• Appear</li> <li>• Custom</li> </ul>
<code>autoGreeting</code>	string	The customized greeting message that the customer receives when an agent accepts a chat request from the chat button or invitation. Available in API version 29.0 and later.
<code>chastitorIdleTimeout</code>	int	Specifies the amount of idle time before the chat times out. The idle time starts being counted after the agent sends the last chat message. Available in API version 35.0 and later.
<code>chastitorIdleTimeoutWarning</code>	int	Specifies the amount of idle time before a warning appears. The idle time starts being counted after the agent sends the last chat message. Available in API version 35.0 and later.

Field Name	Field Type	Description
chatPage	string	Specifies the page that hosts your chat if that page differs from the Chat window.
customAgentName	string	The agent's name as it appears to customers in the chat window. Available in API version 29.0 and later.
deployments	<a href="#">LiveChatButtonDeployments</a>	Specifies the deployments associated with the button.
enableQueue	boolean	Indicates whether queuing is enabled ( <code>true</code> ) or not ( <code>false</code> ).
inviteEndPosition	LiveChatButtonInviteEndPosition ( <a href="#">enumeration</a> of type string)	The end position of the chat invitation. Valid values include: <ul style="list-style-type: none"> <li>• TopLeft</li> <li>• Top</li> <li>• TopRight</li> <li>• Left</li> <li>• Center</li> <li>• Right</li> <li>• BottomLeft</li> <li>• Bottom</li> <li>• BottomRight</li> </ul>
inviteImage	string	The custom button graphic that appears for the invitation.
inviteStartPosition	LiveChatButtonInviteStartPosition ( <a href="#">enumeration</a> of type string)	The start position of the chat invitation. Valid values include: <ul style="list-style-type: none"> <li>• TopLeft</li> <li>• TopLeftTop</li> <li>• Top</li> <li>• TopRightTop</li> <li>• TopRight</li> <li>• TopRightRight</li> <li>• Right</li> <li>• BottomRightRight</li> <li>• BottomRight</li> <li>• BottomRightBottom</li> <li>• Bottom</li> <li>• BottomLeftBottom</li> <li>• BottomLeft</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• BottomLeftLeft</li> <li>• Left</li> <li>• TopLeftLeft</li> </ul>
isActive	boolean	Specifies whether the chat button or invitation is active.
label	string	Specifies the text that appears on the button.
numberOfReroutingAttempts	int	Specifies the number of times a chat request can be rerouted to available agents if all agents reject the chat request. Available in API version 30.0 and later.
offlineImage	string	Specifies the image that appears on the button when no agents are available to chat.
onlineImage	string	Specifies the image that appears on the button when agents are available to chat.
optionsCustomRoutingIsEnabled	boolean	Indicates whether custom routing is enabled for incoming chat requests ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 30.0 and later.
optionsHasChasitorIdleTimeout	boolean	Indicates whether the visitor idle timeout feature is enabled. Available in API version 35.0 and later.
optionsHasInviteAfterAccept	boolean	Indicates whether a new chat invitation triggers after a customer accepts a previous chat invitation ( <code>true</code> ) or not ( <code>false</code> ).
optionsHasInviteAfterReject	boolean	Indicates whether a new chat invitation triggers after a customer rejects a previous chat invitation ( <code>true</code> ) or not ( <code>false</code> ).
optionsHasPerouteDeclinedRequest	boolean	Indicates whether a chat request, which has been rejected by all available agents, is rerouted to available agents again ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 30.0 and later.
optionsIsAutoAccept	boolean	Indicates whether a chat request is automatically accepted by the agent it's assigned to ( <code>true</code> ) or not ( <code>false</code> ). For chat buttons and automated chat invitations with <code>routingType</code> set to <code>MostAvailable</code> or <code>LeastActive</code> . Available in API version 30.0 and later.
optionsIsInviteAutoRemove	boolean	Indicates whether a chat invitation is set to automatically disappear from a customer's screen after a certain amount of time ( <code>true</code> ) or not ( <code>false</code> ).

Field Name	Field Type	Description
overallQueueLength	int	Specifies the maximum number of chat requests that are allowed to queue.
perAgentQueueLength	int	Specifies the number of chat requests that are allowed to queue for an agent with the required skills.
postChatPage	string	Specifies the name of the post-chat form to which customers are routed when the chat ends.
postChatUrl	string	Specifies the URL of the post-chat form to which customers are routed when the chat ends.
preChatFormPage	string	Specifies the name of the pre-chat form to which customers are routed before a chat begins.
preChatFormUrl	string	Specifies the URL of the pre-chat form to which customers are routed when the chat begins.
pushTimeOut	int	Specifies the number of seconds an agent has to answer an incoming chat request before the request is routed to another agent.
routingType	LiveChatButtonRoutingType (enumeration of type string)	Specifies how incoming chats are routed to agents when a customer pushes a button. Valid values are: <ul style="list-style-type: none"> <li>• Choice</li> <li>• LeastActive</li> <li>• MostAvailable</li> </ul>
site	string	Specifies the Salesforce site that hosts your custom chat button images or custom chat page. You must have the CustomDomain permission enabled in your organization before you can use a Salesforce site with Chat.
skills	<a href="#">LiveChatButtonSkills</a>	Specifies the skills associated with the button. When a customer clicks the button to chat, they're automatically routed to agents with those skills.
timeToRemoveInvite	int	Specifies how long the invitation is displayed (in seconds) to customers before it disappears.
type	LiveChatButtonType (enumeration of type string)	Required. The chat button type. Valid values are: <ul style="list-style-type: none"> <li>• Standard</li> <li>• Invite</li> </ul>
windowLanguage	<a href="#">Language</a>	Specifies the language preferences for the chat window associated with the button.

## LiveChatButtonSkills

Represents the skills associated with a chat button or invitation.

### Fields

Field Name	Field Type	Description
skill	string	Specifies the name of the skill.

## LiveChatButtonDeployments

Represents the deployments associated with a chat button or invitation.

### Fields

Field Name	Field Type	Description
deployment	string	Specifies the name of the deployment.

## Declarative Metadata Sample Definition

Here's a sample of a `liveChatButton` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<LiveChatButton xmlns="http://soap.sforce.com/2006/04/metadata">
  <deployments/>
  <enableQueue>>false</enableQueue>
  <isActive>>true</isActive>
  <label>CustomerSupportButton</label>
  <optionsCustomRoutingIsEnabled>>false</optionsCustomRoutingIsEnabled>
  <optionsHasChasitorIdleTimeout>>false</optionsHasChasitorIdleTimeout>
  <optionsHasInviteAfterAccept>>false</optionsHasInviteAfterAccept>
  <optionsHasInviteAfterReject>>false</optionsHasInviteAfterReject>
  <optionsHasRerouteDeclinedRequest>>false</optionsHasRerouteDeclinedRequest>
  <optionsIsAutoAccept>>false</optionsIsAutoAccept>
  <optionsIsInviteAutoRemove>>false</optionsIsInviteAutoRemove>
  <postChatUrl>https://help.salesforce.com</postChatUrl>
  <routingType>Choice</routingType>
  <skills>
    <skill>Chat</skill>
  </skills>
  <type>Standard</type>
</LiveChatButton>
```

**Note:** If you update your chat button through the Metadata API, be sure to update all Web pages that use the same chat button code.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## LiveChatDeployment

---

Represents the configuration settings for a specific Chat deployment, such as the branding image for the deployment and whether or not chat transcripts are automatically saved.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

LiveChatDeployment values are stored in the `<developer_name>.liveChatDeployment` file in the `liveChatDeployments` directory.

## Version

LiveChatDeployment is available in API version 28.0 and later.

## Fields

Field Name	Field Type	Description
<code>brandingImage</code>	string	Specifies the branding image for the deployment.
<code>connectionTimeoutDuration</code>	int	Indicates the amount of time before the chat times out, in seconds.
<code>ConnectionWarningDuration</code>	int	Indicates the amount of time before a time-out warning is displayed to the agent, in seconds.
<code>displayQueuePosition</code>	boolean	(Pilot) Determines whether a customer's queue position is displayed in a standard chat window while the customer waits for an agent to respond to the chat request ( <code>true</code> ) or not ( <code>false</code> ). This field is available as a pilot in API version 32.0. To enable this field, contact Salesforce.
<code>domainWhiteList</code>	<a href="#">LiveChatDeploymentDomainWhiteList</a>	Specifies the list of domains that can host the deployment.
<code>enablePrechatApi</code>	boolean	Indicates whether or not the pre-chat API is enabled for the deployment ( <code>true</code> ) or not ( <code>false</code> ).

Field Name	Field Type	Description
enableTranscriptSave	boolean	Indicates whether chat transcripts are automatically saved after a chat ends ( <code>true</code> ) or not ( <code>false</code> ).
label	string	Specifies the name of the deployment.
mobileBrandingImage	string	Specifies the branding image for the deployment that appears when customers access the deployment on a mobile device.
site	string	Specifies the site that hosts the images for the deployment.   <b>Note:</b> You must have the CustomDomain permission enabled in your organization before you can use a Salesforce site with Chat.
windowTitle	string	Specifies the title of the window associated with the deployment.

## LiveChatDeploymentDomainWhiteList

Represents a Chat deployment's domain whitelist.

### Fields

Field Name	Field Type	Description
domain	string	Specifies a domain that can host the deployment.

## Declarative Metadata Sample Definition

This is a sample of a `liveChatDeployment` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<LiveChatDeployment xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>My Deployment 1</label>
  <brandingImage>pkb_image_bannerBg</brandingImage>
  <mobileBrandingImage>pkb_image_bgBottom</mobileBrandingImage>
  <domainWhiteList>
    <domain>mydomain</domain>
    <domain>test</domain>
  </domainWhiteList>
  <enableTranscriptSave>true</enableTranscriptSave>
  <site>GL_Knowledge_Base</site>
  <windowTitle>My window title</windowTitle>
</LiveChatDeployment>
```

 **Note:** If you update your deployment through the Metadata API, be sure to update all Web pages that use the same deployment code.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## LiveChatSensitiveDataRule

---

Represents a rule for masking or deleting data of a specified pattern. Written as a regular expression (regex).

Use this object to mask or delete data of specified patterns, such as credit card, social security, phone and account numbers, or even profanity. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

LiveChatSensitiveDataRule components have the suffix `.liveChatSensitiveDataRule` and are stored in the `liveChatSensitiveDataRule` folder.

## Version

LiveChatSensitiveDataRule components are available in API version 35.0 and later.

## Fields

Field Name	Field Type	Description
<code>actionType</code>	SensitiveDataActionType (enumeration of type string)	Required. The action to take on the text when the sensitive data rule is triggered. Possible values are: <ul style="list-style-type: none"> <li>Remove</li> <li>Replace</li> </ul>
<code>description</code>	string	The description of the sensitive data rule—for example, “Block social security numbers.”
<code>enforceOn</code>	int	Required. Determines the roles on which the rule is enforced. The value is determined using bitwise OR operation. There are seven possible values: <ol style="list-style-type: none"> <li>Rule enforced on Agent</li> <li>Rule enforced on Visitor</li> <li>Rule enforced on Agent and Visitor</li> <li>Rule enforced on Supervisor</li> <li>Rule enforced on Agent and Supervisor</li> <li>Rule enforced on Visitor and Supervisor</li> </ol>

Field Name	Field Type	Description
		7. Rule enforced on Agent, Visitor, and Supervisor
isEnabled	boolean	Required. Specifies whether a sensitive data rule is active ( <code>true</code> ) or not ( <code>false</code> ). Default value (if none is provided) is <code>false</code> .
pattern	string	Required. The pattern of text blocked by the rule. Written as a JavaScript regular expression (regex).
replacement	string	The string of characters that replaces the blocked text (if <code>ActionType Replace</code> is selected).

## Declarative Metadata Sample Definition

The following is an example of a `LiveChatSensitiveDataRule` component.

```
<LiveChatSensitiveDataRule xmlns="http://soap.sforce.com/2006/04/metadata">
  <actionType>REPLACE</actionType>
  <enforceOn>7</enforceOn>
  <isEnabled>true</isEnabled>
  <pattern>[aeiou]</pattern>
  <replacement>æ</replacement>
</LiveChatSensitiveDataRule>
```

The following is an example `package.xml` that references the previous definition.

```
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <!-- To be used from
support.liveagent.testsuite.unifiedouting.testDeployButtonMDAPIWithExistingQueue -->
  <apiAccessLevel>Unrestricted</apiAccessLevel>

  <types>
    <members>Change_For_all</members>
    <name>LiveChatSensitiveDataRule</name>
  </types>

  <version>35.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## LoyaltyProgramSetup

Represents the configuration of a loyalty program process including its parameters and rules. Program processes determine how new transaction journals are processed. When new transaction journals meet the criteria and conditions for a program process, actions that are set up in the process are triggered for the transaction journals.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

LoyaltyProgramSetup components have the suffix `loyaltyProgramSetup` and are stored in the `loyaltyProgramSetups` folder.

## Version

LoyaltyProgramSetup components are available in API version 54.0 and later for Loyalty Management and in API version 59.0 and later for Referral Marketing.

## Special Access Rules

To use this metadata type, your org must have either B2C - Loyalty, B2C - Loyalty Plus, Loyalty Management - Growth, Loyalty Management - Advanced, or Referral Marketing license enabled.

## Fields

Field Name	Description
<code>label</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the loyalty program that the program process is associated with. If a loyalty program or referral program with the specified name doesn't exist, a new LoyaltyProgram record is created. The name of a program must contain at least one alphanumeric character.</p>
<code>programProcesses</code>	<p><b>Field Type</b> <a href="#">LoyaltyProgramProcess[]</a> on page 1268</p> <p><b>Description</b> Collection of loyalty program processes associated with a loyalty program or a referral program.</p>

## LoyaltyProgramProcess

Represents a collection of fields relating to a loyalty program process.

Field Name	Description
description	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of the loyalty program process.</p>
executionType	<p><b>Field Type</b> LoyaltyPgmProcExecutionType (enumeration of type string)</p> <p><b>Description</b> The mode of processing transaction journals by the loyalty program process. Possible values are:</p> <ul style="list-style-type: none"> <li>• Batch</li> <li>• BatchAndRealTime</li> <li>• RealTime</li> </ul>
journalSubType	<p><b>Field Type</b> string</p> <p><b>Description</b> The subtype of transaction journals processed by the loyalty program process.</p>
journalType	<p><b>Field Type</b> string</p> <p><b>Description</b> The type of transaction journal processed by the loyalty program process. Possible values for loyalty program:</p> <ul style="list-style-type: none"> <li>• Accrual</li> <li>• Redemption</li> </ul> <p>Possible value for referral program:</p> <ul style="list-style-type: none"> <li>• Referral</li> </ul>
loyaltyTierGroup	<p><b>Field Type</b> string</p> <p><b>Description</b> The tier group of a loyalty program. This field is available in API version 56.0 and later. This field isn't applicable for referral programs.</p>
parameters	<p><b>Field Type</b> <a href="#">LoyaltyProgramProcessParameter[]</a> on page 1270</p> <p><b>Description</b> The parameters associated with the loyalty program process.</p>

Field Name	Description
processName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the loyalty program process.</p>
processType	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The type of records processed by the loyalty program process. For referral programs, the process type is <code>TransactionJournal</code>.</p>
rules	<p><b>Field Type</b> <a href="#">LoyaltyProgramProcessRule[]</a> on page 1274</p> <p><b>Description</b> The rules associated with the loyalty program process.</p>
status	<p><b>Field Type</b> LoyaltyPgmProcStatus (enumeration of type string)</p> <p><b>Description</b> The status of the loyalty program process. Possible values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Draft</li> <li>• Inactive</li> </ul> <p> <b>Note:</b> Only active program processes can process transaction journals.</p>

## LoyaltyProgramProcessParameter

Represents a collection of fields relating to a parameter that's associated with the program process. Parameters are dynamic or fixed values that are used in rule. You can define the value of a parameter based on its type and data type.

Field Name	Description
condition	<p><b>Field Type</b> <a href="#">LoyaltyProgramProcessCondition</a> on page 1272</p> <p><b>Description</b> The filter condition that decides which records are stored in the parameter.</p>

Field Name	Description
dataType	<p><b>Field Type</b> LoyaltyPgmProcParmDataType (enumeration of type string)</p> <p><b>Description</b> The data type of the parameter. Determines the type of value that can be stored in the parameter.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• Boolean</li> <li>• Date</li> <li>• DateTime</li> <li>• Numeric</li> <li>• Subject</li> <li>• Text</li> </ul>
decimalPlaces	<p><b>Field Type</b> int</p> <p><b>Description</b> The number of decimal places supported by the parameter when it is of the type Variable and data type Numeric.</p>
description	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of the parameter.</p>
isCollection	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the parameter can store multiple values when it is of the type Variable.</p>
isInput	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether a parameter can be used as an input outside the loyalty program process.</p>
isOutput	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether a parameter can be used as an output outside the loyalty program process.</p>

Field Name	Description
objectName	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the object whose records are stored by the parameter when it is of the type Variable and data type sObject.</p>
parameterName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the parameter.</p>
parameterType	<p><b>Field Type</b> LoyaltyPgmProcParmType (enumeration of type string)</p> <p><b>Description</b> The type of value the parameter can store. Possible values are:</p> <ul style="list-style-type: none"> <li>• Constant</li> <li>• Formula</li> <li>• Variable</li> </ul>
value	<p><b>Field Type</b> string</p> <p><b>Description</b> The value of the parameter when it is of the type Variable or Formula and isn't of the data type sObject.</p>

## LoyaltyProgramProcessCondition

Represents a collection of fields relating to a condition. Conditions filter records that parameters store or check whether child actions must be triggered for a transaction journal.

Field Name	Description
conditionCriteria	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The criteria that determine when the condition is met by a record or by a transaction journal.</p>

Field Name	Description
conditionFilterCriteria	<p><b>Field Type</b>  <a href="#">LoyaltyProgramProcessConditionFilterCriteria[]</a> on page 1273</p> <p><b>Description</b>  The filter criteria that determines which records or transaction journals are filtered.</p>
conditionName	<p><b>Field Type</b>  string</p> <p><b>Description</b>  Required.  The name of the condition.</p>

## LoyaltyProgramProcessConditionFilterCriteria

Represents a collection of fields relating to a filter criteria that's part of a condition. Multiple filter criteria can be added for a condition. Filter criteria determine which records are filtered by related condition.

Field Name	Description
operator	<p><b>Field Type</b>  LoyaltyPgmProcCondOperator (enumeration of type string)</p> <p><b>Description</b>  Required.  The operator of the filter criteria.  Possible values are:</p> <ul style="list-style-type: none"> <li>• Contains</li> <li>• DoesNotContain</li> <li>• EndsWith</li> <li>• Equals</li> <li>• GreaterThan</li> <li>• GreaterThanOrEquals</li> <li>• IsNotNull</li> <li>• IsNull</li> <li>• LessThan</li> <li>• LessThanOrEquals</li> <li>• NotEquals</li> <li>• StartsWith</li> </ul>
sequence	<p><b>Field Type</b>  int</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>The sequence number of the filter criteria within a condition.</p>
sourceFieldName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The name of the field used in the filter criteria.</p>
value	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The value of the filter criteria.</p>
valueType	<p><b>Field Type</b></p> <p>LoyaltyPgmProcCondType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>The type of value specified in the filter criteria.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• Formula</li> <li>• Literal</li> <li>• Lookup</li> <li>• Parameter</li> </ul>

## LoyaltyProgramProcessRule

Represents a collection of fields relating to a rule. A rule consists of a set of conditions and actions.

Field Name	Description
actions	<p><b>Field Type</b></p> <p><a href="#">LoyaltyProgramProcessAction[]</a> on page 1276</p> <p><b>Description</b></p> <p>The actions associated with the rule.</p>
conditions	<p><b>Field Type</b></p> <p><a href="#">LoyaltyProgramProcessCondition[]</a> on page 1272</p>

Field Name	Description
	<p><b>Description</b> The conditions associated with the rule.</p>
description	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of the rule.</p>
endDate	<p><b>Field Type</b> date</p> <p><b>Description</b> The date until which the rule processes transaction journals.</p>
previousRule	<p><b>Field Type</b> string</p> <p><b>Description</b> The rule that processes new transaction journals before the current rule. The current rule is triggered when the previous rule completes processing transaction journals.</p>
promotion	<p><b>Field Type</b> string</p> <p><b>Description</b> The promotion associated with the rule. When a promotion is associated with a rule, the start date, end date, and status of the promotion determines the corresponding fields of the rule.</p>
ruleName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the rule.</p>
startDate	<p><b>Field Type</b> date</p> <p><b>Description</b> The date from which the rule starts processing transaction journals.</p>
status	<p><b>Field Type</b> LoyaltyPgmProcRuleStatus (enumeration of type string)</p> <p><b>Description</b> The status of the rule. Possible values are:</p>

Field Name	Description
	<ul style="list-style-type: none"> <li>• Active</li> <li>• Draft</li> <li>• Inactive</li> </ul>
stepMappings	<p><b>Field Type</b>  <a href="#">LoyaltyProgramProcessRuleStepMapping[]</a> on page 1280</p> <p><b>Description</b>  The list of step mappings associated with rule.</p>

## LoyaltyProgramProcessAction

Represents a collection of fields relating to an action.

Field Name	Description
actionName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the action.</p>
actionParameters	<p><b>Field Type</b>  <a href="#">LoyaltyProgramProcessActionParameter[]</a> on page 1279</p> <p><b>Description</b> The parameters of the action.</p>
actionType	<p><b>Field Type</b> LoyaltyPgmProcActionType (enumeration of type string)</p> <p><b>Description</b> Required. The type of action. Possible values are:</p> <ul style="list-style-type: none"> <li>• These values are used in Loyalty Management: <ul style="list-style-type: none"> <li>– AssignParameterValues—Assigns values to parameters.</li> <li>– AssignBadgeToMember—Assigns a badge to a loyalty program member. This value is available in API version 56.0 and later.</li> <li>– Crud—Creates or updates records in the target object. This value is available in API version 56.0 and later.</li> <li>– CheckMemberBadgeAssignment—Checks whether a badge is assigned to a loyalty program member. This value is available in API version 56.0 and later.</li> </ul> </li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>- <code>ChangeMemberTier</code>—Changes the tier of a loyalty program member. This value is available in API version 56.0 and later.</li> <li>- <code>CreditPoints</code>—Credits points to the loyalty program member associated with the transaction journal that's processed by the rule.</li> <li>- <code>DebitPoints</code>—Debits points from the points balance of the loyalty program member associated with the transaction journal that's processed by the rule.</li> <li>- <code>GetMemberAttributesValues</code>—Gets the details of the loyalty program member's attribute value for the selected engagement attribute. This value is available in API version 55.0 and later.</li> <li>- <code>GetMemberPointBalance</code>—Gets the points balance of a loyalty program member.</li> <li>- <code>GetMemberPromotions</code>—Get promotions of a loyalty program member. This value is available in API version 56.0 and later.</li> <li>- <code>GetMemberTier</code>—Gets the tier details of a loyalty program member.</li> <li>- <code>GetOutputsFromDecisionTable</code>—Gets outputs provided by a decision table. This value is available in API version 56.0 and later.</li> <li>- —Adds the specified value to the loyalty program member's usage towards achieving a cumulative promotion by a specified value.</li> <li>- <code>IncreaseUsageForCumulativePromotion</code>—Increases a loyalty program member's usage for a cumulative promotion.</li> <li>- <code>IssueVoucher</code>—Issues a voucher to the loyalty program member associated with the transaction journal that's processed by the rule.</li> <li>- <code>RedeemVoucher</code>—Redeems a voucher for the loyalty program member associated with the transaction journal that's processed by the rule. This value is available in API version 58.0 and later.</li> <li>- —Updates the loyalty program member's usage towards achieving a cumulative promotion by a specified value.</li> <li>- <code>RunFlow</code>—Runs a flow.</li> <li>- <code>RunProgramProcess</code>—Runs an active loyalty program process as a subprocess. This value is available in API version 56.0 and later.</li> <li>- <code>SendMail</code>—Sends emails to the loyalty program member for whom the process is run. This value is available in API version 59.0 and later.</li> <li>- <code>UpdateCurrentValueForMemberAttribute</code>—Updates the loyalty program member's current attribute value for the selected engagement attribute. This value is available in API version 55.0 and later.</li> <li>- <code>UpdatePointBalance</code>—Updates the points balance of the loyalty program member associated with the transaction journal that's processed by the rule.</li> <li>- <code>UpdateUsageForCumulativePromotion</code>—Updates a loyalty program member's usage for a cumulative promotion.</li> </ul>
	<ul style="list-style-type: none"> <li>• These values are used in Referral Marketing:</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>- <code>AssignParameterValues</code>—Assigns values to parameters.</li> <li>- <code>Crud</code>—Creates or updates records in the target object.</li> <li>- <code>GetMemberAttributesValues</code>—Gets the details of an advocate's attribute value for the selected engagement attribute.</li> <li>- <code>GetMemberPromotions</code>—Gets the promotions of an advocate.</li> <li>- <code>GetOutputsFromDecisionTable</code>—Gets outputs provided by a decision table.</li> <li>- <code>IssueVoucher</code>—Issues a voucher to an advocate or a referred friend.</li> <li>- <code>RedeemVoucher</code>—Redeems a voucher for an advocate or a friend.</li> <li>- <code>SendMail</code>—Sends emails to a referral program's advocates and referrals.</li> <li>- <code>UpdateCurrentValueForMemberAttribute</code>—Updates an advocate's current attribute value for the selected engagement attribute.</li> </ul>
<code>crudActionType</code>	<p><b>Field Type</b> LoyaltyPgmProcCrudActType (enumeration of type string)</p> <p><b>Description</b> The type of operation to perform on target object records by the action. This field is available from API version 56.0 and later.</p> <p> <b>Note:</b> This field is required when the <code>actionType</code> field value is <code>CRUD</code>.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>create</code></li> <li>• <code>update</code></li> </ul>
<code>decisionTable</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The decision that's invoked by the action for the transaction journal that's processed by the rule.</p>
<code>decisionTableDatasetLink</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The dataset link associated with the selected decision table.</p>
<code>entityApiName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The API name of the target object. This field is available from API version 56.0 and later.</p> <p> <b>Note:</b> This field is required when the <code>actionType</code> field value is <code>CRUD</code>.</p>

Field Name	Description
flowDefinition	<p><b>Field Type</b> string</p> <p><b>Description</b> The flow that's run by the action for the transaction journal that's processed by the rule. The selected flow must be of the type LoyaltyManagementFlow.</p>
loyaltyProgramProcess	<p><b>Field Type</b> string</p> <p><b>Description</b> The subprogram processes that's run by the action. This field is available from API version 56.0 and later.</p> <p> <b>Note:</b> This field is required when the <code>actionType</code> field value is <code>RunProgramProcess</code>.</p>

## LoyaltyProgramProcessActionParameter

Represents a collection of fields relating to an action parameter. A parameter is either an input or an output for the action. Input parameters store the values used by the action. Output parameters store the result of the action.

Field Name	Description
operator	<p><b>Field Type</b> LoyaltyPgmProcActParamOper (enumeration of type string)</p> <p><b>Description</b> The type of operator used in the action. This field is available in API version 56.0 and later.</p> <p>Possible value is:</p> <ul style="list-style-type: none"> <li>• Equals</li> </ul>
parameterName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>The name of parameter. The parameter name must be the same as the input or the output field that's supported depending on the associated action's type.</p>
sequenceNumber	<p><b>Field Type</b> int</p> <p><b>Description</b> The sequence number of the parameter in the action. This field is available in API version 56.0 and later.</p>

Field Name	Description
value	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The value of the parameter.</p>
valueType	<p><b>Field Type</b> LoyaltyPgmProcActParamType (enumeration of type string)</p> <p><b>Description</b> The type of value to provide in the parameter. This field is available in API version 56.0 and later. Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>Literal</code>—A constant value.</li> <li>• <code>Parameter</code>—A runtime value passed using a parameter.</li> </ul>

## LoyaltyProgramProcessRuleStepMapping

Represents a collection of fields relating to a step mapping. Map conditions with child actions or map an action without a parent step.

Field Name	Description
associatedStep	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The action that's associated with the mapping.</p>
parentStep	<p><b>Field Type</b> string</p> <p><b>Description</b> The condition that contains one or more child actions.</p>
sequence	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. The sequence number of the mapping within a rule.</p>

## Declarative Metadata Sample Definition

The following is an example of a LoyaltyProgramSetup component.

```
<?xml version="1.0" encoding="UTF-8"?>
<LoyaltyProgramSetup xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>Cloud Kicks Inner Circle</label>
  <programProcesses>
    <executionType>RealTime</executionType>
    <parameters>
      <dataType>Numeric</dataType>
      <decimalPlaces>0</decimalPlaces>
      <isCollection>>false</isCollection>
      <isInput>>false</isInput>
      <isOutput>>false</isOutput>
      <parameterName>VoucherValue</parameterName>
      <parameterType>Constant</parameterType>
      <value>50</value>
    </parameters>
    <processName>Issue Vouchers</processName>
    <processType>Transaction Journal</processType>
    <rules>
      <actions>
        <actionName>Issue High Transaction Value Voucher</actionName>
        <actionParameters>
          <operator>Equals</operator>
          <parameterName>VoucherDefinitionName</parameterName>
          <sequenceNumber>1</sequenceNumber>
          <value>Voucher for High Value Transactions</value>
          <valueType>Literal</valueType>
        </actionParameters>
        <actionParameters>
          <operator>Equals</operator>
          <parameterName>VoucherCode</parameterName>
          <sequenceNumber>2</sequenceNumber>
          <value>{!TransactionJournal.Order.Id}</value>
        </actionParameters>
        <actionParameters>
          <operator>Equals</operator>
          <parameterName>VoucherEffectiveDate</parameterName>
          <sequenceNumber>3</sequenceNumber>
          <value>DATEVALUE(&quot;2021-11-21 00:00:00&quot;)</value>
        </actionParameters>
        <actionParameters>
          <operator>Equals</operator>
          <parameterName>VoucherExpirationDate</parameterName>

    <members>*</members>
    <name>LoyaltyProgramSetup</name>
  </types>
  <version>54.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ManagedContentType

---

Represents the definition of custom content types for use with Salesforce CMS. Custom content types are displayed as forms with defined fields.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### File Suffix and Directory Location

ManagedContentType components have the suffix `managedContentType` and are stored in the `managedContentTypes` folder.

### Version

ManagedContentType components are available in API version 47.0 and later.

### Special Access Rules

ManagedContentType is only available if Salesforce CMS and digital experiences are enabled for your org.

### Fields

Field Name	Field Type	Description
<code>description</code>	string	Describes the custom content type defined in this ManagedContentType declaration.
<code>developerName</code>	string	Required. Unique name for the custom content type. For example: <i>OurSpecialContent_c</i>
<code>managedContentNodeTypes</code>	<a href="#">ManagedContentType</a> on page 1283[]	Nodes included as part of this custom content type. When rendered as a form in the Digital Experiences app, each node is represented as an individual field.
<code>masterLabel</code>	string	Required. Declares the name of the content type as it appears in the UI.

### ManagedContentNodeType

Represents the structure of individual nodes within the custom content type.

Field Name	Field Type	Description
<code>helpText</code>	string	Provides assistive text in the UI, displayed as an info bubble for the field. If this field is empty, no info bubble icon or text is displayed.  For example: <IMG?>

Field Name	Field Type	Description
<code>isLocalizable</code>	boolean	<p>Declares a field as localizable and consumable by &lt;loc MDAPI reference&gt; (<code>true</code>) or not (<code>false</code>). Default is <code>false</code>.</p> <p> <b>Note:</b> NodeTypes <code>IMG</code>, <code>URL</code>, <code>DATE</code>, and <code>DATETIME</code> can't be localized.</p>
<code>isRequired</code>	boolean	<p>Declares a field as required (<code>true</code>) or not (<code>false</code>). Fields declared as required are indicated by a red asterisk. If a value isn't added to the field in the custom content type, the form can't be saved and a standard error is displayed. Default is <code>false</code>.</p> <p> <b>Note:</b> When <code>nodeType</code> on page 1284 is set to <code>NAMEFIELD</code> on a field, <code>isRequired</code> must also be set to <code>True</code> for that field.</p>
<code>nodeLabel</code>	string	<p>Required. Declares the label for the field as it appears in the UI.</p> <p>In enhanced workspaces, the system generates a Title field by default. To prevent having multiple Title fields on the UI when you create a custom content type for use in an enhanced workspace, don't use Title as the label for <code>nodeLabel</code>.</p>
<code>nodeName</code>	string	<p>Required. Unique name of the <code>nodeType</code> within the content type. <code>nodeName</code> is a simple text field that allows up to 100 alphanumeric characters and underscores. The name must begin with a letter, not include spaces, can't have two consecutive underscores, and can't end with an underscore.</p> <p>In enhanced workspaces, the system generates a Title field by default. To prevent having multiple Title fields on the UI when you create a custom content type for use in an enhanced workspace, don't use Title as the label for <code>nodeName</code>.</p>
<code>nodeType</code>	MCNodeType (enumeration of type string)	<p>Required. Identifies the supported type of content in the node. Passed as a string. There's a maximum of 15 node types per content type. Values are case insensitive but are returned in all capital letters as shown. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>TEXT</code> Simple text node (max length=255 characters)</li> <li>• <code>MTEXT</code> Multi-line text node (max length=2000 characters)</li> <li>• <code>RTE</code> Rich text node (max length=65536 characters)</li> <li>• <code>IMG</code> Image node</li> </ul> <p> <b>Note:</b> <code>IMG</code> node types can't be localized. Set <code>isLocalizable</code> to false for images.</p> <ul style="list-style-type: none"> <li>• <code>URL</code></li> </ul>

Field Name	Field Type	Description
		<p>URL node (max length=255 characters)</p> <p> <b>Note:</b> URL accepts protocol string values starting with http://, https://, mailto:, tel:, and /.</p> <p> <b>Note:</b> URL node types can't be localized. Set <code>isLocalizable</code> to false for URLs.</p> <ul style="list-style-type: none"> <li>• DATE Date node <p> <b>Note:</b> DATE accepts dates only in the format yyyy-MM-dd.</p> <p> <b>Note:</b> DATE node types can't be localized. Set <code>isLocalizable</code> to false for dates.</p> </li> <li>• DATETIME Datetime node <p> <b>Note:</b> DATETIME accepts date and time in the format: yyyy-MM-dd'T'HH:mm:ss.SSS'Z' (UTC datetime in ISO 8601 format).</p> <p> <b>Note:</b> DATETIME node types can't be localized. Set <code>isLocalizable</code> to false for datetime notes.</p> </li> <li>• NAMEFIELD <p> <b>Note:</b> NAMEFIELD declares the field as the name that represents the content when referenced in the UI. For example, text entered in this field displays as a list of available content in the Digital Experiences app or as a piece of content available for inclusion in a collection in an Experience Cloud site.</p> <p>One, and only one, <code>nodeType</code> in your managed content type must be declared as NAMEFIELD. NAMEFIELD is a string of 200 characters or fewer.</p> <p>In enhanced workspaces, the system generates a Title field by default. To prevent having multiple Title fields on the UI when you create a custom content type for use in an enhanced workspace, don't use Title as the label for <code>nodeName</code> or <code>nodeLabel</code> for the NAMEFIELD node. If you've already named <code>nodeName</code> Title, choose a different label for <code>nodeLabel</code> to prevent confusion on the content creation page.</p> <p>When NAMEFIELD is used, <code>isRequired</code> must also be set to <code>true</code> for the field.</p> </li> </ul>
<code>placeholderText</code>	string	Provides assistive text in the UI, displayed as placeholder, or ghost text, in a field before any entry is made. For example, <code>Enter a title for your article...</code>

## Declarative Metadata Sample Definition

The following is an example of a ManagedContentType component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ManagedContentType xmlns="http://soap.sforce.com/2006/04/metadata">
  <developerName>myContentType</developerName>
  <masterLabel>My Content Type</masterLabel>
  <description>This is the description for my content type</description>
  <managedContentNodeTypes>
    <nodeName>title</nodeName>
    <nodeLabel>Content Title</nodeLabel>
    <nodeType>NAMEFIELD</nodeType>
    <placeholderText>Placeholder Text for title</placeholderText>
    <helpText>Help Text for title</helpText>
    <isLocalizable>true</isLocalizable>
    <isRequired>true</isRequired>
  </managedContentNodeTypes>
  <managedContentNodeTypes>
    <nodeName>textnode</nodeName>
    <nodeLabel>Content Text</nodeLabel>
    <nodeType>TEXT</nodeType>
    <placeholderText>Placeholder Text for Content Text</placeholderText>
    <helpText>Help Text for Content Text</helpText>
    <isLocalizable>true</isLocalizable>
    <isRequired>false</isRequired>
  </managedContentNodeTypes>
  <managedContentNodeTypes>
    <nodeName>richtextnode</nodeName>
    <nodeLabel>Content RichText</nodeLabel>
    <nodeType>RTE</nodeType>
  </managedContentNodeTypes>
  <managedContentNodeTypes>
    <nodeName>multilinetextnode</nodeName>
    <nodeLabel>Content MultilineText</nodeLabel>
    <nodeType>MTEXT</nodeType>
  </managedContentNodeTypes>
  <managedContentNodeTypes>
    <nodeName>imagenode</nodeName>
    <nodeLabel>Content Image</nodeLabel>
    <nodeType>IMG</nodeType>
  </managedContentNodeTypes>
</ManagedContentType>
```

## Usage

For each custom content type you create, there must also be a CMS Content page created in any Experience Cloud site that displays the content. Each Content page serves as the detail page for all content of a single content type. See [Create Custom Pages with Experience Builder](#).

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ManagedEventSubscription (Beta)

---

Represents a managed event subscription in Pub/Sub API. Use a managed event subscription to track the events that a subscriber client consumed and resume a subscription where it left off. This type extends the metadata type and inherits its `fullName` field.

 **Note:** This feature is a Beta Service. Customer may opt to try such Beta Service in its sole discretion. Any use of the Beta Service is subject to the applicable Beta Services Terms provided at Agreements and Terms.

## File Suffix and Directory Location

ManagedEventSubscription components have the suffix `.managedEventSubscription` and are stored in the `managedEventSubscriptions` folder.

## Version

ManagedEventSubscription components are available in API version 60.0 and later.

## Special Access Rules

You must have the Customize Application permission to deploy and retrieve this type.

## Fields

Field Name	Field Type	Description
<code>defaultReplay</code>	EventSubscriptionReplay (enumeration of type string)	<p>The position in the stream where the subscription starts when the client initiates the subscription for the first time or if the client doesn't commit a Replay ID. Possible values are:</p> <ul style="list-style-type: none"> <li><b>LATEST</b>—(Default) The subscription starts from the latest events received. This option skips sending events that were published when the client was disconnected.</li> <li><b>EARLIEST</b>—The subscription starts from the earliest events stored in the event bus. This option sends new events and any other events less than 72 hours old. You can reprocess all stored events and catch up on missed events. Use this option sparingly. Subscribing with the <b>EARLIEST</b> option when a large number of event messages are stored can slow performance and exhaust the event delivery allocation.</li> </ul>

Field Name	Field Type	Description
<code>errorRecoveryReplay</code>	<code>EventSubscriptionReplay</code> (enumeration of type string)	<p>The position in the stream where the subscription restarts if the committed Replay ID is invalid. The Replay ID can be invalid if it's older than the event retention window. Possible values are:</p> <ul style="list-style-type: none"> <li><code>LATEST</code>—(Default) The subscription restarts from the latest events received. This option skips sending events that were published when the client was disconnected.</li> <li><code>EARLIEST</code>—The subscription restarts from the earliest events stored in the event bus. This option sends new events and any other events less than 72 hours old. You can reprocess all stored events and catch up on missed events. Use this option sparingly. Subscribing with the <code>EARLIEST</code> option when a large number of event messages are stored can slow performance and exhaust the event delivery allocation.</li> </ul>
<code>label</code>	string	The label for the managed subscription.
<code>state</code>	<code>EventSubscriptionAdminState</code> (enumeration of type string)	<p>The execution state that the <code>ManagedSubscribe</code> RPC call consumes. If <code>state</code> is set to <code>RUN</code>, the subscription starts when the <code>ManagedSubscribe</code> RPC call is made. Otherwise, the subscription doesn't start. If an administrator later changes <code>state</code> from <code>RUN</code> to <code>STOP</code>, the system notifies the Pub/Sub API client of the new <code>state</code> value and the subscription disconnects. Also, the stored Replay ID value that was committed previously is deleted. The next time the <code>ManagedSubscribe</code> RPC call is made after <code>state</code> is changed from <code>STOP</code> to <code>RUN</code>, the subscription starts from the <code>defaultReplay</code> value.</p> <p>The possible values for <code>state</code> are:</p> <ul style="list-style-type: none"> <li><code>RUN</code>—(Default) The subscription is running and delivering new events to the Pub/Sub API client.</li> <li><code>STOP</code>—The subscription is stopped. No events are delivered to the Pub/Sub API client during this state and the previously committed Replay ID is deleted.</li> <li><code>PAUSE</code>—Reserved for internal use.</li> </ul>
<code>topicName</code>	string	<p>The topic name of the platform event or change event or the channel name of a custom platform event channel or custom or standard change data capture channel. The topic name can be one of the following values.</p> <ul style="list-style-type: none"> <li>For a platform event—<code>/event/EventName__e</code></li> <li>For a custom platform event channel—<code>/event/CustomPEChannel__chn</code></li> <li>For the standard change event channel—<code>/data/ChangeEvents</code></li> <li>For a change event (replace <code>Object</code> with the object name)—<code>/data/ObjectChangeEvent</code>. For example, for <code>Account</code>, it's <code>/data/AccountChangeEvent</code>.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>For a custom change event channel—/data/CustomChangeChannel__chn</li> </ul>
version	string	Reserved for internal use.

## Declarative Metadata Sample Definition

The following is an example of a ManagedEventSubscription component with the file name `My_Managed_Subscription.managedSubscription`.

```
<?xml version="1.0" encoding="UTF-8"?>
<ManagedEventSubscription xmlns="http://soap.sforce.com/2006/04/metadata">
  <defaultReplay>LATEST</defaultReplay>
  <errorRecoveryReplay>LATEST</errorRecoveryReplay>
  <label>My Managed Subscription</label>
  <state>RUN</state>
  <topicName>/event/Order_Event__e</topicName>
</ManagedEventSubscription>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>My_Managed_Subscription</members>
    <name>ManagedEventSubscription</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ManagedTopics

Represents navigational and featured topics managed in an Experience Cloud site.

**Note:** The related Experience Cloud site must exist before you deploy managed topics. (This occurs automatically when deploying an entire org.)

## File Suffix and Directory Location

Components have the suffix `managedTopics` and are stored in the `managedTopics` folder. In that folder, you find separate files for each Experience Cloud site (for example, `SiteNameA.managedTopics` and `SiteNameB.managedTopics`).

## Version

ManagedTopics components are available in API version 32.0 and later.

## Fields

Field Name	Field Type	Description
ManagedTopic	ManagedTopic	Represents a specific navigational or featured topic.

## ManagedTopic

Field Name	Field Type	Description
name	string	The topic name.
managedTopicType	string	The topic type: "Navigational" or "Featured"
topicDescription	string	An optional description of topic contents. This field is accessible only via the API; there is no corollary in the user interface.
parentName	string	The name of a parent topic for which this topic is a child. Child topics are accessible from the subtopics section of the parent topic page and their feeds are added to the parent topic feed.  Only navigational topics support parent-child relationships.
position	int	The placement of this topic relative to others of the same type. The results differ depending on topic type: <ul style="list-style-type: none"> <li>For top-level navigational topics, <code>position</code> arranges the Topics menu in the Experience Cloud site.</li> <li>For child navigational topics, it arranges sibling topics in the subtopics section.</li> <li>For featured topics, it arranges topic thumbnail images on the Experience Cloud site home page.</li> </ul> Enter a number between 0 and 24. (The maximum amount of navigational or featured topics is 25.)

## Declarative Metadata Sample Definition

The following example retrieves or deploys managed topics for all sites:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ManagedTopics</name>
  </types>
```

```
<version>32.0</version>
</Package>
```

The following example shows a package.xml file referencing the ManagedTopics component:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>SiteName</members>
    <name>ManagedTopics</name>
  </types>
  <version>32.0</version>
</Package>
```

The following example shows the ManagedTopics component itself:

```
<?xml version="1.0" encoding="UTF-8"?>
<ManagedTopics>
  <ManagedTopic>
    <name>Running</name>
    <managedTopicType>Navigational</managedTopicType>
    <topicDescription>Training advice</topicDescription>
    <parentName></parentName>
    <position>0</position>
  </ManagedTopic>
  <ManagedTopic>
    <name>Hiking</name>
    <managedTopicType>Navigational</managedTopicType>
    <topicDescription>Routes and gear</topicDescription>
    <parentName></parentName>
    <position>1</position>
  </ManagedTopic>
  <ManagedTopic>
    <name>Trails</name>
    <managedTopicType>Navigational</managedTopicType>
    <topicDescription>Maps for local favorites</topicDescription>
    <parentName>Hiking</parentName>
    <position>0</position>
  </ManagedTopic>
  <ManagedTopic>
    <name>Backpacks</name>
    <managedTopicType>Navigational</managedTopicType>
    <topicDescription>Recommended models</topicDescription>
    <parentName>Hiking</parentName>
    <position>1</position>
  </ManagedTopic>
  <ManagedTopic>
    <name>Footwear</name>
    <managedTopicType>Featured</managedTopicType>
    <topicDescription>Suggested types for each sport</topicDescription>
    <parentName></parentName>
    <position>0</position>
  </ManagedTopic>
  <ManagedTopic>
    <name>Conditioning</name>
```

```
<managedTopicType>Featured</managedTopicType>
<topicDescription>How to get fit for any activity</topicDescription>
<parentName></parentName>
<position>1</position>
</ManagedTopic>
</ManagedTopics>
```

## Usage

Managed topic images that are uploaded in API version 50.0 and later are stored as asset files. To migrate managed topic images that are uploaded in API version 50.0 and later, use the ContentAsset metadata type. To migrate managed topic images that were uploaded in API version 49.0 and earlier, use the Document metadata type.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MarketingAppExtension

---

Represents an integration with a third-party app or service that is used to work with prospects.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) type and inherits its `fullName` field.

## File Suffix and Directory Location

MarketingAppExtension components have the suffix `.marketingappextension` and are stored in the `marketingappextensions` folder.

## Version

MarketingAppExtension components are available in API version 54.0 and later.

## Special Access Rules

The first Salesforce or designated marketing admin to access Marketing App Extensions in an org must have the Manage Public List Views user permission. Subsequent users don't need the permission to work with the feature.

## Fields

Field Name	Description
description	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of the extension for internal reference. Appears in the UI.</p>
isActive	<p><b>Field Type</b> boolean</p> <p><b>Description</b> This field makes data for a Marketing App Extension available to use in Account Engagement automations. Label is Active in Automations.  The default value is <code>false</code>. Appears in the UI.</p>
isProtected	<p><b>Field Type</b> boolean</p>
marketingAppExtActions	<p><b>Field Type</b> <a href="#">MarketingAppExtAction</a> on page 1296[]</p> <p><b>Description</b> This field is a related list of associated external actions.</p>
marketingAppExtActivities	<p><b>Field Type</b> <a href="#">MarketingAppExtActivity</a> on page 1293[]</p> <p><b>Description</b> This field is a related list of associated external prospect activities.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Label for the MarketingAppExtension. In the UI, this field is Extension Name.</p>

## MarketingAppExtActivity

Represents an Activity Type, which is a prospect activity that occurs in a third-party app and can be used in Account Engagement automations.

Field Name	Description
description	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>The description of the activity for internal reference. Appears in the UI.</p>
endpointUrl	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>A sample endpoint that can be used to help connect the activity type to a third-party app. Appears in the UI.</p>
isActive	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>This field makes data for the Activity Type available to use in Account Engagement automations. Label is Active in Automations.</p> <p>The default value is <code>false</code>. Appears in the UI.</p>
isProtected	<p><b>Field Type</b></p> <p>boolean</p>
marketingAppExtension	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The Marketing App Extension associated with the activity.</p>
masterLabel	<p><b>Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. Label for the MarketingAppExtActivity. In the UI, this field is Activity Name.</p>

## Declarative Metadata Sample Definition

This example retrieves all Activity Types associated with the MarketingAppExtension component.

```
<?xml version="1.0" encoding="UTF-8"?>
<MarketingAppExtension xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>VidLand extension for US region</description>
  <isActive>true</isActive>
  <marketingAppExtActivities>
    <fullName>user_attended</fullName>
    <description>User attended activity capture for VidLand</description>
    <isActive>true</isActive>
    <marketingAppExtension>VidLand_US</marketingAppExtension>
    <masterLabel>user attended</masterLabel>
  </marketingAppExtActivities>
```

```

    <marketingAppExtActivities>
      <fullName>user_registered</fullName>
      <description>User registered activity capture for VidLand</description>
      <isActive>true</isActive>
      <marketingAppExtension>VidLand_US</marketingAppExtension>
      <masterLabel>user registered</masterLabel>
    </marketingAppExtActivities>
    <masterLabel>VidLand_US</masterLabel>
  </MarketingAppExtension>

```

This example package .xml references the previous definition.

```

</Package>
```

## MarketingAppExtAction

Represents an Action Type, which is an action that executes in a third-party app and can be used in Engagement Studio programs.

Field Name	Description
actionName	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the action for internal use. Appears in the UI.</p>
actionParams	<p><b>Field Type</b> string</p> <p><b>Description</b> The parameters for the invocable action. Appears in the UI.</p>
actionSchema	<p><b>Field Type</b> string</p> <p><b>Description</b> The JSON schema for the invocable action. Appears in the UI.</p>
actionSelector	<p><b>Type</b> string</p> <p><b>Description</b> Invocable action selector. Appears in the UI.</p>
apiName	<p><b>Field Type</b> string</p> <p><b>Description</b> This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated, but you can supply your own value if you create the record using the API. Appears in the UI.</p>
Description	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of the action for internal reference. Appears in the UI.</p>

Field Name	Description
isActive	<p><b>Field Type</b> boolean</p> <p><b>Description</b> This field makes data for the Action Type available to use in Engagement Studio Label is Active in Automations.  The default value is <code>false</code>. Appears in the UI.</p>
isProtected	<p><b>Field Type</b> boolean</p>
marketingAppExtension	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The Marketing App Extension associated with the action.</p>

## Declarative Metadata Sample Definition

This example retrieves a specific action associated the MarketingAppExtension component.

```
<?xml version="1.0" encoding="UTF-8"?>
<MarketingAppExtension xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>VidLand_US</fullName>
  <description>VidLand extension for US region</description>
  <isActive>true</isActive>
  <marketingAppExtActions>
    <marketingAppExtension>VidLand_US</marketingAppExtension>
    <apiName>register_user</apiName>
    <isActive>true</isActive>
    <description>Register User for VidLand</description>>
    <actionSelector>VidLand_Register_User</actionSelector>
    <actionSchema>
      <![CDATA[
        {
          "properties": {
            "UserId": {
              "type": "string",
              "title": ""
            },
            "WebinarId": {
              "type": "string",
              "value": "webinarIdXYZ"
            }
          },
          "view": {
            "components": [{
              "definition": "lightning/control",
              "scope": "#/properties/UserId"
            }
          ]
        }
      ]]>
    
```

```

    ]]
  },
  "required": [
    "UserId",
    "WebinarId",
    "From",
    "Body"
  ]
}
]]>
  </actionSchema>
  <actionParams>
    <![CDATA[
      {
        "isStandard": false,
        "type": "apex"
      }
    ]]>
  </actionParams>
  <actionName>Register User</actionName>
</marketingAppExtActions>
<masterLabel>VidLand US</masterLabel>
</MarketingAppExtension>

```

This example `package.xml` references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<!--
~ Copyright 2021 salesforce.com, inc.
~ All Rights Reserved
~ Company Confidential

<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>VidLand_US</members>
    <name>MarketingAppExtension</name>
  </types>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MatchingRule

---

Represents a matching rule that is used to identify duplicate records.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

Matching rule components have the `.matchingRule` suffix and are stored in the `matchingRules` folder. The name of the component file is the standard or custom object name that is associated with the matching rule.

In API version 39.0 and later, MatchingRule supports the Person Account object.

- The component file name is `PersonAccount.matchingRule`.
- The component directory is `matchingRules`.

## Version

MatchingRule is available in API version 33.0 and later.

## Fields

Field Name	Field Type	Description
<code>booleanFilter</code>	string	Specifies filter logic conditions.
<code>description</code>	string	The description of the matching rule.
<code>label</code>	string	Required. The name of the matching rule.
<code>matchingRuleItems</code>	<a href="#">MatchingRuleItem</a>	The criteria that make up a matching rule.
<code>ruleStatus</code>	MatchingRuleStatus (enumeration of type string)	Required. The activation status of the matching rule. Values are: <ul style="list-style-type: none"> <li>• <i>Inactive</i></li> <li>• <i>Deactivating</i></li> <li>• <i>DeactivationFailed</i></li> <li>• <i>Active</i></li> <li>• <i>Activating</i></li> <li>• <i>ActivationFailed</i></li> </ul>

 **Important:** The only valid values you can declare when deploying a package are *Active* and *Inactive*.

## MatchingRuleItem

Field Name	Field Type	Description
<code>blankValueBehavior</code>	BlankValueBehavior (enumeration of type string)	Specifies how blank fields affect whether the fields being compared are considered matches. Valid values are: <ul style="list-style-type: none"> <li>• <i>MatchBlanks</i></li> <li>• <i>NullNotAllowed</i> (default)</li> </ul>
<code>fieldName</code>	string	Required. Indicates which field to compare when determining if a record is similar enough to an existing record to be considered a match.

Field Name	Field Type	Description
matchingMethod	MatchingMethod (enumeration of type string)	<p>Required. Defines how the fields are compared. Choose between the exact matching method and various fuzzy matching methods. Valid values are:</p> <ul style="list-style-type: none"> <li>• <i>Exact</i></li> <li>• <i>FirstName</i></li> <li>• <i>LastName</i></li> <li>• <i>CompanyName</i></li> <li>• <i>Phone</i></li> <li>• <i>City</i></li> <li>• <i>Street</i></li> <li>• <i>Zip</i></li> <li>• <i>Title</i></li> </ul> <p>For details on each matching method, see “Matching Methods Used with Matching Rules” in the Salesforce Help.</p>

## Declarative Metadata Sample Definition

The following is a sample XML definition of a matching rule. A matching rule can be associated with either a standard or a custom object.

```
<?xml version="1.0" encoding="UTF-8"?>
<MatchingRules xmlns="http://soap.sforce.com/2006/04/metadata">
  <matchingRules>
    <fullName>AccountMatchingRule</fullName>
    <label>Matching rule for accounts</label>
    <description>this is sample rule description</description>
    <matchingRuleItems>
      <blankValueBehavior>NullNotAllowed</blankValueBehavior>
      <fieldName>BillingCity</fieldName>
      <matchingMethod>City</matchingMethod>
    </matchingRuleItems>

    <matchingRuleItems>
      <blankValueBehavior>NullNotAllowed</blankValueBehavior>
      <fieldName>Name</fieldName>
      <matchingMethod>CompanyName</matchingMethod>
    </matchingRuleItems>

    <ruleStatus>Inactive</ruleStatus>
  </matchingRules>
</MatchingRules>
```

The following `package.xml` shows how to reference a matching rule by name. It specifies the type name of `MatchingRule`.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Account.AccountMatchingRule</members>
    <name>MatchingRule</name>
```

```
</types>
<version>62.0</version>
</Package>
```

The following `package.xml` shows how to reference all matching rules by specifying the plural `MatchingRules` type name and using a wildcard to include all members.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>MatchingRules</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MessagingChannel

---

Represents the metadata associated with an Embedded Service Messaging channel.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`MessagingChannel` components have the suffix `messagingChannel` and are stored in the `messagingChannels` folder.

### Version

`MessagingChannel` components are available in API version 55.0 and later.

### Special Access Rules

This type is available if your org has the “Configure Messaging” and “View Setup and Configuration” permissions for Messaging enabled.

## Fields

Field Name	Description
automatedResponses	<p><b>Field Type</b>  <a href="#">MessagingAutoResponse[]</a></p> <p><b>Description</b>            The auto-responses associated with the messaging channel.</p>
customParameters	<p><b>Field Type</b>  <a href="#">MessagingChannelCustomParameter[]</a></p> <p><b>Description</b>            The custom parameters associated with the messaging channel.</p>
description	<p><b>Field Type</b>            string</p> <p><b>Description</b>            The channel description.</p>
embeddedConfig	<p><b>Field Type</b>  <a href="#">EmbeddedConfig[]</a></p> <p><b>Description</b>            The settings associated with the messaging channel.</p>
masterLabel	<p><b>Field Type</b>            string</p> <p><b>Description</b>            Required. The channel label.</p>
messagingChannelType	<p><b>Field Type</b>            MessagingChannelType (enumeration of type string)</p> <p><b>Description</b>            Required. Values are:</p> <ul style="list-style-type: none"> <li>• <code>Custom</code>—Bring Your Own Channel or Bring Your Own Channel for CCaaS. Available in API version 61.0 and later.</li> <li>• <code>EmbeddedMessaging</code></li> <li>• <code>Voice</code>—Service Cloud Voice. Available in API version 58.0 and later.</li> </ul> <p>Third-party Messaging channels in Salesforce, such as WhatsApp and Facebook Messenger, don't use this metadata type.</p>
messagingKeywords	<p><b>Field Type</b>  <a href="#">MessagingKeyword[]</a></p>

Field Name	Description
	<p><b>Description</b></p> <p>Keywords associated with the messaging channel.</p>
<code>sessionHandlerFlow</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The Omni-Channel flow used to route the channel's messaging sessions.</p>
<code>sessionHandlerQueue</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The queue used to route messages. If a <code>sessionHandlerFlow</code> is also selected, <code>sessionHandlerQueue</code> is the fallback queue used if a message can't be routed using the selected flow.</p>
<code>sessionHandlerType</code>	<p><b>Field Type</b></p> <p>MessagingSessionHandlerType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. The method used to route messages in the channel. Values are:</p> <ul style="list-style-type: none"> <li>• Flow</li> <li>• Queue</li> </ul>
<code>standardParameters</code>	<p><b>Field Type</b></p> <p><a href="#">MessagingChannelStandardParameter[]</a></p> <p><b>Description</b></p> <p>Parameters added to the messaging channel.</p>

## EmbeddedConfig

Represents settings specific to an embedded messaging channel.

Field Name	Description
<code>isEstimatedWaitTimeEnabled</code>	<p><b>Field Type</b></p> <p>Boolean</p> <p><b>Description</b></p> <p>Indicates whether estimated wait time is enabled. The default value is false.</p>
<code>authMode</code>	<p><b>Field Type</b></p> <p>EmbeddedServiceAuthModeType (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. Auth/UnAuth Mode Types For Embedded Chat. Valid values are:</p> <ul style="list-style-type: none"> <li>• Auth</li> <li>• UnAuth</li> </ul>
verifiedUserJwtExpirationTime	<p><b>Field Type</b></p> <p>Integer</p> <p><b>Description</b></p> <p>If <code>authMode</code> is set to <code>true</code>, this value represents the JWT expiry value in minutes.</p>
anonymousUserJwtExpirationTime	<p><b>Field Type</b></p> <p>Integer</p> <p><b>Description</b></p> <p>If <code>authMode</code> is set to <code>false</code>, this value represents the JWT expiry value in minutes.</p>
isAttachmentUploadEnabled	<p><b>Field Type</b></p> <p>Boolean</p> <p><b>Description</b></p> <p>Indicates whether inbound file attachments are allowed. The default value is false.</p>
isSaveTranscriptEnabled	<p><b>Field Type</b></p> <p>Boolean</p> <p><b>Description</b></p> <p>Indicates whether transcripts can be downloaded. The default value is false.</p>
messagingAuthorizations	<p><b>Field Type</b></p> <p>MessagingAuthorization</p> <p><b>Description</b></p> <p>Represents authorization settings specific to a given MessagingChannel.</p>

## MessagingAuthorization

This junction entity stores the messaging channel authorization for a Messaging Channel (Embedded Messaging Channel). On this entity, we configure different authorization methods supported by the Messaging for In-App and Web (Embedded Messaging) channel. This entity is available in API version 62.0 or later.

Field Name	Description
authIdentifier	<p><b>Field Type</b> String</p> <p><b>Description</b> Required. Represents an identifier for the MessagingAuthorization entity. The value must begin with a letter. Only alphanumeric characters and <code>_</code> are allowed.</p>
authProviderName	<p><b>Field Type</b> String</p> <p><b>Description</b> This field should never be set. Although this field is exposed, it isn't supported. The field represents the name of the AuthProvider that's referenced in the MessagingAuthorization. It's a required field if authorizationType is set to AuthProvider.</p>
authorizationType	<p><b>Field Type</b> MessagingAuthorizationType (enumeration of type string)</p> <p><b>Description</b> Required. Indicates whether MessagingAuthorization has been configured to reference a PublicKeyCertificateSet or an AuthProvider. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>PublicKeyCertificateSet</code> - Indicates that a PublicKeyCertificateSet is referenced in the MessagingAuthorization entity. This is the only option that will lead to a fully functional User Verification setup.</li> <li>• <code>AuthProvider</code> - This option should never be selected. It indicates that an AuthProvider is referenced in the MessagingAuthorization, but we don't support it.</li> </ul>
enabled	<p><b>Field Type</b> Boolean</p> <p><b>Description</b> Indicates whether messaging authorization is enabled. Defaults to false.</p>
publicKeyCertificateSetName	<p><b>Field Type</b> String</p> <p><b>Description</b> Name of the public key certificate set that's referenced in the MessagingAuthorization entity. This is a required field if <code>authorizationType</code> is set to <code>PublicKeyCertificateSet</code>.</p>

## MessagingAutoResponse

Represents an automated response used in a channel.

Field Name	Description
autoResponseContentType	<p><b>Field Type</b> string</p> <p><b>Description</b> The content type of the auto-response: TextResponse or MessageDefinition.</p>
language	<p><b>Field Type</b> string</p> <p><b>Description</b> The language of the auto response.</p>
messageDefinitionName	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the messaging component.</p>
response	<p><b>Field Type</b> string</p> <p><b>Description</b> The text of the auto response.</p>
responseTimeoutInMins	<p><b>Field Type</b> integer</p> <p><b>Description</b> The number of minutes after which a response can no longer be sent. The value can range from 5 to 60.</p>
type	<p><b>Field Type</b> MessagingAutoResponseType (enumeration of type string)</p> <p><b>Description</b> Required. The type of response, which determines when it's used in a messaging session. Values are:</p> <ul style="list-style-type: none"> <li>• AgentEndEngagementResponse</li> <li>• AgentEngagedResponse</li> <li>• InitialResponse</li> </ul>

## MessagingChannelCustomParameter

Represent a custom parameter added to a channel.

Field Name	Description
<code>actionParameterMappings</code>	<p><b>Field Type</b> <a href="#">MessagingChannelActionParameterMapping[]</a></p> <p><b>Description</b> The mapping used to map the parameter value to a flow or task.</p>
<code>externalParameterName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The external name of the parameter.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The label of the parameter.</p>
<code>maxLength</code>	<p><b>Field Type</b> int</p> <p><b>Description</b> The maximum length of the parameter value.</p>
<code>name</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the parameter.</p>
<code>parameterDataType</code>	<p><b>Field Type</b> FlowDataType (enumeration of type string)</p> <p><b>Description</b> Required. The format of the parameter. Values are:</p> <ul style="list-style-type: none"><li>• Apex</li><li>• Boolean</li><li>• Currency</li><li>• Date</li><li>• DateTime</li><li>• Multipicklist</li><li>• Number</li><li>• Picklist</li><li>• SObject</li><li>• String</li></ul>

## MessagingChannelActionParameterMapping

Represents a mapping between a parameter and an Omni-Channel flow or agent task.

Field Name	Description
actionParameterName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the flow that the custom or standard parameters are mapped to.</p>

## MessagingChannelStandardParameter

Represents a standard parameter used to pass information into a channel.

Field Name	Description
actionParameterMappings	<p><b>Field Type</b> <a href="#">MessagingChannelActionParameterMapping[]</a></p> <p><b>Description</b> The mapping associated with the parameter.</p>
externalInteractionId	<p><b>Field Type</b> MessagingChannelStandardParameterType (enumeration of type string)</p> <p><b>Description</b> An ID assigned to the external interaction, such as a campaign ID.</p>
externalInteractionName	<p><b>Field Type</b> MessagingChannelStandardParameterType (enumeration of type string)</p> <p><b>Description</b> The name of the external interaction, such as a campaign name.</p>
externalInteractionType	<p><b>Field Type</b> MessagingChannelStandardParameterType (enumeration of type string)</p> <p><b>Description</b> The type of external interaction, such as MarketingCampaign.</p>
parameterType	<p><b>Field Type</b> MessagingChannelStandardParameterType (enumeration of type string)</p> <p><b>Description</b> Required. The type of parameter. Values are:</p> <ul style="list-style-type: none"> <li>• Email</li> <li>• FirstName</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• LastName</li> <li>• Subject</li> </ul>

## MessagingKeyword

Represents settings specific to an EmbeddedMessaging MessagingChannel. Available in API version 62 or later.

Field Name	Description
keywordType	<p><b>Field Type</b> MessagingKeywordType (enumeration of type string)</p> <p><b>Description</b> Required. The type of messaging keyword for the auto response. Valid values are:</p> <ul style="list-style-type: none"> <li>• OptIn</li> <li>• DoubleOptIn</li> <li>• OptOut</li> <li>• Help</li> <li>• Custom</li> </ul>
language	<p><b>Field Type</b> String</p> <p><b>Description</b> Required. The language of the messaging keyword</p>
keyword	<p><b>Field Type</b> String</p> <p><b>Description</b> The messaging keyword value.</p>

## Declarative Metadata Sample Definition

The following is an example of a MessagingChannel component. This messaging channel passes custom and standard parameters from the messaging channel to a flow, and it routes to a flow with a fallback queue.

```
<?xml version="1.0" encoding="UTF-8"?>
<MessagingChannel xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>Test in-app messaging channel</description>
  <masterLabel>TestInAppChannel</masterLabel>
  <messagingChannelType>EmbeddedMessaging</messagingChannelType>
  <sessionHandlerQueue>Demo_Queue</sessionHandlerQueue>
  <sessionHandlerType>Queue</sessionHandlerType>
  <embeddedConfig>
```

```

<authMode>Auth</authMode>
<isAttachmentUploadEnabled>true</isAttachmentUploadEnabled>
<isSaveTranscriptEnabled>false</isSaveTranscriptEnabled>
<isEstimatedWaitTimeEnabled>false</isEstimatedWaitTimeEnabled>
<verifiedUserJwtExpirationTime>360</verifiedUserJwtExpirationTime>
<messagingAuthorizations>
  <authorizationType>PublicKeyCertificateSet</authorizationType>
  <authProviderName></authProviderName>
  <publicKeyCertificateSetName>pcks1</publicKeyCertificateSetName>
  <enabled>false</enabled>
  <authIdentifier>auth_identifier_one</authIdentifier>
</messagingAuthorizations>
</embeddedConfig>
<automatedResponses>
  <autoResponseContentType>MessageDefinition</autoResponseContentType>
  <messageDefinitionName>Sample</messageDefinitionName>
  <type>EndUserInactiveResponse</type>
  <responseTimeoutInMins>10</responseTimeoutInMins>
</automatedResponses>
<automatedResponses>
  <autoResponseContentType>MessageDefinition</autoResponseContentType>
  <messageDefinitionName>Sample</messageDefinitionName>
  <type>InitialResponse</type>
</automatedResponses>
<automatedResponses>
  <autoResponseContentType>MessageDefinition</autoResponseContentType>
  <messageDefinitionName>Sample</messageDefinitionName>
  <type>AgentEndEngagementResponse</type>
</automatedResponses>
<automatedResponses>
  <autoResponseContentType>MessageDefinition</autoResponseContentType>
  <messageDefinitionName>Sample</messageDefinitionName>
  <type>AgentEngagedResponse</type>
</automatedResponses>
<automatedResponses>
  <autoResponseContentType>TextResponse</autoResponseContentType>
  <language>en_US</language>
  <response>You've opted out of receiving messages from us, so we won't contact you
again.</response>
  <type>OptOutConfirmation</type>
</automatedResponses>
<automatedResponses>
  <autoResponseContentType>TextResponse</autoResponseContentType>
  <language>en_US</language>
  <response>Custom response1</response>
  <type>CustomResponse</type>
</automatedResponses>
<automatedResponses>
  <autoResponseContentType>TextResponse</autoResponseContentType>
  <language>en_US</language>
  <response>Opt In Confirmation response</response>
  <type>OptInConfirmation</type>
</automatedResponses>
<automatedResponses>

```

```

    <autoResponseContentType>TextResponse</autoResponseContentType>
    <language>en_US</language>
    <response>Text STOP to opt out of further messages.</response>
    <type>HelpResponse</type>
  </automatedResponses>
  <messagingKeywords>
    <keyword>stopall</keyword>
    <keyword>cancel</keyword>
    <keyword>stop</keyword>
    <keyword>unsubscribe</keyword>
    <keyword>end</keyword>
    <keyword>quit</keyword>
    <keywordType>OptOut</keywordType>
    <language>en_US</language>
  </messagingKeywords>
  <messagingKeywords>
    <keyword>help</keyword>
    <keywordType>Help</keywordType>
    <language>en_US</language>
  </messagingKeywords>
  <messagingKeywords>
    <keyword>customkeyword1</keyword>
    <keywordType>Custom</keywordType>
    <language>en_US</language>
  </messagingKeywords>
  <messagingKeywords>
    <keyword>OptInkeyword1</keyword>
    <keywordType>OptIn</keywordType>
    <language>en_US</language>
  </messagingKeywords>
</MessagingChannel>

```

If you route the messaging channel to a queue, there's no fallback flow.

```

<?xml version="1.0" encoding="UTF-8"?>
<MessagingChannel xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>EmbeddedChannel2</masterLabel>
  <messagingChannelType>EmbeddedMessaging</messagingChannelType>
  <sessionHandlerQueue>DemoQueueName</sessionHandlerQueue>
  <sessionHandlerType>Queue</sessionHandlerType>
</MessagingChannel>

```

The following is an example package.xml that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>MessagingChannel</name>
  </types>
  <version>55.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Metadata

---

The base class for all metadata types. You can't edit this object. A component is an instance of a metadata type.

Metadata is analogous to `sObject`, which represents all standard objects. Metadata represents all components and fields in the Metadata API. Instead of identifying each component with an ID, each custom object or custom field has a unique `fullName`, which must be distinct from standard object names, as it must be when you create custom objects or custom fields in the Salesforce user interface.

## Version

Metadata components are available in API version 10.0 and later.

## Fields

Field Name	Field Type	Description
<code>fullName</code>	string	<p>Required. The name of the component. For components with parent objects, such as fields and list views, the name must specify the name of the parent, for example <code>Account.FirstName</code>. The <code>__c</code> suffix must be appended to custom object names and custom field names when you're setting the <code>fullName</code>. For example, a custom field in a custom object could have a <code>fullName</code> of <code>MyCustomObject__c.MyCustomField__c</code>.</p> <p>To reference a component in a package, prepend the package's namespace prefix to the component name in the <code>fullName</code> field. Use the following syntax: <b><code>namespacePrefix__ComponentName</code></b>. For example, for the custom field component <code>MyCustomObject__c.MyCustomField__c</code> and the namespace <code>MyNS</code>, the full name is <code>MyNS__MyCustomObject__c.MyCustomField__c</code>.</p> <p>A namespace prefix is a 1-character to 15-character alphanumeric identifier that distinguishes your package and its contents from other publishers' packages. For more information, see <a href="#">Create and Register Your Namespace for Second-Generation Managed Packages</a>.</p>

---

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[CustomObject](#)

[CustomField](#)

[MetadataWithContent](#)

## MetadataWithContent

---

MetadataWithContent is the base type for all metadata types that contain content, such as documents or email templates. It extends Metadata. You can't edit this object.

### Version

MetadataWithContent components are available in API version 14.0 and later.

### Fields

Field Name	Field Type	Description
<code>content</code>	<code>base64Binary</code>	Base 64-encoded binary data. Before making an API call, client applications must encode the binary attachment data as base64. Upon receiving a response, client applications must decode the base64 data to binary. This conversion is handled for you by a SOAP client.
<code>fullName</code>	<code>string</code>	<p>Required. The name of the component. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p> <p>Inherited from the <a href="#">Metadata</a> component, this field isn't defined in the WSDL for this component. It must be specified when creating, updating, or deleting. See <a href="#">create()</a> to see an example of this field specified for a call.</p>

---

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Metadata](#)

## MfgProgramTemplate

---

Represents a definition of a program to create a program-based business. A program-based business, also known as a Manufacturing Program, enables manufacturers to drive their business models with forecasting tools and manage the end-to-end sales process efficiently.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

MfgProgramTemplate components have the suffix `.mfgProgramTemplate` and are stored in the `MfgProgramTemplate` folder.

### Version

MfgProgramTemplate components are available in API version 54.0 and later.

### Special Access Rules

The program-based business feature setting for Manufacturing Cloud is required to create a program template.

### Fields

Field Name	Description
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of the manufacturing program template.</p>
<code>programTemplateItems</code>	<p><b>Field Type</b> <a href="#">MfgProgramTemplateItem[]</a></p> <p><b>Description</b> The list of templates associated with the manufacturing program template.</p>
<code>programTemplateName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The unique identifier for the manufacturing program template.</p>
<code>status</code>	<p><b>Field Type</b> MfgProgramTemplateStatus (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>The status of the manufacturing program template.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Draft</li> <li>• Inactive</li> </ul> <p>The default value is <code>Active</code>.</p>

## MfgProgramTemplateItem

A program template item defines each of the templates associated with a manufacturing program. A template item includes program details, such as a data transformation type and a display order. Transformation type is the method to forecast business visibility to manufacturers.

Field Name	Description
<code>advAccountForecastSet</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The forecast set associated with the transformation.</p>
<code>description</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The description of the manufacturing program template item.</p>
<code>templateItemName</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The name of the manufacturing program template item.</p>
<code>transformationDisplayOrder</code>	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Required.</p> <p>The display order of the transformation in the manufacturing program template.</p>

Field Name	Description
transformationType	<p><b>Field Type</b> MfgProgramTransformationType (enumeration of type string)</p> <p><b>Description</b> Required. Specifies the type of transformation. Values are:</p> <ul style="list-style-type: none"> <li>• BusinessTransformation</li> <li>• ForecastSetRelation</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a MfgProgramTemplate component.

```
<?xml version="1.0" encoding="UTF-8"?>
<MfgProgramTemplate xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <description>Program Template</description>
  <programTemplateItems>
    <templateItemName>Template Item #1</templateItemName>
    <transformationDisplayOrder>1</transformationDisplayOrder>
    <transformationType>BusinessTransformation</transformationType>
    <description>Program Template Item</description>
  </programTemplateItems>
  <programTemplateName>Sample Program Template</programTemplateName>
  <status>Draft</status>
</MfgProgramTemplate>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>MfgProgramTemplate</name>
  </types>
  <version>54.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MilestoneType

Represents the name and description of a milestone, which you can use in an entitlement process to track important steps in cases.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

Milestone types are stored in the `milestoneTypes` directory of the corresponding package directory. The extension is `.milestoneType`.

## Version

[MilestoneType](#) on page 1316 is available in API version 27.0 and later.

## Fields

Field Name	Field Type	Description
<code>description</code>	string	The description of the milestone.
<code>RecurrenceType</code>	<a href="#">MilestoneRecurrenceType</a> (enumeration of type string)	The type of recurrence for the milestone. Available in API version 29.0 and later. Valid values are: <ul style="list-style-type: none"> <li><code>none</code>—Specifies no recurrence for the milestone. The milestone occurs only one time until the entitlement process exits.</li> <li><code>recursIndependently</code>—Specifies independent recurrence for the milestone.</li> <li><code>recursChained</code>—Specifies sequential recurrence for the milestone.</li> </ul>

## Declarative Metadata Sample Definition

Here's a sample milestone type.

```
<?xml version="1.0" encoding="UTF-8"?>
<MilestoneType xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>First Response Time</description>
</MilestoneType>
```

And, here's the sample `package.xml` file that references the `MilestoneType` component definition:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>* or a valid name of a milestone type</members>
    <name>MilestoneType</name>
  </types>
  <version>29.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MIDomain

---

Represents an Einstein Intent Set. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

MIDomain components have the suffix `.mlDomain` and are stored in the `mlDomains` folder.

## Version

MIDomain components are available in API version 43.0 and later.

## Special Access Rules

This object is available only if Chat and Einstein Bots are enabled in your org.

## Fields

Field Name	Field Type	Description
<code>description</code>	string	Einstein Intent Set description.
<code>label</code>	string	Einstein Intent Set name.
<code>mlIntents</code>	<a href="#">MlIntent[]</a>	List of intents under this Einstein Intent Set.
<code>mlSlotClasses</code>	<a href="#">MlSlotClass[]</a>	List of entities under this Einstein Intent Set.

## MlIntent

An intent in an Einstein Intent Set.

Field Name	Field Type	Description
<code>description</code>	string	Einstein Intent Set description.
<code>developerName</code>	string	Required. This unique name prevents conflicts with other Einstein Intent Sets associated with the same bot version. This name can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

Field Name	Field Type	Description
		 <b>Note:</b> Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.
label	string	Einstein Intent Set name.
m1IntentUtterances	<a href="#">MIIntentUtterance</a> []	List of customer inputs for this intent.
relatedM1Intents	<a href="#">MIRelatedIntent</a> []	List of intents within an Einstein Intent Set used to expand customer inputs for this intent. Only intents within local Einstein Intent Sets have related intents.

## MIIntentUtterance

A customer input for this intent.

Field Name	Field Type	Description
utterance	string	A customer input or natural language query that triggers the parent intent.

## MIRelatedIntent

An intent in an Einstein Intent Set used to expand customer inputs for this intent. Only intents within local Einstein Intent Sets have related intents.

Field Name	Field Type	Description
relatedM1Intent	string	Name of the intent that is used to extend the customer inputs of the current parent intent.

## MISlotClass

An entity in this Einstein Intent Set.

Field Name	Field Type	Description
dataType	MISlotClassDataType (enumeration of type string)	A list of the data types available for the MISlotClass. Valid values are: <ul style="list-style-type: none"> <li>• Text</li> <li>• Number</li> <li>• Boolean</li> <li>• Date</li> <li>• DateTime</li> <li>• Currency</li> </ul>
description	string	A description of an Einstein Bot entity.

Field Name	Field Type	Description
developerName	string	Required. This unique name prevents conflicts with other entities in an Einstein Intent Set. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.   <b>Note:</b> Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.
extractionRegex	string	Regular expression used to extract an entity when the type is set to <code>Pattern</code> .
extractionType	MISlotClassExtractionType (enumeration of type string)	Required. Valid values are: <ul style="list-style-type: none"> <li>• <code>Pattern</code></li> <li>• <code>Value</code></li> </ul>
label	string	Label that identifies an entity throughout the Salesforce user interface.
mISlotClassValues	MISlotClassValue[]	List of entity values associated with an entity of type <code>Value</code> .

## MISlotClassValue

An entity value associated with an entity of type `Value`.

Field Name	Field Type	Description
synonymGroup	<a href="#">SynonymGroup</a>	Represents a list of terms or synonyms for the current entity value.
value	string	Single value used to extract an entity of type <code>Value</code> .

## SynonymGroup

Represents a group of synonymous words or phrases.

Field Name	Field Type	Description
languages	Language (enumeration of type string)	Required. Specifies the languages the value list applies to. If value list items are specific to a single language, specify only that language. If the value list items apply to multiple languages, specify multiple languages for one value list.
terms	string	Required. A word or phrase synonymous with other terms in the value list.

## Declarative Metadata Sample Definition

The following is an example of an MIDomain.

```
<?xml version="1.0" encoding="UTF-8"?>
<MIDomain xmlns="http://soap.sforce.com/2006/04/metadata">
```

```

<label>TestDomainMetadata</label>
<description>This is domain 2 for metadata testing</description>
<mlIntents>
  <developerName>Test_Intent_New</developerName>
  <label>Test Intent New</label>
  <mlIntentUtterances>
    <utterance>Utterance Hello</utterance>
  </mlIntentUtterances>
  <mlIntentUtterances>
    <utterance>Utterance Hi</utterance>
  </mlIntentUtterances>
  <mlIntentUtterances>
    <utterance>Utterance What</utterance>
  </mlIntentUtterances>
</mlIntents>
<mlIntents>
  <developerName>Test_Intent_New2</developerName>
  <label>Test Intent New 2</label>
</mlIntents>
<mlSlotClasses>
  <developerName>Test_Entity1</developerName>
  <label>Test Entity 1</label>
  <extractionType>Value</extractionType>
  <mlSlotClassValues>
    <value>Choice value 1</value>
  </mlSlotClassValues>
  <mlSlotClassValues>
    <value>Choice value 2</value>
  </mlSlotClassValues>
</mlSlotClasses>
<mlSlotClasses>
  <developerName>Test_Entity2</developerName>
  <label>Test Entity 2</label>
  <extractionType>Pattern</extractionType>
</mlSlotClasses>
<mlSlotClasses>
  <dataType>Text</dataType>
  <description>Valid Email Address</description>
  <developerName>Email</developerName>
  <extractionRegex>\b[A-Z0-9._%+-]+@[A-Z0-9.-]+\.[A-Z]{2,}\b</extractionRegex>
  <extractionType>Pattern</extractionType>
  <label>Email</label>
</mlSlotClasses>
<mlSlotClasses>
  <developerName>airport</developerName>
  <extractionType>Value</extractionType>
  <label>airport</label>
  <mlSlotClassValues>
    <synonymGroup>
      <languages>en_US</languages>
      <terms>San Francisco</terms>
      <terms>The City</terms>
    </synonymGroup>
    <value>SFO</value>
  </mlSlotClassValues>
</mlSlotClasses>

```

```

    </mlSlotClassValues>
    <mlSlotClassValues>
      <synonymGroup>
        <languages>en_US</languages>
        <terms>Oakland</terms>
        <terms>The Town</terms>
      </synonymGroup>
      <value>OAK</value>
    </mlSlotClassValues>
  </mlSlotClasses>
</MlDomain>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>TestDomainMetadata</members>
    <name>MlDomain</name>
  </types>
  <version>43.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MLDataDefinition

---

Represents a modeling data definition, which specifies the data used to create a model. Such data can include filters, fields to include, fields to exclude, and so on. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`MLDataDefinition` components have the suffix `.mlDataDefinition` and are stored in the `mlDataDefinitions` folder.

## Version

`MLDataDefinition` is available in API version 50.0 and later.

## Fields

Field Name	Field Type	Description
<code>developerName</code>	string	Required. Represents the name of the data definition. Can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

Field Name	Field Type	Description
		 <b>Note:</b> Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.
entityDeveloperName	string	Required. The developer name of the object from which the model data is retrieved.   <b>Note:</b> After the MLDataDefinition entity is created, entityDeveloperName can't be updated.
excludedFields	string[]	Fields that are excluded from the model.
includedFields	string[]	Fields that are included in the model.
joinFields	MLField[]	Reserved for future use.
parentDefinitionDevName	string	Reserved for future use.
scoringFilter	MLFilter	Specifies records to which the prediction scores are written.
segmentFilter	MLFilter	This field further filters data used in training and scoring when segmentFilter is combined with both scoringFilter and trainingFilter. For example, select all records in a specific region.
trainingFilter	MLFilter	Specifies the records that make up the training set.
type	MLDataDefinitionType (enumeration of type string)	Required. Valid values are: <ul style="list-style-type: none"> <li>• Candidate</li> <li>• Interaction</li> <li>• Prediction</li> <li>• Recipient</li> </ul>  <b>Note:</b> After the model is created, type can't be updated.

## MLField

Represents a single field in the data definition. Available in API version 50.0 and later.

Field Name	Field Type	Description
entity	string	Required. The object that contains the field.
field	string	Required. The name of the field.
relatedField	MLField	Reserved for future use.
relationType	MLRelationType (enumeration of type string)	Reserved for future use. Valid values are: <ul style="list-style-type: none"> <li>• Full</li> <li>• Inner</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• Leftinner</li> <li>• Leftouter</li> </ul>
type	MLFieldType (enumeration of type string)	Required. How the field is used in a prediction. Valid values are: <ul style="list-style-type: none"> <li>• Excluded</li> <li>• Expression</li> <li>• Included</li> <li>• Join</li> <li>• Prediction</li> <li>• Pushback</li> <li>• Related</li> <li>• SourceDate</li> </ul>

## MLFilter

Represents a data filter based on a data comparison. For each comparison, there's a left-hand element, an operator, and a right-hand element. For each record, only one of these left-hand elements is populated: `lhFilter`, `lhPredictionField`, or `lhValue`. Similarly, for each record, only one of these right-hand elements is populated: `rhFilter`, `rhPredictionField`, or `rhValue`. Available in API version 50.0 and later.

Field Name	Field Type	Description
filterName	string	Required. Name of the filter.
lhFilter	MLFilter	Left-hand filter condition.
lhPredictionField	string	Left-hand prediction field.
lhType	AValueType (enumeration of type string)	The value type if a left-hand value is specified. Valid values are: <ul style="list-style-type: none"> <li>• Boolean</li> <li>• Comparison</li> <li>• Currency</li> <li>• Date</li> <li>• DateTime</li> <li>• Number</li> <li>• String</li> <li>• Supplier</li> <li>• Varchar</li> </ul>
lhUnit	AFilterUnit (enumeration of type string)	The unit if a left-hand filter is specified. Valid values are: <ul style="list-style-type: none"> <li>• Milliseconds</li> <li>• Seconds</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• Minutes</li> <li>• Hours</li> <li>• Days</li> <li>• Weeks</li> <li>• Months</li> <li>• Years</li> </ul>
lhValue	string	The left-hand value.
operation	AIFilterOperation (enumeration of type string)	Required. Valid values are: <ul style="list-style-type: none"> <li>• And</li> <li>• Or</li> <li>• Not</li> <li>• LessThan</li> <li>• LessThanOrEqual</li> <li>• GreaterThan</li> <li>• GreaterThanOrEqual</li> <li>• Equals</li> <li>• NotEquals</li> <li>• Add</li> <li>• Subtract</li> <li>• Multiply</li> <li>• Divide</li> <li>• IsNull</li> <li>• IsNotNull</li> <li>• StartsWith</li> <li>• EndsWith</li> <li>• Contains</li> <li>• Concat</li> <li>• DoesNotContain</li> <li>• Between</li> <li>• In</li> </ul>
rhFilter	MFilter	Right-hand filter condition.
rhPredictionField	string	Right-hand prediction field.
rhType	AValueType (enumeration of type string)	The value type if a right-hand value is specified. Valid values are: <ul style="list-style-type: none"> <li>• Boolean</li> <li>• Comparison</li> <li>• Currency</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• Date</li> <li>• DateTime</li> <li>• Number</li> <li>• String</li> <li>• Supplier</li> <li>• Varchar</li> </ul>
rhUnit	AIFilterUnit (enumeration of type string)	The unit if a right-hand filter is specified. Valid values are: <ul style="list-style-type: none"> <li>• Milliseconds</li> <li>• Seconds</li> <li>• Minutes</li> <li>• Hours</li> <li>• Days</li> <li>• Weeks</li> <li>• Months</li> <li>• Years</li> </ul>
rhValue	string	The right-hand value.
sortOrder	int	Specifies the order of operations for evaluating the expressions. For example, if you have two conditions, this field specifies which condition is evaluated first.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MLPredictionDefinition

Represents a prediction definition that specifies details about the prediction. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

MLPredictionDefinition components have the suffix `.mlPrediction` and are stored in the `mlPredictions` folder.

## Version

MLPredictionDefinition is available in API version 50.0 and later.

## Fields

Field Name	Field Type	Description
aiApplicationDeveloperName	string	Required. Represents the developer name of the parent AI application. Can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
description	string	Description of the prediction.
developerName	string	Required. Represents the name of the prediction definition. Can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
		 <b>Note:</b> Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.
masterLabel	string	Label that identifies the ML prediction definition throughout the Salesforce user interface.
negativeExpression	MLFilter	Reserved for future use.
positiveExpression	MLFilter	Reserved for future use.
predictionField	string	Field that the prediction is based on.
priority	int	Reflects the priority of the MLPD object when an AIApplication has multiple child MLPDs. Nillable.
pushbackField	string	Field that the prediction writes scores to.
status	MLPredictionDefinitionStatus (enumeration of type string)	Required. The status of the prediction. Valid values are: <ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> <li>• Draft</li> </ul>
type	AIPredictionType (enumeration of type string)	Required. The type of model that returns the prediction values. Valid values are: <ul style="list-style-type: none"> <li>• BinaryClassification</li> <li>• DeepLearningIntentClassification</li> <li>• DeepLearningNameEntityRecognition</li> <li>• GlobalDeepLearningIntentClassification</li> <li>• GlobalDeepLearningNameEntityRecognition</li> <li>• LanguageDetection</li> <li>• MulticlassClassification</li> <li>• Regression</li> <li>• ScoringSpecificOutcome</li> </ul>

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MobileApplicationDetail

---

Represents the packaging attributes for a mobile connected app. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

MobileApplicationDetail components have the suffix `MobileApplicationDetail` and are stored in the `MobileApplicationDetails` folder.

### Version

MobileApplicationDetail components are available in API version 47.0 and later.

### Fields

Field Name	Field Type	Description
<code>applicationBinaryFile</code>	base64	Base 64-encoded binary data file for the mobile app.
<code>applicationBinaryFileName</code>	string	Filename for the mobile app binary data file.
<code>applicationBundleIdentifier</code>	string	iOS apps only: the unique application bundle identifier.
<code>applicationFileLength</code>	int	The length of the mobile app binary data file.
<code>applicationIconFile</code>	string	iOS apps only: the application icon.
<code>applicationIconFileName</code>	string	iOS apps only: the application icon filename.
<code>applicationInstallUrl</code>	string	URL to install the mobile app.
<code>devicePlatform</code>	DevicePlatformType (enumeration of type string)	Required. Platform that supports the mobile app. The valid values are: <ul style="list-style-type: none"> <li>• <code>android</code></li> <li>• <code>ios</code></li> </ul>
<code>deviceType</code>	string	Supported device type for mobile app. The valid values are: <ul style="list-style-type: none"> <li>• <code>minitab</code></li> <li>• <code>phone</code></li> <li>• <code>tablet</code></li> </ul>
<code>minimumOsVersion</code>	string	Minimum OS version required to install the mobile app.
<code>privateApp</code>	boolean	Specifies whether the mobile app is private ( <code>true</code> ) or not ( <code>false</code> ).

Field Name	Field Type	Description
version	string	Required. Version number of the mobile app.

## Usage

When you create a connected app in Salesforce Classic or Lightning Experience and enter mobile app settings, those settings are stored in a MobileApplicationDetail component. In this example, the metadata retrieved for a connected app includes MobileApplicationDetail metadata.

```
<?xml version="1.0" encoding="UTF-8"?>
<<ConnectedApp xmlns="http://soap.sforce.com/2006/04/metadata">
  <contactEmail>paul.chen@salesforce.com</contactEmail>
  <label>MobileApplicationDetailConnectedApp</label>
  <mobileAppConfig>
    <applicationBinaryFile></applicationBinaryFile>
    <applicationInstallUrl>https://appstore.apple.com/MobileApplicationDetail
      </applicationInstallUrl>
    <devicePlatform>ios</devicePlatform>
    <deviceType>phone</deviceType>
    <privateApp>false</privateApp>
    <version>0.0.0.0</version>
  </mobileAppConfig>
  < . mobileStartUrl>https://www.salesforce.com</mobileStartUrl>
</ConnectedApp>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MobileSecurityAssignment

Represents the assignment of mobile app security policies to a profile. The policies apply to the Salesforce mobile app with Enhanced Mobile App Security enabled.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

MobileSecurityAssignment components have the suffix `.mobileSecurityAssignment` and are stored in the `mobileSecurityAssignments` folder.

## Version

MobileSecurityAssignment components are available in API version 54.0 and later.

## Special Access Rules

The Enhanced Mobile App Security add-on subscription and the Enforce Enhanced Mobile App Security user permission are required to use this metadata type.

## Fields

Field Name	Description
connectedApplication	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the connected app that's associated with the mobile security policies assignment.</p>
isProtected	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type. The default is <code>false</code>.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for MobileSecurityAssignment, which is defined when the MobileSecurityAssignment component is created.</p>
profile	<p><b>Field Type</b> string</p> <p><b>Description</b> The profile that the mobile security policies are assigned to.</p>

## Declarative Metadata Sample Definition

The following is an example of a MobileSecurityAssignment component.

```
<?xml version="1.0" encoding="UTF-8"?>
<MobileSecurityAssignment xmlns="http://soap.sforce.com/2006/04/metadata">
  <connectedApplication>MyMobileConnectedApp</connectedApplication>
  <isProtected>false</isProtected>
  <masterLabel>MyMobileSecurityAssignment</masterLabel>
</MobileSecurityAssignment>
```

```
<profile>admin</profile>
</MobileSecurityAssignment>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>MobileSecurityAssignment</name>
  </types>
  <version>61.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MobileSecurityPolicy

---

Represents a mobile app security policy on the Salesforce mobile app with Enhanced Mobile App Security enabled. For a full description of each policy, see [Enable and Configure Mobile App Security Policies](#).

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`MobileSecurityPolicy` components have the suffix `.mobileSecurityPolicy` and are stored in the `mobileSecurityPolicies` folder.

## Version

`MobileSecurityPolicy` components are available in API version 53.0 and later.

## Special Access Rules

The Enhanced Mobile App Security add-on subscription and the Enforce Enhanced Mobile App Security user permission are required to use this metadata type.

## Fields

Field Name	Description
effectiveDate	<b>Field Type</b> dateTime <b>Description</b> The date that a mobile security policy is enforced.
isEnabled	<b>Field Type</b> boolean <b>Description</b> Required. Indicates whether the mobile security policy is enabled. The default value is <code>false</code> , which means that the policy is disabled.
isProtected	<b>Field Type</b> boolean <b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type. The default value is <code>false</code> .
masterLabel	<b>Field Type</b> string <b>Description</b> Required. A user-friendly name for MobileSecurityPolicy, which is defined when the MobileSecurityPolicy component is created.
mobilePlatform	<b>Field Type</b> MobileSecurityMobilePlatform (enumeration of type string) <b>Description</b> The mobile operating system of the mobile security policy. Values are: <ul style="list-style-type: none"><li>• Android</li><li>• iOS</li></ul>
mobileSecurityAssignment	<b>Field Type</b> string <b>Description</b> The name of the mobile security assignment associated with the mobile security policy. See <a href="#">MobileSecurityAssignment</a> on page 1329.
ruleValue	<b>Field Type</b> string

Field Name	Description
	<p><b>Description</b></p> <p>Required. The value of the mobile security policy rule.</p>
ruleValueType	<p><b>Field Type</b></p> <p>MobileSecurityPolicyRuleValueType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. The type of mobile security policy rule.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• Boolean</li> <li>• Text</li> <li>• TextList</li> </ul>
severityLevel	<p><b>Field Type</b></p> <p>MobileSecurityPolicySeverityLevel (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. The severity level of a mobile security policy.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• <b>Critical</b>— Wipes app data and logs user out</li> <li>• <b>Error</b>—Blocks access to the app until the issue is resolved, but doesn't log user out</li> <li>• <b>Info</b>— Blocks prohibited action or logs user action and informs user</li> <li>• <b>warn</b>—Notifies the user of the violation and recommends how to resolve, but user is able to continue using the app</li> </ul>
type	<p><b>Field Type</b></p> <p>MobileSecurityPolicyType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. The type of mobile security policy.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• AllowedDeviceList</li> <li>• Block3dTouch</li> <li>• BlockCalendar</li> <li>• BlockCamera</li> <li>• BlockContacts</li> <li>• BlockCustomKeyboard</li> <li>• BlockFileBackup</li> <li>• BlockMicrophone</li> <li>• BlockOsSharing</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>BlockedDeviceList</li> <li>BrowserUriScheme</li> <li>CheckBiometric</li> <li>DevicePasscode</li> <li>DisableUrlCaching</li> <li>JailbrokenDevice</li> <li>LogCertPin</li> <li>LogEmail</li> <li>LogPhonecall</li> <li>LogPolicyResult</li> <li>LogScreenshot</li> <li>LogTextmessage</li> <li>LogoutAfterRestart</li> <li>LogoutOnBiometricChange</li> <li>MalwareDetection</li> <li>ManInMiddle</li> <li>MaxOffline</li> <li>MaximumAppVersion</li> <li>MaximumOsVersion</li> <li>MinimumAppVersion</li> <li>MinimumOsVersion</li> <li>MinimumSecurityPatchVersion</li> <li>MininumAppVersion</li> <li>PhonecallUriScheme</li> <li>Screenshot</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a MobileSecurityPolicy component.

```
<?xml version="1.0" encoding="UTF-8"?>
<MobileSecurityPolicy xmlns="http://soap.sforce.com/2006/04/metadata">
  <effectiveDate>2022-08-09T22:04:56.000Z</effectiveDate>
  <isEnabled>true</isEnabled>
  <isProtected>false</isProtected>
  <masterLabel>MyMobileSecurityPolicy</masterLabel>
  <mobileSecurityAssignment>MyMobileSecurityAssignment</mobileSecurityAssignment>
  <ruleValue>true</ruleValue>
  <ruleValueType>Boolean</ruleValueType>
  <severityLevel>info</severityLevel>
  <type>BlockCalendar</type>
</MobileSecurityPolicy>
```

```
<mobilePlatform>Android</mobilePlatform>
</MobileSecurityPolicy>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>MobileSecurityPolicy</name>
  </types>
  <version>61.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MobSecurityCertPinConfig

---

Represents the authentication server certificate pin configuration on the Salesforce mobile app with Enhanced Mobile Security.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`MobSecurityCertPinConfig` components have the suffix `.mobSecurityCertPinConfig` and are stored in the `mobSecurityCertPinConfigs` folder.

### Version

`MobSecurityCertPinConfig` components are available in API version 53.0 and later.

### Special Access Rules

The Enhanced Mobile App Security add-on subscription and the Enforce Enhanced Mobile App Security user permission are required to use this metadata type.

## Fields

Field Name	Description
certificateHash	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The unique identifier for the certificate.</p>
domainName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the domain for the server that you want to pin the certificate to. For example, <code>https://MyDomainName.my.salesforce.com</code>.</p>
isEnabled	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Indicates whether authentication server certificate pinning is enabled. The default value is <code>false</code>, which means that certificate pinning is disabled.</p>
isProtected	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type. The default value is <code>false</code>.</p>
isSubdomainIncluded	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Indicates whether subdomains use the same certificate pinning configuration as the specified <code>domainName</code>. The default value is <code>false</code>.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for MobSecurityCertPinConfig, which is defined when the MobSecurityCertPinConfig component is created.</p>
mobilePlatform	<p><b>Field Type</b> MobileSecurityMobilePlatform (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>The mobile operating system.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• Android</li> <li>• iOS</li> </ul>
mobileSecurityAssignment	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The name of the mobile security assignment associated with the mobile security policy. See <a href="#">MobileSecurityAssignment</a> on page 1329.</p>
severityLevel	<p><b>Field Type</b></p> <p>MobileSecurityPolicySeverityLevel (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. The severity level of the mobile security policy.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• <b>Critical</b>— Wipes app data and logs user out</li> <li>• <b>Error</b>—Blocks access to the app until the issue is resolved, but doesn't log user out</li> <li>• <b>Info</b>— Blocks prohibited action or logs user action and informs user</li> <li>• <b>warn</b>—Notifies the user of the violation and recommends how to resolve, but user is able to continue using the app</li> </ul>
type	<p><b>Field Type</b></p> <p>MobileSecurityCertPinType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. The type of pin.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• AuthServer</li> <li>• Resource</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a MobSecurityCertPinConfig component.

```
<?xml version="1.0" encoding="UTF-8"?>
<MobileSecurityCertPinConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <certificateHash>AaBbCcDdEeFfGg</certificateHash>
  <domainName>login.salesforce.com</domainName>
  <isEnabled>true</isEnabled>
</MobileSecurityCertPinConfig>
```

```

<isProtected>>false</isProtected>
<masterLabel>AuthenticationServerCertificatePinning</masterLabel>
<mobilePlatform>Android</mobilePlatform>
<mobileSecurityAssignment>MyMobileSecurityAssignment</mobileSecurityAssignment>
<severityLevel>info</severityLevel>
<type>AuthServer</type>
</MobileSecurityCertPinConfig>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>MobileSecurityCertPinConfig</name>
  </types>
  <version>61.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ModerationRule

---

Represents a rule used in your Experience Cloud site to moderate member-generated content. Each rule specifies the member-generated content the rule applies to, the criteria to enforce the rule on, and the moderation action to take. Moderation rules help protect your site from spammers, bots, and offensive or inappropriate content. This type extends the Metadata metadata type and inherits its `fullName` field.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Moderation rules created with the Metadata API are more powerful than moderation rules set up in the Experience Management UI. For example, in the UI you could create a rule that moderates posts and comments. In the Metadata API you could create a rule that moderates only the Link Name of a Link feed type. Use the Metadata API to express complex moderation rules.

**Important:** Don't update moderation rules you create using the Metadata API in the Experience Management UI. If you do, you overwrite relevant Metadata API fields or the fields are ignored.

Keep the following things in mind when creating moderation rules:

- Your org can have up to 30 rules. This limit is per org, not per site. This limit includes both content rules and rate rules.
- Each rule can have up to three keyword criteria.
- Rules that block content run first, followed by rules to review and approve content, then rules that replace content, and last by rules that flag content. If two or more rules perform the same action, the oldest rule runs first, based on the date the rule was created. Rules to replace content don't run when the content also applies to a review rule—we want community managers to review the original content.

## File Suffix and Directory Location

ModerationRule components have the suffix `.rule` and are stored in the `moderation` directory of the corresponding package directory. The file name format follows `site_name.moderation_rule_developer_name.rule`.

## Version

ModerationRule components are available in API version 36.0 and later.

## Special Access Rules

To view, create, edit, and delete moderation rules, you need the Manage Experiences or Create and Set Up Experiences permission. As of Spring '20 and later, only users with permission to edit moderation rules can access this object.

## Fields

Field Name	Field Type	Description
<code>action</code>	ModerationRuleAction (enumeration of type string)	Required. Indicates the moderation action that you want to take. The valid values are: <ul style="list-style-type: none"> <li>• Block</li> <li>• Review</li> <li>• Replace</li> <li>• Flag</li> <li>• FreezeAndNotify (Reserved for future use.)</li> </ul>
<code>actionLimit</code>	int	Indicates the moderation action limit. Available in API 39.0 and later.
<code>active</code>	boolean	Required. Indicates whether the moderation rule is active ( <code>true</code> ) or inactive ( <code>false</code> ).
<code>description</code>	string	A description of the moderation rule.
<code>entitiesAndFields</code>	ModerateEntityField[]	Indicates the types of user-generated content this moderation rule applies to.
<code>masterLabel</code>	string	Required. Label for the moderation rule.
<code>notifyLimit</code>	int	Indicates the notification limit of the moderation rule. Available in API 39.0 and later.
<code>userCriteria</code>	string	Represents the member criteria to use in moderation rules. Available in API 39.0 and later.
<code>userMessage</code>	string	The message you want your members to see when their content is blocked. Use the <code>%BLOCKED_KEYWORD%</code> variable to display up to five blocked words in the user message. If you don't specify a message, the member sees the standard message: "You can't use <code>%BLOCKED_KEYWORD%</code> or other inappropriate words in this site. Review your content and try again."

## ModeratedEntityField

The fields and entities you want to moderate.

Field Name	Field Type	Description
entityName	string	Required. Indicates the types of user-generated content the moderation rule applies to. Post and comments only apply to content created in groups and user profiles. All feed types, such as polls and links, are supported.
fieldName	string	Indicates the field the moderation rule applies to.   <b>Note:</b> To moderate feed posts, use <code>entityName FeedItem</code> with <code>fieldName RawBody</code> . To moderate feed comments, use <code>entityName FeedComment</code> with <code>fieldName RawCommentBody</code> . The <code>RawBody</code> and <code>RawCommentBody</code> fields aren't available in any other API.
keywordList	KeywordList string	Indicates the keyword list that you want to moderate against.

## ModerationRuleType

Required. Indicates the type of rule to run on user-generated content.

Field Name	Field Type	Description
type	(enumeration of type string)	Required. Indicates the type of rule to run on user-generated content. Valid values are: <ul style="list-style-type: none"> <li>• Content</li> <li>• Rate</li> </ul> Available in API 39.0 and later.

## RateLimitTimePeriod

Required. Indicates the time period that is applied to the rate limit.

Field Name	Field Type	Description
timePeriod	(enumeration of type string)	Required. Indicates the time period that is applied to the rate limit. Valid values are: <ul style="list-style-type: none"> <li>• Short</li> <li>• Medium</li> </ul> Available in API 39.0 and later.

## Declarative Metadata Sample Definition

The following is an example of a ModerationRule component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ModerationRule xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>Blocks Bad Word List in posts, comments, Link URLs, titles, and poll
choices.</description>
  <masterLabel>Blocking Rule</masterLabel>
  <action>Block</action>
  <active>true</active>
  <userMessage>You can't use %BLOCKED_KEYWORD% or other inappropriate words in this site.
Review your content and try again.</userMessage>
  <!-- Applies the rule to FeedComment.RawCommentBody (an internal only field), if it
contains words from the keyword list specified -->
  <entitiesAndFields>
    <entityName>FeedComment</entityName>
    <fieldName>RawCommentBody</fieldName>
    <keywordList>site1.badword_list</keywordList>
  </entitiesAndFields>
  <entitiesAndFields>
    <entityName>FeedItem</entityName>
    <fieldName>LinkUrl</fieldName>
    <keywordList>site1.badword_list</keywordList>
  </entitiesAndFields>
  <!-- Applies the rule to FeedItem.RawBody (an internal only field), if it contains words
from the keyword list specified -->
  <entitiesAndFields>
    <entityName>FeedItem</entityName>
    <fieldName>RawBody</fieldName>
    <keywordList>site1.badword_list</keywordList>
  </entitiesAndFields>
  <entitiesAndFields>
    <entityName>FeedItem</entityName>
    <fieldName>Title</fieldName>
    <keywordList>site1.badword_list</keywordList>
  </entitiesAndFields>
  <entitiesAndFields>
    <entityName>FeedPollChoice</entityName>
    <fieldName>ChoiceBody</fieldName>
    <keywordList>site1.badword_list</keywordList>
  </entitiesAndFields>
</ModerationRule>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <name>ModerationRule</name>
    <members>site1.blocking_rule</members>
  </types>
  <version>36.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MutingPermissionSet

---

Represents a set of disabled permissions and is used in conjunction with [PermissionSetGroup](#).

This type extends the [PermissionSet](#) metadata type.

## Declarative Metadata File Suffix and Directory Location

Muting permission sets are stored in the `mutingpermissionsets` directory. The file name matches the muting permission set API name and the extension is `.mutingpermissionset`. For example, a `mutingpermissionsets` with the name `Finance_Mgmt_MutingPermSet` is stored in `mutingpermissionsets/Finance_Mgmt_MutingPermSet.mutingpermissionset`.

## Version

This object is available in API version 46.0 and later.

## Special Access Rules

As of Summer '20 and later, only users who have one of these permissions can access this type:

- View Setup and Configuration
- Manage Session Permission Set Activations
- Assign Permission Sets
- Manage Profiles and Permission Sets

To view the following settings, assignments, and permissions for standard and custom objects in a specified muting permission set, the View Setup and Configuration permission is required.

- Client settings
- Field permissions
- Layout assignments
- Object permissions
- Permission dependencies
- Permission set tab settings
- Permission set group components
- Record types

## Fields

MutingPermissionSet has the same fields as [PermissionSet](#), plus a single field, `label`, used to name a MutingPermissionSet. Unlike [PermissionSet](#), settings enabled by MutingPermissionSet are turned off for the permission set group that it's a component of.

Field	Field Type	Description
label	string	Required. The name of the muting permission set.

## Declarative Metadata Sample Definition

The following example deploys a MutingPermissionSet used in a Permission Set Group intended for users submitting job applications for a custom application. The muting permission set has administrative permissions enabled to ensure that they're muted in the Permission Set Group.

```
<?xml version="1.0" encoding="UTF-8"?>
<MutingPermissionSet xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>Job Apps User Muted</label>
  <description>Mutes any administrative tasks for the Job Apps user</description>
  <hasActivationRequired>>false</hasActivationRequired>
  <license>Salesforce</license>
  <applicationVisibilities>
    <application>JobApps__Approval</application>
    <visible>>true</visible>
  </applicationVisibilities>
  <classAccesses>
    <apexClass>ApprovalUtility</apexClass>
    <enabled>>true</enabled>
  </classAccesses>
  <customPermissions>
    <enabled>>true</enabled>
    <name>JobAppApprover</name>
  </customPermissions>
  <fieldPermissions>
    <editable>>false</editable>
    <field>Job_Request__c.Salary__c</field>
    <readable>>true</readable>
  </fieldPermissions>
  <objectPermissions>
    <allowCreate>>true</allowCreate>
    <allowDelete>>true</allowDelete>
    <allowEdit>>true</allowEdit>
    <allowRead>>true</allowRead>
    <customizeSetup>>true</customizeSetup>
    <deleteSetup>>true</deleteSetup>
    <modifyAllRecords>>true</modifyAllRecords>
    <object>Approval_Confirmation__c</object>
    <viewAllRecords>>true</viewAllRecords>
    <viewSetup>>true</viewSetup>
  </objectPermissions>
  <pageAccesses>
    <apexPage>Job_Approval_Web_Form</apexPage>
    <enabled>>true</enabled>
  </pageAccesses>
  <recordTypeVisibilities>
    <recordType>Approval_Confirmation__c.DevManager</recordType>
    <visible>>true</visible>
  </recordTypeVisibilities>
</MutingPermissionSet>
```

```

    <tabSettings>
      <tab>Approval_Confirmation_c</tab>
      <visibility>Visible</visibility>
    </tabSettings>
  </MutingPermissionSet>

```

The following is an example package.xml manifest used to retrieve the MutingPermissionSet metadata for an organization.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Job_Apps_User</members>
    <name>PermissionSetGroup</name>
  </types>
  <types>
    <members>Job_Apps_User_Muted</members>
    <name>MutingPermissionSet</name>
  </types>
  <version>49.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[PermissionSet](#)

## MyDomainDiscoverableLogin

---

Represents the configuration settings when the My Domain login page type is Discovery. Login Discovery provides an identity-first login experience, where the login page contains the identifier field only. Based on the identifier entered, a handler determines how to authenticate the user. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

MyDomainDiscoverableLogin components have the suffix `.myDomainDiscoverableLogin` in the `myDomainDiscoverableLogins` folder.

### Version

MyDomainDiscoverableLogin components are available in API version 48.0 and later.

## Fields

Field Name	Field Type	Description
apexHandler	string	Required. The Apex handler class that contains the Discovery authentication logic.
executeApexHandlerAs	string	The user who is executing the handler. Requires the Manage User permission.
usernameLabel	string	The login prompt when the My Domain login page type is Discovery. This label supports localization with custom labels.

## Declarative Metadata Sample Definition

The following is an example of a MyDomainDiscoverableLogin component.

```
<?xml version="1.0" encoding="UTF-8"?>
<MyDomainDiscoverableLogin xmlns="http://soap.sforce.com/2006/04/metadata">
  <apexHandler>MyDomainDiscLoginHandler</apexHandler>
  <executeApexHandlerAs>executeUser@example.com</executeApexHandlerAs>
  <usernameLabel>Enter your email</usernameLabel>
</MyDomainDiscoverableLogin>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>MyDomainDiscoverableLogin</name>
  </types>
  <version>48.0</version>
</Package>
```

## Usage

Use this type to access the My Domain Login Discovery Page. This type of login page prompts users to identify themselves with an email address, phone number, or custom identifier. My Domain Login Discovery performs an interview-based login process, where users are prompted to provide identity for authentication. For example, users receive a verification code that they enter to complete the login process.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## NamedCredential

---

Represents a named credential, which specifies the URL of a callout endpoint and its required authentication parameters in one definition. A named credential can be specified as an endpoint to simplify the setup of authenticated callouts.

**Note:** All credentials stored within this entity are encrypted under a framework that is consistent with other encryption frameworks on the platform. Salesforce encrypts your credentials by auto-creating org-specific keys. Credentials encrypted using the previous encryption scheme have been migrated to the new framework.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

NamedCredential components have the suffix `.namedCredential` and are stored in the `namedCredentials` folder.

### Version

NamedCredential components are available in API version 33.0 and later.

### Special Access Rules

As of Spring '20 and later, only users with the View Setup and Configuration permission can access this type.

### Fields

Field Name	Description
<code>allowMergeFieldsInBody</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Specifies whether Apex code can use merge fields to populate the HTTP request body with org data when a callout is made. Corresponds to <b>Allow Merge Fields in HTTP Body</b> in the user interface. Defaults to <code>false</code>.</p> <p>This field is available in API version 41.0 and later.</p>
<code>allowMergeFieldsInHeader</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Specifies whether Apex code can use merge fields to populate the HTTP header with org data when a callout is made. Corresponds to <b>Allow Merge Fields in HTTP Header</b> in the user interface. Defaults to <code>false</code>.</p> <p>This field is available in API version 41.0 and later.</p>

Field Name	Description
<code>authProvider</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The authentication provider that the AuthProvider component represents. This field is valid only when NamedCredentialType is set to <code>Legacy</code>.</p> <p><b>This field is deprecated in API version 56.0.</b></p>
<code>authTokenEndpointUrl</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The URL where JWTs are exchanged for access tokens. This field is valid only when NamedCredentialType is set to <code>Legacy</code>.</p> <p><b>First available in API version 46.0, this field is deprecated in API version 56.0 and later.</b></p>
<code>awsAccessKey</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> First part of the access key used to sign programmatic requests to AWS. Use when AWS Signature Version 4 is your authentication protocol. This field is valid only when NamedCredentialType is set to <code>Legacy</code>.</p> <p><b>First available in API version 46.0, this field is deprecated in API version 56.0 and later.</b></p>
<code>awsAccessSecret</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The second part of the access key used to sign programmatic requests to AWS. Use when AWS Signature Version 4 is your authentication protocol. This field is valid only when NamedCredentialType is set to <code>Legacy</code>.</p> <p><b>First available in API version 46.0, this field is deprecated in API version 56.0 and later.</b></p>
<code>awsRegion</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Specifies which AWS Region the named credential accesses. This field is valid only when NamedCredentialType is set to <code>Legacy</code>.</p> <p><b>First available in API version 46.0, this field is deprecated in API version 56.0 and later.</b></p>

Field Name	Description
awsService	<p><b>Field Type</b> string</p> <p><b>Description</b> Specifies which AWS resource the named credential accesses. This field is valid only when NamedCredentialType is set to <code>Legacy</code>.</p> <p><b>First available in API version 46.0, this field is deprecated in API version 56.0 and later.</b></p>
calloutStatus	<p><b>Field Type</b> calloutStatus (enumeration of type string)</p> <p><b>Description</b> Specifies whether the named credential is enabled for callouts. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Disabled</code>: The named credential is disabled for callouts.</li> <li>• <code>Enabled</code>: The named credential is enabled for callouts.</li> </ul> <p>This field is available in API version 59.0 and later.</p>
certificate	<p><b>Field Type</b> string</p> <p><b>Description</b> If you specify a certificate, your Salesforce org supplies it when establishing each two-way SSL connection with the external system. The certificate is used for digital signatures, which verify that requests are coming from your Salesforce org. This field is valid only when NamedCredentialType is set to <code>Legacy</code>.</p> <p><b>This field is deprecated in API version 56.0.</b></p>
endpoint	<p><b>Field Type</b> string</p> <p><b>Description</b> The URL or root URL of the callout endpoint. Corresponds to <b>URL</b> in the user interface. This field is valid only when NamedCredentialType is set to <code>Legacy</code>.</p> <p><b>This field is deprecated in API version 56.0.</b></p>
generateAuthorizationHeader	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Specifies whether Salesforce generates an authorization header and applies it to each callout that references the named credential. Corresponds to <b>Generate Authorization Header</b> in the user interface. Defaults to <code>true</code>. This field is available in API version 41.0 and later.</p>

Field Name	Description
jwtAudience	<p><b>Field Type</b> string</p> <p><b>Description</b> External service or other allowed recipients for the JWT. Written as JSON, with a quoted string for a single audience and an array of quoted strings for multiple audiences. Single audience example: "aud1" Multiple audiences example: ["aud1", "aud2", "aud3"]. This field is valid only when NamedCredentialType is set to Legacy.</p> <p><b>This field is deprecated in API version 56.0.</b></p>
jwtFormulaSubject	<p><b>Field Type</b> string</p> <p><b>Description</b> Formula string calculating the Subject of the JWT. API names and constant strings, in single quotes, can be included. Allows a dynamic Subject unique per user requesting the token. For example, 'User='+\$User.Id. Use this field when principalType is set to PerUser. Corresponds to Per User Subject in the user interface. This field is valid only when NamedCredentialType is set to Legacy.</p> <p><b>First available in API version 46.0, this field is deprecated in API version 56.0 and later.</b></p>
jwtIssuer	<p><b>Field Type</b> string</p> <p><b>Description</b> Specify who issued the JWT using a case-sensitive string. This field is valid only when NamedCredentialType is set to Legacy.</p> <p><b>First available in API version 46.0, this field is deprecated in API version 56.0 and later.</b></p>
jwtSigningCertificate	<p><b>Field Type</b> string</p> <p><b>Description</b> Certificate verifying the JWT's authenticity to external sites. This field is valid only when NamedCredentialType is set to Legacy.</p> <p><b>First available in API version 46.0, this field is deprecated in API version 56.0 and later.</b></p>
jwtTextSubject	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Static text, without quotes, that specifies the JWT Subject. Use this field when <code>principalType</code> is set to <code>NamedUser</code>. Corresponds to <code>NamedPrincipalSubject</code> in the user interface.</p> <p>This field is valid only when <code>NamedCredentialType</code> is set to <code>Legacy</code>.</p> <p><b>First available in API version 46.0, this field is deprecated in API version 56.0 and later.</b></p>
<code>jwtValidityPeriodSeconds</code>	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Specify the number of seconds that the token is valid.</p> <p>This field is valid only when <code>NamedCredentialType</code> is set to <code>Legacy</code>.</p> <p><b>First available in API version 46.0, this field is deprecated in API version 56.0 and later.</b></p>
<code>label</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>A user-friendly name for the named credential that appears in the Salesforce user interface, such as in list views.</p>
<code>namedCredentialParameters</code>	<p><b>Field Type</b></p> <p><a href="#">NamedCredentialParameter[]</a></p> <p><b>Description</b></p> <p>Reference to the (one or more) <code>NamedCredentialParameter</code> used to configure a named credential.</p> <p>This field is available in API version 56.0 and later.</p>
<code>namedCredentialType</code>	<p><b>Field Type</b></p> <p><code>NamedCredentialType</code> (enumeration of type string)</p> <p><b>Description</b></p> <p>Specifies the type or behavior of this named credential. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Legacy</code>: The named credential is a legacy type, which means that it doesn't use the schema introduced in the Winter '23 release. Used for backward compatibility.</li> <li>• <code>PrivateEndpoint</code>: The named credential sends traffic through a private connection, bypassing the public internet. If the credential type is <code>PrivateEndpoint</code>, you must specify the value of <code>OutboundNetworkConnection</code>.</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li><code>SecuredEndpoint</code>: The named credential is extensible and uses external credentials to control authentication and permissions.</li> <li><code>Standard</code>: Reserved for internal use.</li> </ul> <p>This field is available in API version 56.0 and later.</p>
<code>oauthRefreshToken</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The OAuth refresh token. Used to obtain a new access token for an end user when a token expires.</p> <p>This field is valid only when <code>NamedCredentialType</code> is set to <code>Legacy</code>.</p> <p><b>This field is deprecated in API version 56.0.</b></p>
<code>oauthScope</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Specifies the scope of permissions to request for the access token. Corresponds to <b>Scope</b> in the user interface.</p> <p>This field is valid only when <code>NamedCredentialType</code> is set to <code>Legacy</code>.</p> <p><b>This field is deprecated in API version 56.0.</b></p>
<code>oauthToken</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The access token that's issued by your authorization server.</p> <p>This field is valid only when <code>NamedCredentialType</code> is set to <code>Legacy</code>.</p> <p><b>This field is deprecated in API version 56.0.</b></p>
<code>outboundNetworkConnection</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Specifies the outbound network connection that uses the named credential to send callouts to AWS.</p> <p>This field is valid only when <code>NamedCredentialType</code> is set to <code>Legacy</code>.</p> <p><b>First available in API version 49.0, this field is deprecated in API version 56.0 and later.</b></p>
<code>password</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>The password to be used by your org to access the external system. Ensure that the credentials have adequate privileges to access the external system. Depending on how you set up access, you might need to provide the administrator password.</p> <p>This field is valid only when NamedCredentialType is set to <code>Legacy</code>.</p> <p><b>This field is deprecated in API version 56.0.</b></p>
principalType	<p><b>Field Type</b></p> <p>ExternalPrincipalType (enumeration of type string)</p> <p><b>Description</b></p> <p>Determines whether you're using one set or multiple sets of credentials to access the external system. Corresponds to <b>Identity Type</b> in the user interface. Values are:</p> <ul style="list-style-type: none"> <li>• Anonymous</li> <li>• NamedUser</li> <li>• PerUser</li> </ul> <p>This field is valid only when NamedCredentialType is set to <code>Legacy</code>.</p> <p><b>This field is deprecated in API version 56.0.</b></p>
protocol	<p><b>Field Type</b></p> <p>AuthenticationProtocol (enumeration of type string)</p> <p><b>Description</b></p> <p>The authentication protocol that's required to access the external system. Valid values are:</p> <ul style="list-style-type: none"> <li>• AwsSv4</li> <li>• Jwt</li> <li>• JwtExchange</li> <li>• NoAuthentication</li> <li>• Oauth</li> <li>• Password</li> </ul> <p>For connections to Amazon Web Services using Signature Version 4, use <code>AwsSv4</code>.</p> <p>For connections using a direct token system, select <code>Jwt</code>. If using an intermediary authorization provider to process JWTs and return access tokens, use <code>JwtExchange</code>.</p> <p>For Simple URL data sources, select <code>NoAuthentication</code>.</p> <p>For cloud-based Files Connect external systems, select <code>Oauth</code>. For on-premises systems, select <code>Password</code>.</p> <p>This field is valid only when NamedCredentialType is set to <code>Legacy</code>.</p> <p><b>This field is deprecated in API version 56.0.</b></p>

Field Name	Description
username	<p><b>Field Type</b> string</p> <p><b>Description</b> The username to be used by your org to access the external system. Ensure that the credentials have adequate privileges for performing callouts to the external system. Depending on how you set up access, you might need to provide the administrator username.</p> <p>This field is valid only when NamedCredentialType is set to <code>Legacy</code>.</p> <p><b>This field is deprecated in API version 56.0.</b></p>

## NamedCredentialParameter

Represents the parameters that configure a named credential. Named credential parameters are used to configure Named Credential callouts through a combination of the type, name, and value/lookup fields. Available in API version 56.0 and later.

These parameters are used internally to provide a flexible architecture and are exposed here for packaging reasons.

Field Name	Description
certificate	<p><b>Field Type</b> string</p> <p><b>Description</b> If the value of the <code>parameterType</code> field is <code>ClientCertificate</code> then this field references the certificate.</p>
description	<p><b>Field Type</b> string</p> <p><b>Description</b> A human-readable description of this named credential parameter.</p>
externalCredential	<p><b>Field Type</b> string</p> <p><b>Description</b> If the value of the <code>parameterType</code> field is <code>Authentication</code>, then this field references an external credential that in turn references a set of authenticated user credentials.</p>
globalNamedPrincipalCredential	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Reserved for internal use.</p>

Field Name	Description
<code>managedFeatureEnabledCallout</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Reserved for internal use.</p>
<code>outboundNetworkConnection</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The lookup field for the <code>OutboundNetworkConnection</code> parameter type. Used when <code>namedCredentialType</code> is <code>PrivateEndpoint</code>.</p>
<code>parameterName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the named credential parameter.</p>
<code>parameterType</code>	<p><b>Field Type</b> <code>NamedCredentialParamType</code> (enumeration of type string)</p> <p><b>Description</b> Required. The type of the named credential parameter. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>AllowedManagedPackageNamespaces</code>: Allows managed packages identified by specified namespaces to use the named credential and make callouts through it.</li> <li>• <code>Authentication</code>: Specifies that this parameter configures authentication using the credentials specified in the external credential, referenced by the <code>externalCredential</code> field.</li> <li>• <code>ClientCertificate</code>: Specifies that this parameter configures a client certificate, referenced by the <code>certificate</code> field.</li> <li>• <code>ConnectionStatus</code>: Reserved for internal use.</li> <li>• <code>CreatedByNamespace</code>: Reserved for internal use.</li> <li>• <code>CustomParameter</code>: Reserved for internal use.</li> <li>• <code>HTTPHeader</code>: Allows the user to specify custom headers to be added to the callout at run time. When using <code>HTTPHeader</code>, the <code>parameterName</code> field must be the header name as a string, and <code>parameterValue</code> must be a formula of a header value that is evaluated at run time.</li> <li>• <code>ManagedByComponent</code>: Reserved for internal use.</li> <li>• <code>ManagedByFeature</code>: Reserved for internal use.</li> <li>• <code>OutboundNetworkConnection</code>: Specifies a lookup to an outbound network connection. When using this parameter type, the</li> </ul>

Field Name	Description
	<p><code>outboundNetworkConnection</code> field is a string representing the lookup. Used when <code>namedCredentialType</code> is <code>PrivateEndpoint</code>.</p> <ul style="list-style-type: none"> <li>• <code>StandardNamedCredentialType</code>: Reserved for internal use.</li> <li>• <code>Url</code>: Specifies that this parameter configures the URL of the endpoint. Store the actual URL in the <code>parameterValue</code> field.</li> </ul>
<code>parameterValue</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> If the <code>parameterType</code> field describes a literal value, such as <code>Url</code>, then the literal value is stored in this field, such as <code>https://iam.amazonaws.com/</code>.</p>
<code>readOnlyNamedCredential</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Reserved for internal use.</p>
<code>sequenceNumber</code>	<p><b>Field Type</b> int</p> <p><b>Description</b> Used to order <code>HTTPHeader</code> parameters.</p>
<code>systemUserNamedCredential</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Reserved for internal use.</p>

## Declarative Metadata Sample Definition

The following is an example of a `NamedCredential` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<NamedCredential xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>SampleNamedCredential</label>
  <namedCredentialType>SecuredEndpoint</namedCredentialType>
  <namedCredentialParameters>
    <description>IAM Endpoint</description>
    <parameterName>DefaultEndpoint</parameterName>
    <parameterType>Url</parameterType>
    <parameterValue>https://iam.amazonaws.com/</parameterValue>
  </namedCredentialParameters>
  <namedCredentialParameters>
    <description>AWS Auth</description>
    <parameterName>DefaultAuth</parameterName>
    <parameterType>Authentication</parameterType>
  </namedCredentialParameters>
</NamedCredential>
```

```

    <externalCredential>SampleExternalCredential</externalCredential>
  </namedCredentialParameters>
  <namedCredentialParameters>
    <description>Cert</description>
    <parameterName>DefaultCert</parameterName>
    <parameterType>ClientCertificate</parameterType>
    <certificate>MyCertificate</certificate>
  </namedCredentialParameters>
  <allowMergeFieldsInBody>true</allowMergeFieldsInBody>
  <allowMergeFieldsInHeader>true</allowMergeFieldsInHeader>
  <generateAuthorizationHeader>true</generateAuthorizationHeader>
</NamedCredential>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>NamedCredential</name>
  </types>
  <version>56.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## NavigationMenu

---

Represents the navigation menu in an Experience Builder site. A navigation menu consists of items that users can click to go to other parts of the site. This type replaces the `NavigationLinkSet` subtype on Network. `NavigationMenu` is available in API version 47.0 and later. This type extends the `Metadata` metadata type and inherits its `fullName` field.

The Help Center and LWR templates (Build Your Own and Microsites) don't include generic record pages. So if you create an object or global action type menu item that links to a Salesforce object, make sure that you also create the corresponding object pages. If you don't create the associated object pages, end users won't see anything if they click on the menu item.

## File Suffix and Directory Location

NavigationMenu components have the suffix `.navigationMenu` and are stored in the `navigationMenus` folder.

## Version

NavigationMenu components are available in API version 47.0 and later.

## Special Access Rules

The `MultipleNavigationMenu` permission is required.

## Fields

Field	Field Type	Description
<code>container</code>	string	The name of the navigation menu container.
<code>containerType</code>	string	The container type. The options are <code>Network</code> or <code>CommunityTemplateDefinition</code> .
<code>label</code>	string	The navigation menu label as it appears in the Experience Builder UI.
<code>navigationMenuItem</code>	<a href="#">NavigationMenuItem[]</a>	A list of menu items in a NavigationMenu. Use this object to create, delete, or update menu items in your site's navigation menu.

## NavigationMenuItem

Represents a single menu item in the `NavigationLinkSet` subtype on `Network` (API version 37.0 to 46.0) or in the `NavigationMenu` type (API version 47.0 and later). Use this object to create, delete, or update menu items in your site's navigation menu.

Field	Field Type	Description
<code>defaultListViewId</code>	string	If the value of the <code>type</code> field is <code>SalesforceObject</code> , the value is the ID of the default list view for the object.
<code>label</code>	string	Required. The text that appears in the navigation menu for this item.
<code>menuItemBranding</code>	<a href="#">NavigationMenuItemBranding</a>	Branding for the navigation menu item. Available in API version 47.0 and later.
<code>position</code>	int	Required. The location of the menu item in the navigation menu.
<code>publiclyAvailable</code>	boolean	When set to <code>true</code> , gives access to guest users.

Field	Field Type	Description
subMenu	<a href="#">NavigationSubMenu</a>	A list of child menu items. This field is available in API 39.0 and later.
target	string	Required if type is <code>ExternalLink</code> , <code>InternalLink</code> , or <code>SalesforceObject</code> . If type is <code>ExternalLink</code> or <code>InternalLink</code> , the target is the URL that the link points to. For <code>ExternalLink</code> , your entry looks like this: <code>https://salesforce.com</code> . For <code>InternalLink</code> , use a relative URL, such as <code>/contactsupport</code> . If type is <code>MenuLabel</code> or <code>NavigationalTopic</code> , target isn't used.
targetPreference	string	Backed by a picklist that includes preferences for the target field. Valid values are: <ul style="list-style-type: none"> <li>• <code>None</code></li> <li>• <code>OpenInExternalTab</code>—Used for external links to determine whether to open in an external tab.</li> </ul>
type	string	Required. The type of navigation menu item. Valid values are: <ul style="list-style-type: none"> <li>• <code>SalesforceObject</code>—Available objects include accounts, cases, contacts, and custom objects.</li> <li>• <code>ExternalLink</code>—Links to a URL outside of your site. For example, <code>https://salesforce.com</code>.</li> <li>• <code>InternalLink</code>—Links to a relative URL inside your site. For example, <code>/contactsupport</code>.</li> <li>• <code>MenuLabel</code>—A parent heading for your navigation menu. See <a href="#">NavigationSubMenu</a> for how to nest items underneath the menu label. This value is available in API 39.0 and later.</li> <li>• <code>NavigationalTopic</code>—A dropdown list with links to the navigational topics in your site.</li> </ul> <p>You can't nest other items of type <code>MenuLabel</code> or</p>

Field	Field Type	Description
		NavigationTopic under MenuLabel.

## NavigationMenuItemBranding

Branding for a menu item.

Field	Field Type	Description
tileImage	string	Name of the ContentAsset to use for the navigation menu item.

## NavigationSubMenu

A list of child menu items. Only NavigationMenuItem items of type MenuLabel can have items in a NavigationSubMenu. Available in API 39.0 and later.

Field	Field Type	Description
navigationMenuItem	<a href="#">NavigationMenuItem</a> []	A list of menu items in a NavigationSubMenu. Use navigationMenuItem to create, delete, or update child items under a parent heading.

## Declarative Metadata Sample Definition

The following is an example of a NavigationMenu component.

```
<?xml version="1.0" encoding="UTF-8"?>
<NavigationMenu xmlns="http://soap.sforce.com/2006/04/metadata">
  <container>Service</container>
  <containerType>Network</containerType>
  <label>Test Navigation</label>
  <navigationMenuItem>
    <label>Accounts</label>
    <position>1</position>
    <publiclyAvailable>false</publiclyAvailable>
    <target>Account</target>
    <type>SalesforceObject</type>
  </navigationMenuItem>
  <navigationMenuItem>
    <label>External Link</label>
    <menuItemBranding>
      <tileImage>google_image</tileImage>
    </menuItemBranding>
  </navigationMenuItem>
</NavigationMenu>
```

```

    <position>2</position>
    <publiclyAvailable>>false</publiclyAvailable>
    <target>http://google.com</target>
    <targetPreference>OpenExternalLinkInSameTab</targetPreference>
    <type>ExternalLink</type>
  </navigationMenuItem>
  <navigationMenuItem>
    <label>All Objects</label>
    <position>3</position>
    <publiclyAvailable>>false</publiclyAvailable>
    <subMenu>
      <navigationMenuItem>
        <label>Leads</label>
        <position>0</position>
        <publiclyAvailable>>false</publiclyAvailable>
        <target>Account</target>
        <type>SalesforceObject</type>
      </navigationMenuItem>
    </subMenu>
    <type>MenuLabel</type>
  </navigationMenuItem>
</NavigationMenu>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>NavigationMenu</name>
  </types>
  <version>47.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Network

---

Represents an Experience Cloud site. Salesforce Experience Cloud lets you create branded spaces for your employees, customers, and partners. You can customize and create experiences, whether they're communities, sites, or portals, to meet your business needs, then transition seamlessly between them. If you want to create zones that contain Chatter Answers and Ideas, use the Community (Zone) component.

This type extends the Metadata metadata type and inherits its `fullName` field.

## Declarative Metadata File Suffix and Directory Location

Network components are stored in the `networks` directory of the corresponding package directory. The file name matches the site name, and the extension is `.network`.

## Version

This object is available in API version 28.0 and later.

## Fields

Field	Field Type	Description
<code>allowedExtensions</code>	string	Specifies the types of files allowed in your site. This list of file types lets you control what your members upload and also prevents spammers from polluting your site with inappropriate files. Available in API version 36.0 and later.
<code>allowInternalUserLogin</code>	boolean	Determines whether internal users can log in with their internal credentials on the site login page. Available in API version 40.0 and later.
<code>allowMembersToFlag</code>	boolean	Determines whether users in the site can flag posts or comments as inappropriate. Flagged items are sent to a moderator for review. Available in API version 29.0 and later.
<code>branding</code>	Branding	The color scheme, header, and footer used in the site. Deprecated in API version 41.0 and later. Replaced by the <code>NetworkBranding</code> type.
<code>caseCommentEmailTemplate</code>	string	Email template used when notifying members when a case comment has been modified or added to a case.  Lightning email templates aren't packageable. We recommend using a Classic email template.
<code>changePasswordTemplate</code>	string	Email template used when notifying a user that their password has been reset.  Lightning email templates aren't packageable. We recommend using a Classic email template.
<code>chgEmailVerNewTemplate</code>	string	Email template used to verify a user's email address change. This email is sent to the new email address.   <b>Note:</b> You can't update this template via metadata API.
<code>chgEmailVerOldTemplate</code>	string	Email template used to verify a user's email address change. This email is sent to the old email address.   <b>Note:</b> You can't update this template via metadata API.
<code>communityRoles</code>	CommunityRoles	Identifies users with Customer, Partner, or Employee roles in a site. Available in API version 41.0 and later.

Field	Field Type	Description
description	string	Description of the site.
deviceActEmailTemplate	string	The ID of the device activation email template. The template is used to customize the device activation email for community users. Available in API version 53.0 and later.
disableReputationRecord Conversations	boolean	When reputation levels are enabled for the site, determines whether to exclude contributions to records when counting points toward reputation levels. Available in API version 41.0 and later.
emailFooterLogo	string	The document name of the logo that appears in the footer of emails. Available in API version 41.0 and later.
emailFooterText	string	The text that appears in the footer of emails. Available in API version 41.0 and later.
emailSenderAddress	string	Required. Email address from which emails are sent.
emailSenderName	string	Required. Name from which emails are sent.
enableApexCDNCaching	boolean	Determines whether public data from @wire calls to Apex methods is cached for guest users. This setting applies only to sites using Salesforce's CDN for Digital Experiences.
enableCustomVFError PageOverrides	boolean	Determines whether to use custom Visualforce error pages instead of the default Visualforce error pages. Available in API version 41.0 and later.
enableDirectMessages	boolean	Determines whether site users can send direct messages to start a private conversation with one or more members. Available in API version 41.0 and later.
enableExperienceBundleBasedSNAOverrideEnabled	boolean	Determines whether the Builder-based SNA page is used ( <b>true</b> ) or not ( <b>false</b> ) and overrides the existing SNA page when an experience is published. Available in API version 52.0 and later.
enableGuestChatter	boolean	Specifies whether guest users can access public Chatter groups in the site without logging in.
enableGuestFileAccess	boolean	Determines whether guest users view asset files shared with the site on publicly accessible pages and login pages. If public access is enabled in Experience Builder at the page or site level, this property is automatically enabled. Available in API version 41.0 and later.
enableGuestMemberVisibility	boolean	Determines if unauthenticated guest users can see the authenticated members ( <b>true</b> ) or not ( <b>false</b> ). Available in API version 47.0 and later.

Field	Field Type	Description
<code>enableImageOptimizationCDN</code>	boolean	Determines whether to optimize cached images for guest users on all devices when a site uses Salesforce's CDN for Digital Experiences. Available in API version 56.0 and later.
<code>enableInvitation</code>	boolean	Determines whether users can invite others to the site.
<code>enableKnowledgeable</code>	boolean	Determines if members can see who's knowledgeable on topics and endorse people for their knowledge on a topic. Available in API version 30.0 and later.
<code>enableMemberVisibility</code>	boolean	Controls user visibility on a per-site basis. If <code>true</code> , the See other members of this site preference is enabled for the selected site. Available in API version 45.0 and later.
<code>enableNicknameDisplay</code>	boolean	Determines if user nicknames display instead of their first and last names in most places in the site. Set to <code>false</code> by default. Available in API version 32.0 and later.
<code>enablePrivateMessages</code>	boolean	Determines if members can send and receive private messages. Available in API version 30.0 and later.
<code>enableReputation</code>	boolean	Determines if reputation is calculated and displayed for members. Available in API version 31.0 and later.  If enabled, <code>reputationLevels</code> and <code>reputationPointsRules</code> are used. If no <code>reputationLevels</code> or <code>reputationPointsRules</code> are defined in the data file, the default values are used.
<code>enableShowAllNetworkSettings</code>	boolean	Shows settings that are hidden by default based on how the site is set up. Available in API version 41.0 and later.
<code>enableSiteAsContainer</code>	boolean	Determines whether the site is an Experience Builder site ( <code>true</code> ) or a Salesforce Tabs + Visualforce site ( <code>false</code> ).
<code>enableTalkingAboutStats</code>	boolean	Determines whether users see how many people are discussing a topic. The number of people discussing the topic appears as the user types the topic and the system gives topic suggestions. Available in API version 41.0 and later.
<code>enableTopicAssignmentRules</code>	boolean	Enables the org to use rules to automatically assign topics to articles in a site. After it's enabled, admins set up rules to map topics to Salesforce Knowledge data categories. This field is available in API version 40.0 and later.
<code>enableTopicSuggestions</code>	boolean	Enables topic suggestions when users write posts. Available in API version 41.0 and later.
<code>enableUpDownVote</code>	boolean	Replaces the option to like a question or answer with the option to upvote or downvote. Available in API version 41.0 and later.

Field	Field Type	Description
<code>expFriendlyUrlsAsDefault</code>	boolean	Determines whether URL slugs are enabled by default on <ul style="list-style-type: none"> <li>Product and Category pages of LWR Commerce stores (available in API version 58.0 and later)</li> <li>Custom object pages on enhanced LWR sites (available in API version 60.0 and later)</li> <li>Account and contact pages on enhanced LWR sites (available in API version 61.0 and later)</li> </ul>
<code>feedChannel</code>	string	Displays the feed of all channel program record or group interactions, including posts, questions, and attachments. This field is available in API version 28.0 and later.
<code>forgotPasswordTemplate</code>	string	Required. The email template used when a user forgets their password.  Lightning email templates aren't packageable. We recommend using a Classic email template.
<code>gatherCustomerSentimentData</code>	boolean	Gathers data when a customer looks at articles and cases in sites, for use in the Community 360 feature. This field is available in API version 40.0 and later.
<code>lockoutTemplate</code>	string	The email template used to communicate with users when they get locked out of their org because of too many failed login attempts. Available in API version 43.0 and later.  Lightning email templates aren't packageable. We recommend using a Classic email template.
<code>logoutUrl</code>	string	Specifies the URL that members are redirected to when they log out from your site. This field is available in API version 28.0 and later.
<code>maxFileSizeKb</code>	int	Specifies the maximum file size (in KBs) that members can upload in your site. Available in API version 36.0 and later. Enter a number between 3072 KB and your org's maximum file size. To use the default limit of 2 GB, leave this field empty.
<code>navigationLinkSet</code>	NavigationLinkSet	Represents the navigation menu in a site. A navigation menu consists of items that users can click to go to other parts of the site. This field is available in API versions 37.0 to 46.0. In API version 47.0 and later, use the NavigationMenu type instead.
<code>networkAuthApiSettings</code>	NetworkAuthApiSettings	The settings that control enablement, access, and security for the Headless Registration Flow, Headless Forgot Password Flow, Headless Passwordless Login Flow, and their associated APIs. Available in API version 60.0 and later.

Field	Field Type	Description
<code>networkMemberGroups</code>	NetworkMemberGroups	<p>The profiles and permission sets that have access to the site. Users with these profiles or permission sets are members of the site.</p> <p> <b>Note:</b> If a Chatter customer (from a customer group) is assigned a permission set that is also associated with a site, the Chatter customer isn't added to the site.</p>
<code>networkPageOverrides</code>	NetworkPageOverride	The settings in the Administration area (in Experience Management or Experience Workspaces) that control which page type Change Password, Forgot Password, Home, and Login each point to. Available in API version 40.0 and later.
<code>newSenderAddress</code>	string	Email address that has been entered as the new value for <code>EmailSenderAddress</code> but hasn't been verified yet. After a user has requested to change the sender email address and has successfully responded to the verification email, the <code>NewSenderAddress</code> value overwrites the value in <code>EmailSenderAddress</code> . This value becomes the email address from which emails are sent.
<code>picassoSite</code>	string	Name of the site of ChatterNetworkPicasso type that's linked to the Experience Cloud site.
<code>recommendationAudience</code>	RecommendationAudience	Creates an audience of new members, or can be used to manage customized lists of audience members to organize and target recommendations. Available in API version 41.0 and later.
<code>recommendationDefinition</code>	RecommendationDefinition	Represents a custom recommendation to drive engagement. Targets a specific audience and uses channels to specify a location for the recommendation. Available in API version 41.0 and later.
<code>reputationLevels</code>	ReputationLevelDefinitions	The reputation levels assigned to members when they accrue points by performing certain actions.
<code>reputationPointsRules</code>	ReputationPointsRules	The points members accrue when they perform certain defined actions.
<code>selfRegMicroBatchSubErrorEmailTemplate</code>	reference	The email template used to communicate with users when their self-registration request, using micro-batching failed. Available in API version 54.0 and later.
<code>selfRegProfile</code>	string	The profile assigned to users who self-register. This value is used only if <code>selfRegistration</code> is enabled for the site. Available in API version 29.0 and later.
<code>selfRegistration</code>	boolean	Determines whether self-registration is available for the site.

Field	Field Type	Description
<code>sendWelcomeEmail</code>	boolean	Determines whether a welcome email is sent when a new user is added to the site.
<code>site</code>	string	Required. The CustomSite associated with the Experience Cloud site.
<code>siteArchiveStatus</code>	SitesArchiveStatus	Specifies whether the site has been archived. Available values are: <ul style="list-style-type: none"> <li>• <code>NotArchived</code>—The site hasn't been archived.</li> <li>• <code>TemporarilyArchived</code>—The site is archived, but can be unarchived in the future.</li> </ul>
<code>status</code>	NetworkStatus[]	Required. Status of the site. Available values are: <ul style="list-style-type: none"> <li>• <code>Live</code>—The site is online and members can access it.</li> <li>• <code>DownForMaintenance</code>—The site was previously published but was taken offline. Members with the Create and Set Up Experiences permission can still access the setup for offline sites regardless of profile or membership. Members aren't able to access offline sites, but they still appear in the user interface dropdown as <code>SiteName (Offline)</code>.</li> <li>• <code>UnderConstruction</code>—The site hasn't yet been published. Users with the Create and Set Up Experiences permission can access sites in this status if their profile is associated with the site.</li> </ul> <p>After a site is published, it can never be in this status again.</p>
<code>tabs</code>	NetworkTabSet	Required. The tabs that are available in the site. The user that created the site selected these tabs.
<code>urlPathPrefix</code>	string	The first part of the path on the site's URL that distinguishes this site from other sites. For example, if your site URL is <code>MyDomainName.my.site.com/partners</code> , then <code>partners</code> is the <code>urlPathPrefix</code> .
<code>verificationTemplate</code>	string	The email template used to communicate with users when they must verify their identity, for example, when they log in without a password or from a new device. Available in API version 44.0 and later.
		Lightning email templates aren't packageable. We recommend using a Classic email template.

Field	Field Type	Description
welcomeTemplate	string	The email template used when sending welcome emails to new members.  Lightning email templates aren't packageable. We recommend using a Classic email template.

## Branding

Represents the branding and color scheme applied to the Experience Cloud site. Available in API version 40.0 and earlier. Replaced by NetworkBranding in API version 41.0 and later.

Field	Field Type	Description
loginFooterText	string	The text that appears in the footer of the login page.
loginLogo	string	The logo that appears on the login page for external users.
pageFooter	string	An image that appears on the footer of the pages. Must be an .html file.
pageHeader	string	An image that appears on the header of the pages. Can be an .html, .gif, .jpg, or .png file.
primaryColor	string	The color used for the active tab.
primaryComplementColor	string	Font color used with <code>primaryColor</code> .
quaternaryColor	string	The background color for pages.
quaternaryComplementColor	string	Font color used with <code>quaternaryColor</code> .
secondaryColor	string	The color used for the top borders of lists and tables.
tertiaryColor	string	The background color for section headers on edit and detail pages.
tertiaryComplementColor	string	Font color used with <code>tertiaryColor</code> .
zeronaryColor	string	The background color for the header.
zeronaryComplementColor	string	Font color used with <code>zeronaryColor</code> .

## CommunityRoles

The labels used to identify users with Customer, Partner, or Employee roles in an Experience Cloud site. Available in API version 41.0 and later.

Field	Field Type	Description
customerUserRole	string	The label for the Customer user role.
employeeUserRole	string	The label for the Employee user role.
partnerUserRole	string	The label for the Partner user role.

## NavigationLinkSet

Represents the navigation menu in an Experience Cloud site. A navigation menu consists of items that users can click to go to other parts of the site. Available in API versions 37.0 to 46.0. In API version 47.0, use [NavigationMenu](#) instead.

Field	Field Type	Description
navigationMenuItem	NavigationMenuItem[]	A list of menu items in a <a href="#">NavigationLinkSet</a> . Use this object to create, delete, or update menu items in your site's navigation menu.

## NavigationMenuItem

Represents a single menu item in the [NavigationLinkSet](#) subtype (API version 37.0 to 46.0) or in the [NavigationMenu](#) type (API version 47.0 and later). Use this subtype to create, delete, or update menu items in your site's navigation menu.

Field	Field Type	Description
defaultListViewId	string	If the value of the <code>type</code> field is <code>SalesforceObject</code> , the value is the ID of the default list view for the object.
label	string	Required. The text that appears in the navigation menu for this item.
menuItemBranding	<a href="#">NavigationMenuItemBranding</a>	Branding for the navigation menu item. Available in API version 47.0 and later.
position	int	Required. The location of the menu item in the navigation menu.
publiclyAvailable	boolean	When set to <code>true</code> , gives access to guest users.
subMenu	<a href="#">NavigationSubMenu</a>	A list of child menu items. This field is available in API 39.0 and later.
target	string	Required if <code>type</code> is <code>ExternalLink</code> , <code>InternalLink</code> , or <code>SalesforceObject</code> . If <code>type</code> is <code>ExternalLink</code> or <code>InternalLink</code> , the <code>target</code> is the URL that the link points to. For <code>ExternalLink</code> , your entry looks like this: <code>https://salesforce.com</code> . For

Field	Field Type	Description
		<p><code>InternalLink</code>, use a relative URL, such as <code>/contactsupport</code>. If type is <code>MenuLabel</code> or <code>NavigationalTopic</code>, target isn't used.</p>
<code>targetPreference</code>	string	<p>Backed by a picklist that includes preferences for the target field. Valid values are:</p> <ul style="list-style-type: none"> <li>• None</li> <li>• <code>OpenInExternalTab</code>—Used for external links to determine whether to open in an external tab.</li> </ul>
<code>type</code>	string	<p>Required. The type of navigation menu item. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>SalesforceObject</code>—Available objects include accounts, cases, contacts, and custom objects.</li> <li>• <code>ExternalLink</code>—Links to a URL outside of your site. For example, <code>https://salesforce.com</code>.</li> <li>• <code>InternalLink</code>—Links to a relative URL inside your site. For example, <code>/contactsupport</code>.</li> <li>• <code>MenuLabel</code>—A parent heading for your navigation menu. See <a href="#">NavigationSubMenu</a> for how to nest items underneath the menu label. This value is available in API 39.0 and later.</li> <li>• <code>NavigationalTopic</code>—A dropdown list with links to the navigational topics in your site.</li> </ul> <p>You can't nest other items of type <code>MenuLabel</code> or <code>NavigationalTopic</code> under <code>MenuLabel</code>.</p>

## NavigationSubMenu

A list of child menu items. Only `NavigationMenuItem` items of type `MenuLabel` can have items in a `NavigationSubMenu`. Available in API 39.0 and later.

Field	Field Type	Description
navigationMenuItem	<a href="#">NavigationMenuItem</a> []	A list of menu items in a NavigationSubMenu. Use <code>navigationMenuItem</code> to create, delete, or update child items under a parent heading.

## NetworkAuthApiSettings

Represents the settings that control enablement, access, and security for the Headless Registration Flow, Headless Forgot Password Flow, Headless Passwordless Login Flow, and their associated APIs. Available in API version 60.0 and later.

Field	Details
doesForgotPasswordRequireAuth	<b>Boolean</b> Determines whether authentication is required to access Headless Forgot Password API when a password reset is requested. If <code>true</code> , an access token issued to an internal integration user in your initial POST request to the <code>/services/auth/headless/forgot_password</code> endpoint is required. The access token must include the <code>forgot_password</code> scope.
doesPwdlessLoginRequireAuth	<b>Boolean</b> Determines whether authentication is required to access Headless Passwordless Login API when user information is submitted to Salesforce. If <code>true</code> , an access token issued to an internal integration user is required in your initial POST request to the <code>/services/auth/headless/init/passwordless/login</code> endpoint. The access token must include the <code>pwdless_login_api</code> scope.
doesPasswordLoginRequireAuth	<b>Boolean</b> Determines whether reCAPTCHA is required for headless username-password login that uses the OAuth 2.0 for First-Party Applications draft protocol.
doesRegistrationRequireAuth	<b>Boolean</b> Determines whether authentication is required to access Headless Registration API when user registration information is submitted to Salesforce. If <code>true</code> , an access token issued to an internal integration user in your initial POST request to the <code>/services/auth/headless/init/registration</code> endpoint is required. The access token must include the <code>user_registration_api</code> scope.
emailTmplsAllowlist	<b>String</b> The email template allowlist for the Headless Registration Flow, Headless Passwordless Login Flow, and Headless Forgot Password Flow. The allowlist defines which email templates can be used for verification emails sent to end users during these flows.
headlessDiscoveryExecutionUser	<b>String</b> An integration user account to run a headless user discovery Apex handler.
headlessDiscoveryHandler	<b>String</b> An Apex class that implements the <code>Auth.HeadlessUserDiscoveryHandler</code> interface.
isFirstPartyAppsAllowed	<b>Boolean</b> Determines whether the Experience Cloud site can use headless identity flows that use the OAuth 2.0 for First-Party Applications draft protocol.
isForgotPwdAllowed	<b>Boolean</b> Determines whether the Headless Forgot Password Flow is enabled.
isForgotPwdEmailTemplateAllowlistingEnabled	<b>Boolean</b> Determines whether email template allowlisting is enabled for the Headless Forgot Password Flow. If <code>true</code> , the <code>emailTemplate</code> parameter in the initial request to Headless Forgot Password API can include only allowlisted email templates.

Field	Details
<code>isHeadlessUserRegistrationAllowed</code>	<b>db</b> Determines whether the Headless Registration Flow is enabled.
<code>IsPwdlessLoginAllowed</code>	<b>db</b> Determines whether the Headless Passwordless Login Flow is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>isRecaptchaRequiredForgotPwd</code>	<b>db</b> Determines whether a reCAPTCHA token is required to access Headless Forgot Password API when a password reset is requested. If <code>true</code> , a reCAPTCHA token is required in your initial POST request to the <code>/services/auth/headless/forgot_password</code> endpoint.
<code>isRecaptchaRequiredPwdlessLogin</code>	<b>db</b> Determines whether a reCAPTCHA token is required to access Headless Passwordless Login API when user information is submitted to Salesforce. If <code>true</code> , a reCAPTCHA token is required in your initial POST request to the <code>/services/auth/headless/init/passwordless/login</code> endpoint.
<code>isRecaptchaRequiredRgstr</code>	<b>db</b> Determines whether a reCAPTCHA token is required to access Headless Registration API when user registration information is submitted to Salesforce. If <code>true</code> , a reCAPTCHA token is required in your initial POST request to the <code>/services/auth/headless/init/registration</code> endpoint.
<code>isUniversalClientRgstrAllowed</code>	<b>db</b> Determines whether self-registration and passwordless login via Universal Registration API are enabled.
<code>maxPasswordResetAttempts</code>	<b>ni</b> The maximum number of password reset attempts you allow for the Headless Forgot Password Flow before the user must request a new one-time password (OTP).
<code>recaptchaScoreThreshold</code>	<b>db</b> The lowest reCAPTCHA score that is accepted before rejecting a request to access Headless Identity APIs. This value must be between 0.5 and 1. Scores closer to 0.5 are more likely to be bots, while scores closer to 1 are more likely to be valid users.  You must set a score threshold if <code>doesForgotPasswordRequireAuth</code> or <code>doesRegistrationRequireAuth</code> fields are set to <code>true</code> . reCAPTCHA settings apply to both the Headless Registration Flow and the Headless Forgot Password Flow.  Google issues a reCAPTCHA score only for reCAPTCHA v3 implementations. If you implement reCAPTCHA v2, this field doesn't apply.
<code>recaptchaSecretKey</code>	<b>ns</b> The reCAPTCHA secret key from your API key pair. You get the API key pair from Google when you set up reCAPTCHA. The secret key helps your app securely communicate with Google. You must enter a secret key if <code>doesForgotPasswordRequireAuth</code> or <code>doesRegistrationRequireAuth</code> are set to <code>true</code> . reCAPTCHA settings apply to all headless identity flows for which reCAPTCHA is enabled.
<code>registrationExecutionUser</code>	<b>ns</b> The user who runs your headless registration Apex handler.
<code>registrationHandler</code>	<b>ns</b> The headless registration Apex handler.
<code>registrationUserDefaultProfile</code>	<b>ns</b> The default profile that gets assigned to new users when they register.

## NetworkEmailTmpAllowlist

Represents the allowlist for one-time password (OTP) email templates sent to end users during the Headless Registration Flow, Headless Passwordless Login Flow, and Headless Forgot Password Flow. Available in API version 60.0 and later.

Field	Field Type	Description
emailTemplate	string	Required. The email templates that can be sent to users during the headless authorization flows for registration, passwordless login, and forgot password. You can list multiple templates. When your app sends its initial request to Headless Registration API or Headless Passwordless Login API, the <code>emailTemplate</code> parameter can include only an email template ID from the allowlist. For Headless Forgot Password API, it works the same way, but only if the <code>isForgotPasswordEmailTemplateAllowlistingEnabled</code> field on the <code>NetworkAuthApiSettings</code> metadata type is <code>true</code> .

## NetworkMemberGroup

Represents the profiles and permission sets that are assigned to the Experience Cloud site. Users with one of the profiles or permission sets are members of the site, unless the user is a Chatter customer (from a customer group).

Field	Field Type	Description
permissionSet	string	A permission set that is assigned to the site.   <b>Note:</b> If a Chatter customer (from a customer group) is assigned a permission set that is also associated with a site, the Chatter customer isn't added to the site.
profile	string	A profile that is part of the site.

## NetworkPageOverride

Represents settings in the Administration area (in Experience Management or Experience Workspaces) that control which page type the Change Password, Forgot Password, Home, and Login pages each point to.

 **Note:** Assigned Visualforce page overrides are specified and deployed via the corresponding CustomSite metadata field.

Field	Field Type	Description
<code>changePasswordPageOverrideSetting</code>	NetworkPageOverrideSetting (enumeration of type string)	<p>Required. Specifies the page type that the Change Password page setting applies to. The valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Configurable</code>—a configurable self-registration page</li> <li>• <code>Designer</code>—an Experience Builder page</li> <li>• <code>Standard</code>—the default page</li> <li>• <code>VisualForce</code>—a Visualforce page</li> </ul>
<code>forgotPasswordPageOverrideSetting</code>	NetworkPageOverrideSetting (enumeration of type string)	<p>Required. Specifies the page type that the Forgot Password page setting applies to. The valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Configurable</code>—a configurable self-registration page</li> <li>• <code>Designer</code>—an Experience Builder page</li> <li>• <code>Standard</code>—the default page</li> <li>• <code>VisualForce</code>—a Visualforce page</li> </ul>
<code>homePageOverrideSetting</code>	NetworkPageOverrideSetting (enumeration of type string)	<p>Required. Specifies the page type that the Experience Home page setting applies to. The valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Configurable</code>—a configurable self-registration page</li> <li>• <code>Designer</code>—an Experience Builder page</li> <li>• <code>Standard</code>—the default page</li> <li>• <code>VisualForce</code>—a Visualforce page</li> </ul>
<code>loginPageOverrideSetting</code>	NetworkPageOverrideSetting (enumeration of type string)	<p>Required. Specifies the page type that the Login page setting applies to. The valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Configurable</code>—a configurable self-registration page</li> <li>• <code>Designer</code>—an Experience Builder page</li> <li>• <code>Standard</code>—the default page</li> <li>• <code>VisualForce</code>—a Visualforce page</li> </ul> <p> <b>Note:</b> To configure an Experience Builder page for your Home and Login pages, make sure you publish your site. Unpublished pages show</p>

Field	Field Type	Description
		up as Default Page from the dropdown menu in Admin settings.
selfRegProfilePageOverrideSetting	NetworkPageOverrideSetting (enumeration of type string)	Required. Specifies the page type that the Self Registration page setting applies to. The valid values are: <ul style="list-style-type: none"> <li>Configurable—a configurable self-registration page</li> <li>Designer—an Experience Builder page</li> <li>Standard—the default page</li> <li>VisualForce—a Visualforce page</li> </ul>

## RecommendationAudience

Creates an audience of new Experience Cloud site members, or can be used to manage customized lists of audience members to organize and target recommendations. Available in API version 41.0 and later.

Field	Field Type	Description
recommendationAudienceDetails	<a href="#">RecommendationAudienceDetail</a>	The specific details of an audience for recommendations.

## RecommendationAudienceDetail

The specific details of an audience for recommendations. Available in API version 41.0 and later.

Field	Field Type	Description
audienceCriteriaType	AudienceCriteriaType (enumeration of type string)	The criteria for the recommendation audience type. Values are: <ul style="list-style-type: none"> <li>CustomList</li> <li>MaxDaysInCommunity</li> </ul>
audienceCriteriaValue	string	For new member criteria, the maximum number of days since a user became a member. Null in case of custom list criteria.
setupName	string	Name of the recommendation audience.

## RecommendationDefinition

Represents a list of custom recommendations to drive engagement for an Experience Cloud site. Available in API version 41.0 and later.

Field	Field Type	Description
recommendationDefinitionDetails	<a href="#">RecommendationDefinitionDetail</a> []	A list of custom recommendations and their details.

## RecommendationDefinitionDetail

The specific details of a custom recommendation. Available in API version 41.0 and later.

Field	Field Type	Description
actionUrl	string	The URL for the button that lets users act on the recommendation.
description	string	An explanation of the recommendation that suggests what users can do.
linkText	string	The text label for the button.
scheduledRecommendations	<a href="#">ScheduledRecommendation</a>	A list of scheduled recommendations.
setupName	string	The name of the recommendation, which appears in Setup.
title	string	The title of the recommendation.

## ReputationBranding

Branding for the reputation level.

Field	Field Type	Description
smallImage	string	Custom image associated with a reputation level. Use files with these extensions: .jpeg, .png, or .gif. Images are stored as documents. If not specified, the default reputation level image is used. Available in API version 32.0 and later.

## ReputationLevelDefinitions

Represents reputation levels members can achieve by performing certain defined actions in an Experience Cloud site.

Field	Field Type	Description
level	<a href="#">ReputationLevel</a> []	Represents reputation levels.

## ReputationLevel

Represents the name and lower value of the reputation level. The application calculates the upper value.

Field	Field Type	Description
branding	<a href="#">ReputationBranding</a> []	Represents any branding associated with the reputation level, specifically, the custom image for the reputation level.  This field is optional. If not specified, the default reputation level image is used. Available in API version 32.0 and later.
label	string	Name of the reputation level.  This field is optional. If not specified, one of the 10 defaults is used. <ul style="list-style-type: none"> <li>• Level 1</li> <li>• Level 2</li> <li>• Level 3</li> <li>• Level 4</li> <li>• Level 5</li> <li>• Level 6</li> <li>• Level 7</li> <li>• Level 8</li> <li>• Level 9</li> <li>• Level 10</li> </ul>
lowerThreshold	double	Required. The lower value in the range for this reputation level. For example, if this reputation level is for points 1–50, 1 is the <code>lowerThreshold</code> .

## ReputationPointsRules

Represents points rules in an Experience Cloud site's point system.

Field	Field Type	Description
pointsRule	<a href="#">ReputationPointsRule</a> []	Represents events and their associated points.

## ReputationPointsRule

Represents the event and associated point value for a points rule. When a user acts, they accrue the associated points.

Field	Field Type	Description
eventType	string	<p>Required. The type of event a member has to perform to get points. The available values are:</p> <ul style="list-style-type: none"> <li>• FeedItemWriteAPost</li> <li>• FeedItemWriteAComment</li> <li>• FeedItemReceiveAComment</li> <li>• FeedItemLikeSomething</li> <li>• FeedItemReceiveALike</li> <li>• FeedItemMentionSomeone</li> <li>• FeedItemSomeoneMentionsYou</li> <li>• FeedItemShareAPost</li> <li>• FeedItemSomeoneSharesYourPost</li> <li>• FeedItemPostAQuestion</li> <li>• FeedItemAnswerAQuestion</li> <li>• FeedItemReceiveAnAnswer</li> <li>• FeedItemMarkAnswerAsBest</li> <li>• FeedItemYourAnswerMarkedBest</li> <li>• FeedItemEndorseSomeoneForKnowledgeOnATopic</li> <li>• FeedItemEndorsedForKnowledgeOnATopic</li> </ul>
points	int	<p>Required. The number of points a member gets for performing the event. The default number of points per event is:</p> <ul style="list-style-type: none"> <li>• FeedItemWriteAPost +1</li> <li>• FeedItemWriteAComment: +1</li> <li>• FeedItemReceiveAComment: +5</li> <li>• FeedItemLikeSomething: +1</li> <li>• FeedItemReceiveALike: +5</li> <li>• FeedItemMentionSomeone: +1</li> <li>• FeedItemSomeoneMentionsYou: +5</li> <li>• FeedItemShareAPost: +1</li> <li>• FeedItemSomeoneSharesYourPost: +5</li> <li>• FeedItemPostAQuestion: +1</li> <li>• FeedItemAnswerAQuestion: +5</li> <li>• FeedItemReceiveAnAnswer: +5</li> <li>• FeedItemMarkAnswerAsBest: +5</li> <li>• FeedItemYourAnswerMarkedBest: +20</li> <li>• FeedItemEndorseSomeoneForKnowledgeOnATopic: +5</li> <li>• FeedItemEndorsedForKnowledgeOnATopic: +20</li> </ul>

## ScheduledRecommendation

Represents a list of scheduled recommendations. Available in API version 41.0 and later.

Field	Field Type	Description
<code>scheduledRecommendationDetails</code>	<a href="#">ScheduledRecommendationDetail</a> []	A list of scheduled recommendations.

## ScheduledRecommendationDetail

The specific details of a scheduled recommendation. Available in API version 41.0 and later.

Field	Field Type	Description
<code>channel</code>	RecommendationChannel (enumeration of type string)	<p>A way to group recommendations together to determine where they show up in the site. The valid values are:</p> <ul style="list-style-type: none"> <li><code>DefaultChannel</code>—The default recommendation channel. Recommendations in the default channel appear in predefined locations, such as directly in the feed in Salesforce mobile web and on the Home and Question Detail pages of the Customer Service (Napili) template.</li> <li><code>CustomChannel1</code>—A custom recommendation channel. Choose where you want recommendations to appear by adding the Recommendations Carousel component to the page in Experience Builder.</li> <li><code>CustomChannel2</code>—A custom recommendation channel.</li> <li><code>CustomChannel3</code>—A custom recommendation channel.</li> <li><code>CustomChannel4</code>—A custom recommendation channel.</li> <li><code>CustomChannel5</code>—A custom recommendation channel.</li> </ul>
<code>enabled</code>	boolean	<p>Indicates whether scheduling is enabled. If <code>true</code>, the recommendation is enabled and appears in sites.</p> <p>If <code>false</code>, recommendations in feeds in Salesforce mobile web aren't removed, but no new recommendations appear. In sites,</p>

Field	Field Type	Description
		disabled recommendations no longer appear.
rank	int	<p>The rank of the recommendation within the channel, which determines the order in which it's displayed.</p> <p>The scheduled recommendation is inserted into the position specified by the rank. The rank of all the scheduled recommendations after it is pushed down. If the specified rank is larger than the size of the list, the scheduled recommendation is put at the end of the list.</p> <p>If a rank isn't specified, the scheduled recommendation is put at the end of the list.</p>
recommendationAudience	string	The name of the audience for this scheduled recommendation.

## NetworkTabSet

Field	Field Type	Description
customTab	string	Custom tab that is part of the site.
defaultTab	string	The Home tab for the site. When members log in, this tab is the first page they see.
standardTab	string	Standard tab that is part of the site.

## Declarative Metadata Sample Definition

A sample XML definition of a network.

```
<?xml version="1.0" encoding="UTF-8"?>

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Community \(Zone\)](#)

## NetworkBranding

---

Represents the branding and color scheme applied to the login pages of an Experience Cloud site. (Experience Cloud sites are represented by the Network component.)

This type extends the [MetadataWithContent](#) type and inherits its `content` and `fullName` fields.

**Note:** For branding properties that apply to Experience Builder sites, see [BrandingSet](#).

## Declarative Metadata File Suffix and Directory Location

NetworkBranding components have the suffix `.networkBranding` and are stored in the `networkBranding` folder.

## Version

This object is available in API version 41.0 and later. It replaces the Branding subtype in the Network component.

## Fields

Field	Field Type	Description
<code>loginBackgroundImageUrl</code>	string	The path to the image URL that appears as the background on the Experience Cloud site's login page. This URL can be fixed, dynamic, or an uploaded image. A dynamic URL contains the experience ID parameter, <code>{expid}</code> , and is resolved dynamically at runtime.

Field	Field Type	Description
loginFooterText	string	The text that appears in the footer of the Experience Cloud site login page.
loginLogo	string	The logo that appears on the Experience Cloud site login page for external users.
loginLogoName	string	The name of the logo that appears on the Experience Cloud site login page for external users.
loginPrimaryColor	string	The background color of the Login button. Available in API version 42.0 and later.
loginQuaternaryColor	string	The background color for the Experience Cloud site's login page.
loginRightFrameUrl	string	The path to the content of the right frame of the Experience Cloud site login page. This URL can be either fixed or dynamic. A dynamic URL contains the experience ID parameter, {expid}. If the URL contains {expid}, the URL is resolved dynamically at runtime depending on the parameter's value.
network	string	The name of the Experience Cloud site associated with the branding.
pageFooter	string	An image that appears on the footer of the Experience Cloud site pages. Must be an .html file.
pageHeader	string	An image that appears on the header of the Experience Cloud site pages. Can be an .html, .gif, .jpg, or .png file.
primaryColor	string	Required. The color used for the active tab.
primaryComplementColor	string	Required. Font color used with primaryColor.
quaternaryColor	string	Required. The background color for pages in the Experience Cloud site.
quaternaryComplementColor	string	Required. Font color used with quaternaryColor.
secondaryColor	string	Required. The color used for the top borders of lists and tables.
staticLogoImageUrl	string	The path to the logo that appears on the Experience Cloud site's login page. This URL can be fixed, dynamic, or an uploaded

Field	Field Type	Description
		image. A dynamic URL contains the experience ID parameter, {expid}. If the URL contains {expid}, the URL is resolved dynamically at runtime depending on the parameter's value.
tertiaryColor	string	Required. The background color for section headers on edit and detail pages.
tertiaryComplementColor	string	Required. Font color used with tertiaryColor.
zeronaryColor	string	Required. The background color for the header.
zeronaryComplementColor	string	Required. Font color used with zeronaryColor.

## Declarative Metadata Sample Definition

A sample XML definition of network branding.

```
<?xml version="1.0" encoding="UTF-8"?>
<NetworkBranding xmlns="http://soap.sforce.com/2006/04/metadata">
  <loginFooterText>salesforce.com</loginFooterText>
  <loginLogo>Communities_Shared_Document_Folder/header2_png.png</loginLogo>
  <loginLogoName>header2.png</loginLogoName>

  <loginBackgroundImageUrl>http://identitycms.herokuapp.com/promo-background.jpg</loginBackgroundImageUrl>

  <loginQuaternaryColor>#B1BAC1</loginQuaternaryColor>
  <loginRightFrameUrl>https://www.example.com/test</loginRightFrameUrl>
  <network>Network 1</network>
  <pageFooter>Branding/footer_html.html</pageFooter>
  <pageHeader>Branding/header_image.jpg</pageHeader>
  <primaryColor>#AF5800</primaryColor>
  <primaryComplementColor>#FFFFFF</primaryComplementColor>
  <quaternaryColor>#286FB8</quaternaryColor>
  <quaternaryComplementColor>#FFFFFF</quaternaryComplementColor>
  <secondaryColor>#000000</secondaryColor>
  <tertiaryColor>#FFFFFF</tertiaryColor>
  <tertiaryComplementColor>#222222</tertiaryComplementColor>
  <zeronaryColor>#0A3764</zeronaryColor>
  <zeronaryComplementColor>#FFFFFF</zeronaryComplementColor>
</NetworkBranding>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## NotificationTypeConfig

---

Represents the metadata associated with org-level notification settings for standard and custom notification types. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

NotificationTypeConfig components have the suffix `.config` and are stored in the `notificationTypeConfig` folder.

### Version

NotificationTypeConfig components are available in API version 48.0 and later.

### Fields

Field Name	Field Type	Description
<code>notificationTypeSettings</code>	<a href="#">NotificationTypeSettings</a> on page 1386[]	An array of delivery settings for an org's notification types.

## NotificationTypeSettings

Represents the delivery settings for a standard or custom notification type.

Field Name	Field Type	Description
<code>notificationType</code>	string	Required. Specifies a notification type's API name.  For standard notification types, this is the predefined API name of the standard notification type. For custom notification types, this is the API name of the custom notification type. If a custom notification type was installed with a managed package, it includes the namespace prefix.  Retrieve NotificationTypeConfig to see the API names of the notification types available in your org.
<code>appSettings</code>	<a href="#">AppSettings</a> on page 1386[]	An array of settings for the connected apps supported for a notification type.
<code>notificationChannels</code>	<a href="#">NotificationChannels</a> on page 1387	Defines the delivery channels for a notification type.

## AppSettings

Represents the settings for the connected apps supported for a notification type.

Field Name	Field Type	Description
connectedAppName	string	Required. Specifies the API name of a connected app. If a connected app was installed with a managed package, it includes the namespace prefix.  Retrieve NotificationTypeConfig to see the API names of the connected apps supported for a notification type.
enabled	boolean	Indicates whether a connected app is enabled ( <code>true</code> ) or not ( <code>false</code> ) for the notification type.

## NotificationChannels

Represents the settings for the delivery channels for a notification type.

Field Name	Field Type	Description
desktopEnabled	boolean	Indicates whether desktop notifications are enabled ( <code>true</code> ) or not ( <code>false</code> ).
mobileEnabled	boolean	Indicates whether mobile notifications are enabled ( <code>true</code> ) or not ( <code>false</code> ).
slackEnabled	boolean	Indicates whether Slack notifications are enabled ( <code>true</code> ) or not ( <code>false</code> ).

## Declarative Metadata Sample Definition

The following is an example of a NotificationTypeConfig component.

```
<NotificationTypeConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <notificationTypeSettings>
    <notificationType>chatter_mention</notificationType>
    <notificationChannels>
      <desktopEnabled>>false</desktopEnabled>
      <mobileEnabled>>true</mobileEnabled>
    </notificationChannels>
    <appSettings>
      <connectedAppName>Datawatch</connectedAppName>
      <enabled>>false</enabled>
    </appSettings>
    <appSettings>
      <connectedAppName>package2__ConnectedApp2</connectedAppName>
      <enabled>>true</enabled>
    </appSettings>
  </notificationTypeSettings>
  <notificationTypeSettings>
    <notificationType>namespace__Custom_Notification</notificationType>
    <notificationChannels>
      <desktopEnabled>>true</desktopEnabled>
      <mobileEnabled>>true</mobileEnabled>
    </notificationChannels>
    <appSettings>
      <connectedAppName>namespace__Connected_App</connectedAppName>
      <enabled>>false</enabled>
    </appSettings>
  </notificationTypeSettings>
</NotificationTypeConfig>
```

```

    </appSettings>
  <appSettings>
    <connectedAppName>namespace2__ConnectedApp2</connectedAppName>
    <enabled>true</enabled>
  </appSettings>
</notificationTypeSettings>
</NotificationTypeConfig>

```

The following is an example of a package manifest used to retrieve all the available notification settings for an organization, using a wildcard:

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>NotificationTypeConfig</name>
  </types>
  <version>48.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OauthCustomScope

---

Represents a permission defining the protected data that a connected app can access from an external entity when Salesforce is the OAuth authorization provider. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

OauthCustomScope components have the suffix `.oauthcustomscope` and are stored in the `oauthcustomscopes` directory.

## Version

OAuth custom scopes are available in API version 46.0 and later.

## Special Access Rules

You must have the “Manage Connected Apps” permission to access this object.

## Fields

Field Name	Field Type	Description
assignedTo	OAuthCustomScopeApp (enumeration of type string)	Represents the name of the connected app to which the custom scope is assigned. Available in API version 49.0 and later.  If the connected app is part of a package, include the package's namespace prefix with the connected app's name. Use the following format: <b>&lt;namespace_prefix&gt;__&lt;connected_app&gt;</b> . Use two underscores (__) between the namespace prefix and connected app's name.
description	string	Required. The description of the permission provided to the connected app by the scope. The custom scope's description must be unique, can only include alphanumeric characters, and can be up to 60 characters long.  You can enter a custom label in place of a description. An advantage of using a custom label is that you can maintain reusable text in a single location and translate the text into multiple languages. See <a href="#">Custom Labels</a> .   <b>Note:</b> The description formatting requirements that apply to custom scopes also apply to custom labels.
developerName	string	Required. Use when referring to the OAuth custom scope from a program.
isProtected	boolean	Required. Indicates whether this component is protected () or not (false). Protected components cannot be linked to or referenced by components created in the installing org.
isPublic	boolean	Indicates whether the object is included in the connected app's OpenID Connect discovery endpoint. The default setting is false. For more information, see <a href="#">OpenID Connect Discovery Endpoint</a> .
masterLabel	string	Required. The primary label for the custom scope record. This label must be unique and begin with a letter. It can include only alphanumeric characters and underscores. It can't contain spaces.

## Declarative Metadata Sample Definition

The following is an example of an OAuthCustomScope component. In this example, `basicScope` is the name of custom scope entity being retrieved.

```
<?xml version="1.0" encoding="UTF-8"?>
<OAuthCustomScope xmlns="http://soap.sforce.com/2006/04/metadata">
  <assignedTo>
    <connectedApp>MyOrgNamespace__TestApp</connectedApp>
  </assignedTo>
  <description>Example of a basic custom scope</description>
```

```

    <developerName>basicScope</developerName>
    <masterLabel>basicScope</masterLabel>
    <isProtected>false</isProtected>
    <isPublic>true</isPublic>
  </OauthCustomScope>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>basicScope</members>
    <name>OauthCustomScope</name>
  </types>
  <version>49.0</version>
</Package>

```

## Usage

An OAuth custom scope tells an external entity about a connected app's permissions to access protected data. The OAuth custom scope you create in your Salesforce org corresponds to the same custom scope defined in your external entity and assigned to the resource.

For example, you define an Order Status custom scope in your external entity that allows access to customer order status data in your order system's API. In Salesforce, you create an OAuth custom scope that you also name Order Status. You assign this custom scope to the connected app requesting access to the order status API. When the external entity receives the connected app's request to access a customer's order status, it validates the connected app's access token and Order Status scope. With a successful validation, the app can access the customer order status information in the order system's API.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OauthTokenExchangeHandler

---

Represents a token exchange handler. The token exchange handler also consists of an Apex class. During the OAuth 2.0 token exchange flow, the token exchange handler is used to validate tokens from an external identity provider and to map users to Salesforce.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

OauthTokenExchangeHandler components have the suffix `.oauthTokenExchangeHandler` and are stored in the `oauthTokenExchangeHandlers` folder.

## Version

OauthTokenExchangeHandler components are available in API version 60.0 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
description	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A description for your token exchange handler.</p>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The API name for the handler.</p>
enablements	<p><b>Field Type</b> <a href="#">OauthTokenExchHandlerApp[]</a></p> <p><b>Description</b> The enablement settings for the token exchange handler, including the execution user who runs the Apex class, the connected apps or external client apps for which it's enabled, and whether or not it's the default handler.</p>
isAccessTokenSupported	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Indicates whether the handler supports OAuth 2.0 access tokens from the identity provider, including opaque access tokens and JSON Web Token (JWT)-based access tokens.</p>
isEnabled	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Indicates whether the handler is enabled. To complete enablement, add an <code>enablements</code> field that specifies the enablement settings.</p>
isIdTokenSupported	<p><b>Field Type</b> boolean</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. Indicates whether the handler supports OpenID Connect ID tokens from the identity provider.</p>
isJwtSupported	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Required. Indicates whether the handler supports tokens from the identity provider that are in JWT format, such as JWT-based access tokens.</p>
isProtected	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the handler can be linked to or referenced by components created in a subscriber org. See <a href="#">Protected Components in Managed Packages</a>.</p>
isRefreshTokenSupported	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Required. Indicates whether the handler supports OAuth 2.0 refresh tokens from the identity provider.</p>
isSaml2Supported	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Required. Indicates whether the handler supports SAML 2.0 assertions from the identity provider.</p>
isUserCreationAllowed	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Required. Indicates whether the handler can set up new users. During the token exchange flow, the Apex handler maps users from the identity provider to Salesforce. If the <code>isUserCreationAllowed</code> field is <code>true</code>, the <code>canCreateUser</code> boolean in the <code>getUserForTokenSubject</code> method is <code>true</code>, and the user doesn't exist in Salesforce, the handler sets up a new User object, which Salesforce automatically inserts to finish creating the user.</p>
masterLabel	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The label of the token exchange handler record.</p>

Field Name	Description
<code>tokenHandlerApex</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The Apex class associated with the token exchange handler. The class contains methods to validate the token and map users to Salesforce. It must extend the <code>Oauth2TokenExchangeHandler</code> Apex class.</p>

## OauthTokenExchHandlerApp

Represents the settings for a specific Salesforce connected app or external client app that's enabled for the token exchange handler. A handler can be enabled for multiple apps.

Field Name	Description
<code>apexExecutionUser</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user who runs the Apex token exchange handler. We recommend that you use an integration user.</p>
<code>connectedApp</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The API name of the connected app that's being used to integrate with Salesforce.</p>
<code>externalClientApp</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The API name of the external client app that's being used to integrate with Salesforce.</p>
<code>isDefault</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Indicates whether the token exchange handler is the default handler for this app. During the token exchange flow, in the token request, you can optionally include a <code>token_handler</code> parameter with the name of a specific handler's Apex class. If you don't include this parameter, Salesforce defaults to the default handler.</p>

## Declarative Metadata Sample Definition

The following is an example of an OAuthTokenExchangeHandler component.

```
<?xml version="1.0" encoding="UTF-8"?>
<OAuthTokenExchangeHandler xmlns="http://soap.sforce.com/2006/04/metadata">
  <developerName>MyTokenExchangeHandler</developerName>
  <description>My token exchange handler</description>
  <isAccessTokenSupported>true</isAccessTokenSupported>
  <isEnabled>true</isEnabled>
  <isIdTokenSupported>false</isIdTokenSupported>
  <isJwtSupported>true</isJwtSupported>
  <isProtected>false</isProtected>
  <isRefreshTokenSupported>false</isRefreshTokenSupported>
  <isSaml2Supported>false</isSaml2Supported>
  <isUserCreationAllowed>true</isUserCreationAllowed>
  <masterLabel>MyTokenExchangeHandler</masterLabel>
  <tokenHandlerApex>MyOAuthTokenExchangeHandler</tokenHandlerApex>
  <enablements>
    <apexExecutionUser>integrationuser@mycompany.com</apexExecutionUser>
    <connectedApp>TokenExchangeApp1</connectedApp>
    <isDefault>true</isDefault>
  </enablements>
</OAuthTokenExchangeHandler>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>OAuthTokenExchangeHandler</name>
  </types>
  <version>60.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OcrSampleDocument

Represents the details of a sample document or a document type that's used as a reference while extracting and mapping information from a customer form. This type extends the Metadata metadata type and inherits its `fullName` field.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

The OcrSampleDocument type doesn't need to represent a real sample document. It can also be an abstract document that represents all documents of the same DocumentType. In such cases, the `contentAsset` and `documentHeight` fields are null.

## File Suffix and Directory Location

OcrSampleDocument components have the suffix `.ocrSampleDocument` and are stored in the `ocrSampleDocuments` folder.

## Version

OcrTemplate components are available in API version 52.0 and later.

## Special Access Rules

To use this metadata type, your Salesforce org must have the AWSTextract1000LimitAddOn license.

## Fields

Field Name	Field Type	Description
<code>applicationType</code>	OcrApplicationType (enumeration of type string)	The type of application using the OCR sample document. Possible values are: <ul style="list-style-type: none"> <li>• <code>EinsteinDocumentReader</code></li> <li>• <code>Industries</code></li> </ul>
<code>contentAsset</code>	string	The ID of the OCR sample document asset. This field is null if the OcrSampleDocument is an abstract document representing the DocumentType.
<code>documentHeight</code>	double	The normalized height of the OCR sample document page. This field is null if the OcrSampleDocument is an abstract document representing the DocumentType.
<code>documentType</code>	string	Required. The type of the OCR sample document.
<code>masterLabel</code>	string	Required. The label for the OCR sample document.
<code>ocrSampleDocumentFields</code>	<a href="#">OcrSampleDocumentField</a>	The details of the field in a form whose value is extracted and mapped to a Salesforce object field.
<code>ocrSampleDocumentPages</code>	<a href="#">OcrSampleDocumentPage</a>	A collection of fields that define a page in the OCR sample document.

## OcrSampleDocumentField

Represents the details of the field in a form whose value is extracted and mapped to a Salesforce object field.

Table 3: Fields

Field Name	Field Type	Description
<code>cellColumnNumber</code>	int	The column number in the item with the cell storing this field's value. Available in API version 56.0 and later.
<code>cellColumnSpanValue</code>	int	The number of columns that span the cell storing this field's value. Available in API version 56.0 and later.
<code>cellRowNumber</code>	int	The row number in the item with the cell storing this field's value. Available in API version 56.0 and later.
<code>cellRowSpanValue</code>	int	The number of rows that span the cell storing this field's value. Available in API version 56.0 and later.
<code>fieldLabelMaxX</code>	double	A normalized coordinate representing the right edge of the bounding box of the key.
<code>fieldLabelMaxY</code>	double	A normalized coordinate representing the bottom edge of the bounding box of the key.
<code>fieldLabelMinX</code>	double	A normalized coordinate representing the left edge of the bounding box of the key.
<code>fieldLabelMinY</code>	double	A normalized coordinate representing the top edge of the bounding box of the key.
<code>fieldValueName</code>	string	Name of the referred field value. Available in API version 56.0 and later.
<code>isAutoExtractedValue</code>	boolean	Indicates whether the key is automatically extracted ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 57.0 and later.  This field helps to distinguish auto-extracted keys from manual ones.
<code>keyContent</code>	string	The content in a particular area of the form, representing the field that is extracted by OCR.
<code>ocrSampleDocument</code>	string	Required. The associated OCR sample document used as a reference while extracting and mapping information from a customer form.
<code>ocrSampleDocumentPage</code>	string	A reference to a page of the OCR sample document that contains the key.  This field is null if the <code>OcrSampleDocument</code> is an abstract document representing the <code>DocumentType</code> .
<code>ocrSampleDocumentPageItem</code>	<a href="#">OcrTemplate</a>	A reference to the item on the sample document page containing this field's value. Available in API version 56.0 and later.

## OcrSampleDocumentPage

Represents a collection of fields that define a page in the OCR sample document. This type exists only if the `OcrSampleDocument` is a real sample document and not an abstract document representing the `DocumentType`.

Table 4: Fields

Field Name	Field Type	Description
ocrSampleDocument	string	Required. The associated OCR sample document used as a reference while extracting and mapping information from a customer form.
ocrSampleDocument PageItems	<a href="#">OcrSampleDocument</a>	The collection of page items with the associated OCR sample document page. Available in API version 56.0 and later.
pageHeight	double	The normalized height of the OCR sample document page.
pageNumber	integer	Required. The page number of the page in the associated OCR sample document.

## OcrSampleDocumentPageItem

Represents a foreign key reference to the item on the sample document page containing a value for the page item.

Table 5: Fields

Field Name	Field Type	Description
hasHeader	boolean	Indicates whether the OCR sample document page item has a header ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . Available in API version 56.0 and later.
sequenceNumber	int	Required. The sequence number of the item on an OCR sample document page with multiple items. Available in API version 56.0 and later.
title	string	The title of the OCR sample document page item. Available in API version 56.0 and later.
type	ItemType (enumeration of type string)	Required. Specifies the type of OCR sample document page item. Available in API version 56.0 and later. Valid value is <code>TABLE</code> .

## Declarative Metadata Sample Definition

The following is an example of a `OcrSampleDocument` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<OcrSampleDocument xmlns="http://soap.sforce.com/2006/04/metadata">
  <contentAsset>asset_01jpeg</contentAsset>
  <documentHeight>1.24</documentHeight>
  <documentType>Form</documentType>
  <masterLabel>Form</masterLabel>
  <ocrSampleDocumentFields>
    ...<cellColumnNumber>1</cellColumnNumber>
      <cellColumnSpanValue>1</cellColumnSpanValue>
      <cellRowNumber>1</cellRowNumber>
      <cellRowSpanValue>1</cellRowSpanValue>
```

```

    <fieldLabelMaxX>0.5975854</fieldLabelMaxX>
    <fieldLabelMaxY>0.46625894</fieldLabelMaxY>
    <fieldLabelMinX>0.5065626</fieldLabelMinX>
    <fieldLabelMinY>0.39605626</fieldLabelMinY>
    <keyContent>Last Name</keyContent>
    <ocrSampleDocument>image240</ocrSampleDocument>
    <ocrSampleDocumentPage>1</ocrSampleDocumentPage>
    <ocrSampleDocumentPageItem>
      <hasHeader>>false</hasHeader>
      <sequenceNumber>1</sequenceNumber>
      <title>Table1</title>
      <type>TABLE</type>
    </ocrSampleDocumentPageItem>
  </ocrSampleDocumentFields>
  <ocrSampleDocumentPages>
    <ocrSampleDocument>Form</ocrSampleDocument>
    <pageHeight>1.0</pageHeight>
    <pageNumber>1</pageNumber>
  </ocrSampleDocumentPages>
  <ocrSampleDocumentPages>
    <ocrSampleDocument>Form</ocrSampleDocument>
    <pageNumber>2</pageNumber>
  </ocrSampleDocumentPages>
</OcrSampleDocument>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>DocumentType</name>
  </types>
  <types>
    <members>*</members>
    <name>ContentAsset</name>
  </types>
  <types>
    <members>*</members>
    <name>OcrSampleDocument</name>
  </types>
  <version>62.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OcrTemplate

---

Represents the details of the mapping between a form and a Salesforce object using Intelligent Form Reader. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### File Suffix and Directory Location

OcrTemplate components have the suffix `.ocrTemplate` and are stored in the `ocrTemplates` folder.

### Version

OcrTemplate components are available in API version 52.0 and later.

### Special Access Rules

To use this metadata type, your Salesforce org must have the `AWSTextract1000LimitAddOn` license.

### Fields

Field Name	Field Type	Description
<code>active</code>	boolean	Indicates whether the OCR template is active ( <code>true</code> ) or not ( <code>false</code> ).
<code>description</code>	string	The description of the OCR template.
<code>documentType</code>	string	Required. The document type for which this template defines mappings.
<code>masterLabel</code>	string	Required. The label for the OCR template.
<code>ocrTargetObjects</code>	<a href="#">OcrTargetObject[]</a>	Represents the details of the object to which information from a form is extracted and mapped.
<code>ocrTemplateSampleDocuments</code>	<a href="#">OcrTemplateSampleDocument[]</a>	Represents the details of a sample document or a document type that's used as a reference while extracting and mapping information from a customer form.
<code>pageCount</code>	integer	The number of pages in the form from which information is extracted.
<code>templateName</code>	string	Required. The name of the OCR template.

### OcrTargetObject

Represents the details of the object to which information from a form is extracted and mapped.

**Table 6: Fields**

Field Name	Field Type	Description
<code>ocrTargetObjectFieldMappings</code>	<a href="#">OcrTargetObjFieldMapping[]</a>	Represents the details of how information from a form field is mapped to fields in an object.
<code>targetObject</code>	string	Required. The object to which information from a form is mapped.
<code>targetObjectRecordType</code>	string	The developer name of the record type of the target object. Available in API version 56.0 and later.

## OcrTargetObjFieldMapping

Represents the details of how information from a form field is mapped to fields in an object.

**Table 7: Fields**

Field Name	Field Type	Description
<code>ocrSampleDocField</code>	<a href="#">OcrSampleDocumentField[]</a>	The details of the field in a form whose value is extracted and mapped to a Salesforce object field.
<code>targetField</code>	string	Required. The field to which information is mapped.
<code>type</code>	OcrMappingType (enumeration of type string)	Required. Specifies the type of mapping. Available in API version 56.0 and later. Valid values are: <ul style="list-style-type: none"> <li>• <code>FormField</code></li> <li>• <code>TableColumn</code></li> </ul> The default value is <code>FormField</code> .

## OcrSampleDocumentField

Represents the details of the field in a form whose value is extracted and mapped to a Salesforce object field.

**Table 8: Fields**

Field Name	Field Type	Description
<code>cellColumnNumber</code>	int	The column number in the item with the cell storing this field's value. Available in API version 56.0 and later.
<code>cellColumnSpanValue</code>	int	The number of columns that span the cell storing this field's value. Available in API version 56.0 and later.
<code>cellRowNumber</code>	int	The row number in the item with the cell storing this field's value. Available in API version 56.0 and later.
<code>cellRowSpanValue</code>	int	The number of rows that span the cell storing this field's value. Available in API version 56.0 and later.
<code>fieldLabelMaxX</code>	double	A normalized coordinate representing the right edge of the bounding box of the key.

Field Name	Field Type	Description
fieldLabelMaxY	double	A normalized coordinate representing the bottom edge of the bounding box of the key.
fieldLabelMinX	double	A normalized coordinate representing the left edge of the bounding box of the key.
fieldLabelMinY	double	A normalized coordinate representing the top edge of the bounding box of the key.
fieldValueName	string	The name of the referred field value. Available in API version 56.0 and later.
isAutoExtractedValue	boolean	Indicates whether the key is automatically extracted ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 57.0 and later.  This field helps to distinguish auto-extracted keys from manual ones.
keyContent	string	The content in a particular area of the form, representing the field that is extracted by OCR.
ocrSampleDocument	string	Required. The associated OCR sample document is used as a reference while extracting and mapping information from a customer form.
ocrSampleDocumentPage	string	A collection of fields that define a page in the OCR sample document.
ocrSampleDocumentPageItem	<a href="#">OcrSampleDocumentPageItem</a>	A reference to the item on the sample document page containing this field's value. Available in API version 56.0 and later.

## OcrSampleDocumentPageItem

Represents a foreign key reference to the item on the sample document page containing a value for the page item.

**Table 9: Fields**

Field Name	Field Type	Description
hasHeader	boolean	Indicates whether the OCR sample document page item has a header ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . Available in API version 56.0 and later.
sequenceNumber	int	Required. The sequence number of the item on an OCR sample document page with multiple items. Available in API version 56.0 and later.
title	string	The title of the OCR sample document page item. Available in API version 56.0 and later.
type	ItemType (enumeration of type string)	Required. Specifies the type of OCR sample document page item. Valid value is <code>TABLE</code> . Available in API version 56.0 and later.

## OcrTemplateSampleDocument

Represents the details of a sample document or a document type that's used as a reference while extracting and mapping information from a customer form.

**Table 10: Fields**

Field Name	Field Type	Description
ocrSampleDocument	string	The associated OCR sample document is used as a reference while extracting and mapping information from a customer form.

## Declarative Metadata Sample Definition

The following is an example of a OcrTemplate component.

```
<?xml version="1.0" encoding="UTF-8"?>
<OcrTemplate xmlns="http://soap.sforce.com/2006/04/metadata">
  <active>false</active>
  <documentType>Form</documentType>
  <masterLabel>Form Test 222</masterLabel>
  <ocrTargetObjects>
    <ocrTargetObjFieldMappings>
      <ocrSampleDocField>
        <cellColumnNumber>1</cellColumnNumber>
        <cellColumnSpanValue>1</cellColumnSpanValue>
        <cellRowNumber>1</cellRowNumber>
        <cellRowSpanValue>1</cellRowSpanValue>
        <fieldLabelMaxX>0.5975854</fieldLabelMaxX>
        <fieldLabelMaxY>0.46625894</fieldLabelMaxY>
        <fieldLabelMinX>0.5065626</fieldLabelMinX>
        <fieldLabelMinY>0.39605626</fieldLabelMinY>
        <keyContent>Last Name</keyContent>
        <ocrSampleDocument>image240</ocrSampleDocument>
        <ocrSampleDocumentPage>1</ocrSampleDocumentPage>
        <ocrSampleDocumentPageItem>
          <hasHeader>false</hasHeader>
          <sequenceNumber>1</sequenceNumber>
          <title>Table1</title>
          <type>TABLE</type>
        </ocrSampleDocumentPageItem>
      </ocrSampleDocField>
      <targetField>Account.Name</targetField>
      <type>TableColumn</type>
    </ocrTargetObjFieldMappings>
    <targetObject>Account</targetObject>
    <targetObjectRecordType>Account.X240</targetObjectRecordType>
  </ocrTargetObjects>
  <ocrTemplateSampleDocuments>
    <ocrSampleDocument>Form</ocrSampleDocument>
  </ocrTemplateSampleDocuments>
  <pageCount>10</pageCount>
</OcrTemplate>
```

```
<templateName>Form Test</templateName>
</OcrTemplate>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>OcrTemplate</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OmniExtTrackingDef

---

Represents a connection between an `OmniTrackingGroup` in `OmniAnalytics` and a third-party Analytics system such as `Google Analytics`.

**Note:** This metadata type is part of `OmniStudio Standard`, not `OmniStudio for Vlocity`.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the `Metadata` metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`OmniExtTrackingDef` components have the suffix `.OmniExtTrackingDef` and are stored in the `OmniExtTrackingDefs` folder.

## Version

`OmniExtTrackingDef` components are available in API version 60.0 and later.

## Special Access Rules

Using `OmniAnalytics` requires having an `OmniStudio` license and enabling `OmniAnalytics` in `Setup`.

## Fields

Field Name	Description
description	<p><b>Field Type</b> string</p> <p><b>Description</b> A description of the OmniExtTrackingDef.</p>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>The unique name of the OmniExtTrackingDef in the API. This name can contain only underscores and alphanumeric characters and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Limit: 80 characters.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> <p> <b>Note:</b> Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
isActive	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required.</p> <p>Specifies whether the OmniExtTrackingDef is active.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>The unique master label of the OmniExtTrackingDef. This internal label doesn't get translated.</p>
omniExtTrackingDefKey	<p><b>Field Type</b> string</p> <p><b>Description</b> A UUID generated internally by Salesforce to uniquely identify an OmniExtTrackingDef record across all orgs.</p>

Field Name	Description
omniExtTrackingEventDefs	<p><b>Field Type</b> OmniExtTrackingEventDef[]</p> <p><b>Description</b> The OmniExtTrackingEventDef objects related to this OmniExtTrackingDef.</p>
trackingFrameworkInformation	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. JSON data containing information about an external service, such as the API call and input parameter names.</p>
trackingServiceProvider	<p><b>Field Type</b> ExternalTrackingVendor (enumeration of type string)</p> <p><b>Description</b> Required. The third-party Analytics system to which user interaction data is sent. Values are:</p> <ul style="list-style-type: none"> <li>• Google</li> <li>• Mixpanel</li> </ul>

## OmniExtTrackingEventDef

Represents a format for FlexCard or OmniScript user interaction data that a third-party Analytics system such as Google Analytics can accept.

Field Name	Description
componentType	<p><b>Field Type</b> OmniAnalyticsComponentType (enumeration of type string)</p> <p><b>Description</b> Required. The type of component for which user interactions are tracked. Values are:</p> <ul style="list-style-type: none"> <li>• Flexcard</li> <li>• Omniscript</li> </ul>
description	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>A description of the OmniExtTrackingEventDef.</p>
developerName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The unique name of the OmniExtTrackingEventDef in the API. This name can contain only underscores and alphanumeric characters and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Limit: 80 characters.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> <p> <b>Note:</b> Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
inclusionRule	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>A true-or-false condition that determines whether an event is sent to the third-party Analytics system.</p>
masterLabel	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The unique master label of the OmniExtTrackingEventDef. This internal label doesn't get translated.</p>
omniExtTrackingDef	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The ID of the related OmniExtTrackingDef object.</p>
omniExtTrackingEventDefKey	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>A UUID generated internally by Salesforce to uniquely identify an OmniExtTrackingEventDef record across all orgs.</p>

Field Name	Description
payloadTemplate	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>The payload template structure with placeholders for runtime data. This is used at runtime to generate the actual payload to be sent to the external Analytics service.</p>

## Declarative Metadata Sample Definition

The following is an example of an OmniExtTrackingDef component.

```
<?xml version="1.0" encoding="UTF-8"?>
<OmniExtTrackingDef xmlns="http://soap.sforce.com/2006/04/metadata">
  <developerName>Purchase_Tracking_Google</developerName>
  <isActive>true</isActive>
  <masterLabel>Purchase_Tracking_Google</masterLabel>
  <trackingFrameworkInformation>{ "id": "GTM-XXXXXXX" }</trackingFrameworkInformation>
  <trackingServiceProvider>Google</trackingServiceProvider>
  <omniExtTrackingEventDefs>
    <componentType>Omniscript</componentType>
    <developerName>Purchase_Funnel_Google</developerName>
    <inclusionRule></inclusionRule>
    <masterLabel>Purchase_Funnel_Google</masterLabel>
    <payloadTemplate>
{
  "event": "promotionClick",
  "ecommerce": {
    "promoClick": {
      "promotions": [
        {
          "name": "%BusinessEvent%"
        }
      ]
    }
  }
}
    </payloadTemplate>
  </omniExtTrackingEventDefs>
</OmniExtTrackingDef>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>OmniExtTrackingDef</name>
  </types>
```

```
<version>60.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OmniScript

Represents an OmniScript for the Discovery Framework, which guides users through sales, service, and other business processes.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

OmniScript components have the suffix `omniScript` and are stored in the `omniScripts` folder.

## Version

OmniScript components are available in API version 56.0 and later.

## Special Access Rules

To use this metadata type, you must have an OmniStudio license and the Discovery Framework feature enabled in your Salesforce org.

## Fields

Field Name	Description
<code>customHtmlTemplates</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The angular OmniScript template definitions.</p>
<code>customJavaScript</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The custom JavaScript used for an OmniScript.</p>
<code>designerCustomizationType</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>The OmniStudio designer customization type.</p> <p> <b>Note:</b> For Discovery Framework, the customization type is <i>discoveryframework</i>.</p>
elementTypeComponentMapping	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Map of custom element overrides.</p>
isActive	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the OmniScript is active (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
isIntegrationProcedure	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether OmniScript is an Integration Procedure (<code>true</code>) or OmniScript metadata (<code>false</code>). The default value is <code>false</code>.</p>
isMetadataCacheDisabled	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether metadata cache for the integration procedure is disabled (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
isOmniScriptEmbeddable	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the OmniScript can be embedded in other OmniScripts (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
isTestProcedure	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether OmniScript is a test procedure setting (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
isWebCompEnabled	<p><b>Field Type</b></p> <p>boolean</p>

Field Name	Description
	<p><b>Description</b></p> <p>Indicates whether web component OmniScript (not Angular) is enabled (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
language	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The language of the OmniScript.</p>
lastPreviewPage	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The last page previewed in the OmniScript designer.</p>
name	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The name of the OmniScript.</p>
namespace	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The namespace associated with this OmniScript record.</p>
omniProcessElements	<p><b>Field Type</b></p> <p><a href="#">OmniProcessElement[]</a></p> <p><b>Description</b></p> <p>The OmniProcessElements associated with the OmniScript.</p>
omniProcessKey	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The integration procedure <code>Type_SubType</code> value.</p>
omniProcessType	<p><b>Field Type</b></p> <p>OmniProcessType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. Integration Procedure or OmniScript.</p> <p>Possible value is:</p>

Field Name	Description
	<ul style="list-style-type: none"> <li>OmniScript</li> </ul>
overrideKey	<p><b>Field Type</b> string</p> <p><b>Description</b> Reserved for future use.</p>
propertySetConfig	<p><b>Field Type</b> string</p> <p><b>Description</b> The configuration information associated with the OmniScript.</p>
questionDevName	<p><b>Field Type</b> string</p> <p><b>Description</b> The developer name of the assessment question in the OmniScript.</p> <p> <b>Note:</b> This field is relevant only for OmniScripts with <code>designerCustomizationType</code> as <code>discoveryframework</code>.</p>
requiredPermission	<p><b>Field Type</b> string</p> <p><b>Description</b> The required permissions to execute the integration procedure.</p>
responseCacheType	<p><b>Field Type</b> string</p> <p><b>Description</b> Response cache used for the integration procedure (session or Org).</p>
subType	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The OmniScript sub type value.</p>
type	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The OmniScript type value.</p>

Field Name	Description
uniqueName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The unique name for the OmniScript as Type_SubType_Language_VersionNumber.</p>
versionNumber	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The OmniScript version number.</p>
webComponentKey	<p><b>Field Type</b> string</p> <p><b>Description</b> Internal unique key for the generated Lightning Web Components (LWC).</p>

## OmniProcessElement

Represents the OmniScript element associated with the OmniScript.

Field Name	Description
childElements	<p><b>Field Type</b> <a href="#">OmniProcessElement[]</a></p> <p><b>Description</b> The child elements associated with the OmniProcessElement.</p>
description	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of the OmniProcessElement.</p>
designerCustomizationType	<p><b>Field Type</b> string</p> <p><b>Description</b> The OmniStudio designer customization type.</p> <p> <b>Note:</b> To create assessment questions using the Discovery Framework feature, use the customization type as <i>discoveryframework</i>.</p>

Field Name	Description
discoveryFrameworkUsageType	<p><b>Field Type</b> string</p> <p><b>Description</b> The usage type for industries that use the Discovery Framework. For example, the value for Health Cloud is <code>HcUsageType</code>. The value for no specific industry is <code>Default</code>.</p>
embeddedOmniScriptKey	<p><b>Field Type</b> string</p> <p><b>Description</b> The ID of the embedded OmniScript</p>
isActive	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the status of the OmniProcessElement is active (<code>true</code>) or not (<code>false</code>).</p>
isOmniScriptEmbeddable	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the OmniScript with the OmniProcessElement can be embedded in other OmniScripts (<code>true</code>) or not (<code>false</code>).</p>
level	<p><b>Field Type</b> double</p> <p><b>Description</b> The vertical level in which the OmniProcessElement occurs on the OmniScript.</p>
name	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the OmniProcessElement.</p>
omniProcessVersionNumber	<p><b>Field Type</b> double</p> <p><b>Description</b> The related OmniProcess version.</p>
parentElementName	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>The name of the parent OmniProcessElement.</p>
parentElementType	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The type of the parent OmniProcessElement.</p>
propertySetConfig	<p><b>Field Type</b></p> <p>textarea</p> <p><b>Description</b></p> <p>The property set of the OmniProcessElement.</p>
QuestionDevName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The developer name of the assessment question in the OmniScript.</p> <p> <b>Note:</b> This field is relevant only for OmniScripts with <code>designerCustomizationType</code> as <code>discoveryframework</code>.</p>
sequenceNumber	<p><b>Field Type</b></p> <p>double</p> <p><b>Description</b></p> <p>The horizontal level in which the OmniProcessElement occurs on the OmniScript.</p>
type	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The OmniProcessElement type. For example, <code>Text</code> and <code>TextArea</code>.</p>
uniqueIndex	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>A unique index number for the OmniScript.</p>

## Declarative Metadata Sample Definition

The following is an example of a OmniScript component.

```
<?xml version="1.0" encoding="UTF-8"?>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Usage Type

Before you retrieve or deploy Discovery Framework OmniScripts, we recommend that you review these considerations.

- If the `DesignerCustomizationType` of the OmniScript is `discoveryframework`, then the questions in the OmniScript must be within the `<uniqueIndex>` tag in the metadata definition file.
- When deploying the OmniScript of type Discovery Framework, enable Discovery Framework Metadata Enabled setting.
- OmniScripts of type Discovery Framework don't support IDX Workbench.
- If any question associated with the OmniScript doesn't exist in the target org or, if the active version of that question doesn't exist in the target org, then deploying the OmniScript fails.

## OmniSupervisorConfig

---

Represents the Omni-Channel supervisor configuration for an assigned group of supervisors.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`OmniSupervisorConfig` components have the suffix `.omniSupervisorConfig` and are stored in the `omniSupervisorConfigs` folder.

## Version

`OmniSupervisorConfig` components are available in API version 57.0 and later.

## Special Access Rules

To access this type, [Omni-Channel](#) must be enabled.

## Fields

Field Name	Description
<code>isTimelineHidden</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. If set to <code>true</code>, hides the agent timeline from the supervisors assigned to this supervisor configuration. The default value is <code>false</code>.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A unique label for the supervisor configuration. The name must begin with a letter and can contain alphanumeric characters and underscores. It can't contain spaces, two consecutive underscores, or end with an underscore. The name appears as Omni Supervisor Configuration Name in the UI.</p>
<code>omniSupervisorConfigAction</code>	<p><b>Field Type</b> <a href="#">OmniSupervisorConfigAction[]</a></p> <p><b>Description</b> Represents the actions available to the supervisors of this Omni-Channel supervisor configuration.</p>
<code>omniSupervisorConfigGroup</code>	<p><b>Field Type</b> <a href="#">OmniSupervisorConfigGroup[]</a></p> <p><b>Description</b> Represents the group of agents who are visible to the supervisors of an Omni-Channel supervisor configuration. The group, if visible, appears in the Agents tab of Omni Supervisor.</p>
<code>omniSupervisorConfigProfile</code>	<p><b>Field Type</b> <a href="#">OmniSupervisorConfigProfile[]</a></p> <p><b>Description</b> Represents the supervisor profiles to which an Omni-Channel supervisor configuration applies. User-level configurations override profile-level configurations.</p>
<code>omniSupervisorConfigQueue</code>	<p><b>Field Type</b> <a href="#">OmniSupervisorConfigQueue[]</a></p>

Field Name	Description
	<p><b>Description</b></p> <p>Represents the queues that are visible to the supervisors of an Omni-Channel supervisor configuration. The queue, if visible, appears in the Queues Backlog and Assigned Work tabs of Omni Supervisor.</p>
omniSupervisorConfigSkill	<p><b>Field Type</b></p> <p><a href="#">OmniSupervisorConfigSkill[]</a></p> <p><b>Description</b></p> <p>Represents the skills that are visible to the supervisors of an Omni-Channel supervisor configuration. These skills, if visible, appear in the Skills Backlog tab of Omni Supervisor.</p>
omniSupervisorConfigTab	<p><b>Field Type</b></p> <p><a href="#">OmniSupervisorConfigTab[]</a></p> <p><b>Description</b></p> <p>Represents the visible tabs specified in an Omni Supervisor configuration. This object is available in API version 60.0 and later.</p>
skillVisibility	<p><b>Field Type</b></p> <p>OmniSuperSkillVisibilityType (enumeration of type string)</p> <p><b>Description</b></p> <p>Determines which work items based on skills are visible to the supervisors assigned to this supervisor configuration. Values are:</p> <ul style="list-style-type: none"> <li>• AllSkills</li> <li>• AnySkill</li> </ul>

## OmniSupervisorConfigAction

Represents an action and associated tab, custom flow, and display order for supervisor actions in this configuration.

Field Name	Description
actionName	<p><b>Field Type</b></p> <p>OmniSupervisorActionName (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. An action that a supervisor can perform. Values are:</p> <ul style="list-style-type: none"> <li>• AWSDashboard</li> <li>• AssignLearning</li> <li>• ChangeQueues</li> <li>• ChangeSkills</li> <li>• CustomAction</li> <li>• ManageQueues</li> </ul>

Field Name	Description
actionTab	<p><b>Field Type</b> OmniSupervisorActionTab (enumeration of type string)</p> <p><b>Description</b> Required. The tab where the action appears. Values are:</p> <ul style="list-style-type: none"> <li>• AgentDetails</li> <li>• AllAgents</li> <li>• AssignedWork</li> <li>• AssignedWorkDetails</li> <li>• QueueDetails</li> <li>• QueuesBacklog</li> <li>• SkillDetails</li> <li>• SkillsBacklog</li> </ul>
customActionFlow	<p><b>Field Type</b> string</p> <p><b>Description</b> A flow that performs a custom action.</p>
displayOrder	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. The order in which the action is displayed.</p>

## OmniSupervisorConfigGroup

Represents the group of agents for the supervisors in this configuration.

Field Name	Description
group	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the group of agents.</p>

## OmniSupervisorConfigProfile

Represents a profile for the supervisors in this configuration.

Field Name	Description
profile	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The profile name.</p>

## OmniSupervisorConfigQueue

Represents a queue that's visible to the supervisors in this configuration.

Field Name	Description
queue	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The queue name.</p>

## OmniSupervisorConfigSkill

Represents a skill that's visible to supervisors in this configuration.

Field Name	Description
skill	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The skill name.</p>

## OmniSupervisorConfigTab

Represents the visible tabs specified in an Omni Supervisor configuration. This object is available in API version 60.0 and later.

Field	Details
displayOrder	<p><b>Type</b> int</p> <p><b>Properties</b> Create, Filter, Group, Nillable, Sort</p> <p><b>Description</b> The order in which tabs are displayed in Omni Supervisor.</p>

Field	Details
flexipage	<p><b>Type</b> string</p> <p><b>Description</b> The name of the <a href="#">FlexiPage</a> added as a customized tab. Required when <code>tabType</code> is set to <code>FlexipageType</code>.</p>
tabType	<p><b>Type</b> OmniSupervisorTabType (enumeration of type string)</p> <p><b>Properties</b> Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p><b>Description</b> Required. Tabs shown on the Omni Supervisor page. Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>Agents</code> — the Agents tab</li> <li>• <code>AssignedWork</code> — the Assigned Work tab</li> <li>• <code>FlexipageType</code> — A custom tab created using Lightning App Builder, with the <code>omniSupervisorPageType</code> value of the <code>FlexiPage Type</code> field</li> <li>• <code>QueuesBacklog</code> — the Queues Backlog tab</li> <li>• <code>SkillsBacklog</code> — the Skills Backlog tab</li> <li>• <code>Wallboard</code> — the Wallboard tab</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a `OmniSupervisorConfig` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<OmniSupervisorConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <isTimelineHidden>true</isTimelineHidden>
  <masterLabel>Supervisor Config</masterLabel>
  <skillVisibility>AllSkills</skillVisibility>
  <omniSupervisorConfigAction>
    <actionName>ChangeQueues</actionName>
    <actionTab>AllAgents</actionTab>
    <displayOrder>0</displayOrder>
  </omniSupervisorConfigAction>
  <omniSupervisorConfigGroup>
    <group>Agent_Group</group>
  </omniSupervisorConfigGroup>
  <omniSupervisorConfigProfile>
    <profile>contractmanager</profile>
  </omniSupervisorConfigProfile>
  <omniSupervisorConfigQueue>
    <queue>CaseQueue</queue>
  </omniSupervisorConfigQueue>
  <omniSupervisorConfigSkill>
    <skill>English</skill>
  </omniSupervisorConfigSkill>
</OmniSupervisorConfig>
```

```
</omniSupervisorConfigSkill>  
</OmniSupervisorConfig>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>  
<Package xmlns="http://soap.sforce.com/2006/04/metadata">  
  <types>  
    <members>*</members>  
    <name>OmniSupervisorConfig</name>  
  </types>  
  <version>57.0</version>  
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OmniTrackingGroup

---

Represents a group of FlexCard and OmniScript components that have their user interactions tracked together in OmniAnalytics.

**Note:** This metadata type is part of OmniStudio Standard, not OmniStudio for Vlocity.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

OmniTrackingGroup components have the suffix `.OmniTrackingGroup` and are stored in the `OmniTrackingGroups` folder.

## Version

OmniTrackingGroup components are available in API version 60.0 and later.

## Special Access Rules

Using OmniAnalytics requires having an OmniStudio license and enabling OmniAnalytics in Setup.

## Fields

Field Name	Description
description	<p><b>Field Type</b> string</p> <p><b>Description</b> A description of the OmniTrackingGroup.</p>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>The unique name of the OmniTrackingGroup in the API. This name can contain only underscores and alphanumeric characters and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Limit: 80 characters.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> <p> <b>Note:</b> Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
endDate	<p><b>Field Type</b> date</p> <p><b>Description</b> The date when the OmniTrackingGroup became inactive.</p>
groupType	<p><b>Field Type</b> OmniTrackingGroupType (enumeration of type string)</p> <p><b>Description</b> Required.</p> <p>Specifies whether this OmniTrackingGroup sends tracking data to a third-party Analytics system such as Google Analytics.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• External—A third-party Analytics system is used.</li> <li>• Internal—No third-party Analytics system is used.</li> </ul>
isActive	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required.</p>

Field Name	Description
	Specifies whether the OmniTrackingGroup is active.
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The unique master label of the OmniTrackingGroup. This internal label doesn't get translated.</p>
maxAgeInDays	<p><b>Field Type</b> int</p> <p><b>Description</b> The maximum number of days the group and its analytics data is active beyond which the data is deleted.</p>
omniExtTrackingDef	<p><b>Field Type</b> string</p> <p><b>Description</b> The ID of the related OmniExtTrackingDef object. Required if <code>GroupType</code> is set to <code>External</code>.</p>
omniTrackingComponentDefs	<p><b>Field Type</b> <a href="#">OmniTrackingComponentDef[]</a></p> <p><b>Description</b> The OmniTrackingComponentDef objects related to this OmniTrackingGroup.</p>
omniTrackingGroupKey	<p><b>Field Type</b> string</p> <p><b>Description</b> A UUID generated internally by Salesforce to uniquely identify an OmniTrackingGroup record across all orgs.</p>
startDate	<p><b>Field Type</b> date</p> <p><b>Description</b> The date when the OmniTrackingGroup became active.</p>

## OmniTrackingComponentDef

Represents a FlexCard or OmniScript that is a member of an OmniTrackingGroup, which tracks user interactions in OmniAnalytics.

Field Name	Description
componentType	<p><b>Field Type</b> OmniAnalyticsComponentType (enumeration of type string)</p> <p><b>Description</b> Required. The type of component for which user interactions are tracked. Values are:</p> <ul style="list-style-type: none"> <li>• Flexcard</li> <li>• Omniscript</li> </ul>
componentVersion	<p><b>Field Type</b> double</p> <p><b>Description</b> Required. The version of the FlexCard or OmniScript.</p>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The unique name of the OmniTrackingComponentDef in the API. This name can contain only underscores and alphanumeric characters and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Limit: 80 characters.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> <p> <b>Note:</b> Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The unique master label of the OmniTrackingComponentDef. This internal label doesn't get translated.</p>
omniTrackingComponentDefKey	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>A UUID generated internally by Salesforce to uniquely identify an OmniTrackingComponentDef record across all orgs.</p>
omniTrackingGroup	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The ID of the related OmniTrackingGroup object.</p>

## Declarative Metadata Sample Definition

The following is an example of an OmniTrackingGroup component.

```
<?xml version="1.0" encoding="UTF-8"?>
<OmniTrackingGroup xmlns="http://soap.sforce.com/2006/04/metadata">
  <developerName>Purchase_Tracking</developerName>
  <groupType>Internal</groupType>
  <isActive>true</isActive>
  <masterLabel>Purchase_Tracking</masterLabel>
  <omniTrackingComponentDefs>
    <componentType>OmniScript</componentType>
    <componentVersion>2</componentVersion>
    <developerName>Purchase_Funnel</developerName>
    <masterLabel>Purchase_Funnel</masterLabel>
  </omniTrackingComponentDefs>
</OmniTrackingGroup>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>OmniTrackingGroup</name>
  </types>
  <version>60.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OutboundNetworkConnection

Represents a private connection between a Salesforce org and a third-party data service. The connection is outbound because the callouts are going *out* of Salesforce. This type extends the Metadata metadata type and inherits its fullName field.

## File Suffix and Directory Location

OutboundNetworkConnection components have the suffix `.outboundNetworkConnection` and are stored in the `outboundNetworkConnections` folder.

## Version

OutboundNetworkConnection components are available in API version 49.0 and later.

## Fields

Field Name	Field Type	Description
<code>connectionType</code>	ExternalConnectionType (enumeration of type string)	Required. Specifies the cloud provider of the connection. The only valid value is <code>AwsPrivateLink</code> .
<code>description</code>	string	A description of the connection. Maximum of 255 characters.
<code>isActive</code>	boolean	Required. Specifies whether the connection is active ( <code>true</code> ) or not ( <code>false</code> ).
<code>label</code>	string	Required. A user-friendly label for the connection.
<code>outboundNetworkConnProperties</code>	<a href="#">OutboundNetworkConnProperty</a> on page 1428[]	Name-value pairs that describe the properties of an outbound network connection. Specify a name-value pair for each of the properties.
<code>status</code>	ExternalConnectionStatus (enumeration of type string)	Required. Connection status. The connection is initially <code>Unprovisioned</code> and moves through the other statuses automatically after an admin performs a <code>Provision</code> , <code>Sync</code> , or <code>Teardown</code> action. The valid values are: <ul style="list-style-type: none"> <li>• <code>Unprovisioned</code></li> <li>• <code>Allocation</code></li> <li>• <code>PendingAcceptance</code></li> <li>• <code>PendingActivation</code></li> <li>• <code>RejectedRemotely</code></li> <li>• <code>DeletedRemotely</code></li> <li>• <code>TeardownInProgress</code></li> <li>• <code>Ready</code></li> </ul>

## OutboundNetworkConnProperty

Represents a name-value pair that describes the properties of an outbound network connection.

Field Name	Field Type	Description
propertyName	OutboundConnPropertyName (enumeration of type string)	Required. The name of a property used to establish to an OutboundNetworkConnection. Valid values are: <ul style="list-style-type: none"> <li>AwsVpcEndpointId—The unique endpoint ID provided by Salesforce after an outbound AwsPrivateLink is created. The value is read-only when the status is Ready.</li> <li>AwsVpcEndpointServiceName—The name of the customer's endpoint service running in an AWS VPC that's used for private connections with Salesforce.</li> <li>Region—The region in which the VPC is hosted.</li> </ul>
propertyValue	string	Required. The value of OutboundConnPropertyName. For example, the propertyValue of Region can be us-west-2.

## Declarative Metadata Sample Definition

The following sample definition has the suffix `.outboundNetworkConnection`.

```
<?xml version="1.0" encoding="UTF-8"?>
<OutboundNetworkConnection xmlns="http://soap.sforce.com/2006/04/metadata">
  <connectionType>AwsPrivateLink</connectionType>
  <description>Outbound Connection to make a callout to a Service deployed in AWS
VPC</description>
  <isActive>true</isActive>
  <label>MyOutboundConnection</label>
  <outboundNetworkConnProperties>
    <propertyName>Region</propertyName>
    <propertyValue>us-west-2</propertyValue>
  </outboundNetworkConnProperties>
  <outboundNetworkConnProperties>
    <propertyName>AwsVpcEndpointServiceName</propertyName>
    <propertyValue>com.amazonaws.vpce.us-west-2.vpce-svc-00d7bd6285c123b4c</propertyValue>
  </outboundNetworkConnProperties>
  <status>Unprovisioned</status>
</OutboundNetworkConnection>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>sampleOutboundConnection</fullName>
  <types>
    <members>MyOutboundConnection</members>
    <name>OutboundNetworkConnection</name>
  </types>
  <version>49.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Package

Specifies which metadata components to retrieve as part of a `retrieve()` call or defines a package of components.

Name	Type	Description
<code>apiAccessLevel</code>	APIAccessLevel (enumeration of type string)	<p>Package components have access via dynamic Apex and the API to standard and custom objects in the organization where they're installed. Administrators who install packages can restrict this access after installation for improved security. The valid values are:</p> <ul style="list-style-type: none"> <li>Unrestricted—Package components have the same API access to standard objects as the user who is logged in when the component sends a request to the API.</li> <li>Restricted—The administrator can select which standard objects the components can access. Further, the components in restricted packages can only access custom objects in the current package if the user's permissions allow access to them.</li> </ul> <p>For more information, see “API and Dynamic Apex Access in Packages” in Salesforce Help.</p>
<code>description</code>	string	A short description of the package.
<code>fullName</code>	string	The package name used as a unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component.
<code>namespacePrefix</code>	string	The namespace of the developer organization where the package was created.
<code>objectPermissions</code>	<a href="#">ProfileObjectPermissions[]</a>	Indicates which objects are accessible to the package, and the kind of access available (create, read, update, delete).
<code>packageType</code>	string	Reserved for future use.
<code>postInstallClass</code>	string	The name of the Apex class that specifies the actions to execute after the package has been installed or upgraded. The Apex class must be a member of the package and must implement the Apex <code>InstallHandler</code> interface. In patch upgrades, you can't change the class name in this field but you can

Name	Type	Description
		change the contents of the Apex class. The class name can be changed in major upgrades. This field is available in API version 24.0 and later.
setupWeblink	string	The weblink used to describe package installation.
types	<a href="#">PackageTypeMembers</a> on page 1431[]	The type of component being retrieved.
uninstallClass	string	The name of the Apex class that specifies the actions to execute after the package has been uninstalled. The Apex class must be a member of the package and must implement the Apex <code>UninstallHandler</code> interface. In patch upgrades, you can't change the class name in this field but you can change the contents of the Apex class. The class name can be changed in major upgrades. This field is available in API version 25.0 and later.
version	string	Required. The version of the component type.

## PackageTypeMembers

Use to specify the name and type of components to be retrieved in a package.

Name	Type	Description
members	string	One or more named components, or the wildcard character (*) to retrieve all metadata components of the type specified in the <code>&lt;name&gt;</code> element. To retrieve a standard object, specify it by name. For example, <code>&lt;members&gt;Account&lt;/members&gt;</code> retrieves the standard Account object.
name	string	The type of metadata component to be retrieved. For example, <code>&lt;name&gt;CustomObject&lt;/name&gt;</code> retrieves one or more custom objects as specified in the <code>&lt;members&gt;</code> element.

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Sample package.xml Manifest Files](#)

## ParticipantRole

---

Represents details, such as the name and associated default access level, for a role that a participant can have in the context of a parent record.

**[other]:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`ParticipantRole` components have the suffix `.participantRole` and are stored in the `participantRoles` folder.

## Version

`ParticipantRole` components are available in API version 50.0 and later.

## Fields

Field Name	Description
<code>defaultAccessLevel</code>	<p><b>Field Type</b> picklist</p> <p><b>Description</b> Required. The default sharing access granted to the participant role.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Edit—Read/Write</code></li> <li>• <code>None</code></li> <li>• <code>Read—Read Only</code></li> </ul>
<code>isActive</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the participant role is activated.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name for the participant role.</p>

Field Name	Description
parentObject	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The parent object for the participant role.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• Account Available in API version 59.0 and later.</li> <li>• Budget Available in API version 59.0 and later.</li> <li>• IndividualApplication Available in API version 59.0 and later.</li> <li>• Interaction Available in API version 52.0 and later.</li> <li>• InteractionSummary Available in API version 51.0 and later.</li> <li>• FinancialDeal Available in API version 52.0 and later.</li> <li>• FundingAward Available in API version 59.0 and later.</li> <li>• FundingOpportunity</li> <li>• Opportunity</li> <li>• Team Available in API version 58.0 and later.</li> <li>• Custom objects</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a ParticipantRole component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ParticipantRole xmlns="http://soap.sforce.com/2006/04/metadata">
  <defaultAccessLevel>Read</defaultAccessLevel>
  <isActive>true</isActive>
  <masterLabel>Advisor</masterLabel>
  <parentObject>Account</parentObject>
</ParticipantRole>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ParticipantRole</name>
  </types>
  <version>50.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PathAssistant

---

Represents Path records. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Note the following when working with PathAssistant:

- Only one path can be created per record type for each object, including `__Master__` record type.
- Rich text guidance information cannot be retrieved or deployed from or to translation workbench.
- The preference does not need to be on to retrieve or deploy PathAssistant.

## File Suffix and Directory Location

PathAssistant components have the suffix `.pathAssistant` and are stored in the `pathAssistants` folder.

## Version

PathAssistant components are available in API version 34.0 and later.

## Fields

Field Name	Field Type	Description
<code>active</code>	boolean	Indicates whether the path is active ( <code>true</code> ) or not ( <code>false</code> ).
<code>entityName</code>	string	Required. The entity name. This is hard coded for Opportunity, Lead, and Quote. For a custom object, this field must be specified and should be the name of the custom object. This field is not updateable.
<code>fieldName</code>	string	Required. The field name. This is hard coded for StageName and Status. For a custom object, this field must be specified and should be the name

Field Name	Field Type	Description
		of the picklist field that determines the steps in the path. This field is not updateable.
masterLabel	string	Required. The label of the path.
pathAssistantSteps	<a href="#">PathAssistantStep[]</a> on page 1435	List of all the steps that have been configured with fields and guidance information. Note that a missing step in the .xml file means it has not been configured, not that it doesn't exist.
recordTypeName	string	Required. The name of the record type associated with the path. This field is not updateable.

## PathAssistantStep

Represents the steps or stages in a Path.

Field Name	Field Type	Description
fieldNames	string	All the fields in <code>entityName</code> that will display in this step.
info	string	The guidance information displayed in this step.
picklistValueName	string	Required. The picklist value associated with the step.

## Declarative Metadata Sample Definition

The following is an example of a PathAssistant component.

```
<?xml version="1.0" encoding="UTF-8"?>
<PathAssistant xmlns="http://soap.sforce.com/2006/04/metadata">
  <active>true</active>
  <entityName>Opportunity</entityName>
  <fieldName>StageName</fieldName>
  <masterLabel>Test Path</masterLabel>
  <pathAssistantSteps>
    <fieldNames>Amount</fieldNames>
    <fieldNames>CloseDate</fieldNames>
    <info>Some Text</info>
    <picklistValueName>Id. Decision Makers</picklistValueName>
  </pathAssistantSteps>
  <pathAssistantSteps>
    <fieldNames>Amount</fieldNames>
    <fieldNames>CloseDate</fieldNames>
    <info>Some Text</info>
    <picklistValueName>Proposal/Price Quote</picklistValueName>
  </pathAssistantSteps>
  <recordTypeName>Test_Record_Type</recordTypeName>
</PathAssistant>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Opportunity.Test_Busines_Process</members>
    <name>BusinessProcess</name>
  </types>
  <types>
    <members>Opportunity.StageName</members>
    <members>Lead.LeadSource</members>
    <members>Opportunity.Type</members>
    <name>CustomField</name>
  </types>
  <types>
    <members>Test_Path</members>
    <name>PathAssistant</name>
  </types>
  <types>
    <members>Opportunity.Test_Record_Type</members>
    <name>RecordType</name>
  </types>
  <types>
    <members>PathAssistant</members>
    <name>Settings</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PaymentGatewayProvider

---

Represents the metadata associated with a payment gateway provider. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

`PaymentGatewayProvider` components have the suffix `paymentGatewayProvider` and are stored in the `paymentGatewayProviders` folder.

## Version

`PaymentGatewayProvider` components are available in API version 48.0 and later.

## Special Access Rules

To access PaymentGatewayProvider, you must have a Salesforce Order Management license with the PaymentPlatform org permission activated.

## Fields

Field Name	Field Type	Description
apexAdapter	string	The Apex adapter class name for your payment gateway. This field is unique within your organization.
comments	string	Users can add comments to provide additional details about a record. Maximum of 1000 characters.
idempotencySupported	IdempotencySupportedStatus (enumeration of type String)	Required. Defines whether the payment gateway ignores duplicate payment gateway calls ( <b>Yes</b> ) or whether it processes duplicate gateway calls ( <b>No</b> ). <ul style="list-style-type: none"> <li>• Yes</li> <li>• No</li> </ul>
masterLabel	string	Required. The label of this payment gateway provider record.

## Declarative Metadata Sample Definition

The following is an example of a PaymentGatewayProvider component.

```
<PaymentGatewayProvider xmlns="http://soap.sforce.com/2006/04/metadata">
  <apexAdapter>SalesforceAdapter</apexAdapter>
  <idempotencySupported>Yes</idempotencySupported>
  <masterLabel>SalesforceAdapter</masterLabel>
  <comments>Comments</comments>
</PaymentGatewayProvider>
```

The following is an example package.xml that references the previous definition.

```
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>PaymentGatewayProvider</name>
  </types>
  <version>48.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PermissionSet

---

Represents a set of permissions that's used to grant more access to one or more users without changing their profile or reassigning profiles. You can use permission sets to grant access but not to deny access.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In API version 40.0 and later, when you retrieve permission set metadata, all content exposed in Metadata API for the permission sets is included. The metadata includes Apex associated with the permission set, CRUD, and so on. Likewise, when you deploy a permission set, you must include all of its metadata to avoid accidentally overwriting the permission set's contents.

In API version 39.0 and earlier, retrieving or deploying permission set metadata returns only app and system permissions assigned to the permission set. Junction metadata (such as Apex, CRUD) are included only if the metadata for the related component is also included in the package definition.

In API version 29.0 and later, you can retrieve and deploy access settings for these managed components in profiles and permission sets:

For more information, see the Managed Component Access section of [Sample package.xml Manifest Files](#) in the *Metadata API Developer Guide*.

## Declarative Metadata File Suffix and Directory Location

Permission sets are stored in the `permissionsets` directory. The file name matches the permission set API name and the extension is `.permissionset`. For example, a permission set with the name `User_Management_Perm` is stored in `permissionsets/User_Management_Perm.permissionset`.

## Version

Permission sets are available in API version 22.0 and later.

## Special Access Rules

As of Summer '20 and later, only users who have one of these permissions can access this type:

- View Setup and Configuration
- Manage Session Permission Set Activations
- Assign Permission Sets
- Manage Profiles and Permission Sets

To view the following settings, assignments, and permissions for standard and custom objects in a specified permission set, the View Setup and Configuration permission is required.

- Client settings
- Field permissions
- Layout assignments
- Object permissions
- Permission dependencies
- Permission set tab settings
- Permission set group components
- Record types

## Fields

Field	Field Type	Description
<code>applicationVisibilities</code>	<a href="#">PermissionSetApplicationVisibility[]</a>	Indicates which apps are visible to users assigned to this permission set. Available in API version 29.0 and later. In API version 29.0, this field supports custom apps only. In API version 30.0 and later, this field supports both standard and custom apps.
<code>classAccesses</code>	<a href="#">PermissionSetApexClassAccess[]</a>	Indicates which top-level Apex classes have methods that users assigned to this permission set can execute. Available in API version 23.0 and later.
<code>customMetadataTypeAccesses</code>	<a href="#">PermissionSetCustomMetadataTypeAccess[]</a>	Indicates the custom metadata types that are read-accessible to a user assigned to this permission set. Available in API version 47.0 and later.
<code>customPermissions</code>	<a href="#">PermissionSetCustomPermissions[]</a>	Indicates which custom permissions are available to users assigned to this permission set. Available in API version 31.0 and later.
<code>customSettingAccesses</code>	<a href="#">PermissionSetCustomSettingAccesses[]</a>	Indicates the custom settings that are read-accessible to a user assigned to this permission set. Available in API version 47.0 and later.
<code>description</code>	string	The permission set description. Limit: 255 characters.
<code>emailRoutingAddressAccesses</code>	<a href="#">PermissionSetEmailRoutingAddressAccess[]</a>	Indicates the Email Routing Address permissions that are available to users assigned to a permission set. Available in API version 62.0 and later.
<code>externalCredentialPrincipalAccesses</code>	<a href="#">PermissionSetExternalCredentialPrincipalAccess[]</a>	Indicates which external credential principals are available to users assigned to this permission set. Available in API version 59.0 and later.
<code>externalDataSourceAccesses</code>	<a href="#">PermissionSetExternalDataSourceAccess[]</a>	Indicates which data sources with identity type of <code>PER_USER</code> are available to users assigned to this permission set. Available in API version 27.0 and later.
<code>fieldPermissions</code>	<a href="#">PermissionSetFieldPermissions[]</a>	Indicates which fields are accessible to a user assigned to this permission set, and the kind of access available (readable or editable). Available in API version 23.0 and later.
<code>flowAccesses</code>	<a href="#">PermissionSetFlowAccess[]</a>	Indicates which flows can be accessed by a user assigned to this permission set. Available in API version 47.0 and later.
<code>hasActivationRequired</code>	boolean	Indicates whether the permission set requires an associated active session ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 37.0 and later.
<code>label</code>	string	Required. The permission set label. Limit: 80 characters.

Field	Field Type	Description
<code>license</code>	string	Either the related permission set license or the user license associated with this permission set. Available in API version 38.0 and later. Use this field instead of <code>userLicense</code> , which is deprecated and only available up to API Version 37.0.
<code>objectPermissions</code>	<a href="#">PermissionSetObjectPermissions[]</a>	Indicates the objects that are accessible to a user assigned to this permission set, and the kind of access available (create, read, edit, delete, and so on). Available in API version 23.0 and later.
<code>pageAccesses</code>	<a href="#">PermissionSetApexPageAccess[]</a>	Indicates which Visualforce pages that users assigned to this permission set can execute. Available in API version 23.0 and later.
<code>recordTypeVisibilities</code>	<a href="#">PermissionSetRecordTypeVisibility[]</a>	Indicates which record types are visible to users assigned to this permission set. Available in API version 29.0 and later. This field is never retrieved or deployed for inactive record types.
<code>tabSettings</code>	<a href="#">PermissionSetTabVisibility[]</a>	Indicates the tab visibility settings for this permission set. Available in API version 26.0 and later.
<code>userLicense</code>	string	Deprecated. The user license for the permission set. A user license determines the baseline of features that the user can access. Every user must have exactly one user license. Available up to API version 37.0. In API version 38.0 and later, use <code>license</code> .
<code>userPermissions</code>	<a href="#">PermissionSetUserPermissions[]</a>	Specifies an app or system permission (such as "API Enabled") and whether it's enabled for this permission set. In API version 28.0 and earlier, this field retrieves all user permissions, enabled or disabled. In API version 29.0 and later, this field retrieves only enabled user permissions. In API Version 40.0 and later, if a permission isn't specified for a deployment, it's disabled.

## PermissionSetApplicationVisibility

[PermissionSetApplicationVisibility](#) on page 1440 determines whether an app is visible to a user assigned to this permission set.

Field Name	Field Type	Description
<code>application</code>	string	Required. The app name.
<code>visible</code>	boolean	Required. Indicates whether this app is visible to users assigned to this permission set ( <code>true</code> ) or not ( <code>false</code> ).

## PermissionSetApexClassAccess

[PermissionSetApexClassAccess](#) on page 1441 represents the Apex class access for users assigned to a permission set.

Field	Field Type	Description
apexClass	string	Required. The Apex class name.
enabled	boolean	Required. Indicates whether users assigned to this permission set can execute methods in the top-level class ( <code>true</code> ) or not ( <code>false</code> ).

## PermissionSetCustomMetadataTypeAccess

[PermissionSetCustomMetadataTypeAccess](#) on page 1441 represents the custom metadata type access for users assigned to a permission set. Available in API version 47.0 and later.

Field	Field Type	Description
enabled	boolean	Required. Indicates whether the records for this custom metadata type are readable ( <code>true</code> ) or not ( <code>false</code> ).
name	string	Required. The custom metadata type name.

## PermissionSetCustomPermissions

[PermissionSetCustomPermissions](#) represents the custom permissions access for users assigned to a permission set. Only enabled custom permissions are retrieved.

Field Name	Field Type	Description
enabled	boolean	Required. Indicates whether the custom permission is enabled ( <code>true</code> ) or not ( <code>false</code> ).
name	string	Required. The custom permission name.

## PermissionSetCustomSettingAccesses

[PermissionSetCustomSettingAccesses](#) represents the custom setting access for users assigned to a permission set. Available in API version 47.0 and later.

Field	Field Type	Description
enabled	boolean	Required. Indicates whether the records for this custom setting are readable ( <code>true</code> ) or not ( <code>false</code> ).
name	string	Required. The custom setting name.

## PermissionSetEmailRoutingAddressAccess

[PermissionSetEmailRoutingAddressAccess](#) represents the Email Routing Address access for users assigned to a permission set. Only enabled email routing addresses are retrieved.

Field	Field Type	Description
<code>enabled</code>	boolean	Required. Indicates whether the custom permission is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>name</code>	string	Required. Represents an organization's Email-to-Case routing address.

## PermissionSetExternalCredentialPrincipalAccess

[PermissionSetExternalCredentialPrincipalAccess](#) on page 1442 represents the access to the external credential's principals. Users assigned to the permission set can make callouts using a named credential that references the external credential. Available in API version 59.0 and later.

Field	Field Type	Description
<code>enabled</code>	boolean	Required. Indicates whether external credential principal access is enabled on the permission set ( <code>true</code> ) or not ( <code>false</code> ).
<code>externalCredentialPrincipal</code>	string	Required. The name of the external credential and principal, separated by a dash. For example, <code>myExternalCredential-myPrincipal</code> .  If the external credential and principal are part of a package, include the package's namespace prefix with the principal's name using this format: <code>namespacePrefix__myExternalCredential-myPrincipal</code> Use two underscores (__) between the namespace prefix and the external credential principal's name.

## PermissionSetExternalDataSourceAccess

[PermissionSetExternalDataSourceAccess](#) on page 1442 represents the data source access for users with identity type of `Per User`. Available in API version 27.0 and later.

Field	Field Type	Description
<code>enabled</code>	boolean	Required. Indicates whether the data source is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>externalDataSource</code>	string	The name of the external data source.

## PermissionSetFieldPermissions

[PermissionSetFieldPermissions](#) on page 1443 represents the field permissions for users assigned to a permission set. In API version 30.0 and later, permissions for required fields can't be retrieved or deployed. In API version 54.0 and later, only field permissions enabled in the permission set are returned in queries.

As of API version 38.0, you can change field permissions to make a field editable using the Metadata API for fields that you can't change through the user interface. For example, you can deploy `Asset.ProductCode` as an editable field even though you can't through the user interface.

Field	Field Type	Description
<code>editable</code>	boolean	Required. Indicates whether the field can be edited by the users assigned to this permission set ( <code>true</code> ) or not ( <code>false</code> ).
<code>field</code>	string	Required. The API name of the field (such as <code>Warehouse__c.Description__c</code> ). When referencing shared Activity fields, specify Event or Task. For example, <code>Event.Meeting__c</code> .
<code>readable</code>	boolean	Indicates whether the field can be read by the users assigned to this permission set ( <code>true</code> ) or not ( <code>false</code> ).

## PermissionSetFlowAccess

[PermissionSetFlowAccess](#) on page 1443 represents which flows a permission set grants access to. Available in API version 47.0 and later.

Field	Field Type	Description
<code>enabled</code>	boolean	Required. Indicates whether users assigned this permission set can access the flow ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>flow</code>	string	Required. The name of the flow to which access is granted.

## PermissionSetObjectPermissions

[PermissionSetObjectPermissions](#) represents the object permissions for a permission set. Use one of these elements for each permission.

Field	Field Type	Description
<code>allowCreate</code>	boolean	Required. Indicates whether the object referenced by the <code>object</code> field can be created by the users assigned to this permission set ( <code>true</code> ) or not ( <code>false</code> ).
<code>allowDelete</code>	boolean	Required. Indicates whether the object referenced by the <code>object</code> field can be deleted by the users assigned to this permission set ( <code>true</code> ) or not ( <code>false</code> ).

Field	Field Type	Description
allowEdit	boolean	Required. Indicates whether the object referenced by the <code>object</code> field can be edited by the users assigned to this permission set ( <code>true</code> ) or not ( <code>false</code> ).
allowRead	boolean	Required. Indicates whether the object referenced by the <code>object</code> field can be viewed by the users assigned to this permission set ( <code>true</code> ) or not ( <code>false</code> ).
modifyAllRecords	boolean	Required. Indicates whether the object referenced by the <code>object</code> field can be viewed, edited, or deleted by the users assigned to this permission set ( <code>true</code> ) or not ( <code>false</code> ), regardless of the sharing settings for the object. Includes private records (records with no parent object). Similar to the Modify All Data user permission, but limited to the individual object level.
object	string	Required. The API name of the object (such as <code>Warehouse__c</code> ).
viewAllRecords	boolean	Required. Indicates whether the object referenced by the <code>object</code> field can be viewed by the users assigned to this permission set ( <code>true</code> ) or not ( <code>false</code> ), regardless of the sharing settings for the object. Includes private records (records with no parent object). The <code>viewAllRecords</code> field is similar to the View All Data user permission but limited to the individual object level.

## PermissionSetApexPageAccess

[PermissionSetApexPageAccess](#) on page 1444 represents the Visualforce page access for users assigned to a permission set.

Field	Field Type	Description
apexPage	string	Required. The Visualforce page name.
enabled	boolean	Required. Indicates whether users assigned to this permission set can execute the Visualforce page ( <code>true</code> ) or not ( <code>false</code> ).

## PermissionSetRecordTypeVisibility

[PermissionSetRecordTypeVisibility](#) on page 1444 represents the visibility of record types for this permission set.

Field	Field Type	Description
recordType	string	Required. The record type name, for example <code>Account.MyRecordType</code> .
visible	boolean	Required. Indicates whether the record type is visible to users assigned to this permission set ( <code>true</code> ) or not ( <code>false</code> ).

## PermissionSetTabSetting

[PermissionSetTabSetting](#) on page 1445 represents the tab settings for a permission set.

Field	Field Type	Description
tab	string	Required. The tab name.
visibility	PermissionSetTabVisibility (enumeration of type string)	Required. Indicates the visibility settings for the tab. Valid values are: <ul style="list-style-type: none"> <li>• <code>Available</code>—The tab is available on the All Tabs page. Individual users can customize their display to make the tab visible in any app.</li> <li>• <code>None</code>—The tab isn't available on the All Tabs page or visible in any apps.</li> <li>• <code>Visible</code>—The tab is available on the All Tabs page and appears in the visible tabs for its associated app. Individual users can customize their display to hide the tab or make it visible in other apps.</li> </ul>

## PermissionSetUserPermission

In API version 28.0 and earlier, [PermissionSetUserPermission](#) represents an app or system permission for a permission set. In API version 29.0 and later, this field retrieves only enabled user permissions. Use one of these elements for each permission.

Field	Field Type	Description
enabled	boolean	Required. Indicates whether the permission is enabled ( <code>true</code> ) or disabled ( <code>false</code> ).
name	string	Required. The name of the permission.

## Declarative Metadata Sample Definition

The following is an example of a PermissionSet component.

```
<?xml version="1.0" encoding="UTF-8"?>
<PermissionSet xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>Grants all rights needed for an HR administrator to manage
employees.</description>
  <label>HR Administration</label>
  <userLicense>Salesforce</userLicense>
  <applicationVisibilities>
    <application>JobApps__Recruiting</application>
    <visible>true</visible>
  </applicationVisibilities>
  <userPermissions>
    <enabled>true</enabled>
    <name>ApiEnabled</name>
  </userPermissions>
</PermissionSet>
```

```

</userPermissions>
<objectPermissions>
  <allowCreate>true</allowCreate>
  <allowDelete>true</allowDelete>
  <allowEdit>true</allowEdit>
  <allowRead>true</allowRead>
  <viewAllRecords>true</viewAllRecords>
  <modifyAllRecords>true</modifyAllRecords>
  <object>Job_Request__c</object>
</objectPermissions>
<fieldPermissions>
  <editable>true</editable>
  <field>Job_Request__c.Salary__c</field>
  <readable>true</readable>
</fieldPermissions>
<pageAccesses>
  <apexPage>Job_Request_Web_Form</apexPage>
  <enabled>true</enabled>
</pageAccesses>
<classAccesses>
  <apexClass>Send_Email_Confirmation</apexClass>
  <enabled>true</enabled>
</classAccesses>
<tabSettings>
  <tab>Job_Request__c</tab>
  <visibility>Available</visibility>
</tabSettings>
<recordTypeVisibilities>
  <recordType>Recruiting.DevManager</recordType>
  <visible>true</visible>
</recordTypeVisibilities>
</PermissionSet>

```

The following is an example package.xml manifest used to retrieve the PermissionSet metadata for an organization. When you retrieve permission sets, also retrieve the related components with assigned permissions. For example, to retrieve `objectPermissions` and `fieldPermissions` for a custom object, you must also retrieve the CustomObject component.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Job_Request__c</members>
    <name>CustomTab</name>
  </types>
  <types>
    <members>Job_Request__c</members>
    <name>CustomObject</name>
  </types>
  <types>
    <members>JobApps__Recruiting</members>
    <name>CustomApplication</name>
  </types>
  <types>
    <members>Recruiting.DevManager</members>
    <name>RecordType</name>
  </types>

```

```

<types>
  <members>*</members>
  <name>PermissionSet</name>
</types>
<version>62.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PermissionSetGroup

---

Represents a group of permission sets and the permissions within them. Use permission set groups to organize permissions based on job functions or tasks. Then, you can package the groups as needed.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Declarative Metadata File Suffix and Directory Location

Permission set groups are stored in the `permissionsetgroups` directory. The file name matches the permission set API name and the extension is `.permissionsetgroup`. For example, a permission set group with the name `Finance_Mgmt_PermSetGroup` is stored in `permissionsetgroups/Finance_Mgmt_PermSetGroup.permissionsetgroup`.

## Version

Permission set groups are available in API version 45.0 and later.

## Special Access Rules

As of Summer '20 and later, to view this type, users must have one of these permissions:

- View Setup and Configuration
- Manage Session Permission Set Activations
- Assign Permission Sets

To edit this type, users must have the Manage Profiles and Permission Sets permission.

## Fields

Field	Field Type	Description
<code>description</code>	string	The permission set group description provided by the permission set group creator.

Field	Field Type	Description
hasActivationRequired	boolean	Indicates whether the permission set group requires an associated active session ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . This field is available in API version 53.0 and later.
label	string	Required. The permission set group label.
mutingPermissionSets	string	A permission set containing permissions to disable in the permission set group. This field is available in API version 46.0 and later.
permissionSets	string	A permission set or permission sets included in the permission set group.
status	string	Indicates permission set group recalculation status. Valid values are: <ul style="list-style-type: none"> <li>• <code>Updated</code>—The group is current.</li> <li>• <code>Outdated</code>—The group requires recalculation.</li> <li>• <code>Updating</code>—The group is in recalculation mode.</li> <li>• <code>Failed</code>—The group recalculation failed.</li> </ul>

## Declarative Metadata Sample Definition

When adding a permission set group, you can do something like this. Individual permissions are included in the permission set referenced, not in the permission set group.

```
<?xml version="1.0" encoding="UTF-8"?>
<PermissionSetGroup xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>Finance_Mgmt_PermSetGroup</fullName>
  <description>Finance_Mgmt_PermSetGroup desc</description>
  <label>Finance_Mgmt_PermSetGroup</label>
  <permissionSets>Billing_PS</permissionSets>
</PermissionSetGroup>
```

The permission set `Billing_PS` contains the individual permissions included in `Finance_Mgmt_PermSetGroup`.

```
<?xml version="1.0" encoding="UTF-8"?>
<PermissionSet xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>Billing_PS</fullName>
  <description>Billing_PS</description>
  <label>Billing_PS</label>
  <hasActivationRequired>false</hasActivationRequired>
  <license>Salesforce</license>
  <userPermissions>
    <enabled>true</enabled>
    <name>ViewSetup</name>
  </userPermissions>
  <userPermissions>
    <enabled>true</enabled>
    <name>ViewRoles</name>
  </userPermissions>
</PermissionSet>
```

```

    </userPermissions>
  <userPermissions>
    <enabled>true</enabled>
    <name>EditBillingInfo</name>
  </userPermissions>
</PermissionSet>

```

This example `package.xml` manifest retrieves the `PermissionSetGroup` metadata for an org. When you retrieve permission set groups, also retrieve the related components. For example, to retrieve `PermissionSetGroup`, you must also retrieve `PermissionSet`.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Finance_Mgmt_PermSetGroup</members>
    <name>PermissionSetGroup</name>
  </types>
  <types>
    <members>Billing_PS</members>
    <name>PermissionSet</name>
  </types>
  <version>45.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PermissionSetLicenseDefinition (Developer Preview)

---

Represents the definition of a custom permission set license, which entitles specified features in a package.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`PermissionSetLicenseDefinition` components have the suffix `.permissionSetLicenseDefinition` and are stored in the `permissionSetLicenseDefinitions` folder.

### Version

`PermissionSetLicenseDefinition` components are available in API version 54.0 and later.

### Special Access Rules

To access `PermissionSetLicenseDefinition`, you must have the Partner Licensing Platform developer preview enabled. To participate in this developer preview, submit a participation request via the [Partner Licensing Platform Developer Preview](#) Partner Community group.

 **Note:** The Partner Licensing Platform is available as a developer preview. The Partner Licensing Platform isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. All commands, parameters, and other features are subject to change or deprecation at any time, with or without notice. Don't implement functionality developed with these commands or tools in your production package.

## Fields

Field Name	Field Type	Description
<code>customPermissions</code>	<a href="#">PermissionSetLicenseDefinitionCustomPermission</a>	An array of licensed custom permissions included in the permission set license definition.
<code>isSupplementLicense</code>	boolean	Indicates whether the custom permission set license is a supplement license ( <code>true</code> ) or a foundation license ( <code>false</code> ). The default value is <code>false</code> . This field is available in API version 55.0 and later.
<code>label</code>	string	Required. The name of the permission set license definition.
<code>licenseExpirationPolicy</code>	LicenseExpirationPolicy (enumeration of type string)	The license expiration policy of the custom permission set license. Valid values are: <ul style="list-style-type: none"> <li><code>BlockNamespaceAccess</code>—Package access is blocked for existing users when all custom permission set licenses expire. This is the default value.</li> <li><code>AllowNamespaceAccess</code>—Package access isn't blocked for existing users when all custom permission set licenses expire.</li> </ul> This field is available in API version 55.0 and later.
<code>userLicenseRestrictions</code>	string	The user license categories that can be assigned the custom permission set license. If no user license categories are specified, all users can be assigned the license. Possible values include: <ul style="list-style-type: none"> <li><code>communities</code></li> <li><code>communitiesLogin</code></li> <li><code>customerCommunities</code></li> <li><code>customerCommunitiesLogin</code></li> <li><code>internal</code></li> <li><code>partnerCommunity</code></li> <li><code>partnerCommunityLogin</code></li> <li><code>platform</code></li> </ul> For more information, see <a href="#">User License Restriction Categories (Developer Preview)</a> . This field is available in API version 55.0 and later.

## PermissionSetLicenseDefinitionCustomPermission

Represents a licensed custom permission included in the permission set license definition.

Field Name	Field Type	Description
name	string	Label of the licensed custom permission. This field must be a reference to a <a href="#">CustomPermission</a> that has the <code>isLicensed</code> field set to <code>true</code> .

## Declarative Metadata Sample Definition

The following is an example of a `PermissionSetLicenseDefinition` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<PermissionSetLicenseDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <customPermissions>>
    <name>AccessReportsPerm</name>
  </customPermissions>
  <isSupplementLicense>false</isSupplementLicense>
  <licenseExpirationPolicy>BlockNamespaceAccess</licenseExpirationPolicy>
  <label>ExampleFeatureLicenseDefinition</label>
  <userLicenseRestrictions>${internal}</userLicenseRestrictions>
</PermissionSetLicenseDefinition>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>PermissionSetLicenseDefinition</name>
  </types>
  <version>54.0</version>
</Package>
```

## Usage

For more information, see the [Partner Licensing Platform Developer Guide \(Developer Preview\)](#).

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PersonAccountOwnerPowerUser

---

Represents a user who can own more than 50,000 customer or partner portal accounts. Person account owner power users can own a large number of either customer or partner users. They can't change their role, look up to a parent role, or reparent their role. Person account owner power user objects can't be created if deferred sharing is turned on for your org. This object is available in API version 57.0 and later.

### Version

PersonAccountOwnerPowerUser components are available in API version 57.0 and later.

### Fields

Field Name	Description
<code>developerName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The unique name of the object in the API.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The label entered when the person account owner power user is created.</p>
<code>portalType</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The type of portal user account that the person account owner power user can own.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>CustomerPortal</code>—Customer Portal</li> <li>• <code>Partner</code>—Partner Portal</li> </ul>
<code>user</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The unique ID associated with the person account owner power user.</p>

## PipelineInspMetricConfig

---

Represents the settings of Pipeline Inspection forecast category metrics.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

PipelineInspMetricConfig components have the suffix `.pipelineInspMetricConfig` and are stored in the `pipelineInspMetricConfigs` folder.

## Version

PipelineInspMetricConfig components are available in API version 57.0 and later.

## Special Access Rules

Only users with the Customize Application or Modify All Data permission can access this type.

## Fields

Field Name	Description
<code>isCumulative</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Read only. Indicates whether the metric is cumulative (<code>true</code>) or not (<code>false</code>). The default value is <code>true</code>.</p>
<code>isProtected</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the component is protected (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Customized label of the Pipeline Inspection metric. Limit: 50 characters.</p>
<code>metric</code>	<p><b>Field Type</b> PipelineInspectionMetric (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. The Pipeline Inspection metric. Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>BestCase</code> (available in API version 58.0 and later)</li> <li>• <code>ClosedLost</code> (available in API version 58.0 and later)</li> <li>• <code>ClosedWon</code> (available in API version 58.0 and later)</li> <li>• <code>Commit</code> (available in API version 58.0 and later)</li> <li>• <code>MostLikely</code> (available in API version 58.0 and later)</li> <li>• <code>OpenPipeline</code> (available in API version 58.0 and later)</li> <li>• <code>TotalPipeline</code> (available in API version 58.0 and later)</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a `PipelineInspMetricConfig` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<PipelineInspMetricConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <isCumulative>true</isCumulative>
  <isProtected>false</isProtected>
  <masterLabel>Lost the opportunity</masterLabel>
  <metric>ClosedLost</metric>
</PipelineInspMetricConfig>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>PipelineInspMetricConfig</name>
  </types>
  <version>57.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PlatformCachePartition

Represents a partition in the Platform Cache. This type extends the Metadata metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

PlatformCachePartition components have the suffix `.cachePartition` and are stored in the `cachePartitions` folder.

## Version

PlatformCachePartition components are available in API version 35.0 and later.

## Special Access Rules

The “Author Apex” permission is required to deploy and retrieve PlatformCachePartition components.

## Fields

Field Name	Field Type	Description
<code>description</code>	string	Describes the cache partition.
<code>isDefaultPartition</code>	boolean	Required. Indicates whether this cache partition is the default partition in your organization ( <code>true</code> ) or not ( <code>false</code> ).
<code>masterLabel</code>	string	Required. The label of the cache partition that appears in the Salesforce user interface.
<code>platformCachePartitionTypes</code>	<a href="#">PlatformCachePartitionType</a> []	An array of cache types that the partition can store.

## PlatformCachePartitionType

Contains information about a partition type, including its minimum and allocated capacity.

Field Name	Field Type	Description
<code>allocatedCapacity</code>	int	Required. The total storage capacity, in megabytes (MB), that is allocated for the cache type, including free, purchased, and trial cache. Purchased capacity includes organization-wide cache, which can be used in any partition, and namespace-specific cache, which can be used only in partitions associated with a namespace.
<code>allocatedPartnerCapacity</code>	int	Required. Free capacity, in megabytes (MB), allocated to Developer Edition orgs for the cache type. Use this capacity with security-reviewed managed packages. Available in API version 51.0 and later.
<code>allocatedPurchasedCapacity</code>	int	Required. The amount of namespace-specific purchased storage capacity, in MB, that is allocated for the cache type.
<code>allocatedTrialCapacity</code>	int	Required. The amount of trial cache space, in MB, that is allocated for the cache type.

Field Name	Field Type	Description
cacheType	PlatformCacheType (enumeration of type string)	The type of cache. Valid values are: <ul style="list-style-type: none"> <li>• Session—Session cache</li> <li>• Organization—Org cache</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a PlatformCachePartition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<PlatformCachePartition xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>Custom partition and marked as default.</description>
  <isDefaultPartition>true</isDefaultPartition>
  <masterLabel>myPartition</masterLabel>
  <platformCachePartitionTypes>
    <allocatedCapacity>10</allocatedCapacity>
    <allocatedPurchasedCapacity>5</allocatedPurchasedCapacity>
    <cacheType>Session</cacheType>
  </platformCachePartitionTypes>
  <platformCachePartitionTypes>
    <allocatedCapacity>5</allocatedCapacity>
    <allocatedPurchasedCapacity>5</allocatedPurchasedCapacity>
    <cacheType>Organization</cacheType>
  </platformCachePartitionTypes>
</PlatformCachePartition>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>myPartition</members>
    <name>PlatformCachePartition</name>
  </types>
  <version>62.0</version>
</Package>
```

If a namespace is defined in your organization, add the namespace prefix to your partition name. For example:

```
<members>Namespace.myPartition</members>
```

To retrieve all cache partitions from your organization, use the wildcard character (\*) as follows.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>PlatformCachePartition</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PlatformEventChannel

Represents a channel that you can subscribe to in order to receive a stream of events. In API version 46.0 and earlier, it is the default standard channel for change data capture events. In API version 47.0 and later, it is a custom channel for change data capture events.

The default standard channel corresponds to the entity selection in the Change Data Capture page in Setup. A custom channel is a channel that you define using this metadata type. Starting in API version 47.0, the channel doesn't contain the selected entities, which are represented each by `PlatformEventChannelMember`. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`PlatformEventChannel` components have the suffix `.platformEventChannel` and are stored in the `platformEventChannels` folder.

## Version

`PlatformEventChannel` components are available in API version 45.0 and later.

## Special Access Rules

You must have the Customize Application permission to deploy and retrieve this type.

## Fields

Field Name	Field Type	Description
<code>channelMembers</code>	<a href="#">PlatformEventChannelSelectedEntity[]</a>	Removed. A list of event names of entities, including standard and custom objects, selected for Change Data Capture notifications.   <b>Note:</b> This field is removed in API version 47.0 and later and is available only in API versions 45.0 and 46.0. In API version 47.0 and later, the channel members are each defined in a <code>PlatformEventChannelMember</code> component.
<code>channelType</code>	<code>PlatformEventChannelType</code> (enumeration of type string)	Required. The channel type. Valid values are: <ul style="list-style-type: none"> <li><code>data</code>—Change Data Capture channel corresponding to the selected entities.</li> <li><code>event</code>—A channel that contains platform events.</li> </ul>
<code>eventType</code>	<code>PlatformEventChannelEventType</code>	The type of events that the channel can hold. A channel can hold only one type of events. Use this field to optionally specify a specific type of

Field Name	Field Type	Description
	(enumeration of type string)	<p>events for a channel in combination with the <code>channelType</code> field. Valid values are:</p> <ul style="list-style-type: none"> <li><code>custom</code>—The channel contains custom platform events. This value is valid with the <code>channelType</code> of <code>event</code>.</li> <li><code>data</code>—The channel contains change data capture events. This value is valid with the <code>channelType</code> of <code>data</code>.</li> <li><code>monitoring</code>—The channel contains Real-Time Event Monitoring events. This value is valid with the <code>channelType</code> of <code>event</code>.</li> <li><code>standard</code>—Reserved for internal use.</li> </ul> <p>Available in API version 61.0 and later.</p>
<code>label</code>	string	Required. The channel label.

## PlatformEventChannelSelectedEntity

 **Note:** This field type is removed in API version 47.0 and later and is available only in API versions 45.0 and 46.0.

Field Name	Field Type	Description
<code>selectedEntity</code>	string	Required. The event name of an entity selected for Change Data Capture notifications. For example, for the Account standard object, the name is <code>AccountChangeEvent</code> , or for a custom object <code>MyObject__c</code> , the name is <code>MyObject__ChangeEvent</code> .

## Usage

The `createMetadata()` and `deleteMetadata()` calls aren't supported with the PlatformEventChannel metadata type.

In API version 47.0 and later, you can't deploy or retrieve the ChangeEvents standard channel.

You can't delete the ChangeEvents standard channel with `destructiveChanges.xml`, but you can delete channel members using the PlatformEventChannelMember type with `destructiveChanges.xml`.

You can delete a custom channel with `destructiveChanges.xml`. If you delete a custom channel, all its member PlatformEventChannelMember components are also deleted.

You can update only the `fullName` field and the `label` field of a PlatformEventChannel component.

## Declarative Metadata Sample Definition for a Custom Channel

The PlatformEventChannel component contains the label of the custom channel and the channel type.

```
<?xml version="1.0" encoding="UTF-8"?>
<PlatformEventChannel xmlns="http://soap.sforce.com/2006/04/metadata">
  <channelType>data</channelType>
  <label>Custom Channel for Sales Events</label>
</PlatformEventChannel>
```

This `package.xml` references the previous definition. The custom channel name is `SalesEvents__chn`.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>SalesEvents__chn</members>
    <name>PlatformEventChannel</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

To deploy or retrieve all custom channels, specify the wildcard character `*` (asterisk) in the `<members>` field.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>PlatformEventChannel</name>
  </types>
  <version>62.0</version>
</Package>
```

## Upgrading to Version 47.0 or Later From an Earlier Version

The `channelMembers` field of the `PlatformEventChannel` type is removed in API version 47.0 and later. As a result, `PlatformEventChannel` components created in prior versions can't be deployed using a later API version but you can deploy them in the same API version they were created with.

To deploy a custom channel component using API version 47.0 and later, upgrade the `PlatformEventChannel` definition by removing the `<channelMembers>` fields. For the `ChangeEvent` standard channel, it can't be deployed or retrieved, so delete the `PlatformEventChannel` definition file.

For example, if you had custom channel called `SalesEvents__chn`, this could be your custom channel definition in API version 46.0.

```
<?xml version="1.0" encoding="UTF-8"?>
<PlatformEventChannel xmlns="http://soap.sforce.com/2006/04/metadata">
  <channelMembers>
    <selectedEntity>AccountChangeEvent</selectedEntity>
  </channelMembers>
  <channelMembers>
    <selectedEntity>ContactChangeEvent</selectedEntity>
  </channelMembers>
  <channelType>data</channelType>
  <label>Sales Events</label>
</PlatformEventChannel>
```

To upgrade to version 47.0 or later, you would replace the custom channel definition with this definition, which doesn't contain any channel members.

```
<?xml version="1.0" encoding="UTF-8"?>
<PlatformEventChannel xmlns="http://soap.sforce.com/2006/04/metadata">
  <channelType>data</channelType>
```

```
<label>SalesEvents__chn</label>
</PlatformEventChannel>
```

For each channel member that is part of either a custom or the standard ChangeEvents channel, add a PlatformEventChannelMember metadata component. Also, in the `package.xml` file, reference both the PlatformEventChannel and PlatformEventChannelMember components.

For example, this PlatformEventChannelMember component is for the AccountChangeEvent member.

```
<?xml version="1.0" encoding="UTF-8"?>
<PlatformEventChannelMember xmlns="http://soap.sforce.com/2006/04/metadata">
  <eventChannel>SalesEvents__chn</eventChannel>
  <selectedEntity>AccountChangeEvent</selectedEntity>
</PlatformEventChannelMember>
```

For more information, see [PlatformEventChannelMember](#).

For an example of a custom channel that holds custom platform events and Real-Time Event Monitoring events, see [Group Platform Events into One Stream with a Custom Channel](#) in the *Platform Events Developer Guide*.

#### SEE ALSO:

[Change Data Capture Developer Guide: Subscription Channels](#)

[Change Data Capture Developer Guide: Compose Streams of Change Data Capture Notifications with Custom Channels](#)

[PlatformEventChannelMember](#)

## PlatformEventChannelMember

---

Represents an entity selected for Change Data Capture notifications on a standard or custom channel, or a platform event selected on a custom channel.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

PlatformEventChannelMember components have the suffix `.platformEventChannelMember` and are stored in the `platformEventChannelMembers` folder.

### Version

PlatformEventChannelMember components are available in API version 47.0 and later.

### Special Access Rules

You must have the Customize Application permission to deploy and retrieve this type.

## Fields

Field Name	Field Type	Description
enrichedFields	<a href="#">EnrichedField</a> []	One or more fields selected for Change Data Capture Enrichment. A non-empty enriched field is added to an update or delete change event even when not changed. For more information, see <a href="#">Enrich Change Events with Extra Fields When Subscribed with CometD</a> in the <i>Change Data Capture Developer Guide</i> . Available in API version 51.0 and later.
eventChannel	string	Required. The name of a channel. For the standard channel, the name is <code>ChangeEventS</code> . For a custom channel, the name is in this format: <b><code>MyChannel__chn</code></b> .
filterExpression	string	An expression that is used to filter the stream of events and deliver only the events that match specific criteria. The filter expression can contain one or more field-value expressions. The filter expression format is based on SOQL and supports a subset of SOQL operators and field types.  For example, this filter expression delivers only events that contain the <code>City__c</code> field with a value of 'San Francisco'. <code>City__c = 'San Francisco'</code>  For more information, see <a href="#">Filter Your Stream of Platform Events with Custom Channels</a> in the <i>Platform Events Developer Guide</i> and <a href="#">Filter Your Stream of Change Events with Channels</a> in the <i>Change Data Capture Developer Guide</i> . Available in API version 56.0 and later.
selectedEntity	string	Required. The change event name of an entity selected for Change Data Capture notifications. For example, for the Account standard object, the name is <code>AccountChangeEvent</code> , or for a custom object <code>MyObject__c</code> , the name is <code>MyObject__ChangeEvent</code> .

## EnrichedField

A field selected on PlatformEventChannelMember for Change Data Capture Enrichment. A non-empty enriched field is added to an update or delete change event even when not changed.

Field Name	Field Type	Description
name	string	The name of a field selected to enrich change events with.

## Usage

The [createMetadata\(\)](#) and [deleteMetadata\(\)](#) calls aren't supported with the PlatformEventChannelMember metadata type.

To delete a channel member from a channel, deploy `destructiveChanges.xml` for this type and specify the full name of the member.

## Declarative Metadata Sample Definition

This PlatformEventChannelMember component represents the selection of the Lead change event as part of the Change Data Capture selections (the standard ChangeEvents channel).

```
<?xml version="1.0" encoding="UTF-8"?>
<PlatformEventChannelMember xmlns="http://soap.sforce.com/2006/04/metadata">
  <eventChannel>ChangeEvents</eventChannel>
  <selectedEntity>LeadChangeEvent</selectedEntity>
</PlatformEventChannelMember>
```

**Note:** The file name of the example component is

ChangeEvents\_LeadChangeEvent.platformEventChannelMember. The file name, without the extension, corresponds to the component full name (ChangeEvents\_LeadChangeEvent).

If the channel has more than one selected entity, each entity is represented separately by a PlatformEventChannelMember component. For example, this component is a second member of the standard ChangeEvents channel and represents the Contact change event.

```
<?xml version="1.0" encoding="UTF-8"?>
<PlatformEventChannelMember xmlns="http://soap.sforce.com/2006/04/metadata">
  <eventChannel>ChangeEvents</eventChannel>
  <selectedEntity>ContactChangeEvent</selectedEntity>
</PlatformEventChannelMember>
```

This example is a selected entity on the SalesEvents\_\_chn custom channel.

```
<?xml version="1.0" encoding="UTF-8"?>
<PlatformEventChannelMember xmlns="http://soap.sforce.com/2006/04/metadata">
  <eventChannel>SalesEvents__chn</eventChannel>
  <selectedEntity>ContactChangeEvent</selectedEntity>
</PlatformEventChannelMember>
```

This example shows one enriched field, Phone, for a selected entity on the SalesEvents\_\_chn custom channel. Enriched fields are supported in API version 51.0 and later.

```
<?xml version="1.0" encoding="UTF-8"?>
<PlatformEventChannelMember xmlns="http://soap.sforce.com/2006/04/metadata">
  <enrichedFields>
    <name>Phone</name>
  </enrichedFields>
  <eventChannel>SalesEvents__chn</eventChannel>
  <selectedEntity>ContactChangeEvent</selectedEntity>
</PlatformEventChannelMember>
```

This example shows a filter expression for a ContactChangeEvent selected entity on the SalesEvents\_\_chn custom channel.

```
<?xml version="1.0" encoding="UTF-8"?>
<PlatformEventChannelMember xmlns="http://soap.sforce.com/2006/04/metadata">
  <eventChannel>SalesEvents__chn</eventChannel>
  <filterExpression><![CDATA[(Region__c='AMER')]]></filterExpression>
  <selectedEntity>ContactChangeEvent</selectedEntity>
</PlatformEventChannelMember>
```

## Underscores in Channel Member Full Names

Two consecutive underscores in full names designate either a component name suffix or a namespace prefix. In all other cases, two consecutive underscores aren't supported in full names. If your channel member name contains a custom channel name to make it unique, ensure to replace the double underscores in the name with one underscore. For example, the member name would be `SalesEvents_chn_AccountChangeEvent` and not `SalesEvents__chn_AccountChangeEvent`.

## Referencing Channel Members and Channels in `Package.xml`

This manifest file references the example definitions on the `ChangeEvent`s standard channel. It lists each member in the `<members>` field of `PlatformEventChannelMember`. The `<members>` field contains the channel member full name in this format:

**`ChannelName_EventName`**.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>ChangeEvent_LeadChangeEvent</members>
    <members>ChangeEvent_ContactChangeEvent</members>
    <name>PlatformEventChannelMember</name>
  </types>
  <version>62.0</version>
</Package>
```

This manifest file references members of the `SalesEvents__chn` custom channel.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>SalesEvents_chn_AccountChangeEvent</members>
    <members>SalesEvents_chn_ContactChangeEvent</members>
    <members>SalesEvents_chn_MyCustomObj_ChangeEvent</members>
    <name>PlatformEventChannelMember</name>
  </types>
  <version>62.0</version>
</Package>
```

To retrieve a custom channel and channel members, you can reference them in the same `package.xml` file, as this example shows.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>SalesEvents__chn</members>
    <name>PlatformEventChannel</name>
  </types>
  <types>
    <members>SalesEvents_chn_AccountChangeEvent</members>
    <members>SalesEvents_chn_ContactChangeEvent</members>
    <members>SalesEvents_chn_MyCustomObj_ChangeEvent</members>
    <name>PlatformEventChannelMember</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Change Data Capture Developer Guide: Example Diagrams for Channels and Channel Members](#)

[Platform Events Developer Guide: Filter Your Stream of Platform Events with Channels](#)

[PlatformEventChannel](#)

## PlatformEventSubscriberConfig

---

Represents configuration settings for a platform event Apex trigger, including the batch size and the trigger's running user.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

`PlatformEventSubscriberConfig` components have the suffix `.platformEventSubscriberConfig` and are stored in the `PlatformEventSubscriberConfigs` folder.

## Version

`PlatformEventSubscriberConfig` components are available in API version 51.0 and later.

## Fields

Field Name	Field Type	Description
<code>batchSize</code>	int	<p>A custom batch size, from 1 through 2,000, for the platform event Apex trigger. The batch size corresponds to the maximum number of event messages that can be sent to a trigger in one execution. The default batch size is 2,000 for platform event triggers.</p> <p>We don't recommend setting the batch size to 1 to process one event at a time. Small batch sizes can slow down the processing of event messages.</p>
<code>isProtected</code>	boolean	(Inherited field.) Indicates whether this component is protected ( <code>true</code> ) or not ( <code>false</code> ). Protected components can't be linked to or referenced by components created in a subscriber org. A developer can delete a protected component in a future release without worrying about failing

Field Name	Field Type	Description
		installations. However, once a component is marked as unprotected and is released globally, the developer can't delete it.
masterLabel	string	Required. The label for the PlatformEventSubscriberConfig component.
numPartitions	int	Specifies the number of parallel subscriptions, or partitions, that are created internally for an Apex trigger. Use this field to set up parallel subscriptions for the platform event Apex trigger. It can be an integer from 1 through 10. See <a href="#">Platform Event Processing at Scale with Parallel Subscriptions for Apex Triggers</a> in the <i>Platform Events Developer Guide</i> . The default value is 1. This field is available in API version 62.0 and later.
partitionKey	string	Can be the standard <code>EventUuid</code> field or a required custom field of the custom platform event that the Apex trigger subscribes to. For the standard <code>EventUuid</code> field, the partition key format is the field name without the event name: <code>EventUuid</code> . For a custom field, the partition key includes the event name as a prefix in this format: <b><code>EventName__e.FieldName__c</code></b> . Based on the field's generated hash value, the system determines which partition to send the event to. Use this field to specify the platform event field that is used as a partition key for parallel subscriptions. See <a href="#">Platform Event Processing at Scale with Parallel Subscriptions for Apex Triggers</a> in the <i>Platform Events Developer Guide</i> . The default value is <code>EventUuid</code> . This field is available in API version 62.0 and later.
platformEventConsumer	string	Required. The full name of the platform event Apex trigger to configure.
user	string	The username of the user that the platform event Apex trigger runs as. By default, the platform event trigger runs as the Automated Process entity. Setting the running user to a specific user has these benefits: <ul style="list-style-type: none"> <li>• Records are created or modified as this user.</li> <li>• Records with <code>OwnerId</code> fields have their <code>OwnerId</code> fields populated to this user when created or modified.</li> <li>• Debug logs for the trigger execution are created by this user.</li> <li>• You can send email from the trigger, which isn't supported with the default Automated Process user.</li> </ul>

## Declarative Metadata Sample Definition

This PlatformEventSubscriberConfig component has the label `OrderEventTriggerConfig`. It contains the configuration of a platform event trigger, `OrderEventTrigger`, and specifies the batch size and user.

```
<?xml version="1.0" encoding="UTF-8"?>
<PlatformEventSubscriberConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <platformEventConsumer>OrderEventTrigger</platformEventConsumer>
```

```

    <batchSize>200</batchSize>
    <masterLabel>OrderEventTriggerConfig</masterLabel>
    <user>user@example.com</user>
    <isProtected>>false</isProtected>
</PlatformEventSubscriberConfig>

```

PlatformEventSubscriberConfig references an Apex trigger, which depends on a platform event. If the referenced items exist in the Salesforce org, you can deploy the PlatformEventSubscriberConfig component. This `package.xml` specifies the PlatformEventSubscriberConfig component.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <name>PlatformEventSubscriberConfig</name>
    <members>OrderEventTriggerConfig</members>
  </types>
  <version>62.0</version>
</Package>

```

If the referenced trigger and platform event don't exist in the org, include their definitions in the package. Otherwise, the deployment fails. This example `package.xml` includes all the referenced components.

- CustomObject represents the platform event.
- CustomField represents a custom field defined on the platform event.
- ApexTrigger represents the platform event trigger.
- PlatformEventSubscriberConfig represents the configuration options for the platform event trigger.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <name>CustomObject</name>
    <members>PlatformEvent__e</members>
  </types>
  <types>
    <name>CustomField</name>
    <members>PlatformEvent__e.Message__c</members>
  </types>
  <types>
    <name>ApexTrigger</name>
    <members>OrderEventTrigger</members>
  </types>
  <types>
    <name>PlatformEventSubscriberConfig</name>
    <members>OrderEventTriggerConfig</members>
  </types>
  <version>62.0</version>
</Package>

```

To specify all PlatformEventSubscriberConfig components, use the wildcard character, as shown in this example.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <name>PlatformEventSubscriberConfig</name>
    <members>*</members>
  </types>

```

```

</types>
<version>62.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Portal

---

The Portal metadata type represents a partner portal.

It extends [Metadata](#) and inherits its `fullName` field. To use this metadata type, you must have a partner portal or Customer Portal enabled for your organization. For more information, see [Partner Portal Overview](#) in Salesforce Help.

## Declarative Metadata File Suffix and Directory Location

Lightning Platform Portal components are stored in the `portals` directory of the corresponding package directory. The file name matches the portal name, and the extension is `.portal`.

## Version

Lightning Platform Portal components are available in API version 15.0 and later.

## Special Access Rules

All users, including unauthenticated guest users, can view portals via the API.

## Fields

Field	Field Type	Description
<code>active</code>	boolean	Required. Denotes whether this portal is active.
<code>admin</code>	string	The full name of the user designated to administer the portal.
<code>defaultLanguage</code>	string	The default language for HTML messages for the portal. Use the abbreviation for the language, for example, <code>en_US</code> for United States English.
<code>description</code>	string	The portal description.
<code>emailSenderAddress</code>	string	Required. The email address used when sending emails using templates configured from the portal (for example, for resetting the password).

Field	Field Type	Description
emailSenderName	string	Required. The name to display when sending emails using templates configured from the portal (for example, for resetting the password).
enableSelfCloseCase	boolean	For the Customer Portal, allows portal users to close their own cases.
footerDocument	string	The file to be used as the footer for this portal.
forgotPassTemplate	string	The email template to use when a user clicks the <b>Forgot Password</b> link.  Lightning email templates aren't packageable. We recommend using a Classic email template.
fullName	string	Required. The name of the portal.  Inherited from <a href="#">Metadata</a> , this field is defined in the WSDL for this metadata type. It must be specified when creating, updating, or deleting. See <a href="#">createMetadata()</a> to see an example of this field specified for a call.
headerDocument	string	The file to be used as the header for this portal.
isSelfRegistrationActivated	boolean	Determines whether self-registration is active or not for this portal.
loginHeaderDocument	string	The file to be used as the header for this portal's login page.
logoDocument	string	The file to be used as the logo for this portal.
logoutUrl	string	The URL that the user is redirected to on logout.
newCommentTemplate	string	The email template to be used for auto-notifications on new case comments.
newPassTemplate	string	The email template to be used for auto-notifications on password reset.  Lightning email templates aren't packageable. We recommend using a Classic email template.
newUserTemplate	string	The email template to be used for auto-notifications on new user creation.  Lightning email templates aren't packageable. We recommend using a Classic email template.
ownerNotifyTemplate	string	The email template to be used for auto-notifications on owner change.  Lightning email templates aren't packageable. We recommend using a Classic email template.
selfRegNewUserUrl	string	The URL of the self-registration page.

Field	Field Type	Description
selfRegUserDefaultProfile	string	The default profile for self-registered users.
selfRegUserDefaultRole	PortalRoles (enumeration of type string)	The default role for self-registered users. The valid values are: <ul style="list-style-type: none"> <li>• Executive</li> <li>• Manager</li> <li>• User</li> <li>• PersonAccount</li> </ul>
selfRegUserTemplate	string	The email template to be used for auto-notifications on self-registration.  Lightning email templates aren't packageable. We recommend using a Classic email template.
showActionConfirmation	boolean	Determines whether confirmation messages are displayed for actions in the portal.
stylesheetDocument	string	The Document object to be used as the CSS style sheet for this portal.
type	PortalType (enumeration of type string)	Required. The type for this portal. The valid values are: <ul style="list-style-type: none"> <li>• CustomerSuccess</li> <li>• Partner</li> </ul>

## Declarative Metadata Sample Definition

Here's a sample XML definition of a portal.

```
<?xml version="1.0" encoding="UTF-8"?>
<Portal xmlns="http://soap.sforce.com/2006/04/metadata">
  <active>true</active>
  <description>Customer Portal</description>
  <emailSenderName>rguest@albany.com</emailSenderName>
  <enableSelfCloseCase>false</enableSelfCloseCase>
  <forgotPassTemplate>unfiled$public/ChangePwdEmail</forgotPassTemplate>
  <isSelfRegistrationActivated>false</isSelfRegistrationActivated>
  <newPassTemplate>unfiled$public/ChangePwdEmail</newPassTemplate>
  <newUserTemplate>unfiled$public/NewUserEmail</newUserTemplate>
  <selfRegUserTemplate>unfiled$public/SelfRegUserEmail</selfRegUserTemplate>
  <showActionConfirmation>false</showActionConfirmation>
  <type>CustomerSuccess</type>
</Portal>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[CustomSite](#)

## PortalDelegablePermissionSet

---

Represents the org-level permission sets that can be assigned to a particular profile for external users or shoppers in a store after enabling the Delegable Administration perm.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

PortalDelegablePermissionSet components have the suffix `.portaldelegablepermissionset` and are stored in the `portaldelegablepermissionsets` folder.

### Version

PortalDelegablePermissionSet components are available in API version 56.0 and later.

### Fields

Field Name	Description
<code>isProtected</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The label for the service that appears to users.</p>
<code>permissionSet</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. Foreign key to the <a href="#">permissionSet</a> on page 1438 entity.</p>
profile	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. Foreign key to the <a href="#">profile</a> on page 1477 entity.</p>

## Declarative Metadata Sample Definition

The following is the definition of the PortalDelegablePermissionSet entity.

```
<xsd:complexType name="PortalDelegablePermissionSet">
  <xsd:complexContent>
    <xsd:extension base="tns:Metadata">
      <xsd:sequence>
        <xsd:element name="isProtected" minOccurs="0" type="xsd:boolean"/>
        <xsd:element name="masterLabel" type="xsd:string"/>
        <xsd:element name="permissionSet" type="xsd:string"/>
        <xsd:element name="profile" type="xsd:string"/>
      </xsd:sequence>
    </xsd:extension>
  </xsd:complexContent>
</xsd:complexType>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>PortalDelegablePermissionSet</name>
  </types>
  <types>
    <members>*</members>
    <name>Profile</name>
  </types>
  <types>
    <members>*</members>
    <name>PermissionSet</name>
  </types>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PostTemplate

Represents the metadata associated with an approval post template for Approvals in Chatter. With approval post templates, you can customize the information included in approval request posts that appear in Chatter feeds. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

**Note:** Review Chatter Post Templates for Approval Requests in the Salesforce Help before you create a post template.

## File Suffix and Directory Location

PostTemplate components have the suffix `.postTemplate` and are stored in the `postTemplates` folder.

## Version

PostTemplate components are available in API version 29.0 and later.

## Fields

Field Name	Field Type	Description
<code>default</code>	boolean	Required. Specifies whether this is the default post template for the given object.  When set to <code>true</code> , this post template is used by approval processes that are associated with the same object and don't specify a post template.  When an object has no default post template, each of its approval processes uses the system default post template, unless the approval process specifies its own post template.
<code>description</code>	string	Optional description of the post template.
<code>fields</code>	string[]	Required. An array of up to four fields to include in approval request posts.  If the approval object is a detail object in a master-detail relationship, <code>Owner</code> isn't available for approval page layouts or approval post templates.
<code>label</code>	string	Required. Name of the post template. This non-unique label is different from the unique name of the post template.

## Declarative Metadata Sample Definition

The following is an example of a PostTemplate component:

```
<PostTemplate xmlns="http://soap.sforce.com/2006/04/metadata">
  <default>false</default>
  <fields>NumberOfEmployees</fields>
  <fields>NumberOfLocations__c</fields>
  <fields>PartnerAccount</fields>
  <fields>LeadCustomFieldNumber__c</fields>
</PostTemplate>
```

```
<label>My Lead Post Template</label>
</PostTemplate>
```

The following is an example package manifest that references the previous PostTemplate component.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Lead.leadtemplate</members>
    <name>PostTemplate</name>
  </types>
  <version>29.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ProductAttributeSet

---

Represents the ProductAttribute information being used as an attribute such as `color_c`, `size_c`.

### Version

ProductAttributeSet components are available in API version 54 and later.

## Special Access Rules

### Fields

Field Name	Field Type	Description
<code>description</code>	string	A meaningful explanation of the attribute set.
<code>developerName</code>	string	A unique name for the attribute set.
<code>masterLabel</code>	string	The name of the attribute set.
<code>productAttributeSetItems</code>	ProductAttributeSetItem	A list of ProductAttributeSetItem.

## PresenceDeclineReason

---

Represents an Omni-Channel decline reason that agents can select when declining work requests. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

PresenceDeclineReason components have the suffix `.presenceDeclineReason` and are stored in the `presenceDeclineReasons` folder.

## Version

PresenceDeclineReason components are available in API version 44.0 and later.

## Special Access Rules

This type is available only if Omni-Channel is enabled in your org.

## Fields

Field Name	Field Type	Description
label	string	The label for the decline reason.

## Declarative Metadata Sample Definition

The following is an example of a PresenceDeclineReason component.

```
<?xml version="1.0" encoding="UTF-8"?>
<PresenceDeclineReason xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>Incorrect queue</label>
</PresenceDeclineReason>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>PresenceDeclineReason</name>
  </types>
  <version>44.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PresenceUserConfig

Represents a configuration that determines a presence user's settings.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

PresenceUserConfig components have the suffix `.presenceUserConfig` and are stored in the `presenceUserConfigs` folder.

## Version

PresenceUserConfig components are available in API version 44.0 and later.

## Special Access Rules

This type is available only if Omni-Channel is enabled in your org.

## Fields

Field Name	Field Type	Description
<code>assignments</code>	<a href="#">PresenceConfigAssignments</a>	Specifies how presence configurations are assigned to Omni-Channel users. Presence configurations can be assigned to sets of users or to sets of profiles.
<code>capacity</code>	int	Required. The maximum number of work units an agent can be assigned at one time.
<code>declineReasons</code>	string	Specifies the list of decline reasons that an agent can select when they decline a work.
<code>enableAutoAccept</code>	boolean	Indicates whether work items that are routed to agents are automatically accepted ( <code>true</code> ) or not ( <code>false</code> ). Available only if <code>enableDecline</code> is set to <code>false</code> .
<code>enableDecline</code>	boolean	Indicates whether agents can decline work items that are routed to them ( <code>true</code> ) or not ( <code>false</code> ). Available only if <code>enableAutoAccept</code> is set to <code>false</code> .
<code>enableDeclineReason</code>	boolean	Indicates whether agents can select a reason for declining work requests ( <code>true</code> ) or not ( <code>false</code> ). This can be selected only if decline reasons are enabled.
<code>enableDisconnectSound</code>	boolean	Indicates whether a sound is played when agents are disconnected from Omni-Channel ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableRequestSound</code>	boolean	Indicates whether a sound plays with incoming work requests ( <code>true</code> ) or not ( <code>false</code> ). Set to <code>true</code> by default.
<code>interruptibleCapacity</code>	int	Indicates the maximum number of work units using interruptible capacity that can be pushed to an agent at a time. An empty value defaults this field to the value set in the <code>capacity</code> field. Available in API version 57.0 and later when the Interruptible Capacity feature is enabled.
<code>label</code>	string	The label of the presence configuration.

Field Name	Field Type	Description
presenceStatusOnDecline	string	The presence status that's automatically assigned to the agent when the agent declines a work item. Available only if <code>enableDecline</code> is set to <code>true</code> .
presenceStatusOnPushTimeout	string	The presence status that's automatically assigned to the agent when the agent doesn't respond to a work item before push timeout occurs.

## PresenceConfigAssignments

Represents the assignments of an org's profiles and users to a Presence configuration.

Field Name	Field Type	Description
profiles	<a href="#">PresenceConfigProfileAssignments</a>	Specifies the profiles that are associated with a specific presence configuration.
users	<a href="#">PresenceConfigUserAssignments</a>	Specifies the users that are associated with a specific presence configuration.

## PresenceConfigProfileAssignments

Represents the profiles associated with a specific presence configuration.

Field Name	Field Type	Description
profile	string	Specifies the name of the profile associated with a specific presence configuration.

## PresenceConfigUserAssignments

Represents the users associated with a specific presence configuration.

Field Name	Field Type	Description
user	string	Specifies the username of the user associated with a specific presence configuration.

## Declarative Metadata Sample Definition

The following is an example of a PresenceUserConfig component.

```
<?xml version="1.0" encoding="UTF-8"?>
<PresenceUserConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <assignments>
    <profiles>
      <profile>standard</profile>
    </profiles>
    <users>
      <user>jdoe@example.com</user>
    </users>
  </assignments>
</PresenceUserConfig>
```

```

        </users>
    </assignments>
    <capacity>5</capacity>
    <declineReasons>Incorrect_queue</declineReasons>
    <enableAutoAccept>false</enableAutoAccept>
    <enableDecline>true</enableDecline>
    <enableDeclineReason>true</enableDeclineReason>
    <enableDisconnectSound>true</enableDisconnectSound>
    <enableRequestSound>true</enableRequestSound>
    <label>My presence configuration</label>
    <presenceStatusOnDecline>Away</presenceStatusOnDecline>
    <presenceStatusOnPushTimeout>Break</presenceStatusOnPushTimeout>
</PresenceUserConfig>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>*</members>
        <name>PresenceUserConfig</name>
    </types>
    <version>44.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Profile

Represents a user profile. A profile defines a user's permission to perform different functions within Salesforce. This type extends the Metadata metadata type and inherits its `fullName` field.

In API version 29.0 and later, you can retrieve and deploy access settings for these managed components in profiles and permission sets:

- Apex classes
- Apps
- Custom field permissions
- Custom object permissions
- Custom tab settings
- External data sources
- Record types
- Visualforce pages

In API version 51.0 and later, you can retrieve and deploy access settings for login flows. For more information, see Managed Component Access in the Components in a Module section of [Sample package.xml Manifest Files](#).

As of API version 50.0 and later, only users with correct permissions can view profile names other than their own if the Profile Filtering setting is enabled.

**!** **Important:** Profile names are also exposed when users with permissions to perform the following tasks take these actions:

- Create a tab or record type with a wizard step that includes the assignment of tabs and record types to profiles.
- Configure a login flow where viewing profile lists is required to make flow associations.
- Set up delegated admins where looking up profiles is needed to identify assignable profiles.
- Administer an org as a delegated customer admin.
- Administer an org as a delegated admin to view and assign profiles of the delegated group.

## Declarative Metadata File Suffix and Directory Location

The file suffix is `.profile`. There's one file for each profile, stored in the `profiles` folder in the corresponding package directory.

## Version

Profiles are available in API version 10.0 and later.

## Special Access Rules

As of Summer '20 and later, Customer Portal and Partner Portal users can't access this type.

To view the following settings, assignments, and permissions for standard and custom objects in a specified profile, the View Setup and Configuration permission is required.

- Client settings
- Field permissions
- Layout assignments
- Object permissions
- Permission dependencies
- Permission set tab settings
- Permission set group components
- Record types

## Fields

The content of a profile returned by Metadata API depends on the content requested in the `RetrieveRequest` message. For example, profiles only include field-level security for fields included in custom objects returned in the same `RetrieveRequest` as the profiles. The profile definition contains the following fields:

**!** **Important:** We designed Profile metadata deployment to overlay the existing Profile settings in a target org. For example, if you disable permissions for a profile, the newly disabled permission information isn't exported. To force all Profile changes to deploy through metadata, including permission disablement, add code that explicitly indicates disabled permissions. For example, add this code to the Profile metadata `.xml` file before deploying into a target org: `<value>false</value>`.

If you deploy a profile that doesn't exist in the target org and don't specify any permissions or settings, then the resulting profile contains all permissions and settings in the standard Minimum Access - Salesforce profile (API version 60.0 and later) or the standard Standard User profile (API version 59.0 and earlier).

 **Note:** As of API version 38.0, you can change field permissions to make a field editable using the Metadata API for fields that you can't change through the user interface. For example, you can deploy `Asset . ProductCode` as an editable field even though you can't through the user interface.

Field Name	Field Type	Description
<code>applicationVisibilities</code>	<a href="#">ProfileApplicationVisibility[]</a>	Indicates which apps are visible to users assigned to this profile. In API version 29.0 and earlier, this field supports custom apps only. In API version 30.0 and later, this field supports both standard and custom apps.
<code>categoryGroupVisibilities</code>	<a href="#">ProfileCategoryGroupVisibility[]</a>	Indicates which data category groups are visible to users assigned to this profile. Available in API version 41.0 and later.
<code>classAccesses</code>	<a href="#">ProfileApexClassAccess[]</a>	Indicates which top-level Apex classes have methods that users assigned to this profile can execute.
<code>custom</code>	boolean	Indicates whether the profile is a custom ( <code>true</code> ) or standard ( <code>false</code> ) profile. Available in API version 30.0 and later.
<code>customMetadataTypeAccesses</code>	<a href="#">ProfileCustomMetadataTypeAccess[]</a>	Indicates the custom metadata types that are read-accessible to a user assigned to this profile. Available in API version 47.0 and later.
<code>customPermissions</code>	<a href="#">ProfileCustomPermissions[]</a>	Indicates which custom permissions are available to users assigned to this profile. Available in API version 31.0 and later.
<code>customSettingAccesses</code>	<a href="#">ProfileCustomSettingAccesses[]</a>	Indicates the custom settings that are read-accessible to a user assigned to this profile. Available in API version 47.0 and later.
<code>description</code>	string	The profile description. Limit: 255 characters. Available in API version 30.0 and later.
<code>externalDataSourceAccesses</code>	<a href="#">ProfileExternalDataSourceAccess[]</a>	Indicates which data sources with identity type of <code>Per User</code> are available to users assigned to this profile. Available in API version 27.0 and later.
<code>fieldLevelSecurities</code>	<a href="#">ProfileFieldLevelSecurity[]</a>	Indicates which fields are visible to a user assigned to this profile, and the kind of access available (editable or hidden). This field is available in API version 22.0 and earlier.
<code>fieldPermissions</code>	<a href="#">ProfileFieldLevelSecurity[]</a>	Indicates which fields are visible to a user assigned to this profile, and the kind of access available (editable or readable). This field is available in API version 23.0 and later.
<code>flowAccesses</code>	<a href="#">ProfileFlowAccess[]</a>	Indicates which flows can be accessed by a user assigned to this profile. Available in API version 47.0 and later.

Field Name	Field Type	Description
fullName	string	<p>The name can only contain characters, letters, and the underscore ( <code>_</code> ) character. The name must start with a letter, and can't end with an underscore or contain two consecutive underscore characters.</p> <p>Inherited from the <a href="#">Metadata</a> component, this field isn't defined in the WSDL for this component. It must be specified when creating, updating, or deleting. See <a href="#">create()</a> to see an example of this field specified for a call.</p>
layoutAssignments	<a href="#">ProfileLayoutAssignments</a> []	Indicates which layout to use for this profile.
loginFlows	<a href="#">LoginFlow</a> []	Indicates a business process that you direct users to before they access Salesforce.
loginHours	<a href="#">ProfileLoginHours</a> []	<p>Indicates the hours within which a user with this profile can log in. If not specified, the profile doesn't restrict a user's login hours.</p> <p>This field is available in API version 25.0 and later.</p>
loginIpRanges	<a href="#">ProfileLoginIpRange</a> []	<p>The list of IP address ranges from which users with a particular profile can log in.</p> <p>This field is available in API version 17.0 and later.</p>
objectPermissions	<a href="#">ProfileObjectPermissions</a> []	<p>Indicates which objects are accessible to a user assigned to this profile, and the kind of access available (create, read, edit, delete, and so on). In API version 28.0 and later, this field is only retrieved when <code>allowRead</code> is <code>true</code>.</p> <p>In API version 50.0 and later, editing standard objects on standard profiles is disabled.</p>
pageAccesses	<a href="#">ProfileApexPageAccess</a> []	Indicates which Visualforce pages that users assigned to this profile can execute.
profileActionOverrides	<a href="#">ProfileActionOverride</a> []	<p>A list of the Lightning Experience Home page action overrides that are assigned to this profile. When a user logs in with a profile, a matching <a href="#">ProfileActionOverride</a> assignment takes precedence over existing overrides for the Home tab specified in <a href="#">ActionOverride</a>.</p> <p>This field is available in API versions 37.0 to 44.0.</p>
recordTypeVisibilities	<a href="#">ProfileRecordTypeVisibility</a> []	Indicates the visibility of record types for users assigned to this profile. In API version 29.0 and later, this field isn't retrieved or deployed for inactive record types.
tabVisibilities	<a href="#">ProfileTabVisibility</a> []	Indicates which record types are visible to a user assigned to this profile, and therefore which tabs within an app are visible.

Field Name	Field Type	Description
<code>userLicense</code>	string	The <code>UserLicense</code> for the profile. A user license determines the baseline of features that the user can access. Every user must have exactly one user license.  This field is available in API version 17.0 and later.
<code>userPermissions</code>	<a href="#">ProfileUserPermission</a> []	Specifies a user permission (such as “API Enabled”) and whether it’s enabled for this profile. This field retrieves only enabled user permissions. Available in API version 29.0 and later.

## LoginFlow

LoginFlow represents a business process that you direct users to before they access Salesforce. You can use Metadata API to define existing flows as login flows and to edit login flow definitions. To delete login flow definitions, use the [Login Flow page](#).

Field Name	Field Type	Description
<code>flow</code>	string	Required only if the <code>uiLoginFlowType</code> is <code>VisualWorkflow</code> . The <code>fullName</code> of the <a href="#">Flow</a> .  Before you can deploy the LoginFlow, the Flow referenced here must be deployed in your org and its status must be <code>Active</code> .
<code>flowtype</code>	LoginFlowType ( <a href="#">enumeration</a> of type string)	Required. The value is <code>UI</code> .
<code>friendlyname</code>	string	Required. The name of the LoginFlow.
<code>uiLoginFlowType</code>	UiLoginFlowType ( <a href="#">enumeration</a> of type string)	Required. The type of login flow. These are valid values. <ul style="list-style-type: none"> <li><code>VisualWorkflow</code>—Indicates a Salesforce <a href="#">Flow</a>. You can create these flows using Flow Builder.</li> <li><code>VisualForce</code>—Indicates a flow created using Visualforce.</li> </ul>
<code>useLightningRuntime</code>	boolean	Indicates if Lightning Runtime is used ( <code>true</code> ) or not ( <code>false</code> (default)). Used only if <code>uiLoginFlowType</code> is <code>VisualWorkflow</code> .
<code>vfFlowPage</code>	string	Required only if the <code>uiLoginFlowType</code> is <code>VisualForce</code> . The name of the VisualForce page.
<code>vfFlowPageTitle</code>	string	Required only if the <code>uiLoginFlowType</code> is <code>VisualForce</code> . The name of the VisualForce page.

## ProfileActionOverride

ProfileActionOverride represents a user profile-based override of an [ActionOverride](#) on a standard Home tab in Lightning Experience.

 Note:

- ProfileActionOverride can be defined only on Profile for API version 39.0 to 44.0. In API version 45.0 and later, ProfileActionOverride must be defined for CustomApplication instead. Beginning with API version 45.0, Home page assignments related to user profile must also have a corresponding app assignment because more granular Home page assignments are supported. As a result, ProfileActionOverride is defined for CustomApplication rather than Profile.
- ProfileActionOverride settings aren't retrieved in the `.profile` file unless a Lightning page is referenced in the `package.xml` file.

Field Name	Field Type	Description
<code>actionName</code>	string	Required. The possible values are the same as the actions you can override: <ul style="list-style-type: none"> <li>• <code>accept</code></li> <li>• <code>clone</code></li> <li>• <code>delete</code></li> <li>• <code>edit</code></li> <li>• <code>list</code></li> <li>• <code>new</code></li> <li>• <code>tab</code></li> <li>• <code>view</code></li> </ul>
<code>content</code>	string	Set this field if <code>type</code> is set to <code>flexipage</code> , <code>lightningcomponent</code> , <code>scontrol</code> , or <code>visualforce</code> . It refers to the name of the Lightning page, Lightning component, s-control, or Visualforce page to use as the override. To reference installed components, use this format: <b><i>Component_namespace__Component_name.</i></b>
<code>formFactor</code>	FormFactor (enumeration of type string)	The size of the page being overridden. The <code>Large</code> value represents the Lightning Experience desktop environment and is valid only for the <code>flexipage</code> and <code>lightningcomponent</code> types. The <code>Small</code> value represents the Salesforce mobile app on a phone or tablet. The <code>Medium</code> value is reserved for future use. The <code>null</code> value (which is the same as specifying no value) represents Salesforce Classic.
<code>pageOrObjectType</code>	string	The name of the sObject type being overridden. Valid values are <code>standard</code> and <code>custom</code> .  This value must be <code>standard-home</code> when <code>actionName</code> is <code>tab</code> .
<code>recordType</code>	string	The record type assigned to the ProfileActionOverride. If the <code>PageOrObjectType</code> is <code>standard-home</code> , this field is null.
<code>type</code>	ActionOverrideType (enumeration of type string)	Required. Represents the type of action override. Valid values are described in <a href="#">ActionOverrideType</a> .

## ProfileApplicationVisibility

ProfileApplicationVisibility determines whether an app is visible to a user assigned to this profile.

Field Name	Field Type	Description
application	string	Required. The name of the app.
default	boolean	Required. Indicates whether the app is the default app ( <code>true</code> ) or not ( <code>false</code> ). Only one app per profile can be set to <code>true</code> .
visible	boolean	Required. Indicates whether this app is visible to users assigned to this profile ( <code>true</code> ) or not ( <code>false</code> ).

## ProfileCategoryGroupVisibility

ProfileCategoryGroupVisibility determines whether a data category group is visible to a user assigned to this profile. Available in API version 41.0 and later.

Field Name	Field Type	Description
dataCategories	string[]	Array of one or more data category names.
dataCategoryGroup	string	Required. The name of the data category group.
visibility	CategoryGroupVisibility (enumeration of type string)	Required. Indicates the visibility of the data category. Valid values are: <ul style="list-style-type: none"> <li>• ALL</li> <li>• CUSTOM</li> <li>• NONE</li> </ul>

## ProfileCustomMetadataTypeAccess

[ProfileCustomMetadataTypeAccess](#) represents the custom metadata type access for users assigned to a profile. Available in API version 47.0 and later.

Field	Field Type	Description
enabled	boolean	Required. Indicates whether the records for this custom metadata type are readable ( <code>true</code> ) or not ( <code>false</code> ).
name	string	Required. The custom metadata type name.

## ProfileApexClassAccess

ProfileApexClassAccess determines which top-level Apex classes have methods that users assigned to this profile can execute.

Field Name	Field Type	Description
<code>apexClass</code>	string	Required. The Apex class name.
<code>enabled</code>	boolean	Required. Indicates whether users assigned to this profile can execute methods in the top-level class ( <code>true</code> ) or not ( <code>false</code> ).

## ProfileCustomPermissions

`ProfileCustomPermissions` represents the custom permissions access for users assigned to a profile. Only enabled custom permissions are retrieved.

Field Name	Field Type	Description
<code>enabled</code>	boolean	Required. Indicates whether the custom permission is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>name</code>	string	Required. The custom permission name.

## ProfileCustomSettingAccesses

`ProfileCustomSettingAccesses` represents the custom setting access for users assigned to a profile. Available in API version 47.0 and later.

Field	Field Type	Description
<code>enabled</code>	boolean	Required. Indicates whether the records for this custom setting are readable ( <code>true</code> ) or not ( <code>false</code> ).
<code>name</code>	string	Required. The custom setting name.

## ProfileExternalDataSourceAccess

`ProfileExternalDataSourceAccess` represents the data source access for users with identity type of `Per User`. Available in API version 27.0 and later.

Field Name	Field Type	Description
<code>enabled</code>	boolean	Required. Indicates whether the data source is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>externalDataSource</code>	string	The name of the external data source.

## ProfileFieldLevelSecurity

`ProfileFieldLevelSecurity` represents the field level security for users assigned to a profile. In API version 30.0 and later, permissions for required fields can't be retrieved or deployed.

Field Name	Field Type	Description
<code>editable</code>	boolean	Required. Indicates whether this field is editable ( <code>true</code> ) or not ( <code>false</code> ). In API version 30.0 and later, when deploying a new custom field, this field is <code>false</code> by default.
<code>field</code>	string	Required. Indicates the name of the field. When referencing shared Activity fields, specify Event or Task. For example, <code>Event.Meeting__c</code> .
<code>hidden</code>	boolean	Indicates whether this field is hidden ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 22.0 and earlier. For portal profiles, this field is set to <code>true</code> by default in API version 19.0 and later.
<code>readable</code>	boolean	Indicates whether this field is readable ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 23.0 and later. It replaces the <code>hidden</code> field. In API version 30.0 and later, when deploying a new custom field, this field is <code>false</code> by default. For portal profiles, this field is set to <code>false</code> by default.

## ProfileFlowAccess

[ProfileFlowAccess](#) represents which flows a profile grants access to. Available in API version 47.0 and later.

Field	Field Type	Description
<code>enabled</code>	boolean	Required. Indicates whether users assigned this profile can access the flow ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>flow</code>	string	Required. The name of the flow to which access is granted.

## ProfileLayoutAssignments

`ProfileLayoutAssignments` determines which layout to use for a profile and a given entity.

Field Name	Field Type	Description
<code>layout</code>	string	Required. Indicates the layout for this particular entity.
<code>recordType</code>	string	This field is optional. If the <code>recordType</code> of the record matches a layout assignment rule, it uses the specified layout.

## ProfileLoginHours

`ProfileLoginHours` restricts the days and times within which users with a particular profile can log in.

Field Name	Field Type	Description
<code>weekdayStart</code>	string	<p>Specifies the earliest time on that day that a user with this profile can log in. If a start time for a particular day is specified, an end time for that day also must be specified. Start can't be greater than end for a particular day.</p> <ul style="list-style-type: none"> <li>Valid values for <code>weekday</code>: <code>monday</code>, <code>tuesday</code>, <code>wednesday</code>, <code>thursday</code>, <code>friday</code>, <code>saturday</code>, or <code>sunday</code>. For example, <code>mondayStart</code> indicates the beginning of the login period for Monday.</li> <li>Valid values for <code>Start</code>: the number of minutes since midnight. Must be evenly divisible by 60 (full hours). For example, <code>300</code> is 5:00 AM.</li> </ul>
<code>weekdayEnd</code>	string	<p>Specifies the time on that day that a user with this profile must log out by.</p> <ul style="list-style-type: none"> <li>Valid values for <code>weekday</code>: <code>monday</code>, <code>tuesday</code>, <code>wednesday</code>, <code>thursday</code>, <code>friday</code>, <code>saturday</code>, or <code>sunday</code>. For example, <code>mondayEnd</code> indicates the close of the login period for Monday.</li> <li>Valid values for <code>End</code>: the number of minutes since midnight. Must be evenly divisible by 60 (full hours). For example, <code>1020</code> is 5:00 PM.</li> </ul>

To delete login hour restrictions from a profile that previously had them, you must explicitly include an empty `loginHours` tag without any start or end times.

## ProfileLoginIpRange

`ProfileLoginIpRange` IP defines an IP address range that users with a particular profile can log in from.

Field Name	Field Type	Description
<code>description</code>	string	Use this field to identify the purpose of the range, such as which part of a network corresponds to this range. This field is available in API version 31.0 and later.
<code>endAddress</code>	string	Required. The end IP address for the range.
<code>startAddress</code>	string	Required. The start IP address for the range.

## ProfileObjectPermissions

`ProfileObjectPermissions` represents a user's access to objects.

### Note:

- In API version 18.0 and later, these permissions are disabled in new custom objects for any profiles where "View All Data" or "Modify All Data" is disabled.
- In API version 50.0 and later, editing standard objects on standard profiles is disabled.

Field Name	Field Type	Description
<code>allowCreate</code>	boolean	<p>Indicates whether the object referenced by the <code>object</code> field can be created by the users assigned to this profile (<code>true</code>) or not (<code>false</code>).</p> <p>This field is named <code>revokeCreate</code> before version 14.0 and the logic is reversed. The field name change and the update from <code>true</code> to <code>false</code> and the reverse is automatically handled between versions and doesn't require any manual editing of existing XML component files.</p>
<code>allowDelete</code>	boolean	<p>Indicates whether the object referenced by the <code>object</code> field can be deleted by the users assigned to this profile (<code>true</code>) or not (<code>false</code>).</p> <p>This field is named <code>revokeDelete</code> before version 14.0 and the logic is reversed. The field name change and the update from <code>true</code> to <code>false</code> and the reverse is automatically handled between versions and doesn't require any manual editing of existing XML component files.</p>
<code>allowEdit</code>	boolean	<p>Indicates whether the object referenced by the <code>object</code> field can be edited by the users assigned to this profile (<code>true</code>) or not (<code>false</code>).</p> <p>This field is named <code>revokeEdit</code> before version 14.0 and the logic is reversed. The field name change and the update from <code>true</code> to <code>false</code> and the reverse is automatically handled between versions and doesn't require any manual editing of existing XML component files.</p>
<code>allowRead</code>	boolean	<p>Indicates whether the object referenced by the <code>object</code> field can be seen by the users assigned to this profile (<code>true</code>) or not (<code>false</code>).</p> <p>This field is named <code>revokeRead</code> before version 14.0 and the logic is reversed. The field name change and the update from <code>true</code> to <code>false</code> and the reverse is automatically handled between versions and doesn't require any manual editing of existing XML component files.</p>
<code>modifyAllRecords</code>	boolean	<p>Indicates whether the object referenced by the <code>object</code> field can be read, edited, or deleted by the users assigned to this profile (<code>true</code>) or not (<code>false</code>), regardless of the sharing settings for the object. This setting is equivalent to the Modify All Data user permission limited to the individual object level. Available in API version 15.0 and later.</p> <p>This field isn't available for all objects. Refer to the profile in the user interface to determine which objects currently support these permissions. Profiles with Modify All Data ignore <code>modifyAllRecords</code> entries in Metadata API and don't return an error if Modify All Data is enabled on the profile.</p>
<code>object</code>	string	<p>Required. The name of the object whose permissions are altered by this profile, for example, <code>MyCustomObject__c</code>.</p>
<code>viewAllRecords</code>	boolean	<p>Indicates whether the object referenced by the <code>object</code> field can be read by the users assigned to this profile (<code>true</code>) or not (<code>false</code>), regardless of the sharing settings for the object. This setting includes private records (records with no parent object). This setting is equivalent</p>

Field Name	Field Type	Description
		to the View All Data user permission limited to the individual object level. Available in API version 15.0 and later.
		This field isn't available for all objects. Refer to the profile in the user interface to determine which objects currently support these permissions. Profiles with "View All Data" ignore <code>viewAllRecords</code> entries in the Metadata API and don't return an error if View All Data is enabled on the profile.

## ProfileApexPageAccess

ProfileApexPageAccess determines which Visualforce pages that users assigned to this profile can execute.

Field Name	Field Type	Description
<code>apexPage</code>	string	Required. The Visualforce page name.
<code>enabled</code>	boolean	Required. Indicates whether users assigned to this profile can execute the Visualforce page ( <code>true</code> ) or not ( <code>false</code> ).

## ProfileRecordTypeVisibility

ProfileRecordTypeVisibility represents the visibility of record types for this profile. Record types let you offer different business processes, picklist values, and page layouts to different users.

Field Name	Field Type	Description
<code>default</code>	boolean	Required. Indicates whether the record type is the default when users with this profile create records for this object ( <code>true</code> ) or not ( <code>false</code> ).
<code>personAccountDefault</code>	boolean	When Person Accounts is enabled, this field indicates whether the record type is this profile's default person account record type ( <code>true</code> ) or not ( <code>false</code> ). When Person Accounts is disabled, this field's value has no impact.  Person accounts aren't enabled by default in Salesforce. To request person accounts, contact Salesforce.
<code>recordType</code>	string	Required. The record type name, for example <code>Account.MyRecordType</code> .
<code>visible</code>	boolean	Required. Indicates whether this record type is visible to users assigned to this profile ( <code>true</code> ) or not ( <code>false</code> ).

## ProfileTabVisibility

ProfileTabVisibility represents the visibility of tabs for this profile. For version 17.0 and later, ProfileTabVisibility supports visibility of tabs for standard objects. The manifest file must include the standard object corresponding to a standard tab to retrieve the tab visibility in a profile.

Field Name	Field Type	Description
tab	string	Required. The name of the tab.
visibility	TabVisibility (enumeration of type string)	<p>Required. Indicates the visibility of the tab. Valid values are:</p> <ul style="list-style-type: none"> <li>DefaultOff—The tab is available on the All Tabs page. Users can individually customize their display to make the tab visible in any app.</li> <li>DefaultOn—The tab is available on the All Tabs page and appears in the visible tabs for its associated app. Users can individually customize their display to hide the tab or make it visible in other apps.</li> <li>Hidden—The tab isn't available on the All Tabs page or visible in any apps.</li> </ul> <p>In API version 36.0 and earlier, Hidden is returned only if visibility was set using the API. If it was set to Hidden from the profile in Salesforce, the API doesn't return a visibility value. For version 37.0 and later, when tab visibility is set to hidden, the API returns Hidden, regardless of how the value was set.</p>

## ProfileUserPermission

ProfileUserPermission represents an app or system permission for a profile. Use one of these elements for each permission.

Field	Field Type	Description
enabled	boolean	Required. Indicates whether the permission is enabled (true) or disabled (false).
name	string	Required. The permission name.

## Java Sample

This sample uses picklists, profiles, record types, and a custom app:

```
public void profileSample() {
    try {
        // Create an expense report record, tab and app...
        CustomObject expenseRecord = new CustomObject();
        expenseRecord.setFullName("ExpenseReport__c");
        expenseRecord.setLabel("Expense Report");
        expenseRecord.setPluralLabel("Expense Reports");
    }
}
```

```

expenseRecord.setDeploymentStatus(DeploymentStatus.Deployed);
expenseRecord.setSharingModel(SharingModel.ReadWrite);

CustomField nameField = new CustomField();
nameField.setType(FieldType.AutoNumber);
nameField.setLabel("Expense Report Number");
nameField.setDisplayFormat("ER-{0000}");
expenseRecord.setNameField(nameField);

AsyncResult[] arsExpenseRecord =
    metadataConnection.create(new Metadata[] {expenseRecord});

Picklist expenseStatus = new Picklist();
PicklistValue unsubmitted = new PicklistValue();
unsubmitted.setFullName("Unsubmitted");
PicklistValue submitted = new PicklistValue();
submitted.setFullName("Submitted");
PicklistValue approved = new PicklistValue();
approved.setFullName("Approved");
PicklistValue rejected = new PicklistValue();
rejected.setFullName("Rejected");
expenseStatus.setPicklistValues(new PicklistValue[] {
    unsubmitted, submitted, approved, rejected
});

CustomField expenseStatusField = new CustomField();
expenseStatusField.setFullName(
    "ExpenseReport__c.ExpenseStatus__c"
);
expenseStatusField.setLabel("Expense Report Status");
expenseStatusField.setType(FieldType.Picklist);
expenseStatusField.setPicklist(expenseStatus);
AsyncResult[] arsStatusField =
    metadataConnection.create(new Metadata[]
        {expenseStatusField});

CustomTab expenseTab = new CustomTab();
expenseTab.setFullName("ExpenseReport__c");
expenseTab.setMotif("Custom70: Handsaw");
expenseTab.setCustomObject(true);
AsyncResult[] arsTab =
    metadataConnection.create(new Metadata[] {expenseTab});

CustomApplication application = new CustomApplication();
application.setFullName("ExpenseForce");
application.setTab(new String[] {expenseTab.getFullName()});
AsyncResult[] arsApp =
    metadataConnection.create(new Metadata[] {application});

// Employees and managers have the same app visibility...
ProfileApplicationVisibility appVisibility =
    new ProfileApplicationVisibility();
appVisibility.setApplication("ExpenseForce");

```

```

appVisibility.setVisible(true);

Profile employee = new Profile();
employee.setFullName("Employee");
employee.setApplicationVisibilities(
    new ProfileApplicationVisibility[] {appVisibility}
);
AsyncResult[] arsProfileEmp =
metadataConnection.create(new Metadata[] {employee});

Profile manager = new Profile();
manager.setFullName("Manager");
manager.setApplicationVisibilities(
    new ProfileApplicationVisibility[] {appVisibility}
);
AsyncResult[] arsProfileMgr =
    metadataConnection.create(new Metadata[] {manager});

// But employees and managers have different access
// to the state of the expense sheet
RecordType edit = new RecordType();
edit.setFullName("ExpenseReport__c.Edit");
RecordTypePicklistValue editStatuses =
    new RecordTypePicklistValue();
editStatuses.setPicklist("ExpenseStatus__c");
editStatuses.setValues(new PicklistValue[]
    {unsubmitted, submitted});
edit.setPicklistValues(new RecordTypePicklistValue[]
    {editStatuses});
AsyncResult[] arsRecTypeEdit =
    metadataConnection.create(new Metadata[] {edit});

RecordType approve = new RecordType();
approve.setFullName("ExpenseReport__c.Approve");
RecordTypePicklistValue approveStatuses =
    new RecordTypePicklistValue();
approveStatuses.setPicklist("ExpenseStatus__c");
approveStatuses.setValues(new PicklistValue[]
    {approved, rejected});
approve.setPicklistValues(new RecordTypePicklistValue[]
    {approveStatuses});
AsyncResult[] arsRecTypeApp =
    metadataConnection.create(new Metadata[] {approve});
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}

```

## Declarative Metadata Sample Definition

The definition of a profile in an organization with a custom app, custom object, record type, tab, and user permission is:

```

<?xml version="1.0" encoding="UTF-8"?>
<Profile xmlns="http://soap.sforce.com/2006/04/metadata">

```

```

<applicationVisibilities>
  <application>PubApps__Myriad_Publishing</application>
  <default>>false</default>
  <visible>>true</visible>
</applicationVisibilities>
<custom>>true</custom>
<objectPermissions>
  <object>TestWeblinks__c</object>
</objectPermissions>
<recordTypeVisibilities>
  <default>>true</default>
  <recordType>TestWeblinks__c.My First Recordtype</recordType>
  <visible>>true</visible>
</recordTypeVisibilities>
<tabVisibilities>
  <tab>Myriad Publications</tab>
  <visibility>DefaultOn</visibility>
</tabVisibilities>
<userPermissions>
  <enabled>>true</enabled>
  <name>APIEnabled</name>
</userpermissions>
</Profile>

```

## Usage

To create custom profiles, we recommend that you use the Profile object instead of the `deploy()` call on the Profile Metadata type. The Profile object allows you to create empty profiles that start without any permissions enabled except for required permissions for the profile's user license.

When you use the `retrieve()` call to get information about profiles, the returned `.profile` files only include security settings for the other metadata types referenced in the retrieve request. Exceptions include user permissions, IP address ranges, and login hours, which are always retrieved. For example, the following `package.xml` file contains a `types` element that matches all custom objects. The returned profiles contain object and field permissions for all custom objects in your organization but don't include permissions for standard objects, such as Account, and standard fields.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>CustomObject</name>
  </types>
  <types>
    <members>*</members>
    <name>Profile</name>
  </types>
  <version>62.0</version>
</Package>

```

The wildcard "\*" on CustomObject doesn't match standard objects. This wildcard behavior helps you to avoid making unintended, high-impact profile changes. If you create a few custom objects in a Developer Edition organization, `retrieve()` the information, and later `deploy()` the custom objects to your production org, the profile and field-level security for all your standard objects and

fields aren't overwritten. You can only overwrite these standard objects and fields by explicitly creating separate `types` elements for the objects or fields.

Metadata API intentionally makes it difficult to include standard fields in `retrieve()` calls to prevent unexpected profile changes. But you can still retrieve and deploy profile permissions for custom and standard fields in standard objects, such as Account.

This `package.xml` file allows you to return profile permissions for Account standard and custom fields. Note how the standard Account object is defined in a `types` element by specifying it as a member of a CustomObject type.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Account</members>
    <name>CustomObject</name>
  </types>
  <types>
    <members>*</members>
    <name>Profile</name>
  </types>
  <version>62.0</version>
</Package>
```

This `package.xml` file allows you to return profile permissions for the `MyCustomField__c` custom field in the Account object.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Account.MyCustomField__c</members>
    <name>CustomField</name>
  </types>
  <types>
    <members>*</members>
    <name>Profile</name>
  </types>
  <version>62.0</version>
</Package>
```

To retrieve field permissions for relationship fields, remove the "Id" part of the field. For example, in this `package.xml` file, to retrieve field permissions for the `AccountId` field for Contacts, you reference this field as `Contact.Account` not `Contact.AccountId`.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Contact.Account</members>
    <name>CustomField</name>
  </types>
  <types>
    <members>*</members>
    <name>Profile</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Salesforce DX Developer Guide: Retrieve Changes to Profiles with Source Tracking](#)

## ProfileActionOverride

---

Represents an override of an ActionOverride by a user profile. You can use it to override an ActionOverride on a standard Home tab or object record page in Lightning Experience. When a user logs in with a profile, a matching ProfileActionOverride assignment takes precedence over existing overrides for the Home tab or record page specified in ActionOverride. In API versions 39.0 to 44.0, you can access ProfileActionOverride by accessing its encompassing [CustomApplication](#) on page 560 or [Profile](#) on page 1477 metadata types. In API version 45.0 and later, you can access ProfileActionOverride only by accessing its encompassing [CustomApplication](#) on page 560.

**Note:** ProfileActionOverrides aren't supported in packaging. They're supported in change sets, but you have to add them manually.

## File Suffix and Directory Location

Profile-based action overrides are defined as part of a custom application or profile.

## Version

ProfileActionOverrides are available in API version 39.0 and later.

ProfileActionOverride can be defined on Profile or CustomApplication for API version 39.0 to 44.0. In API version 45.0 and later, ProfileActionOverride must be defined for CustomApplication instead. Beginning with API version 45.0, Home page assignments related to user profile must also have a corresponding app assignment because more granular Home page assignments are supported. As a result, ProfileActionOverride is defined for CustomApplication rather than Profile.

## Fields

Field Name	Field Type	Description
<code>actionName</code>	string	<p>The name of the action. The only valid values are <code>Tab</code> and <code>View</code>.</p> <p>If <code>pageOrSubjectType</code> is <code>standard-home</code>, this field must be <code>Tab</code>. The <code>Tab</code> action is supported only when ProfileActionOverride is being specified as part of a Profile in API version 39.0 to 44.0.</p> <p>In API version 45.0 and later, this action is supported only when ProfileActionOverride is being specified as part of a CustomApplication, <code>pageOrSubjectType</code> is <code>standard-home</code>, and this field is <code>Tab</code>.</p> <p>If <code>pageOrSubjectType</code> is <code>record-home</code>, this field must be <code>View</code>. The <code>View</code> action is supported only when ProfileActionOverride is being specified as part of a CustomApplication.</p>

Field Name	Field Type	Description
content	string	Read-only. Represents the name of the Lightning page being used as the override.
formFactor	FormFactor (enumeration of type string)	The size of the page being overridden. The <code>Large</code> value represents the Lightning Experience desktop environment.
pageOrSubjectType	string	The name of the page being overridden. The only valid values are <code>record-home</code> and <code>standard-home</code> . If the <code>actionName</code> is <code>Tab</code> , this field must be <code>standard-home</code> .
recordType	string	The record type associated with the override. If <code>pageOrSubjectType</code> is <code>standard-home</code> , this field must be <code>null</code> . This field is required when <code>actionName</code> is set to <code>View</code> .
type	ActionOverrideType (enumeration of type string)	Read-only. The type of action override. The only valid value is <code>flexipage</code> .

## Usage

You can't delete custom app ProfileActionOverrides by deploying with `destructiveChange.xml`. To delete a ProfileActionOverride, retrieve the app. In the app definition file, find the `<profileActionOverrides>` section, and remove the `<content>` row. Then, change the `<type>` value in that same section to `default` instead of `flexipage`. Do this for every override you want to reset. After making the changes, rezip the folder and deploy.

You can remove one override at a time each with its own deploy, or you can remove multiple overrides in a single deploy. However, we recommend that you do a fresh retrieve every time you want to delete a new override. Don't use a previously retrieved file.

Avoid creating duplicate ProfileActionOverrides in your org. Duplicate ProfileActionOverrides can cause problems, including being unable to select or deselect the **Disable end user personalization of nav items in this app** option in app settings and the **Disable Navigation Bar Personalization in Lightning Experience** User Interface setting.

## Declarative Metadata Sample Definition

You can define a ProfileActionOverride like this.

```
<CustomApplication xmlns="http://soap.sforce.com/2006/04/metadata">
  <profileActionOverrides>
    <actionName>View</actionName>
    <content>CustomObjectFlexiPage</content>
    <formFactor>Large</formFactor>
    <pageOrSubjectType>TestObj__c</pageOrSubjectType>
    <type>Flexipage</type>
    <profile>standard</profile>
    <recordType>TestObj__c.TestRecordType</recordType>
  </profileActionOverrides>
  <defaultLandingTab>standard-home</defaultLandingTab>
  <formFactors>Large</formFactors>
  <label>My Custom App</label>
  <tab>standard-Account</tab>
```

```

    <tab>standard-Opportunity</tab>
    <uiType>Lightning</uiType>
    <navType>Standard</navType>
  </CustomApplication>

```

Here's an example `package.xml`.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>MyCustomApp</members>
    <name>CustomApplication</name>
  </types>
  <version>39.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ProfilePasswordPolicy

---

Represents a profile's password policies. Profile password policies override org-wide password policies for that profile's users. Use `ProfilePasswordPolicy` to retrieve password policies for a given profile. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`ProfilePasswordPolicy` components have the suffix `.profilePasswordPolicy` and are stored in the `profilePasswordPolicies` folder.

## Version

`ProfilePasswordPolicy` components are available in API version 40.0 and later.

## Fields

Field Name	Field Type	Description
<code>forgotPasswordRedirect</code>	boolean	If <code>true</code> , reset password links in forgot password emails don't immediately expire the first time they're clicked. Instead, the links stay active until a user confirms the password reset request on an interstitial page. The default value is <code>false</code> .  This field is available in API version 43.0 and later.

Field Name	Field Type	Description
<code>lockoutInterval</code>	int	Required. The duration of the login lockout, in minutes. If users are locked out, they must wait until the lockout period expires. Valid values: 0, 15, 30, 60.
<code>maxLoginAttempts</code>	int	Required. The number of times a user can enter a wrong password before getting locked out. Valid values: 0, 3, 5, 10.
<code>minimumPasswordLength</code>	int	Required. Minimum number of characters required for a password. Valid values: 5–50.
<code>minimumPasswordLifetime</code>	boolean	If <code>true</code> , a user cannot change a password more than once in a 24-hour period.
<code>obscure</code>	boolean	If <code>true</code> , answers to security questions are hidden as the user types.
<code>passwordComplexity</code>	int	Required. Level of complexity required for the character types in a user's password. <ul style="list-style-type: none"> <li>• If 0, the password can contain any type of character.</li> <li>• If 1, the password must contain at least one alphabetic character and 1 number.</li> <li>• If 2, the password must contain at least one alphabetic character, one number, and one of the following special characters: ! # \$ % - _ = + &lt; &gt;.</li> <li>• If 3, the password must contain at least one number, one uppercase letter, and one lowercase letter.</li> <li>• If 4, the password must contain at least one number, one uppercase letter, one lowercase letter, and one of the following special characters: ! # \$ % - _ = + &lt; &gt;.</li> </ul>
<code>passwordExpiration</code>	int	Required. Number of days until user passwords expire and must be changed. If set to 0, the password never expires. Valid values: 0, 30, 60, 90, 365.
<code>passwordHistory</code>	int	Required. Number of previous passwords to save. Saving passwords is required to ensure that users reset their password to a new, unique password. This value must be set before a password reset succeeds. If 0, <code>passwordExpiration</code> must be set to 0.
<code>passwordQuestion</code>	int	Required. If set to 1, the answer to the password hint cannot contain the password itself. If 0, the answer has no restrictions.
<code>profile</code>	string	Required. Name of the user profile.

## Declarative Metadata Sample Definition

The following is an example of a ProfilePasswordPolicy component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ProfilePasswordPolicy xmlns="http://soap.sforce.com/2006/04/metadata">
```

```

<forgotPasswordRedirect>true</forgotPasswordRedirect>
<lockoutInterval>30</lockoutInterval>
<maxLoginAttempts>0</maxLoginAttempts>
<minimumPasswordLength>7</minimumPasswordLength>
<minimumPasswordLifetime>>false</minimumPasswordLifetime>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ProfileSessionSetting

Represents a profile's session settings. Use `ProfileSessionSetting` to retrieve the session settings for a given profile. This type extends the `Metadata` metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`ProfileSessionSetting` components have the suffix `.profileSessionSetting` and are stored in the `profileSessionSettings` folder.

## Version

`ProfileSessionSetting` components are available in API version 40.0 and later.

## Fields

Field Name	Field Type	Description
<code>profile</code>	string	Required. Name of the user profile.
<code>requiredSessionLevel</code>	<a href="#">SessionSecurityLevel</a>	Session security level.
<code>sessionPersistence</code>	boolean	Beta. If <code>true</code> , keep users logged in to their Experience Cloud site until the session times out—even if they close their browser. Use <code>sessionPersistence</code> to reduce how often users must log in to their site. Applies only to the External Identity profile.
<code>sessionTimeout</code>	int	Required. Specifies how many minutes of inactivity elapse before a user's authenticated session times out. At the end of the session, the user must log in again. This session timeout value applies to users of the profile and overrides the org-wide timeout value. Changes to the org-wide

Field Name	Field Type	Description
		timeout value don't apply to users of this profile. Valid values: 15, 30, 60, 120, 240, 480, 720, 1440.

## SessionSecurityLevel

Session security levels control access to certain types of resources based on the type of authentication used for logging in to the current session. For example, username and password authentication requires the `standard` session security level. Multi-factor authentication (MFA) requires `HIGH_ASSURANCE`.

Field Name	Field Type	Description
<code>SessionSecurityLevel</code>	(enumeration of type string)	<p>User's security level for the current session.</p> <ul style="list-style-type: none"> <li>The <code>HIGH_ASSURANCE</code> security level for this session meets the High Assurance requirements set in the org's session settings under Session Security Levels.</li> <li>The <code>STANDARD</code> security level for this session meets the Standard requirements set in the org's session settings under Session Security Levels.</li> <li>The <code>LOW</code> level isn't available or used in the Salesforce UI. It's used at the API level, but users assigned to this level experience unpredictable and reduced functionality.</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a `ProfileSessionSetting` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ProfileSessionSetting xmlns="http://soap.sforce.com/2006/04/metadata">
  <profile>platformportal</profile>
  <requiredSessionLevel>HIGH_ASSURANCE</requiredSessionLevel>
  <sessionTimeout>1440</sessionTimeout>
</ProfileSessionSetting>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Prompt

Represents the metadata related to in-app guidance, which includes prompts and walkthroughs. Help users discover your products and services, adopt your processes, or learn how to use a new feature. Write the content, select the target audience, and specify where and when the in-app guidance appears.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

Prompt components have the suffix `prompt` and are stored in the `prompts` folder.

## Version

Prompt components are available in API version 46.0 and later.

## Special Access Rules

To add, edit, manage, and view prompts and walkthroughs in Lightning Experience or in Experience Cloud sites, see [Considerations for Creating In-App Guidance](#) and [Permissions for Creating and Accessing In-App Guidance](#) in *Salesforce Help* for permissions.

## Prompts and Walkthroughs in Managed Packages

For considerations about including in-app guidance in a managed package, see [Guidelines for In-App Guidance in Managed Packages](#) in *Salesforce Help*.

For more information about creating managed packages, see [Create a First-Generation Managed Package](#).

Unmanaged packages must contain a namespace prefix. For more information, see [Register a Namespace for a First-Generation Managed Packages](#) and [What happens to my namespace prefix when I install a package?](#).

## Fields

Field Name	Description
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The label. Maximum of 80 characters.</p>
<code>promptVersions</code>	<p><b>Field Type</b> <a href="#">PromptVersion[]</a></p> <p><b>Description</b> A list of in-app guidance entries. Each entry represents a different prompt or walkthrough.</p>

## PromptVersion

A list of in-app guidance entries. Each entry represents a different prompt or walkthrough.

Field Name	Description
actionButtonLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Label for the action button or link. Maximum of 25 characters. For a walkthrough, specify this value on the last step.</p>
actionButtonLink	<p><b>Field Type</b> string</p> <p><b>Description</b> URL for the action button or link. Maximum of 1,000 characters. You can't use the <code>GROUP BY</code> option in a SOQL query for this field. For a walkthrough, specify this value on the last step.</p>
body	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Body content.</p> <p>In API version 60.0 and later, enter up to 4,000 characters for all prompt types.</p> <p>In earlier API versions, enter up to 240 characters for floating prompts and targeted prompts. Enter up to 4,000 characters for docked prompts.</p> <p>For docked prompts, the maximum characters include HTML markup, not just readable text.</p>
customApplication	<p><b>Field Type</b> string</p> <p><b>Description</b> Internal use only. No data is populated for this field.</p>
delayDays	<p><b>Field Type</b> int</p> <p><b>Description</b> Required if recurrences are scheduled. Number of days in between occurrences. For a walkthrough, specify this value on the first step.</p>
description	<p><b>Field Type</b> string</p> <p><b>Description</b> Description. Maximum of 255 characters.</p>
dismissButtonLabel	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Label for the dismiss button of a floating or targeted prompt. Maximum of 15 characters.</p>
displayPosition	<p><b>Field Type</b></p> <p>PromptDisplayPosition (enumeration of type string)</p> <p><b>Description</b></p> <p>The position of a floating prompt on the page. Valid values are:</p> <ul style="list-style-type: none"> <li>• BottomCenter</li> <li>• BottomLeft</li> <li>• BottomRight</li> <li>• TopCenter</li> <li>• TopLeft</li> <li>• TopRight</li> </ul>
displayType	<p><b>Field Type</b></p> <p>PromptDisplayType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. The type of prompt. Valid values are:</p> <ul style="list-style-type: none"> <li>• DockedComposer—A docked prompt</li> <li>• FloatingPanel—A floating prompt</li> <li>• Targeted—A targeted prompt. Available in API version 52.0 and later.</li> </ul>
elementRelativePosition	<p><b>Field Type</b></p> <p>PromptElementRelativePosition (enumeration of type string)</p> <p><b>Description</b></p> <p>Indicates the location of a targeted prompt relative to the element. Available in API version 52.0 and later. Valid values are:</p> <ul style="list-style-type: none"> <li>• BottomCenter</li> <li>• BottomLeft</li> <li>• BottomRight</li> <li>• LeftBottom</li> <li>• LeftCenter</li> <li>• LeftTop</li> <li>• RightBottom</li> <li>• RightCenter</li> <li>• RightTop</li> <li>• TopCenter</li> <li>• TopLeft</li> <li>• TopRight</li> </ul>

Field Name	Description
endDate	<p><b>Field Type</b> date</p> <p><b>Description</b> The date to stop showing the in-app guidance. For a walkthrough, specify this value on the first step.</p>
header	<p><b>Field Type</b> string</p> <p><b>Description</b> Label for the header of a docked prompt. This value is the label contained in the window's browser bar. Maximum of 36 characters.</p>
image	<p><b>Field Type</b> string</p> <p><b>Description</b> The developer name of the contentAsset that holds the image. You can specify this field or the <code>imageLink</code> field, but not both.</p>
imageAltText	<p><b>Field Type</b> string</p> <p><b>Description</b> Indicates the alt text of an image. Required if <code>imageLocation</code>, <code>imageLink</code>, or <code>image</code> is specified.</p>
imageLink	<p><b>Field Type</b> string</p> <p><b>Description</b> The URL for a prompt's image. You can specify this field or the <code>image</code> field, but not both. Available in API version 53.0 and later.</p>
imageLocation	<p><b>Field Type</b> picklist</p> <p><b>Description</b> Indicates the location of the image in relation to the body text. Required if <code>image</code>, <code>imageLink</code>, or <code>imageAltText</code> is specified. Valid values are:</p> <ul style="list-style-type: none"> <li>• Top</li> <li>• Bottom</li> <li>• Right, which is for floating or targeted prompts only</li> <li>• Left, which is for floating or targeted prompts only</li> </ul>
indexWithIsPublished	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b> Used by Salesforce for efficient querying.</p>
<code>indexWithoutIsPublished</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Used by Salesforce for efficient querying.</p>
<code>isPublished</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the in-app guidance is active (<code>true</code>) or not (<code>false</code>).</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The label.</p>
<code>publishedByUser</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Internal use only. No data is populated for this field.</p>
<code>publishedDate</code>	<p><b>Field Type</b> date</p> <p><b>Description</b> Indicates the date the in-app guidance was activated. If installed from a package, this value is the date when the package was installed. For walkthroughs, this field can only be specified on the first step.</p>
<code>referenceElementContext</code>	<p><b>Field Type</b> textarea</p> <p><b>Description</b> Used by Salesforce to identify the element that the targeted prompt is associated with. Available in API version 52.0 and later.</p>
<code>shouldDisplayActionButton</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether an action button or link is included (<code>true</code>) or not (<code>false</code>).</p>

Field Name	Description
<code>shouldIgnoreGlobalDelay</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the in-app guidance ignores the global time delay and instead shows on page load (<code>true</code>) or not (<code>false</code>). This field is available in API version 48.0 and later.</p>
<code>startDate</code>	<p><b>Field Type</b> date</p> <p><b>Description</b> Indicates the date to start showing the in-app guidance. For a walkthrough, specify this value on the first step.  In API version 48.0 and earlier, this field is required.</p>
<code>stepNumber</code>	<p><b>Field Type</b> int</p> <p><b>Description</b> Required for walkthroughs only. Indicates the number of the last step the user viewed or interacted with in a walkthrough. Include up to 10 steps. Numbers must be consecutive without repeated or skipped numbers. Available in API version 49.0 and later.</p>
<code>targetAppDeveloperName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The app's developer name where the in-app guidance appears. Deprecated in API version 51.0 and later.</p>
<code>targetAppNamespacePrefix</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The app's namespace prefix where the in-app guidance appears. This value must match the target app's <code>NamespacePrefix</code> in the org that the package is being installed into. Maximum of 15 characters. Deprecated in API version 51.0 and later.</p>
<code>targetPageKey1</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Used by Salesforce to identify the prompt's page location along with <code>targetPageKey2</code>, <code>targetPageKey3</code>, <code>targetPageKey4</code>, and <code>targetPageType</code>.</p>
<code>targetPageKey2</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Used by Salesforce to identify the prompt's page location along with <code>targetPageKey1</code>, <code>targetPageKey3</code>, <code>targetPageKey4</code>, and <code>targetPageType</code>.</p>
<code>targetPageKey3</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Used by Salesforce to identify the prompt's page location along with <code>targetPageKey1</code>, <code>targetPageKey2</code>, <code>targetPageKey4</code>, and <code>targetPageType</code>.</p>
<code>targetPageKey4</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Used by Salesforce to identify the prompt's page location along with <code>targetPageKey1</code>, <code>targetPageKey2</code>, <code>targetPageKey3</code>, and <code>targetPageType</code>. This field is available in API version 53.0 and later.</p>
<code>targetPageType</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. Used by Salesforce to identify the page location along with <code>targetPageKey1</code>, <code>targetPageKey2</code>, <code>targetPageKey3</code>, and <code>targetPageKey4</code>.</p>
<code>targetRecordType</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Used by Salesforce to determine if in-app guidance is specific to a record type. This field is available in API version 53.0 and later.</p>
<code>themeColor</code>	<p><b>Field Type</b></p> <p>PromptThemeColor (enumeration of type string)</p> <p><b>Description</b></p> <p>Indicates which custom theme color is applied to the in-app guidance. Required if <code>themeSaturation</code> is specified. For a walkthrough, specify this value on the first step. Valid values are:</p> <ul style="list-style-type: none"> <li>• Theme1, which is derived from the current brand color</li> <li>• Theme2, which is derived from the current page background color</li> <li>• Theme3, which is derived from the current global header color</li> <li>• Theme4, which is derived from the current app theme color</li> </ul>
<code>themeSaturation</code>	<p><b>Field Type</b></p> <p>PromptThemeSaturation (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>Indicates which color value, or saturation, is applied to the in-app guidance that has a custom theme color. Required if <code>themeColor</code> is specified. For a walkthrough, specify this value on the first step. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Dark</code></li> <li>• <code>Light</code></li> </ul>
<code>timesToDisplay</code>	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Required if recurrences are scheduled. The maximum number of times to show the in-app guidance. Salesforce detects whether the user interacts with the in-app guidance, then determines whether to show the in-app guidance again or cancel scheduled recurrences. Maximum value of 30. For a walkthrough, specify this value on the first step.</p>
<code>title</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The label for the title. Maximum of 36 characters.</p>
<code>uiFormulaRule</code>	<p><b>Field Type</b></p> <p><a href="#">UiFormulaRule[]</a></p> <p><b>Description</b></p> <p>A set of one or more permission filters that define the conditions under which the in-app guidance displays on the page.</p> <p>If the rule evaluates to <code>true</code>, the in-app guidance displays on the page. If <code>false</code>, it doesn't display. If this field is <code>null</code>, the in-app guidance displays by default.</p>
<code>userAccess</code>	<p><b>Field Type</b></p> <p>PromptUserAccess (enumeration of type string)</p> <p><b>Description</b></p> <p>Indicates which permissions can see the in-app guidance. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Everyone</code>, which indicates that there's no permission restrictions</li> <li>• <code>SpecificPermissions</code>, which indicates that only users with all the specific user permissions specified can see the in-app guidance</li> </ul> <p>In API version 48.0 and earlier, this field is required.</p>
<code>userProfileAccess</code>	<p><b>Field Type</b></p> <p>PromptUserProfileAccess (enumeration of type string)</p> <p><b>Description</b></p> <p>Indicates which profiles can see the in-app guidance. This field is available in API version 48.0 and later. Valid values are:</p>

Field Name	Description
	<ul style="list-style-type: none"> <li>• <code>Everyone</code>, which indicates that there are no profile restrictions</li> <li>• <code>SpecificProfiles</code>, which indicates that users with any of the specified user profiles can see the in-app guidance</li> </ul>
<code>versionNumber</code>	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. The number remains 1 since multiple versions aren't saved in the org.</p>
<code>videoLink</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The embed URL for a video in a docked prompt. Maximum of 1,000 characters. You can specify this field or the <code>image</code> field, but not both. This field is available in API version 48.0 and later. See <a href="#">Considerations for Creating In-App Guidance</a>.</p>

## UiFormulaRule

A set of one or more filters that define the conditions under which a prompt displays on a Lightning Experience page.

Field Name	Description
<code>booleanFilter</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Specifies the AND filter condition.</p>
<code>criteria</code>	<p><b>Field Type</b> <a href="#">UiFormulaCriterion[]</a></p> <p><b>Description</b> List of one or more filters that, when evaluated, determine visibility.</p>

## UiFormulaCriterion

A single filter that, when evaluated, helps define visibility on a Lightning Experience page.

Field Name	Description
<code>leftValue</code>	<p><b>Field Type</b> string</p>

**Field Name****Description****Description**

Required. The field used for filtering. Only standard and custom permissions can be included. You can use these expressions in the `leftValue` field when setting filters for visibility.

- `{!$Permission.CustomPermission.permissionName}`—Use this expression to control visibility based on the custom permissions of the user viewing the Lightning page. Supported for app, Home, and record pages only.
- `{!$Permission.StandardPermission.permissionName}`—Use this expression to control visibility based on the standard permissions of the user viewing the Lightning page. Supported for app, Home, and record pages only.
- `{!ENCODED:{!ID:$User.Profile.Key}}`—Use this expression to control visibility based on the custom or standard profile of the user viewing the Lightning page. Available in API Version 48.0 and later.

operator

**Field Type**

string

**Description**

Required. Defines the operator used to filter the data. Valid value is `EQUAL`.

rightValue

**Field Type**

string

**Description**

Specifies if you want to evaluate the visibility for permissions or the name of the profile.

- For permissions, use `true`.
- For profiles, use the name of the profile. Available in API Version 48.0 and later. For example, `Standard` or `custom_regionalsales`.

## Declarative Metadata Sample Definition

The following is an example of a Prompt component.

```
<?xml version="1.0" encoding="UTF-8"?>
<Prompt xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>Prompt Label</masterLabel>
  <promptVersions>
    <actionButtonLabel>Learn How</actionButtonLabel>
    <actionButtonLink>https://trailhead.salesforce.com/en/content/learn/modules/scrum-and-jira-at-salesforce/learn-about-jira</actionButtonLink>
  </promptVersions>
</Prompt>
```

```

    <body>Explore how the Path and the Kanban view can help you track, manage, and
update your records.</body>
    <delayDays>1</delayDays>

  </promptVersions>
</Prompt>

```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>Prompt</name>
  </types>
  <version>46.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PublicKeyCertificate

---

Represents the public key certificate. On this entity we store a public certificate or a JSON web key, which is used to validate the customer-provided JWT.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`PublicKeyCertificate` components have the suffix `.PublicKeyCertificate` and are stored in the `PublicKeyCertificate` folder.

## Version

`PublicKeyCertificate` components are available in API version 62 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
<code>description</code>	<b>Field Type</b> string

Field Name	Description
	<p><b>Description</b></p> <p>A description of the public key certificate.</p>
isActive	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the public key certificate is active (true) or inactive (false). The default value is false.</p>
jsonWebKey	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Represents a public cryptographic key that can be used to verify the validity of a token.</p>
masterLabel	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The label for the public key certificate.</p>

## Declarative Metadata Sample Definition

The following is an example of a PublicKeyCertificate component.

```
<?xml version="1.0" encoding="UTF-8"?>
<PublicKeyCertificate xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>pck1</masterLabel>
  <isActive>true</isActive>
  <description>This is my description for a test PublicKeyCertificate</description>
  <jsonWebKey>
    {
      "kid": "123456",
      "alg": "RS256",
      "use": "sig",
      "kty": "RSA",
      "x5c": [ "<Your public certificate>" ],
      "y": "y",
      "n": "<Base64-encoded modulus>",
      "e": "<Base64-encoded public exponent>",
      "crv": "crv",
      "d": "d",
      "k": "k"
    }
  </jsonWebKey>
</PublicKeyCertificate>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<!--
  ~ Copyright 2024 salesforce.com, inc.
  ~ All Rights Reserved
  ~ Company Confidential
  -->

<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>PublicKeyCertificate</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PublicKeyCertificateSet

---

Represents a set of public certificate keys. On this entity we store a public certificates or JSON web keys.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`PublicKeyCertificateSet` components have the suffix `.PublicKeyCertificateSet` and are stored in the `PublicKeyCertificateSet` folder.

## Version

`PublicKeyCertificateSet` components are available in API version 62 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
description	<p><b>Field Type</b> string</p> <p><b>Description</b> A description of the public key certificate set.</p>
jwksEndPoint	<p><b>Field Type</b> string</p> <p><b>Description</b> The URL of the HTTPS Server that returns the JWKS.</p>
jwtIssuer	<p><b>Field Type</b> string</p> <p><b>Description</b> The user, organization, or service that issued the JSON web token. This value is case-sensitive.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The label for the public key certificate set.</p>
publicKeyCertificateSetKeys	<p><b>Field Type</b> <a href="#">PublicKeyCertificateSetKey[]</a></p> <p><b>Description</b> A set of public certificate keys associated with the public key certificate set.</p>
type	<p><b>Field Type</b> PublicKeyCertificateSetType (enumeration of type string)</p> <p><b>Description</b> Required. Determines how the server's public key set is retrieved. The keys are represented in JWK format. Values are:</p> <ul style="list-style-type: none"> <li>• JWKS- Used to specify a certificate via the child Type PublicKeyCertificateSetKey.</li> <li>• JWKS_URL- Used to specify a certificate via the jwksEndPoint field on this Type.</li> </ul>

## PublicKeyCertificateSetKeys

Represents a set of public certificate keys associated with the public key certificate set.

Field Name	Description
publicKeyCertificate	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The PublicKeyCertificate we want to reference.</p>

## Declarative Metadata Sample Definition

The following is an example of a PublicKeyCertificateSet component.

```
<?xml version="1.0" encoding="UTF-8"?>
<PublicKeyCertificateSet xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>pcks1</masterLabel>
  <description>This is my description for a PublicKeyCertificateSet</description>
  <type>JWKS</type>
  <jwtIssuer>example.com</jwtIssuer>
  <publicKeyCertificateSetKeys>
    <publicKeyCertificate>pck1</publicKeyCertificate>
  </publicKeyCertificateSetKeys>
</PublicKeyCertificateSet>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>PublicKeyCertificate</name>
  </types>
  <types>
    <members>*</members>
    <name>PublicKeyCertificateSet</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Queue

Represents a holding area for items before they are processed.

## Declarative Metadata File Suffix and Directory Location

The file suffix for queue components is `.queue` and components are stored in the `queues` directory of the corresponding package directory. This component supports cases, leads, service contracts (if Entitlements are enabled), and custom objects.

## Version

Queue components are available in API version 24.0 and later.

## Special Access Rules

As of Summer '20 and later, only authenticated internal and external users can access this type.

## Fields

This metadata type represents the valid values that define a queue:

Field Name	Field Type	Description
<code>doesSendEmailToMembers</code>	boolean	Indicates whether emails are sent to queue members ( <code>true</code> ) or not ( <code>false</code> ) when a new record is added to the queue.
<code>email</code>	string	The email address of the queue owner.
<code>name</code>	string	Required. The name of the queue. Corresponds to <b>Label</b> in the user interface.
<code>queueMembers</code>	<a href="#">QueueMembers[]</a>	Represents queue members added to the queue. Members can be added directly or selected by roles and public groups they belong to. Available in API version 42.0 and later.
<code>queueRoutingConfig</code>	string	Routing configuration name. Applies to orgs that use Omni-Channel with a routing configuration. Available in API version 42.0 and later.
<code>queueSubject</code>	<a href="#">QueueSubject[]</a>	Indicates the supported entity types.

## QueueMembers

Represents queue members added to the queue. Members can be added directly as users or selected by the roles and public groups they belong to. Available in API version 42.0 and later.

Field Name	Field Type	Description
<code>publicGroups</code>	<a href="#">PublicGroups[]</a>	Represents public groups in the org. Public groups are optionally used to add queue members.
<code>roleAndSubordinates</code>	<a href="#">RoleAndSubordinates[]</a>	Represents roles and their subordinates in the org's role hierarchy, including customer and partner roles. Roles and their subordinate hierarchy are optionally used to add queue members.

Field Name	Field Type	Description
roleAndSubordinatesInternal	<a href="#">RoleAndSubordinatesInternal</a> []	Represents internal roles and their subordinates in the org's role hierarchy, excluding customer and partner roles. Roles and their subordinate hierarchy are optionally used to add queue members.
roles	<a href="#">Roles</a> []	Represents roles in the org. Roles are optionally used to add queue members.
users	<a href="#">Users</a> []	Represents users in the org. Users can be added directly as queue members.

## PublicGroups

Represents public groups in the org. Public groups are optionally used to add queue members. Available in API version 42.0 and later.

Field Name	Field Type	Description
publicGroup	string	Represents a public group.

## RoleAndSubordinates

Represents roles and their subordinates in the org's role hierarchy, including customer and partner roles. Roles and their subordinate hierarchy can be used to add queue members. Available in API version 42.0 and later.

Field Name	Field Type	Description
roleAndSubordinate	string	Represents a role and its subordinates, including customer and partner roles. In production orgs created before February 8, 2024 and in non-preview sandboxes, this field is available by default. In orgs created on February 8, 2024 or later and in preview sandboxes, this field is only available after digital experiences is enabled.

## RoleAndSubordinatesInternal

Represents internal roles and their subordinates in the org's role hierarchy, excluding customer and partner roles. Roles and their subordinate hierarchy can be used to add queue members. Available in API version 42.0 and later.

Field Name	Field Type	Description
roleAndSubordinateInternal	string	Represents a role and its subordinates, excluding customer and partner roles. In production orgs created before February 8, 2024 and in non-preview sandboxes, this field is only available after digital experiences is enabled. In orgs created on February 8, 2024 or later and in preview sandboxes, this field is available by default.

## Roles

Represents roles in the org. Roles can be used to add queue members. Available in API version 42.0 and later.

Field Name	Field Type	Description
role	string	Represents a role.

## Users

Represents users in the org. Users can be added directly as queue members. Available in API version 42.0 and later.

Field Name	Field Type	Description
user	string	Represents a user. Specify the user's username.

## QueueSubject

QueueSubject represents an entity type that the queue supports.

Field Name	Field Type	Description
subjectType	string	Valid values are: <ul style="list-style-type: none"> <li>• Case</li> <li>• ContactRequest</li> <li>• Lead</li> <li>• ServiceContract</li> <li>• Task (Available in API version 48.0 and later.)</li> <li>• Custom objects (such as ObjA_c)</li> </ul>

## Declarative Metadata Sample Definition

The following is the definition of a queue, which supports Case, Lead, and a custom object named ObjA.

```
<?xml version="1.0" encoding="UTF-8"?>
<Queue xmlns="http://soap.sforce.com/2006/04/metadata">
  <doesSendEmailToMembers>true</doesSendEmailToMembers>
  <email>member@company.com</email>
  <fullName>Your Name</fullName>
  <name>memberQueue</name>
  <queueSubject>
    <subjectType>Case</subjectType>
  </queueSubject>
  <queueSubject>
    <subjectType>Lead</subjectType>
  </queueSubject>
  <queueSubject>
  </queueSubject>
</Queue>
```

```

    <subjectType>ObjA__c</subjectType>
  </queueSubject>
</Queue>

```

Here's another definition of a queue containing queue members added directly or via public groups and roles. Queries retrieve values using the `DeveloperName` field, not the `Name` field, so that the returned names are unique. The query also appends letters to the end of duplicate names, so these groups and roles can be referred to independently.

```

<?xml version="1.0" encoding="UTF-8"?>
<Queue xmlns="http://soap.sforce.com/2006/04/metadata">
  <doesSendEmailToMembers>>false</doesSendEmailToMembers>
  <name>queue1</name>
  <queueMembers>
    <publicGroups>
      <publicGroup>All Internal Users</publicGroup>
    </publicGroups>
    <queueRoleAndSubordinates>
      <queueRoleAndSubordinate>role1</queueRoleAndSubordinate>
      <queueRoleAndSubordinate>role2</queueRoleAndSubordinate>
      <queueRoleAndSubordinate>role3</queueRoleAndSubordinate>
    </queueRoleAndSubordinates>
    <roles>
      <role>role1</role>
    </roles>
    <users>
      <user>s@sm.com</user>
      <user>std@sm.com</user>
    </users>
  </queueMembers>
  <queueRoutingConfig>my_omni_routing_config</queueRoutingConfig>
  <queueSubject>
    <subjectType>Case</subjectType>
  </queueSubject>
  <queueSubject>
    <subjectType>Lead</subjectType>
  </queueSubject>
</Queue>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## QueueRoutingConfig

---

Represents the settings that determine how work items are routed to agents.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

ServicePresenceStatus components have the suffix `.queueRoutingConfig` and are stored in the `queueRoutingConfigs` folder.

## Version

QueueRoutingConfig components are available in API version 44.0 and later.

## Special Access Rules

This type is available only if Omni-Channel is enabled in your org.

## Fields

Field Name	Field Type	Description
<code>capacityPercentage</code>	double	The percentage of an agent's capacity for work items that's consumed by a specific type of work item from this service channel. For example, you might give phone calls a capacity percentage of 100. If an agent receives a phone call, the agent won't receive new work items until the call ends, because at that point the agent's capacity will have reached 100%.
<code>capacityType</code>	CapacityType	The setting applies for PSRs ( <a href="#">PendingServiceRouting</a> ) that are created and managed by the system. <ul style="list-style-type: none"> <li>When set to <code>INHERITED</code>, the value of the Interruptible check box or value set on the Service Channel applies.</li> <li>When set to <code>INTERRUPTIBLE</code>, the generated PSR has the <code>isInterruptible</code> flag set to true.</li> <li>When set to <code>NOT_INTERRUPTIBLE</code>, the generated PSR has the <code>isInterruptible</code> flag set to false.</li> <li>When not set, its behavior is equivalent to <code>INHERITED</code>.</li> </ul>
<code>capacityWeight</code>	double	The amount of an agent's capacity for work items that's consumed by a work item from this service channel. For example, if an agent has a capacity of 6, and cases are assigned a capacity weight of 2, an agent can be assigned up to 3 cases before the agent is at capacity and can't receive new work items.
<code>dropAdditionalSkillsTimeout</code>	int	The number of seconds to elapse before additional skills are dropped from Omni-Channel routing. In skills-based routing, you can set some skills to <b>Additional Skill</b> . After the timeout elapses, a skill marked as <b>Additional Skill</b> is dropped from Omni-Channel routing and the case is routed to the best-matched agent, even if the agent doesn't have all the skills.

Field Name	Field Type	Description
		If CustomRequestedDateTime is set in the <a href="#">PendingServiceRouting</a> object, DropAdditionalSkillsTimeout uses CustomRequestedDateTime as the start time. If CustomRequestedDateTime + DropAdditionalSkillsTimeout has already passed, Omni-Channel immediately drops the additional skills after the pending service request is created.
isAttributeBased	boolean	Indicates whether this routing configuration is used with skills-based routing rules ( <code>true</code> ) or not ( <code>false</code> ).
label	string	Required. The label of the presence status.
pushTimeout	int	The number of seconds set for push timeout. 0 is returned when push timeout isn't enabled.
queueOverflowAssignee	string	The ID of the queue that's set as the Overflow Assignee.
routingModel	RoutingModel (enumeration of type string)	Required. The routing type that determines how work items are routed (pushed) to agents. Possible values are: <ul style="list-style-type: none"> <li>• LEAST_ACTIVE</li> <li>• MOST_AVAILABLE</li> <li>• EXTERNAL_ROUTING</li> </ul>
routingPriority	int	Required. The priority in which work items from the service channels that are related to this routing configuration are routed to agents. Work items from routing configurations that have lower priority values (for example, 0) are routed to agents first.
QueueRoutingConfigSkill	<a href="#">QueueRoutingConfigSkill</a>	Default skills associated with the routing configuration. Work is routed using a combination of rules and default skills.
userOverflowAssignee	string	The ID of the user that's set as the Overflow Assignee.

## QueueRoutingConfigSkill

Represents default skills associated with the routing configuration.

### Fields

Field Name	Field Type	Description
skill	string	Skill used to route a work item.

## Declarative Metadata Sample Definition

The following is an example of a QueueRoutingConfig component.

```
<?xml version="1.0" encoding="UTF-8"?>
<QueueRoutingConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <capacityWeight>1.0</capacityWeight>
  <label>Case Routing</label>
  <pushTimeout>120</pushTimeout>
  <queueOverflowAssignee>queueOverflow</queueOverflowAssignee>
  <routingModel>LEAST_ACTIVE</routingModel>
  <routingPriority>1</routingPriority>
</QueueRoutingConfig>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>QueueRoutingConfig</name>
  </types>
  <version>44.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## QuickAction

---

Represents a specified create or update quick action for an object that then becomes available in the Chatter publisher. For example, you can create an action that, on the detail page of an account, allows a user to create a contact related to that account from the Chatter feed on that page. QuickAction can be created on objects that permit custom fields.

The parent objects supported include:

- Account
- Campaign
- Case
- Contact
- ContentNote
- Custom objects
- Group
- Lead
- Opportunity

## File Suffix and Directory Location

QuickAction components have the suffix `quickAction` and are stored in the `quickActions` folder.

## Version

QuickAction components are available in API version 28.0 and later.

## Fields

Field Name	Field Type	Description
<code>canvas</code>	string	If the custom action invokes a Canvas app, the app name. Returns the fully qualified name of the Canvas app in the format <code>&lt;namespace&gt;__&lt;dev_name&gt;</code> , if the quick action type is <code>Canvas</code> ; otherwise, returns <code>null</code> .  This field is available in API version 29.0 and later.
<code>description</code>	string	The description of the action.
<code>fieldOverrides</code>	<a href="#">FieldOverride</a> on page 1525[]	The specific field that can be overridden within a <a href="#">QuickAction</a> on page 1522.
<code>flowDefinition</code>	string	If the custom action invokes a flow, this field represents the API name of the flow. Otherwise, this field is <code>null</code> .
<code>height</code>	int	If a custom action is created, this field represents the height in pixels of the action pane.
<code>icon</code>	string	The icon used to identify the action.  API version 32.0 and later returns different icons than in earlier API versions.
<code>isProtected</code>	boolean	Indicates whether this component is protected ( <code>true</code> ) or not ( <code>false</code> ). Protected components cannot be linked to or referenced by components created in the installing organization.
<code>label</code>	string	Identifies the action and displays to users. Also the default identifier used for the API and managed packages.
<code>lightningComponent</code>	string	If the custom action invokes a Lightning component, this field represents the fully qualified name of the component. Otherwise, this field is <code>null</code> .  Available in API version 38.0 and later.
<code>optionsCreateFeedItem</code>	boolean	Required. Indicates whether successful completion of the action creates a feed item ( <code>true</code> ) or not ( <code>false</code> ). Applies only to Create Record, Update Record, and Log a Call quick action types.  Available in API version 36.0 and later.

Field Name	Field Type	Description
page	string	If the custom action invokes a Visualforce page, this field identifies the page.
quickActionLayout	<a href="#">QuickActionLayout</a>	The layout of fields on the action.
standardLabel	QuickActionLabel (enumeration of type string)	Specifies the standard label to use for the action. The valid values are: <ul style="list-style-type: none"> <li>• AddRecord</li> <li>• AddMember</li> <li>• ChangeDueDate</li> <li>• ChangePriority</li> <li>• ChangeStatus</li> <li>• CreateNew</li> <li>• CreateNewRecordType (For example, a label with something like "Create New Idea")</li> <li>• Defer</li> <li>• EditDescription</li> <li>• EnrollInProgram (Available in API versions 46.0 and later only if the org has Health Cloud enabled)</li> <li>• Escalate</li> <li>• EscalateToRecord</li> <li>• Forward (Available in API version 42.0 and later)</li> <li>• LogACall</li> <li>• LogANote</li> <li>• ModifyAppointment (Available in API version 47.0 and later)</li> <li>• New (A new record)</li> <li>• NewChild (A new child record)</li> <li>• NewChildRecordType</li> <li>• NewRecordType (For example, a label with something like "New Idea")</li> <li>• OfferFeedback</li> <li>• PatientDetails (Available in API version 57.0 and later if the org has Health Cloud enabled)</li> <li>• Quick (A quick record)</li> <li>• QuickRecordType</li> <li>• Reply (Available in API version 42.0 and later)</li> <li>• ReplyAll (Available in API version 42.0 and later)</li> <li>• RequestFeedback</li> <li>• SendEmail (This value is available in API version 31.0 and later.)</li> <li>• Update</li> </ul>

Field Name	Field Type	Description
successMessage	string	The message that displays to the user upon successful completion of the action.  Available in API version 36.0 and later.
targetObject	string	The object for which the action is created and performed.  For example, you can create an action that, on the detail page of an account, allows a user to create a contact related to that account from the Chatter feed on that page. QuickAction can be created on objects that permit custom fields. In this case, Contact is the targetObject.
targetParentField	string	The parent object type of the action. Links the target object to the parent object. For example, use Account if the target object is Contact and the parent object is Account.
targetRecordType	string	Specifies which record type to create. Valid values are: <ul style="list-style-type: none"> <li>• Business Account</li> <li>• Person Account</li> <li>• Master</li> </ul>
type	QuickActionType (enumeration of type string)	Required. The type of quick action. Valid values are: <ul style="list-style-type: none"> <li>• Canvas</li> <li>• Create</li> <li>• Flow (This value is available as a Beta in API version 41.0 and later)</li> <li>• LightningComponent (This value is available in API version 38.0 and later.)</li> <li>• LogACall</li> <li>• Post</li> <li>• SendEmail (This value is available in API version 31.0 and later.)</li> <li>• SocialPost</li> <li>• Update</li> <li>• VisualforcePage</li> </ul>
width	int	If a custom action is created, this field represents the width in pixels of the action pane.

## FieldOverride

Represents the field names and their respective formulas and literal values that comprise predefined value settings for a [QuickAction](#) on page 1522. If a field on an action has both a predefined value and a default value set, the action uses the predefined value, not the default value. A formula value takes precedence over a literal value if both are defined.

Field Name	Field Type	Description
field	string	Required. The name of the field to allow predefined values on.
formula	string	Specifies the formula to use when setting a field's predefined value. Supported for single-select picklists as of API version 43.0.
literalValue	string	Supported for picklists only. Specifies the literal value of the field defined from values in the picklist. Corresponds to the Specific Value field in the predefined value UI.

## QuickActionLayout

The layout of fields on the action. There's no hard limit to the number of fields you can add to an action layout. However, for optimum usability, we recommend a maximum of eight fields. Adding more than 20 fields can severely affect user efficiency.

Field Name	Field Type	Description
layoutSectionStyle	LayoutSectionStyle (enumeration of type string)	Required. The type of layout structure used. The valid values are: <ul style="list-style-type: none"> <li>TwoColumnsTopToBottom</li> <li>TwoColumnsLeftToRight</li> <li>OneColumn</li> <li>CustomLinks</li> </ul>
quickActionLayoutColumns	QuickActionLayoutColumn on page 1526 []	Specifies columns in a <a href="#">QuickActionLayout</a> on page 1526.

## QuickActionLayoutColumn

A column defined for a [QuickActionLayout](#) on page 1526.

Field Name	Field Type	Description
quickActionLayoutItems	QuickActionLayoutItem on page 1526 []	Specifies row items in a <a href="#">QuickActionLayoutColumn</a> on page 1526.

## QuickActionLayoutItem

A row item comprised of fields and defined for a [QuickActionLayoutColumn](#) on page 1526.

Field Name	Field Type	Description
emptySpace	boolean	Controls if this layout item is a blank space ( <code>true</code> ) or not ( <code>false</code> ).
field	string	Represents a specific field in <a href="#">QuickActionLayoutItem</a> on page 1526.

Field Name	Field Type	Description
uiBehavior	UiBehavior (enumeration of type string)	Specifies user input behavior for specific fields in <a href="#">QuickActionLayoutItem</a> on page 1526. The valid values are: <ul style="list-style-type: none"> <li>Edit</li> <li>Required</li> <li>Readonly</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a [QuickAction](#) on page 1522 component:

```
<?xml version="1.0" encoding="UTF-8"?>
<QuickAction xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>testActionDefinitionTypesCreateTask</description>
  <label>testActionDefinitionTypesCreateTask</label>
  <optionsCreateFeedItem>true</optionsCreateFeedItem>
  <quickActionLayout>
    <layoutSectionStyle>TwoColumnsLeftToRight</layoutSectionStyle>
    <quickActionLayoutColumns>
      <quickActionLayoutItems>
        <emptySpace>>false</emptySpace>
        <field>OwnerId</field>
        <uiBehavior>Required</uiBehavior>
      </quickActionLayoutItems>
      <quickActionLayoutItems>
        <emptySpace>>false</emptySpace>
        <field>WhoId</field>
        <uiBehavior>Edit</uiBehavior>
      </quickActionLayoutItems>
      <quickActionLayoutItems>
        <emptySpace>>false</emptySpace>
        <field>WhatId</field>
        <uiBehavior>Edit</uiBehavior>
      </quickActionLayoutItems>
      <quickActionLayoutItems>
        <emptySpace>>false</emptySpace>
        <field>ActivityDate</field>
        <uiBehavior>Edit</uiBehavior>
      </quickActionLayoutItems>
      <quickActionLayoutItems>
        <emptySpace>>false</emptySpace>
        <field>Subject</field>
        <uiBehavior>Edit</uiBehavior>
      </quickActionLayoutItems>
      <quickActionLayoutItems>
        <emptySpace>>false</emptySpace>
        <field>Status</field>
        <uiBehavior>Required</uiBehavior>
      </quickActionLayoutItems>
    </quickActionLayoutColumns>
  </quickActionLayout>
</QuickAction>
```

```

    <quickActionLayoutItems>
      <emptySpace>false</emptySpace>
      <field>Priority</field>
      <uiBehavior>Required</uiBehavior>
    </quickActionLayoutItems>
  </quickActionLayoutColumns>
</quickActionLayoutColumns/>
</quickActionLayout>
<successMessage>This is a success message</successMessage>
<targetObject>Task</targetObject>
<targetParentField>What</targetParentField>
<type>Create</type>
</QuickAction>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## RedirectWhitelistUrl

---

Represents a trusted URL that's excluded from redirection restrictions when the `redirectionWarning` or `redirectBlockModeEnabled` field on the `SessionSettings` Metadata type is set to `true`. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this metadata type's name.

## File Suffix and Directory Location

`RedirectWhitelistUrl` components have the suffix `.redirectWhitelistUrl` and are stored in the `redirectWhitelistUrls` folder.

## Version

`RedirectWhitelistUrl` components are available in API version 48.0 and later.

## Special Access Rules

Only authenticated internal and external users with the View Setup and Configuration permission can access this type, and only users with the Customize Application permission can edit it.

## Fields

Field Name	Field Type	Description
<code>Url</code>	string	Required. The trusted URL.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## RecommendationStrategy

---

Represents a recommendation strategy. Recommendation strategies are applications, similar to data flows, that determine a set of recommendations to be delivered to the client through data retrieval, branching, and logic operations.

### File Suffix and Directory Location

RecommendationStrategy components have the suffix `.recommendationStrategy` and are stored in the `recommendationStrategies` folder.

### Version

RecommendationStrategy components are available in API version 45.0 and later.

### Special Access Rules

Metadata access for the RecommendationStrategy type is backed by the `ManageRecommendationStrategies` user permission.

### Fields

Field Name	Field Type	Description
<code>actionContext</code>	<a href="#">StrategyAction[]</a>	An array of action contexts used by the strategy.
<code>contextRecordType</code>	string	The sObject type of the \$record used by the flow.
<code>description</code>	string	Description of the recommendation strategy.
<code>filter</code>	<a href="#">StrategyNodeFilter[]</a>	An array of filter nodes.
<code>if</code>	<a href="#">StrategyNodeIf[]</a>	An array of if nodes.
<code>invocableAction</code>	<a href="#">StrategyNodeInvocableAction[]</a>	An array of Apex invocable action nodes. Available in API version 46.0 and later.
<code>isTemplate</code>	boolean	Indicates whether the recommendation strategy is a template ( <code>true</code> ) or not ( <code>false</code> ). When installed from managed packages, recommendation strategies can't be viewed or cloned by subscribers because of intellectual property (IP) protection. But when those recommendation strategies are templates, subscribers can open them in a builder, clone them, and customize the clones. The default value of this field is <code>false</code> . Available in API version 47.0 and later.
<code>label</code>	string	Required. Label for the flow.

Field Name	Field Type	Description
map	<a href="#">StrategyNodeMap</a> []	An array of map nodes. Available in API version 46.0 and later.
mutuallyExclusive	<a href="#">StrategyNodeExclusive</a> []	An array of mutuallyExclusive nodes.
onBehalfOfExpression	string	Formula expression defining the intended target of the recommendations (in other words, the Contact associated with a Case). Mainly used for reaction tracking.
recommendationLimit	<a href="#">StrategyNodeRecommendationLimit</a> []	An array of recommendation limit nodes.
recommendationLoad	<a href="#">StrategyNodeRecommendationLoad</a> []	An array of recommendation load nodes.
sort	<a href="#">StrategyNodeSort</a> []	An array of sort nodes.
union	<a href="#">StrategyNodeUnion</a> []	An array of union nodes.

## StrategyNodeBase

Base class for all strategy nodes. This is an abstract class.

Field Name	Field Type	Description
childNode	string	Array of child node names, in order of execution.
description	string	Description of the node.
label	string	Label of the node.
name	string	Required. Unique name of the node.

## StrategyAction

Defines a call to an invocable action from the strategy. Results are used by decision elements in the strategy.

Field Name	Field Type	Description
action	string	Required. The name or id of the InvocableAction to execute.
argument	<a href="#">StrategyActionArg</a> []	List of strategy action arguments.
description	string	Description of the strategy.
label	string	Label for the strategy action.
name	string	Required. Unique name of the strategy action, which is referenced by decisioning elements in the strategy.
type	InvocableActionType (enumeration of type string)	Required. The action type. Valid values are: <ul style="list-style-type: none"> <li><code>activateSessionPermSet</code>—Activates a session-based permission set for the running user.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>addMessageToChat</code>—Adds a message to an existing Salesforce Anywhere chat. This value is available in API version 49.0 and later.</li> <li>• <code>addMessageToQuipChat</code>—Adds a Quip message to an existing chat room. This value is available in API version 46.0 and later.</li> <li>• <code>addMessageToQuipDocument</code>—Adds a Quip message to an existing Quip document, spreadsheet, or slide. This value is available in API version 46.0 and later.</li> <li>• <code>addQuipDocumentToFolder</code>—Adds an existing Quip document, spreadsheet, or slide to an existing folder. This value is available in API version 46.0 and later.</li> <li>• <code>addUsersToChat</code>—Adds users to an existing Salesforce Anywhere chat. This value is available in API version 49.0 and later.</li> <li>• <code>addUsersToQuipDocument</code>—Adds users, identified by their email addresses, to an existing Quip document, spreadsheet, or slide. This value is available in API version 46.0 and later.</li> <li>• <code>addUsersToQuipChat</code>—Adds users, identified by their email addresses, to an existing Quip chat room. This value is available in API version 46.0 and later.</li> <li>• <code>attachQuipDocumentToRecord</code>—Attaches a Quip document, spreadsheet, or slide to a Salesforce record. This value is available in API version 46.0 and later.</li> <li>• <code>apex</code>—Invokes an Apex method that has the <code>@invocableMethod</code> annotation.</li> <li>• <code>archiveKnowledgeArticles</code>—Archives a list of published Knowledge articles. This value is available in API version 45.0 and later.</li> <li>• <code>assignKnowledgeArticles</code>—Mass assigns knowledge articles from article list views. This value is available in API version 44.0 and later.</li> <li>• <code>cdpRunIdentityResolution</code>—Runs a Data Cloud identity resolution process. This value is available in API version 57.0 and later.</li> <li>• <code>chat</code>—Creates a Salesforce Anywhere chat. This value is available in API version 49.0 and later.</li> <li>• <code>chatterPost</code>—Posts to Chatter.</li> <li>• <code>choosePricebook</code>—Selects a price book.</li> <li>• <code>contactRequestAction</code>—Creates a contact request record. This value is available in API version 45.0 and later.</li> <li>• <code>component</code>—Invokes the Lightning component that implements the <code>lightning:availableForFlowActions</code> interface and that is referenced by <code>actionName</code>. This value is available in API version 43.0 and later.</li> <li>• <code>contentWorkspaceEnableFolders</code>—Enables folders in a library.</li> <li>• <code>copyQuipDocument</code>—Creates a copy of an existing Quip document, spreadsheet, or slide, and gives it a new title. This value is available in API version 46.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>createDraftFromOnlineKnowledgeArticle</code>—Creates a draft from a published knowledge article. This value is available in API version 45.0 and later.</li> <li>• <code>createInvoiceFromFulfillmentOrder</code>—Creates an invoice from a purchase order. Available to B2B Commerce. This value is available in API version 49.0 and later.</li> <li>• <code>createQuipChat</code>—Creates a Quip chat room. This value is available in API version 46.0 and later.</li> <li>• <code>createQuipDocument</code>—Creates a Quip document, spreadsheet, or slide. This value is available in API version 46.0 and later.</li> <li>• <code>createQuipFolder</code>—Creates a Quip folder. This value is available in API version 46.0 and later.</li> <li>• <code>customNotificationAction</code>—Sends a custom notification. This value is available in API version 46.0 and later.</li> <li>• <code>deactivateSessionPermSet</code>—Deactivates a session-based permission set for the running user.</li> <li>• <code>deleteKnowledgeArticle</code>—Deletes a draft version (translation or master-language) or an entire archived knowledge article. This value is available in API version 46.0 and later.</li> <li>• <code>dynamicSendSurveyInvitation</code>—Sends customized notifications to users about important events or updates to the records that they're working on. This value is available in API version 51.0 and later.</li> <li>• <code>editQuipDocument</code>—Modifies the contents of an existing Quip document, spreadsheet, or slide. This value is available in API version 46.0 and later.</li> <li>• <code>emailAlert</code>—Sends an email by referencing a workflow email alert</li> <li>• <code>emailSimple</code>—Sends an email by using flow resources</li> <li>• <code>externalConnector</code>—Reserved for future use.</li> <li>• <code>externalService</code>—Invokes an External Service operation that makes an HTTP request to an external system made available by an External Service schema registered through Setup. This value is available in API version 46.0 and later.</li> <li>• <code>findMatchingIndividuals</code>—Finds contact, lead, or employee records that match a search term.</li> <li>• <code>flow</code>—Invokes an autolaunched flow. This action type isn't available for flows with a <code>processType</code> of <code>Flow</code> or <code>AutolaunchedFlow</code>. To invoke an autolaunched flow from one of those types, use <code>FlowSubflow</code>. This value is available in API version 32.0 and later.</li> <li>• <code>getArticleSmartLinkUrl</code>—Gets the Smart Link URL of the Salesforce Knowledge article. Smart links go to the right article and version, even when a new version is published or the URL name changes. This value is available in API version 54.0 and later.</li> <li>• <code>internalTestAction</code>—Reserved for internal use.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>internalTestConnectApiAction</code>—Reserved for internal use.</li> <li>• <code>limitRepetitions</code>—Limit the number of times the same recommendation or offer appears on the same record or for the same user during a time period in a recommendation strategy flow. This value is available in API version 55.0 and later.</li> <li>• <code>massUpdateAccountForecast</code>—Bulk updates forecasts asynchronously. This value is available in API version 48.0 and later.</li> <li>• <code>massUpdateSalesAgreement</code>—Bulk updates sales agreements asynchronously. This value is available in API version 48.0 and later.</li> <li>• <code>quickAction</code>—Invokes a <a href="#">QuickAction</a>.</li> <li>• <code>publishKnowledgeArticles</code>—Mass publishes knowledge articles from article list views. This value is available in API version 44.0 and later.</li> <li>• <code>restoreKnowledgeArticleVersion</code>—Restores an archived version of a knowledge article. This value is available in API version 45.0 and later.</li> <li>• <code>sendAlert</code>—Sends Salesforce Anywhere alerts to users. This value is available in API version 49.0 and later.</li> <li>• <code>sendNotification</code>—Sends an available notification type. This value is available in API version 54.0 and later.</li> <li>• <code>sendSurveyInvitation</code>—Sends email survey invitations to leads, contacts, and users in your org based on an action, such as when a customer support case closes. This value is available in API version 47.0 and later.</li> <li>• <code>performSurveySentimentAnalysis</code>—Perform survey sentiment analysis to create or update the AI Sentiment Result records. This value is available in API version 55.0 and later.</li> <li>• <code>skillsBasedRouting</code>—Creates a <a href="#">PendingServiceRouting</a> record used for Omni-Channel skills-based routing. This value is available in version 44.0 and later.</li> <li>• <code>slackArchiveChannel</code>—Archives a Slack channel in a Slack workspace. This value is available in API version 54.0 and later.</li> <li>• <code>slackCheckUsersAreConnectedToSlack</code>—Indicates whether a collection of Salesforce users is connected to a given Slack app. This value is available in API version 54.0 and later.</li> <li>• <code>slackCreateChannel</code>—Creates a Slack channel in a Slack workspace. This value is available in API version 54.0 and later.</li> <li>• <code>slackGetConversationInfo</code>—Retrieves the name of a Slack channel or group direct message and finds out whether it's archived. This value is available in API version 54.0 and later.</li> <li>• <code>slackInviteUsersToChannel</code>—Adds users who are connected to a given Slack app to a Slack channel or group direct message. This value is available in API version 54.0 and later.</li> <li>• <code>slackPinMessage</code>—Pin or unpin a message in a Slack channel or group direct message. This value is available in API version 54.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>slackPostMessage</code>—Send a message to a Slack channel or group direct message. This value is available in API version 54.0 and later.</li> <li>• <code>slackSendMessageToLaunchFlow</code>—Send a message to a Slack channel, direct message, or the Messages tab of a Slack app that includes a button that a recipient can use to launch a screen flow. This value is available in API version 55.0 and later.</li> <li>• <code>slackUpdateMessage</code>—Edits a message that was previously sent to a Slack channel or group direct message. This value is available in API version 54.0 and later.</li> <li>• <code>submitKnowledgeArticleForTranslation</code>—Submits a published or draft knowledge article for translation. This value is available in API version 46.0 and later.</li> <li>• <code>submit</code>—Submits a record for approval.</li> </ul> <p>These values are used in Omnichannel Inventory. If no version is specified, the value is available in API version 51.0 and later.</p> <ul style="list-style-type: none"> <li>• <code>ociCreateReservation</code>—Creates one or more inventory reservations at a location or location group.</li> <li>• <code>ociFulfillReservation</code>—Fulfills one or more inventory reservations at a location.</li> <li>• <code>ociGetAvailability</code>—Gets inventory availability data for one or more products at one or more inventory locations or location groups.</li> <li>• <code>ociReleaseReservation</code>—Releases one or more inventory reservations.</li> <li>• <code>ociTransferReservation</code>—Transfers one or more inventory reservations between locations or location groups.</li> </ul> <p>These values are used in the B2B Commerce Checkout Flow. If no version is specified, the value is available in API version 47.0 and later.</p> <ul style="list-style-type: none"> <li>• <code>updateCheckoutSessionStateAction</code>—Updates the checkout session next state for checkout flows. This value is available in API version 49.0 and later.</li> <li>• <code>priceCart</code>—Requests prices for all items in a cart during B2B Commerce checkout. This value is available in API version 47.0 and later.</li> <li>• <code>checkoutSessionAction</code>—Initiates or retrieves an existing Checkout Session for Checkout Flows. Available to B2B Commerce. This value is available in API version 49.0 and later.</li> <li>• <code>cancelCartAsyncOperation</code>—Cancels a WebCart's async operation. Available to B2B Commerce. This value is available in API version 49.0 and later.</li> <li>• <code>calcCartPromotionsAction</code>—Requests a full cart promotion calculation of all applicable line items in the Web Cart during B2B Commerce checkout. This value is available in API version 52.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li><code>checkCartInventoryAction</code>—Requests an inventory for all items in a Web Cart during B2B Commerce checkout. This value is available in API version 47.0 and later.</li> <li><code>calcCartShipmentAction</code>—Calculates the shipping cost for all items in a Web Cart during B2B Commerce checkout. This value is available in API version 47.0 and later.</li> <li><code>cartToOrderAction</code>—Creates a Salesforce Standard Order in draft mode. This value is available in API version 47.0 and later.</li> <li><code>activateOrderAction</code>—Activates a draft order, which creates an order summary. This value is available in API version 47.0 and later.</li> </ul> <p>For values used in Business Rules Engine, see <a href="#">Flow for Business Rules Engine</a>.</p> <p>These values are used in the Commerce Checkout Flow. If no version is specified, the value is available in API version 55.0 and later.</p> <ul style="list-style-type: none"> <li><code>addCartItem</code>—Adds an item to a cart during Commerce checkout.</li> <li><code>createCart</code>—Creates a cart during Commerce checkout.</li> <li><code>deleteCart</code>—Deletes a cart during Commerce checkout.</li> </ul> <p>These values are used in Salesforce CMS Workflows and Approvals. If no version is specified, the value is available in API version 58.0 and later.</p> <ul style="list-style-type: none"> <li><code>managedContentPublishVariant</code>—Publishes a content variant associated with a flow. This value is available in API version 59.0 and later.</li> <li><code>managedContentRoleStepInteractive</code>—Assigns a content variant review to a CMS role.</li> <li><code>managedContentUnpublishVariant</code>—Unpublishes a published content variant associated with a flow. This value is available in API version 59.0 and later.</li> <li><code>managedContentVariantSetLockStatus</code>—Sets the locked status of a content variant.</li> <li><code>managedContentVariantSetReadyStatus</code>—Sets the ready for publication status of a content variant.</li> </ul> <p>These values are used in Order Management. If no version is specified, the value is available in API version 48.0 and later.</p> <ul style="list-style-type: none"> <li><code>addOrderItemSummarySubmit</code>—Adds order item summaries to an order summary. This value is available in API version 54.0 and later.</li> <li><code>adjustOrderItemSummariesPreview</code>—Previews the expected results of applying a price adjustment to order item summaries from an order summary without actually applying it. This value is available in API version 49.0 and later.</li> <li><code>adjustOrderItemSummariesSubmit</code>—Applies a price adjustment to order item summaries from an order summary. This value is available in API version 49.0 and later.</li> <li><code>authorizePayment</code>—Authorizes a card payment. This value is available in API version 55.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>cancelFulfillmentOrderItem</code>—Removes items from a fulfillment order.</li> <li>• <code>cancelOrderItemSummariesPreview</code>—Previews the expected results of canceling order item summaries from an order summary without actually canceling them.</li> <li>• <code>cancelOrderItemSummariesSubmit</code>—Cancels order item summaries from an order summary.</li> <li>• <code>confirmHeldFulfillmentOrderCapacity</code>—Confirms held fulfillment order capacity. This value is available in API version 55.0 and later.</li> <li>• <code>createCreditMemoOrderSummary</code>—Creates a credit memo for an order summary.</li> <li>• <code>createFieldGnrnPromptTplResp</code>—Creates a field generation prompt template response. This value is available in API version 62.0 and later.</li> <li>• <code>createFulfillmentOrder</code>—Creates one or more fulfillment orders and fulfillment order products for an order delivery group summary, which defines a recipient and delivery method.</li> <li>• <code>createFulfillmentOrders</code>—Creates fulfillment orders and fulfillment order products for multiple order delivery group summaries, each of which defines a recipient and delivery method. This value is available in API version 51.0 and later.</li> <li>• <code>createInvoiceFromChangeOrders</code>—Creates an invoice for one or more change orders. This value is available in API version 56.0 and later.</li> <li>• <code>createInvoiceFromFulfillmentOrder</code>—Creates an invoice for a fulfillment order.</li> <li>• <code>createOrderPaymentSummary</code>—Creates an order payment summary for an authorization or payments belonging to an order summary.</li> <li>• <code>createOrderSummary</code>—Creates an order summary for an order.</li> <li>• <code>createReturnOrder</code>—Creates a return order and return order items for an order.</li> <li>• <code>ensureFundsOrderSummaryAsync</code>—Triggers an asynchronous background process to ensure funds through a payment provider for an invoice belonging to an order summary.</li> <li>• <code>ensureRefundsOrderSummaryAsync</code>—Triggers an asynchronous background process to ensure refunds through a payment provider for an invoice belonging to an order summary.</li> <li>• <code>getFulfillmentOrderCapacityValues</code>—Gets fulfillment order capacity information. This value is available in API version 55.0 and later.</li> <li>• <code>holdFulfillmentOrderCapacity</code>—Holds fulfillment order capacity. This value is available in API version 55.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>orderRoutingFindRoutesWithFewestSplits</code>—Evaluates ordered product quantities against available inventory to determine the smallest combination of locations that can fulfill the order. This value is available in API version 51.0 and later.</li> <li>• <code>orderRoutingFindRoutesWithFewestSplitsUsingOCI</code>—Evaluates ordered product quantities against available inventory at specified location groups and locations to determine the smallest combination of locations that can fulfill the order. This value is available in API version 54.0 and later.</li> <li>• <code>orderRoutingRankByAverageDistance</code>—Calculates the average distance from sets of inventory locations to an order recipient, and returns the sets sorted by that average distance. This value is available in API version 51.0 and later.</li> <li>• <code>releaseHeldFulfillmentOrderCapacity</code>—Releases held fulfillment order capacity. This value is available in API version 55.0 and later.</li> <li>• <code>returnOrderItemSummariesPreview</code>—Previews the expected results of returning order item summaries from an order summary without actually returning them.</li> <li>• <code>returnOrderItemSummariesSubmit</code>—Returns order item summaries from an order summary.</li> <li>• <code>returnReturnOrderItems</code>—Processes return order line items.</li> </ul> <p>These values are used in Financial Services Cloud.</p> <ul style="list-style-type: none"> <li>• <code>createCaseForFeeReversal</code>—Creates a case to request a fee reversal for a client. This value is available in API version 62.0 and later.</li> <li>• <code>createFinancialRecords</code>—Creates person accounts, contacts, financial accounts, properties, assets, and liabilities from a residential loan application. This value is available in API version 49.0 and later.</li> </ul> <p>For values used in Fundraising for Nonprofit Cloud, see <a href="#">Flow for Fundraising</a>.</p> <p>For values used in Health Cloud, see <a href="#">Flow for Health Cloud</a>.</p> <p>For values used in Manufacturing Cloud, see <a href="#">Flow for Manufacturing Cloud</a>.</p> <p>These values are used in Rebate Management.</p> <ul style="list-style-type: none"> <li>• <code>addRebateMemberList</code>—Adds a list of members to a rebate program. This value is available in API version 51.0 and later.</li> <li>• <code>calculateProjectedRebateAmount</code>—Calculates the projected rebate amount for rebate types associated with a specified transaction ID. This value is available in API version 54.0 and later.</li> <li>• <code>calculateRebateAmountAndUpsertPayout</code>—Calculates the rebate amount and upserts the rebate payout for the specified aggregate record. This value is available in API version 51.0 and later.</li> <li>• <code>getBenefitAndCalculateRebateAmount</code>—Gets benefit details, and optionally calculates the rebate amount for the specified aggregate record. This value is available in API version 51.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>getEligibleProgramRebateTypes</code>—Retrieves the eligible program rebate types for a mapped object. This value is available in API version 52.0 and later.</li> <li>• <code>generateRebatePayoutPeriods</code>—Generates payout periods for a rebate program based on the frequency specified in the program. This value is available in API version 51.0 and later.</li> <li>• <code>processRebatesBatchCalculationJob</code>—Processes a rebate batch calculation job from the Data Processing Engine. This value is available in API version 51.0 and later.</li> <li>• <code>processProgramRebateTypeProducts</code>—Insert or delete records in the Program Rebate Type Product object. This value is available in API version 53.0 and later.</li> <li>• <code>rebatesProcessCSV</code>—Processes an uploaded CSV file using Bulk API 2.0 and converts the file's data into records in the target object. This value is available in API version 51.0 and later.</li> <li>• <code>upsertCustomRebatePayout</code>—Upserts the custom calculated rebate payout for the specified aggregate record. This value is available in API version 51.0 and later.</li> </ul> <p>These values are used in Loyalty Management.</p> <ul style="list-style-type: none"> <li>• <code>adjustPoints</code>—Adjusts loyalty points for a specified program member or journal transaction. This value is available in API version 51.0 and later.</li> <li>• <code>assignTierBenefits</code>—Assigns Member Benefits to a member tier for benefits that are associated with a Benefit Action. This value is available in API version 51.0 and later.</li> <li>• <code>cancelAccrual</code>—Cancels a specific set of accrual transactions.</li> <li>• <code>creditPoints</code>—Credits loyalty points to a specified program member's balance. This value is available in API version 51.0 and later.</li> <li>• <code>cancelRedemption</code>—Reverts a specific set of redemption transactions. This value is available in API version 51.0 and later.</li> <li>• <code>changeTier</code>—Changes the tier for a specified program member. This value is available in API version 51.0 and later.</li> <li>• <code>changeTierWhenNoErrors</code>—Changes tier for a specified loyalty program member only when all the input parameters meet the criteria. This value is available in API version 51.0 and later.</li> <li>• <code>debitPoints</code>—Debits loyalty points to a specified program member's balance. This value is available in API version 51.0 and later.</li> <li>• <code>executeMemberBenefit</code>—Processes the benefit action associated with the benefit, which is assigned to a loyalty program member. This value is available in API version 51.0 and later.</li> <li>• <code>generateMemberReferralCode</code>—Generates a unique 8-character referral code for a loyalty program member. This value is available in API version 57.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>getMemberActiveSegments</code>—Retrieve active Data Cloud market segments that a loyalty program member is a part of.</li> <li>• <code>getTier</code>—Gets the current tier for a specified program member. This value is available in API version 51.0 and later.</li> <li>• <code>getPointsBalance</code>—Gets the loyalty points balance for a specified program member. This value is available in API version 51.0 and later.</li> <li>• <code>getLoyaltyPromotion</code>—Gets active loyalty promotions based on a transaction journal. This value is available in API version 53.0 and later.</li> <li>• <code>getLoyaltyPromotionBasedOnSalesforceCDP</code>—Gets promotions for a member based on the market segment the member belongs to. This value is available in API version 53.0 and later.</li> <li>• <code>issueVoucher</code>—Issues a voucher for a member or contract. This value is available in API version 51.0 and later.</li> <li>• <code>mergeLoyaltyProgramMembership</code>—Merges two active loyalty program member records that both belong to the same loyalty program. This value is available in API version 56.0 and later.</li> <li>• <code>transferMemberPointsToGroups</code>—Transfers points from an individual member or a corporate member to the member's associated group. This value is available in API version 53.0 and later.</li> <li>• <code>updateProgressForCumulativePromotionUsage</code>—Updates the progress a member has made towards attaining a cumulative type promotion. This value is available in API version 53.0 and later.</li> <li>• <code>unmergeLoyaltyProgramMembership</code>—Unmerges loyalty program member records that have a Merged status. The action unmerges memberships in the Merged status from the previously merged membership. This value is available in API version 56.0 and later.</li> <li>• <code>runProgramProcess</code>—Triggers an active loyalty program process. This value is available in API version 56.0 and later.</li> <li>• <code>runProgramProcessForTransactionJournal</code>—Triggers an active loyalty program process whose process type is TransactionJournal. This value is available in API version 54.0 and later.</li> </ul>
		<p>These values are for Decision Table.</p> <ul style="list-style-type: none"> <li>• <code>decisionTableAction</code>—Runs an active decision table definition. This value is available in API version 51.0 and later.</li> <li>• <code>refreshDecisionTable</code>—Refreshes the decision table cache. This value is available in API version 51.0 and later.</li> </ul>
		<p>These values are for the Batch Management jobs.</p> <ul style="list-style-type: none"> <li>• <code>batchJobAction</code>—Runs the batch management jobs definitions. This value is available in API version 51.0 and later.</li> <li>• <code>submitFailedRecordsBatchJob</code>—Resubmits an existing batch job with failed records for processing. This value is available in API version 52.0 and later.</li> </ul>

Field Name	Field Type	Description
		<p>This value is for Data Processing Engine.</p> <ul style="list-style-type: none"> <li><code>dataProcessingEngineAction</code>—Runs the data processing engine definitions. If no version is specified, the value is available in API version 52.0 and later.</p> <ul style="list-style-type: none"> <li><code>addWorkPlans</code>—Creates work plan and work step objects from the work plan library.</li> <li><code>addWorkSteps</code>—Creates work step objects from the work plan library.</li> <li><code>deleteWorkPlans</code>—Deletes all the work plans and work steps associated with a work order or work order line item.</li> <li><code>generateWorkPlans</code>—Generates work plans based off rules defined in the work plan library.</li> </ul> <p>For values used in Intelligent Form Reader, see Flow for Intelligent Form Reader.</p> <p>For values used in Intelligent Document Reader, see Flow for Intelligent Document Reader.</p> <p>This value is used in Public Sector Solutions.</p> <ul style="list-style-type: none"> <li><code>createBenefitDisbursement</code>—Creates a benefit disbursement for an eligible benefit assignment. This value is available in API version 57.0 and later.</li> <li><code>runRecordAggrBatchProcDef</code>—Runs a Data Processing Engine definition to process an asynchronous batch job that creates or updates record aggregation results. This value is available in API version 59.0 and later.</li> </ul> <p>These values are reserved for future use.</p> <ul style="list-style-type: none"> <li><code>thanks</code></li> <li><code>metricRefresh</code></li> <li><code>exportSurveyResponses</code></li> </ul>

## StrategyActionArg

Defines arguments passed to invocable actions associated with a strategy action.

Field Name	Field Type	Description
<code>name</code>	string	Required. Unique name for the parameter to pass to the invocable action.

Field Name	Field Type	Description
<code>value</code>	string	Required. A Salesforce formula expression that is evaluated with the result being used as the parameter value for the Strategy Action.

## StrategyNodeUnionBase

Base class for nodes that perform a union of their children. Union nodes combine the outputs of their children to form the input to themselves. `StrategyNodeUnionBase` extends `StrategyNodeBase` and inherits all of its fields. This is an abstract class.

Field Name	Field Type	Description
<code>limit</code>	int	Maximum number of results to output.

## StrategyNodeFilter

Defines a filter element that filters recommendations. It extends `StrategyNodeUnionBase` and inherits all its fields.

Field Name	Field Type	Description
<code>expression</code>	string	Required. A formula expression that results in a boolean value when executed on each recommendation in the node's input. Inputs that result in <code>true</code> form the output, and inputs that result in <code>false</code> are excluded.

## StrategyNodeIf

Selects specific children to execute and combines their results. Executes and returns results of children based on the array of child node expressions. Extends `StrategyNodeUnionBase` and inherits all of its fields.

Field Name	Field Type	Description
<code>childNodeExpression</code>	<a href="#">IfExpression[]</a>	Array of if expressions.
<code>onlyFirstMatch</code>	boolean	If <code>true</code> , selects only the results from the matching child. If <code>false</code> , selects and combines results from all matching children. The default value is <code>false</code> .

## IfExpression

Expression used by `StrategyNodeIf`.

Field Name	Field Type	Description
<code>childName</code>	string	Required. Name of child to match.
<code>expression</code>	string	Required. Formula expression returning <code>true</code> or <code>false</code> .

## StrategyNodeInvocableAction

Defines an element that calls an Apex invocable action to generate or enhance a list of recommendations. It extends [StrategyNodeUnionBase](#) and inherits all its fields.

Field Name	Field Type	Description
<code>action</code>	string	Required. The name of the invocable action to execute.
<code>argument</code>	<a href="#">StrategyNodeInvocableActionArg</a>	List of arguments that are passed to the invocable action.
<code>isGenerator</code>	boolean	Required. If <code>true</code> , the UI displays the Generate element. If <code>false</code> , the UI displays the Enhance element. Defaults to <code>false</code> .
<code>type</code>	InvocableActionType (enumeration of type string)	Required. The action type. Valid values are: <ul style="list-style-type: none"> <li><code>activateSessionPermSet</code>—Activates a session-based permission set for the running user.</li> <li><code>addMessageToChat</code>—Adds a message to an existing Salesforce Anywhere chat. This value is available in API version 49.0 and later.</li> <li><code>addMessageToQuipChat</code>—Adds a Quip message to an existing chat room. This value is available in API version 46.0 and later.</li> <li><code>addMessageToQuipDocument</code>—Adds a Quip message to an existing Quip document, spreadsheet, or slide. This value is available in API version 46.0 and later.</li> <li><code>addQuipDocumentToFolder</code>—Adds an existing Quip document, spreadsheet, or slide to an existing folder. This value is available in API version 46.0 and later.</li> <li><code>addUsersToChat</code>—Adds users to an existing Salesforce Anywhere chat. This value is available in API version 49.0 and later.</li> <li><code>addUsersToQuipDocument</code>—Adds users, identified by their email addresses, to an existing Quip document, spreadsheet, or slide. This value is available in API version 46.0 and later.</li> <li><code>addUsersToQuipChat</code>—Adds users, identified by their email addresses, to an existing Quip chat room. This value is available in API version 46.0 and later.</li> <li><code>attachQuipDocumentToRecord</code>—Attaches a Quip document, spreadsheet, or slide to a Salesforce record. This value is available in API version 46.0 and later.</li> <li><code>apex</code>—Invokes an Apex method that has the <code>@invocableMethod</code> annotation.</li> <li><code>archiveKnowledgeArticles</code>—Archives a list of published Knowledge articles. This value is available in API version 45.0 and later.</li> <li><code>assignKnowledgeArticles</code>—Mass assigns knowledge articles from article list views. This value is available in API version 44.0 and later.</li> <li><code>cdpRunIdentityResolution</code>—Runs a Data Cloud identity resolution process. This value is available in API version 57.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>chat</code>—Creates a Salesforce Anywhere chat. This value is available in API version 49.0 and later.</li> <li>• <code>chatterPost</code>—Posts to Chatter.</li> <li>• <code>choosePricebook</code>—Selects a price book.</li> <li>• <code>contactRequestAction</code>—Creates a contact request record. This value is available in API version 45.0 and later.</li> <li>• <code>component</code>—Invokes the Lightning component that implements the <code>lightning:availableForFlowActions</code> interface and that is referenced by <code>actionName</code>. This value is available in API version 43.0 and later.</li> <li>• <code>contentWorkspaceEnableFolders</code>—Enables folders in a library.</li> <li>• <code>copyQuipDocument</code>—Creates a copy of an existing Quip document, spreadsheet, or slide, and gives it a new title. This value is available in API version 46.0 and later.</li> <li>• <code>createDraftFromOnlineKnowledgeArticle</code>—Creates a draft from a published knowledge article. This value is available in API version 45.0 and later.</li> <li>• <code>createInvoiceFromFulfillmentOrder</code>—Creates an invoice from a purchase order. Available to B2B Commerce. This value is available in API version 49.0 and later.</li> <li>• <code>createQuipChat</code>—Creates a Quip chat room. This value is available in API version 46.0 and later.</li> <li>• <code>createQuipDocument</code>—Creates a Quip document, spreadsheet, or slide. This value is available in API version 46.0 and later.</li> <li>• <code>createQuipFolder</code>—Creates a Quip folder. This value is available in API version 46.0 and later.</li> <li>• <code>customNotificationAction</code>—Sends a custom notification. This value is available in API version 46.0 and later.</li> <li>• <code>deactivateSessionPermSet</code>—Deactivates a session-based permission set for the running user.</li> <li>• <code>deleteKnowledgeArticle</code>—Deletes a draft version (translation or master-language) or an entire archived knowledge article. This value is available in API version 46.0 and later.</li> <li>• <code>dynamicSendSurveyInvitation</code>—Sends customized notifications to users about important events or updates to the records that they're working on. This value is available in API version 51.0 and later.</li> <li>• <code>editQuipDocument</code>—Modifies the contents of an existing Quip document, spreadsheet, or slide. This value is available in API version 46.0 and later.</li> <li>• <code>emailAlert</code>—Sends an email by referencing a workflow email alert</li> <li>• <code>emailSimple</code>—Sends an email by using flow resources</li> <li>• <code>externalService</code>—Invokes an External Service operation that makes an HTTP request to an external system made available by an External Service</li> </ul>

Field Name	Field Type	Description
		<p>schema registered through Setup. This value is available in API version 46.0 and later.</p> <ul style="list-style-type: none"> <li>• <code>findMatchingIndividuals</code>—Finds contact, lead, or employee records that match a search term.</li> <li>• <code>flow</code>—Invokes an autolaunched flow. This action type isn't available for flows with a <code>processType</code> of <code>Flow</code> or <code>AutolaunchedFlow</code>. To invoke an autolaunched flow from one of those types, use <code>FlowSubflow</code>. This value is available in API version 32.0 and later.</li> <li>• <code>getArticleSmartLinkUrl</code>—Gets the Smart Link URL of the Salesforce Knowledge article. Smart links go to the right article and version, even when a new version is published or the URL name changes. This value is available in API version 54.0 and later.</li> <li>• <code>internalTestAction</code>—Reserved for internal use.</li> <li>• <code>internalTestConnectApiAction</code>—Reserved for internal use.</li> <li>• <code>limitRepetitions</code>—Limit the number of times the same recommendation or offer appears on the same record or for the same user during a time period in a recommendation strategy flow. This value is available in API version 55.0 and later.</li> <li>• <code>massUpdateAccountForecast</code>—Bulk updates forecasts asynchronously. This value is available in API version 48.0 and later.</li> <li>• <code>massUpdateSalesAgreement</code>—Bulk updates sales agreements asynchronously. This value is available in API version 48.0 and later.</li> <li>• <code>quickAction</code>—Invokes a <a href="#">QuickAction</a>.</li> <li>• <code>publishKnowledgeArticles</code>—Mass publishes knowledge articles from article list views. This value is available in API version 44.0 and later.</li> <li>• <code>restoreKnowledgeArticleVersion</code>—Restores an archived version of a knowledge article. This value is available in API version 45.0 and later.</li> <li>• <code>sendAlert</code>—Sends Salesforce Anywhere alerts to users. This value is available in API version 49.0 and later.</li> <li>• <code>sendNotification</code>—Sends an available notification type. This value is available in API version 54.0 and later.</li> <li>• <code>sendSurveyInvitation</code>—Sends email survey invitations to leads, contacts, and users in your org based on an action, such as when a customer support case closes. This value is available in API version 47.0 and later.</li> <li>• <code>performSurveySentimentAnalysis</code>—Perform survey sentiment analysis to create or update the AI Sentiment Result records. This value is available in API version 55.0 and later.</li> <li>• <code>skillsBasedRouting</code>—Creates a <a href="#">PendingServiceRouting</a> record used for Omni-Channel skills-based routing. This value is available in version 44.0 and later.</li> <li>• <code>slackArchiveChannel</code>—Archives a Slack channel in a Slack workspace. This value is available in API version 54.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>slackCheckUsersAreConnectedToSlack</code>—Indicates whether a collection of Salesforce users is connected to a given Slack app. This value is available in API version 54.0 and later.</li> <li>• <code>slackCreateChannel</code>—Creates a Slack channel in a Slack workspace. This value is available in API version 54.0 and later.</li> <li>• <code>slackGetConversationInfo</code>—Retrieves the name of a Slack channel or group direct message and finds out whether it's archived. This value is available in API version 54.0 and later.</li> <li>• <code>slackInviteUsersToChannel</code>—Adds users who are connected to a given Slack app to a Slack channel or group direct message. This value is available in API version 54.0 and later.</li> <li>• <code>slackPinMessage</code>—Pin or unpin a message in a Slack channel or group direct message. This value is available in API version 54.0 and later.</li> <li>• <code>slackPostMessage</code>—Send a message to a Slack channel or group direct message. This value is available in API version 54.0 and later.</li> <li>• <code>slackSendMessageToLaunchFlow</code>—Send a message to a Slack channel, direct message, or the Messages tab of a Slack app that includes a button that a recipient can use to launch a screen flow. This value is available in API version 55.0 and later.</li> <li>• <code>slackUpdateMessage</code>—Edits a message that was previously sent to a Slack channel or group direct message. This value is available in API version 54.0 and later.</li> <li>• <code>submitKnowledgeArticleForTranslation</code>—Submits a published or draft knowledge article for translation. This value is available in API version 46.0 and later.</li> <li>• <code>submit</code>—Submits a record for approval.</li> </ul> <p>These values are used in Omnichannel Inventory. If no version is specified, the value is available in API version 51.0 and later.</p> <ul style="list-style-type: none"> <li>• <code>ociCreateReservation</code>—Creates one or more inventory reservations at a location or location group.</li> <li>• <code>ociFulfillReservation</code>—Fulfills one or more inventory reservations at a location.</li> <li>• <code>ociGetAvailability</code>—Gets inventory availability data for one or more products at one or more inventory locations or location groups.</li> <li>• <code>ociReleaseReservation</code>—Releases one or more inventory reservations.</li> <li>• <code>ociTransferReservation</code>—Transfers one or more inventory reservations between locations or location groups.</li> </ul> <p>These values are used in the B2B Commerce Checkout Flow. If no version is specified, the value is available in API version 47.0 and later.</p> <ul style="list-style-type: none"> <li>• <code>updateCheckoutSessionStateAction</code>—Updates the checkout session next state for checkout flows. This value is available in API version 49.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>priceCart</code>—Requests prices for all items in a cart during B2B Commerce checkout. This value is available in API version 47.0 and later.</li> <li>• <code>checkoutSessionAction</code>—Initiates or retrieves an existing Checkout Session for Checkout Flows. Available to B2B Commerce. This value is available in API version 49.0 and later.</li> <li>• <code>cancelCartAsyncOperation</code>—Cancels a WebCart's async operation. Available to B2B Commerce. This value is available in API version 49.0 and later.</li> <li>• <code>calcCartPromotionsAction</code>—Requests a full cart promotion calculation of all applicable line items in the Web Cart during B2B Commerce checkout. This value is available in API version 52.0 and later.</li> <li>• <code>checkCartInventoryAction</code>—Requests an inventory for all items in a Web Cart during B2B Commerce checkout. This value is available in API version 47.0 and later.</li> <li>• <code>calcCartShipmentAction</code>—Calculates the shipping cost for all items in a Web Cart during B2B Commerce checkout. This value is available in API version 47.0 and later.</li> <li>• <code>cartToOrderAction</code>—Creates a Salesforce Standard Order in draft mode. This value is available in API version 47.0 and later.</li> <li>• <code>activateOrderAction</code>—Activates a draft order, which creates an order summary. This value is available in API version 47.0 and later.</li> </ul> <p>For values used in Business Rules Engine, see <a href="#">Flow for Business Rules Engine</a>.</p> <p>These values are used in the Commerce Checkout Flow. If no version is specified, the value is available in API version 55.0 and later.</p> <ul style="list-style-type: none"> <li>• <code>addCartItem</code>—Adds an item to a cart during Commerce checkout.</li> <li>• <code>createCart</code>—Creates a cart during Commerce checkout.</li> <li>• <code>deleteCart</code>—Deletes a cart during Commerce checkout.</li> </ul> <p>These values are used in Salesforce CMS Workflows and Approvals. If no version is specified, the value is available in API version 58.0 and later.</p> <ul style="list-style-type: none"> <li>• <code>managedContentPublishVariant</code>—Publishes a content variant associated with a flow. This value is available in API version 59.0 and later.</li> <li>• <code>managedContentRoleStepInteractive</code>—Assigns a content variant review to a CMS role.</li> <li>• <code>managedContentUnpublishVariant</code>—Unpublishes a published content variant associated with a flow. This value is available in API version 59.0 and later.</li> <li>• <code>managedContentVariantSetLockStatus</code>—Sets the locked status of a content variant.</li> <li>• <code>managedContentVariantSetReadyStatus</code>—Sets the ready for publication status of a content variant.</li> </ul> <p>These values are used in Order Management. If no version is specified, the value is available in API version 48.0 and later.</p>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>addOrderItemSummarySubmit</code>—Adds order item summaries to an order summary. This value is available in API version 54.0 and later.</li> <li>• <code>adjustOrderItemSummariesPreview</code>—Previews the expected results of applying a price adjustment to order item summaries from an order summary without actually applying it. This value is available in API version 49.0 and later.</li> <li>• <code>adjustOrderItemSummariesSubmit</code>—Applies a price adjustment to order item summaries from an order summary. This value is available in API version 49.0 and later.</li> <li>• <code>authorizePayment</code>—Authorizes a card payment. This value is available in API version 55.0 and later.</li> <li>• <code>cancelFulfillmentOrderItem</code>—Removes items from a fulfillment order.</li> <li>• <code>cancelOrderItemSummariesPreview</code>—Previews the expected results of canceling order item summaries from an order summary without actually canceling them.</li> <li>• <code>cancelOrderItemSummariesSubmit</code>—Cancels order item summaries from an order summary.</li> <li>• <code>confirmHeldFulfillmentOrderCapacity</code>—Confirms held fulfillment order capacity. This value is available in API version 55.0 and later.</li> <li>• <code>createCreditMemoOrderSummary</code>—Creates a credit memo for an order summary.</li> <li>• <code>createFieldGnrnPromptTplResp</code>—Creates a field generation prompt template response. This value is available in API version 62.0 and later.</li> <li>• <code>createFulfillmentOrder</code>—Creates one or more fulfillment orders and fulfillment order products for an order delivery group summary, which defines a recipient and delivery method.</li> <li>• <code>createFulfillmentOrders</code>—Creates fulfillment orders and fulfillment order products for multiple order delivery group summaries, each of which defines a recipient and delivery method. This value is available in API version 51.0 and later.</li> <li>• <code>createInvoiceFromChangeOrders</code>—Creates an invoice for one or more change orders. This value is available in API version 56.0 and later.</li> <li>• <code>createInvoiceFromFulfillmentOrder</code>—Creates an invoice for a fulfillment order.</li> <li>• <code>createOrderPaymentSummary</code>—Creates an order payment summary for an authorization or payments belonging to an order summary.</li> <li>• <code>createOrderSummary</code>—Creates an order summary for an order.</li> <li>• <code>createReturnOrder</code>—Creates a return order and return order items for an order.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>ensureFundsOrderSummaryAsync</code>—Triggers an asynchronous background process to ensure funds through a payment provider for an invoice belonging to an order summary.</li> <li>• <code>ensureRefundsOrderSummaryAsync</code>—Triggers an asynchronous background process to ensure refunds through a payment provider for an invoice belonging to an order summary.</li> <li>• <code>getFulfillmentOrderCapacityValues</code>—Gets fulfillment order capacity information. This value is available in API version 55.0 and later.</li> <li>• <code>holdFulfillmentOrderCapacity</code>—Holds fulfillment order capacity. This value is available in API version 55.0 and later.</li> <li>• <code>orderRoutingFindRoutesWithFewestSplits</code>—Evaluates ordered product quantities against available inventory to determine the smallest combination of locations that can fulfill the order. This value is available in API version 51.0 and later.</li> <li>• <code>orderRoutingFindRoutesWithFewestSplitsUsingOCI</code>—Evaluates ordered product quantities against available inventory at specified location groups and locations to determine the smallest combination of locations that can fulfill the order. This value is available in API version 54.0 and later.</li> <li>• <code>orderRoutingRankByAverageDistance</code>—Calculates the average distance from sets of inventory locations to an order recipient, and returns the sets sorted by that average distance. This value is available in API version 51.0 and later.</li> <li>• <code>releaseHeldFulfillmentOrderCapacity</code>—Releases held fulfillment order capacity. This value is available in API version 55.0 and later.</li> <li>• <code>returnOrderItemSummariesPreview</code>—Previews the expected results of returning order item summaries from an order summary without actually returning them.</li> <li>• <code>returnOrderItemSummariesSubmit</code>—Returns order item summaries from an order summary.</li> <li>• <code>returnReturnOrderItems</code>—Processes return order line items.</li> </ul> <p>These values are used in Financial Services Cloud.</p> <ul style="list-style-type: none"> <li>• <code>createFinancialRecords</code>—Creates person accounts, contacts, financial accounts, properties, assets, and liabilities from a residential loan application. This value is available in API version 49.0 and later.</li> </ul> <p>For values used in Fundraising for Nonprofit Cloud, see <a href="#">Flow for Fundraising</a>.</p> <p>For values used in Health Cloud, see <a href="#">Flow for Health Cloud</a>.</p> <p>For values used in Manufacturing Cloud, see <a href="#">Flow for Manufacturing Cloud</a>.</p> <p>These values are used in Rebate Management.</p> <ul style="list-style-type: none"> <li>• <code>addRebateMemberList</code>—Adds a list of members to a rebate program. This value is available in API version 51.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>calculateProjectedRebateAmount</code>—Calculates the projected rebate amount for rebate types associated with a specified transaction ID. This value is available in API version 54.0 and later.</li> <li>• <code>calculateRebateAmountAndUpsertPayout</code>—Calculates the rebate amount and upserts the rebate payout for the specified aggregate record. This value is available in API version 51.0 and later.</li> <li>• <code>getBenefitAndCalculateRebateAmount</code>—Gets benefit details, and optionally calculates the rebate amount for the specified aggregate record. This value is available in API version 51.0 and later.</li> <li>• <code>getEligibleProgramRebateTypes</code>—Retrieves the eligible program rebate types for a mapped object. This value is available in API version 52.0 and later.</li> <li>• <code>generateRebatePayoutPeriods</code>—Generates payout periods for a rebate program based on the frequency specified in the program. This value is available in API version 51.0 and later.</li> <li>• <code>processRebatesBatchCalculationJob</code>—Processes a rebate batch calculation job from the Data Processing Engine. This value is available in API version 51.0 and later.</li> <li>• <code>processProgramRebateTypeProducts</code>—Insert or delete records in the Program Rebate Type Product object. This value is available in API version 53.0 and later.</li> <li>• <code>rebatesProcessCSV</code>—Processes an uploaded CSV file using Bulk API 2.0 and converts the file's data into records in the target object. This value is available in API version 51.0 and later.</li> <li>• <code>upsertCustomRebatePayout</code>—Upserts the custom calculated rebate payout for the specified aggregate record. This value is available in API version 51.0 and later.</li> </ul> <p>These values are used in Loyalty Management.</p> <ul style="list-style-type: none"> <li>• <code>adjustPoints</code>—Adjusts loyalty points for a specified program member or journal transaction. This value is available in API version 51.0 and later.</li> <li>• <code>assignTierBenefits</code>—Assigns Member Benefits to a member tier for benefits that are associated with a Benefit Action. This value is available in API version 51.0 and later.</li> <li>• <code>cancelAccrual</code>—Cancels a specific set of accrual transactions.</li> <li>• <code>creditPoints</code>—Credits loyalty points to a specified program member's balance. This value is available in API version 51.0 and later.</li> <li>• <code>cancelRedemption</code>—Reverts a specific set of redemption transactions. This value is available in API version 51.0 and later.</li> <li>• <code>changeTier</code>—Changes the tier for a specified program member. This value is available in API version 51.0 and later.</li> <li>• <code>changeTierWhenNoErrors</code>—Changes tier for a specified loyalty program member only when all the input parameters meet the criteria. This value is available in API version 51.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>debitPoints</code>—Debits loyalty points to a specified program member's balance. This value is available in API version 51.0 and later.</li> <li>• <code>executeMemberBenefit</code>—Processes the benefit action associated with the benefit, which is assigned to a loyalty program member. This value is available in API version 51.0 and later.</li> <li>• <code>generateMemberReferralCode</code>—Generates a unique 8-character referral code for a loyalty program member. This value is available in API version 57.0 and later.</li> <li>• <code>getMemberActiveSegments</code>—Retrieve active Data Cloud market segments that a loyalty program member is a part of.</li> <li>• <code>getTier</code>—Gets the current tier for a specified program member. This value is available in API version 51.0 and later.</li> <li>• <code>getPointsBalance</code>—Gets the loyalty points balance for a specified program member. This value is available in API version 51.0 and later.</li> <li>• <code>getLoyaltyPromotion</code>—Gets active loyalty promotions based on a transaction journal. This value is available in API version 53.0 and later.</li> <li>• <code>getLoyaltyPromotionBasedOnSalesforceCDP</code>—Gets promotions for a member based on the market segment the member belongs to. This value is available in API version 53.0 and later.</li> <li>• <code>issueVoucher</code>—Issues a voucher for a member or contract. This value is available in API version 51.0 and later.</li> <li>• <code>mergeLoyaltyProgramMembership</code>—Merges two active loyalty program member records that both belong to the same loyalty program. This value is available in API version 56.0 and later.</li> <li>• <code>transferMemberPointsToGroups</code>—Transfers points from an individual member or a corporate member to the member's associated group. This value is available in API version 53.0 and later.</li> <li>• <code>updateProgressForCumulativePromotionUsage</code>—Updates the progress a member has made towards attaining a cumulative type promotion. This value is available in API version 53.0 and later.</li> <li>• <code>unmergeLoyaltyProgramMembership</code>—Unmerges loyalty program member records that have a Merged status. The action unmerges memberships in the Merged status from the previously merged membership. This value is available in API version 56.0 and later.</li> <li>• <code>runProgramProcess</code>—Triggers an active loyalty program process. This value is available in API version 56.0 and later.</li> <li>• <code>runProgramProcessForTransactionJournal</code>—Triggers an active loyalty program process whose process type is TransactionJournal. This value is available in API version 54.0 and later.</li> </ul> <p>These values are for Decision Table.</p> <ul style="list-style-type: none"> <li>• <code>decisionTableAction</code>—Runs an active decision table definition. This value is available in API version 51.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>refreshDecisionTable</code>—Refreshes the decision table cache. If no version is specified, the value is available in API version 52.0 and later.</p> <ul style="list-style-type: none"> <li>• <code>addWorkPlans</code>—Creates work plan and work step objects from the work plan library.</li> <li>• <code>addWorkSteps</code>—Creates work step objects from the work plan library.</li> <li>• <code>deleteWorkPlans</code>—Deletes all the work plans and work steps associated with a work order or work order line item.</li> <li>• <code>generateWorkPlans</code>—Generates work plans based off rules defined in the work plan library.</li> </ul> <p>For values used in Intelligent Form Reader, see Flow for Intelligent Form Reader.</p> <p>For values used in Intelligent Document Reader, see Flow for Intelligent Document Reader.</p> <p>This value is used in Public Sector Solutions.</p> <ul style="list-style-type: none"> <li>• <code>createBenefitDisbursement</code>—Creates a benefit disbursement for an eligible benefit assignment. This value is available in API version 57.0 and later.</li> <li>• <code>runRecordAggrBatchProcDef</code>—Runs a Data Processing Engine definition to process an asynchronous batch job that creates or updates record aggregation results. This value is available in API version 59.0 and later.</li> </ul> <p>These values are reserved for future use.</p> <ul style="list-style-type: none"> <li>• <code>thanks</code></li> <li>• <code>metricRefresh</code></li> <li>• <code>exportSurveyResponses</code></li> </ul>

## StrategyNodeInvocableActionArg

Defines arguments passed to an Apex invocable action that generates or enhances a list of recommendations.

Field Name	Field Type	Description
name	string	Required. Unique name for the parameter to pass to the invocable action. The name must match a parameter that's defined in the invocable action.
value	string	Required. A Salesforce formula expression that is evaluated with the result used as the parameter value for the action.

## StrategyNodeRecommendationLimit

Filters out recommendations that have already been accepted or rejected. Extends StrategyNodeUnionBase and inherits all of its fields.

Field Name	Field Type	Description
filterMode	StrategyReactionType (enumeration of type string)	Available reactions to filter out. The valid values are: <ul style="list-style-type: none"> <li>Accepted</li> <li>Rejected</li> </ul>
lookbackDuration	int	Number of days to search back.
maxRecommendationCount	int	Maximum number of times recommendation has been accepted or rejected.

## StrategyNodeRecommendationLoad

Retrieves Recommendation objects. Extends StrategyNodeUnionBase and inherits all of its fields.

Field Name	Field Type	Description
condition	<a href="#">RecommendationLoadCondition</a>	Array of conditions specifying which recommendations to load.
conditionLogic	string	Logic to combine conditions, either AND or OR. All conditions are combined (not mixed). For example: Cond1 AND Cond2 AND Cond3.
object	string	Required. Specifies the API name of the sObject from which recommendations are loaded. For example, the field references Account or MyCustomObject__c and not a specific record of that object. Available in API version 48.0 and later.
sortField	<a href="#">StrategyNodeSortField</a>	The field to sort on. Available in API version 48.0 and later.

## RecommendationLoadCondition

Represents a condition used as part of the query constructed by StrategyNodeRecommendationLoad.

Field Name	Field Type	Description
field	string	Required. Any field from Recommendation BPO (SOAP) object.
operator	<a href="#">RecommendationConditionOperator</a> (enumeration of type string)	Required. Valid values are: <ul style="list-style-type: none"> <li>• EQUALS</li> <li>• GREATER_THAN</li> <li>• GREATER_THAN_OR_EQUAL_TO</li> <li>• LESS_THAN</li> <li>• LESS_THAN_OR_EQUAL_TO</li> <li>• NOT_EQUALS</li> <li>• LIKE</li> <li>• STARTS_WITH</li> <li>• ENDS_WITH=</li> <li>• CONTAINS</li> </ul>
value	<a href="#">RecommendationConditionValue</a>	Required. Constant value to use in query.

## RecommendationConditionValue

Represents a value used as part of a RecommendationCondition.

Field Name	Field Type	Description
type	<a href="#">RecommendationConditionValueType</a> (enumeration of type string)	Required. Valid values are: <ul style="list-style-type: none"> <li>• TEXT</li> <li>• NUMBER</li> <li>• BOOLEAN</li> <li>• DATE</li> <li>• DATE_TIME</li> <li>• TIME</li> </ul>
value	string	Required. The constant value.

## StrategyNodeSortField

Defines the field to sort on for StrategyNodeSort and StrategyNodeRecommendationLoad.

Field Name	Field Type	Description
name	string	Required. Name of the field to sort.

Field Name	Field Type	Description
<code>nullsFirst</code>	boolean	If <code>true</code> , null values are sorted to the beginning of the list. Defaults to <code>false</code> .
<code>order</code>	SortOrder (enumeration of type string)	Order in which the list is sorted. Defaults to <code>Asc</code> . Valid values are: <ul style="list-style-type: none"> <li><code>Asc</code> (ascending)</li> <li><code>Desc</code> (descending)</li> </ul>

## StrategyNodeSort

Sorts the recommendations. Extends `StrategyNodeUnionBase` and inherits all of its fields.

Field Name	Field Type	Description
<code>field</code>	<a href="#">StrategyNodeSortField</a>	Required. Field to sort on.

## StrategyNodeUnion

`StrategyNodeUnion` combines the output of all its child nodes. `StrategyNodeUnion` is a concrete implementation of `StrategyNodeUnionBase` and inherits all its fields.

## StrategyNodeMap

Set recommendation fields with values. Extends `StrategyNodeUnionBase` and inherits all of its fields.

Field Name	Field Type	Description
<code>mapExpression</code>	<a href="#">MapExpression</a> on page 1554[]	List of <code>MaxExpressions</code> .

## StrategyNodeExclusive

Returns results from the first child node that has results and no other. Extends `StrategyNodeUnionBase` and inherits all its fields.

## MapExpression

Sets the value for a recommendation field used by the strategy.

Field Name	Field Type	Description
<code>expression</code>	string	Required. A formula expression that results in a valid value supported by the data type specified in the <code>type</code> field.
<code>name</code>	string	Required. Recommendation field name that the expression sets the value for.

Field Name	Field Type	Description
type	string	<p>Required. The data type of the value resulting from the value in the expression field.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• BOOLEAN</li> <li>• CURRENCY</li> <li>• DATE</li> <li>• DOUBLE</li> <li>• DATE_TIME</li> <li>• INTEGER</li> <li>• LONG</li> <li>• PERCENT</li> <li>• TEXT</li> <li>• TIME</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a RecommendationStrategy component that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<RecommendationStrategy xmlns="http://soap.sforce.com/2006/04/metadata">
  <contextRecordType>Asset</contextRecordType>
  <description>Hills Brothers Coffee strategy to handle machine down

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## RecordActionDeployment

Represents configuration settings for the Actions & Recommendations, Action Launcher, and Bulk Action Panel components. For example, you can have a deployment that specifies which types of actions to display, default actions for channels, and the actions that users can add at runtime. If the component shows Next Best Action recommendations, the deployment configures which strategies to use and how recommendations appear. This type extends the Metadata metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### File Suffix and Directory Location

RecordActionDeployment values are stored in the `developer_name.deployment` file in the `recordActionDeployments` directory.

 **Note:** We don't recommend programmatically changing the API name of a RecordActionDeployment.

### Version

RecordActionDeployment is available in API version 45.0 and later.

### Fields

Field Name	Field Type	Description
<code>channelConfigurations</code>	<a href="#">RecordActionDeploymentChannel</a>	Specifies configuration settings for different channels in an Actions & Recommendations deployment.
<code>componentName</code>	ComponentName (enumeration of type string)	Specifies the name of the component used in the deployment: <ul style="list-style-type: none"> <li><code>ActionsAndRecommendations—0</code></li> <li><code>ActionLauncher—1</code></li> <li><code>BulkActionPanel—2</code>. This value is available in API version 60.0 and later</li> </ul> For example, a value of 1 indicates that 1 is stored in the database if Action Launcher is used to create a deployment. Available in API version 56.0 and later.
<code>deploymentContexts</code>	<a href="#">RecordActionDeploymentContext</a>	Specifies the object context for quick actions and Next Best Action strategies. Available in API version 46.0 and later.
<code>hasComponents</code>	boolean	Indicates whether the record actions deployment includes components ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 61.0 and later.
<code>hasGuidedActions</code>	boolean	Specifies that the component shows standard actions; for example, flows and quick actions. Available in API version 46.0 and later.

Field Name	Field Type	Description
hasOmniscripts	boolean	Indicates whether the record actions deployment includes OmniScripts ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 56.0 and later. The default value is <code>false</code> .
hasRecommendations	boolean	Specifies that the component shows recommendations from a Next Best Action strategy. Available in API version 46.0 and later.
masterLabel	string	Required. Specifies the name of the deployment.
recommendation	<a href="#">RecordActionRecommendation</a>	Specifies settings for how Next Best Action recommendations appear in the component. Available in API version 46.0 and later.
selectableItems	<a href="#">RecordActionDeploymentSelectableItems</a>	Specifies the actions that users can add at runtime.
shouldLaunchActionOnReject	boolean	Required. If <code>true</code> , launch the flow when the recommendation is rejected by the agent. Available in API version 48.0 and later.

## RecordActionDefaultItem

Represents actions and attributes specified as channel defaults in a deployment.

Field Name	Field Type	Description
action	string	Required. Specifies the API name of an action. For example, the API name of a flow, such as <code>Verify_Information</code> .
isMandatory	boolean	Specifies whether the action is marked as mandatory. The default value is <code>false</code> .
isUiRemoveHidden	boolean	Specifies whether the remove option is hidden in the UI. The default value is false. If <code>true</code> , the UI hides the ability to remove the action from the list.
pinned	PinnedAction (enumeration of type string)	Required. Indicates whether the action is pinned to the <code>Top</code> or <code>Bottom</code> , or unpinned ( <code>None</code> ). The default value is <code>None</code> .
position	int	Required. Indicates the order of the action among all actions associated with this record.
type	RecordActionType (enumeration of type string)	Required. The type of action that's associated with the record. Valid values are: <ul style="list-style-type: none"> <li>• <code>Flow</code></li> <li>• <code>QuickAction</code> (Available in API version 46.0 and later.)</li> </ul>

## RecordActionDeploymentChannel

Specifies channel-specific defaults to show in the Actions & Recommendations component. The component displays the channel defaults when the list is otherwise empty.

Field Name	Field Type	Description
channel	ChannelSource (enumeration of type string)	Required. Specifies the channel. Valid values are <code>Phone</code> , <code>Chat</code> , or <code>Default</code> .
channelItems	RecordActionDefaultItem	Specifies default actions for a channel and attributes for each action, such as whether the action is pinned to the list top or bottom or whether an action is considered mandatory.
isAutopopEnabled	boolean	Specifies whether the first action in the list is launched when the record page opens. If <code>true</code> , the first action is launched. The default value is <code>false</code> .

## RecordActionDeploymentContext

Specifies an object that provides context for quick actions and Next Best Action strategies. When the component appears on this type of page, it includes object-specific quick actions and uses an object-specific strategy to filter recommendations. Available in API version 46.0 and later.

 **Note:** We support a maximum of 10 objects that provide context within a deployment.

Field Name	Field Type	Description
entityName	string	Required. Specifies the API name of an object to use as context.
recommendationStrategy	string	Specifies the API name of a Next Best Action strategy that overrides the default strategy on this page. A strategy is a metadata type <a href="#">RecommendationStrategy</a> .

## RecordActionRecommendation

Specifies settings to display Next Best Action recommendations in the component. Available in API version 46.0 and later.

Field Name	Field Type	Description
defaultStrategy	string	Specifies the API name of the default Next Best Action strategy, which is a metadata type, <a href="#">RecommendationStrategy</a> .
hasDescription	boolean	Required. If <code>true</code> , display the description for the recommendation.
hasImage	boolean	Required. If <code>true</code> , display the image for the recommendation.
hasRejectAction	boolean	Required. If <code>true</code> , display the label that the user clicks to reject the recommendation.
hasTitle	boolean	Required. If <code>true</code> , display the title for the recommendation.
maxDisplayRecommendations	int	Required. Specifies the maximum number of recommendations to display. Valid values are 1–4.

## RecordActionSelectableItem

Represents the set of actions available for users to add to the component at runtime.

Field Name	Field Type	Description
action	string	Required. Specifies the API name of an action. For example, the API name of a flow, such as <code>Verify_Information</code> .
type	RecordActionType (enumeration of type string)	Required. The type of action that's associated with the record. Valid values are: <ul style="list-style-type: none"> <li>Flow</li> <li>QuickAction (Available in API version 46.0 and later.)</li> <li>OmniScript (Available in API version 56.0 and later.)</li> </ul>
isFrequentAction	boolean	Indicates whether an action is frequently accessed by users ( <code>true</code> ) or not ( <code>false</code> ). Available in version 57.0 and later.  This field applies only to Action Launcher.
frequentActionSequenceNbr	integer	The sequence number that's assigned to a frequently used action that's shown on Action Launcher. Available in version 57.0 and later.  This field applies only to Action Launcher.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Declarative Metadata Sample Definition

The following is a sample of a `recordActionDeployment` file.

```
<RecordActionDeployment xmlns="http://soap.sforce.com/2006/04/metadata">
  <channelConfigurations>
    <channel>Phone</channel>
    <channelItems>
      <action>Sample_Flow</action>
      <isMandatory>false</isMandatory>
      <isUiRemoveHidden>false</isUiRemoveHidden>
      <position>1</position>
      <pinned>Top</pinned>
      <type>Flow</type>
    </channelItems>
    <channelItems>
      <action>Another_Sample_Flow</action>
      <isMandatory>false</isMandatory>
      <isUiRemoveHidden>true</isUiRemoveHidden>
      <position>2</position>
      <pinned>Top</pinned>
      <type>Flow</type>
    </channelItems>
  </channelConfigurations>
</RecordActionDeployment>
```

```

        </channelItems>
        <isAutopopEnabled>true</isAutopopEnabled>
    </channelConfigurations>
    <masterLabel>Sample Deployment</masterLabel>
    <selectableItems>
        <action>Sample_Flow</action>
        <type>Flow</type>
        <isFrequentAction>true</isFrequentAction>
        <frequentActionSequenceNbr>1</frequentActionSequenceNbr>
    </selectableItems>
    <selectableItems>
        <action>Sample_Flow_2</action>
        <type>Flow</type>
        <isFrequentAction>false</isFrequentAction>
    </selectableItems>
    <hasGuidedActions>true</hasGuidedActions>

## RecordAggregationDefinition

---

Represents a data aggregation from one object to another object to which it is connected by other objects in the data model.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`RecordAggregationDefinition` components have the suffix `.RecordAggregationDefinition` and are stored in the `RecordAggregationDefinitions` folder.

### Version

`RecordAggregationDefinition` components are available in API version 59.0 and later.

### Special Access Rules

To access the `RecordAggregationDefinition` metadata type, you must have the Record Aggregation permission set license and the Record Aggregation Access permission.

### Fields

Field Name	Description
<code>aggregateFromObject</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. API name of the object from which data is aggregated.</p>
<code>aggregateToObject</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>API name of the object to which data is aggregated.</p>
aggregationType	<p><b>Field Type</b></p> <p>RecordAggregationDefinitionAggregationType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>Type of the data aggregation.</p> <p>Valid value is:</p> <ul style="list-style-type: none"> <li>• Record</li> </ul>
batchProcessingDefinition	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Data Processing Engine definition that aggregates data from one record to another.</p>
description	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Description for this record aggregation definition.</p>
displayName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Name of the record aggregation definition that's displayed in the record page.</p>
recordAggregationObject	<p><b>Field Type</b></p> <p><a href="#">RecordAggregationObject[]</a></p> <p><b>Description</b></p> <p>List of record aggregation objects in the record aggregation join sequence.</p>
status	<p><b>Field Type</b></p> <p>RecordAggregationDefinitionStatus (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>Status of this record aggregation definition.</p> <p>Values are:</p>

Field Name	Description
	<ul style="list-style-type: none"> <li>• Active</li> <li>• Draft</li> <li>• Inactive</li> </ul>

## RecordAggregationObject

Represents an object in the record aggregation join sequence.

Field Name	Description
associatedObject	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. API name of the object associated with this record aggregation object.</p>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Developer name of the record aggregation object. May contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
filterLogic	<p><b>Field Type</b> string</p> <p><b>Description</b> Logical sequence in which the record aggregation object filters associated with this record aggregation object are applied to the associated object's records. If you define two or more record aggregation object filters, but don't specify the sequence in which to apply the filters, the filters are applied by using a logical AND expression. Available in API version 60.0 and later.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for RecordAggregationDefinition, which is defined when the RecordAggregationDefinition is created.</p>
recordAggregationJoinCondition	<p><b>Field Type</b> <a href="#">RecordAggregationJoinCondition[]</a></p>

Field Name	Description
	<p><b>Description</b></p> <p>List of join conditions that apply to this record aggregation object.</p>
recordAggregationObjectFilter	<p><b>Field Type</b></p> <p><a href="#">RecordAggregationObjectFilter[]</a></p> <p><b>Description</b></p> <p>List of filters that are applied to the records of this record aggregation object.</p> <p>Available in API version 60.0 and later.</p>

## RecordAggregationJoinCondition

Represents a condition in a join between two record aggregation objects.

Field Name	Description
joinField	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>API name of the field on the record aggregation object's associated object that is used in the join condition.</p>
navigationSequenceNumber	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Required.</p> <p>Sequence number corresponding to this join in the join sequence from the object to which the data is aggregated to the object that contains the data being aggregated.</p>
relatedJoinField	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>API name of the field on the related record aggregation object's associated object that is used in the join condition.</p>
relatedRecordAggregationObject	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Second record aggregation object in the join condition.</p>

Field Name	Description
type	<p><b>Field Type</b> RecordAggregationJoinConditionType (enumeration of type string)</p> <p><b>Description</b> Required.</p> <p>Type of this record aggregation join in the join path from the object to which the data is aggregated to the object that contains the data being aggregated.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• AggregateFrom</li> <li>• AggregateTo</li> <li>• Intermediate</li> </ul>

## RecordAggregationObjectFilter

Represents a filter that is applied to the records of an object in the record aggregation join sequence. Available in API version 60.0 and later.

Field Name	Description
associatedObjectField	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>API name of the associated object's field whose value is used to filter the object's records. The associated object is specified in the record aggregation object.</p>
operator	<p><b>Field Type</b> RecordAggregationObjectFilterOperator (enumeration of type string)</p> <p><b>Description</b> Required.</p> <p>Operator used in the filter expression.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• Contains</li> <li>• Equals</li> <li>• GreaterThan</li> <li>• GreaterThanOrEquals</li> <li>• In</li> <li>• LessThan</li> <li>• LessThanOrEquals</li> <li>• NotEquals</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>NotIn</li> </ul>
sequenceNumber	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. Sequence number of this record aggregation object filter.</p>
value	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Reference value with which the designated field's values are compared when the filter is applied on the associated object's records.</p>

## Declarative Metadata Sample Definition

The following is an example of a RecordAggregationDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<RecordAggregationDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <aggregateToObject>PartyRelationshipGroup</aggregateToObject>
  <aggregateFromObject>PartyIncome</aggregateFromObject>
  <status>Active</status>
  <aggregationType>Record</aggregationType>
  <description>Aggregate head of household's income to household</description>
  <displayName>Party Income to Party Relationship Group</displayName>
  <recordAggregationObject>
    <associatedObject>PartyRelationshipGroup</associatedObject>
    <masterLabel>Party Relationship Group Object</masterLabel>
    <developerName>PartyRelationshipGroupObject</developerName>
    <recordAggregationJoinCondition>
      <joinField>Account</joinField>
      <navigationSequenceNumber>1</navigationSequenceNumber>
      <relatedJoinField>Account</relatedJoinField>
    </recordAggregationJoinCondition>
  </recordAggregationObject>
  <relatedRecordAggregationObject>AccountContactrelationObject</relatedRecordAggregationObject>

  <type>Intermediate</type>
</recordAggregationJoinCondition>
<recordAggregationObjectFilter>
  <associatedObjectField>Type</associatedObjectField>
  <operator>Equals</operator>
  <value>Household</value>
  <sequenceNumber>1</sequenceNumber>
</recordAggregationObjectFilter>
```

```

</recordAggregationObject>
<recordAggregationObject>
  <associatedObject>AccountContactRelation</associatedObject>
  <masterLabel>Account Contact Relation Object</masterLabel>
  <developerName>AccountContactRelationObject</developerName>
  <recordAggregationJoinCondition>
    <joinField>Contact</joinField>
    <navigationSequenceNumber>2</navigationSequenceNumber>
    <relatedJoinField>Party</relatedJoinField>

<relatedRecordAggregationObject>PartyIncomeObject</relatedRecordAggregationObject>
  <type>Intermediate</type>
</recordAggregationJoinCondition>
<recordAggregationObjectFilter>
  <associatedObjectField>IsPrimaryMember</associatedObjectField>
  <operator>Equals</operator>
  <value>>true</value>
  <sequenceNumber>1</sequenceNumber>
</recordAggregationObjectFilter>
</recordAggregationObject>
<recordAggregationObject>
  <associatedObject>PartyIncome</associatedObject>
  <masterLabel>Party Income Object</masterLabel>
  <developerName>PartyIncomeObject</developerName>
  <filterLogic>1 AND 2</filterLogic>
  <recordAggregationObjectFilter>
    <associatedObjectField>IncomeFrequency</associatedObjectField>
    <operator>Equals</operator>
    <value>Monthly</value>
    <sequenceNumber>1</sequenceNumber>
  </recordAggregationObjectFilter>
  <recordAggregationObjectFilter>
    <associatedObjectField>IncomeStatus</associatedObjectField>
    <operator>Equals</operator>
    <value>Active</value>
    <sequenceNumber>2</sequenceNumber>
  </recordAggregationObjectFilter>
</recordAggregationObject>
</RecordAggregationDefinition>

```

The following is an example package.xml that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>RecordAggregationDefinition</name>
  </types>
  <version>60.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## RecordAlertCategory

---

Represents a category to group and present record alerts.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the Metadata metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

RecordAlertCategory components have the suffix `recordAlertCategory` and are stored in the `recordAlertCategories` folder.

## Version

RecordAlertCategory components are available in API version 54.0 and later.

## Fields

Field Name	Description
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of the record alert category.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The user-interface name of the record alert category.</p>
<code>severity</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Indicates the degree of impact that an alert in this category can have.</p>

Field Name	Description
	<p>Possible Education Cloud values are:</p> <ul style="list-style-type: none"> <li>• High</li> <li>• Low</li> <li>• Medium</li> </ul> <p>Possible Financial Service Cloud values are:</p> <ul style="list-style-type: none"> <li>• Error</li> <li>• Info</li> <li>• Minor</li> <li>• Warning</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a RecordAlertCategory component.

```
<?xml version="1.0" encoding="UTF-8"?>
<RecordAlertCategory xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>Tracks Financial Account Fraud Alerts</description>
  <masterLabel>Fraud</masterLabel>
  <severity>Error</severity>
</RecordAlertCategory>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Fraud</members>
    <name>RecordAlertCategory</name>
  </types>
  <version>54.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## RegisteredExternalService

Represents a registered external service, which provides an extension or integration.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

RegisteredExternalService components have the suffix `.registeredExternalService` and are stored in the `registeredExternalServices` folder.

## Version

RegisteredExternalService components are available in API version 49.0 and later.

## Special Access Rules

This metadata type is available only if the B2B Commerce or D2C Commerce license is enabled.

## Fields

Field Name	Description
<code>configUrl</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Link to the configuration page for the integration.</p>
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Description of the external service provider. This field is available in API version 59.0 and later.</p>
<code>documentationUrl</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Link to documentation for the registered external service.</p>
<code>extensionPointName</code>	<p><b>Field Type</b> ExtensionPointName (enumeration of type string)</p> <p><b>Description</b> This field is available in API version 55.0 and later. Name of an extension point. Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>Commerce_Domain_Cart_Calculate</code></li> <li>• <code>Commerce_Domain_Checkout_CreateOrder</code></li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• Commerce_Domain_Inventory_CartCalculator</li> <li>• Commerce_Domain_Inventory_Service</li> <li>• Commerce_Domain_OrderManagement_Product</li> <li>• Commerce_Domain_Pricing_CartCalculator</li> <li>• Commerce_Domain_Pricing_Service</li> <li>• Commerce_Domain_Promotions_CartCalculator</li> <li>• Commerce_Domain_Shipping_CartCalculator</li> <li>• Commerce_Domain_Shipping_SplitShipment</li> <li>• Commerce_Domain_Tax_CartCalculator</li> <li>• Commerce_Domain_Tax_Service</li> <li>• Commerce_Endpoint_Account_Address</li> <li>• Commerce_Endpoint_Account_Addresses</li> <li>• Commerce_Endpoint_Cart_Item—This field value is available in API version 62.0 and later.</li> <li>• Commerce_Endpoint_Cart_ItemCollection—This field value is available in API version 62.0 and later.</li> <li>• Commerce_Endpoint_Catalog_Product</li> <li>• Commerce_Endpoint_Catalog_Products</li> <li>• Commerce_Endpoint_Search_ProductSearch</li> <li>• Commerce_Endpoint_Search_Products</li> <li>• Commerce_Endpoint_Search_ProductsByCategory</li> </ul>
externalServiceProvider	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The ID of an Apex class functioning as a provider. The Apex class can either implement one of the following interfaces:</p> <ul style="list-style-type: none"> <li>• sfdc_checkout.CartInventoryValidation</li> <li>• sfdc_checkout.CartPriceCalculations</li> <li>• sfdc_checkout.CartShippingCharges</li> <li>• sfdc_checkout.CartTaxCalculations</li> </ul> <p>or the Apex class can extend one of the base classes for an extension. See <a href="#">Available Extensions</a>.</p>
externalServiceProviderType	<p><b>Field Type</b> RegistryProviderType (enumeration of type string)</p> <p><b>Description</b> Required. The type of external service provider. For an extension, you set the type to <code>Extension</code>, and you specify an <code>extensionPointName</code>. For example, for a Pricing Cart Calculator extension, you specify</p>

Field Name	Description
	<p>Commerce_Domain_Pricing_CartCalculator as the <code>extensionPointName</code>. For an integration, you set the type to one of the other possible values, such as <code>Price</code>, and you omit <code>extensionPointName</code>.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>Extension</code> (this value is available in API version 55.0 and later)</li> <li>• <code>Inventory</code></li> <li>• <code>Price</code></li> <li>• <code>Promotions</code> (this value is available in API version 53.0 and later)</li> <li>• <code>Shipment</code></li> <li>• <code>Tax</code></li> </ul>
<code>iconUri</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> URI of icon for the extension provider.  This field is available in API version 59.0 and later.</p>
<code>isApplication</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates if the extension provider is contained within a managed package.  The default value is <code>false</code>.  This field is available in API version 59.0 and later.</p>
<code>isProtected</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type.  The default value is <code>false</code>.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The primary label for the RegisteredExternalService.</p>

## Declarative Metadata Sample Definition

The following is an example of a RegisteredExternalService component.

```
<?xml version="1.0" encoding="UTF-8"?>
<RegisteredExternalService xmlns="http://soap.sforce.com/2006/04/metadata">
  <externalServiceProvider>TaxSample</externalServiceProvider>
  <externalServiceProviderType>Tax</externalServiceProviderType>
  <documentationUrl>http://sample.com/doc</documentationUrl>
  <configUrl>http://sample.com/config</configUrl>
  <masterLabel>TaxService</masterLabel>
  <isProtected>>false</isProtected>
</RegisteredExternalService>
```

The following is an example package.xml that references the previous definition.

```
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>TaxSample</members>
    <name>ApexClass</name>
  </types>
  <types>
    <members>TaxService</members>
    <name>RegisteredExternalService</name>
  </types>
  <version>60.0</version>
</Package>
```

## ReferencedDashboard

---

Represents the ReferencedDashboard object in CRM Analytics. A referenced dashboard stores information about an externally referenced dashboard.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`ReferencedDashboard` components have the suffix `.refdash` and are stored in the `wave` folder.

### Version

`ReferencedDashboard` components are available in API version 57.0 and later.

## Special Access Rules

To view referenced dashboards, you need the Enables Tableau Dashboards in CRM Analytics permission.

## Fields

Field Name	Field Type	Description
application	string	Required. The internal name of the Analytics app.
description	string	The dashboard description that appears in the user interface.
embedUrl	string	Required. The URL to the referenced dashboard.
masterLabel	string	Required. The dashboard name that appears in the user interface.
templateAssetSourceName	string	Links the dashboard to the template used to create it. Null for assets not created from a template.
visibility	string	The visibility of the dashboard. Valid values are: ALL and LIMITED.

## Declarative Metadata Sample Definition

The following is an example of a WaveDashboard component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ReferencedDashboard xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <application>my_app</application>
  <masterLabel>ReferencedDashboard1</masterLabel>
  <description>My Tableau Dashboard</description>
  <embedUrl>https://public.tableau.com/views/Superstore_24/Overview</embedUrl>
  <visibility>ALL</visibility>
</ReferencedDashboard>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## RelatedRecordAssocCriteria

Represents criteria for automatically linking records like accounts, leads, opportunities, and cases with the branches that work with them.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its fullName field.

## File Suffix and Directory Location

RelatedRecordAssocCriteria components have the suffix `.relatedRecordAssocCriteria` and are stored in the `relatedRecordAssocCriteria` folder.

## Version

RelatedRecordAssocCriteria components are available in API version 52.0 and later.

## Special Access Rules

To use this object, you must have the Financial Services Cloud Extension permission set.

## Fields

Field Name	Description
<code>associationHandlerApexClass</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of a custom Apex class that handles the creation of association records for specific association criteria. This class must:</p> <ul style="list-style-type: none"> <li>• Apply to an object that the Record Association Builder doesn't directly support</li> <li>• Implement the <code>fscwmgem.BranchManagementAssociationHandler</code> interface</li> <li>• Return a list of Branch Unit Related Records</li> <li>• Populate at least the minimum required fields in each Branch Unit Related Record: <ul style="list-style-type: none"> <li>- <code>BranchUnitId</code>: Represents the current branch unit of the user or contact</li> <li>- <code>BusinessUnitMemberId</code>: The Banker ID of the user or contact</li> <li>- <code>RelatedRecordId</code>: The ID of the custom object to be related</li> </ul> </li> </ul> <p>This field is a relationship field.</p>
<code>associationType</code>	<p><b>Field Type</b> AssociationType (enumeration of type string)</p> <p><b>Description</b> Required. The association type. Values are:</p> <ul style="list-style-type: none"> <li>• <code>BranchManagement</code></li> </ul>
<code>description</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>A description of the association criteria.</p>
eventType	<p><b>Field Type</b></p> <p>AssociationEventType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>The type of reference object event that triggers creation of the association. Values are:</p> <ul style="list-style-type: none"> <li>• Create</li> <li>• Update</li> </ul>
isProtected	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>An auto-generated value that doesn't impact the behavior of the metadata type. The default value is <code>false</code>.</p>
masterLabel	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The master label of the association criteria. This internal label doesn't get translated.</p>
preCondition	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>A formula that, when true, causes a new association to be created.</p>
referenceObject	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The reference object for the association criteria.</p>
selectedOwnerField	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>A field to use instead of the default Owner ID.</p>

Field Name	Description
status	<p><b>Field Type</b> AssociationStatusType (enumeration of type string)</p> <p><b>Description</b> Required. The status of the association criteria. Values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Draft</li> <li>• Inactive</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a RelatedRecordAssocCriteria component.

```
<?xml version="1.0" encoding="UTF-8"?>
<RelatedRecordAssocCriteria xmlns="http://soap.sforce.com/2006/04/metadata">
  <associationType>BranchManagement</associationType>
  <eventType>Create</eventType>
  <masterLabel>RevenueThreeMillion</masterLabel>
  <preCondition>[Account].AnnualRevenue > 3000000</preCondition>
  <referenceObject>Account</referenceObject>
  <status>Active</status>
</RelatedRecordAssocCriteria>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>RelatedRecordAssocCriteria</name>
  </types>
  <version>52.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## RelationshipGraphDefinition

Represents a definition of a graph that you can configure in your organization to traverse object hierarchies and record details, giving you a glimpse of how your business works.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

RelationshipGraphDefinition components have the suffix `.relationshipGraphDefinition` and are stored in the `relationshipGraphDefinitions` folder.

## Version

RelationshipGraphDefinition components are available in API version 55.0 and later.

## Special Access Rules

The Financial Services Cloud permission set license is required to access this object.

## Fields

Field Name	Description
<code>isActive</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Indicates whether the relationship graph is available for use (<code>true</code>) or not (<code>false</code>). The default value is <code>true</code>.</p> <p> <b>Note:</b> This field is read-only in API version 55.0.</p>
<code>isTemplate</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Indicates whether you can configure this relationship graph as a template (<code>true</code> or not <code>false</code>). The default value is <code>false</code>. In the UI, this field is <i>Set as Template</i>.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for RelationshipGraphDefinition, which is defined when the RelationshipGraphDefinition is created. In the UI, this field is <i>Label</i>.</p>

Field Name	Description
relationshipGraphDefVersions	<p><b>Field Type</b> RelationshipGraphDefVersion[]</p> <p><b>Description</b> Represents a list of graph versions associated with the relationship graph definition.</p>

## RelationshipGraphDefVersion

The list of graph versions associated with the relationship graph definition.

Field Name	Description
graphDefinition	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Specifies a set of properties required to create a relationship graph, such as parent node, child relationships, filter and sort fields, and graph UI elements.</p>
graphType	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Specifies the type of graph. In API version 55.0, only HorizontalHierarchy graph type is supported.</p>

## Declarative Metadata Sample Definition

The following is an example of a RelationshipGraphDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<RelationshipGraphDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <isActive>false</isActive>
  <isTemplate>true</isTemplate>
  <masterLabel>Account Graph</masterLabel>
  <relationshipGraphDefVersions>
    <graphDefinition>{
"graph" : {
  "rootNode" : {
    "object" : {
      "entity" : "Account"
    },
    "configurationType" : "Primary",
    "sortFields" : [ {
```

```

    "field" : {
      "field" : "LastModifiedDate",
      "whichEntity" : "TARGET"
    },
    "order" : "DESC"
  } ],
  "nodeUiConfig" : {
    "fieldsToDisplay" : [ ],
    "showFieldLabels" : true,
    "actions" : { }
  },
  "childRelationships" : [ {
    "OneToMany" : {
      "targetObjectNode" : {
        "object" : {
          "entity" : "Contact"
        },
        "configurationType" : "Custom",
        "sortFields" : [ {
          "field" : {
            "field" : "LastModifiedDate",
            "whichEntity" : "TARGET"
          },
          "order" : "DESC"
        } ],
        "nodeUiConfig" : {
          "fieldsToDisplay" : [ {
            "field" : "Name",
            "whichEntity" : "TARGET"
          }, {
            "field" : "Phone",
            "whichEntity" : "TARGET"
          } ],
          "showFieldLabels" : true,
          "actions" : {
            "containerActions" : [ {
              "action" : "New"
            } ],
            "recordActions" : [ {
              "action" : "Edit"
            }, {
              "action" : "Delete"
            } ]
          }
        }
      },
      "childRelationships" : [ ]
    },
    "relationshipUiConfig" : { },
    "filter" : {
      "filterCriteria" : [ {
        "field" : {
          "field" : "Name",
          "whichEntity" : "TARGET"
        },
      },
    ],
  } ],

```

```

        "operator" : "eq",
        "value" : "Salesforce"
    } ],
    "booleanFilter" : "1"
  },
  "targetObjectField" : {
    "field" : "AccountId",
    "whichEntity" : "TARGET"
  }
}
} ]
},
"globalUiConfig" : {
  "borderColor" : "Green2",
  "borderThickness" : "2px";,
  "colorShading" : "Black",
  "fieldLayout" : "Vertically Stacked",
  "recordContainerExpansion" : true,
  "recordExpansion" : true
}
}
}</graphDefinition>
  <graphType>HorizontalHierarchy</graphType>
</relationshipGraphDefVersions>
</RelationshipGraphDefinition>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>Package1</fullName>
  <types>
    <members>*</members>
    <name>RelationshipGraphDefinition</name>
  </types>
  <version>55.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## RemoteSiteSetting

---

Represents a remote site setting. Before any Visualforce page, Apex callout, or JavaScript code using `XmlHttpRequest` in an s-control or custom button can call an external site, that site must be registered in the Remote Site Settings page, or the call fails.

[RemoteSiteSetting](#) on page 1583 extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Declarative Metadata File Suffix and Directory Location

[RemoteSiteSetting](#) on page 1583 components are stored in the `remoteSiteSettings` directory of the corresponding package directory. The file name matches the unique name of the remote site setting, and the extension is `.remoteSite`.

## Version

[RemoteSiteSetting](#) on page 1583 components are available in API version 19.0 and later.

## Fields

Field	Field Type	Description
<code>description</code>	string	The description explaining what this remote site setting is used for.
<code>disableProtocolSecurity</code>	boolean	Required. Indicates whether code within Salesforce can access the remote site regardless of whether the user's connection is over HTTP or HTTPS ( <code>true</code> ) or not ( <code>false</code> ). When <code>true</code> , code within Salesforce can pass data from an HTTPS session to an HTTP session, and vice versa.  Only set to <code>true</code> if you understand the security implications.
<code>fullName</code>	string	The name can only contain characters, letters, and the underscore ( <code>_</code> ) character. The name must start with a letter, and can't end with an underscore or contain two consecutive underscore characters.  Inherited from the <a href="#">Metadata</a> component, this field isn't defined in the WSDL for this component. It must be specified when creating, updating, or deleting. See <a href="#">create()</a> to see an example of this field specified for a call.
<code>isActive</code>	boolean	Required. Indicates if the remote site setting is active ( <code>true</code> ) or not ( <code>false</code> ).
<code>url</code>	string	Required. The URL for the remote site.

## Declarative Metadata Sample Definition

A sample XML definition of a remote site setting is shown in this code block.

```
<?xml version="1.0" encoding="UTF-8"?>
<RemoteSiteSetting xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>Used for Apex callout to mapping web service</description>
  <disableProtocolSecurity>>false</disableProtocolSecurity>
  <isActive>true</isActive>
  <url>https://www.maptestsite.net/mapping1</url>
</RemoteSiteSetting>
```

## Report

---

Represents a custom report. This metadata type only supports custom reports; standard reports aren't supported.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Declarative Metadata File Suffix and Directory Location

Reports are stored in the `reports` directory of the package directory. The file name consists of the report title with the extension `.report`.

## Retrieving Reports

You can't use the wildcard (\*) symbol with reports in `package.xml`.

To retrieve the list of explicit report names to populate `package.xml` with, first call `listMetadata(ListMetadataQuery[])` with a [ListMetadataQuery](#) entry with the `type` field set to `ReportFolder` and the `folder` field to `*` (wildcard). This call returns an array of [FileProperties](#) objects with the names of report folders in the `fullName` field.

Now call `listMetadata` with `ListMetadataQuery` entries where the `type` field is `Report` and the `folder` fields are the full name values from the first `listMetadata` call. These calls return `FileProperties` objects where the `fullName` field is the combination of the folder name and report name. Use these values in the `package.xml` to designate the members for the Report metadata type.

`ReportFolder` isn't returned as a type in `describeMetadata()`. `Report` is returned from `describeMetadata()` with an associated attribute of `inFolder` set to `true`. If that attribute is set to `true`, you can construct the type by using the component name with the word `Folder`, such as `ReportFolder`.

The following example shows folders in `package.xml`:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>MyDBFolder/MyDBName</members>
    <name>Dashboard</name>
  </types>
  <types>
    <members>MyDocumentFolder/MyDocumentName</members>
    <name>Document</name>
  </types>
  <types>
    <members>unfiled$public/MarketingProductInquiryResponse</members>
    <members>unfiled$public/SalesNewCustomerEmail</members>
    <name>EmailTemplate</name>
  </types>
  <types>
    <members>MyReportFolder/MyReportName</members>
    <name>Report</name>
  </types>
  <version>62.0</version>
</Package>
```

## Version

Report components are available in API version 14.0 and later.

## Fields

The following information assumes that you're familiar with creating and running reports. For more information on these fields, see [Build a Report](#) in Salesforce Help.

Field	Field Type	Description
aggregates	<a href="#">ReportAggregate[]</a>	List that defines custom summary formulas for summary, matrix, and joined reports.
block	<a href="#">Report[]</a>	Represents each block in a joined report where every block can be of a different report type.
blockInfo	<a href="#">ReportBlockInfo</a>	Defines attributes for each block in a joined report.
buckets	<a href="#">ReportBucketField[]</a>	Defines a bucket field to be used in the report. This field is available in API version 24.0 and later.
chart	<a href="#">ReportChart</a>	Defines a chart for summary and matrix reports.
colorRanges	<a href="#">ReportColorRange[]</a>	List that specifies conditional highlighting for report summary data. Salesforce Classic only.
columns	<a href="#">ReportColumn[]</a>	List that specifies the fields displayed in the report. Fields appear in the report in the same order as they appear in the Metadata API file.
crossFilters	<a href="#">ReportCrossFilter[]</a>	Defines a cross filter's object, related object, and condition (WITH or WITHOUT). This field is available in API version 62.0 and later.
currency	CurrencyIsoCode (enumeration of type string)	When using multiple currencies, some reports allow you to display converted amounts by selecting the appropriate column to display. For example, in opportunity reports, you can include the Amount (converted) column on the report. This field is an enumeration of type string that defines the currency in which to display converted amounts. Valid values: Must be one of the valid alphabetic, three-letter currency ISO codes defined by the ISO 4217 standard, such as USD, GBPSLE, or JPY.
dataCategoryFilters	string	Specifies a filter according to the data category.
description	string	Specifies a general description, which is displayed with the report name. Maximum characters: 255 characters.

Field	Field Type	Description
division	string	<p>If your organization uses divisions to segment data and the Affected by Divisions permission is enabled, records in the report must match this division.</p> <p>This field is available in API version 17.0 and later.</p>
filter	<a href="#">ReportFilter</a>	<p>Limits report results to records with specific data. For example, you can limit report results to opportunities for which the amount is greater than \$1,000:</p> <pre>&lt;filter&gt;   &lt;criteriaItems&gt;     &lt;column&gt;AMOUNT&lt;/column&gt;      &lt;operator&gt;greaterThan&lt;/operator&gt;      &lt;value&gt;1000&lt;/value&gt;   &lt;/criteriaItems&gt; &lt;/filter&gt;</pre>
folderName	string	<p>Name of the folder that houses the report.</p> <p>This field is available in API version 35.0 and later.</p>
format	<a href="#">ReportFormat</a> (enumeration of type string)	<p>Defines the report format. For example, <code>Tabular</code> for a simple data list without subtotals.</p>
formattingRules	<a href="#">ReportFormattingRule[]</a> (enumeration of type string)	<p>List that specifies conditional highlighting for report data. Lightning Experience only.</p>
groupingsAcross	<a href="#">ReportGrouping[]</a>	<p>List that defines the fields by which you want to group and subtotal data across a matrix report (row headings). When grouping by a date field, you can further group the data by a specific time period such as days, weeks, or months.</p> <p>Maximum: 2 fields.</p>
groupingsDown	<a href="#">ReportGrouping[]</a>	<p>For Summary and Matrix reports: List that defines the fields by which you want to group and subtotal. For summary reports, choosing more than one sort field allows you to subsort your data. For matrix reports, specifies summary fields for column headings. When grouping by a date field, you can further group the data by a specific time period such as days, weeks, or months.</p> <p>Maximum for matrix reports: 2. Maximum for summary reports: 3</p>

Field	Field Type	Description
historicalSelector	<a href="#">ReportHistoricalSelector</a>	Defines a date range for which historical trend reporting data is to be captured. Default is "Any Historical Date."  Available in API version 29.0 and later.
name	string	Required. The report name. For example, Opportunity Pipeline
numSubscriptions	int	Indicates whether a user has subscribed to this report Lightning Experience (1) or not (0). Tied to user context.  This field is available in API version 38.0 and later.
params	<a href="#">ReportParam[]</a>	List that specifies settings specific to each report type, in particular options that let you filter a report to obtain useful subsets. For example, the Activities report type lets you specify whether you want to see open or closed activities or both and whether you want to see tasks or events or both. Valid values depend on the report type.
reportCustomDetailFormula	<a href="#">CustomDetailFormulas</a>	Allows you to apply row-level formulas to reports.
reportType	string	Required. Defines the type of data in the report. For example, Opportunity to create a report of opportunities data.
reportTypeApiName	string	Defines the API Name for the report type.  This field is available in API version 48.0 and later.
roleHierarchyFilter	string	The role name for a report drill down. Some reports, such as opportunity and activity reports, display Hierarchy links that allow you to drill down to different datasets based on the role hierarchy.  This field is available in API version 17.0 and later.
rowLimit	int	Defines the maximum number of rows that can be returned for the report.
scope	string	Defines the scope of data on which you run the report. For example, whether you want to run the report against all opportunities, opportunities you own, or opportunities your team owns. Valid values depend on the <code>reportType</code> . For example, for Accounts reports:

Field	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>MyAccounts</code></li> <li>• <code>MyTeamsAccounts</code></li> <li>• <code>AllAccounts</code></li> </ul>
<code>showCurrentDate</code>	boolean	Can be set to <code>true</code> for historical trending reports in matrix format. Available in API version 29.0 and later.
<code>showDetails</code>	boolean	<code>false</code> shows a collapsed view of the report with only the headings, subtotals, and total. Default: <code>true</code>
<code>showGrandTotal</code>	boolean	<code>true</code> displays the calculated total for the full report.
<code>showSubTotals</code>	boolean	<code>true</code> displays the calculated subtotals for sections of the report.
<code>sortColumn</code>	string	Specifies the field on which to sort data in the report. Use <code>sortOrder</code> to specify the sort order.
<code>sortOrder</code>	<a href="#">SortOrder</a> (enumeration of type string)	Specifies the sort order. Use <code>sortColumn</code> to specify the field on which to sort.
<code>territoryHierarchyFilter</code>	string	The territory name for a report drill down. If your organization uses territory management, some reports display Hierarchy links that allow you to drill down to different datasets based on the territory hierarchy.  This field is available in API version 17.0 and later.
<code>timeFrameFilter</code>	<a href="#">ReportTimeFrameFilter</a>	Limits report results to records within a specified time frame.
<code>userFilter</code>	string	The username for a report drill down. Some reports, such as opportunity and activity reports, display Hierarchy links that allow you to drill down to different datasets based on the user hierarchy.  This field is available in API version 17.0 and later.

## ReportAggregate

ReportAggregate defines custom summary formulas on summary, matrix, and joined reports. For more information on these fields, see [Add a Summary Formula Column to a Report](#) in Salesforce Help.

Field	Field Type	Description
<code>acrossGroupingContext</code>	string	Defines the row grouping level at which you want your custom summary formula to be displayed. This field is available in API version 15.0.
<code>calculatedFormula</code>	string	Required. The custom summary formula. For example, <code>AMOUNT:SUM + OPP_QUANTITY:SUM</code>
<code>datatype</code>	<a href="#">ReportAggregateDatatype</a> (enumeration of type string)	Required. Specifies the data type for formatting and display of the custom summary formula results.
<code>description</code>	string	The custom summary formula description. Maximum: 255 characters.
<code>developerName</code>	string	Required. The internal development name of the custom summary formula, for example, <code>FORMULA1</code> . This name is used to reference custom summary formulas from other report components, including conditional highlighting.
<code>downGroupingContext</code>	string	Defines the column grouping level at which you want your custom summary formula to be displayed. This field is available in API version 15.0 and later.
<code>isActive</code>	boolean	Required. <code>true</code> displays the formula result in the report. <code>false</code> doesn't display the result in the report.
<code>isCrossBlock</code>	boolean	Determines whether the custom summary formula is a cross-block formula, which is available with joined reports. <code>true</code> indicates a cross-block custom summary formula. <code>false</code> indicates a standard custom summary formula. This field is available in API version 25.0 and later.
<code>masterLabel</code>	string	Required. The custom summary formula label (name).
<code>reportType</code>	string	Required for joined reports. Specifies the <code>reportType</code> of the blocks to which the <code>aggregate</code> can be added.
<code>scale</code>	int	The formula result is calculated to the specified number of decimal places. Valid values 0 through 18.

## ReportBlockInfo

ReportBlockInfo defines blocks in a joined report.

Field	Field Type	Description
<code>aggregateReferences</code>	<a href="#">ReportAggregateReference</a> []	Lists the <code>aggregates</code> that represent the custom summary formulas used in a joined report block.
<code>blockId</code>	string	Required. <code>blockId</code> is used in cross-block custom summary formulas and joined report charts to identify the block containing

Field	Field Type	Description
		each summary field. <code>blockId</code> is assigned automatically. Valid values are B1 through B5.  This field is available in API version 25.0 and later.
<code>joinTable</code>	string	Required. Refers to the entity used to join blocks in a joined report. The entity provides a list of fields that are available for globally grouping across the blocks.

## ReportAggregateReference

ReportAggregateReference defines the developer name used for custom summary formulas in joined reports.

Field	Field Type	Description
<code>aggregate</code>	string	Required. The <code>developerName</code> of the ReportAggregate, which specifies the custom summary formula used in a block of a joined report.

## ReportBucketField

ReportBucketField defines a bucket to be used in the report.

Field	Field Type	Description
<code>bucketType</code>	ReportBucketFieldType (enumeration of type string)	Required. Specifies the type of bucket. Valid values: <ul style="list-style-type: none"> <li>• text</li> <li>• number</li> <li>• picklist</li> </ul>
<code>developerName</code>	string	Required. A unique name used as the <code>&lt;field&gt;</code> value to display a bucket field in the column list and other report components, including sort, filter, list, group, and chart. Must be of the format <code>BucketField_&lt;name&gt;</code> . For example, <code>BucketField_BusinessSize</code> .
<code>masterLabel</code>	string	Required. The bucket field label. Maximum 40 characters. Any line breaks, tabs, or multiple spaces at the beginning or end of the label are removed. Any of these characters within the label are reduced to a single space.
<code>nullTreatment</code>	ReportBucketFieldNullTreatment (enumeration of type string)	For numeric bucket fields only. Specifies whether empty values are treated as zeros (z) or not (n).
<code>otherBucketLabel</code>	string	The label of the container for unbucketed values.
<code>sourceColumnName</code>	string	Required. The source field that the bucket is applied to. For example, <code>SALES</code> or <code>INDUSTRY</code> .

Field	Field Type	Description
values	<a href="#">ReportBucketFieldValue</a> (enumeration of type string)	Defines one bucket value used in the bucket field.  While this name is plural, it represents a single bucket. In typical use, a bucket field contains multiple buckets.

## ReportBucketFieldValue

ReportBucketFieldValue defines a bucket value used in the bucket field.

Field	Field Type	Description
sourceValues	ReportBucketFieldSourceValue (enumeration of type string)	The value of a bucket in the bucket field. Valid values: <ul style="list-style-type: none"> <li><code>sourceValue</code>—Used for picklist and text bucket fields. For picklists, describes the picklist item in the bucket. For example, the <code>sourceValue</code> of a bucket on <code>TYPE</code> could be <code>Customer</code>. For text, the full string for the item in the bucket. For example, the <code>sourceValue</code> of a bucket on <code>ADDRESS_STATE1</code> could be <code>NY</code>.</li> <li><code>from</code>—Used only on numeric bucket fields. A non-inclusive lower bound for a numeric bucket range. This value must be a number.</li> <li><code>to</code>—Used only on numeric bucket fields. The inclusive upper bound for a numeric bucket range. This value must be a number.</li> </ul> <p>In numeric buckets, the first value must only have <code>to</code> and last value must only have <code>from</code>. All other values must have both <code>to</code> and <code>from</code>.</p>
value	string	Required. The name of a specific bucket value within the bucket field.

## ReportGrouping

ReportGrouping defines how to group, subtotal, and sort data for summary, matrix, and joined reports.

Field	Field Type	Description
aggregateType	ReportAggrType (enumeration of type string)	The type of aggregate value to sort by. Valid values are: <ul style="list-style-type: none"> <li>Sum</li> <li>Average</li> <li>Maximum</li> <li>Minimum</li> <li>RowCount</li> <li>Unique</li> </ul>

Field	Field Type	Description
		<ul style="list-style-type: none"> <li>• Median</li> <li>• Noop</li> </ul>
dateGranularity	UserDateGranularity (enumeration of type string)	When grouping by a date field, the time period by which to group.
field	string	Required. The field by which you want to summarize data. For example, CAMPAIGN_SOURCE
sortByName	string	The API name of the column, aggregate, or custom summary field used to order the grouping.
sortOrder	SortOrder	Required. Whether to sort data in ascending or descending alphabetical and numerical order.
sortType	ReportSortType (enumeration of type string)	Indicates if the grouping is sorted by a column, aggregate, or custom summary field. Valid values are: <ul style="list-style-type: none"> <li>• Column</li> <li>• Aggregate</li> <li>• CustomSummaryFormula</li> </ul>

## ReportHistoricalSelector

ReportHistoricalSelector defines a date range for historical data.

Field	Field Type	Description
snapshot	string	Represents the date value to apply a historical filter, either relative (in the format <code>N_DAYS_AGO : 2</code> ) or absolute (in the format <code>yyyy-MM-dd</code> ). If unspecified, it's assumed that the filter is applied to all the columns the user sees.  Available in API version 29.0 and later.

## CustomDetailFormulas

CustomDetailFormulas defines row-level formulas for reports.

Field	Field Type	Description
calculatedFormula	string	Required. The custom formula. For example, <code>AMOUNT : SUM + OPP_QUANTITY : SUM</code>
datatype	ReportCustomDetailFormulaDatatype (enumeration of type string)	Required. Specifies the data type for formatting and display of the formula results.
description	string	The formula description. Maximum: 255 characters.

Field	Field Type	Description
developerName	string	Required. The internal development name of the formula, for example, FORMULA1. This name is used to reference custom formulas from other report components, including conditional highlighting.
label	string	Required. The name that identifies this formula.
scale	int	The formula result is calculated to the specified number of decimal places. Valid values 0 through 18.

## ReportCustomDetailFormulaDatatype

An enumeration of type string that specifies the data type for formatting and display of row-level formula results. Valid values:

### Enumeration Value

Double

DateOnly

DateTime

Text

## SortOrder

An enumeration of type string that defines the order in which data is sorted in the report fields. Valid values:

Field	Description
Asc	Sorts data in ascending alphabetical and numerical order.
Desc	Sorts data in descending alphabetical and numerical order.

## UserDateGranularity

An enumeration of type string that defines the time period by which to group data. Valid values:

Enumeration Value	Description
None	No grouping by date
Day	By day
Week	By week
Month	By month
Quarter	By quarter

Enumeration Value	Description
Year	By year
FiscalQuarter	By fiscal quarter. You can set the fiscal year for your organization. See <a href="#">Set the Fiscal Year</a> in Salesforce Help.
FiscalYear	By fiscal year
MonthInYear	By calendar month in year
DayInMonth	By calendar day in month
FiscalPeriod	When custom fiscal years are enabled: By fiscal period
FiscalWeek	When custom fiscal years are enabled: By fiscal week

## ReportSummaryType

An enumeration of type string that defines how report fields are summarized. Valid values:

Enumeration Value	Description
Sum	Total
Average	Average
Maximum	Largest value
Minimum	Smallest value
Unique	Unique values
Median	Median value
Noop	The summary is a no-op.
None	The field isn't summarized.

## ReportColorRange

ReportColorRange defines conditional highlighting for report summary data.

Field	Field Type	Description
aggregate	<a href="#">ReportSummaryType</a> (enumeration of type string)	Required. Defines how the field specified in <code>columnName</code> is summarized. For example, <code>Sum</code> .
columnName	string	Required. Specifies the field whose value ranges are represented by background colors.
highBreakpoint	double	Required. Specifies the number that separates the mid color from the high color.

Field	Field Type	Description
highColor	string	Required. Specifies the color (in HTML format) to represent data that falls into the high number range. This color spans from the highBreakpoint value.
lowBreakpoint	double	Required. Specifies the number that separates the low color from the mid color.
lowColor	string	Required. Specifies a color (in HTML format) to represent data that falls into the low value range, below the lowBreakpoint value.
midColor	string	Required. Specifies a color (in HTML format) to represent data that falls into the mid value range.

## ReportColumn

ReportColumn defines how fields (columns) are displayed in the report.

Field	Field Type	Description
aggregateTypes	<a href="#">ReportSummaryType[]</a> (enumeration of type string)	List that defines if and how each report field is summarized.
field	string	Required. The field name. For example, AGE or OPPORTUNITY_NAME
reverseColors	boolean	In historical trend reports, displays greater Date values as green and greater Amount values as red, reversing the default colors. Available in API version 29.0 and later.
showChanges	boolean	In historical trend reports, adds a column displaying the difference between current and historical Date and Amount values. Available in API version 29.0 and later.

## ReportFilter

ReportFilter limits the report results by filtering data on specified fields.

Field	Field Type	Description
booleanFilter	string	Specifies filter logic conditions.
criteriaItems	<a href="#">ReportFilterItem</a>	The criteria by which you want to filter report data, either by comparing historical values or by applying a date range.

```
<criteriaItems>
  criteriaItems ReportFilterItem
```

Field	Field Type	Description
		<pre> &lt;column&gt;Opportunity.Opportunity_hst\$Amount_hst&lt;/column&gt;    &lt;columnToColumn&gt;false&lt;/columnToColumn&gt;    &lt;operator&gt;equals&lt;/operator&gt;   &lt;snapshot&gt;N_DAYS_AGO:90&lt;/snapshot&gt;   &lt;value&gt;100&lt;/value&gt; &lt;/criteriaItems&gt; </pre>
language	Language (enumeration of type string)	The language used when a report filters against a picklist value using the operators <code>contains</code> or <code>startsWith</code> . For a list of valid language values, see <a href="#">Language</a> .

## ReportFilterItem

ReportFilterItem limits the report results by filtering data on specified fields.

Field	Field Type	Description
column	string	Required. The field in which to filter data. For example, <code>AMOUNT</code>
columnToColumn	boolean	Indicates whether the filter is a column-to-column (field-to-field) filter.  Available in API version 29.0 and later for historical trending reports. Available in API version 48.0 and later for general reports.
isUnlocked	boolean	Optional. Indicates whether the report filter is unlocked ( <code>true</code> ) or locked ( <code>false</code> ). You can edit unlocked filters on the report run page in Lightning Experience. If unspecified, the default value is <code>false</code> .  Available in API version 38.0 and later.
operator	FilterOperation (enumeration of type string)	Required. An enumeration of type string that defines the operator used to filter the data, for example, <code>greaterThan</code> . Valid values are: <ul style="list-style-type: none"> <li><code>equals</code></li> <li><code>notEqual</code></li> <li><code>lessThan</code></li> <li><code>greaterThan</code></li> <li><code>lessOrEqual</code></li> <li><code>greaterOrEqual</code></li> <li><code>contains</code></li> <li><code>notContain</code></li> </ul>

Field	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>startsWith</code></li> <li>• <code>includes</code></li> <li>• <code>excludes</code></li> <li>• <code>within</code> (DISTANCE criteria only)</li> </ul>
<code>snapshot</code>	string	Represents the date value, either relative (in the format <code>N_DAYS_AGO:2</code> ) or absolute (in the format <code>yyyy-MM-dd</code> ). Available in API version 29.0 and later.
<code>value</code>	string	The value by which you want to filter the data, for example, 1000. The Metadata API filter condition values don't always match the values that you enter in the report wizard. For example, in the Metadata API dates are always converted to the US date format and values entered in a non-US English language can be converted to a standard US English equivalent.

## ReportFormat

An enumeration of type string that defines the report format. Valid values:

Enumeration Value	Description
<code>Matrix</code>	Summarizes data in a grid. Use to compare related totals.
<code>Summary</code>	Lists, sorts, and subtotals data.
<code>Tabular</code>	Lists data with no sorting or subtotals.
<code>Joined</code>	Joins data from different report types storing each report's data in its own block.

## ReportFormattingRule

Defines conditional highlighting for report summary data. You can specify up to 5 formatting rules per report.

Field	Field Type	Description
<code>aggregate</code>	<a href="#">ReportFormattingSummaryType</a> (enumeration of type string)	Defines how the field specified in <code>columnName</code> is summarized. For example, <code>Sum</code> .
<code>columnName</code>	string	Required. Specifies the field whose value ranges are represented by colors.
<code>values</code>	<a href="#">ReportFormattingRuleValue</a> (enumeration of type string)	Required. Specifies the background colors and associated ranges for formatted data values.

## ReportFormattingSummaryType

An enumeration of type string that defines how report fields are summarized. Valid values:

Enumeration Value	Description
Sum	Total
Average	Average
Maximum	Largest value
Minimum	Smallest value
Unique	Unique values

## ReportFormattingRuleValue

Specifies the background colors and associated ranges for formatted data values. You can specify up to 3 background colors and 0–3 range upper bounds. Valid values:

Field	Field Type	Description
backgroundColor	string	(Required) Specifies a highlighting color for the field in <code>columnName</code> . Must be a valid hex color string such as #54C254. At least one color is required. You can optionally specify a different color for up to 3 ranges as determined by <code>rangeUpperBound</code> . If you don't specify a color for a particular range, the background is transparent.
rangeUpperBound	double	Delineates a range to which a background color applies. If you don't specify an upper bound for a particular range, the bound is assumed to be plus infinity. The following example sets the background color for the Sales column to #B50E03 for aggregate sales less than or equal to 100, sets no background for sales from 100 to 1000, and sets the background color to #006714 for sales greater than 1000.

```
<formattingRules>
  <aggregate>Sum</aggregate>
  <columnName>Sales</columnName>
  <values>

  <backgroundColor>#B50E03</backgroundColor>

  <rangeUpperBound>100.0</rangeUpperBound>
  </values>
  <values>

  <rangeUpperBound>1000.0</rangeUpperBound>
  </values>
```

Field	Field Type	Description
		<pre>           &lt;values&gt;           &lt;backgroundColor&gt;#006714&lt;/backgroundColor&gt;           &lt;/values&gt;         &lt;/formattingRules&gt; </pre>

## ReportParam

ReportParam represents settings specific to a report type, especially options that let you filter a report to certain useful subsets.

Field	Field Type	Description
name	string	Required. Specifies a specific <code>reportType</code> setting.
value	string	Required. The setting value.

## ReportAggregateDatatype

An enumeration of type string that specifies the data type for formatting and display of custom summary formula results. Valid values:

### Enumeration Value

currency
number
percent

## ReportChart

ReportChart represents charts on summary, matrix, and joined reports.

Field	Field Type	Description
backgroundColor1	string	Specifies the beginning color (in HTML format) for a gradient color background.
backgroundColor2	string	Specifies the end color (in HTML format) for a gradient color background.
backgroundFadeDir	ChartBackgroundDirection (enumeration of type string)	Specifies the direction for a gradient color background. Use with <code>backgroundColor1</code> to specify the beginning color and <code>backgroundColor2</code> to specify the end color for the gradient design. Use white for both if you don't want a background design. Valid values: <ul style="list-style-type: none"> <li>• Diagonal</li> </ul>

Field	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>LeftToRight</code></li> <li>• <code>TopToBottom</code></li> </ul>
<code>chartSummaries</code>	<a href="#">ChartSummary</a> []	Specifies the summaries you want to use for the chart. Invalid summaries are ignored without notification. If there are no valid summaries, <code>RowCount</code> is used by default for the axis value. This field is available in API version 17.0 and later.
<code>chartType</code>	<a href="#">ChartType</a> (enumeration of type string)	Required. Specifies the chart type. Available chart types depend on the <code>report type</code> .
<code>enableHoverLabels</code>	boolean	Specifies whether to display values, labels, and percentages when hovering over charts. Hover details depend on chart type. Percentages apply to pie, donut, and funnel charts only. This field is available in API version 17.0 and later.
<code>expandOthers</code>	boolean	Specifies whether to combine all groups less than or equal to 3% of the total into a single 'Others' wedge or segment. Only applies to pie, donut, and funnel charts. Set to <code>true</code> to show all values individually on the chart; set to <code>false</code> to combine small groups into 'Others.' This field is available in API version 17.0 and later.
<code>groupingColumn</code>	string	Specifies the field by which to group data. This data is displayed on the X-axis for vertical column charts and on the Y-axis for horizontal bar charts.
<code>legendPosition</code>	<a href="#">ChartLegendPosition</a> (enumeration of type string)	Required. The location of the legend with respect to the chart. The valid values are: <ul style="list-style-type: none"> <li>• <code>Bottom</code></li> <li>• <code>OnChart</code></li> <li>• <code>Right</code></li> </ul>
<code>location</code>	<a href="#">ChartPosition</a> (enumeration of type string)	Required. Specifies whether the chart is displayed at the top or bottom of the report.
<code>secondaryGroupingColumn</code>	string	For grouped chart types: Specifies the field by which to group the data.
<code>showAxisLabels</code>	boolean	For bar and line charts: Specifies whether the chart displays names for each axis.
<code>showPercentage</code>	boolean	Indicates if percentages are displayed for wedges and segments of pie, donut, and funnel charts, as well as for gauges ( <code>true</code> ), or not ( <code>false</code> ).
<code>showTotal</code>	boolean	Indicates if the total is displayed for donut charts and gauges ( <code>true</code> ), or not ( <code>false</code> ).

Field	Field Type	Description
showValues	boolean	Indicates if the values of individual records or groups are displayed for charts ( <code>true</code> ), or not ( <code>false</code> ).
size	<a href="#">ReportChartSize</a> (enumeration of type string)	Required. Specifies the chart size.
summaryAggregate	<a href="#">ReportSummaryType</a> (enumeration of type string)	Defines how to summarize the chart data. For example, <code>Sum</code> . No longer supported in version API 17.0 and later. See <code>chartSummaries</code> .
summaryAxisManualRangeEnd	double	When specifying the axis range manually: Defines the ending value.
summaryAxisManualRangeStart	double	When specifying the axis range manually: Defines the starting value.
summaryAxisRange	<a href="#">ChartRangeType</a> (enumeration of type string)	Required. For bar, line, and column charts: Defines whether to specify the axis range manually or automatically.
summaryColumn	string	Required. Specifies the field by which to summarize the chart data. Typically this field is displayed on the Y-axis. No longer supported in version API 17.0 and later. See <code>chartSummaries</code> .
textColor	string	The color (in HTML format) of the chart text and labels.
textSize	int	The size of the chart text and labels. Valid values: <ul style="list-style-type: none"> <li>• 8</li> <li>• 9</li> <li>• 10</li> <li>• 12</li> <li>• 14</li> <li>• 18</li> <li>• 24</li> <li>• 36</li> </ul> The maximum size is 18. Larger values are shown at 18 points.
title	string	The chart title. Max 255 characters.
titleColor	string	The color (in HTML format) of the title text.
titleSize	int	The size of the title text. Valid values: <ul style="list-style-type: none"> <li>• 8</li> <li>• 9</li> <li>• 10</li> <li>• 12</li> <li>• 14</li> <li>• 18</li> </ul>

Field	Field Type	Description
		<ul style="list-style-type: none"> <li>• 24</li> <li>• 36</li> </ul> <p>The maximum size is 18. Larger values are shown at 18 points.</p>

## ChartType

An enumeration of type string that defines the chart type. For information on each of these chart types, see [Chart Types](#) in Salesforce Help. Valid values:

### Enumeration Value

None

HorizontalBar

HorizontalBarGrouped

HorizontalBarStacked

HorizontalBarStackedTo100

VerticalColumn

VerticalColumnGrouped

VerticalColumnStacked

VerticalColumnStackedTo100

Line

LineGrouped

LineCumulative

LineCumulativeGrouped

Pie

Donut

Funnel

Scatter

ScatterGrouped

VerticalColumnLine

VerticalColumnGroupedLine

VerticalColumnStackedLine

Plugin

**Enumeration Value**

Reserved for future use. This value is available in API version 31.0 and later.

## ChartPosition

An enumeration of type string that specifies the position of the chart in the report. Valid values:

**Enumeration Value**

CHART\_TOP

CHART\_BOTTOM

## ChartSummary

ChartSummary defines how data in the chart is summarized. Valid values:

Field	Field Type	Description
aggregate	<a href="#">ReportSummaryType</a>	Specifies the aggregation method—such as <code>Sum</code> , <code>Average</code> , <code>Min</code> , and <code>Max</code> —for the summary value. Use the <code>column</code> field to specify the summary value to use for the aggregation. You don't need to specify this field for <code>RowCount</code> or custom summary formulas.
axisBinding	<a href="#">ChartAxis</a>	Specifies the axis or axes to use on the chart. Use the <code>column</code> field to specify the summary value to use for the axis.
column	string	Required. Specifies the summary field for the chart data. If all columns are invalid, <code>RowCount</code> is used by default for the axis value. For vertical column and horizontal bar combination charts, you can specify up to four values.

## ChartAxis

An enumeration of type string that specifies the axis or axes to be used in charts. Valid values:

Enumeration Value	Description
x	The summary value to use for the X-axis of a scatter chart.
y	The Y-axis for the chart.
y2	The secondary Y-axis for vertical column combination charts with a line added.

## ReportChartSize

An enumeration of type string that specifies the chart size. Valid values:

**Enumeration Value**

Tiny

Small

Medium

Large

Huge

## ChartRangeType

An enumeration of type string that defines the report format. Valid values:

**Enumeration Value**

Auto

Manual

## ReportTimeFrameFilter

ReportTimeFrameFilter represents the report time period.

Field	Field Type	Description
dateColumn	string	Required. The date field on which to filter data. For example, <code>CLOSE_DATE</code>
endDate	date	When <code>interval</code> is <code>INTERVAL_CUSTOM</code> , specifies the end of the custom time period.
interval	<a href="#">UserDateInterval</a> (enumeration of type string)	Required. Specifies the period.
startDate	date	When <code>interval</code> is <code>INTERVAL_CUSTOM</code> , specifies the start of the custom time period.

## ReportCrossFilter

ReportCrossFilter represents the cross filter functionality in reports.

Field	Field Type	Description
criteriaItems	<a href="#">ReportFilterItem</a>	Represents the subfilters of a cross filter. There can be up to five subfilters. This field requires the following attributes. <ul style="list-style-type: none"> <li>Column</li> <li>Operator</li> </ul>

Field	Field Type	Description
		<ul style="list-style-type: none"> <li>Value</li> </ul>
operation	ObjectFilterOperator (Enumeration of type string)	The action indicating whether to include or exclude an object. Valid values: <code>with</code> and <code>without</code> .
primaryTableColumn	string	The field from the parent object used for the cross filter.
relatedTable	string	The child object used for the cross filter.
relatedTableJoinColumn	string	The field from the child object that is used to join the parent.

## Declarative Metadata Sample Definition

A sample XML snippet using cross filters to build an Accounts report for cases where case status isn't closed:

```
<crossFilters>
  <criteriaItems>
    <column>Status</column>
    <operator>notequal</operator>
    <value>Closed</value>
  </criteriaItems>
  <operation>with</operation>
  <primaryTableColumn>ACCOUNT_ID</primaryTableColumn>
  <relatedTable>Case</relatedTable>
  <relatedTableJoinColumn>Account</relatedTableJoinColumn>
</crossFilters>
```

 **Note:** This sample was generated using the API version 23.0.

## UserDateInterval

An enumeration of type string that defines the period. Valid values:

Enumeration Value	Description
INTERVAL_CURRENT	Current fiscal quarter
INTERVAL_CURNEXT1	Current and next fiscal quarters
INTERVAL_CURPREV1	Current and previous fiscal quarters
INTERVAL_NEXT1	Next fiscal quarter
INTERVAL_PREV1	Previous fiscal quarter
INTERVAL_CURNEXT3	Current and next three fiscal quarters
INTERVAL_CURFY	Current fiscal year
INTERVAL_PREVFY	Previous fiscal year
INTERVAL_PREV2FY	Previous two fiscal years

Enumeration Value	Description
INTERVAL_AGO2FY	Two fiscal years ago
INTERVAL_NEXTFY	Next fiscal year
INTERVAL_PREVCURFY	Current and previous fiscal years
INTERVAL_PREVCUR2FY	Current and previous two fiscal years
INTERVAL_CURNEXTFY	Current and next fiscal year
INTERVAL_CUSTOM	A custom time period. Use <code>startDate</code> and <code>endDate</code> fields to specify the time period's start date and end date.
INTERVAL_YESTERDAY	Yesterday
INTERVAL_TODAY	Today
INTERVAL_TOMORROW	Tomorrow
INTERVAL_LASTWEEK	Last calendar week
INTERVAL_THISWEEK	This calendar week
INTERVAL_NEXTWEEK	Next calendar week
INTERVAL_LASTMONTH	Last calendar month
INTERVAL_THISMONTH	This calendar month
INTERVAL_NEXTMONTH	Next calendar month
INTERVAL_LASTTHISMONTH	Current and previous calendar months
INTERVAL_THISNEXTMONTH	Current and next calendar months
INTERVAL_CURRENTQ	Current calendar quarter
INTERVAL_CURNEXTQ	Current and next calendar quarters
INTERVAL_CURPREVQ	Current and previous calendar quarters
INTERVAL_NEXTQ	Next calendar quarter
INTERVAL_PREVQ	Previous calendar quarter
INTERVAL_CURNEXT3Q	Current and next three calendar quarters
INTERVAL_CURY	Current calendar year
INTERVAL_PREVY	Previous calendar year
INTERVAL_PREV2Y	Previous two calendar years
INTERVAL_AGO2Y	Two calendar years ago
INTERVAL_NEXTY	Next calendar year
INTERVAL_PREVCURY	Current and previous calendar years
INTERVAL_PREVCUR2Y	Current and previous two calendar years

Enumeration Value	Description
INTERVAL_CURNEXTY	Current and next calendar years
INTERVAL_LAST7	Last 7 days
INTERVAL_LAST30	Last 30 days
INTERVAL_LAST60	Last 60 days
INTERVAL_LAST90	Last 90 days
INTERVAL_LAST120	Last 120 days
INTERVAL_NEXT7	Next 7 days
INTERVAL_NEXT30	Next 30 days
INTERVAL_NEXT60	Next 60 days
INTERVAL_NEXT90	Next 90 days
INTERVAL_NEXT120	Next 120 days
LAST_FISCALWEEK	When custom fiscal years are enabled: Last fiscal week
THIS_FISCALWEEK	When custom fiscal years are enabled: This fiscal week
NEXT_FISCALWEEK	When custom fiscal years are enabled: Next fiscal week
LAST_FISCALPERIOD	When custom fiscal years are enabled: Last fiscal period
THIS_FISCALPERIOD	When custom fiscal years are enabled: This fiscal period
NEXT_FISCALPERIOD	When custom fiscal years are enabled: Next fiscal period
LASTTHIS_FISCALPERIOD	When custom fiscal years are enabled: This fiscal period and last fiscal period
THISNEXT_FISCALPERIOD	When custom fiscal years are enabled: This fiscal period and next fiscal period
CURRENT_ENTITLEMENT_PERIOD	Current entitlement period
PREVIOUS_ENTITLEMENT_PERIOD	Previous entitlement period
PREVIOUS_TWO_ENTITLEMENT_PERIODS	Previous two entitlement periods
TWO_ENTITLEMENT_PERIODS_AGO	Two entitlement periods ago
CURRENT_AND_PREVIOUS_ENTITLEMENT_PERIOD	Current and previous entitlement period
CURRENT_AND_PREVIOUS_TWO_ENTITLEMENT_PERIODS	Current and previous two entitlement periods

## Declarative Metadata Sample Definition

A sample XML report definition:

```

```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Dashboard](#)

## ReportType

Represents the metadata associated with a custom report type. Custom report types allow you to build a framework from which users can create and customize reports.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Declarative Metadata File Suffix and Directory Location

The file suffix is `.reportType` for the custom report type definition. There's one file per custom report type. Report types are stored in the `reportTypes` directory of the corresponding package directory.

## Version

Custom report types are available in API version 14.0 and later.

## Fields

Field Name	Field Type	Description
<code>autogenerated</code>	boolean	Indicates that the report type was automatically generated when historical trending was enabled for an entity.  Available in API version 29 and later.
<code>baseObject</code>	string	Required. The primary object for the custom report type, for example, Account. All objects, including custom and external objects, are supported. You can't edit this field after initial creation.  Support for external objects is available in API version 38.0 and later.
<code>category</code>	ReportTypeCategory (enumeration of type string)	Required. This field controls the category for the report. The valid values are: <ul style="list-style-type: none"> <li>• <code>accounts</code></li> <li>• <code>opportunities</code></li> <li>• <code>forecasts</code></li> <li>• <code>cases</code></li> <li>• <code>leads</code></li> <li>• <code>campaigns</code></li> <li>• <code>activities</code></li> <li>• <code>busop</code></li> <li>• <code>products</code></li> <li>• <code>admin</code></li> <li>• <code>territory</code></li> <li>• <code>territory2</code> (This value is available in API version 31.0 and later.)</li> <li>• <code>usage_entitlement</code></li> <li>• <code>wdc</code> (This value is available in API version 29.0 and later.)</li> <li>• <code>calibration</code> (This value is available in API version 29.0 and later.)</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• other</li> <li>• content</li> <li>• quotes</li> <li>• individual (This value is available in API version 45.0 and later.)</li> <li>• employee (This value is available in API version 46.0 and later.)</li> <li>• data_cloud (This value is available in API version 55.0 and later.)</li> <li>• commerce (This value is available in API version 60.0 and later.)</li> <li>• flow (This value is available in API version 60.0 and later.)</li> <li>• semantic_model (This value is available in API version 60.0 and later.)</li> </ul>
deployed	boolean	Required. Indicates whether the report type is available to users ( <code>true</code> ) or whether it's still in development ( <code>false</code> ).
description	string	The description of the custom report type.
fullName	string	The report type developer name used as a unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
join	<a href="#">ObjectRelationship</a>	The object joined to the <a href="#">baseObject</a> . For example, Contacts can be joined to the primary Accounts object.
label	string	Required. The report type label.
sections	<a href="#">ReportLayoutSection</a> []	The groups of columns available for the report type. Though columns aren't strictly required, a report without columns isn't useful.

## ObjectRelationship

ObjectRelationship represents a join to another object.

Field Name	Field Type	Description
join	<a href="#">ObjectRelationship</a>	This field is a recursive reference that allows you to join more than two objects. A maximum of four objects can be joined in a custom report type. When more than two objects are joined, an inner join isn't allowed if there has been an outer join earlier in the join sequence. The <a href="#">baseObject</a> is first joined to the object specified in <a href="#">relationship</a> ; the resulting dataset is then joined with any objects specified in this field.
outerJoin	boolean	Required. Indicates whether it's an outer join ( <code>true</code> ) or not ( <code>false</code> ). An outer join returns a row even if the joined table doesn't contain a matching value in the join column.
relationship	string	Required. The object joined to the primary object; for example, Contacts.

## ReportLayoutSection

ReportLayoutSection represents a group of columns used in the custom report type.

Field Name	Field Type	Description
columns	<a href="#">ReportTypeColumn</a> []	The list of columns projected from the query, defined by this custom report type.
masterLabel	string	Required. The label for this group of columns in the report wizard.

## ReportTypeColumn

ReportTypeColumn represents a column in the custom report type.

Field Name	Field Type	Description
checkedByDefault	boolean	Required. Indicates whether this column is selected by default ( <code>true</code> ) or not ( <code>false</code> ).
displayNameOverride	string	A customized column name, if desired.
field	string	Required. The field name associated with the report column.
table	string	Required. The table associated with the field; for example, Account.

## Declarative Metadata Sample Definition

The definition of a custom report type is shown in this example. Account is joined to Contacts and the resulting dataset is joined with Assets.

```
<?xml version="1.0" encoding="UTF-8"?>
<ReportType xmlns="http://soap.sforce.com/2006/04/metadata">
  <baseObject>Account</baseObject>
  <category>accounts</category>
  <deployed>true</deployed>
  <description>Account linked to Contacts and Assets</description>
  <join>
    <join>
      <outerJoin>false</outerJoin>
      <relationship>Assets</relationship>
    </join>
    <outerJoin>false</outerJoin>
    <relationship>Contacts</relationship>
  </join>
  <label>Account Contacts and Assets</label>
  <sections>
    <columns>
      <checkedByDefault>true</checkedByDefault>
      <field>obj_lookup__c.Id</field>
      <table>Account</table>
    </columns>
  </sections>
</ReportType>
```

```

</columns>
<columns>
  <checkedByDefault>>false</checkedByDefault>
  <field>obj_lookup__c.Name</field>
  <table>Account</table>
</columns>
<columns>
  <checkedByDefault>>false</checkedByDefault>
  <field>Opportunity__c.Amount</field>
  <table>Account</table>
</columns>
<columns>
  <checkedByDefault>>false</checkedByDefault>
  <field>Owner.IsActive</field>
  <table>Account</table>
</columns>
<masterLabel>Accounts</masterLabel>
</sections>
<sections>
  <columns>
    <checkedByDefault>>false</checkedByDefault>
    <field>Owner.Email</field>
    <table>Account.Contacts</table>
  </columns>
  <columns>
    <checkedByDefault>>false</checkedByDefault>
    <field>byr__c</field>
    <table>Account.Contacts</table>
  </columns>
  <columns>
    <checkedByDefault>>true</checkedByDefault>
    <field>ReportsTo.CreatedBy.Contact.Owner.MobilePhone</field>
    <table>Account.Contacts</table>
  </columns>
  <masterLabel>Contacts</masterLabel>
</sections>
</ReportType>

```

## Usage

The custom report type refers to fields by using their API names. For a historical field (one that has `trackTrending` set to `true`) the API name includes `hst`, such as `Field2__c_hst`.

```

<sections>
  <columns>
    <checkedByDefault>>false</checkedByDefault>
    <field>Field2__c_hst</field>
    <table>CustomTrendedObject__c.CustomTrendedObject__c_hst</table>
  </columns>
  <masterLabel>History</masterLabel>
</sections>

```

For more information, see [trackTrending](#) on page 629.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## RestrictionRule

---

Represents a restriction rule or a scoping rule. A restriction rule has `enforcementType` set to `Restrict` and controls the access that specified users have to designated records. A scoping rule has `enforcementType` set to `Scoping` and controls the default records that your users see without restricting access. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

RestrictionRule components have the suffix `.rule` and are stored in the `restrictionRules` folder.

## Version

RestrictionRule components are available in API version 52.0 and later.

## Special Access Rules

Only users with the View Restriction and Scoping Rules permission can view restriction rules and scoping rules via the API. Only users with the Manage Sharing permission can view, create, update, and delete restriction rules and scoping rules.

## Fields

Field Name	Field Type	Description
<code>active</code>	boolean	Indicates whether the rule is active ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>description</code>	string	Required. The description of the rule.
<code>enforcementType</code>	EnforcementType (enumeration of type string)	Required. The type of rule. Valid values are: <ul style="list-style-type: none"> <li><code>FieldRestrict</code>—Don't use.</li> <li><code>Restrict</code>—Restriction rule.</li> <li><code>Scoping</code>—Scoping rule.</li> </ul>
<code>masterLabel</code>	string	Required. The name of the rule.

Field Name	Field Type	Description
<code>recordFilter</code>	string	<p>Required. The criteria that determine which records are accessible via the rule. For picklist fields, you can now use the OR operator to specify multiple values for a single picklist field.— For example:</p> <pre>OR(ISPICKVAL(Status,'Draft'), ISPICKVAL(Status,'Activated'), ISPICKVAL(Status,'Negotiating'))</pre> <p>This enhancement applies to both Restriction Rules and Scoping Rules. Support for multiple picklist values using the OR operator was introduced in API version 60.0 and later.</p>
<code>targetEntity</code>	string	<p>Required. The object for which you're creating the rule. We recommend that you don't edit this field after the rule is created.</p> <p>If <code>enforcementType</code> is set to <code>Restrict</code>, custom objects, external objects, and these objects are supported:</p> <ul style="list-style-type: none"> <li>• Contract</li> <li>• Event</li> <li>• Task</li> <li>• TimeSheet</li> <li>• TimeSheetEntry</li> </ul> <p>If <code>enforcementType</code> is set to <code>Scoping</code>, custom objects and these objects are supported:</p> <ul style="list-style-type: none"> <li>• Account</li> <li>• Case</li> <li>• Contact</li> <li>• Event</li> <li>• Lead</li> <li>• Opportunity</li> <li>• Task</li> </ul>
<code>userCriteria</code>	string	Required. The users that this rule applies to, such as all active users or users with a specified role or profile.
<code>version</code>	int	Required. The rule's version number.

## Declarative Metadata Sample Definition

The following is an example of a `RestrictionRule` component representing a restriction rule.

```
<?xml version="1.0" encoding="UTF-8"?>
<RestrictionRule xmlns="http://soap.sforce.com/2006/04/metadata">
  <active>true</active>
  <description>Allows users with a specific profile to see only tasks that they
own.</description>
  <enforcementType>Restrict</enforcementType>
```

```

<masterLabel>Tasks You Own</masterLabel>
<recordFilter>OwnerId = $User.Id</recordFilter>
<targetEntity>Task</targetEntity>
<userCriteria>$User.ProfileId = '00exxxxxxxxxxxxxx'</userCriteria>
<version>1</version>
</RestrictionRule>

```

The following is an example of a RestrictionRule component representing a scoping rule.

```

<?xml version="1.0" encoding="UTF-8"?>
<RestrictionRule xmlns="http://soap.sforce.com/2006/04/metadata">
  <active>true</active>
  <description>View tasks contacts from Department A.</description>
  <enforcementType>Scoping</enforcementType>
  <masterLabel>SR for Department A contacts</masterLabel>
  <recordFilter>Department=$User.Department</recordFilter>
  <targetEntity>Contact</targetEntity>
  <userCriteria>$User.UserId = '00Exxxxxxxxxxxxxx'</userCriteria>
  <version>1</version>
</RestrictionRule>

```

The following is an example package.xml that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>RestrictionRule</name>
  </types>
  <version>55.0</version>
</Package>

```

## Role

---

Represents a role in your organization.

## Declarative Metadata File Suffix and Directory Location

The file suffix for role components is `.role` and components are stored in the `roles` directory of the corresponding package directory.

## Version

Role components are available in API version 24.0 and later.

## Fields

This metadata type extends to subtype [RoleOrTerritory](#) on page 1622.

Field Name	Field Type	Description
fullName	string	The unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component. Corresponds to <b>Role Name</b> in the user interface.
parentRole	string	The role above this role in the hierarchy.

## Declarative Metadata Sample Definition

The following is the definition of a role.

```
<?xml version="1.0" encoding="UTF-8"?>
<Role xmlns="http://soap.sforce.com/2006/04/metadata">
  <caseAccessLevel>Edit</caseAccessLevel>
  <contactAccessLevel>Edit</contactAccessLevel>
  <description>Sample Role</description>
  <mayForecastManagerShare>false</mayForecastManagerShare>
  <name>R22</name>
  <opportunityAccessLevel>Read</opportunityAccessLevel>
</Role>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## RoleOrTerritory

Represents the common base type and valid values for role or territory.

## Version

RoleOrTerritory components are available in API version 24.0 and later.

 **Note:** You can't create a RoleOrTerritory component directly. Use the Role or Territory metadata types instead.

## Fields

Field Name	Field Type	Description
caseAccessLevel	string	Specifies whether a user can access other users' cases that are associated with accounts the user owns. Valid values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>None</li> </ul> <p>This field is not visible if your organization's sharing model for cases is Public Read/Write.</p> <p>If no value is set for this field, this field value uses the default access level that is specified in the Manage Territory page in Setup.</p>
contactAccessLevel	string	<p>Specifies whether a user can access other users' contacts that are associated with accounts the user owns. Valid values are:</p> <ul style="list-style-type: none"> <li>Read</li> <li>Edit</li> <li>None</li> </ul> <p>This field is not visible if your organization's sharing model for contacts is Public Read/Write or Controlled by Parent.</p> <p>If no value is set for this field, this field value uses the default access level that is specified in the Manage Territory page in Setup.</p>
description	string	The description of the role or territory.
fullName	string	The unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component.
mayForecastManagerShare	boolean	Indicates whether the forecast manager can manually share their own forecast.
name	string	Required. The name of the role or territory.
opportunityAccessLevel	string	<p>Specifies whether a user can access other users' opportunities that are associated with accounts the user owns. Valid values are:</p> <ul style="list-style-type: none"> <li>Read</li> <li>Edit</li> <li>None</li> </ul> <p>This field is not visible if your organization's sharing model for opportunities is Public Read/Write.</p> <p>If no value is set for this field, this field value uses the default access level that is specified in the Manage Territory page in Setup.</p>

## Declarative Metadata Sample Definition

The following is the definition of a role.

```
<?xml version="1.0" encoding="UTF-8"?>
<Role xmlns="http://soap.sforce.com/2006/04/metadata">
```

```

<caseAccessLevel>Edit</caseAccessLevel>
<contactAccessLevel>Edit</contactAccessLevel>
<description>Sample Role</description>
<mayForecastManagerShare>>false</mayForecastManagerShare>
<name>R22</name>
<opportunityAccessLevel>Read</opportunityAccessLevel>
</Role>

```

The following is the definition of a territory.

```

<?xml version="1.0" encoding="UTF-8"?>
<Territory xmlns="http://soap.sforce.com/2006/04/metadata">
  <accountAccessLevel>Edit</accountAccessLevel>
  <caseAccessLevel>Edit</caseAccessLevel>
  <contactAccessLevel>Edit</contactAccessLevel>
  <description>Sample Territory</description>
  <mayForecastManagerShare>>false</mayForecastManagerShare>
  <name>T22name</name>
  <opportunityAccessLevel>Read</opportunityAccessLevel>
</Territory>

```

[Territory](#)

## SalesWorkQueueSettings

---

Represents settings used to customize work queue options for third-party scoring. In Sales Engagement, you can add a custom number field on person accounts, contacts, or leads. Then, use the custom number field to sort the work queue. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`SalesWorkQueueSettings` components have the suffix `.salesworkqueuesetting` and are stored in the `salesworkqueuesettings` folder.

### Version

`SalesWorkQueueSettings` components are available in API version 49.0 and later.

### Special Access Rules

You must be a Sales Engagement customer to access this metadata type.

## Fields

Field Name	Field Type	Description
featureName	string	The feature that the SalesWorkQueueSettings record is configuring. The allowed value is <code>ThirdPartyScore</code> .
targetEntity	string	The type that the SalesWorkQueueSettings record is configuring. Possible values are: <ul style="list-style-type: none"> <li>• Contact</li> <li>• Lead</li> <li>• PersonAccount</li> </ul>
targetField	string	The developer name or ID of the custom number field that is used to sort the work queue. Custom fields must have a custom number data type. <ul style="list-style-type: none"> <li>• To use Einstein Intelligence Score for lead scoring, use <code>ScoreIntelligence.Score</code> for the developer name.</li> <li>• To remove custom number fields from the work queue, use <code>None</code>.</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a SalesWorkQueueSettings component. The value for `targetField` is set to `00NRM000001g55D` as an example of a custom field ID. Replace this value with the ID of your custom field.

```
<?xml version="1.0" encoding="UTF-8"?>
<SalesWorkQueueSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <featureName>ThirdPartyScore</featureName>
  <targetEntity>Contact</targetEntity>
  <targetField>00NRM000001g55D</targetField>
</SalesWorkQueueSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>SalesWorkQueueSettings</name>
  </types>
  <version>49.0</version>
</Package>
```

## Usage

Create one SalesWorkQueueSettings record for each type. For example, suppose that you want to create a work queue to sort leads by your custom field called `customLeadScore`. Create a SalesWorkQueueSettings record and set `featureName` to `ThirdPartyScore`, `targetEntity` to `Lead`, and `targetField` to `customLeadScore`.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SamlSsoConfig

---

Represents a SAML Single Sign-On configuration. This type extends the [Metadata](#) metadata type and inherits its `fullName` field. Single sign-on (SSO) is an authentication method that enables users to access multiple applications with one login and one set of credentials. For example, after users log in to your org, they can automatically access all apps from the App Launcher. You can set up your Salesforce org to trust a third-party identity provider to authenticate users. Or you can configure a third-party app to rely on your org for authentication.

## File Suffix and Directory Location

SamlSsoConfig components have the suffix `.samlssoconfig` and are stored in the `samlssoconfigs` folder.

## Version

SamlSsoConfig components are available in API version 28.0 and later.

## Special Access Rules

As of Summer '20 and later, only users with the View Setup and Configuration permission or both the Customize Application and Modify All Data permissions can access this type.

## Fields

Field Name	Field Type	Description
<code>attributeNameIdFormat</code>	string	For SAML 2.0, only and when <code>identityLocation</code> is set to <code>Attribute</code> . Possible values include <code>unspecified</code> , <code>emailAddress</code> , or <code>persistent</code> . All legal values can be found in the "Name Identifier Format Identifiers" section of the <a href="#">Assertions and Protocols SAML 2.0 specification</a> .
<code>attributeName</code>	string	The name of the identity provider's application. Get this name from your identity provider.
<code>decryptionCertificate</code>	string	The name of the certificate to use for decrypting incoming SAML assertions. This certificate is saved in the organization's Certificate and Key Management list. Available in API version 30.0 and later.
<code>errorUrl</code>	string	When there's an error during login, specify the URL of the page where users are directed. It must be publicly accessible, such as a public site Visualforce page. The URL can be absolute or relative.

Field Name	Field Type	Description
executionUserId	string	The user that runs the Apex handler class. The user must have the Manage Users permission. If you specify a SAML JIT handler class, a user is required.
identityLocation	SamlIdentityLocationType (enumeration of type string)	The location in the assertion where a user is identified. Valid values are: <ul style="list-style-type: none"> <li>• <code>SubjectNameId</code> — The identity is in the <code>&lt;Subject&gt;</code> statement of the assertion.</li> <li>• <code>Attribute</code> — The identity is specified in an <code>&lt;AttributeValue&gt;</code>, located in the <code>&lt;Attribute&gt;</code> of the assertion.</li> </ul>
identityMapping	SamlIdentityType (enumeration of type string)	The identifier the service provider uses for the user during <a href="#">Just-in-Time user provisioning</a> . Valid values are: <ul style="list-style-type: none"> <li>• <code>Username</code> — The user's Salesforce username.</li> <li>• <code>FederationId</code> — The federation ID from the user object; the identifier used by the service provider for the user.</li> <li>• <code>UserId</code> — The user ID from the user's Salesforce organization.</li> </ul>
issuer	string	The identification string for the Identity Provider.
loginUrl	string	For SAML 2.0 only: The URL where Salesforce sends a SAML request to start the login sequence.
logoutUrl	string	For SAML 2.0 only: The URL to direct the user to when they click the Logout link. The default is <code>https://salesforce.com</code> .
name	string	The unique name used by the API and managed packages. The name must begin with a letter and use only alphanumeric characters and underscores. The name cannot end with an underscore or have two consecutive underscores.
oauthTokenEndpoint	string	For SAML 2.0 only: The ACS URL used with enabling Salesforce as an identity provider in the web single sign-on OAuth assertion flow.
redirectBinding	boolean	Choose the binding mechanism your identity provider requests for your SAML messages. Values are: <ul style="list-style-type: none"> <li>• <code>HTTP POST</code> — HTTP POST binding sends SAML messages using base64-encoded HTML forms.</li> <li>• <code>HTTP Redirect</code> — HTTP Redirect binding sends base64-encoded and URL-encoded SAML messages within URL parameters.</li> </ul>
requestSignatureMethod	string	The method that's used to sign the SAML request. Valid values are <code>RSA-SHA1</code> and <code>RSA-SHA256</code> .
requestSigningCertId	string	The 18-digit ID for the certificate used to generate the signature on a SAML request to the identity provider. The certificate is saved in the Certificate and Key Management page in Setup.

Field Name	Field Type	Description
<code>salesforceLoginUrl</code>	string	The URL associated with login for the web single sign-on flow.   <b>Note:</b> When encryption is enabled, the URL has a parameter containing the ID of the SAML configuration, <code>sc=<b>samlSsoConfigId</b></code> . For example, <code>https://mycompany.my.salesforce.com?sc=01EB000000000000</code> . This change applies to API Version 47.0 and later.
<code>samlEntityId</code>	string	The issuer in SAML requests generated by Salesforce, and is also the expected audience of any inbound SAML Responses. Salesforce recommends that you use your My Domain login URL.
<code>samlJitHandlerId</code>	string	The name of an existing Apex class that implements the <code>Auth.SamlJitHandler</code> interface.
<code>samlVersion</code>	SamlType (enumeration of type string)	The SAML version in use. Valid values are: <ul style="list-style-type: none"> <li><code>SAML1_1</code> — SAML 1.1</li> <li><code>SAML2_0</code> — SAML 2.0</li> </ul>
<code>singleLogoutBinding</code>	SamlSpSLOBinding (enumeration of type string)	The HTTP binding type. This value determines where to put the LogoutRequest or LogoutResponse in the SAML request during single logout (SLO). The value is base64 encoded. Valid values are: <ul style="list-style-type: none"> <li><code>RedirectBinding</code> — Sent in the query string, deflated.</li> <li><code>PostBinding</code> — Sent in the POST body, not deflated.</li> </ul>
<code>singleLogoutUrl</code>	string	The SAML single logout endpoint. This URL is the endpoint where Salesforce sends LogoutRequests (when Salesforce initiates a logout), or LogoutResponses (when the identity provider initiates a logout).
<code>useConfigRequestMethod</code>	boolean	If <code>true</code> , applies the selected Request Signature Method (RSM) during single logout. If <code>false</code> , the default RSM (RSA-SHA1) is applied.
<code>useSameDigestAlgoForSigning</code>	boolean	If <code>true</code> , uses a digest algorithm based on the selected Request Signature Method (RSM). For example, if the selected RSM is <code>RSA-SHA256</code> , the digest algorithm is set to <code>SHA-256</code> .  If <code>false</code> , uses the default digest algorithm ( <code>SHA-1</code> ), regardless of the selected RSM.  This field is available in API version 55.0 and later. You can edit this field only for legacy SAML configurations created before Spring '22. For configurations created after Spring '22, this field is <code>true</code> by default.
<code>userProvisioning</code>	boolean	If <code>true</code> , Just-in-Time user provisioning is enabled, which creates users the first time they log in. Specify <code>Federation ID</code> for the <code>identityMapping</code> value to use this feature.
<code>validationCert</code>	string	The certificate used to validate the request. Get this certificate from your identity provider.

## Declarative Metadata Sample Definition

The following is an example of a SamlSsoConfig component. The validation certificate string has been truncated for readability.

```
<?xml version="1.0" encoding="UTF-8"?>
<SamlSsoConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <identityLocation>SubjectNameId</identityLocation>
  <identityMapping>FederationId</identityMapping>
  <issuer>https://my-idp.my.salesforce.com</issuer>
  <loginUrl>
    https://my-idp.my.salesforce.com/idp/endpoint/HttpRedirect
  </loginUrl>
  <logoutUrl>https://www.salesforce.com</logoutUrl>
  <name>SomeCompany</name>
  <oauthTokenEndpoint>
    https://login.salesforce.com/services/oauth2/token?so=00DD0000000
  </oauthTokenEndpoint>
  <redirectBinding>true</redirectBinding>
  <requestSignatureMethod>RSA-SHA1</requestSignatureMethod>
  <salesforceLoginUrl>
    https://login.salesforce.com?so=00DD0000000JxeI
  </salesforceLoginUrl>
  <samlEntityId>
    https://saml.salesforce.com/customPath
  </samlEntityId>
  <samlVersion>SAML2_0</samlVersion>
  <useConfigRequestMethod>true</useConfigRequestMethod>
  <userProvisioning>false</userProvisioning>
  <validationCert>
    MIIEojCCA4qgAwIBAgIOATtxsoBFAAAAAD4...
  </validationCert>
</SamlSsoConfig>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SchedulingObjective

Represents a scheduling objective in Workforce Engagement. Scheduling objectives define business goals that the scheduling tools consider when identifying agents for shifts.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`SchedulingObjective` components have the suffix `.SchedulingObjective` and are stored in the `SchedulingObjective` folder.

## Version

`SchedulingObjective` components are available in API version 55.0 and later.

## Special Access Rules

This type is available only if Workforce Engagement is enabled in your org. To view, create, edit, and delete records, the user requires the Workforce Engagement Planner permission set.

## Fields

Field Name	Description
<code>isProtected</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the component is protected (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the objective.</p>
<code>schedulingCategory</code>	<p><b>Field Type</b> SchedulingCategory (enumeration of type string)</p> <p><b>Description</b> Required. What the scheduling logic applies the objective to. The valid values are:</p> <ul style="list-style-type: none"> <li>• A—Service Appointment</li> <li>• B—Shift</li> </ul>
<code>schedulingObjectiveParameters</code>	<p><b>Field Type</b> <a href="#">SchedulingObjectiveParameter[]</a> on page 1631</p> <p><b>Description</b> Parameters associated with a scheduling objective, such as the number of days before and after a shift that the logic considers when balancing assignments.</p>
<code>schedulingObjectiveType</code>	<p><b>Field Type</b> SchedulingObjectiveType (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. Specifies the type of objective. Possible values are:</p> <ul style="list-style-type: none"> <li>• AgentPreference—In the UI, this value appears as Maximized Preferences.</li> <li>• BalanceNonStandardShifts</li> <li>• BalanceShifts</li> </ul>

## SchedulingObjectiveParameter

Represents a parameter that's associated with a scheduling objective.

Field Name	Description
parameterKey	<p><b>Field Type</b></p> <p>ObjectiveParameterKey (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. The scheduling objective parameter key. Possible values are:</p> <ul style="list-style-type: none"> <li>• DaysAhead</li> <li>• DaysBack</li> </ul>
value	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The scheduling objective parameter value.</p>

## Declarative Metadata Sample Definition

The following is an example of a SchedulingObjective component.

```
<?xml version="1.0" encoding="UTF-8"?>
<SchedulingObjective xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>Balance Shifts</masterLabel>
  <schedulingCategory>B</schedulingCategory>
  <schedulingObjectiveType>BalanceShifts</schedulingObjectiveType>
  <schedulingObjectiveParameters>
    <parameterKey>DaysAhead</parameterKey>
    <value>30</value>
  </schedulingObjectiveParameters>
</SchedulingObjective>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
```

```

    <name>SchedulingObjective</name>
  <members>Balance Shifts</members>
</types>
  <version>55.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SchedulingRule

---

Represents a scheduling rule in Workforce Engagement Management. Scheduling rules determine when agents are assigned to shifts.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`SchedulingRule` components have the suffix `.schedulingRule` and are stored in the `SchedulingRules` folder.

### Version

`SchedulingRule` components are available in API version 53.0 and later.

### Special Access Rules

This type is available only if Workforce Engagement is enabled in your org. To view, create, edit, and delete records, the user requires the Workforce Engagement Planner permission set.

### Fields

Field Name	Description
<code>isProtected</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the component is protected (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. The name of the rule.</p>
schedulingCategory	<p><b>Field Type</b></p> <p>SchedulingCategory (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. What the scheduling logic applies the rule to. The valid values are:</p> <ul style="list-style-type: none"> <li>• A—Service Appointment</li> <li>• B—Shift</li> </ul>
schedulingRuleParameters	<p><b>Field Type</b></p> <p><a href="#">SchedulingRuleParameter[]</a> on page 1633</p> <p><b>Description</b></p> <p>Parameters associated with a scheduling rule, such as work limits.</p>
schedulingRuleType	<p><b>Field Type</b></p> <p>SchedulingRuleType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. Specifies the type of rule. The valid values are:</p> <ul style="list-style-type: none"> <li>• A—Active Resources</li> <li>• B—Match Skills</li> <li>• C—Availability</li> <li>• M—Match Territory</li> <li>• Q—Match Queue</li> <li>• RestTimeMinutes—Rest Time in Minutes. Available in API version 56.0 and later.</li> <li>• w—Work Limit</li> <li>• LimitNonstandardShifts—Specifies a rule type that limits how many non-standard shifts can be assigned to each agent. Available in API version 54.0 and later.</li> </ul>

## SchedulingRuleParameter

Represents a scheduling rule parameter, such as a work limit, that's associated with a scheduling rule.

Field Name	Description
schedulingParameterKey	<p><b>Field Type</b></p> <p>SchedulingParameterKey (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. The scheduling rule parameter key.</p>

Field Name	Description
	<ul style="list-style-type: none"> <li>• C—Constraint Field Name</li> <li>• L—Limit Type</li> <li>• R—Resolution</li> <li>• T—Time Resolution</li> <li>• W—Work Unit</li> <li>• ConsiderAbsence—Consider resource absences when evaluating availability. Available in API version 56.0 and later.</li> <li>• ConsiderSTM—Consider service territory membership, which defines working hours, when evaluating availability. Available in API version 56.0 and later.</li> </ul>
value	<p><b>Field Type</b> string</p> <p><b>Description</b> The scheduling rule parameter value.</p>

## Declarative Metadata Sample Definition

The following is an example of a SchedulingRule component.

```
<?xml version="1.0" encoding="UTF-8"?>
<SchedulingRule xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>Max Shifts Per Week</masterLabel>
  <schedulingCategory>B</schedulingCategory>
  <schedulingRuleParameters>
    <schedulingParameterKey>C</schedulingParameterKey>
    <value>MaxShiftsPerWeek</value>
  </schedulingRuleParameters>
  <schedulingRuleParameters>
    <schedulingParameterKey>W</schedulingParameterKey>
    <value>Shifts</value>
  </schedulingRuleParameters>
  <schedulingRuleParameters>
    <schedulingParameterKey>R</schedulingParameterKey>
    <value>Week</value>
  </schedulingRuleParameters>
  <schedulingRuleParameters>
    <schedulingParameterKey>L</schedulingParameterKey>
    <value>Max</value>
  </schedulingRuleParameters>
  <schedulingRuleType>W</schedulingRuleType>
</SchedulingRule>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <name>SchedulingRule</name>
```

```
<members>MaxShiftsPerWeek</members>
  </types>
  <version>53.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Scontrol

Deprecated. Represents an Scontrol component, corresponding to an s-control in the Salesforce user interface.

**Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected and can still be edited.

This type extends the [MetadataWithContent](#) metadata type and inherits its `content` and `fullName` fields.

## Declarative Metadata File Suffix and Directory Location

The file suffix is `.scf` for the s-control file. The accompanying metadata file is named `scontrolName-meta.xml`.

Scontrol components are stored in the `scontrols` folder in the corresponding package directory.

## Version

Scontrols are available in API version 10.0 and later.

## Fields

This metadata type contains the following fields:

Field Name	Field Type	Description
<code>content</code>	<code>base64Binary</code>	Content of the s-control. Base 64-encoded binary data. Before making an API call, client applications must encode the binary attachment data as base64. Upon receiving a response, client applications must decode the base64 data to binary. This conversion is handled for you by a SOAP client. This field is inherited from the <a href="#">MetadataWithContent</a> component.
<code>contentSource</code>	<code>SControlContentSource</code> (enumeration of type string)	Required. Determines how you plan to use the s-control: <ul style="list-style-type: none"> <li><b>HTML:</b> Select this option if you want to enter the content for your s-control in <code>content</code>.</li> <li><b>URL:</b> Select this option if you want to enter the link or URL of an external website in <code>content</code>.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li><b>Snippet:</b> Snippets are s-controls that are designed to be included in other s-controls. Select this option if you want to enter the content for your s-control snippet in <code>content</code>.</li> </ul>
<code>description</code>	string	Optional text that describes the s-control. This only displays to users with View All Data permission (administrator).
<code>encodingKey</code>	Encoding ( <a href="#">enumeration</a> of type string)	Required. The default encoding setting is Unicode: UTF-8. Change it if you're passing information to a URL that requires data in a different format. This option is available when you select URL as the value for <code>contentSource</code> .
<code>fileContent</code>	base64	File contents displayed if you add this s-control to a custom link. The file can contain a Java applet, Active-X control, or any other type of content you want. This option only applies to s-controls with a value of HTML for <code>contentSource</code> .
<code>fileName</code>	string	The unique name for the s-control. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field can't be changed for components installed by a managed package. It's only relevant if the <code>fileContent</code> field also has a value. This field is available in API version 14.0.
<code>fullName</code>	string	The s-control developer name used as a unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. If this field contained characters before version 14.0 that are no longer allowed, the characters were stripped out of this field, and the previous value of the field was saved in the <code>name</code> field. This field is inherited from the <a href="#">Metadata</a> component.
<code>name</code>	string	Required. The unique name for the s-control. It must contain alphanumeric characters only and begin with a letter. For example <code>example_s_control</code> .
<code>supportsCaching</code>	boolean	Required. Indicates whether the s-control supports caching ( <code>true</code> ) or not ( <code>false</code> ). Caching optimizes the page so that it remembers which s-controls are on the page when it reloads. This option only applies to HTML s-controls.

## Declarative Metadata Sample Definition

The following sample creates the `Myriad_Publishing.scf` s-control, which creates a link to the website specified in the s-control. The corresponding `Myriad_Publishing.scf-meta.xml` metadata file follows the s-control file.

Myriad\_Publishing.scf file:

```
http://www.myriadpubs.com
```

Myriad\_Publishing.scf-meta.xml:

```
<?xml version="1.0" encoding="UTF-8"?>
<Scontrol xmlns="http://soap.sforce.com/2006/04/metadata">
  <contentSource>URL</contentSource>
  <description>s-control to open Myriad Publishing website.</description>
  <encodingKey>UTF-8</encodingKey>
  <name>Myriad Publishing</name>
  <supportsCaching>true</supportsCaching>
</Scontrol>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SearchCustomization

---

Represents the configuration of search settings created in Search Manager. The configuration includes the search channel, searchable objects and fields, and rules to filter search results.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

SearchCustomization components have the suffix `.searchCustomization` and are stored in the `searchCustomizations` folder.

## Version

SearchCustomization components are available in API version 61.0 and later.

## Special Access Rules

Only users with the View Setup and Configuration permission can access this object, and only users with the Customize Application permission can edit it.

## Fields

Field Name	Description
channel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The search channel that the configuration applies to.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the configuration.</p>
objectOverride	<p><b>Field Type</b> <a href="#">SearchCustomizationObjectOverride[]</a></p> <p><b>Description</b> A list of object configurations.</p>
objectToAlwaysSearch	<p><b>Field Type</b> string[]</p> <p><b>Description</b> A list of the objects that are always searched for the user profile if the search channel is Einstein Global Search Bar.</p>
profile	<p><b>Field Type</b> string</p> <p><b>Description</b> Specifies user profile if the search channel is Einstein Global Search Bar.</p>
selectedObject	<p><b>Field Type</b> string[]</p> <p><b>Description</b> A list of the objects that are selected in the configuration if the search channel is LWR Experience Sites.</p>

## SearchCustomizationObjectOverride

Represents the configuration for a specific object.

Field Name	Description
fieldOverride	<p><b>Field Type</b>  <a href="#">SearchCustomizationFieldOverride[]</a></p> <p><b>Description</b>            A list of field configurations.</p>
objectApiName	<p><b>Field Type</b>            string</p> <p><b>Description</b>            Required.            The API name of the object that the configuration is applied to.</p>
rule	<p><b>Field Type</b>  <a href="#">SearchCustomizationRule[]</a></p> <p><b>Description</b>            A list of rules applied to filter search results.</p>
searchable	<p><b>Field Type</b>            boolean</p> <p><b>Description</b>            Indicates whether the object is searchable (<code>true</code>) or not (<code>false</code>).</p>

## SearchCustomizationFieldOverride

Represents the configuration for a specific field within an object.

Field Name	Description
fieldApiName	<p><b>Field Type</b>            string</p> <p><b>Description</b>            Required.            The API name of the field that the configuration is applied to.</p>
searchable	<p><b>Field Type</b>            boolean</p> <p><b>Description</b>            Required.            Indicates whether the field is searchable (<code>true</code>) or not (<code>false</code>).</p>

## SearchCustomizationRule

Represents the rules defined in an object to filter search results.

Field Name	Description
fieldApiName	<b>Field Type</b> string <b>Description</b> Required. The field that the rule applies to.
operator	<b>Field Type</b> string <b>Description</b> Required. The operator for the rule.
ruleValue	<b>Field Type</b> <a href="#">SearchCustomizationRuleValue[]</a> <b>Description</b> A list of rule values.

## SearchCustomizationRuleValue

Represents the value of a rule used to filter search results.

Field Name	Description
targetObjectApiName	<b>Field Type</b> string <b>Description</b> The API name of the target object, in case the rule applies to a lookup field.
value	<b>Field Type</b> string <b>Description</b> Required. The value of the rule.

## Declarative Metadata Sample Definition

The following is an example of a SearchCustomization component.

```
<?xml version="1.0" encoding="UTF-8"?>
<SearchCustomization xmlns="http://soap.sforce.com/2006/04/metadata">
  <channel>GlobalSearch</channel>
  <masterLabel>My_Standard_User_Configuration</masterLabel>
  <objectOverride>
    <fieldOverride>
      <fieldApiName>Description</fieldApiName>
      <searchable>>false</searchable>
    </fieldOverride>
    <fieldOverride>
      <fieldApiName>Rating</fieldApiName>
      <searchable>>true</searchable>
    </fieldOverride>
    <objectApiName>Account</objectApiName>
    <rule>
      <fieldApiName>My_Custom_Field__c</fieldApiName>
      <operator>ne</operator>
      <ruleValue>
        <value>Other</value>
      </ruleValue>
    </rule>
    <rule>
      <fieldApiName>Rating</fieldApiName>
      <operator>in</operator>
      <ruleValue>
        <value>Hot</value>
      </ruleValue>
      <ruleValue>
        <value>Warm</value>
      </ruleValue>
    </rule>
  </objectOverride>
  <objectOverride>
    <objectApiName>Asset</objectApiName>
    <searchable>>false</searchable>
  </objectOverride>
  <objectOverride>
    <objectApiName>Contact</objectApiName>
    <rule>
      <fieldApiName>AccountId</fieldApiName>
      <operator>ne</operator>
      <ruleValue>
        <targetObjectApiName>Account</targetObjectApiName>
        <value>A Company</value>
      </ruleValue>
    </rule>
    <rule>
      <fieldApiName>DoNotCall</fieldApiName>
      <operator>eq</operator>
      <ruleValue>
        <value>>false</value>
      </ruleValue>
    </rule>
  </objectOverride>
</SearchCustomization>
```

```

        </ruleValue>
    </rule>
</objectOverride>
<objectToAlwaysSearch>Account</objectToAlwaysSearch>
<objectToAlwaysSearch>Contact</objectToAlwaysSearch>
<objectToAlwaysSearch>My_Custom_Object__c</objectToAlwaysSearch>
<objectToAlwaysSearch>Product2</objectToAlwaysSearch>
<profile>standard</profile>
</SearchCustomization>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>*</members>
        <name>SearchCustomization</name>
    </types>
    <version>61.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SearchOrgWideObjectConfig

---

Represents an object in the search index. The search index contains org-wide search settings created in Search Manager. Each object in the search index includes searchable fields and fields protected by field-level security in search.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`SearchOrgWideObjectConfig` components have the suffix `.searchOrgWideObjectConfig` and are stored in the `searchOrgWideConfiguration` folder.

### Version

`SearchOrgWideObjectConfig` components are available in API version 61.0 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the configuration.</p>
<code>objectReference</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The API name of the object.</p>
<code>searchOrgWideFieldConfig</code>	<p><b>Field Type</b> <a href="#">SearchOrgWideFieldConfig[]</a></p> <p><b>Description</b> A list of field configurations.</p>

## SearchOrgWideFieldConfig

Represents the configuration in the search index for a field in an object.

Field Name	Description
<code>fieldReference</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The API name of the field.</p>
<code>isSearchable</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates if the field is searchable (<code>true</code>) or not (<code>false</code>). If <code>true</code>, the field is shown in search results and used to match results.</p>

Field Name	Description
isSecure	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates if the field is protected by field-level security in search (<code>true</code>) or not (<code>false</code>). If <code>true</code>, the search engine uses this field to match results only for users with permissions. If <code>false</code>, the search engine uses this field to match results even if the user doesn't have permissions to view this field.</p>

## Declarative Metadata Sample Definition

The following is an example of a SearchOrgWideObjectConfig component.

```
<?xml version="1.0" encoding="UTF-8"?>
<SearchOrgWideObjectConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>CustomerLabel</masterLabel>
  <objectReference>Customer</objectReference>
  <searchOrgWideFieldConfig>
    <fieldReference>Custom_Field_1__c</fieldReference>
    <isSearchable>false</isSearchable>
    <isSecure>false</isSecure>
  </searchOrgWideFieldConfig>
  <searchOrgWideFieldConfig>
    <fieldReference>Custom_Field_2__c</fieldReference>
    <isSearchable>true</isSearchable>
    <isSecure>true</isSecure>
  </searchOrgWideFieldConfig>
</SearchOrgWideObjectConfig>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>SearchOrgWideObjectConfig</name>
  </types>
  <version>61.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ServiceAISetupDefinition

---

Represents settings for an Einstein for Service feature such as Einstein Article Recommendations. This type extends the Metadata metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

ServiceAISetupDefinition components have the suffix `.serviceAISetupDescription` and are stored in the `serviceAISetupDescriptions` folder.

### Version

ServiceAISetupDefinition components are available in API version 51.0 and later.

### Special Access Rules

This type is available only when an org is configured to access the application in the `appSourceType` field. For example, if `appSourceType` is set to `ARTICLE_RECOMMENDATION`, this type is available only if Einstein Article Recommendations is enabled in the org and the Main Services Agreement has been accepted.

### Fields

Field Name	Field Type	Description
<code>appSourceType</code>	ApplicationSourceType (enumeration of type string)	Required. The target application for the configuration. Valid values are: <ul style="list-style-type: none"> <li>• <code>REPLY_RECOMMENDATION</code>—Einstein Reply Recommendations</li> <li>• <code>ARTICLE_RECOMMENDATION</code>—Einstein Article Recommendations</li> <li>• <code>UTTERANCE_RECOMMENDATION</code>—Einstein Bot utterances</li> <li>• <code>FAQ</code>—Einstein Bot frequently asked questions</li> </ul>
<code>name</code>	string	Required. A reference to the configuration.
<code>setupStatus</code>	ServiceAISetupDefStatus (enumeration of type string)	Required. The status of the configuration. Valid values are: <ul style="list-style-type: none"> <li>• <code>FIELDS_SELECTED</code></li> <li>• <code>TRAINING</code></li> <li>• <code>READY_TO_ACTIVATE</code></li> <li>• <code>SERVING</code></li> <li>• <code>RETIRED</code></li> <li>• <code>ARCHIVED</code></li> <li>• <code>READY_FOR_REVIEW</code></li> </ul>

Field Name	Field Type	Description
supportedLanguages	string	Required when <code>appSourceType</code> is <code>ARTICLE_RECOMMENDATION</code> . Language codes for selected and supported languages.

## Declarative Metadata Sample Definition

Here's an example of a `ServiceAISetupDefinition` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ServiceAISetupDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <appSourceType>ARTICLE_RECOMMENDATION</appSourceType>
  <name>SA1601228426202</name>
  <setupStatus>ARCHIVED</setupStatus>
  <supportedLanguages>en,de,fr,it,es,pt,nl</supportedLanguages>
</ServiceAISetupDefinition>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ServiceAISetupDefinition</name>
  </types>
</Package>
```

## Usage

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ServiceAISetupField

Represents a field on cases or knowledge articles that Einstein uses to identify relevant articles in Einstein Article Recommendations. This type extends the Metadata metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`ServiceAISetupField` components have the suffix `.serviceAiSetupField` and are stored in the `serviceAiSetupFields` folder.

## Version

`ServiceAISetupField` components are available in API version 51.0 and later.

## Special Access Rules

This type is available only if Einstein Article Recommendations is enabled in your org and the Main Services Agreement has been accepted.

## Fields

Field Name	Field Type	Description
entity	string	Required. The Case or KnowledgeArticle object for the field.
field	string	Required. The API name of the field.
fieldMappingType	ServiceAISetupFieldType (enumeration of type string)	Required. The field type. Valid values are: <ul style="list-style-type: none"> <li>• CASE_DESC</li> <li>• CASE_SUBJ</li> <li>• ARTICLE_TITLE</li> <li>• ARTICLE_CONTENT</li> <li>• ARTICLE_SUMMARY</li> </ul>
fieldPosition	int	Required. A positive number used to rank the field's importance. The value 1 is most important; higher numbers indicate less important fields. Einstein considers fields in the order of importance.
name	string	Required. A reference to the field.
setupDefinition	string	Required. A reference to the parent <a href="#">ServiceAISetupDefinition</a> .

## Declarative Metadata Sample Definition

The following is an example of a ServiceAISetupField component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ServiceAISetupField xmlns="http://soap.sforce.com/2006/04/metadata">
  <entity>Case</entity>
  <field>Subject</field>
  <fieldMappingType>CASE_SUBJ</fieldMappingType>
  <fieldPosition>1</fieldPosition>
  <name>SF16039900475920</name>
  <setupDefinition>4hQRM0000004CDK</setupDefinition>
</ServiceAISetupField>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ServiceAISetupField</name>
  </types>
</Package>
```

## Usage

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ServiceChannel

---

Represents a channel of work items that are received from your organization—for example, cases, chats, or leads.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

ServiceChannel components have the suffix `.serviceChannel` and are stored in the `serviceChannels` folder.

## Version

ServiceChannel components are available in API version 44.0 and later.

## Special Access Rules

This type is available only if Omni-Channel is enabled in your org.

## Fields

Field Name	Field Type	Description
<code>acwExtensionDuration</code>	int	The maximum length of time, measured in seconds, an agent can spend on After Conversation Work (ACW) each time they extend the timer. You must set this field if <code>hasAcwExtensionEnabled</code> is set to <code>true</code> . Specify a value from 10 through 3600. Available only for service channels of type Messaging or Voice.
<code>afterConvoMaxTime</code>	int	The maximum length of time, measured in seconds, an agent has to complete After Conversation Work (ACW). You must set this field if <code>hasAfterConvoWorkTimer</code> is set to <code>true</code> . Specify a value from 10 through 3600. Available only for service channels of type Messaging or Voice.  For service channels of type Voice, this field is available in API version 52.0 and later. For service channels of type Messaging, this field is available in API version 56.0 and later.
<code>doesMinimizeWidgetOnAccept</code>	boolean	Automatically minimizes the Omni-Channel widget when an agent accepts work. This field is available in API version 48.0 and later.
<code>hasAcwExtensionEnabled</code>	Boolean	If set to <code>true</code> , agents can extend their After Conversation Work (ACW) time. Available only if <code>hasAfterConvoWorkTimer</code> is set to <code>true</code> . If set to <code>true</code> , you must also set the <code>acwExtensionDuration</code>

Field Name	Field Type	Description
		and <code>maxExtensions</code> fields. The default value is <code>false</code> . Available only for service channels of type <code>Messaging</code> or <code>Voice</code> . This field is available in API version 56.0 and later.
<code>hasAfterConvoWorkTimer</code>	Boolean	If set to <code>true</code> , After Conversation Work (ACW) time can be configured for the channel. If set to <code>true</code> , you must also set the <code>afterConvoWorkMaxTime</code> field. The default value is <code>false</code> . Available only for service channels of type <code>Messaging</code> or <code>Voice</code> .  For service channels of type <code>Voice</code> , this field is available in API version 52.0 and later. For service channels of type <code>messaging</code> , this field is available in API version 56.0 and later.
<code>hasAutoAcceptEnabled</code>	Boolean	Work items in a service channel open automatically in the agent's workspace so that the agent doesn't have to manually accept them.
<code>interactionComponent</code>	string	The custom console component to open in the footer when an agent accepts a work item from this service channel.
<code>isInterruptible</code>	boolean	Indicates whether a work item consumes interruptible or primary capacity. The default value is <code>false</code> . Available in API version 57.0 and later when the <code>Interruptible Capacity</code> feature is enabled.
<code>label</code>	string	Required. The label of the service channel.
<code>maxExtensions</code>	picklist	The maximum number of times an agent can extend their After Work Conversation (ACW) time. Specify a value from 1 through 10. You must set this field if <code>hasAcwExtensionEnabled</code> is set to <code>true</code> . Available only for service channels of type <code>Messaging</code> or <code>Voice</code> . This field is available in API version 56.0 and later.
<code>relatedEntityType</code>	string	Required. The type of object that's associated with this service channel.
<code>secondaryRoutingPriorityField</code>	string	The name of the standard field or the ID of the custom field that is used for secondary routing priority. This field is available in API version 47.0 and later.
<code>serviceChannelFieldPriorities</code>	<a href="#">ServiceChannelFieldPriority</a>	Required. A set of mappings between secondary routing priority field values and priorities. This field is available in API version 47.0 and later.

## ServiceChannelFieldPriority

Represents a secondary routing priority field value mapping. Available in API version 47.0 and later.

Field Name	Field Type	Description
<code>priority</code>	int	Required. The priority number assigned to the mapped field value.
<code>value</code>	string	Required. The value of the <code>secondaryRoutingPriorityField</code> field defined in the parent <code>ServiceChannel</code> .

## Declarative Metadata Sample Definition

The following is an example of a ServiceChannel component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ServiceChannel xmlns="http://soap.sforce.com/2006/04/metadata">
  <doesMinimizeWidgetOnAccept>true</doesMinimizeWidgetOnAccept>
  <interactionComponent>ConsoleComponent</interactionComponent>
  <label>Case</label>
  <relatedEntityType>Case</relatedEntityType>
  <secondaryRoutingPriorityField>Status</secondaryRoutingPriorityField>
  <serviceChannelFieldPriorities>
    <priority>1</priority>
    <value>Escalated</value>
  </serviceChannelFieldPriorities>
  <serviceChannelFieldPriorities>
    <priority>2</priority>
    <value>On Hold</value>
  </serviceChannelFieldPriorities>
</ServiceChannel>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ServiceChannel</name>
  </types>
  <version>44.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ServicePresenceStatus

---

Represents a presence status that can be assigned to a service channel. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`ServicePresenceStatus` components have the suffix `.servicePresenceStatus` and are stored in the `servicePresenceStatuses` folder.

### Version

`ServicePresenceStatus` components are available in API version 44.0 and later.

## Special Access Rules

This type is available only if Omni-Channel is enabled in your org.

## Fields

Field Name	Field Type	Description
channels	<a href="#">ServiceChannelStatus</a>	Represents the status that's associated with a specific service channel.
label	string	The label of the presence status.

## ServiceChannelStatus

Represents the status that's associated with a specific service channel.

Field Name	Field Type	Description
channel	string	Represents the channels assigned to the presence status.

## Declarative Metadata Sample Definition

The following is an example of a ServicePresenceStatus component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ServicePresenceStatus xmlns="http://soap.sforce.com/2006/04/metadata">
  <channels>
    <channel>Case</channel>
  </channels>
  <label>Available for Cases</label>
</ServicePresenceStatus>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ServicePresenceStatus</name>
  </types>
  <version>44.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ServiceProcess

---

Represents a process created in Service Process Studio and its associated attributes.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

ServiceProcess components have the suffix `.serviceprocess` and are stored in the `.serviceprocess` folder.

### Version

ServiceProcess components are available in API version 57.0 and later.

### Special Access Rules

Access to the ServiceProcess type requires the `AccessToServiceProcess` permission.

### Fields

Field Name	Description
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> A meaningful explanation of the service process.</p>
<code>processLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A meaningful name for the service process.</p>
<code>serviceProcessAttributes</code>	<p><b>Field Type</b> <a href="#">ServiceProcessAttribute[]</a></p> <p><b>Description</b> Custom attributes that store the data associated with the service process.</p>
<code>serviceProcessDependencies</code>	<p><b>Field Type</b> <a href="#">ServiceProcessDependency[]</a></p>

Field Name	Description
	<p><b>Description</b></p> <p>Dependent components of the service process, such as OmniScripts or flows.</p>
serviceProcessItemGroups	<p><b>Field Type</b></p> <p><a href="#">ServiceProcessItemGroup[]</a></p> <p><b>Description</b></p> <p>Groups of related ServiceProcessAttribute records.</p>
shortDescription	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>A brief meaningful explanation of the service process.</p>
usageType	<p><b>Field Type</b></p> <p>SvcCatalogItemUsageType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>The Cloud that uses this service process.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• CustomerService</li> <li>• Employee</li> <li>• FinancialServices</li> <li>• Industry (available in version 58.0 and later)</li> </ul>

## ServiceProcessAttribute

A custom attribute that stores data associated with a service process. For example, a service process that reverses a fee can have a Fee Type attribute.

Field Name	Description
attributeType	<p><b>Field Type</b></p> <p>SvcCtlgItemAttrAttributeType (enumeration of type string)</p> <p><b>Description</b></p> <p>A <code>Base</code> attribute corresponds to a <code>SvcCatalogRequest</code> field, which is subject to field-level security. An <code>Extended</code> attribute is only a <code>ServiceProcessAttribute</code> object record, which isn't subject to field-level security.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• <code>Base</code></li> <li>• <code>Extended</code></li> </ul>

Field Name	Description
	The default is <code>Extended</code> .
<code>dataType</code>	<p><b>Field Type</b> SvcCatalogItemAttrDataType (enumeration of type string)</p> <p><b>Description</b> The data type of the attribute. Values are:</p> <ul style="list-style-type: none"> <li>• <code>Checkbox</code></li> <li>• <code>Currency</code></li> <li>• <code>Date</code></li> <li>• <code>Datetime</code></li> <li>• <code>Integer</code></li> <li>• <code>ListOfBoolean</code></li> <li>• <code>ListOfDouble</code></li> <li>• <code>ListOfInteger</code></li> <li>• <code>ListOfMaps</code></li> <li>• <code>ListOfString</code></li> <li>• <code>Map</code></li> <li>• <code>Number</code></li> <li>• <code>Percentage</code></li> <li>• <code>Text</code></li> </ul> <p>The default is <code>Text</code>.</p> <p> <b>Note:</b> Selecting <code>Currency</code> doesn't cause an error, but currency conversions aren't supported.</p>
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> A meaningful explanation of the attribute.</p>
<code>developerName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A system name for the attribute.</p>
<code>fieldIdentifier</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>For a <code>Base</code> attribute, the Developer Name of the <code>SvcCatalogRequest</code> field. This field can be standard or custom.</p>
<code>groupApiName</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The <code>apiName</code> of the <code>ServiceProcessItemGroup</code> to which this attribute belongs.</p>
<code>inputVariableValue</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The default value of the attribute.</p>
<code>isRequired</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Specifies whether the attribute is required. The default is <code>false</code>.</p>
<code>label</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>A meaningful name for the attribute.</p>
<code>parentAttribute</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The parent attribute of this attribute. For example, a <code>Latitude</code> attribute can have <code>GeoLocation</code> as a parent.</p>
<code>sortOrder</code>	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>The position of the attribute in the payload relative to other attributes having no parent or the same parent.</p>

## ServiceProcessDependency

A dependent component of the service process, which can be a flow, an OmniScript, an Integration Definition, or a preprocessor Apex class.

Field Name	Description
dependencyReference	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The Developer Name of the flow, OmniScript, Integration Definition, or preprocessor Apex class.</p>
type	<p><b>Field Type</b> SvcCatalogItemDependencyType (enumeration of type string)</p> <p><b>Description</b> Required. The type of dependent component. Values are:</p> <ul style="list-style-type: none"> <li>• FlowDefinition</li> <li>• IntegrationProviderDef</li> <li>• OmniScriptConfig</li> <li>• PreprocessorApexClass</li> </ul>

## ServiceProcessItemGroup

A group of related ServiceProcessAttribute records.

Field Name	Description
apiName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The API Name of the group.</p>
groupName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the group.</p>
sortOrder	<p><b>Field Type</b> int</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>The group display order.</p>

## Declarative Metadata Sample Definition

The following is an example of a ServiceProcess component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ServiceProcess xmlns="http://soap.sforce.com/2006/04/metadata">
  <processLabel>EmailUpdate</processLabel>
  <usageType>FinancialServices</usageType>
  <serviceProcessAttributes>
    <label>EmailAddress</label>
    <developerName>EmailAddress</developerName>
    <dataType>Text</dataType>
    <groupApiName>Info</groupApiName>
  </serviceProcessAttributes>
  <serviceProcessDependencies>
    <dependencyReference>EmailPreprocessor</dependencyReference>
    <type>PreprocessorApexClass</type>
  </serviceProcessDependencies>
  <serviceProcessItemGroups>
    <apiName>Info</apiName>
    <groupName>Info</groupName>
    <sortOrder>1</sortOrder>
  </serviceProcessItemGroups>
</ServiceProcess>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ServiceProcess</name>
  </types>
  <version>57.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Settings

---

Represents the organization settings related to a feature. For example, your password policies, session settings and network access controls are all available in the SecuritySettings component type.

Not all feature settings are available in the Metadata API. See [Unsupported Metadata Types](#) on page 157 for information on which feature settings are not available.

Settings can be accessed using the specific component member or via wildcard. For example, in the package manifest file you would use the following section to access SecuritySettings:

```
<types>
  <members>Security</members>
  <name>Settings</name>
</types>
```

The member format when used in the package manifest is the component metadata type name without the “Settings” suffix, so in the preceding example “Security” is used instead of “SecuritySettings”.

## File Suffix and Directory Location

Each settings component gets stored in a single file in the `settings` directory of the corresponding package directory. The filename uses the format `Setting feature.settings`. For example, the SecuritySettings file would be `Security.settings`. See “File Suffix and Directory Location” information for the individual settings components to determine the exact filename.

## Version

Settings is available in API version 27.0 and later. See the version information for the individual setting component to determine which API version the settings component became available.

## Declarative Metadata Sample Definition

The following is an example package manifest used to deploy or retrieve only the MobileSettings for an organization:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Mobile</members>
    <name>Settings</name>
  </types>
  <version>27.0</version>
</Package>
```

The following is an example package manifest used to deploy or retrieve all the available settings metadata for an organization, using a wildcard:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>Settings</name>
  </types>
```

```
<version>27.0</version>  
</Package>
```

### [AccountSettings](#)

Represents an org's account settings for account teams, account owner report, and the **View Hierarchy** link.

### [AccountInsightsSettings](#)

Represents an org's Einstein Account Insights settings. This setting controls features that help your reps maintain their relationships with their customers.

### [AccountIntelligenceSettings](#)

Represents an org's Account Intelligence settings. These settings control features that make it easy for sales reps to create accounts, see relevant news articles, and add logos to account records. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [AccountingSettings](#)

Represents the settings for the Accounting Subledger feature.

### [ActionsSettings](#)

Represents an org's actions settings for default quick actions, multi-dimensional publisher, and third-party actions. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ActivitiesSettings](#)

Represents an org's activity settings, and its user interface settings for the calendar. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [AddressSettings](#)

Represents the configuration of country/territory and state picklists. Use the [AddressSettings](#) component type to configure state and country/territory data in your organization so that you can convert text-based values into standard picklist values. To convert your state and country/territory values, from Setup, enter *State and Country/Territory Picklists* in the Quick Find box, then select **State and Country/Territory Picklists**.

### [AIReplyRecommendationsSettings](#)

Represents the metadata used to manage settings for Einstein Reply Recommendations. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [AgentforceForDevelopersSettings](#)

Represents Agentforce for Developers settings.

### [AnalyticsSettings](#)

Represents Analytics settings in Salesforce. CRM Analytics lets you explore all your data quickly and easily by providing AI-powered advanced Analytics right inside Salesforce. Manage your datasets, query data with Salesforce Analytics Query Language (SAQL), and customize dashboards. You can use these settings to configure which Analytics features are available to users in your organization.

### [ApexSettings](#)

Represents Apex-related org settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [AppAnalyticsSettings](#)

Represents settings to retrieve AppExchange App Analytics usage data.

### [AppExperienceSettings](#)

Represents settings for the app experience. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [AssociationEngineSettings](#)

Represents the record association builder settings for an org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [AutomatedContactsSettings](#)

Represents an org's Einstein Automated Contacts settings. These settings let you find new contacts and opportunity contact roles. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [BotSettings](#)

Represents an organization's Einstein Bot settings, such as whether or not Einstein Bots is enabled. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [BranchManagementSettings](#)

Represents the branch management settings for an org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [BusinessHoursSettings](#)

Represents the metadata used to manage settings for business hours and holidays in entitlements, entitlement templates, campaigns, and cases. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [CampaignSettings](#)

Represents an org's Campaign Influence, Einstein Attribution, Einstein Key Accounts, and campaign member settings. These features help you understand how your campaigns and accounts are affecting your opportunity pipeline. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [CaseSettings](#)

Represents an organization's case settings, such as the default case owner, which case-related features are enabled, and which Classic email templates are used for various case activities. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ChatterAnswersSettings](#)

Represents the metadata used to manage settings for Chatter Answers.

### [ChatterEmailsMDSSettings](#)

Represents an org's settings for Chatter email when Chatter is enabled. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ChatterSettings](#)

Represents an org's settings for their Chatter instance when Chatter is enabled for the org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [CodeBuilderSettings](#)

Represents Code Builder settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [CollectionsDashboardSettings](#)

Represents an org's settings to add the Collections Dashboard application to an org.

### [CommunitiesSettings](#)

Represents community settings for an org. Enable digital experiences and workspaces. Manage moderation, guest user and partner settings, and more. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [CompanySettings](#)

Represents global settings that affect multiple features in your organization. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ConnectedAppSettings](#)

Represents settings for connected apps. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ContentSettings](#)

Represents content settings for an org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ContractSettings](#)

Represents contract settings.

### [ConversationalIntelligenceSettings](#)

Represents the org's Einstein Conversation Insights settings, such as whether Einstein Conversation Insights is enabled. Einstein Conversation Insights lets you analyze your rep's call recordings, and gives you the insights you need to optimize every call.

### [ConversationChannelDefinition](#)

Represents the conversation channel definition that's implemented for Interaction Service for Bring Your Own Channel and Bring Your Own Channel for CCaaS messaging channels. This object is available in API version 60.0 and later.

### [CurrencySettings](#)

Represents an organization's currency settings, including supporting multiple currencies and currency effective dates. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [CustomAddressFieldSettings](#)

Represents the settings for custom address fields.

### [DataDotComSettings](#)

Represents the org's Data.com settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [DataImportManagementSettings](#)

Represents an org's contact and leads import settings.

### [DeploymentSettings](#)

Represents the settings affecting how deployments behave in the org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [DevHubSettings](#)

Represents Dev Hub settings.

### [DocumentGenerationSetting](#)

Represents an org's settings for automatic document generation from templates. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [DynamicFormsSettings](#)

Represents the settings related to Dynamic Forms.

### [EACSettings](#)

Represents the Einstein Activity Capture metadata type. Use Einstein Activity Capture to add emails and events from your Microsoft or Google account to the activity timeline of related Salesforce records. Automatically sync contact and event data between your Microsoft or Google account and Salesforce. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [EinsteinAgentSettings](#)

Represents settings for Einstein classification apps, Einstein Case Classification and Einstein Case Wrap-Up, in an org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [EmailAdministrationSettings](#)

Represents an organization's email administration settings, including email deliverability, security compliance, relay configurations, and system notifications. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [EmailIntegrationSettings](#)

Represents an org's settings for the Outlook integration, Gmail integration, and Salesforce Inbox. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [EmailTemplateSettings](#)

Represents an org's email template settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [EmployeeUserSettings](#)

Represents the employee-user settings used for automatically creating or syncing employee and user data in work.com orgs. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [EnhancedNotesSettings](#)

Represents an org's enhanced note settings, such as enabling enhanced notes and enabling tasks in enhanced notes. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [EncryptionKeySettings](#)

Represents an org's encryption key settings, such as customer-supplied keys options and key derivation settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [EntitlementSettings](#)

Represents an organization's entitlement settings.

### [EventSettings](#)

Represents an org's platform event settings for Event Monitoring.

### [ExperienceBundleSettings](#)

Represents the org setting that enables the ExperienceBundle metadata type for Aura sites in Experience Cloud. The setting doesn't affect LWR sites, which use ExperienceBundle by default. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ExternalClientAppSettings](#)

Represents settings to enable the External Client App feature and provide access to the OAuth consumer secret.

### [ExternalServicesSettings](#)

Represents settings for an External Services registration.

### [FieldServiceSettings](#)

Represents an organization's Field Service settings.

### [FilesConnectSettings](#)

Represents the settings that modify the Files Connect feature. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [FileUploadAndDownloadSecuritySettings](#)

Represents the security settings for uploading and downloading files. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [FlowSettings](#)

Represents the Salesforce settings for processes and flows, such as whether Lightning runtime for flows is enabled.

### [ForecastingObjectListSettings](#)

Represents an org's forecasting object list settings. Use these settings to control which object types and field types appear in the list of object details on the forecasts page. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ForecastingSettings](#)

Represents the Forecasts settings options. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [HighVelocitySalesSettings](#)

Represents an org's Sales Engagement settings. With Sales Engagement, you can make your inside sales team as effective as possible.

### [IdeasSettings](#)

Represents the metadata used to manage settings for Ideas.

[IdentityProviderSettings](#)

Represents the settings used to enable or disable Salesforce as a SAML identity provider for single sign-on (SSO).

[IframeWhiteListUrlSettings](#)

Represents settings related to the list of trusted external domains that you allow to frame your Visualforce pages or surveys. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

[IncidentMgmtSettings](#)

Represents settings for Customer Service Incident Management and Broadcast Communications.

[IndustriesEinsteinFeatureSettings](#)

Represents the settings for enabling the Industries Einstein feature.

[IndustriesLoyaltySettings](#)

Represents the settings to enable capabilities of Loyalty Management.

[IndustriesSettings](#)

Represents settings for industries verticals such as Financial Services Cloud, Consumer Goods Cloud, Public Sector Solutions, Education Cloud, Salesforce Scheduler, Life Sciences Cloud, and Health Cloud.

[InterestTaggingSettings](#)

Represents settings for Interest Tags, which your users can add to client records to capture client needs, interests, and prospecting opportunities.

[InventorySettings](#)

Represents options for the Salesforce Omnichannel Inventory product. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

[InvLatePymntRiskCalcSettings](#)

Represents the org's settings to identify the level of risks associated with payment of invoices.

[InvocableActionSettings](#)

Represents the org's invocable action settings, such as whether partial save is allowed. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

[KnowledgeSettings](#)

Represents the metadata used to manage settings for Salesforce Knowledge.

[LanguageSettings](#)

Represents an organization's language settings. Language settings control end-user language selection, locale formats, and translation options. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

[LeadConfigSettings](#)

Represents configuration settings for Leads that control how they are converted and displayed, and what actions are available. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

[LeadConvertSettings](#)

Represents an organization's custom field mappings for lead conversion. Custom fields can be mapped from Leads to Accounts, Contacts, and Opportunities. Options for creating opportunities during lead conversion can also be specified. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

[LiveAgentSettings](#)

Represents an organization's Chat settings, such as whether Chat is enabled. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [LightningExperienceSettings](#)

Represents the settings that modify an org's Lightning Experience configuration. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [LiveMessageSettings](#)

Represents an org's LiveMessage settings.

### [MacroSettings](#)

Represents an organization's Macro settings, such as whether or not folders is enabled. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [MailMergeSettings](#)

Represents the settings for Extended Mail Merge functionality.

### [MapAndLocationSettings](#)

Represents an org's map and location settings.

### [MeetingsSettings](#)

Represents the settings to enable Salesforce Meetings and the integration with Zoom video conferencing.

### [MobileSettings](#)

Represents an organization's mobile settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [MyDomainSettings](#)

Represents your org's My Domain settings. With My Domain, you can include your company name in your URLs, for example, `https://yourcompanyname.my.salesforce.com`. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [MfgServiceConsoleSettings](#)

Represents the settings to access the Service Console for Manufacturing. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [NameSettings](#)

Enables or disables the formal name, middle name, and suffix attributes for these person objects: Contact, Lead, Person Account, and User. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [NotificationsSettings](#)

Represents an organization's mobile settings.

### [OAuthOidcSettings](#)

Represents org settings for disabling OAuth OpenID Connect authorization flows.

### [ObjectHierarchyRelationship](#)

Represents an organization's custom field mappings for sales agreement conversion. Fields can be mapped from Opportunity and Quotes to SalesAgreement and SalesAgreementProduct.

### [ObjectLinkingSettings \(Beta\)](#)

Represents the channel-object linking settings for an org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [OmniChannelSettings](#)

Represents the Omni-Channel settings for an org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [OmniInteractionAccessConfig](#)

Represents configuration settings for access to OmniStudio FlexCard caching and data sources.

### [OmniInteractionConfig](#)

Represents configuration settings for OmniStudio.

### [OpportunityInsightsSettings](#)

Represents an org's Einstein Opportunity Insights settings. This setting controls features that give you relevant updates about your opportunities.

### [OpportunitySettings](#)

Represents org preferences for features such as automatic opportunity updates and similar-opportunity filters.

### [OpportunityScoreSettings](#)

Represents an org's Einstein Opportunity Scoring settings, such as whether or not Einstein Opportunity Scoring is enabled. Einstein Opportunity Scoring helps determine the likelihood of an opportunity being won. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [OrderManagementSettings](#)

Represents options for the Salesforce Order Management product. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [OrderSettings](#)

Represents order settings.

### [OrgPreferenceSettings](#)

Removed in API version 48.0. Represents the unique org preference settings in a Salesforce org.

### [OrgSettings](#)

Represents the settings for org-wide functionality that isn't associated with any specific feature. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [PartyDataModelSettings](#)

Represents an organization's party data model settings, including options around the Individual object and consent enablement. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [PardotSettings](#)

Represents Marketing Cloud Account Engagement settings in your Salesforce org. Account Engagement, formerly known as Pardot, is a B2B marketing automation solution that helps you create meaningful connections, generate more pipeline, and close more deals. Use these settings to configure how Account Engagement collects and displays data.

### [PardotEinsteinSettings](#)

Represents `PardotEinsteinSettings`. Use these settings to learn what factors drive your campaign performance, and get the best possible engagement score for your prospects. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [PathAssistantSettings](#)

Represents the Path preference setting. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [PaymentsSettings](#)

Represents the Salesforce Payments settings when this feature is enabled for the org.

### [PicklistSettings](#)

Represents an org's picklist settings. These settings control the behavior of a picklist. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [PlatformEncryptionSettings](#)

Represents an org's Platform Encryption settings, such as settings for available encryption schemes, permissions, encryption policy access, and which fields can be encrypted. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [PlatformEventSettings](#)

Represents settings for platform events and change data capture events.

### [PredictionBuilderSettings](#)

Represents the settings that determine how a user can interact with Einstein Prediction Builder. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [PrivacySettings](#)

Represents an organization's settings for data privacy and consent management. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ProcessFlowMigration](#)

Represents a process's migrated criteria and the resulting migrated flow.

### [ProductSettings](#)

Represents organization preferences for quantity schedules, revenue schedules, and active flag interaction with prices. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [QuoteSettings](#)

Represents an org's quotes settings, such as enabling quotes or creating quotes without an associated opportunity. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [RealTimeEventSettings](#)

Represents the list of Real-Time Event entities that you want to enable or disable. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [RecordPageSettings](#)

Represents an org's record page settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [RetailExecutionSettings](#)

Represents settings to manage your inventory, promotions, planograms, and in-store activities.

### [SalesAgreementSettings](#)

Represents settings that control the display of agreement terms metrics in sales agreements and the calculation of the actual quantity of products in sales agreements. These settings also control the approval of sales agreements.

### [SandboxSettings](#)

Represents Sandbox settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [SchemaSettings](#)

Represents an org's schema settings, which manage the availability of custom settings and custom metadata type values. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [SearchSettings](#)

Represents an org's search settings.

### [SecuritySettings](#)

Represents an org's security settings. For example, settings define trusted IP ranges for network access, password and login requirements, session expiration, and single sign-on settings.

### [ServiceCloudVoiceSettings](#)

Represents an organization's Service Cloud Voice settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ServiceSetupAssistantSettings](#)

Represents an organization's Service Setup Assistant settings. The Service Setup Assistant can be used to set up a basic service console app.

### [SharingSettings](#)

Represents an organization's sharing, visibility, and data access settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [SiteSettings](#)

Represents the settings for Experience Cloud sites and for [Salesforce Sites](#).

### [SocialCustomerServiceSettings](#)

Represents Social Customer Service settings such as how to format inbound content from social posts to cases. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [SocialProfileSettings](#)

Represents org preferences for social media features such as enabling Twitter and Facebook. Represents org preferences for social media features such as enabling Twitter and Facebook. This type extends the [Metadata](#) metadata type and inherits the `fullName` field.

### [SourceTrackingSettings \(Beta\)](#)

Represents settings for source tracking, so that changes you make in your Developer and Developer Pro sandboxes or local workspace can be tracked. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [SubscriptionManagementSettings](#)

Represents the settings used to manage recurring subscriptions.

### [SurveySettings](#)

Represents an org's survey settings. Use the [SurveySettings](#) component to enable Salesforce Surveys, enable Customer Lifecycle Maps, and choose whether the owner of a survey can manage the responses.

### [Territory2Settings](#)

Represents an org's Territory2 settings. Use Territory2 settings to set the access level that Territory Management 2.0 users have to records associated with sales territories, and to enable features. The standard record access settings apply to accounts and opportunities. If your Salesforce org uses *Private* default internal access for contacts or cases, you can also set access for those records. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [TrailheadSettings](#)

Represents an org's integration with Trailhead for Learning Paths or Enablement programs, including access to enablement sites (formerly myTrailhead).

### [TrialOrgSettings](#)

Represents the settings in a trial user's org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [UserEngagementSettings](#)

Represents the metadata associated with various feature settings around Lightning Experience transition and adoption, user engagement and adoption assistance, and adoption apps. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [UserInterfaceSettings](#)

Represents the settings that modify the behavior of the org's user interface.

### [UserManagementSettings](#)

Represents a selection of user management options that appear on the User Management Settings Setup page. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [VoiceSettings](#)

Represents an org's Sales Dialer settings, such as call recording, conferencing, and voicemail. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

[WarrantyLifeCycleMgmtSettings](#)

Represents settings that control the Warranty Administration for your org.

[WorkDotComSettings](#)

Represents WorkDotCom settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

[WorkforceEngagementSettings](#)

Represents settings for Workforce Engagement Management.

## AccountSettings

Represents an org's account settings for account teams, account owner report, and the **View Hierarchy** link.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

AccountSettings values are stored in the `Account.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

AccountSettings is available in API versions 29.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableAccountDiscovery</code>	boolean	When <code>true</code> , sets up Einstein Account Management dashboards and installs the related CRM Analytics and Customer Insights apps. The dashboards give users access to account health analytics including metrics on open pipeline, risk, and engagement scores.  Einstein Account Management is part of Revenue Intelligence, which is available for an additional cost.  Available in API version 57.0 and later.
<code>enableAccountHistoryTracking</code>	boolean	Indicates whether history tracking is enabled for accounts ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . If history tracking is disabled, the History related list is removed from account page layouts. However, history data is still available for reporting up to the date and time when tracking was disabled. Available in API version 47.0 and later.
<code>enableAccountInsightsInMobile</code>	boolean	Deprecated in API version 59.0 and later because the feature is no longer available. Indicates whether users can see Einstein Account Insights on their mobile device ( <code>true</code> ) or not ( <code>false</code> ). Insights appear in the Einstein Insights component, which is on account records and the Home page.

Field Name	Field Type	Description
		To use this feature, users must have the Einstein Account Insights permission. Available in API version 47.0 to 58.0.
enableAccountOwnerReport	boolean	Indicates whether the Account Owner Report can ( <code>true</code> ) or can't ( <code>false</code> ) be run by all users.
enableAccountTeams	boolean	Indicates whether account teams are enabled ( <code>true</code> ) or not ( <code>false</code> ). The Metadata API can't be used to disable account teams.
enableContactHistoryTracking	boolean	Indicates whether history tracking is enabled for contacts ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 46.0 and later.
enableRelateContactToMultipleAccounts	boolean	Indicates whether users can relate a contact to multiple accounts ( <code>true</code> ) or only one account ( <code>false</code> ). The default value is <code>false</code> . If this feature (Contacts to Multiple Accounts) is disabled, secondary contact-account relationships created while the feature was enabled are deleted. Available in API version 47.0 and later.  Avoid using the Metadata API to enable this feature. Use the Account Settings page in Setup to enable Contacts to Multiple Accounts.
enableReportsToOnPersonAccount	boolean	Indicates whether the <b>Reports To</b> field on Person Account, which corresponds to the <code>PersonReportsToId</code> field on the Account object, is enabled. The field allows users to associate person accounts and contacts with other person accounts or contacts that they report to.  Available in API version 62.0 and later.
showViewHierarchyLink	boolean	Indicates whether the default <b>View Hierarchy</b> link on all business account detail pages is visible ( <code>true</code> ) or hidden ( <code>false</code> ).

## Declarative Metadata Sample Definition

The following is an example of the Account.settings file:

```
<?xml version="1.0" encoding="UTF-8"?>
<AccountSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableAccountDiscovery>true</enableAccountDiscovery>
  <enableAccountHistoryTracking>true</enableAccountHistoryTracking>
  <enableAccountInsightsInMobile>false</enableAccountInsightsInMobile>
  <enableAccountOwnerReport>true</enableAccountOwnerReport>
  <enableAccountTeams>true</enableAccountTeams>
  <enableContactHistoryTracking>true</enableContactHistoryTracking>
  <enableRelateContactToMultipleAccounts>true</enableRelateContactToMultipleAccounts>
  <enableReportsToOnPersonAccount>true</enableReportsToOnPersonAccount>
  <showViewHierarchyLink>true</showViewHierarchyLink>
</AccountSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the Account settings metadata:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Account</members>
    <name>Settings</name>
  </types>
  <version>29.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AccountInsightsSettings

Represents an org's Einstein Account Insights settings. This setting controls features that help your reps maintain their relationships with their customers.

**Note:** This metadata type has been deprecated as of API version 59.0.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

`AccountInsightsSettings` values are stored in the `AccountInsights.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`AccountInsightsSettings` is available in API versions 48.0 to 58.0.

## Fields

Field Name	Field Type	Description
<code>enableAccountInsights</code>	boolean	Indicates whether Einstein Account Insights is enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of the AccountInsights.settings file:

```
<?xml version="1.0" encoding="UTF-8"?>
<AccountInsightsSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableAccountInsights>true</enableAccountInsights>
</AccountInsightsSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the AccountInsights settings metadata:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>AccountInsights</members>
    <name>Settings</name>
  </types>
  <version>29.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AccountIntelligenceSettings

Represents an org's Account Intelligence settings. These settings control features that make it easy for sales reps to create accounts, see relevant news articles, and add logos to account records. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

AccountIntelligenceSettings values are stored in the `AccountIntelligence.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

AccountIntelligenceSettings is available in API versions 48.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableAccountLogos</code>	boolean	Indicates whether your sales reps can see available company logos ( <code>true</code> ) or not ( <code>false</code> ). The logos are for US-based companies only. The default value is <code>false</code> .  <code>enableAutomatedAccountFields</code> must be <code>true</code> to use this setting.
<code>enableAutomatedAccountFields</code>	boolean	Indicates whether Automated Account Fields is enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>enableNewsStories</code>	boolean	Indicates whether News is enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .  <code>enableAutomatedAccountFields</code> must be <code>true</code> to use this setting.

## Declarative Metadata Sample Definition

The following is an example of the `AccountIntelligence.settings` file:

```
<?xml version="1.0" encoding="UTF-8"?>
<AccountIntelligenceSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableAccountLogos>true</enableAccountLogos>
  <enableAutomatedAccountFields>true</enableAutomatedAccountFields>
  <enableNewsStories>true</enableNewsStories>
</AccountIntelligenceSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the `AccountIntelligence` settings metadata:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>AccountIntelligence</members>
    <name>Settings</name>
  </types>
  <version>29.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AccountingSettings

Represents the settings for the Accounting Subledger feature.

### Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the “Settings” name. See [Settings](#) for more details.

### File Suffix and Directory Location

`AccountingSettings` values are stored in the `AccountingSettings.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there is only one settings file for each settings component.

### Version

AccountingSettings components are available in API version 57.0 and later.

### Fields

Field Name	Description
<code>enableAccountingSubledger</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether Transaction Journal creation is enabled for the organization (<code>true</code>) or not (<code>false</code>).</p>
<code>enableFinancePeriod</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Reserved for internal use.</p>
<code>enablePaymentMethodAdjust</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether changes to the Payment Method generate adjustments on Transaction Journal records (<code>true</code>) or not (<code>false</code>).</p>
<code>enableScheduledJob</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Reserved for internal use.</p>

Field Name	Description
enableSkipReversalLogicEnabled	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether Skip Reversal Logic is enabled (<code>true</code>) or not (<code>false</code>).</p>

## Declarative Metadata Sample Definition

The following is an example of an `AccountingSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<AccountingSettings
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableAccountingSubledger>true</enableAccountingSubledger>
  <enablePaymentMethodAdjust>true</enablePaymentMethodAdjust>
</AccountingSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Accounting</members>
    <name>Settings</name>
  </types>
  <version>57.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ActionsSettings

Represents an org's actions settings for default quick actions, multi-dimensional publisher, and third-party actions. This type extends the `Metadata` metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

`ActionsSettings` values are stored in the `Actions.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

Components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableDefaultQuickActionsOn</code>	boolean	Indicates whether default quick actions are created in the org ( <code>true</code> , the default setting) or not ( <code>false</code> ).
<code>enableMdpEnabled</code>	boolean	Indicates whether multi-dimensional publisher is enabled ( <code>true</code> , the default setting) or not ( <code>false</code> ).
<code>enableThirdPartyActions</code>	boolean	Indicates whether third-party actions are displayed in the multi-dimensional publisher ( <code>true</code> ) or not ( <code>false</code> , the default setting).
<code>enableOfflineWebLinks</code>	boolean	Indicates whether a button or link is available offline ( <code>true</code> ), or if it's only available online ( <code>false</code> , the default setting).

## Declarative Metadata Sample Definition

The following is an example of an `ActionsSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ActionsSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <DefaultQuickActionsOn>true</DefaultQuickActionsOn>
  <MdpEnabled>true</MdpEnabled>
  <ThirdPartyActions>true</ThirdPartyActions>
</ActionsSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ActivitiesSettings

Represents an org's activity settings, and its user interface settings for the calendar. This type extends the `Metadata` metadata type and inherits its `fullName` field.

Use the `ActivitiesSettings` component type to control the following activity settings:

- Configure group and recurring tasks, recurring and multiday events, and email tracking
- Relate multiple contacts to tasks and events (shared activities)
- Display custom logos in meeting requests

Also use the `ActivitiesSettings` component type to control user interface settings for the calendar, including hover links and drag-and-drop editing.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

ActivitiesSettings values are stored in the `Activities.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

ActivitiesSettings is available in API versions 28.0 and later.

## Fields

Settings for all types listed below are controlled on the Activity Settings page or the User Interface settings page as noted.

Field Name	Field Type	Description
<code>allowRelatedMultipleContactsOnEvents</code>	boolean	<p>This field indicates whether Shared Activities is enabled. When the value is true, allows users to relate multiple contacts to a task or event.</p> <p> <b>Important:</b> Beginning with API v36.0, this field is read-only in all versions of the API. You can't change the value of this field. Even though this field was updateable before Spring '16, changing this field's value wasn't supported and could have resulted in an incorrect integration. If you have code in older API versions that changes the value of this field, ensure that you update that code to prevent any errors.</p>
<code>autoRelateEventAttendees</code>	boolean	<p>When users add attendees to events, events are automatically related to up to 50 contacts or one lead. An attendee is matched by their email address to a contact or lead.</p> <p>Admins control this field on the Activity Settings page.</p> <p>Available in API version 42.0 and later.</p>
<code>enableActivityReminders</code>	boolean	<p>Enables popup activity reminders for an organization.</p> <p>Admins control this field on the Activity Settings page.</p>
<code>enableCalendarHomeLWC</code>	boolean	<p>Enables Lightning Web Components for Calendar. Increases the default item limit in Calendar Home and applies styling enhancements to improve readability.</p> <p>Admins control this field on the Activity Settings page.</p>
<code>enableClickCreateEvents</code>	boolean	<p>Lets users create events in day and weekly calendar views by double-clicking a specific time slot and entering the details of the event in an overlay. Hovering over an event displays an overlay where users can view the event details or delete the event without leaving the page. Admins use a mini page layout to configure the fields shown in the overlays. Doesn't support recurring events or multi-person events.</p> <p>Admins control this field on the User Interface settings page.</p>

Field Name	Field Type	Description
<code>enableDragAndDropScheduling</code>	boolean	Lets users create events associated with records by dragging a record from a list view onto a calendar view and entering the details of the event in an overlay. Hovering over an event displays an overlay where users can view the event details or delete the event without leaving the page. Admins use a mini page layout to configure the fields shown in the overlays. Admins control this field on the User Interface settings page.
<code>enableEmailTracking</code>	boolean	Enables tracking of outbound HTML emails if an organization uses HTML email templates. Admins control this field on the Activity Settings page.
<code>enableGroupTasks</code>	boolean	Lets users assign independent copies of a new task to multiple users. Admins control this field on the Activity Settings page.
<code>enableHideChildEventsPreference</code>	boolean	Enables hiding child events from the calendar or activity views. This setting is useful if you have complex event hierarchies and want to simplify the views by hiding less relevant details. This field is available in API version 50.0 and later. Admins control this field on the Activity Settings page.
<code>enableListViewScheduling</code>	boolean	Extends the functionality of <code>enableDragAndDropScheduling</code> and <code>enableClickCreateEvents</code> to list view calendars. Admins control this field on the User Interface settings page.
<code>enableMLSingleClientProfile</code>	boolean	Enable creating a client profile using machine learning. When this setting is enabled, Salesforce uses machine learning algorithms to analyze and consolidate client data, providing a more comprehensive client profile. This can help sales and service teams to better understand their clients and provide more personalized interactions. This field is available in API version 50.0 and later. Admins control this field on the Activity Settings page.
<code>enableMultidayEvents</code>	boolean	Enables creation of events that end more than 24 hours after they start. Admins control this field on the Activity Settings page.
<code>enableRecurringEvents</code>	boolean	Enables creation of events that repeat at specified intervals. Admins control this field on the Activity Settings page.
<code>enableRecurringTasks</code>	boolean	Enables creation of tasks that repeat at specified intervals. Admins control this field on the Activity Settings page.
<code>enableRollUpActivToContactsAcct</code>	boolean	Enables a contact's activities to be rolled up and displayed on the contact's primary account. Default value is <code>true</code> . Available in API versions 47.0 and later.

Field Name	Field Type	Description
<code>enableSidebarCalendarShortcut</code>	boolean	In the sidebar, displays a shortcut link to a user's last-used calendar view. Admins control this field on the Activity Settings page.
<code>enableSimpleTaskCreateUI</code>	boolean	Allows admins to specify whether tapping New Task in Salesforce opens a regular task record edit page or a page that displays key task fields first. Admins control this field on the Activity Settings page.
<code>enableTimelineCompDateSort</code>	boolean	Allows admins to sort past activities by completed date ( <code>true</code> ). If <code>false</code> , activities are sorted by due date. Admins control this field on the Activity Settings page.
<code>enableNSTaskDelegatedNotifications</code>	boolean	On the Activity Settings page, exposes a setting for Admins to hide or show a user setting that lets individual users enable or disable email notifications when tasks are assigned to them.
<code>enableUserListViewCalendars</code>	boolean	Allows users to create and view user list view calendars in Lightning Experience. Available in API versions 47.0 and later
<code>meetingRequestsLogo</code>	string	Available when <code>showCustomLogoMeetingRequests</code> is enabled. Uploads a custom logo. An administrator can select only a logo that has been uploaded to certain folders in the Documents tab. Admins control this field on the Activity Settings page.
<code>showCustomLogoMeetingRequests</code>	boolean	Displays a custom logo in meeting request emails and on a meeting's Web page. Invitees see the logo when a user either invites them to an event or requests a meeting. Admins control this field on the Activity Settings page.
<code>showEventDetailsMultiUserCalendar</code>	boolean	Displays event details on-screen rather than in hover text. Admins control this field on the Activity Settings page.
<code>showHomePageHoverLinksForEvents</code>	boolean	In the calendar section of the Home tab: <ul style="list-style-type: none"> <li>When a user hovers over the subject of an event, a hover link displays an overlay with selected event details. (Hover links are always available in other calendar views.)</li> <li>When a user clicks the subject of an event, displays the event detail page.</li> </ul> Admins use a mini page layout to configure the fields shown in the overlay. Admins control this field on the User Interface settings page.
<code>showMyTasksHoverLinks</code>	boolean	In the My Tasks section of the Home tab and on the calendar day view: <ul style="list-style-type: none"> <li>When a user hovers over the subject of a task, a hover link displays an overlay with selected task details.</li> <li>When a user clicks the subject of a task, displays the task detail page.</li> </ul>

Field Name	Field Type	Description
		Admins use a mini page layout to configure the fields shown in the overlay.
		Admins control this field on the User Interface settings page.

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the activity settings metadata for an organization:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Activities</members>
    <name>Settings</name>
  </types>
  <version>28.0</version>
</Package>
```

## Declarative Metadata Sample Definition

The following is an example of an activity settings file:

```
<?xml version="1.0" encoding="UTF-8"?>
<ActivitiesSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableActivityReminders>true</enableActivityReminders>
  <autoRelateEventAttendees>true</autoRelateEventAttendees>
  <enableClickCreateEvents>true</enableClickCreateEvents>
  <enableDragAndDropScheduling>true</enableDragAndDropScheduling>
  <enableEmailTracking>true</enableEmailTracking>
  <enableGroupTasks>true</enableGroupTasks>
  <enableListViewScheduling>true</enableListViewScheduling>
  <enableMultidayEvents>true</enableMultidayEvents>
  <enableRecurringEvents>true</enableRecurringEvents>
  <enableRollUpActivToContactsAcct>true</enableRollUpActivToContactsAcct>
  <enableRecurringTasks>true</enableRecurringTasks>
  <enableTimelineCompDateSort>true</enableTimelineCompDateSort>
  <enableUserListViewCalendars>true</enableUserListViewCalendars>
  <enableSidebarCalendarShortcut>true</enableSidebarCalendarShortcut>
  <meetingRequestsLogo>Folder02/logo03.png</meetingRequestsLogo>
  <showCustomLogoMeetingRequests>true</showCustomLogoMeetingRequests>
  <showEventDetailsMultiUserCalendar>true</showEventDetailsMultiUserCalendar>
  <showHomePageHoverLinksForEvents>true</showHomePageHoverLinksForEvents>
  <showMyTasksHoverLinks>true</showMyTasksHoverLinks>
</ActivitiesSettings>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Document](#)

## AddressSettings

Represents the configuration of country/territory and state picklists. Use the `AddressSettings` component type to configure state and country/territory data in your organization so that you can convert text-based values into standard picklist values. To convert your state and country/territory values, from Setup, enter *State and Country/Territory Picklists* in the Quick Find box, then select **State and Country/Territory Picklists**.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## Declarative Metadata File Suffix and Directory Location

`AddressSettings` values are stored in a single file named `Address.settings` in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`AddressSettings` is available in API versions 27.0 and later.

## CountriesAndStates

This complex metadata type represents valid definitions of states and countries/territories in picklists.

 **Note:** You can use the Metadata API to edit existing states, countries, and territories in state and country/territory picklists. You can't use the Metadata API to create or delete new states, countries, or territories.

Field	Field Type	Description
<code>countries</code>	<code>Country[]</code>	The countries and territories available in picklists.

## Country

This metadata type provides the definition for a country/territory in a picklist.

Field	Field Type	Description
<code>active</code>	boolean	Determines whether the value is available in the API.   <b>Important:</b> After you enable state and country/territory picklists in your Salesforce organization, you can't set the <code>active</code> status to <code>false</code> .
<code>integrationValue</code>	string	A customizable text value that is linked to a state or country/territory code. Integration values for standard states, countries, and territories default to the full ISO-standard state, country, and territory names. Integration values function similarly to the API names of custom fields and objects. Configuring integration values allows integrations that you set up before enabling state and country/territory picklists to continue to work.   <b>Important:</b> If you don't specify integration values before enabling state and country/territory picklists in your organization, records use the default value provided by Salesforce. If you change integration values later, records created or updated from that point on use your edited values.
<code>isoCode</code>	string	The ISO-standard code populates this field when you issue a <code>retrieve()</code> call. This field is read only in the API but you can edit the label in Setup. You can't edit the <code>isoCode</code> of standard states, countries, and territories.
<code>label</code>	string	The label is what users see in picklists in Salesforce. This field is read only in the API but you can edit the label in Setup.
<code>orgDefault</code>	boolean	Sets a country or territory as the default value for new records in the Salesforce organization.
<code>standard</code>	boolean	Standard states and countries are states and countries that are included with Salesforce. You can't edit the <code>standard</code> attribute.
<code>states</code>	State[]	The states or provinces that are part of the country or territory.
<code>visible</code>	boolean	Makes the state, country, or territory available to users in Salesforce. States, countries, or territories that are <code>visible</code> must also be <code>active</code> .

## State

This metadata type provides the definition for a state in a picklist.

Field	Field Type	Description
active	boolean	Determines whether the value is available in the API.   <b>Important:</b> After you enable state and country/territory picklists in your Salesforce organization, you can't set the <code>active</code> status to <code>false</code> .
integrationValue	string	A customizable text value that is linked to a state or country/territory code. Integration values for standard states, countries, and territories default to the full ISO-standard state, country, and territory names. Integration values function similarly to the API names of custom fields and objects. Configuring integration values allows integrations that you set up before enabling state and country/territory picklists to continue to work.   <b>Important:</b> If you don't specify integration values before enabling state and country/territory picklists in your organization, records use the default value provided by Salesforce. If you change integration values later, records created or updated from that point on use your edited values.
isoCode	string	The ISO-standard code populates this field when you issue a <code>retrieve()</code> call. This field is read only in the API but you can edit the label in Setup.
label	string	The label is what users see in picklists in Salesforce. This field is read only in the API but you can edit the label in Setup.
standard	boolean	Standard states and countries are states and countries that are included with Salesforce. You can't edit the <code>standard</code> attribute.
visible	boolean	Makes the state, country, or territory available to users in Salesforce. States, countries, or territories that are <code>visible</code> must also be <code>active</code> .

## Declarative Metadata Sample Definition

The following is sample XML that configures state and country picklists for the United States and Canada for use in an organization. It also makes the country of Greenland available only in the API. This example is supported in API version 62.0.

```
<?xml version="1.0" encoding="UTF-8"?>
<AddressSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <countriesAndStates>
    <countries>
      <country>
        <active>true</active>
        <integrationValue>United States</integrationValue>
        <isoCode>US</isoCode>
        <label>United States</label>
      </country>
    </countries>
  </countriesAndStates>
</AddressSettings>
```

```

<orgDefault>>true</orgDefault>
<standard>>true</standard>
<states>
  <state>
    <active>>true</active>
    <integrationValue>Alabama</integrationValue>
    <isoCode>AL</isoCode>
    <label>Alabama</label>
    <standard>>true</standard>
    <visible>>true</visible>
  </state>
  <state>
    <active>>true</active>
    <integrationValue>Alaska</integrationValue>
    <isoCode>AK</isoCode>
    <label>Alaska</label>
    <standard>>true</standard>
    <visible>>true</visible>
  </state>
</states>
<visible>true</visible>
</country>
<country>
  <active>true</active>
  <integrationValue>Canada</integrationValue>
  <isoCode>CA</isoCode>
  <label>Canada</label>
  <orgDefault>>false</orgDefault>
  <states>
    <state>
      <active>true</active>
      <integrationValue>Alberta</integrationValue>
      <isoCode>AB</isoCode>
      <label>Alberta</label>
      <standard>true</standard>
      <visible>true</visible>
    </state>
    <state>
      <active>true</active>
      <integrationValue>British Columbia</integrationValue>
      <isoCode>BC</isoCode>
      <label>British Columbia</label>
      <standard>true</standard>
      <visible>true</visible>
    </state>
  </states>
  <visible>true</visible>
</country>
<country>
  <active>true</active>
  <integrationValue>Greenland</integrationValue>
  <isoCode>GL</isoCode>
  <label>Greenland</label>
  <standard>true</standard>

```

```

    <visible>false</visible>
  </country>
</countries>
</countriesAndStates>
</AddressSettings>

```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AIReplyRecommendationsSettings

Represents the metadata used to manage settings for Einstein Reply Recommendations. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

Einstein Reply Recommendations settings are stored in a single file named `aireplyrecommendations.settings` in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

AIReplyRecommendationsSettings is available in API version 49.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableAIReplyRecommendations</code>	boolean	If <code>true</code> (default), Einstein Reply Recommendations is enabled. If <code>false</code> , it is disabled.
<code>enableGenReplyRecommendations</code>	boolean	If <code>true</code> (default), Einstein Service Replies is enabled. If <code>false</code> , it is disabled. Available in API version 58.0 or later.
<code>enableServiceEinsteinGPTGrounding</code>	boolean	If <code>true</code> (default), Service AI Grounding is enabled. If <code>false</code> , it is disabled. Available in API version 58.0 or later.

## Declarative Metadata Sample Definition

The following is an example `aireplyrecommendations.settings` metadata file:

```

<?xml version="1.0" encoding="UTF-8"?>
<AIReplyRecommendationsSettings xmlns="http://soap.sforce.com/2006/04/metadata">

```

```
<enableAIReplyRecommendations>true</enableAIReplyRecommendations>
</AIReplyRecommendationsSettings>
```

## Example Package Manifest

The following is an example package.xml manifest that references the AIReplyRecommendationsSettings definitions:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>AIReplyRecommendations</members>
    <name>Settings</name>
  </types>
  <version>49.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the package.xml manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Copyright

Rights of ALBERT EINSTEIN are used with permission of The Hebrew University of Jerusalem. Represented exclusively by Greenlight.

## AgentforceForDevelopersSettings

Represents Agentforce for Developers settings.

## Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all org settings metadata types are accessed using the Settings name. See [Settings](#) for more details.

## File Suffix and Directory Location

AgentforceForDevelopersSettings values are stored in the `AgentforceForDevelopers.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

AgentforceForDevelopersSettings are available in API versions 62.0 and later.

## Fields

Field Name	Field Type	Description
<code>agentforceForDevelopersOptOut</code>	boolean	Indicates whether Agentforce for Developers is enabled: <code>true</code> or <code>false</code> . If <code>true</code> , Agentforce for Developers isn't enabled in your org, which means that you've opted out of using it. If <code>false</code> , Agentforce for Developers is enabled. The default value is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of the `AgentforceForDevelopers.settings` file:

```
<?xml version="1.0" encoding="UTF-8"?>
  <AgentforceForDevelopersSettings xmlns="http://soap.sforce.com/2006/04/metadata">

    <agentforceForDevelopersOptOut>false</agentforceForDevelopersOptOut>
  </AgentforceForDevelopersSettings>
```

The following is an example `package.xml` manifest that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>AgentforceForDevelopersSettings</members>
    <name>Settings</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AnalyticsSettings

Represents Analytics settings in Salesforce. CRM Analytics lets you explore all your data quickly and easily by providing AI-powered advanced Analytics right inside Salesforce. Manage your datasets, query data with Salesforce Analytics Query Language (SAQL), and customize dashboards. You can use these settings to configure which Analytics features are available to users in your organization.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`AnalyticsSettings` values are stored in the `Analytics.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

AnalyticsSettings components are available in API version 46.0 and later.

## Special Access Rules

The AnalyticsSettings metadata type is accessible in all organizations. The fields that pertain to Reports and Dashboards are available in all organizations, but fields that pertain to CRM Analytics are only available in organizations with CRM Analytics enabled.

## Fields

Field Name	Field Type	Description
<code>alwaysGenPreviews</code>	boolean	Indicates whether Analytics asset previews are generated ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
<code>analyticsAdoptionMetadata</code>	boolean	Indicates whether Adoption Analytics metadata collection can be installed via a dataflow in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
<code>analyticsCalendarApp</code>	boolean	Indicates whether the Analytics Calendar app for Industry-dependent templates can be installed in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 49.0. Removed in API version 50.0.
<code>autoInstallApps</code>	boolean	Indicates whether CRM Analytics apps can be auto-installed in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 54.0 and later.
<code>canAccessAnalyticsViaAPI</code>	boolean	Indicates whether Analytics assets can be accessed via the Analytics REST API in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
<code>canAnnotateDashboards</code>	boolean	Indicates whether the Analytics dashboards Chatter annotation feature is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
<code>canEnableBYOMZeroDayScoring</code>	boolean	Indicates whether zero day scoring on user uploaded Einstein Discover model is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 54.0 to 56.0. Removed in API version 57.0.
<code>canEnableLiveMetrics</code>	boolean	Indicates whether the Data Discovery live model metrics calculation feature is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and 49.0. Removed in API version 50.0.
<code>canEnableSavedView</code>	boolean	Indicates whether the saved view feature for Analytics dashboards is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.

Field Name	Field Type	Description
canExploreData Con conversationally	boolean	Indicates whether Analytics data can be explored via NLQ ( <code>true</code> ) rather than using strict SAQL statements ( <code>false</code> ). For example, "Show me all accounts that are closed won". Available in API version 47.0 and later.
canShareAppsWith Communities	boolean	Indicates whether Analytics apps can be shared with Experience Builder sites and their users, outside of the standard Analytics Studio experience ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
canSubscribeDashboard Widgets	boolean	Indicates whether a user can subscribe to Analytics dashboard widgets in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 to 50.0. Removed in API version 51.0.
canViewThumbnailAssets	boolean	Indicates whether the thumbnail representations of Analytics lenses and dashboards are viewable ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
enableAmazonRedshift OutputConnector	boolean	Indicates whether the Amazon Redshift Output connector is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 58.0 and later.
enableAnalyticsEncryption	boolean	Indicates whether encryption is enabled for Analytics in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and later.
enableAnalyticsSharing Enable	boolean	Indicates whether the Analytics sharing is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and later.
enableAutoCompleteCombo	boolean	Indicates whether using auto-complete when choosing reports and dashboards is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
enableAutonomous Experience	boolean	Indicates whether Ask Salesforce for Data is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available as Beta in API version 54.0 and later.
enableAzureDLGen2Output Connector	boolean	Indicates whether the Azure DL Gen2 output connector is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 54.0 and later.
enableC360GlobalProfile Data	boolean	Indicates whether the Customer 360 data validation dashboard connector is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 or later.
enableCreateLegacy Dataflows	boolean	Indicates whether access to creating dataflows is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 55.0 and later.

Field Name	Field Type	Description
enableDashboardChangeOwnerPref	boolean	Indicates whether changing ownership of Lightning Experience dashboards from one owner to another owner is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 61.0 and later.
enableDashboardComponentSnapshot	boolean	Indicates whether posting dashboard component snapshots to feeds that are visible to all users is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
enableDashboardFlexiTable	boolean	Indicates whether access is enabled to flexible dashboard tables for all users in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
enableDashboardToPDFEnable	boolean	Indicates whether a dashboard can be exported to a PDF in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and later.
enableDataBlending	boolean	Indicates whether the Analytics Explorer data blending feature is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and 49.0. Removed in API version 50.0.
enableEmailReportsToPortalUsers	boolean	Indicates whether this org allows Classic reports and dashboards to be sent to Portal Users ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
enableFirebirdEditor	boolean	Indicates whether the Firebird editor is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and later.
enableFloatingReportHeaders	boolean	Indicates whether report results display floating headers when scrolling ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
enableInsights	boolean	Indicates whether CRM Analytics is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ).
enableInsightsHCMMode	boolean	Indicates whether CRM Analytics for Public Cloud is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 58.0 and later.
enableLightningReportBuilder	boolean	Indicates whether the Lightning Report Builder feature can be enabled or disabled on the Setup page in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
enableLotusNotesImages	boolean	Indicates whether the use of Lotus Notes-friendly images in dashboards and report emails is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.

Field Name	Field Type	Description
enableLwcInDashboards	boolean	Indicates whether Lightning Web Components are enabled for use in CRM Analytics Dashboards ( <code>true</code> ) or not ( <code>false</code> ). Available as Beta in API version 53.0. Removed for GA in API version 54.0.
enableMassEnableReportBuilder	boolean	Indicates whether the Report Builder is available in Salesforce ( <code>true</code> ), overriding profile level settings, or not ( <code>false</code> ). Available in API version 47.0 and later.
enableNewChartsEngine	boolean	Indicates whether the New Charts Engine for reports and dashboards is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
enableNullDimension	boolean	Indicates whether null values are supported as a grouping key value in a SAQL query in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and later.
enableOrgCanSeeLivePreviews	boolean	Indicates whether admins can enable live previews of data in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 57.0 and later.
enableOrgCanViewTableau	boolean	Indicates whether admins can enable Tableau dashboards in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 55.0 and later.
enableOrgCanViewThumbnailForOA	boolean	Indicates whether admins can enable thumbnails for Lightning Experience reports and dashboards in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 57.0 and later.
enableOrgHasMobileOfflineEnabled	boolean	Indicates whether admins can enable mobile offline access in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 51.0 and later.
enableOrgHasWatchlistEnabled	boolean	Indicates whether admins can turn on watchlists for assets in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 50.0 and later.
enablePowerInsights	boolean	Indicates whether admins can turn on Power Insights for this org ( <code>true</code> ) or not ( <code>false</code> ). Removed in API version 51.0.
enableQueryLiveConnectors	boolean	Indicates whether querying live connectors is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and later.
enabledRecommendedReportTypePref	boolean	Indicates whether recommended report types for Lightning Reports are available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 54.0 to 56.0. Removed in API version 57.0.

Field Name	Field Type	Description
enableRemoveFooterForRep Display	boolean	Indicates whether the default disclaimer for the report run page and printable view page is removed ( <code>true</code> ) or not ( <code>false</code> ) in Salesforce. Available in API version 47.0 and later.
enableRemoveFooterFromRep Exp	boolean	Indicates whether the default footer from the exported (csv/excel) report is removed ( <code>true</code> ) or not ( <code>false</code> ) in Salesforce. Available in API version 47.0 and later.
enableReportFieldToField Pref	boolean	Indicates whether the field-to-field filters feature in Lightning Experience Reports is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0. Removed in API version 48.0.
enableReportCrtAutoAdd Pref	boolean	Indicates whether the feature to automatically add new fields to relevant custom Lightning Experience report types when they're created is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 50.0 and 51.0. Removed in API version 52.0.
enableReportHideXlsExport Pref	boolean	Indicates whether the XLS export feature for Lightning Experience Reports is visible in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 51.0 and later.
enableReportInlineEdit Pref	boolean	Indicates whether the inline editing feature for Lightning Experience Reports is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 53.0 and later.
enableReportNotifications Enable	boolean	Indicates whether the notification feature for Lightning Experience Reports is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and later.
enableReportUniqueRow CountPref	boolean	Indicates whether the unique row count aggregate feature in Lightning Experience Reports is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0. Removed in API version 48.0.
enableRequestPriority Schdl	boolean	Indicates whether priority-based dataflow request scheduling is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 50.0 and later.
enableS1AnalyticsEclair Enable	boolean	Indicates whether EclairNG charts can be enabled for S1 Mobile Analytics in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and later.
enableS3OutputConnector	boolean	Indicates whether the S3 output data connector is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 49.0 and later.

Field Name	Field Type	Description
<code>enableSFXJoinedReports</code> Enable	boolean	Indicates whether the Lightning Experience joined report feature can be enabled or disabled on the Setup page in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
<code>enableSalesforceOutput</code> Connector	boolean	Indicates whether the Salesforce output data connector is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 51.0 and later.
<code>enableSecureImageSharing</code>	boolean	Indicates whether secure image sharing and downloading is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 50.0 and later.
<code>enableSmartDataDiscovery</code>	boolean	Indicates whether the org admin can enable Einstein Discovery in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 49.0 and 50.0. Removed in API version 51.0.
<code>enableSnowflakeOutput</code> Connector	boolean	Indicates whether the Snowflake output data connector is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 49.0 and later.
<code>enableSqlDataset</code>	boolean	Indicates whether SQL datasets are available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 52.0. Removed in API version 53.0.
<code>enableSqlLiveDataset</code>	boolean	Indicates whether SQL live datasets are available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 51.0 and 52.0. Removed in API version 53.0.
<code>enableTableauHyperOutput</code> Connector	boolean	Indicates whether the Tableau hyper output data connector is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 51.0 and later.
<code>enableUseOldChartsLookAnd</code> <code>Feel</code>	boolean	Indicates whether this org allows the old charts look and feel for Lightning Experience reports and dashboards ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
<code>enableWaveAssetsNewDate</code> <code>Version</code>	boolean	Indicates whether the new date version for timezone support in Analytics assets is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 51.0 and later.
<code>enableWaveCustomFiscal</code>	boolean	Indicates whether custom fiscal year is enabled for Analytics in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). When enabled, custom fiscal year lets admins import custom fiscal year definitions from Salesforce to Analytics. Available in API version 50.0 and later.

Field Name	Field Type	Description
enableWaveIndexMVDim	boolean	Indicates whether multi-value dimension indexing is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 50.0 and later.
enableWaveIndexMVDimV2	boolean	Indicates whether version 2 multi-value dimension indexing is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 52.0 and later.
enableWaveLwcDashboards	boolean	Indicates whether embedded Analytics dashboards are rendered in Lightning Experience using a Lightning Web Component ( <code>true</code> ) or the legacy Aura Component ( <code>false</code> ). Available in API version 55.0 and 56.0. Removed in API version 57.0.
enableWaveRecord Navigation	boolean	Indicates whether browser tab navigation for record actions from Analytics is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and later.
enableWaveReplication	boolean	Indicates whether replication (extract) for Salesforce objects is enabled in Salesforce ( <code>true</code> ) instead of SFDC Digest ( <code>false</code> ). Available in API version 47.0 and later.
enableWaveSharing Inheritance	boolean	Indicates whether Analytics data can inherit sharing and security settings for their source object in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
enableWaveSqlCFIndexing	boolean	Indicates whether indexing for custom fiscal dates in SQL queries is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 58.0 and later.
enableWaveSqlInQueryApi	boolean	Indicates whether SQL is enabled for CRM Analytics in the Query API in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available as Beta in API version 53.0. Removed for GA in API version 54.0.
enableWaveTemplate	boolean	Indicates whether Analytics templates are enabled for this org ( <code>true</code> ) or not ( <code>false</code> ). Removed in API version 51.0.
enableWaveTrendedDataset Cleanup	boolean	Indicates whether this org allows automatic deletion of inactive trended datasets ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
inheritSharingForNonOppty Objects	boolean	Indicates whether medium visibility support for Analytics sharing inheritance for all Salesforce objects besides the Opportunity object is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and 49.0. Removed in API version 50.0.

Field Name	Field Type	Description
<code>inheritSharingForOpptyObject</code>	boolean	Indicates whether medium visibility support for Analytics sharing inheritance for the Opportunity object is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and 49.0. Removed in API version 50.0.
<code>isHighVolumePushbackEnabled</code>	boolean	Indicates whether Einstein Discovery high volume push back is enabled in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 58.0 and later.
<code>maxHoursAppInProgress</code>	integer	The maximum number of hours an embedded application can have the status <code>InProgress</code> before it's canceled. Available in API version 50.0 and later.
<code>queryCachingOpt</code>	boolean	Indicates whether the option to cache query results is enabled ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 59.0 and later.
<code>recipeDirectDataPref</code>	boolean	Indicates whether the option to enable Data Prep recipe direct data loading is available ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 53.0 and later.
<code>recipeFiscalPref</code>	boolean	Indicates whether the option to enable Data Prep recipe custom fiscal settings is available ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 53.0 and later.
<code>recipePreCachingOptOut</code>	boolean	Indicates whether the option to disable Data Prep recipe prestep caching is available ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 53.0 and later.
<code>recipeStagedDataPref</code>	boolean	Indicates whether staged data for Data Prep recipes is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 53.0 and later.
<code>replaceBlankMeasuresWithNulls</code>	boolean	Indicates whether null values are supported in measures ( <code>true</code> ) or not ( <code>false</code> ). If enabled ( <code>true</code> ), the implicit default value for blank measures is null. Available in API version 48.0 and later.
<code>setWaveIsYearEndFiscalYear</code>	boolean	Indicates whether the Analytics year end is the fiscal year end ( <code>true</code> ) or not ( <code>false</code> ). This preference is only applicable when <code>enableWaveCustomFiscal</code> is <code>true</code> . If <code>false</code> , the fiscal year end is the calendar year end. Available in API version 50.0 and later.
<code>sonicEnabled</code>	boolean	Indicates whether the Sonic feature is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 51.0 and later.

Field Name	Field Type	Description
turnOnTimeZones	boolean	Indicates whether the timezone feature is available in Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and later.

## Declarative Metadata Sample Definition

The following is an example of the `Analytics.settings` file:

```
<?xml version="1.0" encoding="UTF-8"?>
<AnalyticsSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableWaveTemplate>true</enableWaveTemplate>
  <enableInsights>true</enableInsights>
  <canAccessAnalyticsViaAPI>true</canAccessAnalyticsViaAPI>
</AnalyticsSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the Analytics settings metadata:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Analytics</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ApexSettings

Represents Apex-related org settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

`ApexSettings` values are stored in the `Apex.settings` file in the `settings` directory of the corresponding package directory. The `.settings` files are different from other named components, because there's only one settings file for each settings component.

## Version

`ApexSettings` components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>DefaultQueueableDelay</code>	integer	Indicates the admin-controlled minimum delay (in seconds) that applies to all enqueued jobs that were scheduled without a delay parameter. The minimum delay is one second and the maximum is 600 seconds. The default behavior, when the setting is omitted, is no delay in scheduling enqueued jobs.
<code>enableAggregateCodeCoverageOnly</code>	boolean	Indicates whether aggregate (not detailed) totals are tracked for Apex test coverage data ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>enableApexAccessRightsPref</code>	boolean	Deprecated.
<code>enableApexApprovalLockUnlock</code>	boolean	Indicates whether approval process lock and unlock operations from Apex code are allowed ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>enableApexCtrlImplicitWithSharingPref</code>	boolean	Indicates whether the Use with sharing for <code>@AuraEnabled</code> Apex Controllers with Implicit Sharing critical update is activated ( <code>true</code> ) or not ( <code>false</code> ). For more details, see the <a href="#">Winter '20 Release Notes</a> .
<code>enableApexPropertyGetterPref</code>	boolean	Indicates whether the Enforce Access Modifiers on Apex Properties in Lightning Component Markup critical update is activated ( <code>true</code> ) or not ( <code>false</code> ). For more details, see the <a href="#">Winter '20 Release Notes</a> .
<code>enableAuraApexCtrlAuthUserAccessCheckPref</code>	boolean	Indicates whether the Restrict Access to <code>@AuraEnabled</code> Apex Methods for Authenticated Users Based on User Profile critical update is activated ( <code>true</code> ) or not ( <code>false</code> ). For more details, see the <a href="#">Winter '20 Release Notes</a> .
<code>enableAuraApexCtrlGuestUserAccessCheckPref</code>	boolean	Indicates whether the Restrict Access to <code>@AuraEnabled</code> Apex Methods for Guest and Portal Users Based on User Profile critical update is activated ( <code>true</code> ) or not ( <code>false</code> ). For more details, see the <a href="#">Winter '20 Release Notes</a> .
<code>enableCompileOnDeploy</code>	boolean	Indicates whether Apex code is automatically recompiled ( <code>true</code> ) or not ( <code>false</code> ). When set to <code>true</code> , code is recompiled before completing a metadata deployment, change set deployment, package installation, or package upgrade. For production orgs and full sandboxes, the default

Field Name	Field Type	Description
		<p>value is <code>true</code>. For all other orgs, the default value is <code>false</code>.</p> <p> <b>Note:</b> This setting can't be disabled in production orgs.</p>
<code>enableDisableParallelApexTesting</code>	boolean	<p>Indicates whether Apex tests are serially executed (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p> <p> <b>Note:</b> Even when parallel testing is enabled by setting this value to <code>false</code>, tests that are run during deployments are always run serially.</p>
<code>enableDoNotEmailDebugLog</code>	boolean	<p>Indicates whether Apex debug log details are suppressed in unhandled exception emails (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>enableGaplessTestAutoNum</code>	boolean	<p>Indicates whether autonumbering gaps are prevented by Apex test executions not incrementing autonumber fields for non-test records (<code>true</code>) or not (<code>false</code>). The default value is <code>true</code>.</p>
<code>enableMngdCtrlActionAccessPref</code>	boolean	<p>Indicates whether the Disable Access to Non-global Apex Controller Methods in Managed Packages critical update is activated (<code>true</code>) or not (<code>false</code>). For more details, see the <a href="#">Winter '20 Release Notes</a>.</p>
<code>enableNonCertifiedApexMdCrud</code>	boolean	<p>Indicates whether Apex classes can access metadata, public or protected, through classes in the <code>Metadata</code> namespace (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>enableRestrictCommunityExecAnon</code>	boolean	<p>Indicates whether guest users are restricted from executing anonymous Apex. The restriction applies regardless of whether the <code>Author Apex</code> permission is set. The default value is <code>true</code>.</p>
<code>enableSecureNoArgConstructorPref</code>	boolean	<p>Indicates whether Apex type visibility rules are strictly enforced for the <code>Type.newInstance</code> method (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>. When enabled, regardless of API version, you can instantiate only Apex classes with a no-arguments constructor that is visible to the code running <code>Type.newInstance</code>. Available in API version 48.0 and later.</p>

Field Name	Field Type	Description
<code>enableTestSetupSkipTestResults</code>	boolean	Indicates whether Apex test results are generated for <code>@TestSetup</code> methods ( <code>false</code> ) or not ( <code>true</code> ). Available in API version 61.0 and later.

## Declarative Metadata Sample Definition

The following is an example of ApexSettings components.

```
<?xml version="1.0" encoding="UTF-8"?>
<ApexSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableDoNotEmailDebugLog>true</enableDoNotEmailDebugLog>
  <enableDisableParallelApexTesting>true</enableDisableParallelApexTesting>
</ApexSettings>
```

The following is an example `package.xml` manifest that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Apex</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AppAnalyticsSettings

Represents settings to retrieve AppExchange App Analytics usage data.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

AppAnalyticsSettings values are stored in the `AppAnalytics.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

AppAnalyticsSettings is available in API versions 50.0 and later.

## Fields

Field Name	Field Type	Description
enableAppAnalyticsOptOut	boolean	Indicates whether the collection of AppExchange App Analytics package usage data from this org is disabled ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 60.0 and later. Default is <code>false</code> .
enableSimulationMode	boolean	Indicates whether AppExchange App Analytics simulation mode is enabled ( <code>true</code> ) or disabled ( <code>false</code> ). Available in API version 50.0 and later. Default is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of the AppAnalytics.settings file:

```
<?xml version="1.0" encoding="UTF-8"?>
<AppAnalyticsSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableSimulationMode>true</enableSimulationMode>
  <enableAppAnalyticsOptOut>false</enableAppAnalyticsOptOut>
</AppAnalyticsSettings>
```

## Example Package Manifest

This example package manifest deploys or retrieves AppAnalytics settings metadata.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>AppAnalytics</members>
    <name>Settings</name>
  </types>
  <version>50.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AppExperienceSettings

Represents settings for the app experience. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

AppExperienceSettings values are stored in the `.settings` file in the `settings` directory. The `.settings` files are different from other named components because there is only one settings file for each settings component.

## Version

AppExperienceSettings components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>doesHideAllAppsInAppLauncher</code>	boolean	If set to <code>false</code> (default), all standard and custom apps show up on the App Launcher. If set to <code>true</code> , the admin must select which standard and custom apps to display on the App Launcher.

## Declarative Metadata Sample Definition

The following is an example of an AppExperienceSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<AppExperienceSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <doesHideAllAppsInAppLauncher>false</doesHideAllAppsInAppLauncher>
</AppExperienceSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the AppExperienceSettings metadata for an organization:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>AppExperience</members>
    <name>Settings</name>
  </types>
<version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AssociationEngineSettings

Represents the record association builder settings for an org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the “Settings” name. See [Settings](#) for more details.

## File Suffix and Directory Location

`AssociationEngineSettings` values are stored in the `AssociationEngine.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there is only one settings file for each settings component.

## Version

`AssociationEngineSettings` components are available in API version 52.0 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
<code>enableAssociationEngine</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Automatically associates new accounts with the user’s current branch by creating branch unit customer records. The default value is <code>false</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of an `AssociationEngineSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<AssociationEngineSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableAssociationEngine>true</enableAssociationEngine>
</AssociationEngineSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>AssociationEngine</members>
    <name>Settings</name>
  </types>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AutomatedContactsSettings

Represents an org's Einstein Automated Contacts settings. These settings let you find new contacts and opportunity contact roles. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

AutomatedContactsSettings values are stored in the `AutomatedContacts.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

AutomatedContactsSettings is available in API versions 48.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableAddContactAutomatically</code>	boolean	<p>Indicates whether new contacts are automatically added from external email accounts (such as Microsoft and Google) to Salesforce (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p> <p><code>enableAddContactWithSuggestion</code> must be <code>true</code> to use this setting.</p> <p> <b>Note:</b> When this feature is enabled, users do not see new contacts as suggestions. The contacts are added automatically.</p>
<code>enableAddContactRoleAutomatically</code>	boolean	<p>Indicates whether opportunity contact roles from external accounts are automatically added to Salesforce (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p> <p> <b>Note:</b> When this feature is enabled, users do not see new contact roles as suggestions. The contact roles are added automatically.</p>
<code>enableAddContactRoleWithSuggestion</code>	boolean	<p>Indicates whether opportunity contact roles from external accounts are suggested as new Salesforce opportunity contact roles (<code>true</code>) or not (<code>false</code>). The default value is <code>true</code>.</p>

Field Name	Field Type	Description
<code>enableAddContactWithSuggestion</code>	boolean	Indicates whether new contacts from external accounts (such as Microsoft and Google) are suggested as new Salesforce contacts ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>true</code> .  <code>enableAddContactRoleWithSuggestion</code> must be <code>true</code> to use this setting.

## Declarative Metadata Sample Definition

The following is an example of the `AutomatedContactsSettings.settings` file:

```
<?xml version="1.0" encoding="UTF-8"?>
<AutomatedContactsSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableAddContactAutomatically>true</enableAddContactAutomatically>
  <enableAddContactRoleAutomatically>true</enableAddContactRoleAutomatically>
  <enableAddContactRoleWithSuggestion>true</enableAddContactRoleWithSuggestion>
  <enableAddContactWithSuggestion>true</enableAddContactWithSuggestion>
</AutomatedContactsSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the `AutomatedContacts` settings metadata:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>AutomatedContactsSettings</members>
    <name>Settings</name>
  </types>
  <version>29.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## BotSettings

Represents an organization's Einstein Bot settings, such as whether or not Einstein Bots is enabled. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

Bot components have the suffix `.bot` and are stored in the `bot` folder.

## Version

Bot components are available in API version 46.0 and later.

## Fields

Field Name	Field Type	Description
enableBots	boolean	Indicates whether Einstein Bots is enabled ( <code>true</code> ) or not ( <code>false</code> ).

## Declarative Metadata Sample Definition

The following is an example of a BotSetting. This example has been trimmed to make it easier to read.

```
<?xml version="1.0" encoding="UTF-8"?>
<BotSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableBots>true</enableBots>
</BotSettings>
```

The following is an example `package.xml` manifest that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Bot</members>
    <name>Settings</name>
  </types>
  <version>46.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## BranchManagementSettings

Represents the branch management settings for an org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See [Settings](#) for more details.

## File Suffix and Directory Location

`BranchManagementSettings` values are stored in the `BranchManagement.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there is only one settings file for each settings component.

## Version

`BranchManagementSettings` components are available in API version 51.0 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
<code>associateAccountWithBranch</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Automatically associates new accounts with the user's current branch by creating branch unit customer records. The default value is <code>false</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of a `BranchManagementSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<BranchManagementSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <associateAccountWithBranch>true</associateAccountWithBranch>
</BranchManagementSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>BranchManagement</members>
    <name>Settings</name>
  </types>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## BusinessHoursSettings

Represents the metadata used to manage settings for business hours and holidays in entitlements, entitlement templates, campaigns, and cases. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

### File Suffix and Directory Location

Business hours and holidays settings are stored in a single file named `businessHours.settings` in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

### Version

BusinessHoursSettings is available in API version 29.0 and later.

### Fields

Field Name	Field Type	Description
<code>businessHours</code>	<a href="#">BusinessHoursEntry[]</a>	Represents the application of business hours to entitlements, entitlement templates, campaigns, and cases.
<code>holidays</code>	<a href="#">Holidays[]</a>	Represents a holiday and its usage in <code>businessHours</code> .

### BusinessHoursEntry

Represents the application of business hours to entitlements, entitlement templates, campaigns, and cases.

Field Name	Field Type	Description
<code>timeZoneId</code>	string	The time zone for the time that defines business hours.
<code>name</code>	string	Name of the business hours. This name should be unique.
<code>active</code>	string	Indicates whether the business hours are active.
<code>default</code>	string	Indicates whether the business hours are used as the default business hours.
<code>mondayStartTime</code>	string	Start time for the business hours on Monday. Uses the format <code>HH:mm:ss.SSSZ</code> .
<code>mondayEndTime</code>	string	End time for the business hours on Monday. Uses the format <code>HH:mm:ss.SSSZ</code> . The value <code>00:00:00.000Z</code> specifies midnight on Monday.
<code>tuesdayStartTime</code>	string	Start time for the business hours on Tuesday. Uses the format <code>HH:mm:ss.SSSZ</code> .

Field Name	Field Type	Description
tuesdayEndTime	string	End time for the business hours on Tuesday. Uses the format HH:mm:ss.SSSZ. The value 00:00:00.000Z specifies midnight on Tuesday.
wednesdayStartTime	string	Start time for the business hours on Wednesday. Uses the format HH:mm:ss.SSSZ.
wednesdayEndTime	string	End time for the business hours on Wednesday. Uses the format HH:mm:ss.SSSZ. The value 00:00:00.000Z specifies midnight on Wednesday.
thursdayStartTime	string	Start time for the business hours on Thursday. Uses the format HH:mm:ss.SSSZ.
thursdayEndTime	string	End time for the business hours on Thursday. Uses the format HH:mm:ss.SSSZ. The value 00:00:00.000Z specifies midnight on Thursday.
fridayStartTime	string	Start time for the business hours on Friday. Uses the format HH:mm:ss.SSSZ.
fridayEndTime	string	End time for the business hours on Friday. Uses the format HH:mm:ss.SSSZ. The value 00:00:00.000Z specifies midnight on Friday.
saturdayStartTime	string	Start time for the business hours on Saturday. Uses the format HH:mm:ss.SSSZ.
saturdayEndTime	string	End time for the business hours on Saturday. Uses the format HH:mm:ss.SSSZ. The value 00:00:00.000Z specifies midnight on Saturday.
sundayStartTime	string	Start time for the business hours on Sunday. Uses the format HH:mm:ss.SSSZ.
sundayEndTime	string	End time for the business hours on Sunday. Uses the format HH:mm:ss.SSSZ. The value 00:00:00.000Z specifies midnight on Sunday.

## Holidays

Represents a holiday and its usage in `businessHours`.

Field Name	Field Type	Description
name	string	Name of the holiday. This name does not have to be unique.
description	string	The description of the holiday.
isRecurring	string	Indicates whether the holiday is recurring.

Field Name	Field Type	Description
activityDate	string	The date of the holiday. Use for non-recurring holidays. Uses the format HH:mm:ss.SSSZ.
recurrenceStartDate	string	The date the holiday starts recurring. Uses the format yyyy-mm-dd.
recurrenceEndDate	string	The date the holiday stops recurring. Uses the format yyyy-mm-dd. Optional.
startTime	string	The start time on the date of the holiday. Uses the format HH:mm:ss.SSSZ. startTime and endTime must be both null or both not null. If they are both null, indicates the whole day.
endTime	string	The end time on the date of the holiday. Uses the format HH:mm:ss.SSSZ. startTime and endTime must be both null or both not null. If they are both null, indicates the whole day.
recurrenceType	string	The recurrence type of the holiday. Valid values are: RecursDaily, RecursEveryWeekday, RecursMonthly, RecursMonthlyNth, RecursWeekly, RecursYearly, RecursYealyNth.
recurrenceInterval	string	The interval of weeks, months, or years the holiday recurs.
recurrenceDayOfWeek	string	The day of week the holiday recurs. Valid values: Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday.
recurrenceDayOfMonth	string	The day of month the holiday recurs. Valid values: integers 1-31.
recurrenceInstance	string	Valid values: First, Second, Third, Fourth, Last. Only used for recurrenceType RecursMonthlyNth and RecursYearlyNth. For example, if the recurrenceInstance value is First, the holiday recurs on the first Monday of the month every 3 months.
recurrenceMonthOfYear	string	Valid values: January, February, March, April, May, June, July, August, September, October, November, December.
businessHours	string	The name of the business hours setting that applies to this holiday.

## Declarative Metadata Sample Definition

The following is an example `businesshours.settings` metadata file:

```
<?xml version="1.0" encoding="UTF-8"?>
<BusinessHoursSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <businessHours>
    <active>true</active>
    <default>true</default>
    <fridayEndTime>00:00:00.000Z</fridayEndTime>
    <fridayStartTime>00:00:00.000Z</fridayStartTime>
    <mondayEndTime>00:00:00.000Z</mondayEndTime>
    <mondayStartTime>00:00:00.000Z</mondayStartTime>
    <name>Default</name>
    <saturdayEndTime>00:00:00.000Z</saturdayEndTime>
    <saturdayStartTime>00:00:00.000Z</saturdayStartTime>
  </businessHours>
</BusinessHoursSettings>
```

```

    <sundayEndTime>00:00:00.000Z</sundayEndTime>
    <sundayStartTime>00:00:00.000Z</sundayStartTime>
    <thursdayEndTime>00:00:00.000Z</thursdayEndTime>
    <thursdayStartTime>00:00:00.000Z</thursdayStartTime>
    <timeZoneId>America/Los_Angeles</timeZoneId>
    <tuesdayEndTime>00:00:00.000Z</tuesdayEndTime>
    <tuesdayStartTime>00:00:00.000Z</tuesdayStartTime>
    <wednesdayEndTime>00:00:00.000Z</wednesdayEndTime>
    <wednesdayStartTime>00:00:00.000Z</wednesdayStartTime>
  </businessHours>
  <businessHours>
    <active>true</active>
    <default>false</default>
    <fridayEndTime>00:00:00.000Z</fridayEndTime>
    <fridayStartTime>00:00:00.000Z</fridayStartTime>
    <mondayEndTime>15:00:00.000Z</mondayEndTime>
    <mondayStartTime>09:00:00.000Z</mondayStartTime>
    <name>bh1</name>
    <saturdayEndTime>00:00:00.000Z</saturdayEndTime>
    <saturdayStartTime>00:00:00.000Z</saturdayStartTime>
    <sundayEndTime>00:00:00.000Z</sundayEndTime>
    <sundayStartTime>00:00:00.000Z</sundayStartTime>
    <thursdayEndTime>17:00:00.000Z</thursdayEndTime>
    <thursdayStartTime>10:50:00.000Z</thursdayStartTime>
    <timeZoneId>America/Los_Angeles</timeZoneId>
    <tuesdayEndTime>13:00:00.000Z</tuesdayEndTime>
    <tuesdayStartTime>09:00:00.000Z</tuesdayStartTime>
    <wednesdayEndTime>15:00:00.000Z</wednesdayEndTime>
    <wednesdayStartTime>09:00:00.000Z</wednesdayStartTime>
  </businessHours>
  <holidays>
    <activityDate>2013-09-02</activityDate>
    <businessHours>Default</businessHours>
    <businessHours>bh1</businessHours>
    <isRecurring>false</isRecurring>
    <name>Labor Day</name>
  </holidays>
  <holidays>
    <businessHours>bh1</businessHours>
    <isRecurring>true</isRecurring>
    <name>Thanksgiving</name>
    <recurrenceDayOfMonth>21</recurrenceDayOfMonth>
    <recurrenceMonthOfYear>November</recurrenceMonthOfYear>
    <recurrenceStartDate>2013-11-21</recurrenceStartDate>
    <recurrenceType>RecursYearly</recurrenceType>
  </holidays>
</BusinessHoursSettings>

```

The following is an example package.xml manifest that references the BusinessHoursSettings definitions:

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>BusinessHours</members>
    <name>Settings</name>
  </types>
</Package>

```

```

</types>
<version>29.0</version>
</Package>

```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CampaignSettings

Represents an org's Campaign Influence, Einstein Attribution, Einstein Key Accounts, and campaign member settings. These features help you understand how your campaigns and accounts are affecting your opportunity pipeline. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

CampaignSettings values are stored in the `Campaign.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

CampaignSettings is available in API versions 48.0 and later.

## Fields

Field Name	Field Type	Description
<code>aiAttributionTimeframe</code>	<code>int</code>	Indicates the number of months between the opportunity creation date and an engagement activity, during which Einstein scans for influential campaigns. The value must be a multiple of three, up to 24. Available in API version 49.0 and later.  This field supports Einstein Attribution.
<code>enableAIAttribution</code>	<code>boolean</code>	Indicates whether the Einstein Attribution feature is enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . Available in API version 49.0 and later.
<code>enableAccountsAsCM</code>	<code>boolean</code>	Indicates whether accounts can be used as campaign members ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . Available in API version 51.0 and later.
<code>enableAutoCampInfluenceDisabled</code>	<code>boolean</code>	Indicates whether Salesforce creates Campaign Influence information ( <code>true</code> ) or not ( <code>false</code> ). <code>enableCampaignInfluence2</code> must be <code>false</code> to use this setting.  The default value is <code>false</code> .

Field Name	Field Type	Description
enableB2bmaCampaignInfluence2	boolean	Indicates whether your org can access campaign influence models from other systems, such as Pardot ( <code>true</code> ) or not ( <code>false</code> ). enableCampaignInfluence2 must be <code>true</code> to use this setting. The default value is <code>false</code> .
enableCampaignHistoryTrackEnabled	boolean	This read-only field is reserved for system use.
enableCampaignInfluence2	boolean	Indicates whether Customizable Campaign Influence is enabled ( <code>true</code> ) or not ( <code>false</code> ). When <code>true</code> , Campaign Influence 1.0 is hidden from users and is no longer active. The default value is <code>true</code> .
enableCampaignMemberTWCF	boolean	This read-only field is reserved for system use.
enableEKAI	boolean	Indicates whether Einstein Key Accounts Identification is enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . Available in API version 53.0 and later.
enableSuppressNoValueCI2	boolean	This read-only field is reserved for system use.

## Declarative Metadata Sample Definition

The following is an example of the Campaign.settings file:

```
<?xml version="1.0" encoding="UTF-8"?>
<CampaignSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableCampaignInfluence2>true</enableCampaignInfluence2>
  <enableSuppressNoValueCI2>true</enableSuppressNoValueCI2>
  <enableCampaignHistoryTrackEnabled>true</enableCampaignHistoryTrackEnabled>
  <enableAutoCampInfluenceDisabled>true</enableAutoCampInfluenceDisabled>
  <enableCampaignMemberTWCF>true</enableCampaignMemberTWCF>
  <enableB2bmaCampaignInfluence2>true</enableB2bmaCampaignInfluence2>
  <enableAccountsAsCM>true</enableAccountsAsCM>
  <enableAIAttribution>true</enableAIAttribution>
  <aiAttributionTimeframe>9</aiAttributionTimeframe>
  <enableEKAI>true</enableEKAI>
</CampaignSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the Campaign settings metadata:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Campaign</members>
    <name>Settings</name>
  </types>
  <version>29.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CaseSettings

Represents an organization's case settings, such as the default case owner, which case-related features are enabled, and which Classic email templates are used for various case activities. This type extends the Metadata metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

[CaseSettings](#) on page 1712 values are stored in the `Case.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

[CaseSettings](#) on page 1712 is available in API version 27.0 and later.

## Fields

Field Name	Field Type	Description
<code>caseAssignNotificationTemplate</code>	string	Specifies the email template used for case assignment notifications. The format must be <code>folderName/emailTemplateName</code> .  Lightning email templates aren't packageable. We recommend using a Classic email template.
<code>caseAutoProcUser</code>	boolean	Indicates whether to create an automated response record after a customer's initial email ( <code>true</code> ) or not ( <code>false</code> ).
<code>caseCloseNotificationTemplate</code>	string	Specifies the email template used for case close notifications. The format must be <code>folderName/emailTemplateName</code> .  Lightning email templates aren't packageable. We recommend using a Classic email template.
<code>caseCommentNotificationTemplate</code>	string	Specifies the email template used for case comment notifications. The format must be <code>folderName/emailTemplateName</code> .  Lightning email templates aren't packageable. We recommend using a Classic email template.

Field Name	Field Type	Description
caseCreateNotificationTemplate	string	Specifies the email template used for case create notifications. The format must be <code>folderName/emailTemplateName</code> .  Lightning email templates aren't packageable. We recommend using a Classic email template.
caseFeedItemSettings	<a href="#">FeedItemSettings[]</a>	Specifies the settings for feed items in feed-based case page layouts. This field is available in API version 32.0 and later.
caseFeedReadUnreadLtng	boolean	Indicates whether unread feed items are shown in bold in Lightning Experience ( <code>true</code> ) or not ( <code>false</code> ).
caseMergeInLightning	boolean	Indicates whether Case Merge is enabled in Lightning Experience ( <code>true</code> ) or not ( <code>false</code> ).
closeCaseThroughStatusChange	boolean	Indicates whether <code>Closed</code> is included in the Case Status field on case edit pages ( <code>true</code> ) or not ( <code>false</code> ).
defaultCaseFeedLayoutOn	boolean	Indicates whether the default Case Feed layout is used in the org ( <code>true</code> ) or not ( <code>false</code> ).
defaultCaseOwner	string	Specifies the default owner of a case when assignment rules fail to locate an owner.
defaultCaseOwnerType	string	Specifies whether the default case owner is a user or a queue.
defaultCaseUser	string	Specifies the user listed in the Case History related list for automated case changes from: <ul style="list-style-type: none"> <li>• Assignment rules</li> <li>• Escalation rules</li> <li>• On-Demand Email-to-Case</li> <li>• Cases logged in the Self-Service portal</li> </ul> Lightning email templates aren't packageable. We recommend using a Classic email template.
emailActionDefaultsHandlerClass	string	Use this Apex class name to provide default values for the email action.
emailToCase	<a href="#">EmailToCaseSettings</a>	The organization's Email-to-Case settings.
enableCaseFeed	boolean	Indicates whether Case Feed is enabled ( <code>true</code> ) or not ( <code>false</code> ).
enableCollapseEmailThread	boolean	Indicates whether earlier messages in an email thread are removed from email feed items ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
enableDraftEmails	boolean	Indicates whether draft emails are enabled ( <code>true</code> ) or not ( <code>false</code> ). Enabling email drafts requires that Case Feed and Email-to-Case are also enabled.

Field Name	Field Type	Description
enableEarlyEscalationRuleTriggers	boolean	Indicates whether early triggers on escalation rules are enabled ( <code>true</code> ) or not ( <code>false</code> ).
enableEmailActionDefaultsHandler	boolean	Indicates whether the Email Action Default Handler setting is enabled ( <code>true</code> ) or not ( <code>false</code> ). Use this setting to select an Apex class to load a default template or to specify the default target fields for the email action.
enableEmailContactOnCasePost	boolean	If <code>true</code> , the case contact is notified by email when someone makes an externally visible post on a case in an Experience Builder site.
enableEscalateQfiToCaseInternal	boolean	If <code>true</code> , moderators can create cases from Question feed items in Chatter in your organization.
enableEscalateQfiToCaseNetworks	boolean	If <code>true</code> , moderators can create cases from Question feed items in Chatter in all Experience Builder sites where Chatter Questions is enabled.
enableExtNetworksCaseFeedEnabled	boolean	If <code>true</code> , site members can see case-related emails, comments, and updates in the case feed.
enableMultiLangSolnSrchCSS	boolean	Indicates whether multilingual searching for Solutions in self-service portals is enabled ( <code>true</code> ) or not ( <code>false</code> ).
enableMultiLangSolnSrchPKB	boolean	Indicates whether multilingual searching for public Solutions is enabled ( <code>true</code> ) or not ( <code>false</code> ).
enableMultiLangSolution	boolean	Indicates whether multilingual Solutions are enabled ( <code>true</code> ) or not ( <code>false</code> ).
enableNewEmailDefaultTemplate	boolean	Indicates whether default email templates are enabled ( <code>true</code> ) or not ( <code>false</code> ). Default email templates are available only if draft emails are enabled.  Lightning email templates aren't packageable. We recommend using a Classic email template.
enableSolutionCategory	boolean	Indicates whether browsing for Solutions is enabled ( <code>true</code> ) or not ( <code>false</code> ).
enableSolutionInlineCategory	boolean	Indicates whether using inline Solutions category breadcrumbs is enabled ( <code>true</code> ) or not ( <code>false</code> ).
enableSolutionShortSummary	boolean	Indicates whether Solutions summaries are enabled ( <code>true</code> ) or not ( <code>false</code> ).
enableSuggestedArticlesApplication	boolean	Indicates whether the Suggested Articles list appears on case pages. ( <code>true</code> ) or not ( <code>false</code> ). Is only valid if <code>enableSuggestedSolutions=false</code> .

Field Name	Field Type	Description
<code>enableSuggestedArticlesCustomerPortal</code>	boolean	Indicates whether the Suggested Articles list appears on customer portal pages ( <code>true</code> ) or not ( <code>false</code> ). Is only valid if <code>enableSuggestedSolutions=false</code> .
<code>enableSuggestedArticlesPartnerPortal</code>	boolean	Indicates whether the Suggested Articles list appears on partner portal pages ( <code>true</code> ) or not ( <code>false</code> ). Is only valid if <code>enableSuggestedSolutions=false</code> .
<code>enableSuggestedSolutions</code>	boolean	Indicates whether the View Suggested Solutions or Find Articles button appears on case detail pages ( <code>true</code> ) or not ( <code>false</code> ). Is only valid if <code>enableSuggestedArticlesApplication</code> , <code>enableSuggestedArticlesCustomerPortal</code> , and <code>enableSuggestedArticlesPartnerPortal=false</code> .
<code>escalateCaseBefore</code>	boolean	Indicates whether early triggers are enabled to escalate a case ( <code>true</code> ) or not ( <code>false</code> ).
<code>genericMessageEnabled</code>	boolean	Indicates whether generic messages are enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>keepCaseMergeRecords</code>	boolean	If <code>true</code> , duplicate cases aren't deleted after a case merge.
<code>keepRecordTypeOnAssignmentRule</code>	boolean	When applying assignment rules to manually created records, indicates whether to keep the existing record type ( <code>true</code> ) or to override the existing record type with the assignee's default record type ( <code>false</code> ).
<code>newEmailDefaultTemplateClass</code>	string	Specifies the Apex class that defines the default email template for new email messages in Case Feed. This field appears only when <code>enableNewEmailDefaultTemplate=true</code> . Lightning email templates aren't packageable. We recommend using a Classic email template.
<code>notifyContactOnCaseComment</code>	boolean	Indicates whether contacts who aren't members of your Self-Service portal can be notified when a new comment is added to a case ( <code>true</code> ) or not ( <code>false</code> ).
<code>notifyDefaultCaseOwner</code>	boolean	Indicates whether the default case owner is notified when assigned a new case ( <code>true</code> ) or not ( <code>false</code> ).
<code>notifyOwnerOnCaseComment</code>	boolean	Indicates whether the case owner is notified when a comment is added to a case ( <code>true</code> ) or not ( <code>false</code> ).
<code>notifyOwnerOnCaseOwnerChange</code>	boolean	Indicates whether the Send Notification Email checkbox on cases is automatically selected when users change a case owner to another user ( <code>true</code> ).
<code>predictiveSupportEnabled</code>	boolean	Indicates whether predictive support is enabled ( <code>true</code> ) or not ( <code>false</code> ).

Field Name	Field Type	Description
showEmailAttachmentsInCaseAttachmentsRL	boolean	Indicates whether the case Attachments related list shows email attachments. If <code>true</code> , the page displays an email icon next to each attachment from an email in the Attachments related list for cases. The related list's list view also includes a Source column that identifies the attachment's origin. If <code>false</code> , email attachments aren't displayed in the Attachments related list for cases.  This field is available in API version 40.0 and later.
showFewerCloseActions	boolean	Indicates whether the <b>Save &amp; Close</b> button on case edit pages and the <b>Cls</b> link on Cases related lists are hidden ( <code>true</code> ) or shown ( <code>false</code> ).
systemUserEmail	string	Specifies the email address used when the default case user is the system user.
useSystemEmailAddress	boolean	Indicates whom case comment, case attachment, and case assignment email notifications appear to be sent from. Use <code>true</code> to show notifications as sent from a system address. Use <code>false</code> to show notifications as sent from the user or contact who is updating the case.
useSystemUserAsDefaultCaseUser	boolean	Indicates whether the system user is used as the automated case user ( <code>true</code> ) or not ( <code>false</code> ). If false, then you must specify a value for the <code>defaultCaseUser</code> field.
visibleInCssCheckbox	boolean	Sets the default visibility of a case as indicated by the Visible in CSS option on the case edit page. If <code>false</code> , the case is visible in CSS by default. If <code>true</code> , CSS visibility is off.
webToCase	<a href="#">WebToCaseSettings</a>	The organization's Web-to-Case settings.

## EmailToCaseSettings

Represents an organization's Email-to-Case settings.

### Fields

Field Name	Field Type	Description
enableEmailToCase	boolean	Indicates whether Email-to-Case is enabled ( <code>true</code> ) or not ( <code>false</code> ). <b>Note:</b> After Email-to-Case is enabled, it can't be disabled.
enableE2CAttachmentAsFile	boolean	Indicates whether to save attachments sent using Email-to-Case as Salesforce Files ( <code>true</code> ) or not ( <code>false</code> ).
enableE2CDuplicateAttachments	boolean	When Email-to-Case receives an inbound email to thread to an existing case, attachments in the email that already exist

Field Name	Field Type	Description
		on the case are not saved as new records and are instead linked to the new email ( <code>true</code> ).
<code>enableE2CExternalServer</code>	boolean	Indicates whether emails can be sent via an external service such as Gmail or Outlook, rather than the Salesforce email service ( <code>true</code> ). External outbound email services are available in Lightning Experience only.
<code>enableE2CSourceTracking</code>	boolean	Indicates whether Set Case Source to Email is enabled ( <code>true</code> ) or not ( <code>false</code> ). After you enable this setting, the <b>Case Source</b> field is updated to <code>Email</code> for all cases that originate from Email-to-Case. Associated emails are marked as <code>Read</code> when the agent opens the case.
<code>enableHtmlEmail</code>	boolean	Indicates whether HTML email is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableNewtoReadTriggers</code>	boolean	Indicates whether the email status change invokes triggers when emails open in Case feeds or from Email Message records in Lightning ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableOnDemandEmailToCase</code>	boolean	Indicates whether On-Demand Email-to-Case is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableThreadIDInBody</code>	boolean	Indicates whether the Thread ID for a case is inserted in the body of an email ( <code>true</code> ) or not ( <code>false</code> ). This is applicable only to orgs that do not use Lightning Threading.
<code>enableThreadIDInSubject</code>	boolean	Indicates whether the Thread ID for a case is inserted in the subject line of an email ( <code>true</code> ) or not ( <code>false</code> ). This is applicable only to orgs that do not use Lightning Threading.
<code>enableThreadTokenInBody</code>	boolean	Indicates whether a threading token is appended in the email body when agents send an email from a Lightning email composer ( <code>true</code> ) or not ( <code>false</code> ). This is applicable only to orgs using Lightning Threading.
<code>enableThreadTokenInSubject</code>	boolean	Indicates whether a threading token is appended in the email subject when agents send an email from a Lightning email composer ( <code>true</code> ) or not ( <code>false</code> ). This is applicable only to orgs using Lightning Threading.
<code>notifyOwnerOnNewCaseEmail</code>	boolean	Indicates whether the owner of a case receives a notification when a new email related to the case is received ( <code>true</code> ) or not ( <code>false</code> ).
<code>overEmailLimitAction</code>	EmailToCaseOnFailureActionType (enumeration of type string)	Specifies what happens to email messages that are received after an organization exceeds its daily Email-to-Case limits. Valid values are: <ul style="list-style-type: none"> <li>• <code>Bounce</code></li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>Discard</li> <li>Requeue</li> </ul>
preQuoteSignature	boolean	Indicates whether the user signature is inserted after the reply but before the email thread in an outbound email ( <code>true</code> ) or at the end of the email ( <code>false</code> ).
routingAddresses	<a href="#">EmailToCaseRoutingAddress</a> []	The organization's Email-to-Case routing address settings.
replyWithNewContentOnly	boolean	Indicates whether previous thread content is excluded from replies, to reduce the size of outgoing emails ( <code>true</code> ) or not ( <code>false</code> ).
showGeneratedEmailCheckbox	boolean	Indicates whether senders are required to confirm that they reviewed emails written by Einstein ( <code>true</code> ) or not ( <code>false</code> ).
unauthorizedSenderAction	<a href="#">EmailToCaseOnFailureActionType</a> (enumeration of type string)	Specifies what happens to email messages received from invalid senders. Valid values are: <ul style="list-style-type: none"> <li>Bounce</li> <li>Discard</li> </ul>
useEmailHeadersForThreading	boolean	Indicates whether metadata from incoming emails is used to match replies with cases if token-based threading doesn't produce a match ( <code>true</code> ) or not ( <code>false</code> ).

## EmailToCaseRoutingAddress

Represents an organization's Email-to-Case routing address.

### Fields

Field Name	Field Type	Description
addressType	<a href="#">EmailToCaseRoutingAddressType</a> (enumeration of type string)	Specifies the type of Email-to-Case routing address. Valid values are: <ul style="list-style-type: none"> <li><code>EmailToCase</code>—A routing address used with Email-to-Case or On-Demand Email-to-Case.</li> <li><code>Outlook</code>—A routing address used with Salesforce for Outlook to create cases from Outlook. Requires that On-Demand Email-to-Case is enabled.</li> </ul>
authorizedSenders	string	Specifies the email addresses or domains from which On-Demand Email-to-Case can receive email. Include multiple entries in a comma-separated list.
caseOrigin	string	Specifies the default case origin for cases created through this routing address.

Field Name	Field Type	Description
<code>caseOwner</code>	string	Specifies the default owner of cases created through this routing address. The case owner can be either a user or a queue. Specify the case owner using a Salesforce username. Specifying a case owner here in the routing address sets a value of <code>defaultCaseOwner</code> in <code>CaseSettings</code> .
<code>caseOwnerType</code>	string	Specifies whether the default case owner is a user or a queue.
<code>casePriority</code>	string	Specifies the default case priority for cases created through this routing address.
<code>createTask</code>	boolean	Indicates whether a task is automatically assigned to the case owner when a case is created through an email ( <code>true</code> ) or not ( <code>false</code> ).
<code>emailAddress</code>	string	Specifies the email address used to route email messages that are submitted as cases.
<code>emailServicesAddress</code>	string	Specifies the Salesforce-generated routing address used for setting up Email-to-Case forwarding. This field value is read-only and can't be modified.
<code>fallbackQueue</code>	string	Defines which queue to use when emails can't be routed with the specified Omni-Channel flow. This queue must use <code>Case</code> as the service channel object. Available in API version 56.0 and later.
<code>isPermsetControlled</code>	boolean	Indicates whether users' access to the email routing address is controlled by a permission set. If <code>true</code> , only users with access via a permission set can use the routing address to send emails.
<code>isVerified</code>	boolean	Indicates whether the customer has verified the routing address (typically by clicking a confirmation email). This field value is read-only and can't be modified.
<code>routingFlow</code>	string	Specifies the name of an Omni-Channel flow that routes cases generated in Email-to-Case. Available in API version 56.0 and later.
<code>routingName</code>	string	Specifies the name of the Email-to-Case routing address.
<code>saveEmailHeaders</code>	boolean	Indicates whether email routing and envelope information are saved ( <code>true</code> ) or not ( <code>false</code> ).
<code>taskStatus</code>	string	Specifies the default status on tasks automatically assigned to the case owner when email is submitted as a case. Only applies if <code>createTask</code> is set to <code>true</code> .

## FeedItemSettings

Represents an organization's feed item settings. Available in API version 32.0 and later.

Field Name	Field Type	Description
<code>characterLimit</code>	int	Specifies the maximum number of characters displayed for each feed item.
<code>collapseThread</code>	boolean	Removed. Indicates whether earlier messages in an email thread are removed from email feed items ( <code>true</code> ) or not ( <code>false</code> ).  Available in API versions 27.0 to 46.0.
<code>displayFormat</code>	FeedItemDisplayFormat (enumeration of type string)	Indicates how email feed items are displayed. Valid values are: <ul style="list-style-type: none"> <li><code>Default</code>—Blank lines in email feed items are displayed.</li> <li><code>HideBlankLines</code>—Blank lines in email feed items aren't displayed.</li> </ul>
<code>feedItemType</code>	FeedItemType (enumeration of type string)	The type of feed item to which the settings apply. For <code>FeedItemSettings</code> , the only valid <code>feedItemType</code> value is <code>EmailMessageEvent</code> .

## WebToCaseSettings

Represents an organization's Web-to-Case settings.

### Fields

Field Name	Field Type	Description
<code>caseOrigin</code>	string	Specifies the default case origin for cases created through this web form. Applies only if <code>enableWebToCase</code> is set to <code>true</code> .
<code>defaultResponseTemplate</code>	string	Specifies the default template used for email responses to cases that are submitted through a Self-Service portal. Applies only if <code>enableWebToCase</code> is set to <code>true</code> .  Lightning email templates aren't packageable. We recommend using a Classic email template.
<code>enableWebToCase</code>	boolean	Indicates whether Web-to-Case is enabled ( <code>true</code> ) or not ( <code>false</code> ).

## Declarative Metadata Sample Definition

This code sample is an example of a case settings file.

```
<?xml version="1.0" encoding="UTF-8"?>
<CaseSettings xmlns="http://soap.sforce.com/2006/04/metadata">
```

```

<caseAssignNotificationTemplate>
  unfiled$public/SupportCaseAssignmentNotification
</caseAssignNotificationTemplate>
<caseCloseNotificationTemplate>
  unfiled$public/SupportCaseCloseNotification
</caseCloseNotificationTemplate>
<caseCommentNotificationTemplate>
  unfiled$public/SupportCaseCommentNotification
</caseCommentNotificationTemplate>
<caseCreateNotificationTemplate>
  unfiled$public/SupportCaseCreateNotification
</caseCreateNotificationTemplate>
<closeCaseThroughStatusChange>true</closeCaseThroughStatusChange>
<defaultCaseOwner>admin@acme.com</defaultCaseOwner>
<defaultCaseOwnerType>User</defaultCaseOwnerType>

</webToCase>
</CaseSettings>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Case</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>

```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ChatterAnswersSettings

Represents the metadata used to manage settings for Chatter Answers.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

Chatter Answers settings are stored in a single file named `ChatterAnswers.settings` in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

ChatterAnswersSettings is available in API version 27.0 and later.

## Fields

Field Name	Field Type	Description
<code>emailFollowersOnBestAnswer</code>	boolean	Indicates whether users are notified when a best answer is selected for a question that they're following ( <code>true</code> ) or not ( <code>false</code> ).
<code>emailFollowersOnReply</code>	boolean	Indicates whether users are notified when other users reply to questions that they're following ( <code>true</code> ) or not ( <code>false</code> ).
<code>emailOwnerOnPrivateReply</code>	boolean	Indicates whether users are notified when customer support responds to their questions privately ( <code>true</code> ) or not ( <code>false</code> ).
<code>emailOwnerOnReply</code>	boolean	Indicates whether users are notified when other users reply to their questions ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableAnswerViaEmail</code>	boolean	Indicates whether users can post answers by replying to email notifications ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 29.0 and later.
<code>enableChatterAnswers</code>	boolean	Indicates whether the Chatter Answers feature is enabled in the organization ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableFacebookSSO</code>	boolean	Indicates whether users can sign in to your Chatter Answers forums with their Facebook logins ( <code>true</code> ) or not ( <code>false</code> ). To enable this feature, you must define and enable a Facebook authentication provider in your organization's security controls and enable Auth Providers in your organization.
<code>enableInlinePublisher</code>	boolean	Indicates whether users can filter search results by articles or questions before they post a question to any of your Chatter Answers forums ( <code>true</code> ) or not ( <code>false</code> ). Also, adds <code>Title</code> and <code>Body</code> fields to questions for easier text input and scanning. This field is available in API version 29.0 and later.
<code>enableReputation</code>	boolean	Indicates whether user reputations appear as hover text on their profile pictures ( <code>true</code> ) or not ( <code>false</code> ). Reputation is enabled across all zones. To enable the reputation setting, you must enable Reputation in your organization.
<code>enableRichTextEditor</code>	boolean	Indicates whether the rich text editor is enabled for users to format text and upload images when posting questions ( <code>true</code> ) or not ( <code>false</code> ). To enable rich text editor, you must enable Optimize Question Flow.
<code>facebookAuthProvider</code>	string	The name of an existing Facebook authentication provider. To implement Facebook Single Sign On for your Chatter Answers forums, you must choose a Facebook authentication provider.
<code>showInPortals</code>	boolean	Indicates whether Chatter Answers can be added as a tab to your Customer portal or partner portal ( <code>true</code> ) or not ( <code>false</code> ).

## Declarative Metadata Sample Definition

The following is an example `chatteranswers.settings` metadata file:

```
<?xml version="1.0" encoding="UTF-8"?>
<ChatterAnswersSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <emailFollowersOnBestAnswer>true</emailFollowersOnBestAnswer>
  <emailFollowersOnReply>true</emailFollowersOnReply>
  <emailOwnerOnPrivateReply>true</emailOwnerOnPrivateReply>
  <emailOwnerOnReply>true</emailOwnerOnReply>
  <enableChatterAnswers>true</enableChatterAnswers>
  <enableFacebookSSO>true</enableFacebookSSO>
  <enableInlinePublisher>true</enableInlinePublisher>
  <enableReputation>true</enableReputation>
  <enableRichTextEditor>true</enableRichTextEditor>
  <facebookAuthProvider>FacebookAuthProvider</facebookAuthProvider>
  <showInPortals>true</showInPortals>
</ChatterAnswersSettings>
```

The following is an example `package.xml` manifest that references the `ChatterAnswersSettings` definitions:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>ChatterAnswers</members>
    <name>Settings</name>
  </types>
  <version>29.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ChatterEmailsMDSettings

Represents an org's settings for Chatter email when Chatter is enabled. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

The `ChatterEmailsMDSettings` component appears in the `ChatterEmailsMD.settings` file, and is stored in the `settings` folder. The `.settings` files are different from other named components because there is only one settings file for each settings component.

## Version

`ChatterEmailsMDSettings` components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableChatterDigestEmailsApiOnly</code>	boolean	Indicates whether Chatter digests can be sent via the API, rather than according to the regular schedule, for your org ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableChatterEmailAttachment</code>	boolean	Indicates whether attachments can be included on posts to chatter feeds via email replies ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableCollaborationEmail</code>	boolean	Indicates whether collaboration email notifications can be sent ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableDisplayAppDownloadBadges</code>	boolean	Indicates whether iOS and Android app download badges display in Chatter notifications ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableEmailReplyToChatter</code>	boolean	Indicates whether users can reply to chatter notifications through an email response ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableEmailToChatter</code>	boolean	Indicates whether users can post to chatter feeds via email ( <code>true</code> ) or not ( <code>false</code> ).
<code>noQnOwnNotifyOnCaseCmt</code>	boolean	Indicates whether a user is notified when a question is posted on their case comment ( <code>false</code> ) or not ( <code>true</code> ).
<code>noQnOwnNotifyOnRep</code>	boolean	Indicates whether a user is notified when a reply is posted on their question ( <code>false</code> ) or not ( <code>true</code> ).
<code>noQnSubNotifyOnBestR</code>	boolean	Indicates whether a user is notified when a best reply is selected on a question they follow ( <code>false</code> ) or not ( <code>true</code> ).
<code>noQnSubNotifyOnRep</code>	boolean	Indicates whether a user is notified when a reply is posted on a question they follow ( <code>false</code> ) or not ( <code>true</code> ).

## Declarative Metadata Sample Definition

The following is an example of a `chatteremailmd.settings` metadata file.

```
<?xml version="1.0" encoding="UTF-8"?>
<ChatterEmailsMDSSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableChatterDigestEmailsApiOnly>false</enableChatterDigestEmailsApiOnly>
  <enableChatterEmailAttachment>false</enableChatterEmailAttachment>
  <enableCollaborationEmail>true</enableCollaborationEmail>
  <enableDisplayAppDownloadBadges>true</enableDisplayAppDownloadBadges>
  <enableEmailReplyToChatter>false</enableEmailReplyToChatter>
  <enableEmailToChatter>true</enableEmailToChatter>
  <noQnOwnNotifyOnCaseCmt>false</noQnOwnNotifyOnCaseCmt>
  <noQnOwnNotifyOnRep>false</noQnOwnNotifyOnRep>
  <noQnSubNotifyOnBestR>false</noQnSubNotifyOnBestR>
  <noQnSubNotifyOnRep>false</noQnSubNotifyOnRep>
</ChatterEmailsMDSSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ChatterSettings

Represents an org's settings for their Chatter instance when Chatter is enabled for the org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

The ChatterSettings component appears in the `Chatter.settings` file, and is stored in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

ChatterSettings components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>allowChatterGroupArchiving</code>	boolean	Indicates whether manual and automatic group archiving are allowed on all Chatter groups ( <code>true</code> ) or aren't allowed ( <code>false</code> ).  In Setup, <code>allowChatterGroupArchiving</code> equates to the Chatter setting <b>Allow Group Archiving</b> .
<code>allowRecordsInChatterGroup</code>	boolean	Indicates whether records can be associated with groups ( <code>true</code> ), or not ( <code>false</code> ). If groups already have record data, setting this field to <code>false</code> doesn't delete it.  In Setup, <code>allowRecordsInChatterGroup</code> equates to the Chatter setting <b>Allow Records in Groups</b> .
<code>allowSharingInChatterGroup</code>	boolean	Removed. The setting of this field has no effect on the org. Available in API version 47.0 only.
<code>enableApprovalRequest</code>	boolean	Indicates whether Approvals in Chatter are enabled for the org. When the value is <code>true</code> , users see approval requests as posts in Chatter feeds. Users can update their own Chatter feeds settings to opt out of receiving approval requests as Chatter posts. When the value is <code>false</code> , approval requests aren't posted to Chatter. The default value is <code>false</code> .  In Setup, <code>enableApprovalRequest</code> equates to the Chatter setting <b>Allow Approvals</b> .

Field Name	Field Type	Description
<code>enableCaseFeedRelativeTimestamps</code>	boolean	<p>In Case feeds, indicates whether to use relative (<code>true</code>) or absolute (<code>false</code>) date and time stamp formats on Case feed items. When the value is <code>true</code>, Case feed items show a relative timestamp (for example, 10m ago). When the value is <code>true</code>, users can hover over the relative timestamp to see the absolute. When the value is <code>false</code>, Case feed items show an absolute timestamp (for example, January 7, 2020 at 12:15PM). When you change this setting, all timestamps in Case feeds reflect that change. The default value is <code>true</code>. This field is available in API version 48.0 and later.</p> <p>In Setup, <code>enableCaseFeedRelativeTimestamps</code> equates to the Chatter setting <b>Show relative timestamp</b>.</p>
<code>enableChatter</code>	boolean	<p>Indicates whether Chatter is enabled for your org (<code>true</code>) or not (<code>false</code>).</p>
<code>enableChatterEmoticons</code>	boolean	<p>Indicates whether the automatic conversion of text characters, such as <code>:</code>, into a graphic emoticon is allowed in Chatter (<code>true</code>) or isn't allowed (<code>false</code>).</p> <p>In Setup, <code>enableChatter</code> equates to the Chatter setting <b>Allow Emoticons</b>.</p>
<code>enableFeedEdit</code>	boolean	<p>Indicates whether qualified users can edit feed posts and comments (<code>true</code>) or not (<code>false</code>). Qualified users include:</p> <ul style="list-style-type: none"> <li>• The author of the post or comment</li> <li>• The person who owns the record that was posted to or commented on</li> <li>• The Chatter or site moderator</li> </ul> <p>In Setup, <code>enableFeedEdit</code> equates to the Chatter setting <b>Allow users to edit posts and comments</b>.</p>
<code>enableFeedPinning</code>	boolean	<p>Indicates whether to allow the pinning of posts in a feed (<code>true</code>) or not (<code>false</code>). When set to <code>true</code>:</p> <ul style="list-style-type: none"> <li>• Authorized users can pin posts to the top of the feed.</li> <li>• The feed supports up to three pinned posts.</li> <li>• Pinned posts stay pinned until they're unpinned.</li> </ul> <p>After post pinning is enabled, authorized users include admins and group owners and managers. Admins can also assign post pinning permission through permission sets or user profiles.</p> <p>In Setup, <code>enableFeedPinning</code> equates to the Chatter setting <b>Allow post pinning</b>.</p>
<code>enableFeedsDraftPosts</code>	boolean	<p>Indicates whether draft posts are automatically saved every seven seconds (<code>true</code>) or not (<code>false</code>). When set to <code>true</code>:</p> <ul style="list-style-type: none"> <li>• Adds the My Drafts feed to the Chatter tab</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>Saves draft posts automatically every seven seconds</li> <li>Makes drafts available in the My Drafts feed</li> </ul> <p>When the user posts the entry, the draft is automatically removed from the My Drafts feed.</p> <p>In Setup, <code>enableFeedsDraftPosts</code> equates to the Chatter setting <b>Allow draft posts</b>.</p>
<code>enableFeedsRichText</code>	boolean	<p>Indicates whether to use the Rich Text Editor in the Chatter Publisher (<code>true</code>) or not (<code>false</code>). The rich text editor supports text formats, inline images, hyperlinks, and, when enabled for the org, code snippets.</p> <p>In Setup, <code>enableFeedsRichText</code> equates to the Chatter setting <b>Allow users to compose rich text posts</b>.</p>
<code>enableInviteCsnUsers</code>	boolean	<p>Indicates whether a licensed user can invite customers to private groups that the licensed user owns or manages (<code>true</code>) or not (<code>false</code>). When the value is set to <code>true</code>, licensed users can invite customers who are from outside org email domains. Invited customers can see information only in the groups that they're invited to. They can interact only with members of those groups.</p> <p>In Setup, <code>enableInviteCsnUsers</code> equates to the Chatter setting <b>Allow customer invitations</b>.</p>
<code>enableOutOfOfficeEnabledPref</code>	boolean	<p>Indicates whether to add an Out of Office setting to a user profile page (<code>true</code>), or to omit it (<code>false</code>). When the value is set to <code>true</code>, this option adds a control to user profile pages for setting a personal out-of-office message.</p> <p>In Setup, <code>enableOutOfOfficeEnabledPref</code> equates to the Chatter setting <b>Users can set Out of Office message</b>.</p>
<code>enableRichLinkPreviewsInFeed</code>	boolean	<p>Indicates whether to convert links in posts into embedded videos, images, and article previews (<code>true</code>) or not to convert the links (<code>false</code>).</p> <p>In Setup, <code>enableRichLinkPreviewsInFeed</code> equates to the Chatter setting <b>Allow Rich Link Previews</b>.</p>
<code>enableTodayRecsInFeed</code>	boolean	<p>Indicates whether to allow the posting of recommendations for using the Salesforce Today app in users' feeds (<code>true</code>) or not (<code>false</code>). When set to <code>true</code>, automatically posts recommendations for using the Salesforce Today app in users' feeds.</p> <p>In Setup, <code>enableTodayRecsInFeed</code> equates to the Chatter setting <b>Allow Today Recommendations</b>.</p>
<code>unlistedGroupsEnabled</code>	boolean	<p>Indicates whether to allow the creation of unlisted groups (<code>true</code>) or to prevent their creation (<code>false</code>). When the value is set to <code>true</code>, users can create unlisted groups. Unlisted groups don't appear on the Groups list page. Membership in unlisted groups is by invitation only.</p>

Field Name	Field Type	Description
		In Setup, <code>unlistedGroupsEnabled</code> equates to the Chatter setting <b>Enable Unlisted Groups</b> .

## Declarative Metadata Sample Definition

The following is an example of a Chatter.settings file.

```
<?xml version="1.0" encoding="UTF-8"?>
  <ChatterSettings xmlns="http://soap.sforce.com/2006/04/metadata">
    <allowChatterGroupArchiving>true</allowChatterGroupArchiving>
    <allowRecordsInChatterGroup>true</allowRecordsInChatterGroup>
    <enableApprovalRequest>true</enableApprovalRequest>
    <enableChatter>true</enableChatter>
    <enableChatterEmoticons>true</enableChatterEmoticons>
    <enableFeedEdit>true</enableFeedEdit>
    <enableFeedsDraftPosts>false</enableFeedsDraftPosts>
    <enableFeedsRichText>true</enableFeedsRichText>
    <enableInviteCsnUsers>true</enableInviteCsnUsers>
    <enableOutOfOfficeEnabledPref>false</enableOutOfOfficeEnabledPref>
    <enableRichLinkPreviewsInFeed>true</enableRichLinkPreviewsInFeed>
    <enableTodayRecsInFeed>true</enableTodayRecsInFeed>
    <unlistedGroupsEnabled>true</unlistedGroupsEnabled>
  </ChatterSettings>
```

The following is an example `package.xml` manifest that references the ChatterSettings definitions:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Chatter</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CodeBuilderSettings

Represents Code Builder settings. This type extends the Metadata metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

CodeBuilderSettings values are stored in the `CodeBuilder.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

CodeBuilderSettings is available in API versions 58.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableCodeBuilder</code>	boolean	Indicates whether Code Builder is enabled (true) or not (false). When enabled, you can install and use the generally available (GA) Code Builder package in the org.

## Declarative Metadata Sample Definition

The following is an example of the `CodeBuilder.settings` file:

```
<?xml version="1.0" encoding="UTF-8"?>
<CodeBuilderSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableCodeBuilder>true</enableCodeBuilder>
</CodeBuilderSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CollectionsDashboardSettings

Represents an org's settings to add the Collections Dashboard application to an org.

## Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See [Settings](#) for more details.

## File Suffix and Directory Location

CollectionsDashboardSettings values are stored in the `CollectionsDashboard.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there's only one settings file for each settings component.

## Version

CollectionsDashboardSettings components are available in API version 56.0 and later.

## Fields

Field Name	Description
enableCollectionsDashboard	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to add the Collections Dashboard application to an org (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>

## Declarative Metadata Sample Definition

This example shows a sample CollectionsDashboardSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<CollectionsDashboardSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableCollectionsDashboard>true</enableCollectionsDashboard>
</CollectionsDashboardSettings>
```

This example shows a sample `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>CollectionsDashboard</members>
    <name>Settings</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CommunitiesSettings

Represents community settings for an org. Enable digital experiences and workspaces. Manage moderation, guest user and partner settings, and more. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

CommunitiesSettings values are stored in the `Communities.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there's only one settings file for each settings component.

## Version

CommunitiesSettings components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>applyLoginPageTypeToEmbeddedLogin</code>	boolean	<p>When <code>true</code>, applies the Experience Cloud site login page type (default, Login Discovery, Experience Builder, or Visualforce) to all Embedded Login implementations. When <code>false</code>, applies the username and password login page type to all Embedded Login implementations.</p> <p>For orgs created before the Salesforce Summer '20 release, the default setting is <code>false</code>. For new orgs, the default setting is <code>true</code>. Available in API version 49.0 and later.</p>
<code>blockEmbeddedLoginUnknownURLRedirect</code>	boolean	<p>When <code>true</code>, blocks redirects to unknown URLs that are provided in the state parameter of the OAuth response during a server-side callback. Redirects are allowed when the URL is in the same host or domain as the site, or is allow-listed in the Embedded Login <code>salesforce-allowed-domains</code> meta tag. When <code>false</code>, all redirects are allowed.</p> <p>For orgs created before the Salesforce Summer '21 release, the default setting is <code>false</code>. For new orgs, the default setting is <code>true</code>. Available in API version 52.0 and later.</p>
<code>canModerateAllFeedPosts</code>	boolean	<p>When <code>true</code>, allows moderation features, such as flags and rules, to be set on all feed posts including posts that are visible in Experience Cloud sites. When set to <code>false</code>, only feed posts in sites can be moderated. Default is <code>false</code>.</p>
<code>canModerateInternalFeedPosts</code>	boolean	<p>When <code>true</code>, allows moderation features, such as flags and rules, to be set on record feed posts created by internal users. Such posts can also be visible in multiple sites. Default is <code>false</code>.</p>
<code>embeddedVisualforcePages</code>	boolean	<p>When <code>true</code>, allows links to Visualforce pages from other Visualforce pages in Salesforce via the API. Default is <code>false</code>. Available in API version 48.0 and later.</p>
<code>enableCommunityWorkspaces</code>	boolean	<p>When <code>true</code>, allows admins to enable Experience Workspaces. Available in API version 48.0 and later.</p>
<code>enableCspContactVisibilityPref</code>	boolean	<p>When <code>true</code>, allows users to see contacts from private accounts that they have read access to, when the contact is controlled by the parent record. Available in API version 48.0 and later.</p>

Field Name	Field Type	Description
enableCspNotesOnAccConPref	boolean	When <code>true</code> , allows customer users to access notes and attachments associated with accounts and contacts. Available in API version 48.0 and later.
enableEnablePRM	boolean	When <code>true</code> , allows admins to enable partner users. Available in API version 48.0 and later.
enableExternalAccHierPref	boolean	When <code>true</code> , enables the External Account Hierarchy object. Available in API version 48.0 and later.
enableGuestRecordReassignOrgPref	boolean	When <code>true</code> , allows admins to set a default owner for records created by guest users. Available in API version 48.0 and later.
enableGuvSecurityOptOutPref	boolean	When <code>true</code> , guest user visibility can be turned off. Available in API version 49.0 and later.
enableInviteChatterGuestEnabled	boolean	When <code>true</code> , allows guest users to be invited to use Chatter. Available in API version 48.0 and later.
enableNetPortalUserReportOpts	boolean	When <code>true</code> , allows external users in Experience Cloud sites, with permission, to run reports. Available in API version 48.0 and later.
enableNetworksEnabled	boolean	When <code>true</code> , allows users to enable digital experiences. Available in API version 47.0 and later.
enableOotbProfExtUserOpsEnable	boolean	When <code>true</code> , allows use of standard external profiles for self-registration and user creation. Available in API version 48.0 and later.
enablePreventBadgeGuestAccess	boolean	When <code>true</code> , hides badges from guest users in Experience Builder sites. Available in API version 53.0 and later.
enablePowerCustomerCaseStatus	boolean	When <code>true</code> , allows users with Customer Community Plus licenses to change case status. Available in API version 48.0 and later.
enablePRMAccRelPref	boolean	When <code>true</code> , enables Account Relationship object and Account Relationship Data Sharing Rule setup options. Available in API version 48.0 and later.
enableRelaxPartnerAccountFieldPref	boolean	When <code>true</code> , allows editing for partner account fields on and opportunities and leads. Available in API version 48.0 and later.
enableUnsupportedBrowserModalPref	boolean	When <code>true</code> , warnings about unsupported browsers are displayed in Experience Cloud sites. Available in API version 48.0 and later.
enableUsernameUniqForOrgPref	boolean	When <code>true</code> , username uniqueness is set at the org level. Available in API version 48.0 and later.

## Declarative Metadata Sample Definition

The following is an example of a CommunitiesSettings component.

```
<CommunitiesSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <canModerateAllFeedPosts>true</canModerateAllFeedPosts>
</CommunitiesSettings>
```

```
<canModerateInternalFeedPosts>true</canModerateInternalFeedPosts>
</CommunitiesSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
<types>
<members>Communities</members>
<name>Settings</name>
</types>
<version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CompanySettings

Represents global settings that affect multiple features in your organization. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## Declarative Metadata File Suffix and Directory Location

`CompanySettings` values are stored in a single file named `Company.settings` in the `settings` directory of the corresponding package directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

Company Profile Settings are available in API version 27.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableCustomFiscalYear</code>	boolean	If a custom fiscal period is set up, this field is used to determine whether the custom fiscal period is used for forecasts. If <code>true</code> , the custom fiscal period is used. If <code>false</code> (default), standard periods are used. Available in API version 47.0 and later.
<code>fiscalYear</code>	<a href="#">FiscalYearSetting</a>	The organization's fiscal year setting based on year and start month. Not available if Custom Fiscal Year or Forecasts (Classic) is enabled. When changing fiscal year settings, quotas and adjustments can be purged. For example changing your start month results in purging this data.

## FiscalYearSetting

Represents your organization's fiscal year setting.

Field	Field Type	Description
<code>fiscalYearNameBasedOn</code>	string	This field is used to determine the fiscal year name. Valid values are <code>endingMonth</code> or <code>startingMonth</code> . For example, if your fiscal year starts in April 2012 and ends in March 2013, and this value is: <ul style="list-style-type: none"> <li>• <code>endingMonth</code>, then 2013 is used for the fiscal year name.</li> <li>• <code>startingMonth</code>, then 2012 is used for the fiscal year name.</li> </ul>
<code>startMonth</code>	string	The month on which the fiscal year is based.

## Declarative Metadata Sample Definition — Fiscal Year Setting

A sample XML definition of a fiscal year setting is shown below. Note that this example is supported in API version 27.0 and later.

```
<?xml version="1.0" encoding="UTF-8"?>
<CompanySettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <fiscalYear>
    <fiscalYearNameBasedOn>endingMonth</fiscalYearNameBasedOn>
    <startMonth>January</startMonth>
  </fiscalYear>
</CompanySettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ConnectedAppSettings

Represents settings for connected apps. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`ConnectedAppSettings` values are stored in a single file named `ConnectedApp.settings` in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`ConnectedAppSettings` components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableAdminApprovedAppsOnly</code>	boolean	If <code>false</code> (default), any connected app can call the Salesforce API. If <code>true</code> , only apps that have been approved or installed by the admin can call the Salesforce API. To access this field, you must contact Salesforce Customer Support to enable API Access Control.
<code>enableAdminApprovedAppsOnlyForExternalUser</code>	boolean	If <code>false</code> (default), authenticated customers or partners can use any unblocked connected app to access the Salesforce API. If <code>true</code> , authenticated customers and partners can't access the Salesforce API unless they use a connected app that is installed in the org and unblocked. Install and unblock connected apps on the Connected Apps OAuth Usage page. To access this field, you must contact Salesforce Customer Support to enable API Access Control.
<code>enableSkipUserProvisioningWizardWelcomePage</code>	boolean	If <code>false</code> (default), the User Provisioning Wizard Welcome page shows up when you access the wizard. To skip the welcome page in the future, you can select <b>Do not show me this next time</b> . If <code>true</code> , the Welcome page doesn't show up the next time that you access the wizard.

## Declarative Metadata Sample Definition

The following is an example of a `ConnectedAppSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ConnectedAppSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableAdminApprovedAppsOnly>false</enableAdminApprovedAppsOnly>

  <enableAdminApprovedAppsOnlyForExternalUser>false</enableAdminApprovedAppsOnlyForExternalUser>

  <enableSkipUserProvisioningWizardWelcomePage>true</enableSkipUserProvisioningWizardWelcomePage>
</ConnectedAppSettings>
```

The following is an example `package.xml` manifest that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>ConnectedApp</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## ContentSettings

Represents content settings for an org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

ContentSettings values are stored in the `contentsettings.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there's only one settings file for each settings component.

## Version

ContentSettings components are available in API version 48.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableChatterFileLink</code>	boolean	When <code>true</code> , allows users to share files via links. When set to <code>false</code> , users can't use file sharing. Default is <code>true</code> .
<code>enableCMSC2CConnections</code>	boolean	When <code>true</code> , allows org to enable Salesforce CMS Cloud to Cloud Connections.
<code>enableContent</code>	boolean	When <code>true</code> , allows org to enable Content.
<code>enableContentAutoAssign</code>	boolean	When <code>true</code> , allows org to auto assign Content feature licenses to users.
<code>enableContentDistForPortalUsers</code>	boolean	When <code>true</code> , allows portal users to create Content Deliveries for managed files in a library.
<code>enableContentDistPwOptionsBit1</code>	boolean	When <code>true</code> , allow using with <code>ContentDistPasswordOptionsBit2</code> to set up one of three possible delivery security options.
<code>enableContentDistPwOptionsBit2</code>	boolean	When <code>true</code> , allow using with <code>ContentDistPasswordOptionsBit1</code> to set up one of three possible delivery security options.
<code>enableContentDistribution</code>	boolean	When <code>true</code> , allows the Content Delivery user permission to be enabled for users. Content deliveries let users create links to share files externally, with optional security settings.
<code>enableContentSupportMultiLanguage</code>	boolean	When <code>true</code> , enables content to support multiple languages.
<code>enableContentWorkspaceAccess</code>	boolean	When <code>true</code> , content libraries are visible in the API and UI for users who have read access to libraries, even if they don't have access to the original Salesforce CRM Content app.
<code>enableDeleteFileInContentPacks</code>	boolean	When <code>true</code> , enables an org preference that allows a file's owner to delete the file, which is included in one or more content packs. The default setting is based on the org.
<code>enableFileShareSetByRecord</code>	boolean	When <code>true</code> , files shared to records default to Set by Record.
<code>enableFilesUsrShareNetRestricted</code>	boolean	When <code>true</code> , files respect user sharing settings. Files shared with users with <b>SharedUsers</b> visibility are only accessible to users who are members of the Experience Cloud site the file was created in.

Field Name	Field Type	Description
enableJPGPreviews	boolean	When <code>true</code> , attempts to use other SVG alternative formats such as JPG as preview images.
enableLibraryManagedFiles	boolean	When <code>true</code> , controls the ability to publish files created in Chatter with a Content Library (ContentWorkspace). The library can manage the file.
enableShowChatterFilesInContent	boolean	When <code>true</code> , allows users to search for Chatter files in content.
enableSiteGuestUserToUploadFiles	boolean	When <code>true</code> , site guest users can upload files.
enableUploadFilesOnAttachments	boolean	When <code>true</code> , shows the <b>New File</b> button on the Attachments related lists to upload files, rather than legacy Attachments.
setValidContentTypeForAttachDownload	boolean	When <code>true</code> , enables an org preference that controls whether the Content-Type HTTP response header is set to a valid content type during file and attachment downloads. If <code>false</code> the response header is set to the value that the user provided during file upload. Values provided by the user can be invalid. If the content type provided by the user isn't a valid content type, the system tries to determine a valid content type based on the file name extension. This field is available in API version 50.0 and later.
skipContentAssetTriggers	boolean	When <code>true</code> , disables content trigger execution and custom validation on content assets.
skipContentAssetTriggersOnDeploy	boolean	When <code>true</code> , disables content trigger execution when deploying content assets.

## Declarative Metadata Sample Definition

The following is an example of a Content.settings file.

```
<ContentSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableChatterFileLink>true</enableChatterFileLink>
  <enableCMSC2CConnections>true</enableCMSC2CConnections>
  <enableContent>true</enableContent>
  <enableContentAutoAssign>true</enableContentAutoAssign>
  <enableContentDistForPortalUsers>true</enableContentDistForPortalUsers>
  <enableContentDistribution>true</enableContentDistribution>
  <enableContentSupportMultiLanguage>false</enableContentSupportMultiLanguage>
  <enableContentWorkspaceAccess>true</enableContentWorkspaceAccess>
  <enableFileShareSetByRecord>true</enableFileShareSetByRecord>
  <enableFilesUsrShareNetRestricted>true</enableFilesUsrShareNetRestricted>
  <enableJPGPreviews>true</enableJPGPreviews>
  <enableLibraryManagedFiles>true</enableLibraryManagedFiles>
  <enableShowChatterFilesInContent>true</enableShowChatterFilesInContent>
  <enableSiteGuestUserToUploadFiles>true</enableSiteGuestUserToUploadFiles>
  <enableUploadFilesOnAttachments>true</enableUploadFilesOnAttachments>
  <skipContentAssetTriggers>true</skipContentAssetTriggers>
  <skipContentAssetTriggersOnDeploy>true</skipContentAssetTriggersOnDeploy>
</ContentSettings>
```

The following is an example `ContentSettings.xml` manifest that references the `ContentSettings` definitions:

```
<?xml version="1.0" encoding="UTF-8"?>
<ContentSettings xmlns=
  <types>
    <members>Content</members>
    <name>Settings</name>
  </types>
  <version>48.0</version>
</ContentSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ContractSettings

Represents contract settings.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

There is one contract settings file stored in a file named `Contract.settings` in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`ContractSettings` is available in API version 27.0 and later.

## Fields

Field Name	Field Type	Description
<code>autoCalculateEndDate</code>	boolean	Indicates whether the end date of a contract is automatically calculated ( <code>true</code> ) or not ( <code>false</code> ).
<code>notifyOwnersOnContractExpiration</code>	boolean	Indicates whether account and contract owners are automatically sent email notifications when a contract expires ( <code>true</code> ) or not ( <code>false</code> ).

## Declarative Metadata Sample Definition

This is a sample contract settings file.

```
<?xml version="1.0" encoding="UTF-8"?>
<ContractSettings xmlns="http://soap.sforce.com/2006/04/metadata">

```

```
<notifyOwnersOnContractExpiration>false</notifyOwnersOnContractExpiration>
</ContractSettings>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ConversationalIntelligenceSettings

Represents the org's Einstein Conversation Insights settings, such as whether Einstein Conversation Insights is enabled. Einstein Conversation Insights lets you analyze your rep's call recordings, and gives you the insights you need to optimize every call.

## Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See [Settings](#) for more details.

## File Suffix and Directory Location

`ConversationalIntelligenceSettings` values are stored in the `ConversationalIntelligence.settings` file in the `settings` folder.

## Version

`ConversationalIntelligenceSettings` components are available in API version 49.0 and later.

## Fields

Field Name	Description
<code>enableCallCoaching</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether Einstein Conversation Insights is enabled (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>. Available in API version 49.0 and later.</p>
<code>enableCallCoachingZoom</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether Zoom video calls are enabled for Einstein Conversation Insights (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>. Available in API version 51.0 and later.</p>

Field Name	Description
<code>enableDiarizationPref</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether optimal speaker separation is enabled (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>. Available in API version 58.0 and later.</p> <p>Optimal speaker separation lets Einstein Conversation Insights use acoustic features of speaker voices to separate an audio stream into separate segments.</p>
<code>enableOpptyMatching</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether voice and video calls are related to opportunities automatically (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>. Available in API version 53.0 and later.</p>
<code>enableUnifiedActivities</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether Activity 360 Reporting is enabled (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>. Available in API version 58.0 and later.</p>

## Declarative Metadata Sample Definition

The following is an example of a `ConversationalIntelligenceSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ConversationalIntelligenceSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableCallCoaching>true</enableCallCoaching>
</ConversationalIntelligenceSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>ConversationalIntelligence</members>
    <name>Settings</name>
  </types>
  <version>49.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ConversationChannelDefinition

Represents the conversation channel definition that's implemented for Interaction Service for Bring Your Own Channel and Bring Your Own Channel for CCaaS messaging channels. This object is available in API version 60.0 and later.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

ConversationChannelDefinition components have the suffix `.ConversationChannelDefinition` and are stored in the `conversationChannelDefinitions` folder.

### Version

ConversationChannelDefinition components are available in API version 60.0 and later.

### Special Access Rules

Interaction service must be configured. Access to tooling objects requires Salesforce administrator privileges or the Customize Application permission.

### Fields

Field Name	Description
<code>connectedAppOAuthLink</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> DO NOT SET OR CHANGE THIS VALUE. This value is automatically generated. This field represents the OAuth link for the connected app if the <code>connectedAppType</code> value is <code>Partner</code>. This is a string identifier to the connected app containing the partner Org ID and the consumer ID minus the key prefixes. Used to identify the connected app to use for the channel definition and channel at runtime.</p>
<code>connectedAppType</code>	<p><b>Field Type</b> CustomChannelConnectedAppType</p> <p><b>Description</b> The owner of the connected app used to manage authentication between Salesforce Interaction Service and the Messaging or CCaaS partner's system.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>Partner</code></li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• Customer</li> </ul> <p>The default value is <i>Partner</i>.</p> <p>If set to <i>Partner</i>, the partner creates the connected app and includes it in their managed package. If set to <i>Customer</i>, the admin creates the connected app.</p> <p>Available in API version 62.0 and later.</p>
<code>consentOwner</code>	<p><b>Field Type</b> ConsentOwner (enumeration of type string)</p> <p><b>Description</b> The system the customer uses to manage consent levels.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• Partner</li> <li>• Salesforce</li> </ul> <p>The default value is <i>Salesforce</i>.</p> <p>For example, if set to <i>Salesforce</i>, consent levels are managed by the Salesforce system. If set to <i>Partner</i>, consent levels are managed by the partner's telephony system.</p> <p>For Bring Your Own Channel, this value must be set to <i>Salesforce</i>.</p>
<code>conversationVendorInfo</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The <i>ConversationVendorInfo.developerName</i> used to link this record to the ConversationVendorInfo record. For example, <i>PartnerName</i>.</p>
<code>customEventChnlAddrIdField</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The mapping field that points to the custom field used to point to the <i>ChannelAddressIdentifier</i> field.</p> <p>This field is available in API version 60.0 and earlier. Use a combination of <i>customEventTypeField</i> and <i>customEventPayloadField</i> in API version 61.0 and later instead.</p>
<code>customEventPayloadField</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The mapping field that points to the custom field used to point to the <i>Payload</i> field in the format <code>&lt;orgNamespace&gt;__&lt;CustomFieldName&gt;__c</code>. This is the API name of the custom Payload field in the custom platform event. For example, <code>devorg__Payload__c</code>.</p>

Field Name	Description
customEventRecipientField	<p><b>Field Type</b> string</p> <p><b>Description</b> The mapping field that points to the custom field used to point to the Recipient field.  This field is available in API version 60.0 and earlier. Use a combination of <code>customEventTypeField</code> and <code>customEventPayloadField</code> in API version 61.0 and later instead.</p>
customEventTypeField	<p><b>Field Type</b> string</p> <p><b>Description</b> The mapping field that points to the custom field used to point to the Platform event type (EventType) field, in the format <code>&lt;orgNamespace&gt;__&lt;CustomFieldName&gt;__c</code>. This is the API name of the custom EventType field in the custom platform event. For example, <code>devorg__EventType__c</code>.</p>
customIcon	<p><b>Field Type</b> string</p> <p><b>Description</b> For Bring Your Own Channel and Bring Your Own Channel for CCaaS, this field represents the name of the status resource image used to identify the channel integration, such as a channel logo. For the best results, set the image size to 50px x 50px and save the image in SVG file format. This field is optional. This field is a relationship field. Available in API version 61.0 and later.</p>
customPlatformEvent	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The API name of the custom platform event created for the Interaction Service API in the format <code>&lt;orgNamespace&gt;__&lt;CustomPlatformEventName&gt;__e</code>. For example, <code>devorg__TestEvent__e</code>.</p>
customerConnectedAppOAuthLink	<p><b>Field Type</b> string</p> <p><b>Description</b> DO NOT SET OR CHANGE THIS VALUE. This value is automatically generated. This field represents the OAuth link for the connected app created by an admin if the ConnectedAppType is <code>Customer</code>. Available in API version 62.0 and later.</p>
developerName	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>The unique name of the custom metadata type object in the API in the format <code>&lt;Prefix&gt;_&lt;ConversationChannelDefinition&gt;</code>, where <i>Prefix</i> matches the prefix you gave to the name of the interaction service connected app. For example, <code>Partner1_ChannelDefinition1</code>, where <i>Partner1</i> is the prefix and <i>ChannelDefinition1</i> is the given name.</p>
masterLabel	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation. The namespace prefix can have one of the following values.</p> <ul style="list-style-type: none"> <li>In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.</li> <li>In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.</li> </ul> <p><code>NamespacePrefix</code> is null if the publisher is Salesforce.</p>
routingOwner	<p><b>Field Type</b></p> <p>RoutingOwner (enumeration of type string)</p> <p><b>Description</b></p> <p>The system the customer uses to manage routing for Bring Your Own Channel or Bring Your Own Channel for CCaaS.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>Partner</li> <li>Salesforce</li> </ul> <p>The default value is <code>Salesforce</code>.</p> <p>For example, if set to <code>Salesforce</code>, routing is managed by the Salesforce system. If set to <code>Partner</code>, routing is managed by the partner's telephony or Contact Center as a Service (CCaaS) system.</p> <p>For Bring Your Own Channel, this value must be set to <code>Salesforce</code>.</p>
supportsCustomChannelParameters	<p><b>Field Type</b></p> <p>boolean</p>

Field Name	Description
	<p><b>Description</b></p> <p>Indicates whether admins can configure custom parameters and parameter mappings for messaging channels. Custom parameters and parameter mappings are used to pass additional information at runtime to Omni-Channel flows. The default value is <code>false</code>. Available in API version 61.0.</p>
<code>supportsDoubleOptInConsent</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the channel supports (<code>true</code>) the Double Opt-In consent level. The default value is <code>false</code>. If set to true, then <code>capabilitiesSupportsExplicitConsent</code> must also be set to true. This field is optional and isn't supported for Bring Your Own Channel.</p>
<code>supportsExplicitConsent</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the channel supports (<code>true</code>) the Explicit Opt-In consent level. This field is optional.</p>
<code>supportsImplicitConsent</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the channel supports (<code>true</code>) the Implicit Opt-In consent level. This value is required and must always be set to true. The default value is false.</p>
<code>supportsIsoCountryCode</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the channel supports (<code>true</code>) ISO country codes. The default value is false.</p>
<code>supportsKeywords</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the channel supports (<code>true</code>) keywords. The default value is false.</p>

## Declarative Metadata Sample Definition

The following is an example of a ConversationChannelDefinition component.

The following is an example `package.xml` that references the previous definition.

## CurrencySettings

Represents an organization's currency settings, including supporting multiple currencies and currency effective dates. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

CurrencySettings values are stored in the `Currency.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

CurrencySettings is available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableCurrencyEffectiveDates</code>	boolean	Indicates whether effective dated currency is enabled ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> . To enable this preference, <code>enableMultiCurrency</code> must be set to <code>true</code> .
<code>enableCurrencySymbolWithMultiCurrency</code>	boolean	Indicates whether the currency symbol ( <code>true</code> ) or ISO code ( <code>false</code> ) displays in multi-currency orgs. This field has a default value of <code>false</code> . This field has no effect if <code>enableMultiCurrency</code> is set to <code>false</code> .
<code>enableMultiCurrency</code>	boolean	Indicates whether multiple currencies are enabled ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> .   <b>Note:</b> After set to <code>true</code> , this field can't be set to <code>false</code> . See <a href="#">Considerations for Enabling Multiple Currencies</a> for more information.
<code>isMultiCurrencyActivationAllowed</code>	boolean	Deprecated in API version 49.0 and later. Regardless of the value in this field, a Salesforce admin can activate multiple currencies.  In API version 48.0 and earlier, if Customizable Forecasting was enabled, this field indicated whether Salesforce Customer Support could activate multiple currencies ( <code>true</code> ) or the feature couldn't be activated ( <code>false</code> ).  This field is only visible if multiple currencies are disabled. It has a default of <code>false</code> to provide an extra layer of protection against accidentally enabling multiple currencies when Customizable Forecasting was

Field Name	Field Type	Description
		<p>enabled. In API version 48.0 and earlier, customers with Customizable Forecasting enabled in their orgs had to contact Salesforce Customer Support to activate multiple currencies. Customers set this field to <code>true</code> when Salesforce Customer Support requested that they do so to validate their request to activate multiple currencies.</p> <p> <b>Note:</b> Customizable Forecasting was retired in Summer '20. Users can't access the Customizable Forecasting feature and its underlying data via the user interface or API. To predict sales revenue and quantities from your opportunity pipeline, use Salesforce Forecasting.</p>
<code>isParenCurrencyConvDisabled</code>	<code>boolean</code>	Indicates whether parenthetical currency conversion is disabled ( <code>true</code> ) or enabled ( <code>false</code> ). This field has a default value of <code>true</code> . When this field is set to <code>false</code> , Salesforce displays converted currency amounts to users whose personal currency differs from the currency of the record they're viewing.

## Declarative Metadata Sample Definition

The following is an example of a `CurrencySettings` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<CurrencySettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableCurrencyEffectiveDates>false</enableCurrencyEffectiveDates>
  <enableCurrencySymbolWithMultiCurrency>false</enableCurrencySymbolWithMultiCurrency>
  <enableMultiCurrency>false</enableMultiCurrency>
  <isMultiCurrencyActivationAllowed>false</isMultiCurrencyActivationAllowed>
  <isParenCurrencyConvDisabled>false</isParenCurrencyConvDisabled>
</CurrencySettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Currency</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CustomAddressFieldSettings

Represents the settings for custom address fields.

### Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the “Settings” name. See [Settings](#) for more details.

### File Suffix and Directory Location

`CustomAddressFieldSettings` values are stored in the `CustomAddressField.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there is only one settings file for each settings component.

### Version

`CustomAddressFieldSettings` components are available in API version 55.0 and later.

### Fields

Field Name	Field Type	Description
<code>enableCustomAddressField</code>	boolean	<p>Indicates whether the <a href="#">Address Field Type</a> is available for custom fields (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p> <p>Custom Address Fields can't be disabled. When <code>enableCustomAddressField</code> is set to <code>true</code>, you can't change the value to <code>false</code>.</p> <p> <b>Note:</b> Before you set this field to <code>true</code>, review <a href="#">Custom Address Fields Requirements and Limitations</a> in Salesforce Help.</p>

### Declarative Metadata Sample Definition

The following is an example of a `CustomAddressFieldSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomAddressFieldSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableCustomAddressField>true</enableCustomAddressField>
</CustomAddressFieldSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>CustomAddressField</members>
```

```

    <name>Settings</name>
  </types>
  <version>55.0</version>
</Package>

```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DataDotComSettings

Represents the org's Data.com settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

DataDotComSettings values are stored in the `DataDotCom.settings` file in the `settings` folder.

## Version

DataDotComSettings components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableAccountExportButtonOff</code>	boolean	Indicates whether Account Export to Excel is enabled for Prospector ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> .
<code>enableAccountImportButtonOff</code>	boolean	Indicates whether Account Import to CRM is enabled for Prospector ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> .
<code>enableAllowDupeContactFromLead</code>	boolean	Indicates whether Prospector Lead Import Duplicate Check is enabled ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> .
<code>enableAllowDupeLeadFromContact</code>	boolean	Indicates whether Prospector Contact Import Duplicate Check is enabled ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> .
<code>enableCleanUpgradeRequested</code>	boolean	This field is no longer in use.
<code>enableContactExportButtonOff</code>	boolean	Indicates whether Contact Export to Excel is enabled for Prospector ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> .
<code>enableContactImportButtonOff</code>	boolean	Indicates whether Contact Import to CRM is enabled for Prospector ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of a DataDotComSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DataDotComSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableAccountExportButtonOff>true</enableAccountExportButtonOff>
  <enableAccountImportButtonOff>true</enableAccountImportButtonOff>
  <enableAllowDupeContactFromLead>true</enableAllowDupeContactFromLead>
  <enableAllowDupeLeadFromContact>true</enableAllowDupeLeadFromContact>
  <enableContactExportButtonOff>true</enableContactExportButtonOff>
  <enableContactImportButtonOff>true</enableContactImportButtonOff>
</DataDotComSettings>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>DataDotCom</members>
    <name>Settings</name>
  </types>
  <version>29.0</version>
</Package>
```

## DataImportManagementSettings

Represents an org's contact and leads import settings.

### Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See [Settings](#) for more details.

### File Suffix and Directory Location

DataImportManagementSettings values are stored in the `DataImportManagement.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there is only one settings file for each settings component.

### Version

DataImportManagementSettings components are available in API version 57.0 and later.

### Special Access Rules

DataImportManagementSettings is available when your org enables the DataImportManagement permission, which is only available for particular editions.

## Fields

Field Name	Description
<code>enableEasyImport</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether Basic Data Import is enabled (<code>true</code>) or not (<code>false</code>). When <code>true</code>, users are guided step by step to select how they want to import contacts and leads to Salesforce.</p>

## Declarative Metadata Sample Definition

The following is an example of a `DataImportManagementSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DataImportManagementSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableEasyImport>true</enableEasyImport>
</DataImportManagementSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>DataImportManagement</members>
    <name>Settings</name>
  </types>
  <version>57.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DeploymentSettings

Represents the settings affecting how deployments behave in the org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

`DeploymentSettings` values are stored in the `Deployment.settings` file in the `settings` directory. The `.settings` files are different from other named components, because there is only one settings file for each settings component.

## Version

DeploymentSettings components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
doesSkipAsyncApexValidation	boolean	<p>Indicates whether deployments from this org skip asynchronous Apex validations (<code>true</code>) or not (<code>false</code>). The default value is <code>true</code>.</p> <p>Set this field to <code>false</code> when an Apex class in the package you're deploying is used by an Apex batch job that could run during the deployment. The deployment of a package containing an Apex class that is used by a running batch job fails without validation.</p>

## Declarative Metadata Sample Definition

The following is an example of a DeploymentSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DeploymentSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <doesSkipAsyncApexValidation>true</doesSkipAsyncApexValidation>
</DeploymentSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Deployment</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DevHubSettings

Represents Dev Hub settings.

## Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all org settings metadata types are accessed using the Settings name. See [Settings](#) for more details.

## File Suffix and Directory Location

DevHubSettings values are stored in the `DevHub.settings` file in the `settings` folder. The `.settings` files are different from other named components because there is only one settings file for each settings component.

## Version

DevHubSettings are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableDevOpsCenterGA</code>	boolean	Indicates whether DevOps Center is enabled: <code>true</code> or <code>false</code> . When enabled, you can install and use the generally available (GA) DevOps Center package in the org.  Available in API version 56.0 and later.
<code>enableDevOpsCenter</code>	boolean	(Deprecated) Indicates whether DevOps Center beta is enabled: <code>true</code> or <code>false</code> . When enabled, you can install and use the DevOps Center beta package in the org.
<code>enablePackaging2</code>	boolean	Indicates whether unlocked and second-generation managed packaging is enabled: <code>true</code> or <code>false</code> .  To enable <code>enablePackaging2</code> , first enable <code>enableScratchOrgManagementPref</code> .
<code>enableScratchOrgManagementPref</code>	boolean	Indicates whether Dev Hub is enabled: <code>true</code> or <code>false</code> . When enabled, a Dev Hub allows you to create and manage scratch orgs.
<code>enableScratchOrgSnapshotPref</code>	boolean	Indicates whether Scratch Org Snapshots is enabled: <code>true</code> or <code>false</code> . When enabled, you can create snapshots of a fully configured scratch org. A snapshot is a point-in-time copy of a scratch org that you can use to create additional scratch orgs.  Available in API version 61.0 and later.
<code>enableShapeExportPref</code>	boolean	Indicates whether Org Shape is enabled: <code>true</code> or <code>false</code> . When enabled, you can create org shapes as the basis for scratch orgs.  Available in API version 55.0 and later.

## Declarative Metadata Sample Definition

The following is an example of a DevHubSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DevHubSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enablePackaging2>true</enablePackaging2>
```

```
<enableScratchOrgManagementPref>true</enableScratchOrgManagementPref>
</DevHubSettings>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DocumentGenerationSetting

Represents an org's settings for automatic document generation from templates. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

`DocumentGenerationSetting` components have the suffix `documentGenerationSetting` and are stored in the `documentGenerationSettings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`DocumentGenerationSetting` components are available in API version 52.0 and later.

## Special Access Rules

`DocumentGenerationSetting` is available if your org has the DocGen platform license and related addon and user licenses.

Server-side document generation isn't enabled by default, and selecting `isServerSideDocGenEnabled` isn't sufficient. To enable this feature, see the [Request Access to Server-Side Document Generation](#) knowledge article.

## Fields

Field Name	Field Type	Description
<code>documentTemplateLibraryName</code>	string	Required. The name of the library that stores the document templates to which this setting applies.
<code>generationMechanism</code>	GenerationMechanism (enumeration of type string)	Specifies how and where a document is generated. Valid values are: <ul style="list-style-type: none"> <li><code>ClientSide</code>—Generates documents in the browser with an optional preview.</li> <li><code>ServerSide</code>—Generates documents on the server and attaches them to the objects for which they're generated.</li> </ul> The default is <code>ClientSide</code> .
<code>guestAccessNamedCredential</code>	string	Specifies the named credential that lets guest users generate documents.

Field Name	Field Type	Description
<code>isServerSideDocGenEnabled</code>	boolean	Enables server-side document generation if the prerequisite license is present in the org.
<code>masterLabel</code>	string	Required. Specifies a name for the setting, such as <code>DocGen</code> .
<code>previewType</code>	PreviewType (enumeration of type string)	Specifies the format of previews of generated documents. Valid values are: <ul style="list-style-type: none"> <li><code>PDF</code>—Displays how the generated document looks in PDF format.</li> <li><code>Thumbnail</code>—Displays a miniature representation of the generated document.</li> </ul> <p>The default is <code>PDF</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of a `DocumentGenerationSetting` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DocumentGenerationSetting xmlns="http://soap.sforce.com/2021/10/metadata">
  <documentTemplateLibraryName>DocgenDocumentTemplateLibrary</documentTemplateLibraryName>

  <masterLabel>DocGen</masterLabel>
</DocumentGenerationSetting>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2021/10/metadata">
  <types>
    <members>DocumentGeneration</members>
    <name>Settings</name>
  </types>
  <version>53.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DynamicFormsSettings

Represents the settings related to Dynamic Forms.

## Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See [Settings](#) for more details.

## File Suffix and Directory Location

`DynamicFormsSettings` values are stored in the `DynamicForms.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there is only one settings file for each settings component.

## Version

`DynamicFormsSettings` components are available in API version 58.0 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
<code>enableFormsOnMobile</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Determines whether an org has Dynamic Forms for Mobile (Beta) enabled (<code>true</code>) or not (<code>false</code>).</p> <p> <b>Note:</b> This feature is a Beta Service. Customer may opt to try such Beta Service in its sole discretion. Any use of the Beta Service is subject to the applicable Beta Services Terms provided at <a href="#">Agreements and Terms</a>.</p>

## Declarative Metadata Sample Definition

The following is an example of a `DynamicFormsSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DynamicFormsSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableFormsOnMobile>true</enableFormsOnMobile>
</DynamicFormsSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>DynamicForms</members>
    <name>Settings</name>
  </types>
  <version>58.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EACSettings

Represents the Einstein Activity Capture metadata type. Use Einstein Activity Capture to add emails and events from your Microsoft or Google account to the activity timeline of related Salesforce records. Automatically sync contact and event data between your Microsoft or Google account and Salesforce. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

`EACSettings` components have the suffix `EAC` and are stored in the `Settings` folder.

## Version

`EACSettings` components are available in API version 48.0 and later.

## Fields

Field Name	Field Type	Description
<code>addRcCompToFlexiPages</code>	boolean	Indicates whether the Recommended Connections component is automatically added ( <code>true</code> ) to standard contact, lead, and person account Lightning record pages or not ( <code>false</code> ). Default value is <code>false</code> . Available in API version 53.0 and later.
<code>autoContactCreationPref</code>	boolean	Indicates whether Automatic Contact Creation is enabled ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> . Available in API version 61.0 and later.
<code>autoContactEnrichmentPref</code>	boolean	Indicates whether Automatic Contact Enhancements is enabled ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> . Available in API version 61.0 and later.
<code>automatedEmailFilter</code>	boolean	Indicates whether the setting to prevent automated emails from being shared is on ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 54.0 and later.

Field Name	Field Type	Description
<code>autoPopulateGoogleMeetLinks</code>	boolean	<p>Indicates whether the details to join with Google Meet are added (<code>true</code>) to the Google version of the event or not (<code>false</code>) when sales reps create events in Salesforce. The Google Meet details don't sync back to Salesforce.</p> <p>Default value is <code>false</code>.</p> <p>Available in API version 53.0 and later.</p>
<code>enableActivityAnalyticsPref</code>	boolean	<p>Indicates whether the Activities dashboard is enabled (<code>true</code>) or not (<code>false</code>).</p> <p>For orgs that enable Einstein Activity Capture after the Summer '21 release, the default value is <code>false</code>.</p> <p>Available in API version 53.0 and later.</p>
<code>enableActivityCapture</code>	boolean	<p>Indicates whether Einstein Activity Capture is enabled (<code>true</code>) or not (<code>false</code>). <code>provisionProductivityFeatures</code> must be <code>true</code> to use this feature. To ensure that your org's requirements for handling sensitive data are met, see <a href="#">Einstein Activity Capture Considerations</a>.</p> <p>Default value is <code>false</code>.</p>
<code>enableActivityMetrics</code>	boolean	<p>Indicates whether Activity Metrics are enabled (<code>true</code>) or not (<code>false</code>). <code>enableActivityCapture</code> must be <code>true</code> to use this feature. Before enabling this feature, see <a href="#">Considerations for Using Activity Metrics</a>.</p> <p>Default value is <code>false</code>.</p>
<code>enableActivitySyncEngine</code>	boolean	<p>Indicates whether combined sync and capture is enabled for events, contacts, and emails (<code>true</code>) or not (<code>false</code>).</p> <p>Default value is <code>false</code>.</p>
<code>enableEACForEveryonePref</code>	boolean	<p>Indicates whether users who have the <code>enableActivityCapture</code> set to <code>false</code> can still see emails and events in their Salesforce timeline (<code>true</code>) or not (<code>false</code>).</p> <p>Default value is <code>true</code>.</p>
<code>enableEnforceEacSharingPref</code>	boolean	<p>Indicates whether new Einstein Activity Capture users are required to keep their activity sharing setting as Don't Share (<code>true</code>) or not (<code>false</code>). Users can still share individual emails and events, and respond to sharing requests from other users.</p>
<code>enableInboxActivitySharing</code>	boolean	<p>Indicates whether the default activity sharing for new users is set to <code>Everyone</code> (<code>true</code>) or not (<code>false</code>).</p> <p>For example, if <code>enableInboxActivitySharing</code> is <code>true</code>, then new Einstein Activity Capture users have their activity sharing set to <code>Everyone</code> by default. This setting does not affect the activity sharing setting of existing users.</p>

Field Name	Field Type	Description
		Default value is <code>true</code> .
<code>enableInsightsInTimeline</code>	<code>boolean</code>	Indicates whether Email Insights is enabled ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>true</code> .
<code>enableInsightsInTimelineEacStd</code>	<code>boolean</code>	Indicates whether Email Insights is enabled for users with an Einstein Activity Capture Standard permission set ( <code>true</code> ) or not ( <code>false</code> ). For more information, see "Turn On Einstein Email Insights" in Salesforce Help. Default value is <code>false</code> .
<code>provisionProductivityFeatures</code>	<code>boolean</code>	Indicates whether your org is ready for productivity features to be enabled ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> .
<code>relationshipGraphPref</code>	<code>boolean</code>	Indicates whether Buyer Relationship Map is enabled ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>true</code> . Available in API version 61.0 and later.
<code>salesforceEventsOnlyPref</code>	<code>boolean</code>	Indicates whether the activity timeline shows only events that are Salesforce records ( <code>true</code> ) or not ( <code>false</code> ). For more information, see <a href="#">Guidelines for Using Events with Einstein Activity Capture</a> Available in API version 53.0 and later.
<code>sensitiveEmailFilter</code>	<code>boolean</code>	Indicates whether the setting to prevent sensitive emails from being shared is on ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 54.0 and later.
<code>syncInternalEvents</code>	<code>boolean</code>	Indicates whether internal events sync between the connected account and Salesforce ( <code>true</code> ) or not ( <code>false</code> ). Events are internal when all attendees are part of the internal domain. Available in API version 53.0 and later.

## Declarative Metadata Sample Definition

The following is an example of the EAC.settings file:

```
<?xml version="1.0" encoding="UTF-8"?>
<EACSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableActivityCapture>true</enableActivityCapture>
  <enableActivityMetrics>true</enableActivityMetrics>
  <enableActivitySyncEngine>true</enableActivitySyncEngine>
  <enableEACForEveryonePref>true</enableEACForEveryonePref>
  <enableInboxActivitySharing>true</enableInboxActivitySharing>
```

```
<enableInsightsInTimeline>true</enableInsightsInTimeline>
<enableInsightsInTimelineEacStd>true</enableInsightsInTimelineEacStd>
<provisionProductivityFeatures>true</provisionProductivityFeatures>
</EACSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the EAC settings metadata:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>EAC</members>
    <name>Settings</name>
  </types>
  <version>29.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EinsteinAgentSettings

Represents settings for Einstein classification apps, Einstein Case Classification and Einstein Case Wrap-Up, in an org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

EinsteinAgentSettings values are stored in the `EinsteinAgent.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

EinsteinAgentSettings components are available in API version 52.0 and later. In API version 52.0, we renamed CaseClassificationSettings components to EinsteinAgentSettings components to reflect how we consolidated settings for Einstein Case Classification and Einstein Case Wrap-Up. CaseClassificationSettings components are available in API version 47.0 through 51.0.

## Fields

Field Name	Field Type	Description
<code>einsteinAgentRecommendations</code>	boolean	Indicates whether Einstein classification apps are enabled in your org. The default value is <code>false</code> .

Field Name	Field Type	Description
reRunAttributeBasedRules	boolean	If <code>true</code> , skills-based routing rules are run after Einstein Case Classification automatically updates field values. The default value is <code>false</code> .
runAssignmentRules	boolean	If <code>true</code> , assignment rules are run after Einstein Case Classification automatically updates field values. The default value is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of a `EinsteinAgentSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<EinsteinAgentSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <einsteinAgentRecommendations>true</einsteinAgentRecommendations>
  <reRunAttributeBasedRules>true</reRunAttributeBasedRules>
  <runAssignmentRules>true</runAssignmentRules>
</EinsteinAgentSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>EinsteinAgent</members>
    <name>Settings</name>
  </types>
  <version>52.0</version>
</Package>
```

## EmailAdministrationSettings

Represents an organization's email administration settings, including email deliverability, security compliance, relay configurations, and system notifications. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

`EmailAdministrationSettings` values are stored in the `EmailAdminstration.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`EmailAdministrationSettings` is available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
enableComplianceBcc	boolean	Indicates whether a copy of each outbound email message is sent to an email address you specify ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> .   <b>Note:</b> To use this feature, you must specify an email address in <b>Compliance BCC Email</b> in Setup.
enableEmailConsentManagement	boolean	Indicates whether Enforce Email Privacy Settings is enabled ( <code>true</code> ) or not ( <code>false</code> ). When enabled, Salesforce respects each recipient's email privacy preferences. Default value is <code>false</code> .
enableEmailSenderIdCompliance	boolean	Indicates whether outgoing emails comply with Sender ID email protocols ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> . To enable this preference, <code>enableEmailSpfCompliance</code> must be set to <code>true</code> .   <b>Note:</b> Evaluate the multiple standard email security protocols (SPF, DKIM, and DMARC) supported by Salesforce before you enable this setting.
enableEmailSpfCompliance	boolean	Indicates whether outgoing emails comply with Sender Policy Framework (SPF) email authentication ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>true</code> .
enableEmailToSalesforce	boolean	Indicates whether Email to Salesforce is enabled ( <code>true</code> ) or disabled ( <code>false</code> ). This field has a default value of <code>false</code> .
enableEmailWorkflowApproval	boolean	Indicates whether users can respond to email approval requests directly from their email ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> . See <a href="#">Considerations for Email Approval</a> before enabling this field.
enableEnhancedEmailEnabled	boolean	Indicates whether Enhanced Email is enabled ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>true</code> .
enableHandleBouncedEmails	boolean	Indicates whether emails sent from Salesforce to an invalid email address bounce back to Salesforce ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>true</code> . With bounce handling enabled, reps know which lead, contact, or person account has a bad email address, and they know which specific email wasn't delivered.
enableHtmlEmail	boolean	Indicates whether users receive Email-To-Case emails in HTML format ( <code>true</code> ) or receive a text version instead ( <code>false</code> ). This field has a default value of <code>false</code> . When this field is set to <code>true</code> , users receive a warning message

Field Name	Field Type	Description
		about potential malicious HTML before they view incoming HTML email content.
<code>enableInternationalEmailAddresses</code>	boolean	Indicates whether non-Latin-based characters are allowed in email addresses ( <code>true</code> ) or not ( <code>false</code> ) when sending emails to and from Salesforce. This field has a default value of <code>true</code> in orgs created in Summer '20 or later. In orgs created in Spring '20 or earlier, the default value is <code>false</code> . Available in API version 49.0 and later.   <b>Note:</b> Review the Email Address Internationalization prerequisites and considerations in Salesforce Help before enabling this setting.
<code>enableListEmailLogActivities</code>	boolean	Indicates whether Salesforce logs sent list emails as activities ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>true</code> .
<code>enableResendBouncedEmails</code>	boolean	Indicates whether the system forwards a copy of each bounced email message to the sender ( <code>true</code> ) or only displays the bounce alert ( <code>false</code> ). This field has a default value of <code>false</code> . To enable this preference, <code>enableHandleBouncedEmails</code> must be set to <code>true</code> .
<code>enableRestrictTlsToDomains</code>	boolean	Indicates whether the selected Transport Layer Security (TLS) setting applies only to specific domains ( <code>true</code> ) or applies to all domains ( <code>false</code> ). This field has a default value of <code>false</code> .   <b>Note:</b> To enable this preference, you must specify a <b>TLS Setting</b> other than Preferred and provide the comma-separated list of domains through <b>Deliverability</b> in Setup. When this field is set to <code>true</code> , any domains not in the list use the system default TLS Setting of Preferred.
<code>enableSendThroughGmailPref</code>	boolean	Deprecated.
<code>enableSendViaExchangePref</code>	boolean	Indicates whether users can use Office 365 to send emails ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> .
<code>enableSendViaGmailPref</code>	boolean	Indicates whether users can use Gmail to send emails ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> .
<code>enableUseOrgFootersForExtTrans</code>	boolean	Indicates whether emails sent through external email services (such as Gmail or Office 365) include the Salesforce footer ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> .

Field Name	Field Type	Description
sendMassEmailNotification	boolean	Indicates whether users receive an auto-generated status email from Salesforce for each mass email they send ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>true</code> .
sendTextOnlySystemEmails	boolean	Indicates whether all system emails are sent via text only ( <code>true</code> ) or allow other formats ( <code>false</code> ). This field has a default value of <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of an `EmailAdministrationSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
  <EmailAdministrationSettings xmlns="http://soap.sforce.com/2006/04/metadata">

    <enableEmailWorkflowApproval>false</enableEmailWorkflowApproval>
    <enableComplianceBcc>false</enableComplianceBcc>
    <enableEmailSenderIdCompliance>false</enableEmailSenderIdCompliance>
    <enableEmailSpfCompliance>true</enableEmailSpfCompliance>
    <enableEmailToSalesforce>false</enableEmailToSalesforce>
    <enableHandleBouncedEmails>true</enableHandleBouncedEmails>
    <enableHtmlEmail>true</enableHtmlEmail>
    <enableInternationalEmailAddresses>true</enableInternationalEmailAddresses>

    <enableResendBouncedEmails>false</enableResendBouncedEmails>
    <enableRestrictTlsToDomains>false</enableRestrictTlsToDomains>
    <sendMassEmailNotification>true</sendMassEmailNotification>
    <sendTextOnlySystemEmails>false</sendTextOnlySystemEmails>
    <enableUseOrgFootersForExtTrans>false</enableUseOrgFootersForExtTrans>
    <enableSendViaGmailPref>false</enableSendViaGmailPref>
    <enableSendViaExchangePref>true</enableSendViaExchangePref>
    <enableListEmailLogActivities>false</enableListEmailLogActivities>
    <enableEnhancedEmailEnabled>false</enableEnhancedEmailEnabled>
    <enableEmailConsentManagement>false</enableEmailConsentManagement>
  </EmailAdministrationSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
  <Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
      <members>EmailAdministration</members>
      <name>Settings</name>
    </types>
    <version>49.0</version>
  </Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Salesforce Help: Email Address Internationalization](#)

## EmailIntegrationSettings

Represents an org's settings for the Outlook integration, Gmail integration, and Salesforce Inbox. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

EmailIntegrationSettings values are stored in the `EmailIntegration.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

EmailIntegrationSettings fields are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>doesEmailLogAsEmailMessageInOutlook</code>	boolean	Indicates whether the Outlook integration logs emails to the Email Message object ( <code>true</code> ) or as tasks ( <code>false</code> ). The default value is <code>true</code> .  This field can only be used if the <code>enableOutlookIntegration</code> field is set to <code>true</code> .
<code>doesGmailStayConnectedToSalesforce</code>	boolean	Indicates whether Gmail integration users log in to Salesforce from Gmail each time their session expires. If set to <code>true</code> , users log in from the Gmail integration one time, and their credentials are remembered the next time they use the Gmail integration. If set to <code>false</code> , users log in to Salesforce from the Gmail integration each time their Salesforce session expires. The default value is <code>false</code> .  This field can only be used if the <code>enableGmailIntegration</code> field is set to <code>true</code> .
<code>enableContactAndEventSync</code>	boolean	Indicates whether users can sync calendar events and contacts between Salesforce and their Microsoft and Google accounts ( <code>true</code> ) or not ( <code>false</code> ). Lightning Sync or Einstein Activity Capture must be enabled to use this feature. The default value is <code>false</code> .

Field Name	Field Type	Description
		Available in API version 48.0 and later.
<code>enableContextualEverywhere</code>	boolean	Indicates whether contextual insights in Sales Cloud Everywhere, available in the Salesforce Chrome extension, are enabled ( <code>true</code> ) or not ( <code>false</code> ).  This field is available in API version 58.0 and later.
<code>enableEmailTrackingInMobile</code>	boolean	Indicates whether Salesforce Inbox users can track emails ( <code>true</code> ) or not ( <code>false</code> ) while in the Outlook integration with Inbox or the Gmail integration with Inbox. It also controls email tracking in the Inbox mobile app and legacy versions of Inbox. The default value is <code>true</code> .
<code>enableEngageForOutlook</code>	boolean	Indicates whether Engage For Outlook is enabled ( <code>true</code> ) or not ( <code>false</code> ). When set to <code>true</code> , Engage users can connect their Outlook account and send Engage emails from their Outlook inbox.
<code>enableExtensionHostUnrestricted</code>	boolean	Indicates whether the contextual web experience is enabled in the chrome extension or not.
<code>enableGmailIntegration</code>	boolean	Indicates whether the Gmail integration is enabled ( <code>true</code> ) or not ( <code>false</code> ). When set to <code>true</code> , G Suite users with the Gmail integration can connect their Gmail account and work with Salesforce data in their email. The default value is <code>true</code> .
<code>enableInboxInternalEmailTracking</code>	boolean	Indicates whether a read-receipt status is shown for emails that are sent within the same domain ( <code>true</code> ) or not ( <code>false</code> ).  This field is available in API version 58.0 and later.
<code>enableInboxMobileIntune</code>	boolean	Indicates whether Inbox is enabled to use Microsoft Intune to manage security settings ( <code>true</code> ) or not ( <code>false</code> ). When set to <code>true</code> , Inbox mobile users need a Microsoft Intune license to log in to the app. The default value is <code>false</code> .  Available in API version 50.0 and later.
<code>enableOutlookIntegration</code>	boolean	Indicates whether the Outlook integration is enabled ( <code>true</code> ) or not ( <code>false</code> ). When set to <code>true</code> , Outlook users with the Outlook integration can connect their Outlook account and work with Salesforce data in their email. The default value is <code>false</code> .
<code>enableProductivityFeatures</code>	boolean	Indicates whether Inbox features, such as Availability and Send later, are available ( <code>true</code> ) or not available ( <code>false</code> ) in the Outlook or Gmail integration. The default value is <code>false</code> .  This field can only be used if either the <code>enableOutlookIntegration</code> or <code>enableGmailIntegration</code> field is set to <code>true</code> and if the org has an Inbox license.

Field Name	Field Type	Description
		 <b>Note:</b> To see Inbox features, users must also have either the Inbox with Einstein Activity Capture or the Inbox without Einstein Activity capture permission set.
<code>enableSupplementalContactInfoInMobile</code>	boolean	Indicates whether Salesforce Inbox mobile app users see third-party contact information when contacts are shown ( <code>true</code> ) or not ( <code>false</code> ) in the Inbox mobile app. The default value is <code>false</code> .
<code>isLayoutCustomizationAllowed</code>	boolean	<p>Indicates whether Salesforce admins are allowed (<code>true</code>) or not allowed (<code>false</code>) to create custom email application panes using the Lightning App Builder. The email application pane defines the layout of the Salesforce pane in Outlook and Gmail. The default value is <code>true</code>.</p> <p>This field can only be used if either the <code>enableOutlookIntegration</code> or <code>enableGmailIntegration</code> field is set to <code>true</code>.</p>
<code>orgIsSyncingEventsOutbound</code>	boolean	<p>Indicates whether changes to Salesforce events sync to Outlook and Google calendars (<code>true</code>) or not (<code>false</code>).</p> <p> <b>Note:</b> This field is set by Salesforce. We do not recommend that you set this field manually, as doing so may cause interruptions in your org's event syncing.</p> <p>This field is available in API version 50.0 and later</p>
<code>shouldUseTrustedDomainsList</code>	boolean	<p>Indicates if the web domains listed in the Outlook Integration &amp; Sync page in Salesforce Setup are supported (<code>true</code>) or not (<code>false</code>). These domains are for users who access email using Outlook on the web. The default value is <code>true</code>.</p> <p>This field can only be used if the <code>enableOutlookIntegration</code> field is set to <code>true</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of a `EmailIntegrationSettings` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<EmailIntegrationSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableContactAndEventSync>true</enableContactAndEventSync>
  <enableProductivityFeatures>true</enableProductivityFeatures>
  <doesGmailStayConnectedToSalesforce>true</doesGmailStayConnectedToSalesforce>
  <enableOutlookIntegration>true</enableOutlookIntegration>
  <enableGmailIntegration>true</enableGmailIntegration>
  <isLayoutCustomizationAllowed>true</isLayoutCustomizationAllowed>
  <doesEmailLogAsEmailMessageInOutlook>false</doesEmailLogAsEmailMessageInOutlook>
  <shouldUseTrustedDomainsList>false</shouldUseTrustedDomainsList>
  <enableEmailTrackingInMobile>true</enableEmailTrackingInMobile>
  <enableSupplementalContactInfoInMobile>false</enableSupplementalContactInfoInMobile>
</EmailIntegrationSettings>
```

```
<enableEngageForOutlook>true</enableEngageForOutlook>
</EmailIntegrationSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>EmailIntegration</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EmailTemplateSettings

Represents an org's email template settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

`EmailTemplateSettings` values are stored in the `EmailTemplate.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`EmailTemplateSettings` is available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableTemplateEnhancedFolderPref</code>	boolean	Indicates whether Folders and Enhanced Sharing for Email Templates is enabled ( <code>true</code> ) or not ( <code>false</code> ). This feature allows users to create and manage folders for email templates.  Default value is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of the package file.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>EmailTemplate</members>
    <name>Settings</name>
  </types>
</Package>
```

The package file references the following EmailTemplate.settings file.

```
<?xml version="1.0" encoding="UTF-8"?>
<EmailTemplateSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableTemplateEnhancedFolderPref>true</enableTemplateEnhancedFolderPref>
</EmailTemplateSettings>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EmployeeUserSettings

Represents the employee-user settings used for automatically creating or syncing employee and user data in work.com orgs. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

A `EmployeeUserSettings` component file has the suffix `.settings` and is stored in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

### Version

`EmployeeUserSettings` components are available in API version 50.0 and later.

### Special Access Rules

Access to the `EmployeeUserSettings` type requires the Workplace Command Center permission set license available in the org and assigned to the user. The `WorkplaceCommandCenterUser` scratch org feature must also be enabled in the org.

## Fields

Field Name	Field Type	Description
emailEncoding	string	<p>Required. The default encoding setting is Unicode: UTF-8.</p> <p>Valid values include:</p> <ul style="list-style-type: none"> <li>UTF-8—Unicode (UTF-8)</li> <li>ISO-8859-1—General US &amp; Western Europe (ISO-8859-1, ISO-LATIN-1)</li> <li>Shift_JIS—Japanese (Shift-JIS)</li> <li>ISO-2022-JP—Japanese (JIS)</li> <li>EUC-JP—Japanese (EUC-JP)</li> <li>x-SJIS_0213—Japanese (Shift-JIS_2004)</li> <li>ks_c_5601-1987—Korean (ks_c_5601-1987)</li> <li>Big5—Traditional Chinese (Big5)</li> <li>GB2312—Simplified Chinese (GB2312)</li> <li>Big5-HKSCS—Traditional Chinese Hong Kong (Big5-HKSCS)</li> </ul>
enableEmployeeAutoCreateUser	boolean	If <code>true</code> , users are auto-created when a new employee record is created. The default value for this field is <code>false</code> .
enableEmployeeIsSourceOfTruth	boolean	If <code>true</code> , the employee record is the source of truth. The default value for this field is <code>false</code> .
permset	string	Represents a set of permissions that's used to grant more access to a user. You can use permission sets to grant access but not to deny access.
profile	string	Required. Represents a user profile. A profile defines a user's permission to perform different functions within Salesforce.
usernameSuffix	string	Represents a domain name. We create a unique login by combining this domain name with each employee's username.

## Declarative Metadata Sample Definition

The following is an example `EmployeeUser.settings-meta.xml` that deploys the `EmployeeUserSettings` metadata to an org. The file is in the dir path `force-app/main/default/settings`:

```
<?xml version="1.0" encoding="UTF-8"?>
<EmployeeUserSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <emailEncoding>ISO-8859-1</emailEncoding>
  <enableEmployeeAutoCreateUser>true</enableEmployeeAutoCreateUser>
  <enableEmployeeIsSourceOfTruth>false</enableEmployeeIsSourceOfTruth>
  <profile>MarketingProfile</profile>
  <usernameSuffix>example.com</usernameSuffix>
</EmployeeUserSettings>
```

The following example of `package.xml` file retrieves the `EmployeeUserSettings` metadata:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <name>Settings</name>
    <members>EmployeeUser</members>
  </types>
  <version>50.0</version>
</Package>
```

## EnhancedNotesSettings

Represents an org's enhanced note settings, such as enabling enhanced notes and enabling tasks in enhanced notes. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`EnhancedNotesSettings` values are stored in the `EnhancedNotes.settings` file in the `settings` directory.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

### Version

`EnhancedNotesSettings` is available in API version 47.0 and later.

### Fields

Field Name	Field Type	Description
<code>enableEnhancedNotes</code>	boolean	Indicates whether enhanced notes are enabled ( <code>true</code> ) or not ( <code>false</code> ). With enhanced notes, users can relate a note to multiple records, access version history, and enjoy enhanced format options. Users must have the Use New Notes permission to use enhanced notes. Default value is <code>true</code> .
<code>enableTasksOnEnhancedNotes</code>	boolean	Indicates whether users can create tasks from notes ( <code>true</code> ) or not ( <code>false</code> ). In the Salesforce app, users can create a task from a note by swiping a line on the note. Alternatively, they can tap in the toolbar to add or update the status of an action item. Users must have the Use New Notes permission to use enhanced notes. Default value is <code>true</code> .

## Declarative Metadata Sample Definition

The following is an example of the `EnhancedNotesSettings.settings` file:

```
<?xml version="1.0" encoding="UTF-8"?>
<EnhancedNotesSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableEnhancedNotes>true</enableEnhancedNotes>
  <enableTasksOnEnhancedNotes>true</enableTasksOnEnhancedNotes>
</EnhancedNotesSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the `EnhancedNotesSettings` metadata:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>EnhancedNotes</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## EncryptionKeySettings

Represents an org's encryption key settings, such as customer-supplied keys options and key derivation settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

`EncryptionKeySettings` values are stored in the `EncryptionKey.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`EncryptionKeySettings` is available in API versions 47.0 and later.

## Special Access Rules

To enable `EncryptionKeySettings`, you need the `Customize Application` and `Manage Encryption Keys` permissions.

## Fields

Field Name	Field Type	Description
<code>enableCacheOnlyKeys</code>	boolean	Indicates whether the Cache-Only Key Service is available ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . If set to <code>true</code> , users can

Field Name	Field Type	Description
		configure a cache-only key callout connection and apply key material stored outside of Salesforce to data on demand.
canOptOutOfDerivationWithBYOK	boolean	Indicates that users can opt out of key derivation processes on a key-by-key basis when they upload key material ( <code>true</code> ) or can't ( <code>false</code> ). The default value is <code>false</code> .
enableReplayDetection	boolean	Indicates whether cache-only key callouts are protected from replay attacks by a nonce ( <code>true</code> ) or not ( <code>false</code> ). Requires <code>enableCacheOnlyKeys="true"</code> before setting <code>enableReplayDetection</code> to <code>true</code> .

## Declarative Metadata Sample Definition

The following is an example of the `EncryptionKey.settings` file:

```
<?xml version="1.0" encoding="UTF-8"?>
<EncryptionKeySettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableCacheOnlyKeys>true</enableCacheOnlyKeys>
  <enableReplayDetection>true</enableReplayDetection>
  <canOptOutOfDerivationWithBYOK>true</canOptOutOfDerivationWithBYOK>
</EncryptionKeySettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the encryption key settings metadata for an organization:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>EncryptionKey</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EntitlementSettings

Represents an organization's entitlement settings.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

EntitlementSettings values are stored in the `Entitlements.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

EntitlementSettings is available in API version 27.0 and later.

## Fields

Field Name	Field Type	Description
<code>assetLookupLimitedToActiveEntitlementsOnAccount</code>	boolean	Indicates whether entitlements-related lookup filters on cases return only the assets related to the active entitlements on the case's account ( <code>true</code> ) or not ( <code>false</code> ).
<code>assetLookupLimitedToActiveEntitlementsOnContact</code>	boolean	Indicates whether entitlements-related lookup filters on cases return only the assets related to the active entitlements on the case's contact ( <code>true</code> ) or not ( <code>false</code> ).
<code>assetLookupLimitedToSameAccount</code>	boolean	Indicates whether entitlements-related lookup filters on cases return only the assets related to the case's account ( <code>true</code> ) or not ( <code>false</code> ).
<code>assetLookupLimitedToSameContact</code>	boolean	Indicates whether entitlements-related lookup filters on cases return only the assets related to the case's contact ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableEntitlements</code>	boolean	Indicates whether entitlements are enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableEntitlementVersioning</code>	boolean	Indicates whether entitlement versioning is enabled ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 28.0 and later.
<code>enableMilestoneFeedItem</code>	boolean	When set to <code>true</code> , indicates whether to post to the feed and the record owner's profile page when a milestone is completed or violated. When set to <code>false</code> , indicates that no post occurs when a milestone is completed or violated. This field is available in API version 47.0 and later.
<code>enableMilestoneStoppedTime</code>	boolean	Indicates whether to show the <b>Stopped Time</b> and <b>Actual Elapsed Time</b> fields on an entitlement milestone ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 47.0 and later.
<code>entitlementLookupLimitedToActiveStatus</code>	boolean	Indicates whether entitlements-related lookup filters on cases return only active entitlements ( <code>true</code> ) or not ( <code>false</code> ).

Field Name	Field Type	Description
entitlementLookupLimitedToSameAccount	boolean	Indicates whether entitlements-related lookup filters on cases return only the entitlements related to the case's account ( <code>true</code> ) or not ( <code>false</code> ).
entitlementLookupLimitedToSameAsset	boolean	Indicates whether entitlements-related lookup filters on cases return only the entitlements related to the case's asset ( <code>true</code> ) or not ( <code>false</code> ).
entitlementLookupLimitedToSameContact	boolean	Indicates whether entitlements-related lookup filters on cases return only the entitlements related to the case's contact ( <code>true</code> ) or not ( <code>false</code> ).
ignoreMilestoneBusinessHours	boolean	Indicates whether to show the time remaining on an event milestone in actual hours ( <code>true</code> ) or business hours ( <code>false</code> ).  This field is available in API version 47.0 and later.

## Declarative Metadata Sample Definition

This is a sample entitlements settings file.

```
<?xml version="1.0" encoding="UTF-8"?>
<EntitlementSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <assetLookupLimitedToActiveEntitlementsOnAccount>
    false
  </assetLookupLimitedToActiveEntitlementsOnAccount>
  <assetLookupLimitedToActiveEntitlementsOnContact>
    false
  </assetLookupLimitedToActiveEntitlementsOnContact>
  <assetLookupLimitedToSameAccount>
    false
  </assetLookupLimitedToSameAccount>
  <assetLookupLimitedToSameContact>
    false
  </assetLookupLimitedToSameContact>
  <enableEntitlements>
    true
  </enableEntitlements>
  <entitlementLookupLimitedToActiveStatus>
    false
  </entitlementLookupLimitedToActiveStatus>
  <entitlementLookupLimitedToSameAccount>
    false
  </entitlementLookupLimitedToSameAccount>
  <entitlementLookupLimitedToSameAsset>
    false
  </entitlementLookupLimitedToSameAsset>
  <entitlementLookupLimitedToSameContact>
    false
  </entitlementLookupLimitedToSameContact>
</EntitlementSettings>
```

```
</entitlementLookupLimitedToSameContact>
</EntitlementSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EventSettings

Represents an org's platform event settings for Event Monitoring.

### File Suffix and Directory Location

EventSettings components have the suffix `.settings` and are stored in the `settings` folder.

### Version

EventSettings components are available in API version 47.0 and later.

### Fields

Field Name	Field Type	Description
<code>bypassMeteringBlock</code>	boolean	Determines the behavior of metering service protection for Transaction Security policies. When <code>true</code> , metering occurs but doesn't block the user operation that triggered the policy. When <code>false</code> and a policy can't be handled within three seconds, metering occurs and the user's action is blocked. Default value is <code>false</code> .
<code>enableDeleteMonitoringData</code>	boolean	Allows ( <code>true</code> ) or disallows ( <code>false</code> ) users to delete event log files and LoginEvent data. Users require the Delete Event Monitoring Records user permission, which is available when this setting is enabled. Default value is <code>false</code> .
<code>enableDynamicStreamingChannel</code>	boolean	Enables ( <code>true</code> ) or disables ( <code>false</code> ) the dynamic creation of a streaming channel when you subscribe to generic streaming. Default value is <code>false</code> .
<code>enableEventLogGeneration</code>	boolean	Enables ( <code>true</code> ) or disables ( <code>false</code> ) the generation of event monitoring log files. Default value is <code>false</code> .
<code>enableEventLogWaveIntegration</code>	boolean	Enables ( <code>true</code> ) or disables ( <code>false</code> ) the integration of event monitoring log files and Analytics apps. Analytics apps help you visualize your user's activity. Default value is <code>false</code> .
<code>enableLightningLoggerEvents</code>	boolean	Enables ( <code>true</code> ) or disables ( <code>false</code> ) the generation of Lightning Logger events. Lightning Logger events track

Field Name	Field Type	Description
		information about custom Lightning web components. Default value is <code>false</code> . Requires Salesforce Shield or Salesforce Event Monitoring add-on subscriptions.
<code>enableLoginForensics</code>	boolean	Enables ( <code>true</code> ) or disables ( <code>false</code> ) the Login Forensics feature. Login Forensics helps you track and audit your org's user login activity. Default value is <code>false</code> . Available in API versions 47.0–49.0.   <b>Tip:</b> In versions 50.0 and later, enable <code>LoginEvent</code> on the Event Manager Setup page.
<code>enableStreamingApi</code>	boolean	Enables ( <code>true</code> ) or disables ( <code>false</code> ) Streaming API in the org. Default value is <code>true</code> .
<code>enableTerminateOldestSession</code>	boolean	Determines the behavior of legacy transaction security policies that trigger an end-session action during an API-based login (a login that doesn't come through the UI.) An end-session action occurs when a user exceeds the maximum number of allowed Salesforce sessions.  When <code>true</code> , and a user triggers an end-session action, Salesforce terminates the user's oldest session until the user is in compliance. When set to <code>false</code> , Salesforce blocks the most recent user's attempt to log in and doesn't allow a new user session. Default value is <code>false</code> . Available in API versions 47.0–49.0.   <b>Note:</b> As of Summer '20, Legacy Transaction Security is a retired feature in all Salesforce orgs.
<code>enableTransactionSecurityPolicies</code>	boolean	Enables ( <code>true</code> ) or disables ( <code>false</code> ) the ability to create and use transaction security policies in the Salesforce UI. Default value is <code>false</code> .
<code>enableApexLimitEvents</code>	boolean	Enables ( <code>true</code> ) or disables ( <code>false</code> ) the Apex Limit Events (Pilot) feature. Default value is <code>false</code> .   <b>Note:</b> The Apex Limit Events (Pilot) feature has been discontinued so don't use this field.
<code>eventLogRetentionDuration</code>	integer	Specifies the number of days (between 30 and 365) that your event log file data is retained for. If this value is not set, your event log file data is retained for your org's default retention period.

## Declarative Metadata Sample Definition

The following is an example of an `EventSettings.settings` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<EventSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableDeleteMonitoringData>true</enableDeleteMonitoringData>
  <enableDynamicStreamingChannel>false</enableDynamicStreamingChannel>
  <enableEventLogWaveIntegration>true</enableEventLogWaveIntegration>
  <enableStreamingApi>true</enableStreamingApi>
  <enableTransactionSecurityPolicies>true</enableTransactionSecurityPolicies>
</EventSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the Event settings metadata:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Event</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ExperienceBundleSettings

Represents the org setting that enables the ExperienceBundle metadata type for Aura sites in Experience Cloud. The setting doesn't affect LWR sites, which use ExperienceBundle by default. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Note:** ExperienceBundle is a text-based code structure of the settings and site components, such as pages, branding sets, and themes, that make up an Experience Builder site. Developers can quickly update and deploy one or more Experience Builder sites programmatically using their preferred development tools.

## File Suffix and Directory Location

ExperienceBundleSettings values are stored in a single file named `ExperienceBundle.settings` in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

ExperienceBundleSettings is available in API version 46.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableExperienceBundleMetadata</code>	boolean	Indicates whether the ExperienceBundle metadata type is enabled for Aura sites. Default is <code>false</code> . LWR sites use ExperienceBundle by default.

## Declarative Metadata Sample Definition

Here's an example of `ExperienceBundle.settings` that references the previous definition.

```
<ExperienceBundleSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableExperienceBundleMetadata>true</enableExperienceBundleMetadata>
</ExperienceBundleSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[ExperienceBundle](#)

## ExternalClientAppSettings

Represents settings to enable the External Client App feature and provide access to the OAuth consumer secret.

### Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types are accessed using the Settings name. See [Settings](#) for more details.

### File Suffix and Directory Location

`ExternalClientAppSettings` values are stored in the `.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there's only one settings file for each settings component.

### Version

`ExternalClientAppSettings` components are available in API version 58.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableClientSecretInRestApiAccess</code>	boolean	Indicates whether OAuth consumer secrets can be accessed through the <code>credentials</code> REST API ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 62.0 and later.
<code>enableConsumerSecretApiAccess</code>	boolean	Indicates whether OAuth consumer secrets can be accessed through Metadata API ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableExternalClientApps</code>	boolean	Indicates whether you opted in to the External Client App feature ( <code>true</code> ) or not ( <code>false</code> ). When enabled, you can configure and deploy external client apps.
<code>enablePackageEcaOauthFromDevOrg</code>	boolean	Indicates whether you can package an external client app that is owned by an org, that isn't a Dev Hub org, ( <code>true</code> ) or not ( <code>false</code> ). It's recommended that you only package OAuth-enabled external client apps that are owned by a Dev Hub org. This practice maintains the integrity of the OAuth client credentials by storing them on an org that won't be deleted. If you have other ways to maintain the OAuth client credentials, you can enable this field and package an external client app form a different type of org. External client apps built on ephemeral orgs, like Scratch orgs or sandboxes, can't be packaged even with this field set to true. This field is available in API version 62.0 and later.

## Declarative Metadata Sample Definition

The example shows a settings file component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExternalClientAppSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableClientSecretInRestApiAccess>true</enableClientSecretInRestApiAccess>
  <enableConsumerSecretApiAccess>true</enableConsumerSecretApiAccess>
  <enableExternalClientApps>true</enableExternalClientApps>
  <enablePackageEcaOauthFromDevOrg>false</enablePackageEcaOauthFromDevOrg>
</ExternalClientAppSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ExternalServicesSettings

Represents settings for an External Services registration.

## Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the “Settings” name. See [Settings](#) for more details.

## File Suffix and Directory Location

`ExternalServicesSettings` values are stored in the `externalServicesSettings.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there is only one settings file for each settings component.

## Version

`ExternalServicesSettings` components are available in API version 47.0 to 55.0. This metadata type is removed in version 56.0 and later.

As of Winter '23, External Services automatically validates the schema and provides detailed messages for any errors in the UI at registration time so that you can make corrections. See [Register an External Service](#) in Salesforce Help.

## Fields

Field Name	Description
<code>enableIgnoreUnsupportedOperations</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether your registration should ignore and filter out unsupported schema operations rather than fail the entire registration (<code>true</code>), or whether a specification with invalid schema operations can't be registered successfully (<code>false</code>). Detailed schema errors pertaining to unsupported operations are shown only if this flag is <code>false</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of an `ExternalServicesSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExternalServicesSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableIgnoreUnsupportedOperations>true</enableIgnoreUnsupportedOperations>
</ExternalServicesSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<types>
  <members>ExternalServices</members>
  <name>Settings</name>
</types>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## FieldServiceSettings

Represents an organization's Field Service settings.

To learn more about Field Service settings, see [Enable Field Service](#) in Salesforce Help.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for more details.

## Version

FieldServiceSettings is available in API version 40.0 and later.

## Fields

Field	Field Type	Description
<code>apptAssistantExpiration</code>	int	The expiration time of <code>apptAssistantInfoUrl</code> after which the customer stops seeing the mobile worker's location and estimated time of arrival. Available in API version 50.0 and later.
<code>apptAssistantInfoUrl</code>	string	The tracking URL that helps a customer see the mobile worker's estimated time of arrival and tracking information. Available in API version 50.0 and later.
<code>apptAssistantRadiusUnitValue</code>	<code>ApptAssistantRadiusUnit</code> (enumeration of type string)	The units for specifying the geofence radius. When the mobile worker enters this area, a Last Mile notification is automatically sent. Valid values are: <ul style="list-style-type: none"> <li>• Kilometer</li> <li>• Meter</li> <li>• Mile</li> <li>• Yard</li> </ul> Available in API version 50.0 and later.
<code>apptAssistantRadiusValue</code>	int	The geofence radius from the service appointment's address used for sending a notification to the customer when the mobile worker approaches the address. Available in API version 50.0 and later.
<code>apptAssistantStatus</code>	string	The status on the service appointment used to trigger En Route notification. The value has

Field	Field Type	Description
		to match one of the service appointment's Status field options. When the mobile worker selects this status on a service appointment, the customer receives the En Route notification with tracking details. Available in API version 50.0 and later.
canPopulateGoogleAddress	boolean	Allows desktop and mobile to send geolocation and map data to Google and Apple. Available in API version 57.0 and later.
canSendAppCenterCrashReports	boolean	Allows Salesforce to send crash reports to Microsoft App Center. Available in API version 57.0 and later.
canStoreMobileAnalytics	boolean	Allows third parties to store mobile analytics. Available in API version 57.0 and later.
deepLinkPublicSecurityKey	string	Provides a public security key for users accessing a deep link action in the Field Service mobile app. Hide the redirection warning by configuring the deep link URL with a security key. The deep link URL then processes the security check. Available in API version 54.0 and later.
doesAllowEditSaForCrew	boolean	Lets service crew members edit their service appointments.  This setting applies only if <code>doesShareSaWithAr</code> is selected. For assigned resources of type Crew, crew members get Read-Write access to their service appointment and, if <code>doesShareSaParentWoWithAr</code> is selected, to their service appointments' parent work orders.
doesShareSaParentWoWithAr	boolean	Shares service appointments' parent work orders with their assigned resources.  This setting applies only if <code>doesShareSaWithAr</code> is selected and sharing access for work orders is set to Private or Public Read Only. Technician assigned resources get Read-Write access to their work orders. For assigned resources of type Crew, the crew leader gets Read-Write access and crew members get Read access. If the service appointment's parent is a work order line item,

Field	Field Type	Description
		assigned resources get access to the associated work order.
doesShareSaWithAr	boolean	<p>Shares dispatched service appointments with their assigned resources.</p> <p>This setting applies only if sharing access for service appointments is set to Private or Public Read Only. Technician assigned resources get Read-Write access to their service appointments. For assigned resources of type Crew, the crew leader gets Read-Write access and crew members get Read access.</p>
enableDocumentBuilder	boolean	Enables access to Document Builder feature.
enableFloatingWorkOrder	boolean	<p>Enables floating work orders for the org.</p> <p>Allows users to create work orders with a floating recurrence cadence based on the previous work order's completion.</p>
enablePopulateWorkOrderAddress	boolean	Enables address to be populated when work orders are generated from Maintenance Plan.
enableWorkOrders	boolean	<p>Enables Work Orders for the org.</p> <p>This setting allows users to use the Work Order object, whether or not Field Service is enabled. When Field Service is enabled, you can't turn off Work Orders.</p>
enableWorkPlansAutoGeneration	boolean	<p>Allows work plans and their work steps to be generated automatically when a work order or a work order line item is newly created. The specific work plans and work steps to be generated depends on matching criteria specified in Work Plan Selection Rules.</p> <p>Available in API version 52.0 and later.</p>
enableWorkStepManualStatusUpdate	boolean	Allows a work step status to be updated manually. A prompt suggests a status update that users can accept or defer.
fieldServiceNotificationsOrgPref	boolean	<p>Turns on in-app notifications for the Salesforce mobile app and Lightning Experience users. Notifications are sent when any of the following actions occurs on a work order or work order line item that they own or follow:</p> <ul style="list-style-type: none"> <li>• A text or file post is added</li> <li>• A tracked field is updated</li> </ul>

Field	Field Type	Description
		<ul style="list-style-type: none"> <li>The record owner changes</li> <li>The resource assignments change on a related service appointment</li> </ul> <p>If the option to track all related objects is selected in the feed tracking settings for work orders, users are also notified when child records of work orders—such as service appointments—are created or deleted.</p>
fieldServiceOrgPref	boolean	Indicates whether Field Service is enabled.
isGeoCodeSyncEnabled	boolean	Syncs the location of a Service Resource to an Inventory object.
isLocationHistoryEnabled	boolean	Tracks the location history of a Service Resource.
mobileFeedbackEmails	string	Stores an email address to which a feedback email is sent when users leave feedback from the Field Service mobile app. Available in API version 54.0 and later.
o2EngineEnabled	boolean	Enables Field Service Enhanced Scheduling and Optimization. The default value is false. Available in API version 55.0 and later.
objectMappingItem	<a href="#">ObjectMappingItem</a> on page 1787	Represents an organization's custom field mapping for Work Plan or Work Step generation. Custom Fields can be mapped from WorkPlanTemplate to WorkPlan, WorkStepTemplate to WorkStep, or WorkPlanTemplateEntry to WorkStep. Available in API version 52.0 and later.
optimizationServiceAccess	boolean	Allows the optimization service to access data in your Salesforce org.
serviceAppointmentsDueDateOffsetOrgValue	int	Indicates the number of days past the Created Date that the Due Date on auto-created service appointments should fall. Work types include an option to automatically add a service appointment to new work orders or work order line items using the work type.
workOrderDurationSource	WorkOrderDurationSource (enumeration of type string)	The source for the work order duration value. Possible values are: <ul style="list-style-type: none"> <li>WorkType</li> <li>TotalFromWorkPlan</li> <li>Custom</li> </ul>

Field	Field Type	Description
		Available in API version 55.0 and later.
workOrderLineItemSearchFields	string	The work order line item fields that the search engine should scan to suggest knowledge articles on work order line items.
workOrderSearchFields	string	The work order fields that the search engine should scan to suggest knowledge articles on work orders.

## ObjectMappingItem

Represents an organization's custom field mapping for Work Plan or Work Step generation. Custom Fields can be mapped from WorkPlanTemplate to WorkPlan, WorkStepTemplate to WorkStep, or WorkPlanTemplateEntry to WorkStep. Available in API version 52.0 and later.

Field Name	Field Type	Description
mappingType	string	The type of object mapping. Valid values are: <ul style="list-style-type: none"> <li>WorkPlans_WorkPlanTemplate_WorkPlan — Maps a WorkPlanTemplate to a WorkPlan</li> <li>WorkPlans_WorkStepTemplate_WorkStep — Maps a WorkStepTemplate to a WorkStep</li> <li>WorkPlans_WorkPlanTemplateEntry_WorkStep — Maps a WorkPlanTemplateEntry to a WorkStep</li> </ul>
objectMapping	<a href="#">ObjectMapping</a> on page 1787	The object mapping details.

## ObjectMapping

Represents a map of fields in the input object to fields in the output object.

Field Name	Field Type	Description
inputObject	string	Required. The name of the object type containing the source fields for mapping. Valid values are: <ul style="list-style-type: none"> <li>WorkPlanTemplate</li> <li>WorkStepTemplate</li> <li>WorkPlanTemplateEntry</li> </ul>

Field Name	Field Type	Description
mappingFields	[ObjectMappingField on page 1788]	Required. The mapping of source object fields to target object fields.
outputObject	string	Required. The name of the object type that receives data from the source fields. Valid values are: <ul style="list-style-type: none"> <li>WorkPlan</li> <li>WorkStep</li> </ul>

## ObjectMappingField

A field name in the input object and the corresponding field name in the output object.

Field Name	Field Type	Description
inputField	string	Required. The name of a custom field supplying source data. This field is from the object specified in <code>inputObject</code> .
outputField	string	Required. The name of a custom field that receives data from the source field specified in <code>inputField</code> . This field is from the object specified in <code>outputObject</code> .

## Declarative Metadata Sample Definition

This sample file shows a subset of the possible field service settings that you can customize.

```
<?xml version="1.0" encoding="UTF-8"?>
<FieldServiceSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <doesAllowEditSaForCrew>false</doesAllowEditSaForCrew>
  <doesShareSaParentWoWithAr>false</doesShareSaParentWoWithAr>
  <doesShareSaWithAr>false</doesShareSaWithAr>
  <enableWorkOrders>false</enableWorkOrders>
  <enableWorkPlansAutoGeneration>true</enableWorkPlansAutoGeneration>
  <fieldServiceNotificationsOrgPref>false</fieldServiceNotificationsOrgPref>
  <fieldServiceOrgPref>true</fieldServiceOrgPref>
  <isGeoCodeSyncEnabled>false</isGeoCodeSyncEnabled>
  <isLocationHistoryEnabled>false</isLocationHistoryEnabled>
  <o2EngineEnabled>false</o2EngineEnabled>
  <objectMappingItem>
    <mappingType>WorkPlans_WorkPlanTemplate_WorkPlan</mappingType>
    <objectMapping>
      <inputObject>WorkPlanTemplate</inputObject>
      <mappingFields>
        <inputField>WorkPlanTemplate_CustomNumberField__c</inputField>
        <outputField>WorkPlan_CustomNumberField__c</outputField>
      </mappingFields>
      <mappingFields>
        <inputField>WorkPlanTemplate_CustomTextField__c</inputField>
        <outputField>WorkPlan_CustomPicklistField__c</outputField>
      </mappingFields>
    </objectMapping>
  </objectMappingItem>
</FieldServiceSettings>
```

```

        </mappingFields>
        <outputObject>WorkPlan</outputObject>

    <workOrderLineItemSearchFields>Subject</workOrderLineItemSearchFields>
    <workOrderSearchFields>Subject</workOrderSearchFields>
</FieldServiceSettings>

```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## FilesConnectSettings

Represents the settings that modify the Files Connect feature. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

`FilesConnectSettings` values are stored in the `FilesConnect.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there's only one settings file for each settings component.

## Version

`FilesConnectSettings` components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableContentHubAllowed</code>	boolean	Indicates whether Files Connect is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableContentHubCvtLinksAllowed</code>	boolean	Indicates whether the ability to link conversions in the feed publisher is enabled ( <code>true</code> ) or not ( <code>false</code> ) for Google Drive and Quip links.
<code>enableContentHubEOSearchLayout</code>	boolean	Indicates whether the external object's search layout can be used in Global Search ( <code>true</code> ) or not ( <code>false</code> ).

## Declarative Metadata Sample Definition

The following is an example of a `FilesConnectSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<FilesConnectSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableContentHubAllowed>false</enableContentHubAllowed>
  <enableContentHubCvtLinksAllowed>false</enableContentHubCvtLinksAllowed>
  <enableContentHubEOSearchLayout>false</enableContentHubEOSearchLayout>
</FilesConnectSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>FilesConnect</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## FileUploadAndDownloadSecuritySettings

Represents the security settings for uploading and downloading files. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`FileUploadAndDownloadSecuritySettings` components have the suffix `.settings` and are stored in the `settings` folder.

### Version

`FileUploadAndDownloadSecuritySettings` components are available in API version 39.0 and later.

### Fields

Field Name	Field Type	Description
<code>dispositions</code>	<a href="#">FileTypeDispositionAssignmentBean[]</a>	Represents the metadata used to manage filetype behavior. This field is available in API version 39.0 and later.
<code>noHtmlUploadAsAttachment</code>	<code>boolean</code>	Indicates whether to allow HTML uploads as attachments or document records. This field is available in API version 39.0 and later.

## FileTypeDispositionAssignmentBean

Represents the metadata used to manage filetype behavior.

Field Name	Field Type	Description
<code>behavior</code>	<code>FileDownloadBehavior</code> ( <a href="#">enumeration</a> of type string)	<p>One of the following values:</p> <ul style="list-style-type: none"> <li>• DOWNLOAD</li> <li>• EXECUTE</li> <li>• HYBRID</li> </ul> <p>The following filetypes are a security risk and can not have EXECUTE behavior:</p> <ul style="list-style-type: none"> <li>• EXE</li> <li>• FLASH</li> <li>• HTML</li> <li>• RFC822</li> <li>• SVG</li> <li>• TXML</li> <li>• UNKNOWN</li> <li>• WEBVIEW</li> <li>• XHTML</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>XML</li> </ul>
filetype	FileType (enumeration of type string)	<p>Although more filetypes exist, these are the only ones supported by FileTypeDispositionAssignmentBean:</p> <ul style="list-style-type: none"> <li>AVI</li> <li>EXCEL</li> <li>EXCEL_X</li> <li>EXE</li> <li>FLASH</li> <li>HTML</li> <li>INSIGHT</li> <li>MOV</li> <li>MP3</li> <li>MP4</li> <li>MPEG</li> <li>PDF</li> <li>POWER_POINT</li> <li>POWER_POINT_X</li> <li>RFC822</li> <li>SVG</li> <li>TXML</li> <li>UNKNOWN</li> <li>WAV</li> <li>WEBVIEW</li> <li>WMA</li> <li>WMV</li> <li>WORD</li> <li>WORD_X</li> <li>XHTML</li> <li>XML</li> </ul>
securityRiskFileType	boolean	Indicates filetypes that cannot have behavior set to EXECUTE, due to security risks. This field is read-only.

## Declarative Metadata Sample Definition

The following is an example of a FileUploadAndDownloadSecuritySettings component.

```
<FileUploadAndDownloadSecuritySettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <dispositions>
    <behavior>HYBRID</behavior>
  </dispositions>
</FileUploadAndDownloadSecuritySettings>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>FileUploadAndDownloadSecurity</members>
    <name>Settings</name>
  </types>
  <version>39.0</version>
</Package>

```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## FlowSettings

Represents the Salesforce settings for processes and flows, such as whether Lightning runtime for flows is enabled.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

`FlowSettings` values are stored in the `Flow.settings` file in the settings directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`FlowSettings` components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>canDebugFlowAsAnotherUser</code>	boolean	Indicates whether a flow can be debugged as another user ( <code>true</code> ) or not ( <code>false</code> ). Corresponds to the <code>Let admins debug flows as other users</code> field on the Process Automation Settings page in Setup. Available in API version 50.0 and later.
<code>doesEnforceApexCpuTimeLimit</code>	boolean	Indicates whether Salesforce accurately measures the CPU time that flows and processes consume ( <code>true</code> ) or not ( <code>false</code> ).  Corresponds to the <code>Accurately Measure the CPU Time Consumption of Flows and Processes</code> release update. Available in API version 51.0 and later.
<code>doesFormulaEnforceDataAccess</code>	boolean	Indicates whether formula resources and formula fields in a flow enforce record-level security ( <code>true</code> ) or not ( <code>false</code> ).  Corresponds to the <code>Enforce Data Access in Flow Formulas</code> critical update. Available in API version 48.0 and later.
<code>doesFormulaGenerateHtmlOutput</code>	boolean	Indicates whether flow formula functions that generate HTML, such as <code>BR()</code> , <code>IMAGE()</code> , and <code>HYPERLINK()</code> , include encoded markers ( <code>__BR_ENCODED__</code> ) ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and later.
<code>enableFlowBREncodedFixEnabled</code>	boolean	Indicates whether <code>BR()</code> functions in flow and process formulas result in a line break ( <code>true</code> ) or resolve to <code>__BR_ENCODED__</code> as a literal value ( <code>false</code> ).  Corresponds to the <code>Use the BR() Function in Flows and Processes</code> critical update.
<code>enableFlowCustomPropertyEditor</code>	boolean	Indicates whether an org has custom property editors enabled for actions and screen fields in Flow Builder ( <code>true</code> ) or not ( <code>false</code> ).  This field is available in API version 48.0 to 50.0. The field is deprecated in API version 50.0 and later. All orgs that have Flow Builder support custom property editors for actions and screen fields.
<code>enableFlowDeployAsActiveEnabled</code>	boolean	Indicates whether processes and flows can be deployed as active via change sets or Metadata API. When the value is <code>false</code> , all processes and flows are deployed as inactive. When the value is <code>true</code> , deploying an active process or flow in a production org causes your Apex tests to run. If Apex tests don't launch your org's required percentage of active processes and autolaunched flows, the deployment is rolled back.  The default value is <code>false</code> for production orgs and is <code>true</code> for non-production orgs such as scratch, sandbox, and developer orgs.

Field Name	Field Type	Description
		Corresponds to the <code>Deploy processes and flows as active</code> field on the Process Automation Settings page in Setup. The field appears in the user interface on production orgs only.
<code>enableFlowFieldFilterEnabled</code>	boolean	<p>Indicates whether flows can successfully execute Create Records and Update Records elements that update fields to which the running doesn't have edit access. By default (<code>false</code>), the Create Records or Update Records element fails and executes the fault path if it has one. When the value is <code>true</code>, the element sets only the fields that the running user can edit. No notification is sent when some fields aren't updated.</p> <p>Corresponds to the <code>Filter inaccessible fields from flow requests</code> field on the Process Automation Settings page in Setup.</p>
<code>enableFlowFormulasFixEnabled</code>	boolean	<p>Indicates whether process and flow formulas return null values when the calculations involve a null record variable or null lookup relationship field. When the value is <code>true</code>, those formulas return null values at run time. When the value is <code>false</code>, those formulas return unhandled exceptions at run time.</p> <p>Corresponds to the Check for Null Record Variables or Null Values of Lookup Relationship Fields in Process and Flow Formulas critical update.</p>
<code>enableFlowInterviewSharingEnabled</code>	boolean	<p>Indicates whether users can resume the paused flow interviews that they have edit access to. By default (<code>true</code>), users can resume interviews that are shared with them, either directly or via the role hierarchy. When the value is <code>false</code>, each paused interview can be resumed only by the interview owner or a flow admin who has view access to the interview.</p> <p>Corresponds to the <code>Let users resume shared flow interviews</code> field on the Process Automation Settings page in Setup.</p>
<code>enableFlowNullPreviousValueFix</code>	boolean	<p>Indicates whether each process evaluates criteria by always using the original record field values from when the process begins. When the value is <code>true</code>, each process with an Update Records action and multiple criteria nodes always evaluates criteria using the original field values of the record. When the value is <code>false</code>, processes evaluate the updated values of record fields that were null when the process began.</p> <p>Corresponds to the Evaluate Criteria Based on Original Record Values in the Process Builder critical update.</p>
<code>enableFlowPauseEnabled</code>	boolean	<p>Indicates whether screens can display the Pause button so that users can pause flow interviews. By default, the value is <code>false</code>.</p> <p>Corresponds to the <code>Let users pause flows</code> field on the Process Automation Settings page in Setup.</p>

Field Name	Field Type	Description
<code>enableFlowReactiveScreens</code>	boolean	<p>Indicates whether supported screen components in flows running on API version 57.0 and 58.0 can react to changes in other components on the same screen. This setting isn't applicable to flows running on API version 59.0 and later. By default, the value is <code>false</code>. To make a component reactive, reference the output of another component on the same screen in the configuration pane.</p> <p>Corresponds to the <code>Enable Reactive Components for Specific Flow Versions</code> field on the Process Automation Settings page in Setup.</p>
<code>enableFlowUseApexExceptionEmail</code>	boolean	<p>Indicates whether process and flow error emails are sent to:</p> <ul style="list-style-type: none"> <li>The user who last modified the process or flow (<code>false</code>)</li> <li>The addresses set on the Apex Exception Email page in Setup (<code>true</code>)</li> </ul> <p>By default, the value is <code>false</code>. Corresponds to the <code>Send Process or Flow Error Email to</code> field on the Process Automation Settings page in Setup.</p>
<code>enableFlowViaRestUsesUserCtxt</code>	boolean	<p>Indicates whether a flow that runs via REST API uses the running user's profile and permission sets to determine the object permissions and field-level access of the flow.</p> <p>Corresponds to the Run Flows in User Context via REST API critical update. Available in API version 54.0 and later.</p>
<code>enableInvocableFlowFixEnabled</code>	boolean	<p>Removed in API version 50.0 and later.</p> <p>Indicates whether all autolaunched flow interviews are executed when they're invoked in bulk from a process or the Invocable Actions resource in REST API (<code>true</code>) or not (<code>false</code>). When the value is <code>false</code>, flow interviews that share identical input parameters aren't executed.</p> <p>Corresponds to the Execute All Flow Interviews When Invoked in Bulk critical update.</p>
<code>enableLightningRuntimeEnabled</code>	boolean	<p>Indicates whether flows that are launched from a URL or from Setup use the Lightning runtime experience (<code>true</code>) or the Classic runtime experience (<code>false</code>). By default, the value is <code>true</code>.</p> <p>Corresponds to the <code>Enable Lightning runtime for flows</code> field on the Process Automation Settings page in Setup.</p>
<code>isAccessToInvokedApexRequired</code>	boolean	<p>Indicates whether flows can invoke Apex classes only when the running users' profiles or permission sets include access to those Apex classes. When the value is <code>false</code>, Apex class security doesn't apply to flows.</p> <p>Corresponds to the Require User Access to Apex Classes Invoked by Flow critical update.</p>

Field Name	Field Type	Description
		This field is available in API versions 47.0 to 58.0. The field is deprecated in API version 59.0 and later.
<code>isApexPluginAccessModifierRespected</code>	boolean	<p>Indicates whether flows respect the public access modifiers for legacy Apex actions. When the value is <code>true</code>:</p> <ul style="list-style-type: none"> <li>Flows fail when they execute public legacy Apex actions from a different namespace.</li> <li>Public legacy Apex actions from a different namespace aren't available in Flow Builder.</li> <li>Global legacy Apex actions with public <code>describe</code> or <code>invoke</code> methods are unavailable to flows in a different namespace.</li> </ul> <p>When the value is <code>false</code>, you can add public legacy Apex actions to flows even though they're not supported. Also, global legacy Apex actions with public <code>describe</code> or <code>invoke</code> methods are available to flows in a different namespace.</p> <p>Corresponds to the Make Flows Respect Access Modifiers for Legacy Apex Actions critical update. Available in API version 48.0 and later.</p>
<code>isEnhancedFlowListViewVisible</code>	boolean	Indicates whether the enhanced Flows list view in Lightning Experience replaces the Classic Flows list view ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>true</code> . If the field is set to <code>false</code> , the Classic Flows list view replaces the enhanced list view.
<code>isFlowApexContextRetired</code>	boolean	<p>Indicates whether the rules for enforcing explicit access to Apex classes are disabled (<code>true</code>) or not (<code>false</code>). For most Salesforce orgs the default value is <code>true</code>.</p> <p>Corresponds to the Disable Rules for Enforcing Explicit Access to Apex Classes release update.</p> <p>This field is available in API versions 49.0 to 58.0. The field is deprecated in API version 59.0 and later.</p>
<code>isFlowBlockAccessToSessionIDEnabled</code>	boolean	Indicates whether a valid session ID is returned in <code>API.SessionID</code> ( <code>false</code> ) or not ( <code>true</code> ). The default value is <code>false</code> . When the value is <code>true</code> , flows that access the session ID variable receive a placeholder string instead of a valid session ID.
<code>isManageFlowRequiredForAutomationCharts</code>	boolean	Indicates whether the Manage Flow permission is required to view all charts in Automation Home (Beta) ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . All users with the View Setup and Configuration permission can view all charts in Automation Home. If the field is set to <code>true</code> , then users with the View Setup and Configuration permission can view only the Total Started Automations by Process Type chart. The Manage Flow permission is required to view all charts.

Field Name	Field Type	Description
isTimeResumedInSameRunContext	boolean	<p>Indicates whether paused autolaunched flows always resume in the same context and retain the user access that they had before being paused (<code>true</code>) or not (<code>false</code>).</p> <p>Corresponds to the Make Paused Flow Interviews Resume in the Same Context with the Same User Access release update.</p> <p>This field is available in API version 57.0 and later.</p>

## Declarative Metadata Sample Definition

Here's an example of the `Flow.settings` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<FlowSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <doesFormulaEnforceDataAccess>true</doesFormulaEnforceDataAccess>
  <enableFlowBREncodedFixEnabled>true</enableFlowBREncodedFixEnabled>
  <enableFlowDeployAsActiveEnabled>false</enableFlowDeployAsActiveEnabled>
  <enableFlowFieldFilterEnabled>false</enableFlowFieldFilterEnabled>
  <enableFlowFormulasFixEnabled>true</enableFlowFormulasFixEnabled>
  <enableFlowInterviewSharingEnabled>true</enableFlowInterviewSharingEnabled>
  <enableFlowNullPreviousValueFix>true</enableFlowNullPreviousValueFix>
  <enableFlowPauseEnabled>true</enableFlowPauseEnabled>
  <enableFlowUseApexExceptionEmail>false</enableFlowUseApexExceptionEmail>
  <enableLightningRuntimeEnabled>true</enableLightningRuntimeEnabled>
  <isApexPluginAccessModifierRespected>true</isApexPluginAccessModifierRespected>
  <isEnhancedFlowListViewVisible>true</isEnhancedFlowListViewVisible>
  <isManageFlowRequiredForAutomationCharts>false</isManageFlowRequiredForAutomationCharts>
</FlowSettings>
```

## Example Package Manifest

Here's an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Flow</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ForecastingObjectListSettings

Represents an org's forecasting object list settings. Use these settings to control which object types and field types appear in the list of object details on the forecasts page. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

### File Suffix and Directory Location

`ForecastingObjectListSettings` values are stored in the `ForecastingObjectList.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

### Version

`ForecastingObjectListSettings` is available in API versions 52.0 and later.

**Note:** The information in this topic applies only to forecast types created in Summer '21 and later.

### Fields

Field Name	Field Type	Description
<code>forecastingTypeObjectListSettings</code>	<a href="#">ForecastingTypeObjectListSettings</a>	For each forecast type, specifies the information that is displayed in the list of object details that roll up into the forecasts. For example, the list of opportunities rolls up into opportunity-based forecasts.

## ForecastingTypeObjectListSettings

Represents an org's forecasting type object list settings.

Field Name	Field Type	Description
<code>forecastingObjectListLabelMappings</code>	<a href="#">ForecastingObjectListLabelMapping</a>	Mapping of labels with each field displayed as a column in the object detail list on the forecasts page.
<code>forecastingObjectListSelectedSettings</code>	<a href="#">ForecastingObjectListSelectedSettings</a>	Specifies the object fields that are used as columns in the object detail list on the forecasts page.
<code>forecastingObjectListUnselectedSettings</code>	<a href="#">ForecastingObjectListUnselectedSettings</a>	Lists the object fields that are available but not currently used as columns in the object detail list on the forecasts page. Changes to <code>forecastingObjectListSelectedSettings</code> field are reflected in this field.
<code>forecastingTypeDeveloperName</code>	string	Developer name of the forecast type that these object list settings apply to.

## ForecastingObjectListLabelMapping

Represents an org's forecasting type object list label mapping.

Field Name	Field Type	Description
field	string	Object field's API name.
label	string	Object field's name in the object detail list on the forecasts page.

## forecastingObjectListSelectedSettings

Represents an org's forecasting type object list selected settings.

Field Name	Field Type	Description
field	string	Object field's API name.

## forecastingObjectListUnselectedSettings

Represents an org's forecasting type object list unselected settings.

Field Name	Field Type	Description
field	string	Object field's API name.

## Declarative Metadata Sample Definition

The following is an example of the ForecastingObjectListSettings.settings file:

```
<?xml version="1.0" encoding="UTF-8"?>

  </forecastingTypeObjectListSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the ForecastingObjectListSettingsSettings settings metadata:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>ForecastingObjectListSettings</members>
    <name>Settings</name>
  </types>
  <version>52.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ForecastingSettings

Represents the Forecasts settings options. This type extends the Metadata metadata type and inherits its `fullNameName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

 **Note:** `ForecastingSettings` components are available in API version 28 and later. The structure of the `ForecastingSettings` type changed significantly in API version 30.0 and in API version 53.0.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

`ForecastingSettings` values are stored in a single file named `Forecasting.settings` in the `settings` directory of the corresponding package directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`ForecastingSettings` components are available in API version 28 and later. The structure of the `ForecastingSettings` type changed significantly in API version 30.0 and in API version 53.0.

## Fields

Field Name	Field Type	Description
<code>displayCurrency</code>	DisplayCurrency (enumeration of type string)	<p>Removed. The currency for displaying forecasts; either the organization's corporate currency or each forecast owner's personal currency setting. The selected currency is the default used in forecasts and selected in setup. The selection must be one of the currencies enabled for use in the organization, and only one selection is allowed. The default is CORPORATE. The valid values are:</p> <ul style="list-style-type: none"> <li>CORPORATE</li> <li>PERSONAL</li> </ul> <p>Available in API version 28.0 to 46.0. In API version 47.0 and later, use <code>defaultToPersonalCurrency</code>.</p>
<code>defaultToPersonalCurrency</code>	boolean	<p>If multicurrency is enabled, this field indicates whether the user's personal currency is used in forecasts. If <code>true</code> (default), the user's personal currency is used. If <code>false</code>, the corporate currency is used.</p> <p>Available in API version 47.0 and later.</p>
<code>enableForecasts</code>	boolean	<p>Indicates if Salesforce Forecasting is enabled or not. Set to <code>true</code> to enable and <code>false</code> to disable the functionality.</p> <p>Disabling Forecasts can result in data loss. Refer to Salesforce Help before disabling any functionality.</p>
<code>forecastingCategoryMappings</code>	ForecastingCategoryMapping[]	<p>A list of mappings associating forecast types with forecast rollups. As of Spring '20 and later, only standard users with the View All Forecasts or Allow Forecasting permission or delegated forecast manager status can access this subtype.</p>
<code>forecastingDisplayedFamilySettings</code>	ForecastingDisplayedFamilySettings[]	<p>The product families chosen to allow forecasting on in Lightning Experience. This field is available in API version 40.0 and later.</p>
<code>forecastingSubmissionSettings</code>	ForecastingSubmissionSettings	<p>The submission options for forecasts. Available in API version 62.0 and later.</p>
<code>forecastingTypeSettings</code>	ForecastingTypeSettings[]	<p>A list of forecast types. For field values, see <a href="#">ForecastingTypeSettings</a>. The maximum number of forecast types is four.</p>
<code>globalAdjustmentsSettings</code>	AdjustmentsSettings[]	<p>The adjustment options for forecasts. Available in API version 53.0 and later. In API version 52.0 and earlier, use the <code>adjustmentsSettings</code> field on <a href="#">ForecastingTypeSettings</a>.</p>
<code>globalForecastRangeSettings</code>	ForecastRangeSettings[]	<p>The default periods and range selections in forecasts. Available in API version 53.0 and later. In API version 52.0 and earlier, use the <code>forecastRangeSettings</code> field on <a href="#">ForecastingTypeSettings</a>.</p>
<code>globalQuotasSettings</code>	QuotasSettings[]	<p>Enables or disables quotas in Salesforce Forecasting. Available in API version 53.0 and later. In API version 52.0 and earlier, use the <code>quotasSettings</code> field on <a href="#">ForecastingTypeSettings</a>.</p>

## ForecastingCategoryMapping

The category mappings for forecasts. This subtype appears eight times within the `ForecastingSettings` type. Each occurrence includes fields that specify a type of forecast category rollup, which forecast categories each rollup includes, and the weight of each forecast category in the rollup. Organizations using either cumulative forecast rollups or individual forecast category columns must include all eight occurrences of this subtype. As of Spring '20 and later, only standard users with the View All Forecasts or Allow Forecasting permission or delegated forecast manager status can access this subtype.

Field	Field Type	Description
<code>forecastingItemCategoryApiName</code>	string	<p>Required. This field specifies the API name of the rollup type. The valid values are:</p> <ul style="list-style-type: none"> <li>• <code>openpipeline</code></li> <li>• <code>bestcaseforecast</code></li> <li>• <code>commitforecast</code></li> <li>• <code>pipelineonly</code></li> <li>• <code>bestcaseonly</code></li> <li>• <code>commitonly</code></li> <li>• <code>closedonly</code></li> <li>• <code>omittedonly</code></li> <li>• <code>customcategory</code></li> </ul>
<code>weightedSourceCategories</code>	<code>WeightedSourceCategory[]</code>	<p>This field can occur more than one time when specifying more than one forecast category to include in the rollup type. Each occurrence contains two subfields that specify a forecast category to include in the forecast rollup type and its weight. Some rollup types include more than one forecast category. This list shows the forecast categories that are included in each rollup type.</p> <ul style="list-style-type: none"> <li>• Rollup: <code>openpipeline</code>, Forecast categories: pipeline, best case, commit</li> <li>• Rollup: <code>bestcaseforecast</code>, Forecast categories: best case, commit, closed</li> <li>• Rollup: <code>commitforecast</code>, Forecast categories: commit, closed</li> <li>• Rollup: <code>pipelineonly</code>, Forecast categories: pipeline</li> <li>• Rollup: <code>bestcaseonly</code>, Forecast categories: best case</li> <li>• Rollup: <code>commitonly</code>, Forecast categories: commit</li> <li>• Rollup: <code>closedonly</code>, Forecast categories: closed</li> <li>• Rollup: <code>omittedonly</code>, Forecast categories: omitted</li> <li>• Rollup: <code>customcategory</code>, Forecast categories: custom category</li> </ul>

## ForecastingDisplayedFamilySettings

The product families that an admin chooses to allow forecasting on in Lightning Experience. This field is available in API version 40.0 and later.

Field	Field Type	Description
<code>productFamily</code>	string	The product family available to forecast on. Each product family is unique.

## ForecastingSubmissionSettings

The setting allows forecast users to submit their forecast numbers at a point in time.

Field	Field Type	Description
<code>allowForecastingSubmissions</code>	boolean	Required. Indicates whether forecast submissions are allowed in forecasts.

## ForecastingTypeSettings

The settings for each forecast type. An organization can have up to four forecast types active. If you omit a previously enabled forecast type that has a minimum API version less than or equal to the metadata package version, its quota and adjustment data is deleted from the org.

Omitting a forecast type field from the XML can deactivate that forecast type: if the forecast type was available in the release specified by the XML package version, that forecast type is deactivated and its quota and adjustment data are deleted.

Field Name	Field Type	Description
<code>active</code>	boolean	Required. Indicates whether the forecast type specified in the <code>name</code> field is active.  Setting the <code>active</code> field to false purges all forecasting data, adjustments, and quotas for the forecast type. When <code>active</code> is set to true, some values on the Forecasts tab don't appear immediately. An in-process con appears to indicate that the values are being calculated.
<code>adjustmentsSettings</code>	<a href="#">AdjustmentsSettings</a>	Removed. This field enables or disables the adjustments option in forecasts. In API version 53.0 and later, use <code>globalAdjustmentsSettings</code> .
<code>displayedCategoryApiNames</code>	string	This read-only field appears four times to specify the four forecast rollup categories displayed in the Forecasts tab, for either cumulative forecast rollups, or individual forecast category rollups. Always use the same 4 values for both <code>displayedCategoryApiNames</code> and <code>forecastedCategoryApiNames</code> .  Valid values for organizations using cumulative forecast rollups: <ul style="list-style-type: none"> <li><code>openpipeline</code></li> <li><code>bestcaseforecast</code></li> <li><code>commitforecast</code></li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>closedonly</li> </ul> <p>Valid values for organizations using individual forecast category rollups:</p> <ul style="list-style-type: none"> <li>pipelineonly</li> <li>bestcaseonly</li> <li>commitonly</li> <li>closedonly</li> </ul>
forecastedCategoryApiNames	string	<p>This field appears four times to specify the four forecast rollup categories used in the organization, for either cumulative forecast rollups, or individual forecast category rollups.</p> <p>Valid values for organizations using cumulative forecast rollups:</p> <ul style="list-style-type: none"> <li>openpipeline</li> <li>bestcaseforecast</li> <li>commitforecast</li> <li>closedonly</li> <li>customcategory</li> </ul> <p>Valid values for organizations using individual forecast category rollups:</p> <ul style="list-style-type: none"> <li>pipelineonly</li> <li>bestcaseonly</li> <li>commitonly</li> <li>closedonly</li> <li>customcategory</li> </ul> <p>Changing from one set of four values to the other changes the organization setting for Enable Cumulative Forecast Rollups in Setup. If this field is omitted, the setting isn't changed.</p>
forecastingDateType	ForecastingDateType (enumeration of type string)	<p>Required. The date type that forecast amounts are based on.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>OpportunityCloseDate (default)</li> <li>ProductDate</li> <li>ScheduleDate</li> <li>OLIMeasureCloseDateOnly</li> <li>ProductDateOnly</li> <li>ScheduleDateOnly</li> <li>OpportunityCustomDate (Available in API version 57.0 and later)</li> <li>OLIMeasureOppCustomDateOnly (Available in API version 57.0 and later)</li> </ul>

Field Name	Field Type	Description
		Available in API version 42.0 and later. In API version 42.0 only, date types are read only and available only via API.
forecastRangeSettings	<a href="#">ForecastRangeSettings</a>	Removed. The default periods and range selections in forecasts. In API version 53.0 and later, use globalForecastRangeSettings.
hasProductFamily	boolean	Required. Indicates whether the forecasting type has product family forecasts enabled. Available in API version 41.0 and later.
isAmount	boolean	Required. This read-only field indicates whether the forecast type is based on revenue amounts. The value of <code>isAmount</code> is always the opposite of the value of <code>isQuantity</code> .
isAvailable	boolean	Required. This read-only field indicates whether the forecast type can currently be used in the organization. For example, the revenue splits forecast type can't be used in an organization that doesn't have Opportunity Splits enabled.
isQuantity	boolean	Required. This read-only field indicates whether the forecast type is based on product quantities. The value of <code>isQuantity</code> is always the opposite of the value of <code>isAmount</code> .
managerAdjustableCategoryApiNames	string	<p>This read-only field appears twice to specify the two forecast rollup categories that forecast managers can adjust in the organization for either cumulative forecast rollups or individual forecast category rollups. This field can only be used when the <code>enableAdjustments</code> field contains a value of <code>true</code>. If both the <code>managerAdjustableCategoryApiNames</code> and <code>ownerAdjustableCategoryApiNames</code> fields are being used, they must contain the same two values. Their values must also be consistent with the values of the <code>enableAdjustments</code> and <code>enableOwnerAdjustments</code> fields.</p> <p>Valid values for organizations using cumulative forecast rollups:</p> <ul style="list-style-type: none"> <li>• <code>bestcaseforecast</code></li> <li>• <code>commitforecast</code></li> </ul> <p>Valid values for organizations using individual forecast category rollups:</p> <ul style="list-style-type: none"> <li>• <code>bestcaseonly</code></li> <li>• <code>commitonly</code></li> </ul>
masterLabel	string	Required. This read-only field indicates the UI label for the forecast type.
name	string	<p>Required. The name of the forecast type. Each forecast type requires a specific string.</p> <p>Using ForecastingSettings, you can activate only these forecast types.</p> <ul style="list-style-type: none"> <li>• <code>LineItemQuantityProductDate</code>: Product Families - Quantity by product date. Available in API versions 47.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>LineItemQuantityScheduleDate</code>: Product Families - Quantity by schedule date. Available in API versions 47.0 and later.</li> <li>• <code>LineItemRevenueProductDate</code>: Product Families - Revenue by product date. Available in API versions 47.0 and later.</li> <li>• <code>LineItemRevenueScheduleDate</code>: Product Families - Revenue by schedule date. Available in API versions 47.0 and later.</li> <li>• <code>OpportunityLineItemQuantity</code>: Product Families - Quantity.</li> <li>• <code>OpportunityLineItemRevenue</code>: Product Families - Revenue.</li> <li>• <code>OpportunityOverlayRevenue</code>: Opportunity Overlay Splits - Revenue.</li> <li>• <code>OpportunityQuantity</code>: Opportunities - Quantity.</li> <li>• <code>OpportunityQuantityProductDate</code>: Opportunities - Quantity by product date. Available in API versions 43.0 and later.</li> <li>• <code>OpportunityQuantityScheduleDate</code>: Opportunities - Quantity by schedule date. Available in API versions 43.0 and later.</li> <li>• <code>OpportunityRevenue</code>: Opportunities - Revenue.</li> <li>• <code>OpportunityRevenueProductDate</code>: Opportunities - Revenue by product date. Available in API versions 43.0 and later.</li> <li>• <code>OpportunityRevenueScheduleDate</code>: Opportunities - Revenue by schedule date. Available in API versions 43.0 and later.</li> <li>• <code>OpportunitySplitRevenue</code>: Opportunity Revenue Splits - Revenue.</li> <li>• <b><code>Territory_Model_NameN</code></b>: Territories, where <i>Territory_Model_Name</i> is the name of your active territory model in the API. <i>Territory_Model_Name</i> can be followed by <i>N</i>, an auto-generated number that distinguishes between territory forecast types. Available in API versions 44.0 and later.</li> <li>• <b><code>Territory_Model_NameN_ProductFamily</code></b>: Deprecated. Territories - Product Families, where <i>Territory_Model_Name</i> is the name of your active territory model in the API and can be followed by <i>N</i>, an auto-generated number that distinguishes between territory forecast types. Available in API versions 45.0 and 46.0. For territory models created in API version 47.0 and later, <b><code>Territory_Model_NameN</code></b> is used.</li> <li>• The name of a custom opportunity split type that has been enabled as a forecast type. Custom split types are based on currency fields, which can contain revenue amounts only.</li> </ul> <p>To create and manage other forecast types in API version 52.0 and later, use <a href="#">ForecastingSourceDefinition</a>, <a href="#">ForecastingType</a>, and <a href="#">ForecastingTypeSource</a>.</p>

Field Name	Field Type	Description
<code>opportunityListFieldsLabelMappings</code>	<a href="#">OpportunityListFieldsLabelMapping</a>	A read-only list of the API names and UI labels for all fields on the Opportunity object.
<code>opportunityListFieldsSelectedSettings</code>	<a href="#">OpportunityListFieldsSelectedSettings</a>	Required. The fields selected to appear in the opportunity pane of the forecast page for the forecast type. One of the selected fields must be <b>Opportunity Name</b> . You can select up to 15 fields.
<code>opportunityListFieldsUnselectedSettings</code>	<a href="#">OpportunityListFieldsUnselectedSettings</a>	Required. The fields <i>not</i> selected to appear in the opportunity pane of the forecast page for the forecast type.
<code>opportunitySplitName</code>	string	Indicates whether the forecasting type has a split type, and if so, the name of the split type. Available in API version 41.0 and later.
<code>ownerAdjustableCategoryApiNames</code>	string	<p>This read-only field appears twice to specify the two forecast rollup categories that forecast owners can adjust in the organization, for either cumulative forecast rollups, or individual forecast category rollups. This field can only be used when the <code>enableOwnerAdjustments</code> field contains a value of <code>true</code>. If both the <code>managerAdjustableCategoryApiNames</code> and <code>ownerAdjustableCategoryApiNames</code> fields are being used, they must contain the same two values. Their values must also be consistent with the values of the <code>enableAdjustments</code> and <code>enableOwnerAdjustments</code> fields.</p> <p>Valid values for organizations using cumulative forecast rollups:</p> <ul style="list-style-type: none"> <li>• <code>bestcaseforecast</code></li> <li>• <code>commitforecast</code></li> </ul> <p>Valid values for organizations using individual forecast category rollups:</p> <ul style="list-style-type: none"> <li>• <code>bestcaseonly</code></li> <li>• <code>commitonly</code></li> </ul>
<code>quotasSettings</code>	<a href="#">QuotasSettings</a>	Removed. This field enables or disables the quota option in forecasts. In API version 53.0 and later, use <code>globalQuotasSettings</code> .
<code>territory2ModelName</code>	string	Indicates whether the forecasting type has a Territory2 model, and if so, the name of the Territory2 model. Available in API version 41.0 and later.

## AdjustmentsSettings

The adjustment options for forecasts.

Field	Field Type	Description
<code>allowExpandedColumns</code>	boolean	Required. Set to <code>true</code> to show separate columns on the forecasts page for each adjustable forecast category and <code>false</code> to show adjustments when a user hovers over a forecast category. All forecast types must contain the same <code>allowExpandedColumns</code> value.

Field	Field Type	Description
<code>enableAdjustments</code>	boolean	Required. Set to <code>true</code> to enable manager adjustments and <code>false</code> to disable them. All forecast types must contain the same <code>enableAdjustments</code> value.  Disabling adjustments results in adjustment data being purged.
<code>enableOwnerAdjustments</code>	boolean	Required. Set to <code>true</code> to enable owner adjustments for forecasts and <code>false</code> to disable them. All forecast types must contain the same <code>enableOwnerAdjustments</code> value.  Disabling adjustments results in forecast adjustment data being purged.

## ForecastingGroup

The group based on a custom picklist that is used to group or roll up forecast totals on the forecasts page. For example, group forecasts using a custom picklist for industry or sales type.

Field	Field Type	Description
<code>developerName</code>	string	Required. The API name that identifies the forecast group.
<code>forecastingGroupItems</code>	<a href="#">ForecastingGroupItem</a>	Required. The picklist values for the forecast type. Possible values include the picklist values defined in <code>groupField</code> .
<code>groupField</code>	string	Required. The field name of the custom picklist used as a group. Possible values include custom, single-selection picklists available in <code>sourceObject</code> .
<code>masterLabel</code>	string	Required. This read-only field indicates the UI label for the forecast group.
<code>sourceObject</code>	string	Required. The source object for the picklist for the forecast group. Possible values include: <ul style="list-style-type: none"> <li>• Opportunity</li> <li>• OpportunityLineItem</li> <li>• Product2</li> </ul>

## ForecastingGroupItem

The picklist value that is specified as the forecasting group for a forecast type, and the order it displays in on the forecasts page.

Field	Field Type	Description
<code>displayPosition</code>	int	Required. Indicates the display order of the values on the forecasts page.
<code>sourceAPIValue</code>	string	Required. The API name is that's derived from the group value.

## ForecastRangeSettings

The default periods and range selections in forecasts. Users can forecast up to 15 months, 15 fiscal periods, or 8 quarters in the future or past. If your forecast range includes the current month, period, or quarter, the forecasts page shows the current month, period, or quarter by default. If not, the first month, period, or quarter of the range is selected. All forecast types must contain the same `forecastRangeSettings` field values.

**Warning:** If you change the time period from monthly to quarterly or quarterly to monthly, or you change the standard fiscal year, all adjustments, manager judgments, and quotas are purged. If you enable custom fiscal years, creating the first custom fiscal year deletes any quotas and adjustments in the corresponding and subsequent standard fiscal years. These changes trigger a forecast recalculation that can take significant time, depending on the quantity of your data.

Field	Field Type	Description
<code>beginning</code>	int	Required. Indicates the beginning month or quarter to display by default.
<code>displaying</code>	int	Required. Indicates the number of months or quarters to display by default. The maximum number of months is 12 and quarters is 8.
<code>periodType</code>	PeriodTypes (enumeration of type string)	Required. Indicates what type of period to use. Valid values are: <ul style="list-style-type: none"> <li>• <code>Month</code></li> <li>• <code>Quarter</code></li> <li>• <code>Week</code></li> <li>• <code>Year</code></li> </ul>

## OpportunityListFieldsLabelMapping

A read-only list of the API names and UI labels for all fields on the Opportunity object.

Field	Field Type	Description
<code>field</code>	string	Required. The API name of the Opportunity field.
<code>label</code>	string	Required. The UI label of the Opportunity field.

## OpportunityListFieldsSelectedSettings

The fields selected to appear in the opportunity pane of the forecast page for the forecast type. One of the selected fields must be **Opportunity Name**. You can select up to 15 fields.

Field	Field Type	Description
<code>field</code>	string	Specifies names of fields to display in the opportunity pane.

## OpportunityListFieldsUnselectedSettings

The fields *not* selected to appear in the opportunity pane of the forecast page for the forecast type.

Field	Field Type	Description
field	string	Specifies names of fields not displayed in the opportunity pane.

## QuotasSettings

[QuotasSettings](#) indicates if quotas are available in forecasts.

Field	Field Type	Description
showQuotas	boolean	Required. Set to <code>true</code> to enable quotas. All forecast types must contain the same <code>showQuotas</code> field value.

## WeightedSourceCategory

This field can occur more than one time when specifying more than one forecast category to include in the rollup type. Each occurrence contains two subfields that specify a forecast category to include in the forecast rollup type and its weight. Some rollup types include more than one forecast category. This table shows the forecast categories that are included in each rollup type.

Field	Field Type	Description
sourceCategoryApiName	string	Required. Specifies the API name of a forecast category to include in the rollup type. The valid values are: <ul style="list-style-type: none"> <li>• pipeline</li> <li>• best case</li> <li>• commit</li> <li>• closed</li> <li>• omitted</li> <li>• customcategory</li> </ul>
weight	double	Required. Specifies the weight given to the forecast category when calculating the forecast for the rollup type. The only supported value is 1.0.

## Declarative Metadata Sample Definition

The following is an example of a [ForecastingSettings](#) component that enables the Opportunity-Revenue forecast type, adjustments, owner adjustments, and quotas, and changes forecast range settings:

```
<?xml version="1.0" encoding="UTF-8"?>
<ForecastingSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <defaultToPersonalCurrency>false</defaultToPersonalCurrency>

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## HighVelocitySalesSettings

Represents an org's Sales Engagement settings. With Sales Engagement, you can make your inside sales team as effective as possible.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

HighVelocitySalesSettings values are stored in a single file named `HighVelocitySales.settings` in the `settings` directory of the corresponding package directory.

## Version

HighVelocitySalesSettings components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableACAutoSendEmail</code>	boolean	Indicates whether a cadence step of type Automated Send can be created ( <code>true</code> ) or not ( <code>false</code> ). Allowing Salesforce to automatically send an email to a prospect can make your sales team more efficient, because reps don't have to send the email themselves.  Default value is <code>true</code> .  Available in API version 48.0 and later.

Field Name	Field Type	Description
enableACChangeTargetAssignee	boolean	Indicates whether target assignees, target owners, and users with access to related cadences can update target assignees ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 50.0 and later.
enableACSkipWeekends	boolean	Indicates whether Skip Weekends is enabled ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and later.
enableBusinessHours	boolean	Indicates whether Business Hours is enabled in Sales Engagement ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 58.0 and later.
enableCadenceVariantTestingPref	boolean	Indicates whether AB testing for cadence steps is enabled ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 53.0 and later.
enableChgTgtAssigneeUsrPermPref	boolean	Indicates whether the change target assignee action is controlled by user permission ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 51.0 and later.
enableDispositionCategory	boolean	Indicates whether Call Outcomes For Branching is enabled in Sales Engagement ( <code>true</code> ) or not ( <code>false</code> ). Use Call Outcomes For Branching to group calls into different outcome categories such as "Left Voicemail" or "Not Interested." You can see the outcomes in a report, or use them to determine how cadences are branched. <code>enableHighVelocitySales</code> must be <code>true</code> to use Sales Engagement. Default value is <code>false</code> .
enableEngagementWaveAnalyticsPref	boolean	Indicates whether you can see engagement statistics in CRM Analytics ( <code>true</code> ) or not ( <code>false</code> ). Use CRM Analytics to analyze information about calls, engagement, and how each sales rep moves through their cadence steps.
enableHighVelocitySales	boolean	Indicates whether Sales Engagement is enabled ( <code>true</code> ) or not ( <code>false</code> ). If enabled, it turns on the features required for the product and makes the app available to users. Default value is <code>false</code> .
enableHighVelocitySalesSetup	boolean	Indicates whether Sales Engagement is enabled ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> .

Field Name	Field Type	Description
enableInvoiceAttributionPref	boolean	Indicates whether Invoice Attribution is enabled ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 56.0 and later.
enableLogACallForCTIPref	boolean	Indicates whether Log a Call appears to CTI users by default ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 54.0 and later.
enableLogTasksForLinkedInPref	boolean	Indicates whether users can log standard tasks upon completion of a LinkedIn step ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 54.0 and later.
enableMultipleCadencesPref	boolean	Indicates whether targets can be assigned to multiple cadences ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 57.0 and later.
enableOpportunityAttributionPermPref	boolean	Indicates whether Opportunity Attribution is enabled ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 51.0 and later.
enableQuickCadenceAutoSendEmail	boolean	Indicates whether Automated Email send is enabled for Sales Engagement quick cadences ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 57.0 and later.
enableTaskLoggingPref	boolean	Indicates whether users can log tasks after manual completion of a cadence step ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 56.0 and later.

## Declarative Metadata Sample Definition

The following is an example of the `HighVelocitySales.settings` file:

```
<?xml version="1.0" encoding="UTF-8"?>
<HighVelocitySalesSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableACAutoSendEmail>false</enableACAutoSendEmail>
  <enableACChangeTargetAssignee>false</enableACChangeTargetAssignee>
  <enableACSkipWeekends>false</enableACSkipWeekends>
  <enableBusinessHours>false</enableBusinessHours>
  <enableCadenceVariantTestingPref>false</enableCadenceVariantTestingPref>
  <enableChgTgtAssigneeUsrPermPref>false</enableChgTgtAssigneeUsrPermPref>
  <enableDispositionCategory>true</enableDispositionCategory>
  <enableEngagementWaveAnalyticsPref>true</enableEngagementWaveAnalyticsPref>
  <enableHighVelocitySales>true</enableHighVelocitySales>
  <enableHighVelocitySalesSetup>true</enableHighVelocitySalesSetup>
  <enableInvoiceAttributionPref>false</enableInvoiceAttributionPref>
  <enableLogACallForCTIPref>false</enableLogACallForCTIPref>
```

```
<enableLogTasksForLinkedInPref>false</enableLogTasksForLinkedInPref>
<enableMultipleCadencesPref>false</enableMultipleCadencesPref>
<enableOpportunityAttributionPermPref>false</enableOpportunityAttributionPermPref>
<enableQuickCadenceAutoSendEmail>false</enableQuickCadenceAutoSendEmail>
<enableTaskLoggingPref>true</enableTaskLoggingPref>
</HighVelocitySalesSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the HighVelocitySalesSettings settings metadata:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>HighVelocitySalesSettings</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## IdeasSettings

Represents the metadata used to manage settings for Ideas.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

IdeasSettings is stored in one file named `Ideas.settings` in the `settings` folder of the corresponding package directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

IdeasSettings is available in API version 27.0 and later.

## Ideas

Represents settings for Ideas and Idea Themes.

## Fields

Field Name	Field Type	Description
<code>enableIdeaThemes</code>	boolean	Indicates whether Idea Themes is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableIdeas</code>	boolean	Indicates whether Ideas is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableIdeasReputation</code>	boolean	Indicates whether Reputation is enabled ( <code>true</code> ) or not ( <code>false</code> ). You can't enable IdeasReputation without enabling the Ideas Reputation

Field Name	Field Type	Description
		permission in your organization. This field is available in API version 28.0 and later.
<code>enableChatterProfile</code>	boolean	Indicates that the Chatter user profile is used for Ideas user profiles. If <code>enableChatterProfile</code> is <code>true</code> , the <code>ideasProfilePage</code> value must not be specified. If <code>enableChatterProfile</code> is <code>false</code> , then specify a <code>ideasProfilePage</code> value, otherwise the Ideas zone profile is used. This field is available in API version 29.0 and later.
<code>ideasProfilePage</code>	string	The name of the Visualforce page to use for a custom Ideas user profile, if <code>enableChatterProfile</code> is <code>false</code> . If <code>enableChatterProfile</code> is <code>false</code> , then specify a <code>ideasProfilePage</code> value, otherwise the Ideas zone profile is used. This field is available in API version 29.0 and later.
<code>halfLife</code>	double	Indicates how quickly old ideas drop in ranking on the Popular Ideas subtab. The half-life setting determines how the number of days after which old ideas drop in ranking on the Popular Ideas subtab, to make room for ideas with more recent votes. A shorter half-life moves older ideas down the page faster than a longer half-life.

## Declarative Metadata Sample Definition

The following is an example `ideas.settings` metadata file:

```
<?xml version="1.0" encoding="UTF-8"?>
<IdeasSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableIdeaThemes>true</enableIdeaThemes>
  <enableIdeas>true</enableIdeas>
  <enableIdeasReputation>true</enableIdeasReputation>
  <enableChatterProfile>false</enableChatterProfile>
  <ideasProfilePage>name of Visualforce page</ideasProfilePage>
  <halfLife>2.6</halfLife>
</IdeasSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## IdentityProviderSettings

Represents the settings used to enable or disable Salesforce as a SAML identity provider for single sign-on (SSO).

## Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the “Settings” name. See [Settings](#) for more details.

## File Suffix and Directory Location

`IdentityProviderSettings` values are stored in the `IdentityProvider.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there is only one settings file for each settings component.

## Version

`IdentityProviderSettings` components are available in API version 57.0 and later.

## Special Access Rules

To access `IdentityProviderSettings`, a user must have the Customize Application user permission.

## Fields

Field Name	Description
<code>certificateName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The certificate that Salesforce uses to communicate with SAML SSO service providers, such as third-party service providers or another Salesforce org acting as a service provider. You can enter the name of a self-signed certificate or a certificate signed by a certificate authority.</p>
<code>enableIdentityProvider</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Indicates whether Salesforce can be used as a SAML identity provider (<code>true</code>) or not (<code>false</code>).</p>

## Declarative Metadata Sample Definition

The following is an example of an `IdentityProviderSettings` component. In this example, Salesforce is enabled as a SAML identity provider.

```
<?xml version="1.0" encoding="UTF-8"?>
<IdentityProviderSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <certificateName>Certificate Name</certificateName>
  <enableIdentityProvider>true</enableIdentityProvider>
</IdentityProviderSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>IdentityProvider</members>
    <name>Settings</name>
  </types>
  <version>57.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## IframeWhiteListUrlSettings

Represents settings related to the list of trusted external domains that you allow to frame your Visualforce pages or surveys. This type extends the Metadata metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this metadata type's name.

## File Suffix and Directory Location

`IframeWhiteListUrlSettings` on page 1825 values are stored in the `IframeWhiteListUrlSettings` on page 1825 `.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`IframeWhiteListUrlSettings` on page 1825 components are available in API version 49.0 and later.

## Fields

Field Name	Field Type	Description
<code>iframeWhiteListUrls</code>	<code>IframeWhiteListUrl[]</code>	The list of external domains that you allow to frame your Visualforce pages or surveys.

## IframeWhiteListUrl

Represents the external domains that you allow to frame your Visualforce pages or surveys.

Field Name	Field Type	Description
context	IframeWhitelistContext (enumeration of type string)	Required. The type of content in the iframe. Valid values are: <ul style="list-style-type: none"> <li>LightningOut—Reserved for future use. Available in API version 60.0 and later</li> <li>Surveys</li> <li>VisualforcePages</li> <li>DisclosureAndComplianceHubConnector</li> </ul>
url	string	The unique domain that is allowed to frame your Visualforce pages, surveys, or Disclosure and Compliance Hub Connector. Accepts these formats: <code>example.com</code> , <code>*example.com</code> , and <code>https://example.com</code> .

## Declarative Metadata Sample Definition

The following is an example of a `IframeWhiteListUrlSettings` on page 1825 component.

```
<?xml version="1.0" encoding="UTF-8"?>
<IframeWhiteListUrlSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <iframeWhiteListUrl>
    <context>Surveys</context>
    <url>example1.com</url>
  </iframeWhiteListUrl>
  <iframeWhiteListUrl>
    <context>VisualforcePages</context>
    <url>example2.com</url>
  </iframeWhiteListUrl>
  <iframeWhiteListUrl>
    <context>DisclosureAndComplianceHubConnector</context>
    <url>example3.com</url>
  </iframeWhiteListUrl>
</IframeWhiteListUrlSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>IframeWhiteListUrlSettings</members>
    <name>IframeWhiteListUrlSettings</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## IncidentMgmtSettings

Represents settings for Customer Service Incident Management and Broadcast Communications.

### Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the “Settings” name. See [Settings](#) for more details.

### File Suffix and Directory Location

`IncidentMgmtSettings` values are stored in the `IncidentMgmt.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there is only one settings file for each settings component.

### Version

`IncidentMgmtSettings` components are available in API version 54.0 and later.

### Special Access Rules

`IncidentMgmtSettings` requires a Service Cloud license.

### Fields

Field Name	Description
<code>enableAlertBroadcastType</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether broadcast communication alerts are enabled (<code>true</code>) or not (<code>false</code>). Lets incident managers send disruptive in-app notifications when an incident occurs. Default is <code>false</code>. Available in API version 57.0 and later.</p>
<code>enableEmailBroadcastType</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether broadcast communication emails are enabled (<code>true</code>) or not (<code>false</code>). Lets users send an email with critical information to impacted customers. Default is <code>false</code>. Available in API version 56.0 and later.</p>
<code>enableIncidentMgmt</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether Customer Service Incident Management is enabled (<code>true</code>) or not (<code>false</code>). Customer Service Incident Management is a Service Cloud solution that helps your teams track large-scale disruptions and delegate tasks to the right experts</p>

Field Name	Description
	to ensure that your business delivers on customer expectations. Default is <code>true</code> . Available in API version 54.0 and later.
<code>enableSiteBannerBroadcastType</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether broadcast communication for site banners is enabled (<code>true</code>) or not (<code>false</code>). Lets users add a banner with critical information to your Aura and LWR sites. Default is <code>false</code>. Available in API version 56.0 and later.</p>
<code>enableSlackBroadcastType</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether broadcast communication Slack messages are enabled (<code>true</code>) or not (<code>false</code>). Lets incident managers send broadcasts to Slack when an incident occurs. Default is <code>false</code>. Available in API version 57.0 and later.</p>

## Declarative Metadata Sample Definition

The following is an example of an IncidentMgmtSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<AccountSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableAccountDiscovery>true</enableAccountDiscovery>
  <enableAccountHistoryTracking>true</enableAccountHistoryTracking>
  <enableAccountInsightsInMobile>false</enableAccountInsightsInMobile>
  <enableAccountOwnerReport>true</enableAccountOwnerReport>
  <enableAccountTeams>true</enableAccountTeams>
  <enableContactHistoryTracking>true</enableContactHistoryTracking>
  <enableRelateContactToMultipleAccounts>true</enableRelateContactToMultipleAccounts>
  <showViewHierarchyLink>true</showViewHierarchyLink>
</AccountSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>IncidentMgmt</members>
    <name>Settings</name>
  </types>
  <version>54.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## IndustriesEinsteinFeatureSettings

Represents the settings for enabling the Industries Einstein feature.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for more details.

## File Suffix and Directory Location

IndustriesEinsteinFeatureSettings values are stored in a single file named `IndustriesEinsteinFeature.settings` in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

IndustriesEinsteinFeatureSettings components are available in API version 57.0 and later.

## Fields

Field Name	Description
<code>documentReaderConfidenceOrgValue</code>	<p><b>Field Type</b></p> <p>double</p> <p><b>Description</b></p> <p>Required.</p> <p>Specify the confidence score threshold to indicate the reliability of data in a document. You can enter a number from 0 to 100, with up to two decimal places, where 0 is the least confident and 100 is the most confident.</p>

## Declarative Metadata Sample Definition

The following is an example of a IndustriesEinsteinFeatureSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<IndustriesEinsteinFeatureSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <documentReaderConfidenceOrgValue>61</documentReaderConfidenceOrgValue>
</IndustriesEinsteinFeatureSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>IndustriesEinsteinFeature</members>
    <name>Settings</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## IndustriesLoyaltySettings

Represents the settings to enable capabilities of Loyalty Management.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for more details.

## File Suffix and Directory Location

IndustriesLoyaltySettings values are stored in a single file named `IndustriesLoyalty.settings` in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

IndustriesLoyaltySettings components are available in API version 53.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableAutomaticVoucherCodeGeneration</code>	boolean	Indicates whether the capability to automatically generate voucher codes is enabled ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 57.0 and later.
<code>enableNQPPRealTimePointBalance</code>	boolean	Indicates whether the capability to update the non-qualifying point balance of members in real time is enabled ( <code>true</code> ) or disabled ( <code>false</code> ) for your org. The default value is <code>true</code> .
<code>enableFixedTypeNQPAggregation</code>	boolean	Indicates whether the capability to aggregate and expire fixed type non-qualifying points in batches is enabled ( <code>true</code> ) or disabled ( <code>false</code> ) for your org. The default value is <code>true</code> . This field is available in API version 54.0 or later.

Field Name	Field Type	Description
<code>enableNonQualifyingPointsConsolidation</code>	boolean	Indicates whether the capability to aggregate and expire fixed type non-qualifying points in real time is enabled ( <code>true</code> ) or disabled ( <code>false</code> ) for your org. The default value is <code>true</code> . This field is available in API version 58.0 or later.
<code>enableQPREalTimePointBalance</code>	boolean	Indicates whether the real time qualifying points balance update capability is enabled ( <code>true</code> ) or disabled ( <code>false</code> ) for your org. The default value is <code>true</code> . This field is available in API version 55.0 or later.
<code>enableLoyaltyRulesVerifyForMemberSegment</code>	boolean	Indicates whether the capability that allows: <ul style="list-style-type: none"> <li>Loyalty program process rules to process transaction journals only when the loyalty program member is part of a Data Cloud segment associated with the rule's promotion is enabled (<code>true</code>) or disabled (<code>false</code>) for your org.</li> <li>The Promotion Eligibility component on Loyalty Program Member record page to categorize promotions based on whether the member belongs to the promotion's campaign or Data Cloud segment is enabled (<code>true</code>) or disabled (<code>false</code>) for your org.</li> </ul> The default value is <code>false</code> . This field is available in API version 55.0 or later.
<code>enableLoyaltyRedeemPointsExpirationInfoPref</code>	boolean	Indicates whether the capability that automatically calculates and adds the expiration date of points credited back to members for canceled redemptions is enabled ( <code>true</code> ) or disabled ( <code>false</code> ) for your org. The default value is <code>true</code> . This field is available in API version 55.0 or later.
<code>enableLoyaltyServiceExcellence</code>	boolean	Indicates whether Service Console for Loyalty Management is enabled ( <code>true</code> ) or disabled ( <code>false</code> ) for your org. The default value is <code>false</code> . This field is available in API version 57.0 or later.
<code>enableLoyaltyApiAccessForExternalSiteUsers</code>	boolean	Indicates whether the capability that allows customers to join and leave loyalty programs and allows members to join and opt out of promotions from Experience Cloud sites is enabled ( <code>true</code> ) or disabled ( <code>false</code> ) for your org. The default value is <code>false</code> . This field is available in API version 58.0 or later.
<code>enableAutomaticTierAssessmentSelection</code>	boolean	Indicates whether the capability that automatically selects members as eligible for tier assessment when members' qualifying points balance changes is enabled ( <code>true</code> ) or disabled ( <code>false</code> ) for your org. The default value is <code>false</code> . This field is available in API version 58.0 or later.
<code>enablePointsLifecycleTracking</code>	boolean	Indicates whether the capability that allows the company to trace how members redeem their accrued fixed-model non-qualifying points is enabled ( <code>true</code> ) or disabled ( <code>false</code> ) for your org. The default value is <code>false</code> . This field is available in API version 62.0 or later.
<code>enableNegativePointBalance</code>	boolean	Indicates whether the capability that lets loyalty program members to hold negative point balances for non-qualifying currencies is enabled

Field Name	Field Type	Description
		( <code>true</code> ) or disabled ( <code>false</code> ) for your org. The default value is <code>false</code> . This field is available in API version 61.0 or later.
<code>enableSegmentQueryByDataGraph</code>	<code>boolean</code>	Indicates whether the capability, which uses Data Cloud data graphs to query for Data Cloud segments that customers are part of, is enabled ( <code>true</code> ) or disabled ( <code>false</code> ). The default value is <code>false</code> . This field is available in API version 62.0 or later.
<code>enablePromSetupProcRuleStatusInheritDplymt</code>	<code>boolean</code>	Indicates whether the capability, which allows Promotion Setup processes and rules to be deployed to target orgs in the same status as the source orgs when using the <code>LoyaltyProgramSetup</code> metadata type, is enabled ( <code>true</code> ) or disabled ( <code>false</code> ). The default value is <code>false</code> . This field is available in API version 62.0 or later.
<code>enableLoyaltyGenerativeAi</code>	<code>boolean</code>	Indicates whether the Einstein AI capabilities of Loyalty Management are enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . This field is available in API version 62.0 or later.

## Declarative Metadata Sample Definition

The following is an example of a `IndustriesLoyaltySettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<IndustriesLoyaltySettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableNQPPRealTimePointBalance>true</enableNQPPRealTimePointBalance>
  <enableFixedTypeNQPAggregation>true</enableFixedTypeNQPAggregation>
  <enableQPPRealTimePointBalance>true</enableQPPRealTimePointBalance>

  <enableLoyaltyRulesVerifyCdpMemberSegment>false</enableLoyaltyRulesVerifyCdpMemberSegment>

  <enableLoyaltyRedeemedPointsExpirationInfoPref>true</enableLoyaltyRedeemedPointsExpirationInfoPref>

  <enableLoyaltyServiceExcellence>true</enableLoyaltyServiceExcellence>
  <enableAutomaticVoucherCodeGeneration>true</enableAutomaticVoucherCodeGeneration>

  <enableLoyaltyApiAccessForExternalSiteUsers>false</enableLoyaltyApiAccessForExternalSiteUsers>

  <enableAutomaticMemberTierAssessmentSelection>false</enableAutomaticMemberTierAssessmentSelection>

  <enableNonQualifyingPointsConsolidation>false</enableNonQualifyingPointsConsolidation>

  <enablePointsLifecycleTracking>false</enablePointsLifecycleTracking>
  <enableNegativePointBalance>false</enableNegativePointBalance>
  <enableSegmentQueryByDataGraph>false</enableSegmentQueryByDataGraph>

  <enablePromSetupProcRuleStatusInheritDplymt>false</enablePromSetupProcRuleStatusInheritDplymt>
</IndustriesLoyaltySettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>IndustriesLoyalty</members>
    <name>Settings</name>
  </types>
  <version>53.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## IndustriesSettings

Represents settings for industries verticals such as Financial Services Cloud, Consumer Goods Cloud, Public Sector Solutions, Education Cloud, Salesforce Scheduler, Life Sciences Cloud, and Health Cloud.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this metadata type's name.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for more details.

## File Suffix and Directory Location

IndustriesSettings are stored in a single file named `Industries.settings` in the `settings` directory.

## Version

Industries settings are available in API version 47.0 and later.

## Special Access Rules

Settings are specific to an industry vertical and are only available to customers with org editions where the vertical is enabled.

## Fields for Financial Services Cloud

Users need the FSC Insurance permission set to access the settings available in editions with Financial Services Cloud.

Field Name	Field Type	Description
<code>allowMultipleProducersToWorkOnSamePolicy</code>	boolean	Indicates whether multiple producers can be assigned to the same insurance policy. The default is <code>false</code> . This field is available in editions where Financial Services Cloud is enabled.

Field Name	Field Type	Description
<code>createCustomerPropertyFromLAProperty</code>	boolean	When importing loan application data, indicates whether to create a customer property record from a loan application property record to represent the new home.
<code>createFinancialAccountFromLAAsset</code>	boolean	When importing loan application data, indicates whether to create financial account records from the assets listed in the loan application.
<code>createFinancialAccountFromLALiability</code>	boolean	When importing loan application data, indicates whether to create financial account records from the liabilities listed in the loan application.
<code>createFinancialAccountsFromLAFinancials</code>	boolean	When importing loan application data, indicates whether to create a financial account record that represents the mortgage loan.
<code>createFinancialAccountsFromLAProperty</code>	boolean	When importing loan application data, indicates whether to create a financial account record from the loan application property to represent the new home.
<code>createFSCAssetFromLAAsset</code>	boolean	When importing loan application data, indicates whether to create asset records from the assets listed in the loan application.
<code>createFSCAssetFromLAProperty</code>	boolean	When importing loan application data, indicates whether to create an asset record from a loan application property record to represent the new home that was acquired.
<code>createFSCLiabilityFromLAFinancial</code>	boolean	When importing loan application data, indicates whether to create a liability record from a loan application property record to represent the new mortgage loan.
<code>createFSCLiabilityFromLALiability</code>	boolean	When importing loan application data, indicates whether to create liability records from the liabilities listed in the loan application.
<code>enableAccessToMasterListOfCoverageTypes</code>	boolean	Indicates whether insurance agents can access the main list of coverage types. The default is <code>false</code> . This field is available in editions where Financial Services Cloud is enabled.
<code>enableCallReportAdminContextPref</code>	boolean	Indicates whether admins can configure the Account Interactions component and use a component attribute to control whether end users can view data on the component with admin privileges ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> .
<code>enableCalculationUsingParentPolicyOnly</code>	boolean	Indicates whether the policy premiums are calculated by using only the parent policy's premium ( <code>true</code> ) or not ( <code>false</code> ). Use this for hierarchical policies where premiums are stored at different levels. The default value is <code>false</code> .
<code>enableCompliantDataSharingForInteraction</code>	boolean	Indicates whether compliant data sharing is enabled for the Interaction object ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>enableClaimMgmt</code>	boolean	Indicates whether the recording and processing of the first loss notifications and managing claim participants, coverages, and

Field Name	Field Type	Description
		settlements are enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>enableCompliantDataSharingForAccount</code>	boolean	Indicates whether the Compliant Data Sharing feature is enabled for the Account object. The default is <code>false</code> . This field is available in editions where Financial Services Cloud is enabled.
<code>enableCompliantDataSharingForCustomObjects</code>	boolean	Indicates whether the Compliant Data Sharing feature is enabled for custom objects ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . This field is available in editions where Financial Services Cloud is enabled.
<code>enableCompliantDataSharingForOpportunity</code>	boolean	Indicates whether the Compliant Data Sharing feature is enabled for the Opportunity object ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . This field is available in editions where Financial Services Cloud is enabled.
<code>enableCompliantDataSharingForInteractionSummary</code>	boolean	Indicates whether Compliant Data Sharing is enabled for the Interaction Summary object ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>enableDealManagement</code>	boolean	Indicates whether the Financial Deal Management feature is enabled. The default is <code>false</code> . This field is available in editions where Financial Services Cloud is enabled.
<code>enableDiscoveryFrameworkMetadata</code>	boolean	Indicates whether the Assessment Question and Assessment Question Set features of the Discovery Framework Metadata are enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>enableEinsteinDocReaderMappings</code>	boolean	Indicates whether the Intelligent Form Reader Mappings feature is enabled. The default is <code>false</code> .
<code>enableEnhancedQuestionCreation</code>	boolean	Indicates whether the Enhanced Question Creation Experience feature of the Discovery Framework is enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>enableFinancialAccountMgmt</code>	boolean	Indicates whether the Financial Account Management Standard Objects setting is enabled for your org. The default is <code>false</code> . This field is available in editions where Financial Services Cloud is enabled.
<code>enableFinancialDealRoleHierarchy</code>	boolean	Indicates whether data sharing for the financial deals is configured to follow the role-based hierarchy ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>enableFinancialDealCallReportCmpPref</code>	boolean	Indicates whether admins can use junction objects between the Financial Deal object and the Interaction and Interaction Summary objects within the Interaction Summary/Sharing component ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 54.0 and later.
<code>enableFinancialDealCallReportPref</code>	boolean	Indicates whether the junction object is enabled between the Financial Deal object and the Interaction and Interaction Summary objects

Field Name	Field Type	Description
		( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 54.0 and later.
<code>enableFSCInsuranceReport</code>	boolean	Indicates whether sales managers can access the dashboard and prebuilt reports. The default is <code>false</code> . This field is available in API version 48.0 and later in editions where Financial Services Cloud is enabled.   <b>Note:</b> This setting can be enabled only if the <code>allowMultipleProducersToWorkOnSamePolicy</code> setting is already set to <code>true</code> .
<code>enableIndustriesAssessment</code>	boolean	Indicates whether the Industries Assessment feature of the Discovery Framework is enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>enableIndustriesKYC</code>	boolean	Indicates whether the Industries KYC (Know Your Customer) is enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>enableInteractionRoleHierarchy</code>	boolean	Indicates whether role hierarchy-based sharing is available for interactions to users in the organization ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>enableInteractionSummaryPref</code>	boolean	Indicates whether the Interaction Summary setting is enabled for your org. The default is <code>false</code> . This field is available in editions where Financial Services Cloud is enabled.
<code>enableInteractionSummaryRoleHierarchy</code>	boolean	Indicates whether the Role-Hierarchy-Based Sharing for Interaction Summaries is enabled for your org. The default is <code>false</code> . This field is available in editions where Financial Services Cloud is enabled.
<code>enableManyToManyRelationships</code>	boolean	Indicates whether insurance can manage many-to-many relationships between claims and cases, claims and assets, and assets and policy participants. For example, if set to <code>true</code> , agents can handle multiple claims through one case or have multiple cases handling one claim. The default is <code>false</code> . This field is available in editions where Financial Services Cloud is enabled.
<code>enableMortgageRlaTotalsOrgPref</code>	boolean	Indicates whether the calculation of assets and liabilities for residential loan application records is enabled for your org ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> . This field is available in editions where Financial Services Cloud is enabled.
<code>enablePolicyAdministration</code>	boolean	Indicates whether the data model related to policy administrator is enabled ( <code>true</code> ) or not ( <code>false</code> ). If this option is enabled, entities such as transactions and transaction details are available within the policy admin data model. The default value is <code>false</code> .
<code>enableRBLUsingCalcService</code>	boolean	Indicates whether Roll-by-Lookup (RBL) Using Calc Service is enabled for your org. The default is <code>false</code> . This field is available in editions where Financial Services Cloud is enabled.

Field Name	Field Type	Description
enableRecordRollup	boolean	Indicates whether Record Rollup Optimization is enabled for your org. The default is <code>false</code> . This field is available in editions where Financial Services Cloud is enabled.
enableReferralScoring	boolean	Indicates whether Einstein Referral Scoring for Financial Services Cloud is enabled for your org (true) or not (false). The default is <code>false</code> . This field is available in editions where Financial Services Cloud is enabled.
enableSlackForCib	boolean	Indicates whether the access to Financial Services Cloud capabilities on Slack is enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
enableSyncInteractionsPref	boolean	Indicates whether the Sync Interactions with Einstein Activity Capture setting is enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
enableTimelinePref	boolean	Indicates whether the Timeline features are enabled for your organization ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
loanApplicantAddressAutoCreation	boolean	Indicates whether automatic generation of loan applicant records for new residential loan applications that are associated with person accounts is enabled for your org. The default is <code>false</code> . This field is available in editions where Financial Services Cloud is enabled. Available in API version 51.0 and later.
loanApplicantAutoCreation	boolean	Indicates whether automatic generation of loan applicant address records for new residential loan applications that are associated with person accounts is enabled for your org. The default is <code>false</code> . This field is available in editions where Financial Services Cloud is enabled. Available in API version 51.0 and later.
rlaEditIfAccHasEdit	boolean	Indicates whether a user can edit a residential loan application only if they have edit access on the account ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
transformRBLtoDPE	boolean	Indicates whether you can convert RBL rules into Data Processing Engine definitions for faster calculations. The default is <code>false</code> .

## Fields for Health Cloud

Field Name	Field Type	Description
enableClinicalDataModel	boolean	Indicates whether Clinical Data Model is enabled for your org. The default is <code>false</code> . Available in API version 51.0 and later.
enableContactCenterAccess	boolean	Indicates whether Contact Center for Health Cloud app is enabled for your org. The default is <code>false</code> . Available in API version 56.0 and later.

Field Name	Field Type	Description
<code>enableCareMgmtSlackAccess</code>	boolean	Indicates whether Care Coordination for Slack app is enabled for your org. Available in API version 56.0 and later.
<code>enableCustomFlowsOnExpiryPage</code>	boolean	Indicates whether Custom Flows on Expiry page for Health Cloud app is enabled for your org. Available in API version 56.0 and later.
<code>enableCustomFlowsOnCycleCount</code>	boolean	Indicates whether Custom Flows on Cycle Count page for the Health Cloud app is enabled for your org. Available in API version 56.0 and later.
<code>enableMultipleCareProgramEnrolleeOrgPref</code>	boolean	Indicates whether Multiple Care Program Enrollee is enabled for your org. Available in API version 49.0 and later.
<code>enableMedicalDeviceEnabled</code>	boolean	Indicates whether the Intelligent Sales features are enabled.
<code>enableMedicationManagementEnabled</code>	boolean	Indicates whether Medication Management is enabled for your org ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> . This field is available in API version 53.0 and later.
<code>enableMedRecSetting</code>	boolean	Indicates whether Medication Reconciliation is enabled for your org ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> . This field is available in API version 54.0 and later.
<code>enableProviderSearchSyncOrgPref</code>	boolean	Indicates whether provider data search is synced every six hours. The default is <code>false</code> . This field is available in editions where Health Cloud is enabled.
<code>enableVisitInventoryEnabled</code>	boolean	Indicates whether the visit data model is enabled.

## Fields for Life Sciences Cloud

Field Name	Field Type	Description
<code>enableAdverseEvents</code>	boolean	Indicates whether Adverse Events and its data model is enabled for your org ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . Available in API version 61.0 and later.
<code>enableComprehendMedical</code>	boolean	Indicates whether Comprehend Medical Analysis is enabled for your org ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . This field is available in API version 54.0 and later.
<code>enableIESentimentAnalysis</code>	boolean	Indicates whether Industries Einstein Sentiment Insights is enabled for your org ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . This field is available in API version 54.0 and later.
<code>enableLifeSciencesClinicalTrialManagement</code>	boolean	Indicates whether Clinical Trial Management and its data model is enabled for your org ( <code>true</code> ) or not ( <code>false</code> ). Using this feature, organizations can design and execute clinical trials and manage trial

Field Name	Field Type	Description
		participant journeys. The default value is <code>false</code> . Available in API version 61.0 and later.
<code>enableTrialManagementRandomization</code>	boolean	Indicates whether Research Study Randomization is enabled for your org ( <code>true</code> ) or not ( <code>false</code> ). Using this feature, users can design and run randomization procedures for their clinical trials. The default value is <code>false</code> . Available in API version 61.0 and later.

## Fields for Automotive Cloud

Field Name	Field Type	Description
<code>enableCriteriaBasedSearchAndFilter</code>	boolean	Indicates whether Criteria-Based Search and Filter is enabled for your org. The default is <code>false</code> . This field is available in editions where Automotive Cloud is enabled.

## Fields for Net Zero Cloud

Field Name	Description
<code>enableGnrcDisclsFrmwrk</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Industries Disclosure and Compliance Hub feature is enabled (<code>true</code>) or not (<code>false</code>) for your org. The default is <code>false</code>. Available in API version 57.0 and later in editions where Disclosure and Compliance Hub is enabled.</p>
<code>enableMaterialityAssessment</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Manage Materiality Assessments feature is enabled for your org. The default is <code>false</code>. Available in API version 59.0 and later in editions where Net Zero Cloud is enabled.</p>
<code>enableNZCMngEsgPgm</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Manage Environmental, Social, and Governance Programs feature is enabled for your org. The default is <code>false</code>. Available in API version 59.0 and later in editions where Net Zero Cloud is enabled.</p>

Field Name	Description
enableSCAssignFootprint	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Assign Carbon Footprint to Energy Use Records feature is enabled for your org. The default is <code>false</code>. Available in API version 54.0 and later in editions where Net Zero Cloud is enabled.</p>
enableSCBEIEnabled	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Manage Building Energy Intensity feature is enabled for your org. The default is <code>false</code>. Available in API version 54.0 and later in editions where Net Zero Cloud is enabled.</p>
enableSCCarbonAccounting	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Manage Carbon Accounting feature is enabled for your org. The default is <code>false</code>. Available in API version 54.0 and later in editions where Net Zero Cloud is enabled.</p>
enableSCCarbonCreditAlloc	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Allocate Carbon Credits to offset the unavoidable emissions feature is enabled for your org. The default is <code>false</code>. Available in API version 56.0 and later in editions where Net Zero Cloud is enabled.</p>
enableSCCreateFootprint	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Auto-Create Carbon Footprints feature is enabled for your org. The default is <code>false</code>. Available in API version 54.0 and later in editions where Net Zero Cloud is enabled.</p>
enableSCDGF	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Manage Data Gaps feature is enabled for your org. The default is <code>false</code>. Available in API version 54.0 and later in editions where Net Zero Cloud is enabled.</p>

Field Name	Description
enableSCExpansionUseCase	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Manage Carbon Accounting for Extended Organizational Boundaries feature is enabled for your org. The default is <code>false</code>. Available in API version 57.0 and later in editions where Net Zero Cloud is enabled.</p>
enableSCEExternalEngMgmt	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Manage Supplier Sustainability Data feature is enabled for your org. The default is <code>false</code>. Available in API version 54.0 and later in editions where Net Zero Cloud is enabled.</p>
enableSCEmsnsForecasting	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Manage Carbon Emissions Forecast feature is enabled for your org. The default is <code>false</code>. Available in API version 54.0 and later in editions where Net Zero Cloud is enabled.</p>
enableSCSNGManagement	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Manage Social and Governance feature is enabled for your org. The default is <code>false</code>. Available in API version 57.0 and later in editions where Net Zero Cloud is enabled.</p>
enableSCScope3HubEnabled	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Manage Scope 3 Procurement Hub feature is enabled for your org. The default is <code>false</code>. Available in API version 54.0 and later in editions where Net Zero Cloud is enabled.</p>
enableSCTargetSetting	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Manage Emissions Target feature is enabled for your org. The default is <code>false</code>. Available in API version 54.0 and later in editions where Net Zero Cloud is enabled.</p>

Field Name	Description
<code>enableSCWasteManagement</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Manage Waste-Related Data feature is enabled for your org. The default is <code>false</code>. Available in API version 54.0 and later in editions where Net Zero Cloud is enabled.</p>
<code>enableSCWaterManagement</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Manage Water-Related Data feature is enabled for your org. For example, water consumption, withdrawal, and discharge. The default is <code>false</code>. Available in API version 56.0 and later in editions where Net Zero Cloud is enabled.</p>
<code>enableSustainabilityCloud</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Net Zero Cloud feature is enabled for your org. The default is <code>false</code>. Available in API version 54.0 and later in editions where Net Zero Cloud is enabled.</p>

## Fields for Public Sector Solutions Features

Industries settings for Public Sector Solutions features are available in API version 57.0 and later.

Field Name	Field Type	Description
<code>enableBenefitAndGoalSharingPref</code>	boolean	Indicates whether the benefit and goal sharing feature is enabled for your org. The default is <code>false</code> . Available in editions where Public Sector Solutions is enabled.
<code>enableBenefitManagementPreference</code>	boolean	Indicates whether the program and benefit management feature is enabled for your org. The default is <code>false</code> . Available in editions where Public Sector Solutions is enabled.
<code>enableCarePlansPreference</code>	boolean	Indicates whether the care plan feature is enabled for your org. The care plan feature lets you create and edit care plans. The default is <code>false</code> . Available in editions where Public Sector Solutions is enabled.  This field is available in API version 58.0 and later.
<code>enableEnhancedUIForISPref</code>		Indicates whether the enhanced interaction note interface feature is enabled for your org. The enhanced interaction note interface is a single guided flow that enables you to seamlessly create meeting

Field Name	Field Type	Description
		notes; add interaction details, attendees, and interest tags; and share the notes with other users. The default is <code>false</code> . Available in editions where Public Sector Solutions is enabled.  This field is available in API version 61.0 and later.

## Fields for Salesforce Scheduler

Field Name	Field Type	Description
<code>appointmentDistributionOrgPref</code>	boolean	Indicates whether to schedule appointments for service resources based on appointment distribution ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . Available in API version 52.0 and later.
<code>captureResourceUtilizationOrgPref</code>	boolean	Indicates whether to use a background process to calculate the usage of service resources from service appointments ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . Available in API version 52.0 and later.
<code>enableAnyResourceTypeOrgPref</code>	boolean	Indicates whether to enable Salesforce Scheduler to consider service resource records with Agent resource type ( <code>true</code> ) or not ( <code>false</code> ). Before enabling this setting, create a service resource record as Main for each user, or update one of the service resource records as Main for each user. The default value is <code>false</code> . Available in API version 57.0 and later.
<code>enableAppFrmAnywhereOrgPref</code>	boolean	Indicates whether to use engagement channels for setting up shifts, work types, and booking a service appointment ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . Available in API version 56.0 and later. See the <a href="#">prerequisites</a> before you enable this setting.
<code>enableBlockResourceAvailabilityOrgPref</code>	boolean	Indicates whether Salesforce Scheduler service appointments are added to users' Salesforce calendars. For example, if set to <code>false</code> , users don't see their service appointments on their calendars. The default is <code>false</code> . Available in API version 47.0 and later.  This setting is used in Financial Services Cloud.
<code>enableCreateMultiAttendeeEventOrgPref</code>	boolean	Indicates whether users can group individual events, and view the list of all attendees under a single event <code>true</code> or not <code>false</code> . The default is <code>false</code> . See the <a href="#">prerequisites</a> before you enable this setting. Available in API version 55.0 and later.  This setting is used in Financial Services Cloud.
<code>enableDropInAppointmentsOrgPref</code>	boolean	Indicates whether users can manage drop-in participants ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . Available in API version 58.0 and later. See the <a href="#">prerequisite</a> before you enable this setting.
<code>enableDropInSkillMatchingOrgPref</code>	boolean	Indicates whether skill and skill level matching is enabled for service resources that are assigned to waitlists for a service territory ( <code>true</code> ) or

Field Name	Field Type	Description
		not ( <code>false</code> ). The default value is <code>false</code> . Available in API version 58.0 and later.
<code>enableEventManagementOrgPref</code>	boolean	Indicates whether users can add Salesforce Scheduler service appointments to their Salesforce calendars. The default is <code>false</code> . Available in API version 47.0 and later.  This setting is used in Financial Services Cloud.
<code>enableEventWriteOrgPref</code>	boolean	Indicates whether to publish high-volume platform events when users create, update, or delete service appointments in Salesforce Scheduler ( <code>true</code> ) or not ( <code>false</code> ). If enabled, write these events to an external system to update it with Salesforce Scheduler service appointments. The default value is <code>false</code> . Available in API version 49.0 and later.
<code>enableMultipleTopicsForShiftsOrgPref</code>	boolean	Indicates whether the multiple topics for shifts feature is enabled ( <code>true</code> ) or disabled ( <code>false</code> ). The default value is <code>false</code> . Available in API version 56.0 and later. See the <a href="#">prerequisite</a> before you enable this setting.
<code>enableMultiResourceOrgPref</code>	boolean	Indicates whether users can add multiple service resources to a service appointment. The default is <code>false</code> . Available in API version 47.0 and later.  This setting is used in Financial Services Cloud.
<code>enableOverbookingOrgPref</code>	boolean	Indicates whether users can add multiple service appointments to a single time slot for a service resource. If set to <code>false</code> , concurrent time slots are visible, but can't be modified. The default is <code>false</code> . Available in API version 47.0 and later.  This setting is used in Financial Services Cloud.
<code>enableShareSaWithArOrgPref</code>	boolean	Indicates whether to share service appointments with assigned resources ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . Available in API version 55.0 and later.
<code>enableTopicOrTemplate</code>	boolean	Indicates whether to use Salesforce Scheduler to manage Health Cloud appointments ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . You must enable the <code>enableTopicTimeSlot</code> field before enabling this setting. Available in API version 52.0 and later.
<code>enableTopicTimeSlot</code>	boolean	Indicates whether to set operating hours for Service Territory Members for Work Type Groups ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . Available in API version 52.0 and later.  See the <a href="#">prerequisites</a> before you enable this setting. After you enable this setting, you can't disable it.

## Fields for Education Cloud

Field Name	Field Type	Description
enableEducationCloud	boolean	Indicates whether Education Cloud is enabled in Salesforce (true) or not (false). The default is <code>false</code> . Available in API version 57.0 and later in Developer, Enterprise, Performance and Unlimited editions.
enableStudentSuccess	boolean	Indicates whether Student Success is enabled in Salesforce (true) or not (false). The default is <code>false</code> . Available in API version 58.0 and later in Developer, Enterprise, Performance and Unlimited editions.
enableAcademicOperations	boolean	Indicates whether Academic Operations is enabled in Salesforce (true) or not (false). The default is <code>false</code> . Available in API version 59.0 and later in Developer, Enterprise, Performance and Unlimited editions.
enableAlumniRelations	boolean	Indicates whether Alumni Relations is enabled (true) or not (false). The default is <code>false</code> . Available in API version 59.0 and later in Developer, Enterprise, Performance and Unlimited editions.
enableMentoring	boolean	Indicates whether Mentoring is enabled (true) or not (false). The default is <code>false</code> . Available in API version 60.0 and later in Developer, Enterprise, Performance and Unlimited editions.

## Declarative Metadata Sample Definition

The following is an example of an Industries.Settings metadata file.

```
<?xml version="1.0" encoding="UTF-8"?>
<IndustriesSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableCreateMultiAttendeeEventOrgPref>true</enableCreateMultiAttendeeEventOrgPref>
  <enableEventManagementOrgPref>true</enableEventManagementOrgPref>
  <enableMultiResourceOrgPref>false</enableMultiResourceOrgPref>
  <enableOverbookingOrgPref>true</enableOverbookingOrgPref>
  <enableBlockResourceAvailabilityOrgPref>true</enableBlockResourceAvailabilityOrgPref>

  <enableAccessToMasterListOfCoverageTypes>true</enableAccessToMasterListOfCoverageTypes>

  <enableManyToManyRelationships>true</enableManyToManyRelationships>

<allowMultipleProducersToWorkOnSamePolicy>false</allowMultipleProducersToWorkOnSamePolicy>

  <enableMortgageRlaTotalsOrgPref>true</enableMortgageRlaTotalsOrgPref>
  <enableObjectDetection>true</enableObjectDetection>
  <enableProviderSearchSyncOrgPref>true</enableProviderSearchSyncOrgPref>
  <enableReferralScoring>true</enableReferralScoring>
  <enableFSCInsuranceReport>true</enableFSCInsuranceReport>
  <enableSCCarbonAccounting>true</enableSCCarbonAccounting>
  <enableBenefitAndGoalSharingPref>true</enableBenefitAndGoalSharingPref>
  <enableBenefitManagementPreference>true</enableBenefitManagementPreference>
  <enableCarePlansPreference>true</enableCarePlansPreference>
</IndustriesSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Industries</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## InterestTaggingSettings

Represents settings for Interest Tags, which your users can add to client records to capture client needs, interests, and prospecting opportunities.

### Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See [Settings](#) for more details.

### File Suffix and Directory Location

`InterestTaggingSettings` values are stored in the `InterestTagging.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there's only one settings file for each settings component.

### Version

`InterestTaggingSettings` components are available in API version 54.0 and later.

### Special Access Rules

Before you enable Interest Tags, you must enable Topics for Financial Services Cloud objects and assign Interest Tags permissions to users. See [Interest Tags](#).

### Fields

Field Name	Description
<code>enableInterestTagging</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Enables Interest Tags in your org when set to <code>true</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of an InterestTaggingSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<InterestTaggingSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableInterestTagging>true</enableInterestTagging>
</InterestTaggingSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>InterestTagging</members>
    <name>Settings</name>
  </types>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## InventorySettings

Represents options for the Salesforce Omnichannel Inventory product. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

InventorySettings values are stored in the `Inventory.settings` file in the `settings` directory. The `.settings` files are different from other named components because there is only one settings file for each settings component.

## Version

Inventory settings are available in API version 51 and later.

## Special Access Rules

This metadata type is only accessible by developers and customers using Salesforce Omnichannel Inventory.

## Fields

Field Name	Field Type	Description
enableOCIB2CIntegration	boolean	Indicates whether Omnichannel Inventory is allowed to exchange inventory data with B2C Commerce ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
enableOmniChannelInventory	boolean	Indicates whether Omnichannel Inventory features are enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of an `InventorySettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<InventorySettings xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <enableOmniChannelInventory>true</enableOmniChannelInventory>
  <enableOCIB2CIntegration>true</enableOCIB2CIntegration>
</InventorySettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Inventory</members>
    <name>Settings</name>
  </types>
  <version>51.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## InvLatePymntRiskCalcSettings

Represents the org's settings to identify the level of risks associated with payment of invoices.

## Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See [Settings](#) for more details.

## File Suffix and Directory Location

InvLatePymntRiskCalcSettings values are stored in the InvLatePymntRiskCalc.settings file in the settings folder. The .settings files are different from other named components, because there's only one settings file for each settings component.

## Version

InvLatePymntRiskCalcSettings components are available in API version 55.0 and later.

## Fields

Field Name	Description
enableInvLatePymntRiskCalc	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates the level of risk associated with payment of an invoice when the value is <code>true</code>.</p>

## Declarative Metadata Sample Definition

This example shows a sample InvLatePymntRiskCalcSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<InvLatePymntRiskCalcSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableInvLatePymntRiskCalc>true</enableInvLatePymntRiskCalc>
</InvLatePymntRiskCalcSettings>
```

This example shows a sample package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>InvLatePymntRiskCalc</members>
    <name>Settings</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the package.xml manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## InvocableActionSettings

Represents the org's invocable action settings, such as whether partial save is allowed. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

InvocableActionSettings values are stored in the `InvocableAction.settings` file in the settings directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

### Version

InvocableActionSettings components are available in API version 47.0 and later.

### Fields

Field Name	Field Type	Description
<code>isPartialSaveAllowed</code>	boolean	Indicates whether partial save is enabled for most invocable actions that are invoked via REST API and executed in bulk. When the value is <code>true</code> , Salesforce tries three times to execute invocable actions that run successfully and rolls back only the invocable actions that fail to execute. This functionality is called partial save. If the field is set to <code>false</code> , if one invocable action fails, Salesforce rolls back other invocable actions in the same transaction and the entire transaction fails.  Corresponds to the Enable Partial Save for Invocable Actions critical update.

### Declarative Metadata Sample Definition

The following is an example of the `InvocableAction.settings` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<InvocableActionSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <isPartialSaveAllowed>false</isPartialSaveAllowed>
</InvocableActionSettings>
```

### Example Package Manifest

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>InvocableAction</members>
    <name>Settings</name>
  </types>
```

```
<version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## KnowledgeSettings

Represents the metadata used to manage settings for Salesforce Knowledge.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for more details.

## File Suffix and Directory Location

KnowledgeSettings values are stored in a single file named `Knowledge.settings` in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

KnowledgeSettings is available in API version 27.0 and later.

## Fields

Field Name	Field Type	Description
<code>answers</code>	<a href="#">KnowledgeAnswerSettings</a>	Represents the metadata used to manage settings for Salesforce Knowledge and Answers.
<code>cases</code>	<a href="#">KnowledgeCaseSettings</a>	Represents the metadata used to manage settings for Salesforce Knowledge and Cases.
<code>defaultLanguage</code>	string	Required. The default language for Salesforce Knowledge. Use the abbreviation for the language, for example, <code>en_US</code> for United States English.
<code>enableChatterQuestionKBDeflection</code>	boolean	Indicates whether tracking for case deflection via Chatter is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableCreateEditOnArticlesTab</code>	boolean	Indicates whether users can create and edit articles on the articles tab ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableExternalMediaContent</code>	boolean	Indicates whether connecting to external media is enabled ( <code>true</code> ) or not ( <code>false</code> ).

Field Name	Field Type	Description
<code>enableKbStandardSharing</code>	boolean	Indicates whether standard Salesforce sharing is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableKnowledge</code>	boolean	Indicates whether Salesforce Knowledge is enabled ( <code>true</code> ) or not ( <code>false</code> ). This field is <code>false</code> by default.
<code>enableKnowledgeAgentContribution</code>	boolean	Indicates whether a user can create an article from a case ( <code>true</code> ) or not ( <code>false</code> ). (Classic only)
<code>enableKnowledgeArticleTextHighlights</code>	boolean	Indicates whether text snippet highlights in Salesforce Knowledge search results are enabled ( <code>true</code> ) or not ( <code>false</code> ). This field is <code>true</code> by default. Available in API version 47.0 and later.
<code>enableKnowledgeAnswersPromotion</code>	boolean	Indicates whether a user can create an article from a reply ( <code>true</code> ) or not ( <code>false</code> ). (Classic Only)
<code>enableKnowledgeCaseRL</code>	boolean	Indicates whether creating a list of cases linked to an article is enabled ( <code>true</code> ) or not ( <code>false</code> ). (Classic Only)
<code>enableKnowledgeKeywordAutoComplete</code>	boolean	Indicates whether auto-complete for keywords is enabled ( <code>true</code> ) or not ( <code>false</code> ) when searching Salesforce Knowledge. This field is <code>true</code> by default. Available in API version 47.0 and later.
<code>enableKnowledgeTitleAutoComplete</code>	boolean	Indicates whether auto-complete for article titles is enabled ( <code>true</code> ) or not ( <code>false</code> ) when searching Salesforce Knowledge. This field is <code>true</code> by default. Available in API version 47.0 and later.
<code>enableLightningKbAutoLoadRichTextField</code>	boolean	Indicates whether rich text fields are enabled for editing when an article loads in Lightning Knowledge ( <code>true</code> ) or not ( <code>false</code> ). This field is <code>false</code> by default. Available in API version 47.0 and later.
<code>enableLightningKnowledge</code>	boolean	Indicates whether Lightning Knowledge is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>languages</code>	<a href="#">KnowledgeLanguageSettings</a>	A list of languages enabled for Salesforce Knowledge.
<code>showArticleSummariesCustomerPortal</code>	boolean	Indicates whether article summaries appear in the Customer Portal ( <code>true</code> ) or not ( <code>false</code> ).
<code>showArticleSummariesInternalApp</code>	boolean	Indicates whether article summaries appear in the internal knowledge base ( <code>true</code> ) or not ( <code>false</code> ).

Field Name	Field Type	Description
showArticleSummariesPartnerPortal	boolean	Indicates whether article summaries appear in the partner portal ( <code>true</code> ) or not ( <code>false</code> ).
showValidationStatusField	boolean	Indicates whether validation status appears on articles ( <code>true</code> ) or not ( <code>false</code> ).
suggestedArticles	<a href="#">KnowledgeSuggestedArticlesSettings</a>	Represents the metadata used to manage settings for the case fields used to suggest articles for cases. Available in API version 37.0 and later.
votingEnabled	boolean	When <code>true</code> , enables users to vote for a product or feature that uses Vote, such as Articles in Knowledge. Available in API version 50.0 and later.

## KnowledgeAnswerSettings

Represents the metadata used to manage settings for Salesforce Knowledge and Answers.

Field Name	Field Type	Description
assignTo	string	Specifies the username an article is assigned to from Answers.
defaultArticleType	string	The default article type for articles created from Answers. Uses the API name of the article type.
enableArticleCreation	boolean	Indicates whether users can create articles from Answers ( <code>true</code> ) or not ( <code>false</code> ).

## KnowledgeCaseSettings

Represents the metadata used to manage settings for Salesforce Knowledge and Cases.

Field Name	Field Type	Description
articlePDFCreationProfile	string	The profile used to create a PDF of an article from Cases.
articlePublicSharingSites	<a href="#">KnowledgeSitesSettings</a>	Represents the metadata used to manage settings for Salesforce Knowledge and Sites.
articlePublicSharingCommunities	<a href="#">KnowledgeSitesSettings</a>	Represents the metadata used to manage settings for Salesforce Knowledge and Experience Cloud sites.
articlePublicSharingSitesChatterAnswers	<a href="#">KnowledgeSitesSettings</a>	Represents the metadata used to manage settings for Salesforce Knowledge and Sites with Chatter Answers.
assignTo	string	Specifies the username an article is assigned to from Cases.

Field Name	Field Type	Description
customizationClass	string	Specifies the Apex class used for customization.
defaultContributionArticleType	string	The default article type for articles created from Cases.
editor	KnowledgeCaseEditor (enumeration of type string)	Indicates the rich text editor type. Valid values are: <ul style="list-style-type: none"> <li>simple</li> <li>standard</li> </ul>
enableArticleCreation	boolean	Indicates whether users can create articles from Cases ( <code>true</code> ) or not ( <code>false</code> ). Controls whether other fields on KnowledgeCaseSettings can be set.
enableArticlePublicSharingSites	boolean	Indicates whether articles can be shared via a public site (URL) from Cases ( <code>true</code> ) or not ( <code>false</code> ).
enableCaseDataCategoryMapping	boolean	Indicates whether Case Data Category mapping is enabled ( <code>true</code> ) or not ( <code>false</code> ).
useProfileForPDFCreation	boolean	Indicates whether a profile is used to create a PDF of an article from Cases ( <code>true</code> ) or not ( <code>false</code> ).

## KnowledgeSitesSettings

Represents the metadata used to manage settings for Salesforce Knowledge and Sites.

Field Name	Field Type	Description
site	string[]	Specifies the site used for Salesforce Knowledge and Sites.

## KnowledgeLanguageSettings

A list of languages enabled for Salesforce Knowledge. KnowledgeLanguageSettings is available in API version 28.0 and later.

Field Name	Field Type	Description
language	KnowledgeLanguage[]	Represents the metadata used to manage settings for the languages enabled for Salesforce Knowledge.

## KnowledgeLanguage

Represents the metadata used to manage settings for the languages enabled for Salesforce Knowledge. KnowledgeLanguage is available in API version 28.0 and later.

Field Name	Field Type	Description
active	boolean	Indicates whether the language is enabled ( <code>true</code> ) or not ( <code>false</code> ).

Field Name	Field Type	Description
defaultAssignee	string	The default assignee for articles in the language.
defaultAssigneeType	KnowledgeLanguageLookupValueType (enumeration of type string)	Indicates the default assignee type. Valid values are: <ul style="list-style-type: none"> <li>User</li> <li>Queue</li> </ul>
defaultReviewer	string	The default reviewer for articles in the language.
defaultReviewerType	KnowledgeLanguageLookupValueType (enumeration of type string)	Indicates the default reviewer type. Valid values are: <ul style="list-style-type: none"> <li>User</li> <li>Queue</li> </ul>
name	string	The code for the language name, for example: English is en. See "What languages does Salesforce support?" in the Salesforce Help for a list of supported languages and their codes.

## KnowledgeSuggestedArticlesSettings

Represents the metadata used to manage settings for the articles suggested for cases, work orders, and work order line items. The Work Order and Work Order Line Item objects must be enabled in the org to use the associated fields.

Field Name	Field Type	Description
caseFields	<a href="#">KnowledgeCaseFieldsSettings</a>	Represents a list of the case fields used to suggest articles for the case.
useSuggestedArticlesForCase	boolean	Indicates whether case content is used to suggest articles for cases (true) or not (false).
workOrderFields	<a href="#">KnowledgeWorkOrderFieldsSettings</a>	Represents a list of the work order fields used to suggest articles for the work order.
workOrderLineItemFields	<a href="#">KnowledgeWorkOrderLineItemFieldsSettings</a>	Represents a list of the work order line item fields used to suggest articles for the work order line item.

## KnowledgeCaseFieldsSettings

Represents a list of the case fields used to suggest articles for the case. Available in API version 37.0 and later.

Field Name	Field Type	Description
field	<a href="#">KnowledgeCaseField[]</a>	Specifies the names of the case fields used to suggest articles for the case.

## KnowledgeCaseField

Represents the name of the case field used to suggest articles for the case. Available in API version 37.0 and later.

Field Name	Field Type	Description
name	string	Specifies the name of the case field used to suggest articles for the case.

## KnowledgeWorkOrderFieldsSettings

Represents a list of the work order fields used to suggest articles for the work order. Available in API version 39.0 and later.

Field Name	Field Type	Description
field	<a href="#">KnowledgeWorkOrderField[]</a>	Specifies the names of the work order fields used to suggest articles for the work order.

## KnowledgeWorkOrderField

Represents the name of the work order field used to suggest articles for the work order. Available in API version 39.0 and later.

Field Name	Field Type	Description
name	string	Specifies the name of the work order field used to suggest articles for the work order.

## KnowledgeWorkOrderLineItemFieldsSettings

Represents a list of the work order line item fields used to suggest articles for the work order line item. Available in API version 39.0 and later.

Field Name	Field Type	Description
field	<a href="#">KnowledgeWorkOrderLineItemField[]</a>	Specifies the names of the work order line item fields used to suggest articles for the work order line item.

## KnowledgeWorkOrderLineItemField

Represents the name of the work order line item field used to suggest articles for the work order line item. Available in API version 39.0 and later.

Field Name	Field Type	Description
name	string	Specifies the name of the work order line item field used to suggest articles for the work order line item.

## Declarative Metadata Sample Definition

```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## LanguageSettings

Represents an organization's language settings. Language settings control end-user language selection, locale formats, and translation options. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

### File Suffix and Directory Location

LanguageSettings values are stored in the `Language.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

### Version

LanguageSettings is available in API version 47.0 and later.

### Fields

Field Name	Field Type	Description
<code>enableCanadaIcuFormat</code>	boolean	Indicates whether the ICU format is enabled for the <code>en_CA</code> locale ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>true</code> for orgs created in API version 47.0 and later. Orgs created prior to API version 47.0 have a default of <code>false</code> .
<code>enableDataTranslation</code>	boolean	Indicates whether data translation is enabled ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> . This field is available in API version 49.0 and later.
<code>enableEndUserLanguages</code>	boolean	Indicates whether end-user languages are enabled ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> .
<code>enableICULocaleDateFormat</code>	boolean	Indicates whether date and currency are formatted with the International Components for Unicode ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> .  See <a href="#">Go Global with New International Locale Formats</a> for more information.
<code>enableLocaleInsensitiveFiltering</code>	boolean	Indicates whether users can filter query results, regardless of the locale or language associated with the user ( <code>true</code> ) or if they can't filter results ( <code>false</code> ). This field has a default value of <code>false</code> . This field is available in API version 56.0 and later.
<code>enableLocalNamesForStdObjects</code>	boolean	Indicates whether local name fields can be defined for standard objects ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> . This field is available in API version 48.0 and later.
<code>enablePlatformLanguages</code>	boolean	Indicates whether platform-only languages are enabled ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> . Setting this field to <code>true</code> also sets <code>enableEndUserLanguages</code> to <code>true</code> .

Field Name	Field Type	Description
enableTranslationWorkbench	boolean	Indicates whether the Translation Workbench is enabled ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> .
useLanguageFallback	boolean	Indicates whether translation follows the language fallback rule ( <code>true</code> ) or returns the primary label ( <code>false</code> ). This field has a default value of <code>true</code> .

## Declarative Metadata Sample Definition

The following is an example of a `LanguageSettings` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<LanguageSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableCanadaIcuFormat>true</enableCanadaIcuFormat>
  <enableDataTranslation>false</enableDataTranslation>
  <enableEndUserLanguages>true</enableEndUserLanguages>
  <enableICULocaleDateFormat>true</enableICULocaleDateFormat>
  <enableLocalNamesForStdObjects>false</enableLocalNamesForStdObjects>
  <enablePlatformLanguages>false</enablePlatformLanguages>
  <enableTranslationWorkbench>true</enableTranslationWorkbench>
  <useLanguageFallback>true</useLanguageFallback>
</LanguageSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Language</members>
    <name>Settings</name>
  </types>
  <version>49.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## LeadConfigSettings

Represents configuration settings for Leads that control how they are converted and displayed, and what actions are available. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

LeadConfigSettings values are stored in the `LeadConfig.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

LeadConfigSettings is available in API versions 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>defaultConvertDefaultSubjectField</code>	boolean	Configures whether tasks without a subject are created during lead conversion. If <code>true</code> , tasks are created when the default subject field has no value. If <code>false</code> , only tasks with a subject are created.
<code>doesHideOpportunityInConvertLeadWindow</code>	boolean	Hides the opportunity section of the Convert Lead window during the conversion of a lead. Default value is <code>false</code> .
<code>doesPreserveLeadStatus</code>	boolean	If your organization uses record types, the lead status changes to the lead status value of the new owner's record type during conversion. Set <code>doesPreserveLeadStatus</code> to <code>true</code> to preserve the value of the lead status during conversion.  Orgs that use record types can create a lead process that allows different lead status values for different record types. If <code>doesPreserveLeadStatus</code> is <code>false</code> , the lead status might change during lead conversion if the new owner's record type has a different default value for lead status. Default value is <code>true</code> .
<code>doesSelectNoOpportunityOnConvertLead</code>	boolean	Prevents an opportunity from being created when the lead is converted. Default value is <code>false</code> .
<code>doesTrackHistory</code>	boolean	Enables field history tracking for leads. When field history tracking is enabled, users can choose the fields they want to track. Default value is <code>false</code> .
<code>enableConversionsOnMobile</code>	boolean	Lets a user convert leads on their mobile devices. The Convert Lead action converts qualified leads to contacts. Default value is <code>true</code> .
<code>enableOrgWideMergeAndDelete</code>	boolean	Lets a user merge and delete leads. The user must also have the Public Read/Write/Transfer permission. Default value is <code>false</code> .

Field Name	Field Type	Description
<code>shouldLeadConvertRequireValidation</code>	boolean	Enforces validation rules when converting leads. Default value is <code>true</code> .
<code>shouldSendNotificationEmailWhenLeadOwnerUpdatesViaApexInLEX</code>	boolean	Indicates whether an email notification is sent when the lead owner is updated through Apex in Lightning Experience. Default value is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of the `LeadConfigSettings` type:

```
<?xml version="1.0" encoding="UTF-8"?>
<LeadConfigSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <doesEnableLeadConvertDefaultSubjectBlankTaskCreation>false</doesEnableLeadConvertDefaultSubjectBlankTaskCreation>
  <doesHideOpportunityInConvertLeadWindow>false</doesHideOpportunityInConvertLeadWindow>
  <doesPreserveLeadStatus>true</doesPreserveLeadStatus>
  <doesSelectNoOpportunityOnConvertLead>false</doesSelectNoOpportunityOnConvertLead>
  <doesTrackHistory>false</doesTrackHistory>
  <enableConversionsOnMobile>true</enableConversionsOnMobile>
  <enableOrgWideMergeAndDelete>false</enableOrgWideMergeAndDelete>
  <shouldLeadConvertRequireValidation>true</shouldLeadConvertRequireValidation>
  <shouldSendNotificationEmailWhenLeadOwnerUpdatesViaApexInLEX>false</shouldSendNotificationEmailWhenLeadOwnerUpdatesViaApexInLEX>
</LeadConfigSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the `LeadConfig` settings metadata for an organization:

```
<?xml version="1.0" encoding="UTF-8"?>
<!--
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>LeadConfig</members>
    <name>Settings</name>
  </types>
  <version>61.0</version>
</Package>
```

## LeadConvertSettings

Represents an organization's custom field mappings for lead conversion. Custom fields can be mapped from Leads to Accounts, Contacts, and Opportunities. Options for creating opportunities during lead conversion can also be specified. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

LeadConvertSettings components have the suffix `LeadConvertSetting` and are stored in the `LeadConvertSettings` folder.

## Version

LeadConvertSettings is available in API versions 39.0 and later.

## Fields

Field Name	Description
<code>allowOwnerChange</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to include the <b>Record Owner</b> field in the <b>Convert Lead</b> dialog box (<code>true</code>) or not (<code>false</code>).</p>
<code>objectMapping</code>	<p><b>Field Type</b> <a href="#">ObjectMapping[]</a></p> <p><b>Description</b> A set of custom field mappings between objects. Up to three <code>objectMapping</code> types can be declared—one each for account, contact, and opportunity.</p>
<code>opportunityCreationOptions</code>	<p><b>Field Type</b> VisibleOrRequired (enumeration of type string)</p> <p><b>Description</b> This field determines whether the <b>Opportunity</b> field is visible or required in the <b>Convert Lead</b> dialog box.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• <code>VisibleOptional</code>—The <b>Opportunity</b> field is included in the dialog box but not required. A new opportunity is created if the user enters an opportunity name. This is the default value.</li> <li>• <code>VisibleRequired</code>—The <b>Opportunity</b> field is included in the dialog box and is required. A new opportunity is created based on the name the user enters.</li> <li>• <code>NotVisible</code>—The <b>Opportunity</b> field is not included in the dialog box. No opportunity is created.</li> </ul>

## ObjectMapping

Represents a custom field mapping between two objects.

Field Name	Description
inputObject	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the object type containing the source fields for mapping. The value is always Lead.</p>
mappingFields	<p><b>Field Type</b> <a href="#">ObjectMappingField[]</a></p> <p><b>Description</b> A set of input and output field names of the custom fields to be mapped.</p>
outputObject	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The object type receiving data during lead conversion.</p> <ul style="list-style-type: none"> <li>• Account</li> <li>• Contact</li> <li>• Opportunity</li> </ul>

## ObjectMappingField

Represents custom field names to be mapped between objects.

Field Name	Description
inputField	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of a custom lead field supplying source data during lead conversion.</p>
outputField	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of a custom account, contact, or opportunity field that will receive data from source field named in the accompanying <code>inputField</code> entry.</p>

## Declarative Metadata Sample Definition

The following is an example of the LeadConvertSettings type:

```
<?xml version="1.0" encoding="UTF-8"?>
<LeadConvertSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <allowOwnerChange>false</allowOwnerChange>
  <objectMapping>
    <inputObject>Lead</inputObject>
    <mappingFields>
      <inputField>custom_lead_field_1</inputField>
      <outputField>custom_account_field_1</outputField>
    </mappingFields>
    <mappingFields>
      <inputField>custom_lead_field_2</inputField>
      <outputField>custom_account_field_2</outputField>
    </mappingFields>
    <mappingFields>
      <inputField>custom_lead_field_3</inputField>
      <outputField>custom_account_field_3</outputField>
    </mappingFields>
    <outputObject>Account</outputObject>
  </objectMapping>
  <objectMapping>
    <inputObject>Lead</inputObject>
    <mappingFields>
      <inputField>custom_lead_field_4</inputField>
      <outputField>custom_opportunity_field_1</outputField>
    </mappingFields>
    <outputObject>Opportunity</outputObject>
  </objectMapping>
  <opportunityCreationOptions>VisibleOptional</opportunityCreationOptions>
</LeadConvertSettings>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## LiveAgentSettings

Represents an organization's Chat settings, such as whether Chat is enabled. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

LiveAgentSettings values are stored in the `LiveAgent.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## Version

LiveAgentSettings is available in API version 28.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableChatFindOrCreateEnable</code>	boolean	Indicates whether the <code>findOrCreate</code> method of the Chat API is enabled for agents ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 53.0 and later.
<code>enableLiveAgent</code>	boolean	Indicates whether Chat is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableQuickTextEnabled</code>	boolean	Indicates whether Quick Text is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>priority</code>	integer	Indicates the priority level of a Chat.

## Declarative Metadata Sample Definition

This is a sample Chat settings file.

```
<?xml version="1.0" encoding="UTF-8"?>
<LiveAgentSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableLiveAgent>true</enableLiveAgent>
</LiveAgentSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

[Service Cloud Chat Developer Guide: findOrCreate](#)

## LightningExperienceSettings

Represents the settings that modify an org's Lightning Experience configuration. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

A `LightningExperienceSettings` component has the suffix `.settings` and is stored in the `settings` folder. The `.settings` files are different from other named components because there is only one settings file for each settings component.

## Version

LightningExperienceSettings components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>activeThemeName</code>	string	If specified, indicates the API name of the custom <a href="#">LightningExperienceTheme</a> that's currently active in the org. If the field isn't specified, then the org uses one of the built-in themes that Salesforce provides. Custom themes are available in API version 48.0 and later.
<code>enableAccessCheckCrucPref</code>	boolean	Deprecated in API version 47.0 and later because the feature is no longer available.
<code>enableApiUserLtngOutAccessPref</code>	boolean	Deprecated in API version 48.0 and later because the feature is no longer available. This field corresponds to the API Only Users Can Access Only Salesforce APIs critical update, which was enforced in Spring '20. If a user has the API Only User permission, they can access Salesforce only via APIs, regardless of their other permissions. This restriction already applied to other Salesforce features, but the critical update enforced the restriction in Lightning Out also.
<code>enableAuraCDNPref</code>	boolean	Indicates whether Lightning Experience and other apps use a content delivery network (CDN) to serve the static content for Lightning Component framework. A CDN generally speeds up page load time, but it also changes the source domain that serves the files. If your company has IP range restrictions for content served from Salesforce, test thoroughly before enabling this setting. The default is <code>true</code> .
<code>enableAuraDepAccessChksCRUCPref</code>	boolean	Removed in API version 51.0 and later because the feature is no longer available.
<code>enableAuraSecStaticResCRUCPref</code>	boolean	Indicates whether the Enable Secure Static Resources for Lightning Components release update is enforced ( <code>true</code> ) or not ( <code>false</code> ). To improve security, this update serves all static resources from the <code>visualforce</code> domain instead of the <code>lightning</code> domain. This change prevents a script included in a static resource from accessing the document in the <code>lightning</code> domain due to the same-origin security policy. This field is available in API version 50.0 and later.
<code>enableErrorExperienceEnabled</code>	boolean	Reserved for future use.
<code>enableFeedbackInMobile</code>	boolean	Indicates whether users can send feedback to Salesforce from the mobile app. The default is <code>false</code> .
<code>enableGoogleSheetsForSfdcEnabled</code>	boolean	Reserved. Do not use.
<code>enableIE11DeprecationMsgHidden</code>	boolean	Deprecated in API version 47.0 and later because the feature is no longer available.

Field Name	Field Type	Description
<code>enableIE11LEXCrucPref</code>	boolean	Deprecated in API version 47.0 and later because the feature is no longer available.
<code>enableInAppLearning</code>	boolean	Indicates whether Learning Paths is enabled ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . If <code>false</code> , you can't assign learning items to users, and users can't view assigned learning items in the Guidance Center or access Learning Home. This field is available in API version 54.0 and later. See <a href="#">Learning Paths</a> in Salesforce Help.
<code>enableInAppTooltips</code>	boolean	Indicates whether users see onboarding tips in the mobile app. The default is <code>false</code> .
<code>enableLEXOnIpadEnabled</code>	boolean	Indicates whether Lightning Experience is turned on for iPad Browsers ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> . See <a href="#">Give Users Access to Lightning Experience on iPad Browsers (Beta)</a> in Salesforce Help.
<code>enableLexEndUsersNoSwitching</code>	boolean	Indicates whether Salesforce Classic is turned off for your org ( <code>true</code> ) or not ( <code>false</code> ). Removes the Switcher for all users in the org. The default is <code>false</code> . See <a href="#">Turn Off Salesforce Classic for Your Org</a> in Salesforce Help. This field is similar to <code>enableUsersAreLightningOnly</code> . If either field is set to <code>true</code> , users are blocked from switching to Salesforce Classic.
<code>enableNavPersonalizationOptOut</code>	boolean	Indicates whether users are blocked from personalizing the Lightning Experience navigation bar ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> (that is, users can personalize the navigation bar by default). Salesforce recommends disabling personalization at the app level, not the org level. See <a href="#">Configure User Interface Settings</a> in Salesforce Help.
<code>enableNoBackgroundNavigations</code>	boolean	Indicates whether consecutive API navigation calls in Visualforce pages are allowed ( <code>false</code> ) or blocked ( <code>true</code> ). The default is <code>false</code> .
<code>enableQuip</code>	boolean	Indicates whether Quip is available for your org. This field is available in API version 51.0 and later.
<code>enableRemoveThemeBrandBanner</code>	boolean	Deprecated in API version 47.0 and later because the feature is no longer available.
<code>enableS1BannerPref</code>	boolean	Deprecated in API version 47.0 and later because the feature is no longer available.
<code>enableS1BrowserEnabled</code>	boolean	Indicates whether all users can access the Salesforce mobile web view from a supported mobile browser ( <code>true</code> ) or not ( <code>false</code> ). If <code>false</code> , then users must access the Salesforce mobile full site view from a mobile browser. Full site view doesn't have the full functionality of mobile web view. Salesforce Classic and Lightning Experience aren't supported on mobile browsers.
<code>enableS1DesktopEnabled</code>	boolean	Indicates whether Lightning Experience is turned on in the org ( <code>true</code> ) or not ( <code>false</code> ). After it's enabled, this setting can't be disabled via the user interface or the API. See <a href="#">Turn on Lightning Experience for Your Org</a> in Salesforce Help.

Field Name	Field Type	Description
enableS1UiLoggingEnabled	boolean	Deprecated in API version 47.0 and later because the feature is no longer available.
enableSidToken3rdPartyAuraApp	boolean	Reserved for internal use.
enableSkypeChatEnabled	boolean	Deprecated in API version 50.0 and later because the feature is no longer available.
enableSparkAllUsers	boolean	Deprecated in API version 50.0 and later because the feature is no longer available.
enableSparkConversationEnabled	boolean	Deprecated in API version 50.0 and later because the feature is no longer available.
enableSplitViewOnStandard	boolean	Removed in API version 52.0 and later because the feature is no longer available.
enableStackedModalManagerEnabled	boolean	Indicates whether the Enable LWC Stacked Modals release update is enabled ( <code>true</code> ) or not ( <code>false</code> ). For orgs created before Summer '24, the default value is <code>false</code> . For orgs created in Summer '24 and later, the default value is <code>true</code> . This field is available in API version 61.0 and later.
enableTryLightningOptOut	boolean	Indicates whether the Try Lightning Experience Now prompt is hidden from users ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> . See <a href="#">Try Lightning Experience Now Prompt</a> in Salesforce Help.
enableUseS1AlohaDesktop	boolean	Deprecated in API version 47.0 and later because the feature is no longer available.
enableUsersAreLightningOnly	boolean	Indicates whether Salesforce Classic is turned off for your org ( <code>true</code> ) or not ( <code>false</code> ). Removes the Switcher for all users in the org. The default is <code>false</code> . This field is similar to <code>enableLexEndUsersNoSwitching</code> . If either field is set to <code>true</code> , users are blocked from switching to Salesforce Classic.
enableWebExEnabled	boolean	Deprecated in API version 50.0 and later because the feature is no longer available.
enableWebexAllUsers	boolean	Deprecated in API version 50.0 and later because the feature is no longer available.
isLEXExtensionComponentCustomizationOff	boolean	Indicates whether all users can enable the Lightning Extension Component Customization feature. If <code>false</code> , the feature is disabled for all users, even users who had it enabled. See <a href="#">Try New Features with the Lightning Extension for Chrome</a> . This field is available in API version 48.0 and later.
isLEXExtensionDarkModeOff	boolean	Indicates whether all users can enable the Lightning Extension Dark Mode feature. If <code>false</code> , the feature is disabled for all users, even users who had it enabled. This field is available in API version 48.0 and later.

Field Name	Field Type	Description
isLEXExtensionLinkGrabberOff	boolean	Indicates whether all users can enable the Lightning Extension Link Grabber feature. If <code>false</code> , the feature is disabled for all users, even users who had it enabled. This field is available in API version 48.0 and later.
isLEXExtensionOff	boolean	Indicates whether all users can enable the Lightning Extension for your org. If <code>false</code> , your users can't enable the Lightning Extension, even if they already have it installed. This field is available in API version 48.0 and later.

## Declarative Metadata Sample Definition

The following is an example of a LightningExperienceSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<LightningExperienceSettings xmlns="http://soap.sforce.com/2006/04/metadata">

  <enableAuraCDNPref>true</enableAuraCDNPref>
  <enableFeedbackInMobile>true</enableFeedbackInMobile>
  <enableInAppTooltips>true</enableInAppTooltips>
  <enableLEXOnIpadEnabled>true</enableLEXOnIpadEnabled>
  <enableLexEndUsersNoSwitching>true</enableLexEndUsersNoSwitching>
  <enableNavPersonalizationOptOut>true</enableNavPersonalizationOptOut>
  <enableS1BrowserEnabled>false</enableS1BrowserEnabled>
  <enableS1DesktopEnabled>true</enableS1DesktopEnabled>
  <enableTryLightningOptOut>true</enableTryLightningOptOut>
  <enableUsersAreLightningOnly>true</enableUsersAreLightningOnly>
</LightningExperienceSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>LightningExperience</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## LiveMessageSettings

Represents an org's LiveMessage settings.

## Version

LiveMessageSettings components are available in API version 42.0 and later.

## File Suffix and Directory Location

LiveMessageSettings values are stored in the LiveMessage.settings file in the settings folder. The .settings files are different from other named components because there is only one settings file for each settings component.

## Fields

Field Name	Field Type	Description
enableCheckCEUserPerm	boolean	Gives access to ConversationEntry objects only to users with the Access Conversation Entries user permission enabled (true) or to all users (false) in an org.  For orgs created before API version 50.0, the default value is <code>false</code> . For orgs created on or after API version 50.0, the default value is <code>true</code> .
enableLiveMessage	boolean	Turns LiveMessage on ( <code>true</code> ) or off ( <code>false</code> ) in an org. The default value is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of a `liveMessageSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<LiveMessageSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableLiveMessage>true</enableLiveMessage>
</LiveMessageSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>LiveMessage</members>
    <name>Settings</name>
  </types>
  <version>44.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MacroSettings

Represents an organization's Macro settings, such as whether or not folders is enabled. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

MacroSettings values are stored in the `Macro.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

### Version

MacroSettings is available in API version 39.0 and later.

### Fields

Field Name	Field Type	Description
<code>enableAdvancedSearch</code>	boolean	Indicates whether users can search all macro text fields ( <code>true</code> ) or not ( <code>false</code> ).
<code>macrosInFolders</code>	boolean	Indicates whether users can organize and share macros using folders ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 44.0 and later.

### Declarative Metadata Sample Definition

This is a sample Macro settings file.

```
<?xml version="1.0" encoding="UTF-8"?>
<MacroSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableAdvancedSearch>true</enableAdvancedSearch>
  <macrosInFolders>true</macrosInFolders>
</MacroSettings>
```

### Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MailMergeSettings

Represents the settings for Extended Mail Merge functionality.

## File Suffix and Directory Location

A MailMerge component file has the suffix `MailMerge.settings` and is stored in the `settings` directory.

## Version

MailMergeSettings components are available in API version 51.0 and later. Before API version 51.0, fields from MailMergeSettings were found within OrgSettings components.

## Fields

Field Name	Field Type	Descriptions
<code>enableExtendedMailMerge</code>	boolean	Indicates whether the Salesforce Classic product, Extended Mail Merge, is enabled ( <code>true</code> ) or not ( <code>false</code> ). Use Extended Mail Merge to generate Microsoft Word documents — such as form letters or address labels — from Salesforce records using Word document templates. Default value is <code>false</code> .
<code>saveMailMergeDocsAsSalesforceDocs</code>	boolean	Indicates whether mail-merged documents are saved to the My Personal Documents folder of the user who generated the mail merge. ( <code>true</code> ) or not ( <code>false</code> ). If ( <code>false</code> ), only documents over 3 MB are saved to the user's documents folder. Smaller documents are emailed to the user. Default value is ( <code>false</code> ).

## Declarative Metadata Sample Definition

The following is an example of a MailMergeSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<MailMergeSettings xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <enableExtendedMailMerge>true</enableExtendedMailMerge>
</MailMergeSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve mail merge settings metadata for an organization:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <name>MailMergeSettings</name>
  </types>
  <version>51.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MapAndLocationSettings

Represents an org's map and location settings.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## Declarative Metadata File Suffix and Directory Location

MapAndLocationSettings values are stored in a single file named `Mapandlocation.settings` in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

Map and location settings are available in API version 46.0 and later.

## Fields

Field	Field Type	Description
<code>enableAddressAutoComplete</code>	boolean	Indicates whether auto-complete is enabled on address fields ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableMapsAndLocation</code>	boolean	Indicates whether the maps and location services are enabled ( <code>true</code> ) or not ( <code>false</code> ).

## Declarative Metadata Sample Definition

This is a sample `mapandlocation.settings` metadata file.

```
<?xml version="1.0" encoding="UTF-8"?>
<MapsAndLocationSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableAddressAutoComplete>false</enableAddressAutoComplete>
  <enableMapsAndLocation>false</enableMapsAndLocation>
</MapsAndLocationSettings>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MeetingsSettings

Represents the settings to enable Salesforce Meetings and the integration with Zoom video conferencing.

### Version

MeetingsSettings components are available in API version 51.0 and later.

### Special Access Rules

The MeetingsSettings type isn't available in scratch orgs.

### Fields

Field Name	Description
<code>enableSalesforceMeetings</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Salesforce Meetings feature is enabled (<code>true</code>) or not (<code>false</code>). When set to <code>true</code>, Salesforce admins can assign the Salesforce Meetings user permission to grant users access to the Meeting Digest and other Salesforce Meetings features. The default value is <code>false</code>.</p>
<code>enableSalesforceMeetingsSyncCheck</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether your company uses an activity sync solution (<code>true</code>) or hasn't made that indication (<code>false</code>). Indicating your company uses an activity solution such as Einstein Activity Capture is required to enable Salesforce Meetings. The default value is <code>false</code>.</p>
<code>enableZoomVideoConference</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether users can connect their company Zoom accounts to Salesforce (<code>true</code>) or not (<code>false</code>). When set to <code>true</code>, Zoom can be added as a recording in Einstein Conversation Insights. The default value is <code>false</code>.</p>

### Declarative Metadata Sample Definition

The following is an example of a MeetingsSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<MeetingsSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableSalesforceMeetings>true</enableSalesforceMeetings>
</MeetingsSettings>
```

```

    <enableSalesforceMeetingsSyncCheck>true</enableSalesforceMeetingsSyncCheck>
    <enableZoomVideoConference>false</enableZoomVideoConference>
</MeetingsSettings>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>MeetingsSettings</members>
    <name>Settings</name>
  </types>
  <version>51.0</version>
</Package>

```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MobileSettings

Represents an organization's mobile settings. This type extends the Metadata metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

 **Note:** [MobileSettings](#) on page 1875 is no longer available in API versions 25.0 and 26.0.

## Declarative Metadata File Suffix and Directory Location

[MobileSettings](#) on page 1875 values are stored in a single file named `Mobile.settings` in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

Mobile settings are available in API version 27.0 and later.

## Fields

Field	Field Type	Description
<code>chatterMobile</code> (Removed)	<a href="#">ChatterMobileSettings</a>	The settings for devices running Chatter mobile. Removed in API version 46.0.
<code>dashboardMobile</code> (Deprecated)	<a href="#">DashboardMobileSettings</a>	The settings for devices running the mobile dashboards app.

Field	Field Type	Description
enableImportContactFromDevice	boolean	Indicates whether users can import contacts from their mobile device ( <code>true</code> ) or not ( <code>false</code> ).  Available in API version 47.0 and later.
enableLightningOnMobile (Removed)	boolean	Indicates whether the org is enabled for the Salesforce mobile app. Available in API version 47.0 only. Removed in API version 48.0.
enableNewSalesforceMobileAppForTablet (Removed)	boolean	Indicates whether the org is enabled for the Salesforce mobile app tablet experience. Removed in API version 56.0.
enableNewSalesforceMobileAppForTabletWideScreen (Removed)	boolean	Indicates whether the org is enabled for the Salesforce mobile app widescreen tablet experience. Available in API version 52.0 through 55.0. Removed in API version 56.0.
enableOfflineDraftsEnabled	boolean	Indicates whether users can create, edit, and delete records while offline in the Salesforce mobile app ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>true</code> . This option isn't available if <code>enableS1OfflinePref</code> is set to <code>false</code> .  Available in API version 47.0 and later.
enablePopulateNameManuallyInToday	boolean	Indicates whether the user's name is shown on the Today page in the Salesforce mobile app ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .  Available in API version 47.0 and later.
enableS1EncryptedStoragePref2	boolean	Indicates whether the Salesforce mobile web uses secure and persistent browser caching to improve performance ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>true</code> .  Available in API version 47.0 and later.
enableS1OfflinePref	boolean	Indicates whether users can access records offline in the Salesforce mobile app ( <code>true</code> ) or not ( <code>false</code> ). This option is set to <code>true</code> the first time someone in your org installs one of the Salesforce downloadable apps.  Available in API version 47.0 and later. However, offline access isn't supported in all versions of the downloadable mobile

Field	Field Type	Description
		apps. Users must have version 10.0 or later of the Salesforce for Android app or the Salesforce for iOS app. Offline access isn't available for the Salesforce mobile web.
<code>touchMobile</code> (Removed)	<a href="#">TouchMobileSettings</a>	The settings for devices running Salesforce Touch. Removed in API version 46.0.

## ChatterMobileSettings

These fields are removed in API version 46.0. Represents your organization's Chatter Mobile settings.

Field	Field Type	Description
<code>iPadAuthorized</code>	boolean	Indicates whether iPad devices are enabled for Chatter Mobile ( <code>true</code> ) or not ( <code>false</code> ).
<code>iPhoneAuthorized</code>	boolean	Indicates whether iPhone devices are enabled for Chatter Mobile ( <code>true</code> ) or not ( <code>false</code> ).
<code>androidAuthorized</code>	boolean	Indicates whether Android devices are enabled for Chatter Mobile ( <code>true</code> ) or not ( <code>false</code> ).
<code>blackBerryAuthorized</code>	boolean	Indicates whether Blackberry devices are enabled for Chatter Mobile ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableChatterMobile</code>	boolean	Indicates whether Chatter Mobile has been enabled for your organization ( <code>true</code> ) or not ( <code>false</code> ).  Setting this field to <code>true</code> enables you to set all the other ChatterMobile settings. If you change this setting from <code>true</code> to <code>false</code> , and also try to change any of the other ChatterMobile settings, your deployment fails with an error.
<code>enablePushNotifications</code>	boolean	Indicates whether Chatter push notifications have been enabled for your organization ( <code>true</code> ) or not ( <code>false</code> )
<code>sessionTimeout</code>	MobileSessionTimeout (enumeration of type string)	The length of time after which users without activity are prompted to log out or continue working. Valid values are: <ul style="list-style-type: none"> <li>• <code>Never</code></li> <li>• <code>OneMinute</code></li> </ul>

Field	Field Type	Description
		<ul style="list-style-type: none"> <li>• FiveMinutes</li> <li>• TenMinutes</li> <li>• ThirtyMinutes</li> </ul>

## Dashboard/MobileSettings

These fields are deprecated. Represents your organization's Mobile Dashboards iPad app settings.

Field	Field Type	Description
enableDashboardIPadApp	boolean	Indicates whether Mobile Dashboards iPad app has been enabled for your organization ( <code>true</code> ) or not ( <code>false</code> ).

## Touch/MobileSettings

These fields are removed in API version 46.0. Salesforce Touch has been upgraded to the Salesforce mobile app.

Field	Field Type	Description
enableTouchBrowserIPad	boolean	Indicates whether your organization has the Salesforce Touch mobile browser app enabled ( <code>true</code> ) or not ( <code>false</code> ).
enableTouchAppIPad	boolean	Indicates whether your organization has the Salesforce Touch downloadable app enabled ( <code>true</code> ) or not ( <code>false</code> ).

## Declarative Metadata Sample Definition

Here's a sample `mobile.settings` metadata file.

```
<?xml version="1.0" encoding="UTF-8"?>
<MobileSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableImportContactFromDevice>true</enableImportContactFromDevice>
  <enableOfflineDraftsEnabled>true</enableOfflineDraftsEnabled>
  <enableS1EncryptedStoragePref2>true</enableS1EncryptedStoragePref2>
  <enableS1OfflinePref>true</enableS1OfflinePref>
</MobileSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MyDomainSettings

Represents your org's My Domain settings. With My Domain, you can include your company name in your URLs, for example, `https://yourcompanyname.my.salesforce.com`. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

MyDomainSettings values are stored in a single file named `MyDomain.settings` in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

### Version

MyDomainSettings components are available in API version 47.0 and later.

### Fields

Field Name	Field Type	Description
<code>canOnlyLoginWithMyDomainUrl</code>	boolean	<p>If <code>true</code>, users must use the org's My Domain login URL to log in. If <code>false</code> (default), users can also log in using the org's instance Salesforce URL, <code>https://InstanceName.salesforce.com</code>, and through the login URL <code>https://login.salesforce.com</code>.</p> <p>Admins can log in to a sandbox via the <b>Log In</b> action on the Sandboxes Setup page only when <code>canOnlyLoginWithMyDomainUrl</code> is <code>false</code> in the sandbox.</p>
<code>doesApiLoginRequireOrgDomain</code>	boolean	<p>If <code>true</code>, users must use the org's My Domain login URL to access the Salesforce API. If <code>false</code> (default), users can also access the Salesforce API using the generic Salesforce page, <code>https://InstanceName.salesforce.com</code> and through the login URL <code>https://login.salesforce.com</code>.</p>
<code>doesWarnOnForceComRedirect</code>	boolean	<p>Indicates whether users who visit a previous *.force.com site URL for this org see a message with the current URL during redirections (<code>true</code>) or not (<code>false</code>). The default is <code>false</code>.</p> <p>This field is applicable only when</p> <ul style="list-style-type: none"> <li>Your org has a previous *.force.com URL associated with an Experience Cloud site or Salesforce Site.</li> <li><code>redirectForceComSitesUrls</code> is <code>true</code></li> </ul> <p>This field is available in API version 59.0 and later.</p>
<code>doesWarnOnRedirect</code>	boolean	<p>Indicates whether users who visit a previous My Domain URL see a message with the current URL during redirections (<code>true</code>) or not (<code>false</code>). The default is <code>false</code>.</p> <p>This field is applicable only when</p>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>Your org has a previous My Domain. For example, after an admin deploys a change to the My Domain.</li> <li>The previous My Domain hasn't been removed via the Routing options on the My Domain Setup page. If the previous My Domain is removed, calls to URLs associated with that My Domain aren't redirected.</li> <li><code>redirectPriorMyDomain</code> is <code>true</code>.</li> </ul> <p>This field is available in API version 59.0 and later.</p>
<code>domainPartition</code>	OrgDomainShard (enumeration of type string)	<p>The partition for this org. When <code>none</code>, partitioned domains aren't enabled. Otherwise, My Domain hostnames include the partition value. For example, the format of a My Domain login hostname for a Developer Edition org with partitioned domains is <code>MyDomainName.develop.my.salesforce.com</code>.</p> <p>This field is read-only in the API. Possible values are:</p> <ul style="list-style-type: none"> <li><code>demo</code>—Used in demo orgs. Available in API version 60.0 and later.</li> <li><code>develop</code>—Used in Developer Edition orgs. Also used in patch orgs where partitioned domains were deployed before Winter '24.</li> <li><code>free</code>—Reserved for internal use.</li> <li><code>none</code>—Indicates that this org doesn't use partitioned domains.</li> <li><code>patch</code>—Used in patch orgs. Available in API version 59.0 and later.</li> <li><code>sandbox</code>—Used in sandboxes with enhanced domains. These orgs are always partitioned.</li> <li><code>scratch</code>—Used in scratch orgs.</li> <li><code>sfdctest</code>—Reserved for internal use.</li> <li><code>sfirestore</code>—Reserved for internal use. Available in API version 62.0 and later.</li> <li><code>trailblaze</code>—Used in Trailblazer Playgrounds.</li> </ul> <p>Partitioned domains require enhanced domains. Production orgs always have a value of <code>none</code>. Only the <code>sandbox</code> partition is available in Government Cloud—Defense orgs, and partitioned domains aren't available in Trailhead Playgrounds on Salesforce Edge Network.</p> <p>Qualifying new orgs are partitioned by default and get the corresponding <code>domainPartition</code> value. You can't disable this feature in those orgs.</p> <p>Available in API version 55.0 and later.</p>
<code>enableCrossDomainPreviewCookies</code>	boolean	<p>If <code>isFirstPartyCookieUseRequired</code> is <code>true</code>, indicates whether cross-domain cookies are allowed on the Experience Builder preview domain (<code>true</code>) or not (<code>false</code>).</p> <p>If <code>isFirstPartyCookieUseRequired</code> is <code>false</code>, this field has no effect.</p>

Field Name	Field Type	Description
		Available in API version 62.0 and later.
<code>enableEdgeDuringRollout</code>	boolean	<p>Indicates whether Salesforce Edge Network is enabled in this org during the scheduled rollout. If <code>true</code>, Salesforce notifies admins by email before Salesforce Edge Network is enabled. If <code>false</code>, the Edge enablement is deferred. The default value is <code>true</code>.</p> <p>If <code>useEdge</code> is <code>true</code>, this field has no effect.</p> <p>Available in API version 58.0 and later.</p>
<code>enableExtendedRedirections</code>	boolean	<p>If Salesforce configured temporary extended redirections for select legacy hostnames for this org, indicates whether calls to those hostnames are redirected (<code>true</code>) or not (<code>false</code>). The default is <code>true</code>. If extended redirections aren't configured for this org, this field has no effect.</p> <p>Available in API version 62.0 and later.</p>
<code>enableLegacyRedirections</code>	boolean	<p>If <code>redirectPriorMyDomain</code> is <code>true</code>, indicates whether legacy hostnames for this org are redirected (<code>true</code>) or not (<code>false</code>).</p> <p>If any of these conditions are true, this field has no effect.</p> <ul style="list-style-type: none"> <li>No legacy (non-enhanced) hostnames exist for the org</li> <li><code>redirectPriorMyDomain</code> is <code>false</code></li> <li>Salesforce stopped legacy redirections for this org</li> </ul> <p>For more information about the end of legacy hostname redirections, see <a href="#">Prepare for the End of Redirections for Non-Enhanced Domains</a> in Salesforce Help.</p> <p>Available in API version 62.0 and later.</p>
<code>enableNativeBrowserForAuthOnAndroid</code>	boolean	<p>If <code>true</code>, use the native browser for authentication of Android mobile apps. Default is <code>false</code>.</p>
<code>enableNativeBrowserForAuthOnIos</code>	boolean	<p>If <code>true</code>, use the native browser for authentication of iOS mobile apps. Default is <code>false</code>.</p>
<code>instancedUrlRedirectHandling</code>	OrgDomainRedirectOption (enumeration of type string)	<p>Indicates how user visits to this org's instanced URL are handled.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li><code>Redirect</code>—Redirect users to the equivalent page on this org's My Domain hostnames.</li> <li><code>WarnOnRedirect</code>—Display a brief warning message to users as they are redirected to the equivalent page on this org's My Domain hostnames.</li> <li><code>NoRedirect</code>—Require users to use your My Domain hostnames when they view this org's pages. Visits to this page's instanced URL aren't redirected.</li> </ul> <p>For example, when a user visits <code>https://<i>InstanceName</i>.lightning.force.com/lightning/page/home</code>,</p>

Field Name	Field Type	Description
		<p>this setting determines whether they're redirected to <code>https://<b>MyDomainName</b>.lightning.force.com/lightning/page/home</code>.</p> <p>The value of this field has no effect on user's ability to log in via the org's instanced URL. To control that behavior, use <code>canOnlyLoginWithMyDomainUrl</code>.</p> <p>Available in API version 59.0 and later.</p>
<code>isFirstPartyCookieUseRequired</code>	boolean	<p>Indicates whether the <code>SameSite=None</code> attribute is removed from Salesforce cookies (<code>true</code>) or not (<code>false</code>). In Salesforce orgs created in Summer '24 and later, the default is <code>true</code>. In all other orgs, the default is <code>false</code>.</p> <p>Available in API version 61.0 and later.</p>
<code>logRedirections</code>	boolean	<p>If <code>true</code>, Salesforce produces a log for the Hostname Redirects event type when daily event logs are generated. The default is <code>false</code>.</p> <p>The Hostname Redirects event is free for all customers with a 24-hour data retention period. When <code>logRedirections</code> is <code>true</code>, this event is available in the API but not in the Event Monitoring Analytics app. You can also download the latest Hostname Redirects event log file through a button on the My Domain page.</p> <p>Available in API version 56.0 and later.</p>
<code>myDomainName</code>	string	<p>The subdomain name used in My Domain URLs for this org, such as <code>MyDomainName.my.salesforce.com</code> and <code>MyDomainName.lightning.force.com</code>.</p> <p>This field is read-only in the API. You can change your org's My Domain name from the My Domain Setup page.</p> <p>Available in API version 51.0 and later.</p>
<code>myDomainSuffix</code>	OrgDomainProdSuffix (enumeration of type string)	<p>The domain suffix for this org's My Domain login URL. This field is read-only in the API.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>CloudforceLimited—cloudforce.com</code></li> <li>• <code>DatabaseLimited—database.com</code></li> <li>• <code>MySalesforce—my.salesforce.com</code> with enhanced domains</li> <li>• <code>MySalesforceLimited—my.salesforce.com</code> without enhanced domains</li> <li>• <code>OrgLevelCertificate—my-salesforce.com</code></li> <li>• <code>OrgLevelCertificateLimited—legacy version of my-salesforce.com</code> that's noncompliant with browsers that block third-party cookies</li> <li>• <code>Restricted1—Reserved for future use.</code></li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>Restricted2—Reserved for future use.</li> </ul> Available in API version 51.0 and later.
redirectForceComSitesUrls	boolean	<p>If <code>true</code>, calls to URLs ending in <code>.force.com</code> that serve your Experience Cloud sites and Salesforce Sites are redirected to the corresponding current My Domain site URL. If <code>false</code>, these calls aren't redirected and the user gets a file not found (404) error. The default is <code>true</code>.</p> <p>This field is only applicable when</p> <ul style="list-style-type: none"> <li>Enhanced domains are enabled.</li> <li>Your org has a previous <code>*.force.com</code> URL associated with an Experience Cloud site or Salesforce Site.</li> </ul> Available in API version 55.0 and later.
redirectPriorMyDomain	boolean	<p>If <code>true</code>, calls to URLs associated with your previous My Domain name are redirected to the corresponding URL associated with your current My Domain. If <code>false</code>, these calls aren't redirected. When you deploy a new My Domain, this setting resets to its default, <code>true</code>.</p> <p>This field is only applicable when</p> <ul style="list-style-type: none"> <li>Your org has a previous My Domain. For example, after an admin deploys a change to the My Domain.</li> <li>The previous My Domain hasn't been removed via the Routing options on the My Domain Setup page. If the previous My Domain is removed, calls to URLs associated with that My Domain aren't redirected.</li> </ul> Available in API version 54.0 and later.
useThirdPartyCookieBlockingCompatibleHostnames	boolean	<p>Indicates whether the org's instance name is included in Visualforce URLs when third-party cookies are blocked (<code>true</code>) or not (<code>false</code>). This field has a default value of <code>true</code>. Setting this field <code>true</code> prevents potential issues loading Visualforce pages with stabilized URLs.</p> <p>Only applicable when <code>useStabilizedMyDomainHostnames</code> is set to <code>true</code> and <code>myDomainSuffix</code> is set to <code>MySalesforceLimited</code>, <code>CloudforceLimited</code>, or <code>DatabaseLimited</code>.</p> Available in API version 51.0 and later.
useEdge	boolean	<p>Indicates whether this org's qualifying My Domain URLs are routed through Salesforce Edge Network (<code>true</code>) or not (<code>false</code>). This field has a default value of <code>true</code>.</p> <p>This field is read-only in the API. If your org can use Salesforce Edge Network, you can enable this setting from the My Domain Setup page. After this field is set to <code>true</code> from Setup, it can't be set to <code>false</code>.</p>

Field Name	Field Type	Description
		Available in API version 51.0 and later.
<code>useEnhancedDomainsInSandbox</code>	boolean	<p>This field corresponds to the previous My Domain setting, Use enhanced domains by default in new and refreshed sandboxes, that was removed in Summer '23.</p> <p>Previously, in API versions 55.0 to 57.0, if enhanced domains weren't enabled, this field indicated whether new and refreshed sandboxes created from this org used enhanced domains by default (<code>true</code>) or not (<code>false</code>), and the default value was <code>true</code>. As of API version 58.0, this field's value is always <code>true</code>, regardless of the value that you set. Changing its value has no effect on Salesforce, even if it reads <code>false</code>.</p>
<code>useStabilizedMyDomainHostnames</code>	boolean	<p>Indicates whether the instance name is hidden in My Domain URLs for Visualforce, Experience Builder, Site.com Studio, and content files (<code>true</code>) or not (<code>false</code>). This field has a default value of <code>true</code>. For example, <code>MyDomainName--PackageName.na44.visual.force.com</code> becomes <code>MyDomainName--PackageName.visualforce.com</code> when this field is set to <code>true</code>.</p> <p>Only applicable when <code>myDomainSuffix</code> is set to <code>MySalesforceLimited</code>, <code>CloudforceLimited</code>, or <code>DatabaseLimited</code>.</p>
<code>useStabilizedSandboxMyDomainHostnames</code>	boolean	<p>This field corresponds to the Stabilize the Hostname for My Domain URLs in Sandboxes release update, which was enforced in Summer '20.</p> <p>When <code>true</code>, the instance name is hidden in My Domain URLs for sandboxes orgs. For example, <code>MyDomainName--test.cs5.my.salesforce.com</code> became <code>MyDomainName--test.my.salesforce.com</code>. As of API version 49.0, this field's value is always <code>true</code>, regardless of the value that you set. Changing its value has no effect on Salesforce, even if it reads <code>false</code>.</p> <p>This change applies retroactively back to API version 47.0, when this field was first introduced. Previously, in API version 47.0 to 49.0, this field indicated whether the instance name was hidden in My Domain URLs for sandboxes orgs (<code>true</code>) or not (<code>false</code>), and the field's default value was <code>false</code>. Now, in all API versions, this field's value is always <code>true</code>, even if it reads <code>false</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of a MyDomainSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<MyDomainSettings xmlns="http://soap.sforce.com/2006/04/metadata">
```

```

<canOnlyLoginWithMyDomainUrl>false</canOnlyLoginWithMyDomainUrl>
<doesApiLoginRequireOrgDomain>false</doesApiLoginRequireOrgDomain>
<doesWarnOnForceComRedirect>false</doesWarnOnForceComRedirect>
<doesWarnOnRedirect>true</doesWarnOnRedirect>
<domainPartition>none</domainPartition>
<enableCrossDomainPreviewCookies>true</enableCrossDomainPreviewCookies>
<enableEdgeDuringRollout>true</enableEdgeDuringRollout>
<enableExtendedRedirections>false</enableExtendedRedirections>
<enableLegacyRedirections>false</enableLegacyRedirections>
<enableNativeBrowserForAuthOnAndroid>false</enableNativeBrowserForAuthOnAndroid>
<enableNativeBrowserForAuthOnIos>false</enableNativeBrowserForAuthOnIos>
<instancedUrlRedirectHandling></instancedUrlRedirectHandling>
<isFirstPartyCookieUseRequired>true</isFirstPartyCookieUseRequired>
<logRedirections>true</logRedirections>
<myDomainName>mycompany</myDomainName>
<myDomainSuffix>MySalesforce</myDomainSuffix>
<redirectForceComSitesUrls>true</redirectForceComSitesUrls>
<redirectPriorMyDomain>true</redirectPriorMyDomain>

<use3rdPartyCookieBlockingCompatibleHostnames>true</use3rdPartyCookieBlockingCompatibleHostnames>

<useEdge>true</useEdge>
<useEnhancedDomainsInSandbox>true</useEnhancedDomainsInSandbox>
<useStabilizedMyDomainHostnames>true</useStabilizedMyDomainHostnames>
<useStabilizedSandboxMyDomainHostnames>true</useStabilizedSandboxMyDomainHostnames>
</MyDomainSettings>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>MyDomain</members>
    <name>Settings</name>
  </types>
  <version>62.0</version>
</Package>

```

## MfgServiceConsoleSettings

Represents the settings to access the Service Console for Manufacturing. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for more details.

### File Suffix and Directory Location

`MfgServiceConsoleSettings` values are stored in the `MfgServiceConsole.settings` file in the `settings` directory.

### Version

`MfgServiceConsoleSettings` components are available in API version 56.0 and later.

## Special Access Rules

To use this metadata type, your Salesforce org must have the Manufacturing Cloud license.

## Fields

Field Name	Field Type	Description
enableMfgServiceConsole	boolean	Indicates whether Service Console for Manufacturing is enabled in your org ( <code>true</code> ) or not ( <code>false</code> ).

 **Note:** By default, Service Console for Manufacturing is disabled.

## Declarative Metadata Sample Definition

The following is an example of a `MfgServiceConsoleSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<MfgServiceConsoleSettings
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableMfgServiceConsole>true</enableMfgServiceConsole>
</MfgServiceConsoleSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>MfgServiceConsole</members>
    <name>Settings</name>
  </types>
  <version>56.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## NameSettings

Enables or disables the formal name, middle name, and suffix attributes for these person objects: Contact, Lead, Person Account, and User. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

NameSettings values are stored in a single file named `Name.settings` in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

NameSettings components are available in API version 31.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableInformalName</code>	boolean	Reserved for internal use. Available in API version 48.0 and later.
<code>enableMiddleName</code>	boolean	Indicates whether middle names are enabled ( <code>true</code> ) or disabled ( <code>false</code> ) for person objects.
<code>enableNameSuffix</code>	boolean	Indicates whether suffixes are enabled ( <code>true</code> ) or disabled ( <code>false</code> ) for person objects.

## Declarative Metadata Sample Definition

This example shows a NameSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<NameSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableMiddleName>true</enableMiddleName>
  <enableNameSuffix>false</enableNameSuffix>
</NameSettings>
```

This example `package.xml` manifest references the NameSettings definitions.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Name</members>
    <name>Settings</name>
  </types>
  <version>31.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## NotificationsSettings

Represents an organization's mobile settings.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## Declarative Metadata File Suffix and Directory Location

NotificationsSettings values are stored in a single file named `Notifications.settings` in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

Mobile settings are available in API version 46.0 and later.

## Fields

Field	Field Type	Description
<code>enableActivityReminderBrowserNotifs</code>	boolean	Reserved for internal use.
<code>enableMobileAppPushNotifications</code>	boolean	Indicates whether mobile push notifications are enabled.
<code>enableNotifications</code>	boolean	Indicates whether notifications are enabled.

## Declarative Metadata Sample Definition

This is a sample `notifications.settings` metadata file.

```
<NotificationsSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableMobileAppPushNotifications>true</enableMobileAppPushNotifications>
  <enableNotifications>true</enableNotifications>
</NotificationsSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OauthOidcSettings

Represents org settings for disabling OAuth OpenID Connect authorization flows.

## Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See [Settings](#) for more details.

## File Suffix and Directory Location

OauthOidcSettings values are stored in the OauthOidc.settings file in the settings folder. The .settings files are different from other named components, because there is only one settings file for each settings component.

## Version

OauthOidcSettings is available in API version 56.0 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
blockOAuthUnPwFlow	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the username-password flow is blocked (<code>true</code>) or not blocked (<code>false</code>). The default value is <code>false</code>.</p>
blockOAuthUsrAgtFlow	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the user-agent flow is blocked (<code>true</code>) or not blocked (<code>false</code>). The default value is <code>false</code>.</p>
enableHdlessFgtPswFlow	<p><b>Field Type</b> boolean</p> <p><b>Description</b> For internal use only.</p>
isPkceRequired	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the OAuth 2.0 Proof Key for Code Exchange (PKCE) security extension is required for variations of the OAuth authorization code flow that access this org (<code>true</code>) or not (<code>false</code>). This setting requires PKCE for all supported variations of the authorization code flow, including the web server flow, the Authorization Code and Credentials Flow, and their derivatives. The default value is <code>false</code>. This field is available in API version 59.0 and later.</p>
oAuthCdCrdtFlowEnable	<p><b>Field Type</b> boolean</p>

Field Name	Description
	<p><b>Description</b></p> <p>Indicates whether the Authorization Code and Credentials Flow is enabled (<code>true</code>) or blocked (<code>false</code>). The default value is <code>false</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of the `OauthOidcSettings` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<OauthOidcSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <blockOAuthUnPwFlow>true</blockOAuthUnPwFlow>
  <blockOAuthUsrAgtFlow>true</blockOAuthUsrAgtFlow>
  <oAuthCdCrdtFlowEnable>false</oAuthCdCrdtFlowEnable>
</OauthOidcSettings>
```

## Example Package Manifest

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>OauthOidc</members>
    <name>Settings</name>
  </types>
  <version>56.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ObjectHierarchyRelationship

Represents an organization's custom field mappings for sales agreement conversion. Fields can be mapped from Opportunity and Quotes to SalesAgreement and SalesAgreementProduct.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

`ObjectHierarchyRelationship` components have the suffix `ObjectHierarchyRelationship.settings` and are stored in the `ObjectHierarchyRelationship` folder.

## Version

ObjectHierarchyRelationship components are available in API version 51.0 and later.

## Fields

Field Name	Description
childObjectMapping	<p><b>Field Type</b> ObjectMapping</p> <p><b>Description</b> Set of <code>inputObject</code>, <code>mappingFields</code>, and <code>outputObject</code> entries. For example, fields from the input object of <code>OpportunityLineItem</code> maps to fields of the output object of <code>SalesAgreementProduct</code>.</p>
childObjectMappingId	<p><b>Field Type</b> String</p> <p><b>Description</b> The ID of the child object mapping record. This field is available in API version 56.0 and later.</p>
inputObjRecordsGrpFieldName	<p><b>Field Type</b> string</p> <p><b>Description</b> The field name in the input object used to group the records. This field is available in API version 55.0 and later.</p>
mappingType	<p><b>Field Type</b> ObjHierarchyMappingType (enumeration of type string)</p> <p><b>Description</b> Specifies the type of relationship between two objects. This field is available in API version 55.0 and later.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• ChildToChild</li> <li>• ParentToChild</li> <li>• ParentToParent</li> <li>• Support</li> </ul>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Label name of the mapping definition.</p>

Field Name	Description
outputPntRelationshipFieldName	<p><b>Field Type</b> string</p> <p><b>Description</b> The field name that defines the relationship between a parent and child for the output object. This field is available in API version 55.0 and later.</p>
parentObjectMapping	<p><b>Field Type</b> <a href="#">ObjectMapping</a></p> <p><b>Description</b> Required.  Set of <code>inputObject</code>, <code>mappingFields</code>, and <code>outputObject</code> entries. For example, fields from the input object of Opportunity maps to fields of the output object of SalesAgreement.</p>
parentObjectMappingId	<p><b>Field Type</b> string</p> <p><b>Description</b> The ID of the parent object mapping record. This field is available in API version 56.0 and later.</p>
parentRecord	<p><b>Field Type</b> string</p> <p><b>Description</b> The parent record for this object hierarchy relationship. This field is available in API version 55.0 and later.</p>
parentRelationshipFieldName	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the field that defines the relationship between the parent and child.</p>
sourceReferenceRelaFieldName	<p><b>Field Type</b> string</p> <p><b>Description</b> The field name in an object that's used to define the relationship between a source and reference object. This field is available in API version 56.0 and later.</p>
usageType	<p><b>Field Type</b> MappingUsageType (enumeration of type string)</p> <p><b>Description</b> Required.  Name of the usage type of an object hierarchy relationship.</p>

Field Name	Description
	<p>Valid value is:</p> <ul style="list-style-type: none"> <li>• ConvertToSalesAgreement</li> <li>• CLMFieldMapping</li> <li>• EligibleProgramRebateType</li> <li>• MapJournalToMemberAggregate</li> <li>• TransformationMapping</li> </ul>

## ObjectMapping

Represents a set of `inputObject`, `mappingFields`, and `outputObject` entries.

### Fields

Field Name	Description
<code>inputObject</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  Name of the input object type containing the source fields for mapping. For example, Opportunity or OpportunityLineItem.</p>
<code>mappingFields</code>	<p><b>Field Type</b> <a href="#">ObjectMappingField</a></p> <p><b>Description</b> Mapping of source object input fields to target object for SalesAgreement and SalesAgreementProduct.</p>
<code>outputObject</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  Name of the output object type receiving data conversion. For example, SalesAgreement or SalesAgreementProduct.</p>

## ObjectMappingField

Represents a set of `inputField` and `outputField` entries.

## Fields

Field Name	Description
inputField	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>Field in the object specified by the <code>inputObject</code> field in <a href="#">ObjectMapping</a> on page 1893. This field is mapped to the field in <code>outputField</code>, which is a field in the object specified by the <code>outputObject</code> field in <a href="#">ObjectMapping</a> on page 1893.</p>
outputField	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>Field in the object specified by the <code>outputObject</code> field in <a href="#">ObjectMapping</a> on page 1893. This field is mapped to the field name in <code>inputField</code>, which is a field in the object specified by the <code>inputObject</code> field in <a href="#">ObjectMapping</a> on page 1893.</p>

## Declarative Metadata Sample Definition

The following is an example of a `ObjectHierarchyRelationship` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ObjectHierarchyRelationship xmlns="http://soap.sforce.com/2006/04/metadata">

  <parentObjectMapping>
    <inputObject>Opportunity</inputObject>
    <mappingFields>
      <inputField>Name</inputField>
      <outputField>Name</outputField>
    </mappingFields>
    <mappingFields>
      <inputField>CloseDate</inputField>
      <outputField>StartDate</outputField>
    </mappingFields>
    <mappingFields>
      <inputField>Account</inputField>
      <outputField>Account</outputField>
    </mappingFields>
    <mappingFields>
      <inputField>Pricebook2</inputField>
      <outputField>Pricebook</outputField>
    </mappingFields>
    <outputObject>SalesAgreement</outputObject>
  </parentObjectMapping>
```

```

<childObjectMapping>
  <inputObject>OpportunityLineItem</inputObject>
  <mappingFields>
    <inputField>Id</inputField>
    <outputField>Name</outputField>
  </mappingFields>
  <mappingFields>
    <inputField>UnitPrice</inputField>
    <outputField>SalesPrice</outputField>
  </mappingFields>
  <mappingFields>
    <inputField>PricebookEntry</inputField>
    <outputField>PricebookEntry</outputField>
  </mappingFields>
  <mappingFields>
    <inputField>Quantity</inputField>
    <outputField>InitialPlannedQuantity</outputField>
  </mappingFields>
  <outputObject>SalesAgreementProduct</outputObject>
</childObjectMapping>

<masterLabel>ObjectHierarchyRelationship</masterLabel>
<usageType>ConvertToSalesAgreement</usageType>
<parentRelationshipFieldName>Opportunity</parentRelationshipFieldName>
<outputPntRelationshipFieldName>SalesAgreement</outputPntRelationshipFieldName>
<parentRecord></parentRecord>
<inputObjRecordsGrpFieldName>Account</inputObjRecordsGrpFieldName>
<mappingType>ParentToParent</mappingType>

</ObjectHierarchyRelationship>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ObjectHierarchyRelationship</name>
  </types>
  <version>51.0</version>
</Package>

```

## Usage

Use the `deploy()` call to deploy metadata with a .zip file. Every .zip file contains a project manifest, a file that's named `package.xml`, and a set of directories that contain the components. The manifest file defines the components that you're trying to retrieve or deploy in the .zip file. The manifest also defines the API version that's used for the deployment or retrieval. For more information on the .zip file, deploying, and retrieving metadata, see [Deploying and Retrieving Metadata with the Zip File](#). You can also deploy and retrieve the metadata API using Postman.

Ensure you map all the required fields for sales agreement conversion.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ObjectLinkingSettings (Beta)

Represents the channel-object linking settings for an org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Note:** As a beta feature, Channel-Object Linking is a preview and isn't part of the "Services" under your Main Services Agreement with Salesforce. Use this feature at your sole discretion, and make your purchase decisions only on the basis of generally available products and features. Salesforce doesn't guarantee general availability of this feature within any particular time frame or at all, and we can discontinue it at any time. This feature is for evaluation purposes only, not for production use. It's offered as is and isn't supported, and Salesforce has no liability for any harm or damage arising out of or in connection with it. All restrictions, Salesforce reservation of rights, obligations concerning the Services, and terms for related Non-Salesforce Applications and Content apply equally to your use of this feature. For information on enabling this feature, contact Salesforce.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

ObjectLinkingSettings values are stored in the `ObjectLinking.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

ObjectLinkingSettings components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableObjectLinking</code>	boolean	Indicates whether Channel-Object Linking is enabled, allowing you to link channel interactions to objects such as Contacts. The default value is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of an ObjectLinkingSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ObjectLinkingSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableObjectLinking>true</enableObjectLinking>
</ObjectLinkingSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
```

```

<types>
  <members>ObjectLinking</members>
  <name>Settings</name>
</types>
<version>47.0</version>
</Package>

```

## OmniChannelSettings

Represents the Omni-Channel settings for an org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field. In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

### File Suffix and Directory Location

OmniChannelSettings values are stored in the `OmniChannel.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

### Version

OmniChannelSettings components are available in API version 44.0 and later.

### Fields

Field Name	Field Type	Description
<code>enableOmniAutoLoginPrompt</code>	boolean	Indicates whether to display a login confirmation upon loading a console with Omni-Channel. The default value is <code>false</code> .  When <code>true</code> , the console displays a prompt before logging into Omni-Channel when an agent opens another Omni-Channel console in a different tab or window or refreshes the current tab. The agent is logged out of Omni-Channel on other consoles and any ongoing conversations are ended. Available in API version 47.0 and later.
<code>enableOmniChannel</code>	boolean	Indicates whether Omni-Channel is enabled, giving you access to the objects required to set up the feature in your org. The default value is <code>false</code> .
<code>enableOmniSecondaryRoutingPriority</code>	boolean	Indicates whether Secondary Routing Priority is enabled in your org. The default value is <code>false</code> . Available in API version 47.0 and later.
<code>enableOmniSkillsRouting</code>	boolean	Indicates whether skills-based routing is enabled in your org. The default value is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of a `OmniChannelSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<OmniChannelSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableOmniChannel>true</enableOmniChannel>
  <enableOmniAutoLoginPrompt>true</enableOmniAutoLoginPrompt>
  <enableOmniSecondaryRoutingPriority>true</enableOmniSecondaryRoutingPriority>
  <enableOmniSkillsRouting>true</enableOmniSkillsRouting>
</OmniChannelSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>OmniChannel</members>
    <name>Settings</name>
  </types>
  <version>44.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OmniInteractionAccessConfig

Represents configuration settings for access to OmniStudio FlexCard caching and data sources.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`OmniInteractionAccessConfig` components have the suffix `.omniInteractionAccessConfig` and are stored in the `OmniInteractionAccessConfig` folder.

### Version

`OmniInteractionAccessConfig` components are available in API version 53.0 and later.

### Special Access Rules

`OmniInteractionAccessConfig` is available if your org has the OmniStudio platform license and related addon and user licenses.

## Fields

Field Name	Field Type	Description
configName	string	Not used.
isAsyncCardCachingEnabled	boolean	Required. If set to <code>true</code> , enables asynchronous FlexCard caching. The default is <code>false</code> .
isCardApexRemoteDisabled	boolean	Required. If set to <code>true</code> , disables remote Apex method calls for FlexCards. The default is <code>false</code> .
isCardCacheDisabled	boolean	Required. If set to <code>true</code> , disables FlexCard caching. The default is <code>false</code> .
isCardDataTfrmDisabled	boolean	Required. If set to <code>true</code> , disables Data Mapper data sources for FlexCards. The default is <code>false</code> .
isCardIntegrationProcDisabled	boolean	Required. If set to <code>true</code> , disables Integration Procedure data sources for FlexCards. The default is <code>false</code> .
isCardRestApiDisabled	boolean	Required. If set to <code>true</code> , disables REST calls for FlexCards. The default is <code>false</code> .
isCardSoqlDisabled	boolean	Required. If set to <code>true</code> , disables SOQL queries for FlexCards. The default is <code>false</code> .
isCardSoslDisabled	boolean	Required. If set to <code>true</code> , disables SOSL queries for FlexCards. The default is <code>false</code> .
isCardStreamingApiDisabled	boolean	Required. If set to <code>true</code> , disables Streaming API calls for FlexCards. The default is <code>false</code> .
isDataTfrmEncrpfFieldsDisabled	boolean	Required. If set to <code>true</code> , disables Data Mapper field encryption for FlexCards. The default is <code>false</code> .
masterLabel	string	Required. The name of the setting. The value is <code>Profile_ProfileId</code> , <code>User_UserId</code> , or <code>Org_Wide</code> .
setupOwner	string	The ID of the profile, user, or org to which the settings apply.

## Declarative Metadata Sample Definition

The following is an example of an OmniInteractionAccessConfig component.

```
<?xml version="1.0" encoding="UTF-8"?>
<OmniInteractionAccessConfig xmlns="http://soap.sforce.com/2021/10/metadata">
  <isAsyncCardCachingEnabled>false</isAsyncCardCachingEnabled>
  <isCardApexRemoteDisabled>false</isCardApexRemoteDisabled>
  <isCardCacheDisabled>false</isCardCacheDisabled>
  <isCardDataTfrmDisabled>false</isCardDataTfrmDisabled>
  <isCardIntegrationProcDisabled>false</isCardIntegrationProcDisabled>
  <isCardRestApiDisabled>false</isCardRestApiDisabled>
  <isCardSoqlDisabled>false</isCardSoqlDisabled>
  <isCardSoslDisabled>false</isCardSoslDisabled>
</OmniInteractionAccessConfig>
```

```
<isCardStreamingApiDisabled>>false</isCardStreamingApiDisabled>
<isDataTfrmEncrpfFieldsDisabled>>false</isDataTfrmEncrpfFieldsDisabled>
<masterLabel>Profile_00eB0000000ijOH</masterLabel>
<setupOwner>00eB0000000ijOH</setupOwner>
</OmniInteractionAccessConfig>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2021/10/metadata">
  <types>
    <members>*</members>
    <name>OmniInteractionAccessConfig</name>
  </types>
  <version>53.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OmniInteractionConfig

Represents configuration settings for OmniStudio.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

OmniInteractionConfig components have the suffix `.omniInteractionConfig` and are stored in the `OmniInteractionConfig` folder.

### Version

OmniInteractionConfig components are available in API version 51.0 and later.

### Special Access Rules

OmniInteractionConfig is available if your org has the OmniStudio platform license and related addon and user licenses.

### Fields

Field Name	Field Type	Description
<code>masterLabel</code>	string	Required. The name of the setting.
<code>value</code>	string	Required. The value of the setting.

## Declarative Metadata Sample Definition

The following is an example of an OmniInteractionConfig component.

```
<?xml version="1.0" encoding="UTF-8"?>
<OmniInteractionConfig xmlns="http://soap.sforce.com/2021/10/metadata">
  <masterLabel>TheFirstInstalledOmniPackage</masterLabel>
  <value>omnistudio</value>
</OmniInteractionConfig>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2021/10/metadata">
  <types>
    <members>*</members>
    <name>OmniInteractionConfig</name>
  </types>
  <version>51.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Usage

Settings configured using OmniInteractionConfig include:

- `CheckCachedMetadataRecordSecurity`—If set to `true`, performs a record-level security check for cached data in Data Mappers and Integration Procedures.
- `DefaultRequiredPermission`—The Custom Permission a user must have to run Data Mappers and Integration Procedures.
- `DocuSignAccountId`—The API Account ID from DocuSign's Apps and Keys page.
- `DocuSignNamedCredential`—The named credential for connecting to DocuSign. Set the value to `DocuSign`.
- `InstalledIndustryPackage`—If present, lists the namespace of the Salesforce Industries managed package that was installed. Values are `vLOCITY_cmt`, `vLOCITY_ins`, or `vLOCITY_ps`. Read-only.
- `newportZipUrl`—The relative URL (without the hostname) for the static resource that contains custom Newport styles for FlexCards.
- `OmniAnalyticsTrackingDebug`—If set to `true`, includes debugging data in OmniStudio Tracking Service records.
- `RollbackDRChanges`—If set to `true`, rolls back Data Mapper functionality changes. Use it if an upgrade causes some Data Mappers to stop working.
- `TheFirstInstalledOmniPackage`—Lists the namespace of the managed package that was installed first, which determines whether new or legacy OmniStudio features are available. Values are `omnistudio` for new features, or `vLOCITY_cmt`, `vLOCITY_ins`, or `vLOCITY_ps` for legacy features. Read-only.
- `Track_component`—If set to `true`, enables tracking for a component or component type in the OmniStudio Tracking Service.
- `TurnOffScaleCache`—If set to `true`, turns off the Scale Cache that Data Mappers and Integration Procedures use.

## OpportunityInsightsSettings

Represents an org's Einstein Opportunity Insights settings. This setting controls features that give you relevant updates about your opportunities.

 **Note:** This metadata type has been deprecated as of API version 59.0.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

### File Suffix and Directory Location

OpportunityInsightsSettings values are stored in the `OpportunityInsights.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

### Version

OpportunityInsightsSettings is available in API versions 48.0 to 58.0.

### Fields

Field Name	Field Type	Description
<code>enableOpportunityInsights</code>	boolean	Indicates whether Einstein Opportunity Insights is enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .

### Declarative Metadata Sample Definition

The following is an example of the `OpportunityInsights.settings` file:

```
<?xml version="1.0" encoding="UTF-8"?>
<OpportunityInsightsSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableOpportunityInsights>true</enableOpportunityInsights>
</OpportunityInsightsSettings>
```

### Example Package Manifest

The following is an example package manifest used to deploy or retrieve the OpportunityInsights settings metadata:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>OpportunityInsights</members>
    <name>Settings</name>
  </types>
  <version>29.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OpportunitySettings

Represents org preferences for features such as automatic opportunity updates and similar-opportunity filters.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

Use opportunity settings to control the actions that users can perform on their opportunities.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

Opportunities values are stored in a single file named `Opportunity.settings` in the `settings` directory of the corresponding package directory.

## Version

OpportunitySettings is available in API version 28.0 and later.

## Fields

Field Name	Field Type	Description
<code>autoActivateNewReminders</code>	boolean	Automatically uses scheduled updates for new opportunities.
<code>customizableProductSchedulesEnabled</code>	boolean	Lets Salesforce admins customize product schedules by using custom fields, validation rules, and Apex triggers on the <code>LineItemSchedule</code> object. This field is available in API version 46.0 and later.  If customizable product schedules are enabled, you can use custom fields in default schedules and customize their layout, but Apex triggers or validation rules that you apply to default schedules are bypassed.
<code>doesEnforceStandardOpportunitySaveLogic</code>	boolean	Enforces standard validation and triggers for opportunity products and opportunity product schedules. Default value is <code>true</code> . Can't be set to <code>false</code> .  Available in API version 47.0 and later.
<code>enableExpandedPipelineInspectionSetup</code>		Displays a Pipeline Inspection setup page to Salesforce admins with all setup steps for enabling and configuring the feature. The set up also includes historical trending. The default value is <code>false</code> .  Available in API version 52.0 and later.
<code>enableFindSimilarOpportunities</code>	boolean	Lets users see related or similar existing opportunities.

Field Name	Field Type	Description
<code>enableForecastCategoryMetrics</code>	boolean	Lets users see single and cumulative forecast category rollups over a selected period. Applies to the following categories: Best Case, Closed Lost, Closed Won, Commit, Most Likely, Open Pipeline, and Total.  Default value is <code>true</code> . Available in API version 57.0 and later.
<code>enableOpportunityFieldHistoryTracking</code>	boolean	Enables history tracking for the opportunity field. For more information, see “Field History Tracking” in Salesforce Help. Default value is <code>true</code> .  Available in API version 47.0 and later.
<code>enableOpportunityInsightsInMobile</code>	boolean	Deprecated in API version 59.0 and later because the feature is no longer available. Indicates whether a user can see Einstein Opportunity Insights on their mobile device ( <code>true</code> ) or not ( <code>false</code> ). Einstein Opportunity Insights includes predictions about which deals are likely to be won, reminders to follow up, and notifications when key moments in a deal take place.  Available in API version 47.0 to 58.0.
<code>enableOpportunityTeam</code>	boolean	Lets users associate team members with opportunities.
<code>enablePipelineChangesMetrics</code>	boolean	Lets users see net change to the pipeline (positive or negative) contributed by each deal within a selected timeframe. Applies to the following categories: Open Pipeline, New, Won, Increased, Moved In, Moved Out, Decreased, Lost, and Overdue.  Default value is <code>true</code> . Available in API version 57.0 and later.
<code>enablePipelineInspection</code>	boolean	Enables the Pipeline Inspection feature in the Opportunity tab. Also enables historical trending for opportunities, if the org has the historical trending org perm. Pipeline Inspection is a consolidated view of pipeline metrics, corresponding opportunities, and highlights of recent opportunity changes and insights. The default value is <code>false</code> .  Also enables historical trending for opportunities, if historical trending isn’t already enabled. To use Pipeline Inspection, additional configuration in Setup is required.  Available in API version 52.0 and later.
<code>enablePipelineInspectionFlow</code>	boolean	Enables the Pipeline Inspection Flow Chart in the Opportunity tab. This chart shows Pipeline Inspection users the changes to opportunities in different forecast categories over time. Users can filter results to see the data that’s most useful to them.  To use this feature, access to Revenue Insights is required.  Available in API version 54.0 and later.

Field Name	Field Type	Description
<code>enablePipelineInspectionSingleCategoryRollup</code>	boolean	Indicates that Pipeline Inspection metrics display as single forecast categories ( <code>true</code> ), or multiple categories rolled up ( <code>false</code> ). The default value is ( <code>false</code> ).  To use this feature, Pipeline Inspection configuration in Setup is required.  Available in API version 55.0 and later.
<code>enableRevenueInsights</code>	boolean	Sets up Revenue Insights dashboards and installs the related CRM Analytics app. The dashboards give users access to sales performance, pipeline, and forecasting reports and analytics.  Revenue Insights is part of Revenue Intelligence, which is available for an additional cost.  Available in API version 54.0 and later.
<code>enableServiceCaseInsights</code>	boolean	Indicates whether insights based on service cases are enabled ( <code>true</code> ) or not ( <code>false</code> ) in Pipeline Inspection. The default value is ( <code>false</code> ).  Available in API version 55.0 and later.
<code>enableUpdateReminders</code>	boolean	Lets users enable automatic, scheduled updates on opportunities.
<code>findSimilarOppFilter</code>	<a href="#">FindSimilarOppFilter</a> on page 1906	Defines parameters for similar opportunities.
<code>oppAmountDealMotionEnabled</code>	boolean	Indicates whether deal change highlights are enabled for opportunity amounts ( <code>true</code> ) or not ( <code>false</code> ). The default value is ( <code>true</code> ).  Available in API version 50.0 and later.
<code>oppCloseDateDealMotionEnabled</code>	boolean	Indicates whether deal change highlights are enabled for opportunity close dates ( <code>true</code> ) or not ( <code>false</code> ). The default value is ( <code>true</code> ).  Available in API version 50.0 and later.
<code>promptToAddProducts</code>	boolean	Prompts users to add related products to an opportunity.
<code>pushCountEnabled</code>	boolean	Indicates whether the Push Count field is visible to users in opportunity list views and Pipeline Inspection views ( <code>true</code> ) or not ( <code>false</code> ). The default value is ( <code>true</code> ).  Available in API version 56.0 and later.
<code>simpleOppCreateFromContact</code>	boolean	Indicates whether you can create an opportunity with prefilled information (such as the contact's account) from the Global Actions menu while viewing a contact ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 54.0 and later.
<code>simpleOppCreateFromEvent</code>	boolean	Indicates whether you can create an opportunity with prefilled information (such as the event's account) from the Global Actions menu while viewing an event ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 54.0 and later.

## FindSimilarOppFilter

Defines whether to match by entire columns or fields.

Field	Field Type	Description
similarOpportunitiesDisplayColumns	string	The columns to compare.
similarOpportunitiesMatchFields	string	The fields to compare.

## Declarative Metadata Sample Definition

The following is an example of the package file.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Opportunity</members>
    <name>Settings</name>
  </types>
  <version>28.0</version>
</Package>
```

The package file references the following Opportunity.settings file.

```
<?xml version="1.0" encoding="UTF-8"?>
<OpportunitySettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <autoActivateNewReminders>true</autoActivateNewReminders>
  <customizableProductSchedulesEnabled>>false</customizableProductSchedulesEnabled>
  <doesEnforceStandardOpportunitySaveLogic>true</doesEnforceStandardOpportunitySaveLogic>

  <enableFindSimilarOpportunities>true</enableFindSimilarOpportunities>
  <enableForecastCategoryMetrics>true</enableForecastCategoryMetrics>
  <enablePipelineChangesMetrics>true</enablePipelineChangesMetrics>
  <findSimilarOppFilter>
    <similarOpportunitiesMatchFields>OPPORTUNITY.Account</similarOpportunitiesMatchFields>

<similarOpportunitiesMatchFields>OPPORTUNITY.OpportunityCompetitors</similarOpportunitiesMatchFields>

    <similarOpportunitiesMatchFields>CustomField__c</similarOpportunitiesMatchFields>
    <similarOpportunitiesDisplayColumns>CustomField__c</similarOpportunitiesDisplayColumns>

  </findSimilarOppFilter>
  <enableOpportunityFieldHistoryTracking>true</enableOpportunityFieldHistoryTracking>
  <enableOpportunityInsightsInMobile>false</enableOpportunityInsightsInMobile>
  <enableOpportunityTeam>true</enableOpportunityTeam>
  <enableUpdateReminders>true</enableUpdateReminders>
  <promptToAddProducts>true</promptToAddProducts>
  ..<oppAmountDealMotionEnabled>true</oppAmountDealMotionEnabled>
  ..<oppCloseDateDealMotionEnabled>true</oppCloseDateDealMotionEnabled>
</OpportunitySettings>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OpportunityScoreSettings

Represents an org's Einstein Opportunity Scoring settings, such as whether or not Einstein Opportunity Scoring is enabled. Einstein Opportunity Scoring helps determine the likelihood of an opportunity being won. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

`OpportunityScoreSettings` values are stored in the `OpportunityScore.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`OpportunityScoreSettings` is available in API versions 49.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableOpportunityScoring</code>	boolean	Indicates whether Einstein Opportunity Scoring is enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of the `OpportunityScore.settings` file:

```
<?xml version="1.0" encoding="UTF-8"?>
<OpportunityScoreSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableOpportunityScoring>true</enableOpportunityScoring>
</OpportunityScoreSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the `OpportunityScore` settings metadata:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>OpportunityScore</members>
    <name>Settings</name>
  </types>
```

```
<version>49.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OrderManagementSettings

Represents options for the Salesforce Order Management product. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

`OrderManagementSettings` values are stored in the `OrderManagement.settings` file in the `settings` directory. The `.settings` files are different from other named components because there is only one settings file for each settings component.

## Version

Order Management settings are available in API version 48 and later.

## Special Access Rules

This metadata type is only accessible by developers and customers using Salesforce Order Management.

## Fields

Field Name	Field Type	Description
<code>deliveryEstimationEnabled</code>	boolean	Specifies whether delivery estimation is active ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . Available in API version 62.0 and later.
<code>enableB2CIntegration</code>	boolean	Indicates whether Order Management is allowed to accept order data from B2C Commerce ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>enableDuplicateManagement</code>	boolean	Indicates whether the Order Management B2C Commerce Integration applies the Salesforce org's duplicate and matching rules for Accounts, Contacts, and Person Accounts to shopper records ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . The Setup toggle label is <b>B2C Integration Data Matching Rules</b> . Available in API version 53.0 and later.
<code>enableHighScaleOrders</code>	boolean	Indicates whether the Order Management B2C Commerce Integration uses the High Scale Orders feature ( <code>true</code> ) or the original order ingestion

Field Name	Field Type	Description
		system ( <code>false</code> ). The default value is <code>false</code> . Available in API version 56.0 and later.
<code>enableOrderManagement</code>	boolean	Indicates whether Order Management features are enabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>enablePersonAccountsForShoppers</code>	boolean	Indicates whether Order Management represents each shopper with a Person Account ( <code>true</code> ) or a normal Account and a Contact ( <code>false</code> ). The default value is <code>false</code> . Available in API version 49.0 and later.

## Declarative Metadata Sample Definition

The following is an example of an `OrderManagementSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<OrderManagementSettings xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <enableOrderManagement>true</enableOrderManagement>
  <deliveryEstimationEnabled>false</deliveryEstimationEnabled>
  <enableB2CIntegration>true</enableB2CIntegration>
  <enableDuplicateManagement>true</enableB2CIntegration>
  <enableHighScaleOrders>false</enableB2CIntegration>
  <enablePersonAccountsForShoppers>true</enablePersonAccountsForShoppers>
</OrderManagementSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>OrderManagement</members>
    <name>Settings</name>
  </types>
  <version>49.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OrderSettings

Represents order settings.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

There is one OrderSettings component in a file named `Order.settings` in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

OrderSettings components are available in API version 30.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableEnhancedCommerceOrders</code>	boolean	Indicates whether enhanced commerce orders are enabled for the org ( <code>true</code> ) or not ( <code>false</code> ). This preference is available only in orgs with the Salesforce Order Management license. Default value is <code>false</code> . Available in API versions 48.0 and later.
<code>enableNegativeQuantity</code>	boolean	Indicates whether users in the org can add order products with quantities of less than zero ( <code>true</code> ) or not ( <code>false</code> ). To enable this preference, <code>enableOrders</code> must be set to <code>true</code> .
<code>enableOptionalPricebook</code>	boolean	Indicates whether users in the org can create orders without price books ( <code>true</code> ) or not ( <code>false</code> ). For more information, see <a href="#">Enable Orders Without Price Books</a> in Salesforce Help.
<code>enableOrderEvents</code>	boolean	Indicates whether order events are enabled for the org ( <code>true</code> ) or not ( <code>false</code> ). For more information, see <code>OrderStatusChangedEvent</code> in the <a href="#">Platform Events Developer Guide</a> .
<code>enableOrders</code>	boolean	Indicates whether orders are enabled for the org ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableOrderWithMultiplePriceBooks</code>	boolean	Indicates whether users in the org can create orders containing order items that refer to multiple price books ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 60.0 and later. To enable this preference, <code>enableOrders</code> and <code>enableEnhancedCommerceOrders</code> must be set to <code>true</code> . This field helps to offer different pricing structures for various customer segments, regions, or promotional periods.
<code>enableReductionOrders</code>	boolean	Indicates whether reduction orders are enabled for the org ( <code>true</code> ) or not ( <code>false</code> ). For more information, see <a href="#">Reduction Orders</a> in Salesforce Help. To enable this preference, <code>enableOrders</code> must be set to <code>true</code> .
<code>enableZeroQuantity</code>	boolean	Indicates whether users in the org can add order products with quantities of zero ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> . To enable this preference, <code>enableOrders</code> must be set to <code>true</code> . Available in API version 42.0 and later.

## Declarative Metadata Sample Definition

This is a sample OrderSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<OrderSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableNegativeQuantity>false</enableNegativeQuantity>
  <enableZeroQuantity>false</enableZeroQuantity>
  <enableOrders>true</enableOrders>
  <enableReductionOrders>true</enableReductionOrders>
  <enableEnhancedCommerceOrders>true</enableEnhancedCommerceOrders>
  <enableOptionalPricebook>false</enableOptionalPricebook>
  <enableOrderEvents>false</enableOrderEvents>
  <enableOrderWithMultiplePriceBooks>false</enableOrderWithMultiplePriceBooks>
</OrderSettings>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Order</members>
    <name>Settings</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the package.xml manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OrgPreferenceSettings

Removed in API version 48.0. Represents the unique org preference settings in a Salesforce org.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

OrgPreferenceSettings values are stored in the `OrgPreference.settings` file in the settings directory. The `.settings` files are different from other named components because there is only one settings file for each settings component.

## Version

OrgPreferenceSettings components are available in API versions 37.0 to 47.0.

OrgPreferenceSettings is deprecated in API version 47.0 and removed in API version 48.0. In API version 47.0, most of the settings supported in the `preferences` field were made available in the form of Boolean fields on other Settings types. For example, in API version 47.0 and later, you can enable and disable the `CompileOnDeploy` preference by using the `enableCompileOnDeploy` field on the `ApexSettings` type.

## Fields

Field Name	Field Type	Description
preferences	<a href="#">OrganizationSettingsDetail</a>	<p>The preferences associated with the org settings. In the following list of preferences, click hyperlinked preference names to go to the topic for the Settings type that contains that preference. If there is no link, the preference hasn't been moved to another Settings type.</p> <ul style="list-style-type: none"> <li>• <a href="#">AnalyticsSharingEnable</a> (available in API version 40.0 and later)</li> <li>• <a href="#">ApexApprovalLockUnlock</a></li> <li>• <a href="#">AsyncSaveEnabled</a> (available in API versions 40.0 to 46.0)</li> <li>• <a href="#">ChatterEnabled</a></li> <li>• <a href="#">CompileOnDeploy</a> (available in API version 43.0 and later)</li> <li>• <a href="#">ConsentManagementEnabled</a> (available in API version 45.0 and later)</li> <li>• <a href="#">EnhancedEmailEnabled</a></li> <li>• <a href="#">EventLogWaveIntegEnabled</a></li> <li>• <a href="#">LoginForensicsEnabled</a></li> <li>• <a href="#">NetworksEnabled</a> (available in API version 40.0 and later)</li> <li>• <a href="#">NotesReservedPref01</a></li> <li>• <a href="#">OfflineDraftsEnabled</a></li> <li>• <a href="#">PathAssistantsEnabled</a></li> <li>• <a href="#">S1DesktopEnabled</a></li> </ul> <p> <b>Note:</b> After it is enabled, <a href="#">S1DesktopEnabled</a> can't be disabled in any version of the API.</p> <ul style="list-style-type: none"> <li>• <a href="#">S1EncryptedStoragePref2</a></li> <li>• <a href="#">S1OfflinePref</a></li> <li>• <a href="#">ScratchOrgManagementPref</a> on page 1754 (available in API version 41.0 and later)</li> <li>• <a href="#">SendThroughGmailPref</a></li> <li>• <a href="#">SocialProfilesEnable</a></li> <li>• <a href="#">Translation</a> (available in API version 40.0 and later)</li> <li>• <a href="#">VoiceEnabled</a></li> </ul> <p> <b>Note:</b> The <a href="#">VoiceEnabled</a> preference isn't being moved to another metadata type. If you want to use it in a scratch org in API version 48.0 and later, you can enable it as a scratch org feature.</p>

## OrganizationSettingsDetail

Field Name	Field Type	Description
settingName	string	The name of the setting. For example, "S1EncryptedStoragePref2."
settingValue	boolean	Indicates whether the setting is enabled ( <code>true</code> ) or not ( <code>false</code> ).

## Declarative Metadata Sample Definition

The following is an example of a `OrgPreferenceSettings` component. The example shows only the `preferences` values that are supported but not yet available as fields on another `Settings` type in API version 47.0.

```
<?xml version="1.0" encoding="UTF-8"?>
<OrgPreferenceSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <preferences>
    <settingName>AnalyticsSharingEnable</settingName>
    <settingValue>true</settingValue>
  </preferences>
  <preferences>
    <settingName>NetworksEnabled</settingName>
    <settingValue>true</settingValue>
  </preferences>
  <preferences>
    <settingName>NotesReservedPref01</settingName>
    <settingValue>>false</settingValue>
  </preferences>
  <preferences>
    <settingName>ScratchOrgManagementPref</settingName>
    <settingValue>true</settingValue>
  </preferences>
  <preferences>
    <settingName>VoiceEnabled</settingName>
    <settingValue>>false</settingValue>
  </preferences>
</OrgPreferenceSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OrgSettings

Represents the settings for org-wide functionality that isn't associated with any specific feature. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

A OrgSettings component file has the suffix `.settings` and is stored in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

OrgSettings components are available in API version 46.0 and later.

Before API version 51.0, the fields `enableExtendedMailMerge` and `saveMailMergeDocsAsSalesforceDocs` were found within OrgSettings components. In API version 51.0 and later, those fields are found within [MailMergeSettings](#) on page 1871.

## Fields

Field Name	Field Type	Descriptions
<code>enableCustomerSuccessPortal</code>	boolean	Indicates whether Customer Portal is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableManageSelfServiceUsers</code>	boolean	Indicates whether mass management of self-service users is enabled through the Self-Service Portal ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableOrgFeedSentimentAnalysis</code>	boolean	Indicates whether feed sentiment analysis is enabled for the org ( <code>true</code> ) or not ( <code>false</code> ).

## Declarative Metadata Sample Definition

The following is an example of a OrgSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<OrgSettings xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <enableCustomerSuccessPortal>false</enableCustomerSuccessPortal>
  <enableMakeDeploymentsMandatory>true</enableMakeDeploymentsMandatory>
  <enableManageSelfServiceUsers>false</enableManageSelfServiceUsers>
  <enableOrgFeedSentimentAnalysis>false</enableOrgFeedSentimentAnalysis>
  <enableRADeploymentAttributeOnly>true</enableRADeploymentAttributeOnly>
  <enableResetDivisionOnLogin xsi:nil="true"/>
</OrgSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the org settings metadata for an organization:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Org</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PartyDataModelSettings

Represents an organization's party data model settings, including options around the Individual object and consent enablement. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

PartyDataModelSettings values are stored in the `PartyDataModel.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

PartyDataModelSettings is available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableAutoSelectIndividualOnMerge</code>	boolean	Indicates whether the most recently modified data privacy record for the Individual is retained when merging lead, contact, and person accounts ( <code>true</code> ) or users must manually determine which data privacy record to retain during the merge process ( <code>false</code> ). This field has a default value of <code>false</code> .
<code>enableConsentManagement</code>	boolean	Indicates whether data protection details are available in records ( <code>true</code> ) or not ( <code>false</code> ). This has a default value of <code>true</code> .   <b>Note:</b> Setting this field to <code>false</code> purges all data protection details, such as privacy preferences and stored consent forms.
<code>enableIndividualAutoCreate</code>	boolean	Deprecated in API version 48.0 and removed in API version 49.0 and later.

## Declarative Metadata Sample Definition

The following is an example of a PartyDataModelSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<PartyDataModelSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableAutoSelectIndividualOnMerge>true</enableAutoSelectIndividualOnMerge>
  <enableConsentManagementEnabled>true</enableConsentManagementEnabled>
</PartyDataModelSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>PartyDataModel</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PardotSettings

Represents Marketing Cloud Account Engagement settings in your Salesforce org. Account Engagement, formerly known as Pardot, is a B2B marketing automation solution that helps you create meaningful connections, generate more pipeline, and close more deals. Use these settings to configure how Account Engagement collects and displays data.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

This object is stored in a file named `Pardot.Settings` in the `settings` folder of the corresponding package directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

PardotSettings is available in API version 47.0 and later.

## Special Access Rules

This metadata type is available only to orgs with Account Engagement.

## Fields

Field Name	Field Type	Description
<code>enableAeDataConnector</code>	boolean	Enable the Account Engagement Data Cloud Connector for creating Account Engagement Data Streams.
<code>enableAIOptimizedSendTime</code>	boolean	Enable Einstein Send Time Optimization for sending Account Engagement emails.
<code>enableB2bmaAppEnabled</code>	boolean	Deprecated.

Field Name	Field Type	Description
<code>enableEngagementHistoryDashboards</code>	boolean	Enable the Engagement History Dashboard and allow related Account Engagement data to be shared to campaign records in Salesforce by setting this value to <code>true</code> . The default value is <code>false</code> . If <code>enableEngagementHistoryDashboards</code> is disabled after being enabled, the Engagement History Dashboard is removed, but engagement data continues to be retained and updated.
<code>enableEnhancedProspectCustomFieldsSync</code>	boolean	Enable Object Sync to enhance with B2B Marketing Analytics or B2B Marketing Analytics Plus by setting this property to <code>true</code> . The default value is <code>false</code> . Available in API version 52.0 and later.
<code>enablePardotAppV1Enabled</code>	boolean	Enable the Account Engagement Lightning App by setting this property to <code>true</code> . The default value is <code>false</code> .
<code>enablePardotEnabled</code>	boolean	Deprecated.
<code>enablePardotObjectSync</code>	boolean	Deprecated.
<code>enableProspectActivityDataset</code>	boolean	<p>Enable the Prospect and Activity Dataset for B2B Marketing Automation apps by setting this property to <code>true</code>. When <code>enableProspectActivityDataset</code> is <code>true</code>, the datasets take some time to populate. Depending on how much data and the type of licenses you have, enabling this preference can impact the account's row limit for Analytics.</p> <p>If <code>enableProspectActivityDataset</code> is disabled after being enabled:</p> <ul style="list-style-type: none"> <li>• The data that makes up the datasets is deleted.</li> <li>• The Prospect and Activity Dataset in existing B2B Marketing Automation apps stops getting updates.</li> <li>• The dataset isn't available to add to new apps.</li> <li>• When apps are reconfigured, the dataset is deleted.</li> </ul> <p>Requires that <code>enableEngagementHistoryDashboards</code> is set to <code>true</code>.</p>
<code>PardotEngageFreqSetting</code>	boolean	Enable Einstein Engagement Frequency for sending Account Engagement emails.

## Declarative Metadata Sample Definition

The following is an example of a `PardotSettings` component.

```

1 <?xml version="1.0" encoding="UTF-8"?>
2 <PardotSettings xmlns="http://soap.sforce.com/2006/04/metadata">
3   <enablePardotEnabled>true</enablePardotEnabled>
4   <enablePardotAppV1Enabled>true</enablePardotAppV1Enabled>
5   <enableB2bmaAppEnabled>true</enableB2bmaAppEnabled>
6   <enableEngagementHistoryDashboards>true</enableEngagementHistoryDashboards>
7   <enableEnhancedProspectCustomFieldsSync>true</enableEnhancedProspectCustomFieldsSync>

```

```

8     <enablePardotObjectSync>true</enablePardotObjectSync>
9     <enableProspectActivityDataset>true</enableProspectActivityDataset>
10    <enableAIOptimizedSendTime>true</enableAIOptimizedSendTime>
11 </PardotSettings>

```

The following is an example `package.xml` that references the previous definition.

```

1 <?xml version="1.0" encoding="UTF-8"?>
2 <Package xmlns="http://soap.sforce.com/2006/04/metadata">
3   <types>
4     <members>Pardot</members>
5     <name>Settings</name>
6   </types>
7   <version>47</version>
8 </Package>

```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PardotEinsteinSettings

Represents `PardotEinsteinSettings`. Use these settings to learn what factors drive your campaign performance, and get the best possible engagement score for your prospects. This type extends the `Metadata` metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

`PardotEinsteinSettings` values are stored in the `PardotEinstein.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`PardotEinsteinSettings` is available in API versions 48.0 and later.

Fields

Field Name	Field Type	Description
<code>enableCampaignInsight</code>	boolean	Indicates whether Einstein Campaign Insights is enabled ( <code>true</code> ) or not ( <code>false</code> ). Einstein Campaign Insights helps you understand what factors drive campaign performance.  The default value is <code>false</code> .
<code>enableEngagementScore</code>	boolean	Indicates whether Einstein Behavior Scoring is enabled ( <code>true</code> ) or not ( <code>false</code> ). Einstein Behavior Scoring identifies prospects whose behavior suggests that they are ready to buy, and scores them based on Einstein's engagement model.

Field Name	Field Type	Description
		The default value is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of the `PardotEinstein.settings` file:

```
<?xml version="1.0" encoding="UTF-8"?>
<PardotEinsteinSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableCampaignInsight>true</enableCampaignInsight>
  <enableEngagementScore>true</enableEngagementScore>
</PardotEinsteinSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the `PardotEinstein` settings metadata:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>PardotEinstein</members>
    <name>Settings</name>
  </types>
  <version>29.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PathAssistantSettings

Represents the Path preference setting. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

`PathAssistantSettings` components have the suffix `.settings` and are stored in the `settings` folder.

## Version

`PathAssistantSettings` components are available in API version 34.0 and later.

## Fields

Field Name	Field Type	Description
<code>canOverrideAutoPathCollapseWithUserPref</code>	boolean	Keeps a user's path expanded to show guidance and key fields on all their records. A user's path stays expanded until the user collapses it. To use this preference, Path must be enabled.  Default value is <code>false</code> for all editions. When set to <code>false</code> , the user's path is collapsed when the page loads.  Available in API version 47.0 and later.
<code>pathAssistantEnabled</code>	boolean	Determines whether the preference is enabled for Path. Default value is <code>true</code> for Enterprise Edition and <code>false</code> for other editions. Available in API version 35.0 and later.
<code>pathAssistantForOpportunityEnabled</code>	boolean	Determines whether the preference is enabled for Path in Opportunity or not.  Available in API version 34.0 and earlier.

## Declarative Metadata Sample Definition

The following is an example of a `PathAssistantSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<PathAssistantSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <pathAssistantEnabled>true</pathAssistantEnabled>
  <canOverrideAutoPathCollapseWithUserPref>true</canOverrideAutoPathCollapseWithUserPref>
</PathAssistantSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>PathAssistant</members>
    <name>Settings</name>
  </types>
  <version>API</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PaymentsSettings

Represents the Salesforce Payments settings when this feature is enabled for the org.

## Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the “Settings” name. See [Settings](#) for more details.

## File Suffix and Directory Location

`PaymentsSettings` values are stored in the `Payments.settings` file in the `settings` folder.

The `.settings` files are different from other named components because there’s only one settings file for each settings component.

## Version

`PaymentsSettings` is available in API version 57.0 and later.

## Special Access Rules

This metadata type is only accessible by developers and customers using Salesforce Payments.

## Fields

Field Name	Description
<code>enablePayments</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether Salesforce Payments is enabled (<code>true</code>) or not (<code>false</code>) for an org. The default is false.</p>

## Declarative Metadata Sample Definition

The following is a sample `payments.settings` metadata file.

```
<?xml version="1.0" encoding="UTF-8"?>
  <PaymentsSettings xmlns="http://soap.sforce.com/2006/04/metadata">
    <enablePayments>true</enablePayments>
  </PaymentsSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Payments</members>
    <name>Settings</name>
  </types>
  <version>57.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PicklistSettings

Represents an org's picklist settings. These settings control the behavior of a picklist. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

PicklistSettings values are stored in a single file named `Picklist.settings` in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

Picklist settings are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>isPicklistApiNameEditDisabled</code>	boolean	While <code>true</code> , users, including admins with Customize Application permission, can't change the API name of a picklist field. Formulas reference a picklist's API name so that the formula continues to work even if the displayed name value changes. Prevent changes to the API name to protect the references to fields in formulas or during integrations, such as during a data import. The default is <code>false</code> .

## Declarative Metadata Sample Definition

The following is a sample `picklist.settings` metadata file.

```
<?xml version="1.0" encoding="UTF-8"?>
<PicklistSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <isPicklistApiNameEditDisabled>true</isPicklistApiNameEditDisabled>
</PicklistSettings>
```

The following is an example `package.xml` manifest that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Picklist</members>
    <name>Settings</name>
```

```
</types>
<version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PlatformEncryptionSettings

Represents an org's Platform Encryption settings, such as settings for available encryption schemes, permissions, encryption policy access, and which fields can be encrypted. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

`PlatformEncryptionSettings` values are stored in the `PlatformEncryption.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`PlatformEncryptionSettings` is available in API versions 47.0 and later.

## Special Access Rules

To enable and disable `PlatformEncryptionSettings` attributes, you need the Customize Application permission. Attributes that allow key management tasks require the Manage Encryption Keys permission. For a complete list of required permissions, read [Which User Permissions Does Shield Platform Encryption Require?](#).

## Fields

Field Name	Field Type	Description
<code>canEncryptManagedPackageFields</code>	boolean	Indicates whether users can enable encryption on custom fields in installed managed packages ( <code>true</code> ) or not ( <code>false</code> ).
<code>isUseHighAssuranceKeysRequired</code>	boolean	This field is for internal use.
<code>isMEKForEncryptionRequired</code>	boolean	Indicates whether encryption policy tasks, such as enabling encryption on fields, also require the Manage Encryption Keys permission ( <code>true</code> ) or not ( <code>false</code> ), in addition to those tasks' baseline permissions.
<code>enableDeterministEncryption</code>	boolean	Indicates whether customers apply the deterministic encryption scheme to supported fields ( <code>true</code> ) or not ( <code>false</code> ). The deterministic encryption scheme lets customers filter on encrypted data..

Field Name	Field Type	Description
<code>enableEncryptFieldHistory</code>	boolean	Indicates whether the background encryption process applies the customer's active key material to field history and feed tracking values ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . If <code>false</code> , background encryption processes apply active key material to all encrypted data except duplicates of that data stored in field history or feed tracking.
<code>enableEventBusEncryption</code>	boolean	Indicates whether events are encrypted at rest in the event bus ( <code>true</code> ) or not ( <code>false</code> ). The events include change data capture events and platform events. The default value is <code>false</code> . If <code>false</code> , events aren't encrypted and are stored in clear text in the event bus.  Generate or upload key material of the Event Bus type before turning on the <code>enableEventBusEncryption</code> setting.

## Declarative Metadata Sample Definition

The following is an example of the `PlatformEncryption.settings` file:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<PlatformEncryptionSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <canEncryptManagedPackageFields>true</canEncryptManagedPackageFields>
  <isUseHighAssuranceKeysRequired>true</isUseHighAssuranceKeysRequired>
  <isMEKForEncryptionRequired>true</isMEKForEncryptionRequired>
  <enableDeterministEncryption>true</enableDeterministEncryption>
  <enableEncryptFieldHistory>true</enableEncryptFieldHistory>
  <enableEventBusEncryption>true</enableEventBusEncryption>
</PlatformEncryptionSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the Platform Encryption settings metadata for an organization:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>PlatformEncryption</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PlatformEventSettings

Represents settings for platform events and change data capture events.

### Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the “Settings” name. See [Settings](#) for more details.

### File Suffix and Directory Location

`PlatformEventSettings` values are stored in the `PlatformEvent.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there’s only one settings file for each settings component.

### Version

PlatformEventSettings components are available in API version 58.0 and later.

### Special Access Rules

There are no additional access requirements that are specific to this type.

### Fields

Field Name	Description
<code>enableEnhancedUsageMetrics</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Enables enhanced usage metrics for queries run against PlatformEventUsageMetric. Enhanced usage metrics provide additional fields for the queries and granular time segments. For more information, see <a href="#">Enhanced Usage Metrics</a> in the <i>Platform Events Developer Guide</i>. Default value is <code>false</code>.</p>

### Declarative Metadata Sample Definition

The following is an example of a PlatformEventSettings component that enables the enhanced usage metrics feature.

```
<?xml version="1.0" encoding="UTF-8"?>
<PlatformEventSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableEnhancedUsageMetrics>true</enableEnhancedUsageMetrics>
</PlatformEventSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
```

```

    <members>PlatformEvent</members>
    <name>Settings</name>
  </types>
  <version>58.0</version>
</Package>

```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PredictionBuilderSettings

Represents the settings that determine how a user can interact with Einstein Prediction Builder. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

PredictionBuilderSettings values are stored in the `PredictionBuilder.settings` file in the settings directory. The `.settings` files are different from other named components in that each settings component has only one settings file.

## Version

PredictionBuilderSettings components are available in API version 47.0 and later.

## Special Access Rules

This type is available only if the CRM Analytics Plus or Einstein Predictions license is enabled in your org.

## Fields

Field Name	Field Type	Description
<code>enablePredictionBuilder</code>	boolean	Indicates whether Einstein Prediction Builder is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>isPredictionBuilderStarted</code>	boolean	Indicates whether to display the predictions list view to the user ( <code>true</code> ) or not ( <code>false</code> ).

## Declarative Metadata Sample Definition

This is a sample Prediction Builder settings file.

```

<?xml version="1.0" encoding="UTF-8"?>
<PredictionBuilderSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <isPredictionBuilderStarted>false</isPredictionBuilderStarted>

```

```
<enablePredictionBuilder>false</enablePredictionBuilder>
</PredictionBuilderSettings>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## PrivacySettings

Represents an organization's settings for data privacy and consent management. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

PrivacySettings values are stored in the `Privacy.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

PrivacySettings components are available in API version 47.0 and later.

## Special Access Rules

To use PrivacySettings, you need the Customize Application or Modify Data Classification user permission.

## Fields

Field Name	Field Type	Description
<code>enableConsentAuditTrail</code>	boolean	Reserved for future use.
<code>enableConsentEventStream</code>	boolean	Allows orgs to stream consent changes to the party data model via platform events. This field has a default value of <code>false</code> . Available in API version 47.0 and later.
<code>enableDefaultMetadataValues</code>	boolean	Indicates whether a default data sensitivity value is applied to all contacts, leads, person accounts, and users ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> . Available in API version 47.0 and later.
<code>useUmaDefaultConsentRecs</code>	boolean	Indicates whether a Preference Manager setup in Privacy Center uses default Marketing Cloud consent parameters and features. This field has a default value of <code>false</code> . Available in API version 58.0 and later.

## Declarative Metadata Sample Definition

The following is an example of a PrivacySettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<PrivacySettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableDefaultMetadataValues>false</enableDefaultMetadataValues>
</PrivacySettings>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Privacy</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the package.xml manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ProcessFlowMigration

Represents a process's migrated criteria and the resulting migrated flow.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its fullName field.

### Version

ProcessFlowMigration components are available in API version 58.0 and later.

## Special Access Rules

### Fields

Field Name	Description
destinationFlowDefinition	<b>Field Type</b> string

Field Name	Description
	<p><b>Description</b> Required. The ID of the resulting migrated flow.</p>
destinationFlowVersion	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The version ID of the migrated flow.</p>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The label for the ProcessFlowMigration.</p>
migratedCriteriaLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> The label of the criteria that was migrated.</p>
migratedCriteriaName	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the criteria that was migrated.</p>
processVersion	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The version ID of the originating process.</p>

## Declarative Metadata Sample Definition

The following is an example of a ProcessFlowMigration component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ProcessFlowMigration xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
```

```

<destinationFlowDefinition>Migration_1</destinationFlowDefinition>
<destinationFlowVersion>Migration_1-1</destinationFlowVersion>
<developerName>Migration</developerName>
<masterLabel>Migration_1</masterLabel>
<migratedCriteriaLabel>myCriteria_1</migratedCriteriaLabel>
<migratedCriteriaName>myDecision</migratedCriteriaName>
<processVersion>Migration-1</processVersion>
</ProcessFlowMigration>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ProcessFlowMigration</name>
  </types>
  <types>
    <members>*</members>
    <name>Flow</name>
  </types>
  <version>58.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ProductSettings

Represents organization preferences for quantity schedules, revenue schedules, and active flag interaction with prices. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`ProductSettings` values are stored in a single file named `Product.settings` in the `settings` directory of the corresponding package directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`ProductSettings` is available in API version 28.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableCascadeActivateToRelatedPrices</code>	boolean	When changing active flag on a product record, automatically updates active flag on related prices.

Field Name	Field Type	Description
enableMySettings	boolean	Moves users' personal settings pages from Setup to a separate My Settings pane ( <code>true</code> ) or not ( <code>false</code> ). When set to ( <code>true</code> ), Salesforce makes a reorganized Setup pane accessible to admins via one click in the header. This setting affects all users in your organization. The default is <code>true</code> . Available in API version 47.0 and later.
enableQuantitySchedule	boolean	Enables quantity schedules for products.
enableRevenueSchedule	boolean	Enables revenue schedules for products.

## Declarative Metadata Sample Definition

The following is an example of the package file.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Product</members>
    <name>Settings</name>
  </types>
  <version>28.0</version>
</Package>
```

The package file references the following Product.settings file.

```
<?xml version="1.0" encoding="UTF-8"?>
<ProductSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableCascadeActivateToRelatedPrices>true</enableCascadeActivateToRelatedPrices>
  <enableQuantitySchedule>false</enableQuantitySchedule>
  <enableRevenueSchedule>false</enableRevenueSchedule>
</ProductSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## QuoteSettings

Represents an org's quotes settings, such as enabling quotes or creating quotes without an associated opportunity. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

QuoteSettings values are stored in a single file named `Quote.settings` in the `settings` directory of the corresponding package directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

QuoteSettings is available in API version 28.0 and later.

## Fields

Field Name	Field Type	Description
enableQuote	boolean	When set to <code>true</code> , users can access Quotes.
enableQuotesWithoutOppEnabled	boolean	<p>When set to <code>true</code>, users can create quotes independently of an opportunity. For example, a user can create a quote for budgeting purposes, before creating the Opportunity. Default value is <code>false</code>.</p> <p>When set to <code>false</code>, users can only create quotes from an Opportunity. Before setting to <code>false</code>, delete any quotes that do not have opportunities.</p> <p>Available in API version 47.0 and later.</p>

## Declarative Metadata Sample Definition

The following is an example of the package file.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Quote</members>
    <name>Settings</name>
  </types>
  <version>28.0</version>
</Package>
```

The package file references the following Quote.settings file.

```
<?xml version="1.0" encoding="UTF-8"?>
<QuoteSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableQuote>true</enableQuote>
  <enableQuotesWithoutOppEnabled>true</enableQuotesWithoutOppEnabled>
</QuoteSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## RealTimeEventSettings

Represents the list of Real-Time Event entities that you want to enable or disable. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

Real-Time Event settings are stored in a single file named `RealTimeEvent.settings` in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

RealTimeEventSettings is available in API version 50.0 and later.

## Fields

Field Name	Field Type	Description
<code>realTimeEvents</code>	<a href="#">RealTimeEvent[]</a>	Represents the list of Real-Time Event entities that you want to enable or disable.

## RealTimeEvent

Represents one of the Real-Time Event entities that you want to enable or disable.

Field Name	Field Type	Description
<code>entityName</code>	string	The storage or streaming entity name that you want to modify. For example: <code>ApiEvent</code> or <code>ApiEventStream</code> .
<code>isEnabled</code>	boolean	Indicates whether you want the storage or streaming capability to be enabled ( <code>true</code> ) or disabled ( <code>false</code> ).

## Declarative Metadata Sample Definition

The following is an example `RealTimeEvent.settings` metadata file:

```
<?xml version="1.0" encoding="UTF-8"?>
<RealTimeEventSettings xmlns="http://soap.sforce.com/2006/04/metadata"/>
  <realTimeEvents>
    <entityName>ApiEventStream</entityName>
    <isEnabled>true</isEnabled>
  </realTimeEvents>
  <realTimeEvents>
    <entityName>ApiEvent</entityName>
    <isEnabled>true</isEnabled>
  </realTimeEvents>
</RealTimeEventSettings>
```

The following is an example `package.xml` manifest that references the `RealTimeEventSettings` definitions:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
```

```

<types>
  <members>RealTimeEvent</members>
  <name>Settings</name>
</types>
<version>51.0</version>
</Package>

```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## RecordPageSettings

Represents an org's record page settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## Declarative Metadata File Suffix and Directory Location

RecordPageSettings values are stored in a single file named `RecordPage.settings` in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

Record page settings are available in API version 47.0 and later.

## Fields

Field	Field Type	Description
<code>enableActivityRelatedList</code>	boolean	Indicates whether the default activities view is related lists ( <code>true</code> ) or activity timeline ( <code>false</code> ).
<code>enableDynamicForms</code>	boolean	Indicates whether Dynamic Forms is enabled for the org. Removed in API version 50.0 and later.
<code>enableFullRecordView</code>	boolean	Indicates whether the default record page view is full view ( <code>true</code> ) or grouped view ( <code>false</code> ).

## Declarative Metadata Sample Definition

This is a sample `recordpage.settings` metadata file.

```
<?xml version="1.0" encoding="UTF-8"?>
<RecordPageSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableDynamicForms>true</enableDynamicForms>
  <enableActivityRelatedList>true</enableActivityRelatedList>
  <enableFullRecordView>true</enableFullRecordView>
</RecordPageSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the Record Page settings metadata for an organization

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>RecordPage</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

[Settings](#)

## RetailExecutionSettings

Represents settings to manage your inventory, promotions, planograms, and in-store activities.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for more details.

## File Suffix and Directory Location

`RetailExecutionSettings` are stored in a single file named `RetailExecution.settings` in the `settings` directory.

## Version

`RetailExecutionSettings` are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableProductHierarchy</code>	boolean	Indicates whether Product Hierarchy is enabled for your org ( <code>true</code> ) or not ( <code>false</code> ).  This field is available in API version 53.0 and later.
<code>enableRetailExecution</code>	boolean	Indicates whether Retail Execution is enabled for your org ( <code>true</code> ) or not ( <code>false</code> ).  The default value is <code>false</code> .
<code>enableVisitSharing</code>	boolean	Indicates whether Visit Share is enabled for your org ( <code>true</code> ) or not ( <code>false</code> ).  The default value is <code>false</code> .  This field is available in API version 55.0 and later.

## Declarative Metadata Sample Definition

The following is an example of a `RetailExecutionSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<RetailExecutionSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableRetailExecution>true</enableRetailExecution>
  <enableProductHierarchy>true</enableProductHierarchy>
  <enableVisitSharing>false</enableVisitSharing>
</RetailExecutionSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>RetailExecution</members>
    <name>Settings</name>
  </types>
  <version>55.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SalesAgreementSettings

Represents settings that control the display of agreement terms metrics in sales agreements and the calculation of the actual quantity of products in sales agreements. These settings also control the approval of sales agreements.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for more details.

## File Suffix and Directory Location

SalesAgreementSettings values are stored in the `SalesAgreementSettings.salesAgreementSetting` file in the `salesAgreementSettings` directory.

## Version

SalesAgreementSettings components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>actualsCalculationMode</code>	<a href="#">ActualMode</a> (enum of type string)	Required. Source from which the actual ordered quantity of a product in a sales agreement is calculated. Valid values are: <ul style="list-style-type: none"> <li>• <code>Manual: Default</code></li> <li>• <code>Orders</code></li> <li>• <code>OrdersThroughContracts</code></li> </ul>
<code>displayGroups</code>	<a href="#">AdvAcctFrstDisplayGroup</a>	Represents information about the groups for the advanced account forecast set measures or dimensions. Available in API version 56.0 and later.
<code>displayedAgreementTermsMetrics</code>	string	Required. Metrics that are selected for display in the sales agreement terms in the specified sequence. There can be a maximum of 10 comma-separated metric names in this list.
<code>isOnlyApprovalProcessUsed</code>	boolean	Required. Indicates whether both self-approval and approval of sales agreements are allowed ( <code>true</code> ) or only approval of sales agreements is allowed ( <code>false</code> ) through the Approval Flow.
<code>measureDefinitions</code>	<a href="#">AdvAcctForecastMeasureDef</a> on page 1938	Represents information about the measures to be displayed in the advanced account forecasts grid for the forecast set. Available in API version 56.0 and later.
<code>objectMapping</code>	<a href="#">ObjectMapping</a> on page 1939	Foreign key to <a href="#">ObjectMapping</a> on page 1939 that maps fields from the input object of SalesAgreementSettings to fields in the output object of SalesAgreementSettings.
<code>primaryNotifEmailAddress</code>	string	The email address to which notifications are sent.
<code>renewalPeriodDayCount</code>	int	The number of days before the end date of a sales agreement from when the agreement can be renewed. Available in API version 50.0 and later.
<code>secondaryNotifEmailAddress</code>	string	The second email address to which notifications are sent.

## AdvAcctFrcstDisplayGroup

Represents information about the groups for the advanced account forecast set measures or dimensions. Available in API version 56.0 and later.

Field Name	Field Type	Description
<code>advAcctFrcstDisplayGroupName</code>	string	Required. Name of the advanced account forecast display group.
<code>displayGroupItems</code>	<a href="#">AdvAcctFrcstDplyGroupItem</a> on page 1938	Represents information about the items associated with a display group for an advanced account forecast set.
<code>displayGroupType</code>	<a href="#">AdvAcctFrcstDplyGroupType</a> (of type string)	Category for the display group. Possible values are: <ul style="list-style-type: none"> <li>• MEASURE</li> </ul>
<code>isDefault</code>	boolean	Indicates whether the display group is the default group ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>userProfileName</code>	string	Profile for which the display group is applicable.

## AdvAcctFrcstDplyGroupItem

Represents information about the items associated with a display group for an advanced account forecast set. Available in API version 56.0 and later.

Field Name	Field Type	Description
<code>advAcctFrcstDplyGroupItemName</code>	string	Required. Name of the advanced account forecast display group item.
<code>displayOrder</code>	string	Required. Display order of the display group item.
<code>measureReferenceName</code>	string	Name of the measure associated with the display group item.

## AdvAcctForecastMeasureDef

Represents information about the measures to be displayed in the advanced account forecasts grid for the forecast set. Available in API version 56.0 and later.

Field Name	Field Type	Description
<code>advAcctForecastMeasureDefName</code>	string	Required. Name for the measure.
<code>aggregationType</code>	<a href="#">AdvAcctAggrType</a> (of type string)	Required. Type of aggregation used for calculating advanced account forecast values. Possible values are: <ul style="list-style-type: none"> <li>• AVERAGE</li> <li>• MAXIMUM</li> <li>• MINIMUM</li> <li>• SUM</li> </ul>

Field Name	Field Type	Description
computationMethod	AdvancedMethod (of type string)	Required. Method used for calculating advanced account forecast values. Possible values are: <ul style="list-style-type: none"> <li>CUSTOM</li> <li>DATA_PROCESSING_ENGINE_DEFINITION</li> <li>FORMULA</li> </ul>
forecastDataMeasureName	string	Required. Field of the facts object used for this measure.
forecastMeasureName	string	Required. Name for the measure to show on UI.
forecastMeasureType	AdvancedType (of type string)	Required. Measure type used for the generated advanced forecast values. Possible values are: <ul style="list-style-type: none"> <li>QUANTITY</li> <li>REVENUE</li> </ul>
isAdjustmentTracked	boolean	Indicates whether the adjustments made to the advanced account forecast values for this metric are tracked ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .

## ObjectMapping

Represents a map of fields in the input object of SalesAgreementSettings to fields in the output object of SalesAgreementSettings. The input object is SalesAgreementProductSchedule. The output object is SalesAgreementProduct.

Field Name	Field Type	Description
inputObject	string	Required. The input object for the SalesAgreementSettings. SalesAgreementProductSchedule is the input object for the SalesAgreementSettings.
mappingFields	ObjectMappingField on page 1939	The mapping of source object fields to target object fields for SalesAgreementSettings.
outputObject	string	Required. The output object for the SalesAgreementSettings. SalesAgreementProduct is the output object for the SalesAgreementSettings.

## ObjectMappingField

A field name in the SalesAgreementProductSchedule object and the corresponding field name in the SalesAgreementProduct object. For example, you can create a field named Revenue on the SalesAgreementProductSchedule object and a field named Total Revenue on the SalesAgreementProduct object. To view these field values in the agreement terms of a sales agreement, select the input object as SalesAgreementProductSchedule and the output object as SalesAgreementProduct. In this case, the input field is Revenue and the output field is Total Revenue.

Field Name	Field Type	Description
inputField	string	Required. Field in the object specified by the <code>inputObject</code> field in <a href="#">ObjectMapping</a> on page 1939. This field is mapped to the field in <code>outputField</code> , which is a field in the object specified by the <code>outputObject</code> field in <a href="#">ObjectMapping</a> on page 1939.
outputField	string	Required. Field in the object specified by the <code>outputObject</code> field in <a href="#">ObjectMapping</a> on page 1939. This field is mapped to the field name in <code>inputField</code> , which is a field in the object specified by the <code>inputObject</code> field in <a href="#">ObjectMapping</a> on page 1939.

## Declarative Metadata Sample Definition

The following is an example of SalesAgreementSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<SalesAgreementSettings
  xmlns="http://soap.sforce.com/2006/04/metadata"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <actualsCalculationMode>Orders</actualsCalculationMode>
  <displayGroups>
    <advAcctFrcstDisplayGroupName>Test Measure Group</advAcctFrcstDisplayGroupName>
    <displayGroupItems>
      <advAcctFrcstDplyGroupItemName>PlannedQuantity</advAcctFrcstDplyGroupItemName>
      <displayOrder>1</displayOrder>
      <measureReferenceName>PlannedQuantity</measureReferenceName>
    </displayGroupItems>
    <displayGroupType>MEASURE</displayGroupType>
    <isDefault>>false</isDefault>
    <userProfileName xsi:nil="true"/>
  </displayGroups>

  <displayAgreementMetrics>PlannedQuantity,ActualQuantity,SalesPrice,DiscountPercentage,DerivedPlannedAmount</displayAgreementMetrics>

  <isOnlyApprovalProcessUsed>>false</isOnlyApprovalProcessUsed>
  <measureDefinitions>
    <advAcctForecastMeasureDefName>PlannedQuantity</advAcctForecastMeasureDefName>
    <aggregationType>MINIMUM</aggregationType>
    <computationMethod>DATA_PROCESSING_ENGINE_DEFINITION</computationMethod>
    <forecastDataMeasureName>PlannedQuantity</forecastDataMeasureName>
    <forecastMeasureName>PlannedQuantity</forecastMeasureName>
    <forecastMeasureType>QUANTITY</forecastMeasureType>
    <isAdjustmentTracked>>true</isAdjustmentTracked>
  </measureDefinitions>
  <secondaryNotifEmailAddress>abc@salesforce.com</secondaryNotifEmailAddress>
  <primaryNotifEmailAddress>abc@salesforce.com</primaryNotifEmailAddress>
  <renewalPeriodDayCount>50</renewalPeriodDayCount>
  <objectMapping>
    <inputObject>SalesAgreementProductSchedule</inputObject>
    <mappingFields>
      <inputField>SAPS1__c</inputField>
      <outputField>SAP1__c</outputField>
    </mappingFields>
  </objectMapping>
</SalesAgreementSettings>
```

```

</mappingFields>
<outputObject>SalesAgreementProduct</outputObject>
</objectMapping>
</SalesAgreementSettings>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>SalesAgreementProduct.SAP1__c</members>
    <members>SalesAgreementProductSchedule.SAPS1__c</members>
    <name>CustomField</name>
  </types>
  <types>
    <members>*</members>
    <name>SalesAgreementSettings</name>
  </types>
  <version>62.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SandboxSettings

Represents Sandbox settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

SandboxSettings values are stored in the `Sandbox.settings` file in the `settings` folder. The `.settings` files are different from other named components because there is only one settings file for each settings component.

## Version

SandboxSettings are available in API version 56.0 and later.

## Fields

Field Name	Field Type	Description
<code>disableSandboxExpirationEmails</code>	boolean	Indicates whether to disable sandbox expiration email notifications for the source (production) org: <code>true</code> or <code>false</code> . When disabled in the source (production) org, users no longer receive email notifications for impending deletions of sandboxes that have been inactive for 180 days or longer.

## Declarative Metadata Sample Definition

The following is an example of a SandboxSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<SandboxSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <disableSandboxExpirationEmails>true</disableSandboxExpirationEmails>
</SandboxSettings>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SchemaSettings

Represents an org's schema settings, which manage the availability of custom settings and custom metadata type values. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

SchemaSettings values are stored in the `Schema.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

SchemaSettings is available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableAdvancedCMTSecurity</code>	boolean	Indicates whether custom metadata type values are available only to Apex, flow, and formula operations ( <code>true</code> ) or exposed in other contexts such as through the Enterprise WSDL or SOAP API ( <code>false</code> ). This field has a default value of <code>false</code> .
<code>enableAdvancedCSSecurity</code>	boolean	Indicates whether custom settings type values are available only to Apex, flow, and formula operations ( <code>true</code> ) or exposed in other contexts such as through the Enterprise WSDL or SOAP API ( <code>false</code> ). This field has a default value of <code>false</code> .
<code>enableListCustomSettingCreation</code>	boolean	Indicates whether you can create custom settings when using application-level data definitions ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> .

Field Name	Field Type	Description
enableSOSLOnCustomSettings	boolean	Indicates whether custom settings values are returned in Salesforce Object Search language (SOSL) queries ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of a `SchemaSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<SchemaSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableAdvancedCMTSecurity>true</enableAdvancedCMTSecurity>
  <enableAdvancedCSSecurity>true</enableAdvancedCSSecurity>
  <enableListCustomSettingCreation>false</enableListCustomSettingCreation>
  <enableSOSLOnCustomSettings>true</enableSOSLOnCustomSettings>
</SchemaSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Schema</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SearchSettings

Represents an org's search settings.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for more details.

## File Suffix and Directory Location

`SearchSettings` values are stored in a single file named `Search.settings` in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`SearchSettings` is available in API version 37.0 and later.

## Fields

Field Name	Field Type	Description
documentContentSearchEnabled	boolean	Indicates whether a full-text document search is performed.
enableAdvancedSearchInAlohaSidebar	boolean	Indicates whether advanced search is available in the search sidebar ( <code>true</code> ) or not ( <code>false</code> ). Available in Salesforce Classic only. Available in API version 46.0 and later.
enableEinsteinSearchAssistantDialog	boolean	Indicates whether the Einstein search experience is enabled ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 50.0 and later.
enableEinsteinSearchNaturalLanguage	boolean	Indicates whether natural language search is enabled ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 50.0 and later.
enableEinsteinSearchPersonalization	boolean	Indicates whether search personalization is enabled ( <code>true</code> ) or not ( <code>false</code> ). Available in Lightning Experience only. Available in API version 47.0 and later.
enablePersonalTagging	boolean	Indicates whether users are allowed to group records from various objects by a common theme ( <code>true</code> ) or not ( <code>false</code> ). Personal tags are visible to the user only. Available in Salesforce Classic only. Available in API version 48.0 and later.
enablePublicTagging	boolean	Indicates whether users are allowed to group records from various objects by a common theme ( <code>true</code> ) or not ( <code>false</code> ). Personal tags are visible to all users. Available in Salesforce Classic only. Available in API version 48.0 and later.
enableSalesforceGeneratedSynonyms	boolean	Indicates whether search synonyms are enabled ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 47.0 and later.
enableSearchTermHistory	boolean	Indicates whether users are allowed to group records from various objects by a common theme ( <code>true</code> ) or not ( <code>false</code> ). Public tags are visible to everyone in the organization. Available in Salesforce Classic only. Available in API version 48.0 and later.
enableSetupSearch	boolean	Indicates whether the search box in the Setup sidebar returns matching custom fields, custom objects, and other supported setup items when you press Enter ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> in Developer, Performance, Professional, Enterprise, and Unlimited editions, and <code>false</code> in all other editions. Available in API version 47.0 and later.
enableSuggestArticlesLinksOnly	boolean	Indicates whether links are provided to knowledge articles from Cases similar to the current Case ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and later.
enableUseDefaultSearchEntity	boolean	Indicates whether to use the admin-specified default entity in sidebar search ( <code>true</code> ) or not ( <code>false</code> ). Available in Salesforce Classic only. Available in API version 48.0 and later.

Field Name	Field Type	Description
<code>optimizeSearchForCJKEnabled</code>	boolean	Required. Indicates whether the search is optimized for the Japanese, Chinese, and Korean languages ( <code>true</code> ) or not ( <code>false</code> ). This setting affects sidebar search and the account search for <b>Find Duplicates</b> on a lead record in sidebar search and global search. Enable this option if users are searching mostly in Japanese, Chinese, or Korean, and if the text in searchable fields is mostly in those languages.
<code>recentlyViewedUsersForBlankLookupEnabled</code>	boolean	Required. Indicates whether the list of records that are returned from a user autocomplete lookup and from a blank user lookup is taken from the user's recently viewed user records ( <code>true</code> ). Otherwise this setting is <code>false</code> if the lookup shows a list of recently accessed user records from across your org ( <code>false</code> ). Only applies to User object blank lookup searches.
<code>searchSettingsByObject</code>	<a href="#">SearchSettingsByObject</a>	Required. Represents a list of search settings for each object.
<code>sidebarAutoCompleteEnabled</code>	boolean	Required. Indicates whether autocomplete is enabled for sidebar search ( <code>true</code> ) or not ( <code>false</code> ). Autocomplete is when users start typing search terms and sidebar search displays a matching list of recently viewed records.
<code>sidebarDropDownListEnabled</code>	boolean	Required. Indicates whether a dropdown list appears in the sidebar search section ( <code>true</code> ) or not ( <code>false</code> ). From this list, users can select to search within tags, within a specific object, or across all objects.
<code>sidebarLimitToItemsIOwnCheckboxEnabled</code>	boolean	Required. Indicates whether the <b>Limit to Items I Own</b> checkbox appears ( <code>true</code> ) or not ( <code>false</code> ). The checkbox allows your users to include only records for which they are the record owner when entering search queries in the sidebar.
<code>singleSearchResultShortcutEnabled</code>	boolean	Required. Indicates whether a shortcut is enabled ( <code>true</code> ) or not ( <code>false</code> ). With the shortcut, users skip the search results page and go directly to the record's detail page when their search returns only a single item. This setting doesn't apply to tags, case comments (in advanced search), and global search.
<code>spellCorrectKnowledgeSearchEnabled</code>	boolean	Required. Indicates whether spell check is enabled for Knowledge search ( <code>true</code> ) or not ( <code>false</code> ).

## SearchSettingsByObject

Field Name	Field Type	Description
<code>searchSettingsByObject</code>	<a href="#">ObjectSearchSetting</a>	Contains a list of search settings for each object.

## ObjectSearchSetting

A list of search settings for each object.

Field Name	Field Type	Description
enhancedLookupEnabled	boolean	Required. Indicates whether enhanced lookups is enabled for the object ( <code>true</code> ) or not ( <code>false</code> ).
lookupAutoCompleteEnabled	boolean	Required. Indicates whether autocomplete is enabled for lookup search ( <code>true</code> ) or not ( <code>false</code> ). Autocomplete is when users edit the lookup field inline by choosing an autosuggestion.
name	string	Required. The entity name of the object being configured.
resultsPerPageCount	int	Required. The number of search results per page.

## Declarative Metadata Sample Definition

The following is an example of the `Search.settings` file.

```
<?xml version="1.0" encoding="UTF-8"?>
  <SearchSettings xmlns="http://soap.sforce.com/2006/04/metadata">
    <enableSetupSearch>false</enableSetupSearch>
    <enableAdvancedSearchInAlohaSidebar>false</enableAdvancedSearchInAlohaSidebar>
    <enableQuerySuggestionPigOn>false</enableQuerySuggestionPigOn>
    <enableSalesforceGeneratedSynonyms>false</enableSalesforceGeneratedSynonyms>
    <enableSearchTermHistory>false</enableSearchTermHistory>
    <enablePublicTagging>false</enablePublicTagging>
    <enablePersonalTagging>false</enablePersonalTagging>
    <enableSuggestArticlesLinksOnly>false</enableSuggestArticlesLinksOnly>
    <enableUseDefaultSearchEntity>false</enableUseDefaultSearchEntity>
    <documentContentSearchEnabled>true</documentContentSearchEnabled>
    <optimizeSearchForCJKEEnabled>true</optimizeSearchForCJKEEnabled>

  <recentlyViewedUsersForBlankLookupEnabled>true</recentlyViewedUsersForBlankLookupEnabled>

    <searchSettingsByObject>
      <searchSettingsByObject>
        <enhancedLookupEnabled>false</enhancedLookupEnabled>
        <lookupAutoCompleteEnabled>false</lookupAutoCompleteEnabled>
        <name>Account</name>

```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the Search settings metadata for an organization.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Search</members>
    <name>Settings</name>
  </types>
  <version>37.0</version>
</Package>

```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SecuritySettings

Represents an org's security settings. For example, settings define trusted IP ranges for network access, password and login requirements, session expiration, and single sign-on settings.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for more details.

## File Suffix and Directory Location

SecuritySettings values are stored in a single file named `Security.settings` in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

Security settings are available in API version 27.0 and later. API versions 26 and earlier are no longer available.

## Fields

Field Name	Field Type	Description
<code>canUsersGrantLoginAccess</code>	boolean	<p>If <code>true</code>, users can grant login access to Support. If <code>false</code>, only an admin can grant login access.</p> <p>Users can't grant login access to managed packages that are licensed to your entire Salesforce org. Only admins with the Manage Users permission enabled on their profiles can grant access to these publishers. Also, some managed packages don't have login access. If a package isn't listed on the Login Access Policies page, login access isn't available for that package.</p>
<code>enableAdminLoginAsAnyUser</code>	boolean	<p>If <code>true</code>, the <b>Administrators Can Log in as Any User</b> field is enabled. The default isn't enabled (<code>false</code>).</p>
<code>enableAuditFieldsInactiveOwner</code>	boolean	<p>If <code>true</code>, this setting enables audit fields and updating the owner for records that are owned by inactive users. The default value is <code>false</code>. This field is available in API version 47.0 and later.</p>
<code>enableAuraSecureEvalPref</code>	boolean	<p>If <code>true</code>, this setting prevents the creation of function expressions in dynamically created Aura components. The default is <code>false</code>. This field is available in API version 47.0 and later.</p>
<code>enableCoepHeader</code>	boolean	<p>Indicates whether the Cross-Origin Embedder Policy (COEP) response header is applied to this org's custom Visualforce pages (<code>true</code>) or not (<code>false</code>). If <code>true</code>, externally sourced embedded content loads only when the external origin allows it via CORS or CORP. The default value is <code>false</code>.</p> <p>Available in API version 55.0 and later.</p>
<code>enableCoopHeader</code>	boolean	<p>Indicates whether the Cross-Origin Opener Policy (COOP) response header is applied to this org's custom Visualforce pages (<code>true</code>) or not (<code>false</code>). If <code>true</code>, each custom Visualforce page opens in a new browsing context group. The default value is <code>false</code>.</p> <p>Available in API version 55.0 and later.</p>
<code>enableCrossOrgRedirects</code>	boolean	<p>Indicates whether redirections to other Salesforce orgs are allowed (<code>true</code>) or blocked (<code>false</code>). In Summer '24 and later, this field is always <code>false</code>.</p> <p>This setting applies to user redirections to another Salesforce org via a direct link, a post-action URL, or a post-login URL in Salesforce. An example of a direct link with a redirection is <code>&lt;a href="/?startURL=<i>targetUrl</i>"&gt;LinkText&lt;/a&gt;</code>. Post-action URLs and post-login URLs use a protected URL redirect parameter, such as <code>retURL</code>, <code>startURL</code>, <code>saveURL</code>,</p>

Field Name	Field Type	Description
		<p><code>cancelURL</code>, and <code>targetURL</code>. Subsequent redirections can't be verified because they occur outside Salesforce.</p> <p>To allow cross-org redirections, add the URLs for the Salesforce orgs that you own to <a href="#">RedirectWhitelistUrl</a>.</p> <p>Available in API version 59.0 to 60.0.</p>
<code>enablePermissionsPolicy</code>	boolean	<p>Indicates whether the pages that Salesforce serves for this org include the <code>Permissions-Policy</code> HTTP header. This HTTP header controls access to browser features such as cameras and microphones. When this field is <code>false</code>, access to the browser features is always permitted. The default value is <code>false</code>.</p> <p>Available in API version 59.0 and later.</p>
<code>enableRequireHttpsConnection</code>	boolean	<p>Deprecated in API version 47.0 and later.</p>
<code>grantCameraAccess</code>	PermissionsPolicy (enumeration)	<p>When <code>enablePermissionsPolicy</code> is <code>true</code>, indicates when apps and websites loaded from Salesforce can access the user's camera.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>Always</code>—All apps and websites loaded from Salesforce can access the user's camera.</li> <li>• <code>Never</code>—No apps or websites, including scripts from Salesforce domains, can access the user's camera.</li> <li>• <code>TrustedUrls</code>—Only <a href="#">CspTrustedSite</a> entries with <code>canAccessCamera</code> set to <code>true</code> can access the user's camera.</li> </ul> <p>If <code>enablePermissionsPolicy</code> is <code>false</code>, this field has no effect.</p> <p>This field is available in API version 59.0 and later.</p>
<code>grantMicrophoneAccess</code>	Permissions Policy (enumeration)	<p>When <code>enablePermissionsPolicy</code> is <code>true</code>, indicates when apps and websites loaded from Salesforce can access the user's microphone.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>Always</code>—All apps and websites loaded from Salesforce can access the user's microphone.</li> <li>• <code>Never</code>—No apps or websites, including scripts from Salesforce domains, can access the user's microphone.</li> <li>• <code>TrustedUrls</code>—Only <a href="#">CspTrustedSite</a> entries with <code>canAccessMicrophone</code> set to <code>true</code> can access the user's microphone.</li> </ul> <p>If <code>enablePermissionsPolicy</code> is <code>false</code>, this field has no effect.</p>

Field Name	Field Type	Description
		This field is available in API version 59.0 and later.
<code>isTLsv12Required</code>	boolean	Indicates whether connections to or from your Salesforce org must use TLS 1.2 or higher ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> . Removed in API version 51.0 and later.
<code>isTLsv12RequiredCommunities</code>	boolean	Indicates whether connections with your Salesforce sites and portals or Experience Cloud sites must use TLS 1.2 or higher ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> . Removed in API version 51.0 and later.
<code>networkAccess</code>	<a href="#">NetworkAccess</a>	The trusted IP address ranges from which users can always log in without requiring computer activation.
<code>passwordPolicies</code>	<a href="#">PasswordPolicies</a>	The requirements for passwords and logins, and assistance with retrieving forgotten passwords.
<code>sendCspForUncommonClients</code>	boolean	<p>In rare cases, Salesforce can't identify whether the requesting app or specialized browser supports the <code>Content-Security-Policy: frame-ancestors</code> HTTP header directive. In those cases, this field indicates whether that directive is included in (<code>true</code>) or omitted from (<code>false</code>) the HTTP response header for pages that Salesforce serves for this org. The default value is <code>false</code>.</p> <p>When <code>sendCspForUncommonClients</code> is <code>true</code>, users who access Salesforce via an app or browser that doesn't support the <code>Content-Security-Policy: frame-ancestors</code> HTTP header directive can experience errors if that lack of support is unclear.</p> <p>This field is available in API version 59.0 and later.</p>
<code>sessionSettings</code>	<a href="#">SessionSettings</a>	The settings for session expiration and security.
<code>singleSignOnSettings</code>	<a href="#">SingleSignOnSettings</a>	The settings for single sign-on (SSO).

## NetworkAccess

Represents your org's trusted IP address ranges for network access.

Field	Field Type	Description
<code>ipRanges</code>	<a href="#">IpRange[]</a>	<p>The trusted IP address ranges from which users can always log in without requiring computer activation.</p> <p>To add an IP range, deploy all existing IP ranges, including the one you want to add. Otherwise, the existing IP ranges are replaced with the ones you deploy. To remove all the IP ranges,</p>

Field	Field Type	Description
		leave the networkAccess field blank (<networkAccess></networkAccess>).

## IpRange

Defines a range of trusted IP addresses for network access.

Field	Field Type	Description
description	string	The description of the trusted IP range. Use this field to identify the range, such as which corporate network corresponds to this range. Available in API version 34.0 and later.
end	string	The IP address that defines the high end of a range of trusted addresses.
start	string	The IP address that defines the low end of a range of trusted addresses.

## PasswordPolicies

Represents your org's password and login policies, which show up under **Security Controls | Password Policies**.

Field	Field Type	Description
apiOnlyUserHomePageURL	string	The URL to which users with the API Only User permission are redirected instead of the login page.
complexity	Complexity (enumeration of type string)	<p>The types of characters that must be used in a user's password. Valid values are:</p> <ul style="list-style-type: none"> <li><b>NoRestriction</b>—Has no requirements and is the least secure option.</li> <li><b>AlphaNumeric</b>—The default setting. Requires at least one alphabetic character and one number. This value is the default value.</li> <li><b>SpecialCharacters</b>—Requires at least one alphabetic character, one number, and one of the following characters: <code>! " # \$ % &amp; ' ( ) * + , - . / : ; &lt; = &gt; ? @ [ \ ] ^ _ ` {   } ~</code>.</li> <li><b>UpperLowerCaseNumeric</b>—Requires at least one number, one uppercase letter, and one lowercase letter. This value is available in API version 31.0 and later.</li> <li><b>UpperLowerCaseNumericSpecialCharacters</b>—Requires at least one number, one uppercase letter, one lowercase letter, and one of the following characters: <code>! " # \$ % &amp; ' ( ) * + , - . / : ; &lt; = &gt; ? @ [ \</code></li> </ul>

Field	Field Type	Description
		<p>] ^ _ ` {   } ~. This value is available in API version 31.0 and later.</p> <ul style="list-style-type: none"> <li>Any3UpperLowerCaseNumericSpecialCharacters—Requires at least three of the following options: one number, one uppercase letter, one lowercase letter, and one special character (! " # \$ % &amp; ' ( ) * + , - . / : ; &lt; = &gt; ? @ [ \ ] ^ _ ` {   } ~). This value is available in API version 46.0 and later.</li> </ul>
enableSetPasswordInApi	boolean	Deprecated in API version 51.0. Removed in API version 52.0.
expiration	Expiration (enumeration of type string)	<p>The length of time until a user password expires and must be changed. Valid values are:</p> <ul style="list-style-type: none"> <li>Never</li> <li>ThirtyDays</li> <li>SixtyDays</li> <li>NinetyDays. This value is the default value.</li> <li>SixMonths</li> <li>OneYear</li> </ul>
historyRestriction	string	<p>The number of previous passwords saved for users so that they must always reset a new, unique password. Valid values are 0 through 24 passwords remembered. The maximum value of 24 applies to API version 31.0 and later. In earlier versions, the maximum value is 16. The default value is 3.</p>
lockoutInterval	LockoutInterval (enumeration of type string)	<p>The duration of the login lockout. Valid values are:</p> <ul style="list-style-type: none"> <li>FifteenMinutes. This value is the default value.</li> <li>ThirtyMinutes</li> <li>SixtyMinutes</li> <li>Forever (must be reset by admin)</li> </ul>
maxLoginAttempts	MaxLoginAttempts (enumeration of type string)	<p>The number of login failures allowed for a user before the user is locked out. Valid values are:</p> <ul style="list-style-type: none"> <li>NoLimit</li> <li>ThreeAttempts</li> <li>FiveAttempts</li> <li>TenAttempts. This value is the default value.</li> </ul>
minimumPasswordLength	string	<p>The minimum number of characters required for a password. The number can contain from 5 to 50 characters (default is 8). Available in API version 35.0 and later.</p>

Field	Field Type	Description
		Before API version 35.0, specify minimum password length with the enumeration <code>minPasswordLength</code> , with valid values <code>FiveCharacters</code> , <code>EightCharacters</code> (default), <code>TenCharacters</code> , <code>TwelveCharacters</code> (API version 31.0 and later), and <code>FifteenCharacters</code> (API version 34.0 and later).
<code>minimumPasswordLifetime</code>	boolean	If <b>Require a minimum 1 day password lifetime</b> is enabled ( <code>true</code> ), passwords can't be changed more than one time during a 24-hour period. The default is <code>false</code> . Available in API version 31.0 and later.
<code>obscureSecretAnswer</code>	boolean	If enabled ( <code>true</code> ), hide answers to security questions as the user types. The default is <code>false</code> .  If your org uses the Microsoft Input Method Editor (IME) with the input mode set to Hiragana, when you type ASCII characters, they're converted in to Japanese characters in normal text fields. However, the IME doesn't work properly in fields with obscured text. If your org's users can't properly enter their passwords or other values after enabling this feature, disable the feature.
<code>passwordAssistanceMessage</code>	string	The text that appears in the Account Lockout email and at the bottom of the Confirm Identity screen for users resetting their passwords.
<code>passwordAssistanceURL</code>	string	The URL that users can click to retrieve forgotten passwords.
<code>questionRestriction</code>	QuestionRestriction (enumeration of type string)	The restriction on whether the answer to the password hint question can contain the password itself. Valid values are: <ul style="list-style-type: none"> <li>• <code>None</code></li> <li>• <code>DoesNotContainPassword</code>. This value is the default value.</li> </ul>

## SessionSettings

Represents your org's session expiration and security settings.

Field	Field Type	Description
<code>allowUserAuthenticationByCertificate</code>	boolean	If enabled ( <code>true</code> ), users can authenticate with a PEM-encoded X.509 digital certificate. Not enabled by default. Available in API version 47.0 and later.
<code>allowUserCertificateAuthenticationWithOcsPValidation</code>	boolean	If enabled ( <code>true</code> ), authentication certificates are validated using the Online Certificate Status Protocol (OCSP) or a Certificate Revocation List (CRL).

Field	Field Type	Description
<code>canConfirmEmailChangeInLightningCommunities</code>	boolean	If <b>Require email confirmations for email address changes</b> is enabled ( <code>true</code> ), when users change their email address, they receive an email at the new address with a link. After they click the link, their new email address takes effect. For orgs created before Winter '20, the field isn't enabled by default. For new orgs, this field is always enabled. To disable the field (not recommended), contact Salesforce Customer Support. Available in API version 47.0 and later.
<code>canConfirmIdentityBySmsOnly</code>	boolean	Prevents identity verification by email for users who have registered other verification methods, such as SMS or Salesforce Authenticator. If no other verification methods are configured, users are verified by email.  By default, this setting is disabled ( <code>false</code> ) for existing orgs. For new orgs, this setting is enabled ( <code>true</code> ) by default. Available in API version 48.0 and later.
<code>disableTimeoutWarning</code>	boolean	Indicates whether the session timeout warning popup is disabled ( <code>true</code> ) or enabled ( <code>false</code> ).
<code>enableBuiltInAuthenticator</code>	boolean	Indicates whether users can verify their identity with a built-in authenticator that's already on their device ( <code>true</code> ), such as Touch ID or Windows Hello, or not ( <code>false</code> ). The default value is <code>false</code> .
<code>enableCSPOnEmail</code>	boolean	Indicates whether a content security policy is enabled for the email template. A content security policy helps prevent cross-site scripting attacks by listing allowed sources of images and other content.
<code>enableCSRFOnGet</code>	boolean	Indicates whether Cross-Site Request Forgery (CSRF) protection on GET requests on non-setup pages is enabled ( <code>true</code> ) or disabled ( <code>false</code> ).
<code>enableCSRFOnPost</code>	boolean	Indicates whether Cross-Site Request Forgery (CSRF) protection on POST requests on non-setup pages is enabled ( <code>true</code> ) or disabled ( <code>false</code> ).
<code>enableCacheAndAutocomplete</code>	boolean	Indicates whether the user's browser is allowed to store usernames and auto-fill the <code>User Name</code> field on the login page ( <code>true</code> ) or not ( <code>false</code> ).
<code>enableClickjackNonsetupSFDC</code>	boolean	Indicates whether clickjack protection for non-setup Salesforce pages is enabled ( <code>true</code> ) or disabled ( <code>false</code> ).
<code>enableClickjackNonsetupUser</code>	boolean	Indicates whether clickjack protection for customer Visualforce pages with standard headers turned on is enabled ( <code>true</code> ) or disabled ( <code>false</code> ).

Field	Field Type	Description
<code>enableClickjackNonsetupUserHeaderless</code>	boolean	Indicates whether clickjack protection for customer Visualforce pages with standard headers turned off is enabled ( <code>true</code> ) or disabled ( <code>false</code> ). Available in API version 34.0 and later.
<code>enableClickjackSetup</code>	boolean	Indicates whether clickjack protection for setup pages is enabled ( <code>true</code> ) or disabled ( <code>false</code> ).
<code>enableContentSniffingProtection</code>	boolean	Indicates whether the browser is prevented from inferring the MIME type from the document content and from executing malicious files (JavaScript, Style sheet) as dynamic content.  This field is available in API version 39.0 and later. In API version 58.0 and later, <code>enableContentSniffingProtection</code> is always <code>true</code> .
<code>enableLightningLogin</code>	boolean	If enabled ( <code>true</code> ), users can use Lightning Login (Salesforce Authenticator) to log in instead of a password. Available in API Version 47.0 and later.
<code>enableLightningLoginOnlyWithUserPerm</code>	boolean	If enabled ( <code>true</code> ), only users with the Lightning Login User permission can log in with Salesforce Authenticator instead of a password. Available in API version 47.0 and later.
<code>enableMFADirectUILoginOptIn</code>	boolean	Requires all users in your Salesforce org to provide an additional verification method when logging in directly to the UI with their username and password. Users who are already enabled via the Multi-Factor Authentication for User Interface Logins user permission experience no change. The Waive Multi-Factor Authentication for Exempt Users user permission overrides this setting.
<code>enableOauthCorsPolicy</code>	boolean	If set to <code>true</code> , enables Cross-Origin Resource Sharing (CORS) for these OAuth endpoints: <ul style="list-style-type: none"> <li><code>/services/oauth2/token</code></li> <li><code>/services/oauth2/revoke</code></li> <li><code>/services/oauth2/introspect</code></li> </ul> Default setting is <code>false</code> . Available in API version 50.0 and later.
<code>enablePostForSessions</code>	boolean	Indicates whether cross-domain session information is exchanged using a POST request instead of a GET request, such as when a user is using a Visualforce page. In this context, POST requests are more secure than GET requests. Available in API version 31.0 and later.
<code>enableSMSIdentity</code>	boolean	If enabled ( <code>true</code> ), the default, users can receive a one-time password in a text message (SMS) to verify their identity. Users must verify their mobile phone number before they can receive SMS messages.

Field	Field Type	Description
<code>enableU2F</code>	boolean	If enabled ( <code>true</code> ), users can use a physical U2F-compatible security key for multi-factor authentication (MFA) and identity verification. The default is <code>false</code> . Available in API version 47.0 and later.
<code>enableUpgradeInsecureRequests</code>	boolean	Indicates whether HTTPS is required for connecting to third-party domains.  This setting is enabled by default on accounts created after the Summer '17 release.  This field is available in API version 42.0 to 60.0.
<code>enableXssProtection</code>	boolean	Indicates whether the HTTP <code>X-XSS-Protection</code> response header is enabled to protect against reflected cross-site scripting attacks.  This field is available in API version 39.0 to 59.0. The HTTP <code>X-XSS-Protection</code> response header is deprecated. To help prevent cross-site scripting (XSS) and other code injection attacks, use the <a href="#">CSPTtrustedSite</a> metadata type.
<code>enforceIpRangesEveryRequest</code>	boolean	If <code>true</code> , the IP addresses in Login IP Ranges are enforced when a user accesses Salesforce (on every page request), including access from a client app. If <code>false</code> , the IP addresses in Login IP Ranges are enforced only when a user logs in. This field affects all user profiles with login IP restrictions. Available in API version 34.0 and later.
<code>enforceUserDeviceRevoked</code>	boolean	If enabled, and a UserDevice's status is set to revoked, that device can't log in from a Salesforce app. Logins from browsers aren't affected.  This field is available in API version 50.0 and later.
<code>forceLogoutOnSessionTimeout</code>	boolean	If enabled ( <code>true</code> ), the default, when sessions time out for inactive users, current sessions become invalid. The browser refreshes and returns to the login page. To access the org, the user must log in again. Available in API version 31.0 and later.
<code>forceRelogin</code>	boolean	If <code>true</code> , an admin who is logged in as another user must log in again to their original session, after logging out as the secondary user. If <code>false</code> , the admin isn't required to log in again.
<code>hasRetainedLoginHints</code>	boolean	If you enable <b>Remember me until logout</b> ( <code>true</code> ), usernames (login hints) are cached until the user logs out. If a session times out, usernames appear on the Switcher as inactive. If <code>false</code> (default), usernames aren't cached for SSO sessions.

Field	Field Type	Description
hasUserSwitching	boolean	If <b>Enable user switching</b> is <code>true</code> (default), users can log in to other orgs by selecting their profile picture and using the Switcher. You must also enable the <b>Enable caching and autocomplete on login page</b> setting.  If <code>false</code> , the Switcher isn't enabled and your org doesn't appear in Switchers on other orgs.
hstsOnForcecomSites	boolean	Indicates whether Visualforce, Salesforce sites, or Experience Cloud sites must use HTTPS. Available in API version 41.0 and later.
identityConfirmationOnEmailChange	boolean	Indicates whether a user's identity is confirmed when changing their email address, instead of requiring a relogin.  This field is available in API version 42.0 and later.
identityConfirmationOnTwoFactorRegistrationEnabled	boolean	Indicates whether users are required to confirm their identities when adding a verification method such as Salesforce Authenticator for multi-factor authentication (MFA), instead of requiring a relogin. (Multi-factor authentication was formerly called two-factor authentication.)  This field is available in API version 40.0 and later.
lockSessionsToDomain	boolean	Indicates whether the current UI session for a user is associated with a specific domain. This check helps prevent unauthorized use of the session ID in another domain. The value is <code>true</code> by default for orgs created with the Spring '15 release or later. Available in API version 33.0 and later.
lockSessionsToIp	boolean	Indicates whether user sessions are locked to the IP address from which the user logged in ( <code>true</code> ) or not ( <code>false</code> ).
lockerServiceAPIVersion	string	The API version that Lightning Locker enforces for security of custom Lightning components. The default value matches the Salesforce API version of the current release. Only valid Salesforce API versions between 46.0 and the current release can be specified. The version must be specified as a string in the format " <code>nn.n</code> ", such as " <code>48.0</code> ". This setting has no effect on the <code>lockerServiceNext</code> setting, which enables Lightning Web Security.  This field is available in API version 47.0 and later.
lockerServiceCSP	boolean	If <code>true</code> , a stricter Content Security Policy is enabled to disallow the <code>unsafe-inline</code> source for the <code>script-src</code> CSP directive. Script tags can't be used to load JavaScript, and event handlers can't use inline JavaScript. Lightning Locker and Lightning Web Security depend on this setting to be enabled to protect Lightning components.

Field	Field Type	Description
lockerServiceNext	boolean	If <code>true</code> , Lightning Web Security is used instead of Lightning Locker to protect Lightning web components. Lightning Locker continues to protect Aura components. If <code>false</code> , Lightning Locker protects Lightning web components and Aura components. Available in API version 53.0 and later.
lockerServiceNextControl	boolean	Reserved for internal use.
logoutURL	string	The URL to which users are redirected when they log out of Salesforce. If no value is specified, the default is <code>https://MyDomainName.my.salesforce.com</code> . Available in API version 34.0 and later.
redirectBlockModeEnabled	boolean	<p>If <code>true</code>, users can't access untrusted URLs outside the Salesforce domains via links in a web tab. When a user clicks the link, a message informs the user that they can't access the page because the external site isn't trusted. The default is <code>false</code>.</p> <p>To specify the URLs that you trust, use the <a href="#">RedirectWhitelistUrl</a> Metadata type.</p> <p>The <code>redirectBlockModeEnabled</code> and <code>redirectionWarning</code> fields are mutually exclusive. Only one of those fields can be <code>true</code>.</p> <p>Available in API 56.0 and later.</p>
redirectionWarning	boolean	<p>If <code>true</code>, users see an alert when they click a link in a web tab that redirects them to an untrusted URL outside the Salesforce domains. The default is <code>true</code> in orgs created in Spring '18 and later and <code>false</code> in orgs created in Winter '18 and earlier.</p> <p>To specify the URLs that you trust, use the <a href="#">RedirectWhitelistUrl</a> Metadata type.</p> <p>The <code>redirectBlockModeEnabled</code> and <code>redirectionWarning</code> fields are mutually exclusive. Only one of those fields can be <code>true</code>.</p> <p>Available in API version 42.0 and later.</p>
referrerPolicy	boolean	<p>If <code>true</code>, pages served by Salesforce for this org include the <code>referrer-policy</code> HTTP header with the directive defined by <code>referrerPolicyDirective</code>. If <code>false</code>, that HTTP header isn't included and requests can always see the full URL of the Salesforce page. The default is <code>true</code>. Available in API version 42.0 and later.</p> <p>In API version 42.0–57.0, if <code>referrerPolicy</code> is <code>true</code>, pages served by Salesforce for this org include the <code>referrer-policy</code> HTTP header with the <code>origin-when-cross-origin</code> directive.</p>

Field	Field Type	Description
<code>referrerPolicyDirective</code>	ReferrerPolicy (enumeration of type string)	<p>The HTTP referrer policy directive for pages served by Salesforce. The default is <code>origin-when-cross-origin</code>. If <code>referrerPolicy</code> is <code>false</code>, this value has no effect. Available in API version 58.0 and later.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li><code>origin-when-cross-origin</code>—Send the origin only for cross-domain requests or when the target website is on a downgraded protocol. An example of a downgraded protocol is a request made from an HTTPS URL to an HTTP site. This is the default setting.</li> <li><code>no-referrer</code>—Never include the referrer.</li> <li><code>no-referrer-when-downgrade</code>—Omit the referrer when the target website is on a downgraded protocol. For example, when making a request to an HTTP site from an HTTPS URL. This <code>referrerPolicyDirective</code> isn't recommended, because the full URL of the page is exposed to cross-origin requests to the same or a higher protocol level. For example, requests from HTTPS to HTTPS and requests from HTTP to either HTTP or HTTPS.</li> <li><code>origin</code>—Always send the origin only.</li> <li><code>same-origin</code>—Omit the referrer for cross-origin requests.</li> <li><code>strict-origin</code>—For requests with the same protocol level (HTTPS to HTTPS), send the origin only. Omit the referrer when the target website is on a downgraded protocol. An example of a downgraded protocol is a request made from an HTTPS URL to an HTTP site.</li> <li><code>strict-origin-when-cross-origin</code>—For same-origin requests, send the full referrer URL. For cross-origin requests with the same protocol level (HTTPS to HTTPS), send the origin only. Omit the referrer when the target website is on a downgraded protocol.</li> <li><code>unsafe-url</code>—Always include the full referrer URL. This <code>referrerPolicyDirective</code> isn't recommended because the full URL of the page is exposed to requests from insecure origins.</li> </ul> <p>For more information on HTTP referrer policy directives, including examples, see the <a href="#">Referrer-Policy</a> entry in the <i>MDN Docs HTTP Guide</i>.</p>

Field	Field Type	Description
<code>requireHttpOnly</code>	boolean	<p>Sets the <code>HttpOnly</code> attribute on session cookies, making them inaccessible via JavaScript. If <code>true</code>, session ID cookie access is restricted. If <code>false</code>, access is restricted.</p> <p>If you have a custom or packaged application that uses JavaScript to access session ID cookies, your application breaks if <code>requireHttpOnly</code> is set to <code>true</code>. The application can't access the cookie.</p> <p>This field is available in API version 40.0 to 60.0.</p>
<code>requireHttps</code>	boolean	<p>Determines whether HTTPS is required to log in to or access Salesforce. This option is enabled by default for security reasons and can't be disabled. To change to HTTP, contact Salesforce Customer Support.</p> <p>This field is available in API version 40.0 and later.</p>
<code>securityCentralKillSession</code>	boolean	<p>Deprecated in API version 36.0 to 50.0. Removed in API version 51.0 and later.</p>
<code>sessionTimeout</code>	SessionTimeout (enumeration of type string)	<p>The length of time after which users without activity are prompted to log out or continue working. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>FifteenMinutes</code></li> <li>• <code>ThirtyMinutes</code></li> <li>• <code>SixtyMinutes</code></li> <li>• <code>NinetyMinutes</code>—Available in API version 58.0 and later.</li> <li>• <code>TwoHours</code></li> <li>• <code>FourHours</code></li> <li>• <code>EightHours</code></li> <li>• <code>TwelveHours</code></li> <li>• <code>TwentyFourHours</code>—Available in API version 38.0 and later.</li> </ul>
<code>sidToken3rdPartyAuraApp</code>	boolean	<p>If <code>true</code>, a Lightning app replaces the authentication cookie with a session token when the Lightning app is in a third-party context, such as Lightning Out.</p> <p>Browsers are restricting the use of third-party cookies. This org setting is an alternative for the authentication cookie to requiring that users disable browser settings, such as Safari's <code>Prevent cross-site tracking</code> setting.</p> <p>This field is available in API version 59.0 and later.</p>

Field	Field Type	Description
skipSFAWhenMFADirectUILogin	boolean	<p>Indicates which screen users see first when they're prompted to register a verification method for multi-factor authentication (MFA).</p> <p>If <code>true</code>, users see a list of all supported verification methods.</p> <p>If <code>false</code>, users see only the Salesforce Authenticator option. To see a list of all supported verification methods, users must navigate to a new page.</p>
terminateUserSessionsWhenAdminResetsPassword	boolean	<p>Indicates what happens to a user's UI sessions when an admin resets that user's password. If <code>true</code>, all of the user's UI sessions are terminated. If <code>false</code>, no UI sessions are terminated.</p>
useLocalStorageForLogoutUrl	boolean	<p>Redirects all expired tabs in your browser to your custom logout URL (<code>true</code>). By default, this option is enabled for all new orgs and is available in API version 52.0 and later.</p> <p>For orgs created prior to the Summer '21 release, the default setting is <code>false</code>. Before enabling this setting, review these considerations.</p> <ul style="list-style-type: none"> <li>This setting uses the browser's local storage to store the custom logout URL.</li> <li>Verify that this setting doesn't interfere with your custom login integrations.</li> </ul>

## SingleSignOnSettings

Represents your org's single sign-on (SSO) settings. These settings are available API version 47.0 and later.

Field Name	Field Type	Description
enableCaseInsensitiveFederationID	boolean	<p>If you enable <b>Make Federation ID case-insensitive</b> (<code>true</code>), the Federation ID field on a user object isn't case-sensitive. If disabled (<code>false</code>), the Federation ID field remains case-sensitive. The default is <code>false</code>.</p>
enableForceDelegatedCallout	boolean	<p>If you enable <b>Force Delegated Authentication Callout</b> (<code>true</code>), a callout to the SSO endpoint occurs regardless of login restriction failures. If disabled (<code>false</code>), the default, and if a user's first login attempt fails due to login restrictions within the Salesforce org, a call isn't made to the SSO endpoint.</p>
enableMultipleSamlConfigs	boolean	<p>If <code>true</code> (default), you can configure multiple SAML providers. After enabling the setting, it can't be disabled.</p>
enableSamlJitProvisioning	boolean	<p>If you enable <b>User Provisioning Enabled</b> (<code>true</code>), you can provision users through a SAML assertion (called just-in-time provisioning). Requires <code>EnableSamlLogin</code> to be <code>true</code>.</p>

Field Name	Field Type	Description
		and <code>enableMultipleSamlConfigs</code> to be <code>false</code> . The default is enabled ( <code>false</code> ).
<code>enableSamlLogin</code>	boolean	If you enable <b>SAML Enabled</b> ( <code>true</code> ), users can SSO into Salesforce from providers via SAML. The default isn't enabled ( <code>false</code> ).
<code>isLoginWithSalesforceCredentialsDisabled</code>	boolean	If <b>Disable login with Salesforce credentials</b> is <code>true</code> , users are redirected to third-party identity providers for authentication. The default is enabled ( <code>false</code> ).  If you enabled this feature prior to the Summer '20 release and want to disable it prior to July 27, 2020, contact Customer Support.

## Declarative Metadata Sample Definition

The following is a sample `security.settings` metadata file.

```
<?xml version="1.0" encoding="UTF-8"?>
<SecuritySettings xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">

```

```

    </singleSignOnSettings>
  </SecuritySettings>

```

The following is an example `package.xml` manifest that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Security</members>
    <name>Settings</name>
  </types>
  <version>61.0</version>
</Package>

```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ServiceCloudVoiceSettings

Represents an organization's Service Cloud Voice settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

`ServiceCloudVoiceSettings` values are stored in the `ServiceCloudVoice.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`ServiceCloudVoiceSettings` is available in API versions 52.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableSCVExternalTelephony</code>	boolean	Indicates whether to allow a third-party telephony service to work with Service Cloud Voice with Partner Telephony.
<code>enableServiceCloudVoice</code>	boolean	Indicates whether to enable the Service Cloud Voice with Amazon Connect.
<code>enableVoiceInGovCloudOptIn</code>	boolean	Indicates whether you agree to the terms of using Service Cloud Voice with Amazon Connect in a Salesforce Government Cloud environment. Amazon Connect is a third-party Amazon service that sits outside the Salesforce Government Cloud FedRAMP environment. Amazon Connect

Field Name	Field Type	Description
		is a separate service offered by Amazon and not a FedRAMP authorized service. Therefore, Amazon Connect's processing environment falls outside the Government Cloud FedRAMP authorization boundary. To learn more, see <a href="#">Amazon Connect</a> .

## Declarative Metadata Sample Definition

The following is an example of a `ServiceCloudVoice.settings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ServiceCloudVoiceSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableServiceCloudVoice>true</enableServiceCloudVoice>
</ServiceCloudVoiceSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>ServiceCloudVoice</members>
    <name>Settings</name>
  </types>
  <version>52.0</version>
</Package>
```

## ServiceSetupAssistantSettings

Represents an organization's Service Setup Assistant settings. The Service Setup Assistant can be used to set up a basic service console app.

This type extends the `Metadata` metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

`ServiceSetupAssistantSettings` values are stored in the `ServiceSetupAssistant.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`ServiceSetupAssistantSettings` components are available in API version 50.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableServiceSetupAssistant</code>	boolean	Indicates whether the Service Setup Assistant is enabled ( <code>true</code> ) or not ( <code>false</code> ).

## Declarative Metadata Sample Definition

The following is an example of a `ServiceSetupAssistantSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ServiceSetupAssistantSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableServiceSetupAssistant>true</enableServiceSetupAssistant>
</ServiceSetupAssistantSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SharingSettings

Represents an organization's sharing, visibility, and data access settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

`SharingSettings` values are stored in the `Sharing.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`SharingSettings` is available in API version 47.0 and later.

## Special Access Rules

To use `SharingSettings`, you need the Manage Sharing permission.

## Fields

Field Name	Field Type	Description
<code>deferGroupMembership</code>	boolean	Indicates whether group membership calculations are suspended ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> . This field is available in API version 49.0 and later.

**Important:**

- The defer sharing calculation feature isn't enabled by default. To enable it for your Salesforce org, contact Salesforce Customer Support.
- When you change the value of this field from `true` to `false`, group membership is automatically recalculated.

Field Name	Field Type	Description
		<p>Sharing rules are also automatically recalculated, unless the <code>deferSharingRules</code> field is set to <code>true</code> prior to modifying <code>deferGroupMembership</code>. Depending on your org, these recalculations can take a significant amount of time to complete.</p> <ul style="list-style-type: none"> <li>If the <code>deferGroupMembership</code> field is set to <code>true</code>, you can't change the value of <code>deferSharingRules</code>. Sharing rule calculations are suspended regardless of the value of <code>deferSharingRules</code>.</li> </ul>
<code>deferSharingRules</code>	boolean	<p>Indicates whether sharing rule calculations are suspended (<code>true</code>) or not (<code>false</code>). This field has a default value of <code>false</code>. This field is available in API version 49.0 and later.</p> <p><b>!</b> <b>Important:</b></p> <ul style="list-style-type: none"> <li>The defer sharing calculation feature isn't enabled by default. To enable it for your Salesforce org, contact Salesforce Customer Support.</li> <li>When you change the value of this field from <code>true</code> to <code>false</code>, sharing rules are automatically recalculated. Depending on your org, this recalculation can take a significant amount of time to complete.</li> <li>If the <code>deferGroupMembership</code> field is set to <code>true</code>, you can't change the value of <code>deferSharingRules</code>. Sharing rule calculations are suspended regardless of the value of <code>deferSharingRules</code>.</li> </ul>
<code>enableAccountRoleOptimization</code>	boolean	Indicates whether person roles are assigned to new site users in accounts without existing users ( <code>true</code> ) or if regular site roles are created for new users ( <code>false</code> ). This field has a default value of <code>false</code> .
<code>enableAssetSharing</code>	boolean	Indicates whether sharing is enabled for assets ( <code>true</code> ) or asset access is determined by the parent object's sharing rules ( <code>false</code> ). This field has a default value of <code>false</code> .
<code>enableCommunityUserVisibility</code>	boolean	Indicates whether site users in the same site can see each other regardless of the organization-wide defaults ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> . In orgs created in API version 47.0 and later, this setting doesn't apply to guest users.
<code>enableExternalSharingModel</code>	boolean	Indicates whether the external sharing model is enabled ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>true</code> if Salesforce Experiences are enabled, and a default value of <code>false</code> if not. To use this field, you need the Customize Application permission.
<code>enableManagerGroups</code>	boolean	Indicates whether users can share records with their managers and manager subordinates groups ( <code>true</code> ) or not ( <code>false</code> ). This field has a

Field Name	Field Type	Description
		default value of <code>false</code> . To use this field, you need the View and Manage Users permission.
<code>enableManualUserRecordSharing</code>	boolean	Indicates whether users can share their own user record ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> .
<code>enablePartnerSuperUserAccess</code>	boolean	Indicates whether you can grant super user access to partners in sites ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> . To use this field, you need the Customize Application permission
<code>enablePortalUserCaseSharing</code>	boolean	Indicates whether portal users can access related contacts for cases that they own ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> .
<code>enablePortalUserVisibility</code>	boolean	Indicates whether portal users in the same customer or partner portal account can see each other regardless of the organization-wide defaults ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> . To enable this field, contact Salesforce Support.
<code>enableRemoveTMGroupMembership</code>	boolean	Removes group membership info for the original territory management feature after migrating to Enterprise Territory Management when set to <code>true</code> . This field has a default value of <code>false</code> . Once this field is set to <code>true</code> , it can't be set to <code>false</code> again.
<code>enableRestrictAccessLookupRecords</code>	boolean	Indicates whether users must have read access to a record to see the record's name in lookup and system fields ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>true</code> in Salesforce orgs created in Spring '20 or later and a default value of <code>false</code> in all other orgs. This field is available in API version 48.0 and later.
<code>enableSecureGuestAccess</code>	boolean	<p>When <code>true</code>, guest users have org-wide defaults set to Private. To share records with them, you must use guest user sharing rules.</p> <p>As of API version 50.0, this field's value is always <code>true</code>, regardless of the value that you set. Changing its value has no effect on Salesforce, even if it reads <code>false</code>.</p> <p>This change applies retroactively back to API version 47.0, when this field was first introduced. Previously, in API version 47.0 to 49.0, this field indicated whether guest users' record access is secured (<code>true</code>) or not (<code>false</code>), and the field's default value was <code>false</code>. Now, in all API versions, this field's value is always <code>true</code>, even if it reads <code>false</code>.</p>
<code>enableStandardReportVisibility</code>	boolean	Indicates whether users can view reports based on standard report types that may expose data of users to whom they don't have access ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> .
<code>enableTerritoryForecastManager</code>	boolean	Indicates whether forecast managers can act as delegated administrators for territories below them in the hierarchy ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of a SharingSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<SharingSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <deferGroupMembership>false</deferGroupMembership>
  <deferSharingRules>false</deferSharingRules>
  <enableAccountRoleOptimization>false</enableAccountRoleOptimization>
  <enableAssetSharing>false</enableAssetSharing>
  <enableCommunityUserVisibility>false</enableCommunityUserVisibility>
  <enableExternalSharingModel>true</enableExternalSharingModel>
  <enableManagerGroups>false</enableManagerGroups>
  <enableManualUserRecordSharing>true</enableManualUserRecordSharing>
  <enablePartnerSuperUserAccess>false</enablePartnerSuperUserAccess>
  <enablePortalUserCaseSharing>false</enablePortalUserCaseSharing>
  <enablePortalUserVisibility>true</enablePortalUserVisibility>
  <enableRemoveTMGroupMembership>false</enableRemoveTMGroupMembership>
  <enableRestrictAccessLookupRecords>true</enableRestrictAccessLookupRecords>
  <enableSecureGuestAccess>true</enableSecureGuestAccess>
  <enableStandardReportVisibility>false</enableStandardReportVisibility>
  <enableTerritoryForecastManager>false</enableTerritoryForecastManager>
</SharingSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Sharing</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SiteSettings

Represents the settings for Experience Cloud sites and for [Salesforce Sites](#).

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

SiteSettings values are stored in a single file named `Site.settings` in the `settings` directory. The `.settings` files are different from other named components because there's only one `.settings` file for each settings component.

## Version

SiteSettings components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableEnhancedSitesAndContentPlatform</code>	boolean	Indicates whether the enhanced sites and content platform for Experience Cloud is enabled for your org ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . When <code>true</code> , new LWR sites and enhanced CMS workspaces are hosted together on a redesigned platform that offers partial deployment, site content search, and easy content management. Enhanced LWR sites are represented by the <a href="#">DigitalExperienceBundle</a> and <a href="#">DigitalExperienceConfig</a> types. Available in API version 56.0 and later.
<code>enableExperienceFriendlyUrls</code>	boolean	Indicates whether SEO-friendly URL snippets, or “slugs,” are enabled for your org ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> . When <code>true</code> , available only in B2C Commerce LWR sites. Available only in API version 58.0. In API version 59.0 and later, use <code>expFriendlyUrlsAsDefault</code> in the <a href="#">Network</a> type.
<code>enableProxyLoginICHeader</code>	boolean	Indicates whether security tokens for API logins from callouts (in API version 31.0 and earlier) are required ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>true</code> .
<code>enableSitesRecordReassignOrgPref</code>	boolean	When <code>true</code> , indicates when the org assigns records created by guest users of a site to a default owner in the org. When <code>false</code> , the guest user remains the owner of the record. The default value is <code>false</code> . Available in API version 48.0 and later.
<code>enableTopicsInSites</code>	boolean	Indicates whether guest and authenticated external users can view topics in Salesforce Sites and Salesforce portals ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>enableVisualforceApiAccessAllowed</code>	boolean	Deprecated in API version 52.0 and later. Allow users of Visualforce pages to override API access control restrictions and access APIs when the <code>enableAdminApprovedAppsOnly</code> in <a href="#">ConnectedAppSettings</a> is enabled ( <code>true</code> ). The default value is <code>false</code> .
<code>enableWebruntimeBYOTemplate</code>	boolean	Indicates whether the Build Your Own (LWC) template is available in Experience Builder. The default value is <code>false</code> . Available in API version 48.0 and later. Removed in API version 51.0.

## Declarative Metadata Sample Definition

The following is an example of a SiteSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<SiteSettings xmlns="http://soap.sforce.com/2006/04/metadata">
```

```
<enableProxyLoginICHeader>true</enableProxyLoginICHeader>
<enableTopicsInSites>false</enableTopicsInSites>
</SiteSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Site</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SocialCustomerServiceSettings

Represents Social Customer Service settings such as how to format inbound content from social posts to cases. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

`SocialCustomerServiceSettings` components have the suffix `settings` and are stored in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`SocialCustomerServiceSettings` is available in API version 41.0 and later.

## Fields

Field Name	Field Type	Description
<code>caseSubjectOption</code>	<code>CaseSubjectOption</code> ( <a href="#">enumeration</a> of type string)	Required. Specifies an option from which inbound social content is formatted to appear in case records' <b>Case Subject</b> field. Valid values are: <ul style="list-style-type: none"> <li>• <code>SocialPostSource</code></li> <li>• <code>SocialPostContent</code></li> <li>• <code>BuildCustom</code></li> </ul>

Field Name	Field Type	Description
<code>enableAllFBResponseAccounts</code>	boolean	Indicates whether responses from all Facebook managed accounts are enabled. If this setting is disabled, responses to a Facebook post can only be sent from the account that the original customer post was directed to. The default value is <code>true</code> . Available in API version 56.0 and later.
<code>enableSocialApprovals</code>	boolean	Indicates whether social approvals are enabled. To learn more, see <a href="#">Enable Social Post Approvals</a> . The default value is <code>false</code> . Available in API version 47.0 and later.
<code>enableSocialCaseAssignmentRules</code>	boolean	Indicates whether case assignment rules are enabled. Use case assignment rules to determine how cases are assigned to users or put into queues as they are created. The default value is <code>false</code> . Available in API version 47.0 and later.
<code>enableSocialCustomerService</code>	boolean	Indicates whether to enable the Social Customer Service feature. The default value is <code>false</code> . Available in API version 47.0 and later.
<code>enableSocialPersonaHistoryTracking</code>	boolean	Indicates whether to enable Social Persona history tracking. History tracking helps identify who made what changes when, and for differentiating between automatic and manual changes. The default value is <code>false</code> . Available in API version 47.0 and later.
<code>enableSocialPostHistoryTracking</code>	boolean	Indicates whether to enable Social Post history tracking. History tracking helps identify who made what changes when, and for differentiating between automatic and manual changes. The default value is <code>false</code> . Available in API version 47.0 and later.
<code>enableSocialReceiveParentPost</code>	boolean	Indicates whether to use the original social post that initiated the case as the parent record. The default value is <code>false</code> . Available in API version 47.0 and later.

## Declarative Metadata Sample Definition

This is a sample of a `SocialCustomerServiceSettings.settings` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<SocialCustomerServiceSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <caseSubjectOption>SocialPostSource</caseSubjectOption>
  <enableSocialApprovals>true</enableSocialApprovals>
  <enableSocialCaseAssignmentRules>false</enableSocialCaseAssignmentRules>
  <enableSocialCustomerService>true</enableSocialCustomerService>
  <enableSocialPersonaHistoryTracking>false</enableSocialPersonaHistoryTracking>
  <enableSocialPostHistoryTracking>false</enableSocialPostHistoryTracking>
  <enableSocialReceiveParentPost>true</enableSocialReceiveParentPost>
</SocialCustomerServiceSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>SocialCustomerService</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SocialProfileSettings

Represents org preferences for social media features such as enabling Twitter and Facebook. Represents org preferences for social media features such as enabling Twitter and Facebook. This type extends the Metadata metadata type and inherits the `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

`SocialProfileSettings` values are stored in a single file named `SocialProfile.settings` in the `settings` directory of the corresponding package directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`SocialProfileSettings` is available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>isFacebookSocialProfilesDisabled</code>	boolean	Prevents users from accessing Facebook in social CRM ( <code>true</code> ) or not ( <code>false</code> ). <code>enableSocialProfiles</code> must be <code>true</code> to enable Facebook social profiles.
<code>isLinkedInSocialProfilesDisabled</code>	boolean	Prevents users from accessing LinkedIn in social CRM ( <code>true</code> ) or not ( <code>false</code> ). <code>enableSocialProfiles</code> must be <code>true</code> to enable LinkedIn social profiles.

Field Name	Field Type	Description
<code>isTwitterSocialProfilesDisabled</code>	boolean	Prevents users from accessing Twitter in social CRM ( <code>true</code> ) or not ( <code>false</code> ). <code>enableSocialProfiles</code> must be <code>true</code> to enable Twitter social profiles.  This setting is permanently set to True because Twitter access was removed in API version 59.0.
<code>isYouTubeSocialProfilesDisabled</code>	boolean	Prevents users from accessing YouTube in social CRM ( <code>true</code> ) or not ( <code>false</code> ). <code>enableSocialProfiles</code> must be <code>true</code> to enable YouTube social profiles.  This setting is permanently set to True because YouTube access was removed in API version 60.0.
<code>enableSocialProfiles</code>	boolean	Indicates whether users can access social media profiles in social CRM ( <code>true</code> ) or not ( <code>false</code> ).

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SourceTrackingSettings (Beta)

Represents settings for source tracking, so that changes you make in your Developer and Developer Pro sandboxes or local workspace can be tracked. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

`SourceTrackingSettings` values are stored in the `SourceTracking.settings` file in the `settings` folder. The `.settings` files are different from other named components because there is only one settings file for each settings component.

## Version

`SourceTrackingSettings` is available in API version 49.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableSourceTrackingSandboxes</code>	boolean	<p>Indicates whether to enable source tracking automatically when Developer or Developer Pro sandboxes are created or refreshed (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p> <p>If you set <code>enableSourceTrackingSandboxes</code> back to <code>false</code> after it was enabled, a sandbox that is tracking source changes continues to do so until it is refreshed.</p> <p> <b>Note:</b> You don't need to have the Developer Hub (DevHub) enabled in the same org to enable source tracking.</p> <p>This field applies to production orgs only; in other orgs, this field is ignored.</p>

## Declarative Metadata Sample Definition

The following is an example of a `SourceTrackingSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<SourceTrackingSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableSourceTrackingSandboxes>true</enableSourceTrackingSandboxes>
</SourceTrackingSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SubscriptionManagementSettings

Represents the settings used to manage recurring subscriptions.

### Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See [Settings](#) for more details.

### File Suffix and Directory Location

`SubscriptionManagementSettings` values are stored in the `subscriptionmanagement.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there's only one settings file for each settings component.

## Version

SubscriptionManagementSettings components are available in API version 55.0 and later.

## Special Access Rules

This metadata type is available with Subscription Management.

## Fields

Field Name	Field Type	Description
enableBillingDocGen	boolean	Indicates whether document generation is enabled in the org ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
enableConvertNegativeInvoiceLinesToCreditMemoAndApply	boolean	Indicates whether to convert negative invoice lines into a credit note ( <code>true</code> ) or not ( <code>false</code> ). This credit note holds a positive balance that you can later use to apply against future invoices. The default value is <code>false</code> .
enableInvHeaderLvlSettlement	boolean	Indicates whether payments can be applied on the whole invoice ( <code>true</code> ) or only on invoice lines ( <code>false</code> ). The default value is <code>false</code> .
enablePaymentScheduleAutomation	boolean	Indicates whether the payment schedule and payment schedule item are created automatically ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
enableRefundAutomation	boolean	Indicates whether refunds are processed automatically ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
enableRevSubMgmtBlngOptOut	boolean	Indicates whether the billing schedules in Subscription Management are disabled ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
enableSubscriptionManagement	boolean	Indicates whether Subscription Management is enabled ( <code>true</code> )

Field Name	Field Type	Description
		or not ( <code>false</code> ). The default value is <code>false</code> .

## Declarative Metadata Sample Definition

This example shows a sample `SubscriptionManagementSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<SubscriptionManagementSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableSubscriptionManagement>true</enableSubscriptionManagement>
</SubscriptionManagementSettings>
```

This example shows a sample `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>SubscriptionManagementSettings</members>
    <name>Settings</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SurveySettings

Represents an org's survey settings. Use the `SurveySettings` component to enable Salesforce Surveys, enable Customer Lifecycle Maps, and choose whether the owner of a survey can manage the responses.

## Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See [Settings](#) for more details.

## File Suffix and Directory Location

`SurveySettings` values are stored in a single file named `Survey.settings` in the `settings` folder. The `.settings` files are different from other named components because there is only one settings file for each settings component.

## Version

`SurveySettings` is available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableGenerativeAISurveys</code>	boolean	Indicates whether AI-Generated Surveys is enabled for your org (true) or not (false). The default value is <code>false</code> . Available in API version 62.0 and later.
<code>enableIndustriesCxmEnabled</code>	boolean	Indicates whether Customer Lifecycle Maps is enabled for your org (true) or not (false). The default value is <code>false</code> .
<code>enableSurvey</code>	boolean	Indicates whether Surveys is enabled for your org (true) or not (false). The default value is <code>false</code> .
<code>enableSurveyOwnerCanManageResponse</code>	boolean	Indicates whether the owner of a survey can manage its responses. The default value is <code>false</code> .

## Declarative Metadata Sample Definition

This example shows a sample `SurveySettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<SurveySettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableIndustriesCxmEnabled>false</enableIndustriesCxmEnabled>
  <enableSurvey>true</enableSurvey>
  <enableSurveyOwnerCanManageResponse>false</enableSurveyOwnerCanManageResponse>
  <enableGenerativeAISurveys>false</enableGenerativeAISurveys>
</SurveySettings>
```

This example shows a sample `package.xml` file that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Survey</members>
    <name>Settings</name>
  </types>
  <version>61.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Territory2Settings

Represents an org's Territory2 settings. Use Territory2 settings to set the access level that Territory Management 2.0 users have to records associated with sales territories, and to enable features. The standard record access settings apply to accounts and opportunities. If your Salesforce org uses `Private` default internal access for contacts or cases, you can also set access for those records. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

Territory2Settings values are stored in a single file named `Territory2.settings` in the `settings` directory of the corresponding package directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

Territory2Settings is available in API version 32.0 and later.

## Special Access Rules

### Fields

Field Name	Field Type	Description
<code>defaultAccountAccessLevel</code>	string	Sets the default level of access that users have to account records in territories: <i>view</i> and <i>edit</i> accounts assigned to territories or <i>view</i> , <i>edit</i> , <i>transfer</i> , and <i>delete</i> accounts assigned to territories.
<code>defaultCaseAccessLevel</code>	string	Sets the default level of access that users have to case records in territories: <i>view</i> and <i>edit</i> accounts assigned to territories or <i>view</i> , <i>edit</i> , <i>transfer</i> , and <i>delete</i> accounts assigned to territories.
<code>defaultContactAccessLevel</code>	string	Sets the default level of access that users have to contact records in territories: <i>view</i> and <i>edit</i> accounts assigned to territories or <i>view</i> , <i>edit</i> , <i>transfer</i> , and <i>delete</i> accounts assigned to territories.
<code>defaultOpportunityAccessLevel</code>	string	Sets the default level of access that users have to opportunity records in territories: <i>view</i> and <i>edit</i> accounts assigned to territories or <i>view</i> , <i>edit</i> , <i>transfer</i> , and <i>delete</i> accounts assigned to territories.
<code>enableTerritoryManagement2</code>	boolean	Enables and disables Enterprise Territory Management only. If <code>true</code> , Enterprise Territory Management is enabled. If <code>false</code> (default), Enterprise Territory Management isn't enabled. Enabling and disabling Enterprise Territory Management is exclusive of all other operations, and the field value must be <code>true</code> before other territory-management operations can run.  Available in API version 47.0 and later.
<code>opportunityFilterSettings</code>	<a href="#">Territory2SettingsOpportunityFilter</a>	Optional. Specifies an Apex class to assign territories to opportunities and whether you want to run it when an opportunity is created. Available in API version 34.0 and later.

Field Name	Field Type	Description
showTM2EnabledBanner	boolean	If <code>true</code> , a success banner appears on the Territory Settings page in Setup.  Available in API version 49.0 and later.
supportedObjects	<a href="#">Territory2SupportedObject[]</a>	Sets the user access levels of all objects that support territory assignments in the org. Available in API version 57.0 and later.
t2ForecastAccessLevel	string	Sets the access level that users in a parent territory get to the opportunities assigned to its child territories, regardless of who owns the opportunities.  Valid values are: <ul style="list-style-type: none"> <li>• View</li> <li>• Edit</li> </ul> Available in API version 49.0 and later.
tm2BypassRealignAccInsert	boolean	If <code>true</code> , account assignment rules don't run during account insert jobs.  Available in API version 53.0 and later.
tm2EnableUserAssignmentLog	boolean	If <code>true</code> , when a user is assigned to a territory, the assignment action is logged.  Available in API version 57.0 and later.

## Territory2SettingsOpportunityFilter

This subtype specifies an Apex class that assigns territories to opportunities. You can run the Apex class automatically every time a user creates an opportunity, or run it by using multithreading.

Field Name	Description
apexClassName	<p><b>Field Type</b> string</p> <p><b>Description</b> Represents the Apex class name.</p>
enableFilter	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If <code>true</code>, the Apex class is used to assign territories to opportunities.</p>
runMultiThreaded	<p><b>Field Type</b> boolean</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. If <code>true</code>, the Apex class runs by using multithreading, which can improve performance. Set this value to <code>true</code> only if you're assigning opportunity or opportunity product splits, and your Apex code can run with multithreading. This field has a default value of <code>false</code>.</p> <p>Available in API version 62.0 and later.</p>
<code>runOnCreate</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>If <code>true</code>, the Apex class runs automatically every time a user creates an opportunity.</p>

## Territory2SupportedObject

Sets the user access levels of all objects that support territory assignments in the org.

Field Name	Description
<code>defaultAccessLevel</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The default user access level as permitted by the organization's sharing settings. Valid values are:</p> <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> <li>• Transfer</li> <li>• All</li> </ul>
<code>objectType</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The only supported object type is <code>Lead</code>.</p>
<code>state</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. Valid values are:</p> <ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> </ul>

## Declarative Metadata Sample Definition

The following example shows the definition of a Territory2Settings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<Territory2Settings xmlns="http://soap.sforce.com/2006/04/metadata">
  <defaultAccountAccessLevel>Owner</defaultAccountAccessLevel>
  <defaultOpportunityAccessLevel>Read</defaultOpportunityAccessLevel>
  <defaultCaseAccessLevel>None</defaultCaseAccessLevel>
  <defaultContactAccessLevel>Edit</defaultContactAccessLevel>
  <enableTerritoryManagement2>true</enableTerritoryManagement2>
  <showTM2EnabledBanner>true</showTM2EnabledBanner>
  <supportedObjects>
    <defaultAccessLevel>Read</defaultAccessLevel>
    <state>Disabled</state>
    <objectType>Lead</objectType>
  </supportedObjects>
  <tm2EnableUserAssignmentLog>true</tm2EnableUserAssignmentLog>
  <t2ForecastAccessLevel>View</t2ForecastAccessLevel>
</Territory2Settings>
```

## Usage

Territory Management 2.0 components don't support packaging or change sets and aren't supported in [CRUD calls](#).

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## TrailheadSettings

Represents an org's integration with Trailhead for Learning Paths or Enablement programs, including access to enablement sites (formerly myTrailhead).

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

TrailheadSettings values are stored in the `Trailhead.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

TrailheadSettings components are available in API version 47.0 and later.

## Special Access Rules

To access enablement site (myTrailhead) content, the org must have a Sales Enablement license.

## Fields

Field Name	Field Type	Description
<code>enableConfettiEffect</code>	boolean	Indicates whether animated confetti plays on the screen after a user reaches certain milestones, such as completing an Enablement program in the Guidance Center. The default value of this field is <code>false</code> .
<code>enableMyTrailheadPref</code>	boolean	Indicates whether the org is connected to an enablement site (myTrailhead). The default value of this field is <code>true</code> .
<code>enableTrailheadInLexTerms</code>	boolean	Indicates whether the terms and conditions for showing Trailhead content in Lightning Experience are accepted in your org. The default value of this field is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of a `TrailheadSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<TrailheadSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableMyTrailheadPref>true</enableMyTrailheadPref>
</TrailheadSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Trailhead</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## TrialOrgSettings

Represents the settings in a trial user's org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the `Settings` name. See [Settings](#) for details.

## File Suffix and Directory Location

`TrialOrgSettings` values are stored in the `TrialOrg.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

TrialOrgSettings is available in API version 48.0 and later.

## Special Access Rules

Access to TrialOrgSettings requires users to complete the checkout flow in Enterprise, Professional, or Essentials editions. For Essentials, you can also access TrialOrgSettings by completing step 7 of the Setup Assistant.

## Fields

Field Name	Field Type	Description
enableSampleDataDeleted	boolean	Indicates whether sample data may be deleted on trial orgs ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of a TrialOrgSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<TrialOrgSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableSampleDataDeleted>false</enableSampleDataDeleted>
</TrialOrgSettings>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## UserEngagementSettings

Represents the metadata associated with various feature settings around Lightning Experience transition and adoption, user engagement and adoption assistance, and adoption apps. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

UserEngagementSettings components have the suffix `.settings` and are stored in the `settings` folder.

## Version

Prompt components are available in API version 47.0 and later.

## Special Access Rules

See related Salesforce Help for each feature for permission and edition requirements.

## Fields

Field Name	Field Type	Description
canGovCloudUseAdoptionApps	boolean	Indicates whether an org can access Lightning Experience transition tools ( <code>true</code> ) or not ( <code>false</code> ). Examples of these tools are Salesforce Optimizer, Lightning Experience Transition Assistant, and the Lightning Experience Readiness Report. The default is <code>false</code> . This field applies only to orgs with the External Application Settings page in Setup. Otherwise, this field has no effect. Available through API version 61.0. Removed in API version 62.0. Instead, use the <code>canUseAdoptionApps</code> field.
canUseAdoptionApps	boolean	Indicates whether an org can access Lightning Experience transition tools ( <code>true</code> ) or not ( <code>false</code> ). Examples of these tools are Salesforce Optimizer, Lightning Experience Transition Assistant, and the Lightning Experience Readiness Report. The default is <code>false</code> . This field applies only to orgs with the External Application Settings page in Setup. Otherwise, this field has no effect. Available in API version 62.0 and later.
doesScheduledSwitcherRunDaily	boolean	Indicates where users are automatically switched from Salesforce Classic to Lightning Experience every day ( <code>true</code> ) or weekly ( <code>false</code> ). If <code>false</code> , then users are switched weekly. The default is <code>false</code> . See <a href="#">Encourage Users to Stay in Lightning Experience</a> in Salesforce Help.
enableCustomHelpGlobalSection	boolean	Indicates whether a custom section has been added to the Lightning Experience Help Menu ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> . See <a href="#">Define Custom Help for the Lightning Experience Help Menu</a> in Salesforce Help for more information.
enableHelpMenuShowFeedback	boolean	Indicates whether the Give Feedback to Salesforce link in the Lightning Experience Help Menu is visible to users ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . Even if <code>false</code> , admins always see all links in the Help Menu. See <a href="#">Define Custom Help for the Lightning Experience Help Menu</a> in Salesforce Help for more information.
enableHelpMenuShowHelp	boolean	Indicates whether the Help For This Page section in the Lightning Experience Help Menu is visible to users ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . Even if <code>false</code> , admins always see all links in the Help Menu. See <a href="#">Define Custom Help for the Lightning Experience Help Menu</a> in Salesforce Help for more information.
enableHelpMenuShowNewUser	boolean	Indicates whether the Getting Started section in the Lightning Experience Help Menu is visible to users ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . Even if <code>false</code> , admins always see all links in the Help Menu. See <a href="#">Define Custom Help for the Lightning Experience Help Menu</a> in Salesforce Help for more information.
enableHelpMenuShowSearch	boolean	Indicates whether the Search Documentation link in the Lightning Experience Help Menu is visible to users ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . Even if <code>false</code> , admins always see all links in the Help

Field Name	Field Type	Description
		Menu. See <a href="#">Define Custom Help for the Lightning Experience Help Menu</a> in Salesforce Help for more information.
<code>enableHelpMenuShowSfdcContent</code>	boolean	Indicates whether any Salesforce-created help resources in Lightning Experience Help Menu are visible to users ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . Even if <code>false</code> , admins always see all links in the Help Menu. See <a href="#">Define Custom Help for the Lightning Experience Help Menu</a> in Salesforce Help for more information.
<code>enableHelpMenuShowShortcut</code>	boolean	Indicates whether the View Keyboard Shortcuts link in the Lightning Experience Help Menu is visible to users ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . Even if <code>false</code> , admins always see all links in the Help Menu. See <a href="#">Define Custom Help for the Lightning Experience Help Menu</a> in Salesforce Help for more information.
<code>enableHelpMenuShowSupport</code>	boolean	Indicates whether the Get Support link in the Lightning Experience Help Menu is visible to users ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . Even if <code>false</code> , admins always see all links in the Help Menu. See <a href="#">Define Custom Help for the Lightning Experience Help Menu</a> in Salesforce Help for more information.
<code>enableHelpMenuShowTrailhead</code>	boolean	Indicates whether the Go to Trailhead link in the Lightning Experience Help Menu is visible to users ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . Even if <code>false</code> , admins always see all links in the Help Menu. See <a href="#">Define Custom Help for the Lightning Experience Help Menu</a> in Salesforce Help for more information.
<code>enableIBIIOptOutDashboards</code>	boolean	Indicates whether the It's Better in Lightning prompt about Dashboards is hidden from users ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . Deprecated in API version 51.0 and later.
<code>enableIBIIOptOutEvents</code>	boolean	Indicates whether the It's Better in Lightning prompt about Events/Calendar is hidden from users ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . Deprecated in API version 51.0 and later.
<code>enableIBIIOptOutReports</code>	boolean	Indicates whether the It's Better in Lightning prompt about Reports is hidden from users ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . Deprecated in API version 51.0 and later.
<code>enableIBIIOptOutTasks</code>	boolean	Indicates whether the It's Better in Lightning prompt about Tasks is hidden from users ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . Deprecated in API version 51.0 and later.
<code>enableLexToClassicFeedbackEnable</code>	boolean	Indicates whether the Switch to Salesforce Classic Feedback Form is shown to users ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> . See <a href="#">Switch to Salesforce Classic Feedback Form</a> in Salesforce Help for more information.
<code>enableOrchestrationInSandbox</code>	boolean	Indicates whether adoption assistance and other in-app guidance is shown to users in sandbox orgs ( <code>true</code> ) or not ( <code>false</code> ). The default is

Field Name	Field Type	Description
		<code>false</code> . See <a href="#">Define Prompts in Lightning Experience in Salesforce Help</a> for more information.
<code>enableOrgUserAssistEnabled</code>	boolean	Indicates whether all custom in-app guidance created by an org is shown to users ( <code>true</code> ) or not ( <code>false</code> ). Doesn't affect active status. The default is <code>true</code> . See <a href="#">Define Prompts in Lightning Experience in Salesforce Help</a> for more information.
<code>enableScheduledSwitcher</code>	boolean	Indicates whether users are automatically switched from Salesforce Classic to Lightning Experience ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . See <a href="#">Encourage Users to Stay in Lightning Experience</a> in Salesforce Help.
<code>enableSfdcProductFeedbackSurvey</code>	boolean	Indicates whether the Salesforce Product Feedback Form is shown to users ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . See <a href="#">Salesforce Product Feedback Form</a> in Salesforce Help for more information.
<code>enableShowSalesforceUserAssist</code>	boolean	Indicates whether all standard in-app guidance created by Salesforce is shown to users ( <code>true</code> ) or not ( <code>false</code> ). Doesn't affect active status. The default is <code>true</code> . See <a href="#">Define Prompts in Lightning Experience in Salesforce Help</a> for more information.
<code>isCrucNotificationDisabled</code>	boolean	Indicates whether all notifications about the Winter '20 Turn on Lightning Experience critical update are hidden from admins ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> .
<code>isLEXWelcomeMatDisabled</code>	boolean	Indicates whether the Lightning Experience welcome mat is hidden from users the first time they log into the user interface ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> . See <a href="#">Lightning Experience Welcome Mat</a> in Salesforce Help for more information.
<code>isMeetTheAssistantDisabledInClassic</code>	boolean	Indicates whether all notifications about the Lightning Experience Transition Assistant are hidden from admins in Salesforce Classic ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> .
<code>isMeetTheAssistantDisabledInLightning</code>	boolean	Indicates whether all notifications about the Lightning Experience Transition Assistant are hidden from admins in Lightning Experience ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> .
<code>optimizerAppEnabled</code>	boolean	Indicates whether Salesforce Optimizer is turned on in the org ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> . See <a href="#">Improve Your Implementation with Salesforce Optimizer</a> in Salesforce Help.
<code>suggestedForYou</code>	boolean	Indicates whether Suggested For You is turned on in the org ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . See <a href="#">Suggested For You</a> in Salesforce Help.

## Declarative Metadata Sample Definition

The following is an example of a UserEngagementSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<UserEngagementSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <canUseAdoptionApps>false</canUseAdoptionApps>
  <doesScheduledSwitcherRunDaily>true</doesScheduledSwitcherRunDaily>
  <enableCustomHelpGlobalSection>true</enableCustomHelpGlobalSection>
  <enableHelpMenuShowFeedback>true</enableHelpMenuShowFeedback>
  <enableHelpMenuShowHelp>true</enableHelpMenuShowHelp>
  <enableHelpMenuShowNewUser>true</enableHelpMenuShowNewUser>
  <enableHelpMenuShowSearch>true</enableHelpMenuShowSearch>
  <enableHelpMenuShowSfdcContent>true</enableHelpMenuShowSfdcContent>
  <enableHelpMenuShowShortcut>true</enableHelpMenuShowShortcut>
  <enableHelpMenuShowSupport>true</enableHelpMenuShowSupport>
  <enableHelpMenuShowTrailhead>true</enableHelpMenuShowTrailhead>
  <enableIBILOptOutDashboards>true</enableIBILOptOutDashboards>
  <enableIBILOptOutEvents>true</enableIBILOptOutEvents>
  <enableIBILOptOutReports>true</enableIBILOptOutReports>
  <enableIBILOptOutTasks>true</enableIBILOptOutTasks>
  <enableLexToClassicFeedbackEnable>true</enableLexToClassicFeedbackEnable>
  <enableOrgUserAssistEnabled>true</enableOrgUserAssistEnabled>
  <enableScheduledSwitcher>true</enableScheduledSwitcher>
  <enableSfdcProductFeedbackSurvey>true</enableSfdcProductFeedbackSurvey>
  <enableOrchestrationInSandbox>true</enableOrchestrationInSandbox>
  <enableShowSalesforceUserAssist>true</enableShowSalesforceUserAssist>
  <isCrucNotificationDisabled>false</isCrucNotificationDisabled>
  <isLEXWelcomeMatDisabled>false</isLEXWelcomeMatDisabled>

  <isMeetTheAssistantDisabledInLightning>false</isMeetTheAssistantDisabledInLightning>
  <optimizerAppEnabled>true</optimizerAppEnabled>
</UserEngagementSettings>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>UserEngagement</members>
    <name>Settings</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the package.xml manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## UserInterfaceSettings

Represents the settings that modify the behavior of the org's user interface.

## Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

A `UserInterfaceSettings` component file has the suffix `.settings` and is stored in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

`UserInterfaceSettings` components are available in API version 46.0 and later.

## Fields

Field Name	Field Type	Description
<code>dynamicMruActionsOff</code>	boolean	Indicates whether users can create custom actions for their Recently Viewed lists ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . Available in API version 52.0 and later. Applies to Lightning Experience only.
<code>enableAsyncRelatedLists</code>	boolean	Indicates whether related lists are loaded asynchronously ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> . Available in API version 47.0 and later. Salesforce Classic only.
<code>enableClickjackUserPageHeaderless</code>	boolean	Indicates whether a Visualforce page that hides the standard header has clickjack protections ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . This setting applies to all of your Visualforce pages.
<code>enableCollapsibleSections</code>	boolean	Indicates whether users are allowed to collapse or expand sections in record details by using the arrow icon next to the section heading. The default is <code>true</code> .
<code>enableCollapsibleSidebar</code>	boolean	Indicates whether users are allowed to show or hide the sidebar on every page that normally includes it ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> . Applies to Salesforce Classic only.
<code>enableCustomObjectTruncate</code>	boolean	Indicates whether users with Customize Application permission can truncate custom objects ( <code>true</code> ) or not ( <code>false</code> ). When you truncate an object, you delete the object's associated records permanently, while preserving the empty object and its metadata. The default is <code>false</code> . Available in API version 47.0 and later.
<code>enableCustomSidebarOnAllPages</code>	boolean	Indicates whether custom sidebar components are available on all pages for all org users ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> . Applies to Salesforce Classic only.
<code>enableDeleteFieldHistory</code>	boolean	Indicates whether users can delete field history and field history archive records ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> . Available in API version 47.0 and later.

Field Name	Field Type	Description
<code>enableExternalObjectAsyncRelatedLists</code>	boolean	Indicates whether related lists of external objects are loaded asynchronously ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . Available in API version 48.0 and later. Salesforce Classic only.
<code>enableHoverDetails</code>	boolean	Indicates whether an interactive overlay containing record details is displayed ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> .   <b>Note:</b> To view hover details for a record, users need the appropriate sharing access and field-level security access for the fields in the mini page layout.
<code>enableInlineEdit</code>	boolean	Indicates whether users are allowed to edit field values on a record's detail page ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> .
<code>enablePersonalCanvas</code>	boolean	Indicates whether users can install and use personal canvas apps ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>true</code> . This setting applies to all of your Visualforce pages.
<code>enableRelatedListHovers</code>	boolean	Indicates whether related list hover links display at the top of record detail pages and custom object detail pages in Setup ( <code>true</code> ) or not ( <code>false</code> ). Users can hover over a related list link to display the list and its number of records in an interactive overlay. Users quickly view and manage the related list items from the overlay. Users can also click a related list hover link to jump to the related list without having to scroll down the page. The default is <code>true</code> . Available in API version 50.0 and later.
<code>enableQuickCreate</code>	boolean	Indicates whether an area displays on a tab home page ( corresponds to the <b>Show Quick Create</b> setting), allowing users to create a record quickly with minimal information ( <code>true</code> ) or not ( <code>false</code> ). The Quick Create area displays by default on the tab home pages for leads, accounts, contacts, and opportunities. You can control whether the Quick Create area is displayed on all relevant tab home pages.

## Declarative Metadata Sample Definition

The following is an example of a `UserInterfaceSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<UserInterfaceSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableDeleteFieldHistory>false</enableDeleteFieldHistory>
  <enableInlineEdit>true</enableInlineEdit>
  <enableHoverDetails>false</enableHoverDetails>
  <enableQuickCreate>true</enableQuickCreate>
  <enablePersonalCanvas>false</enablePersonalCanvas>
  <enableClickjackUserPageHeaderless>true</enableClickjackUserPageHeaderless>
</UserInterfaceSettings>
```

## Example Package Manifest

The following is an example package manifest used to deploy or retrieve the user interface settings metadata for an organization:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>UserInterface</members>
    <name>Settings</name>
  </types>
  <version>46.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## UserManagementSettings

Represents a selection of user management options that appear on the User Management Settings Setup page. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

UserManagementSettings are stored in the `UserManagement.settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

Manage org-wide settings for certain options. User Management Settings are available in API version 46.0 and later.

## Fields

Field	Field Type	Description
<code>enableConcealPersonalInfo</code>	boolean	Indicates if personal information fields in user records are hidden from external users ( <code>true</code> ) or not ( <code>false</code> ). When this field is set to <code>true</code> , 10 personal information fields are hidden. The default value is <code>false</code> . This field is unavailable for orgs created in Winter '22 or later.  Salesforce recommends that you use the <code>enableEnhancedConcealPersonalInfo</code> field instead of <code>enableConcealPersonalInfo</code> . Before you set the <code>enableEnhancedConcealPersonalInfo</code> field

Field	Field Type	Description
		to <code>true</code> , make sure that <code>enableConcealPersonalInfo</code> is set to <code>false</code> .
<code>enableContactlessExternalIdentityUsers</code>	boolean	<p>If <code>true</code> and your org has the External Identity license, you can create contactless users. Having users without contact information reduces the overhead of managing customers. Purchase the External Identity license to access the Customer 360 Identity product.</p> <p>The default is <code>false</code>. Available in API version 47.0 and later.</p>
<code>enableEnhancedConcealPersonalInfo</code>	boolean	<p>Indicates if personal information fields in user records are hidden from external users (<code>true</code>) or not (<code>false</code>). When this field is set to <code>true</code>, you can choose which fields are classified as personal information and hidden on the User Management Settings Setup page. The default value is <code>false</code>. This field is available in API version 53.0 and later.</p> <p>Before you set the <code>enableEnhancedConcealPersonalInfo</code> field to <code>true</code>, make sure that <code>enableConcealPersonalInfo</code> is set to <code>false</code>.</p>
<code>enableEnhancedPermsetMgmt</code>	boolean	<p>If you enable <b>Enhanced Permission Set Component Views</b> (<code>true</code>), you can work with permission sets more easily. For example, when you have large numbers of Apex class assignments for permission sets, you can enable a paginated result set, standard filtering, and sorting.</p>
<code>enableEnhancedProfileMgmt</code>	boolean	<p>If you enable <b>Enhanced Profile Lists Views</b> (<code>true</code>), you can quickly view, customize, and edit list data.</p>
<code>enableEnhcUiUserAccessPolicies</code>	boolean	<p>Indicates whether you create and manage user access policies through an improved user interface (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>. If user access policies aren't enabled, this field has no effect. If user access policies are enabled, this field is automatically set to <code>true</code>, but you can change it to <code>false</code>. Available in API version 60.0 and later.</p>
<code>enableNewProfileUI</code>	boolean	<p>If you enable <b>Enhanced Profile User Interface</b> (<code>true</code>), you can use the streamlined, enhanced profile user interface to browse, search, and modify settings. You can use only one user interface at a time.</p>
<code>enableProfileFiltering</code>	boolean	<p>With profile filtering enabled (<code>true</code>), you can restrict who sees profile names to the users who require the</p>

Field	Field Type	Description
		<p>access for their job roles. If profile filtering is disabled (<code>false</code>), users can see all profiles in a Salesforce org, regardless of which permissions they have.</p> <p> <b>Important:</b> Profile names are also exposed when users with permissions to perform the following tasks take these actions:</p> <ul style="list-style-type: none"> <li>• Create a tab or record type with a wizard step that includes the assignment of tabs and record types to profiles.</li> <li>• Configure a login flow where viewing profile lists is required to make flow associations.</li> <li>• Set up delegated admins where looking up profiles is needed to identify assignable profiles.</li> <li>• Administer an org as a delegated customer admin.</li> <li>• Administer an org as a delegated admin to view and assign profiles of the delegated group.</li> </ul> <p>This field is available in API version 50.0 and later.</p>
<code>enableRestrictEmailDomains</code>	boolean	<p>Indicates whether the Email Domain Allowlist is visible (<code>true</code>) or hidden (<code>false</code>) in Setup. The default value is <code>false</code>.</p> <p>This field is available in API version 53.0 and later.</p>
<code>enableScrambleUserData</code>	boolean	<p>If you enable <b>Let Users Scramble Their User Data</b> (<code>true</code>), users can request that Salesforce remove all their personal data. Because Salesforce can't delete information, it scrambles their data. Scrambling a user's data is unrecoverable. So this org-wide setting serves as an extra precaution. If a user requests it, you scramble the data programmatically with the <code>obfuscateUser</code> Apex method. You can use the method, for example, in a custom Apex trigger, workflow, or the Developer Console.</p> <p>This field is available in API version 47.0 and later.</p>
<code>enableUserSelfDeactivate</code>	boolean	<p>If you enable <b>User Self Deactivate</b> (<code>true</code>), users can deactivate their Experience Cloud site or Chatter accounts.</p>
<code>enhancedUserListView</code>	boolean	<p>Indicates whether you manage users with an updated user interface on the Users Setup page (<code>true</code>) or not</p>

Field	Field Type	Description
		( <code>false</code> ). The default value is <code>false</code> . Available in API version 62.0 and later.
<code>groupSummaryUIEnhancement</code>	<code>boolean</code>	Indicates whether you use an improved user interface to add or remove public group members through the group's summary page <code>true</code> or not ( <code>false</code> ). If this field is set to <code>true</code> , you can still manage public group membership through the group's detail page. The default value is <code>true</code> . Available in API version 62.0 and later.
<code>permsetsInFieldCreation</code>	<code>boolean</code>	If <code>true</code> , users can assign field-level security to permission sets instead of to profiles when creating a field on an object, setting field-level security on a field, or changing a field type on a field. The default is <code>false</code> . Available in API version 56.0 and later.
<code>psaExpirationUIEnabled</code>	<code>boolean</code>	Indicates if admins can use an updated user interface that includes an assignment expiration for permission sets and permission set groups ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> . This field is available in API version 52.0 and later.
<code>restrictedProfileCloning</code>	<code>boolean</code>	When enabled ( <code>true</code> ), only permissions accessible to your org are enabled when you clone profiles. When disabled ( <code>false</code> ), all permissions currently enabled in the source profile are also enabled for the cloned profile, even if your org can't currently access them. This field is available in API version 50.0 and later.
<code>userAccessPoliciesEnabled</code>	<code>boolean</code>	Indicates if user access policies are enabled ( <code>true</code> ) or not ( <code>false</code> ). With user access policies, you can automate and migrate your users' assignments to managed package licenses, permission sets, and other access mechanisms based on criteria that you set. The default value is <code>false</code> . This field is available in API version 58.0 and later.

## Declarative Metadata Sample Definition

The following is an example of a `UserManagementSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<UserManagementSettings xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <enableConcealPersonalInfo>false</enableConcealPersonalInfo>
  <enableContactlessExternalIdentityUsers>false</enableContactlessExternalIdentityUsers>

  <enableEnhancedConcealPersonalInfo>true</enableEnhancedConcealPersonalInfo>
```

```

<enableEnhancedPermsetMgmt>false</enableEnhancedPermsetMgmt>
<enableEnhancedProfileMgmt>true</enableEnhancedProfileMgmt>
<enableNewProfileUI>false</enableNewProfileUI>
<enableProfileFiltering>false</enableProfileFiltering>
<enableRestrictEmailDomains>true</enableRestrictEmailDomains>
<enableScrambleUserData>false</enableScrambleUserData>
<enableUserSelfDeactivate>false</enableUserSelfDeactivate>
<enhancedUserListView>true</enhancedUserListView>
<groupSummaryUIEnhancement>true</groupSummaryUIEnhancement>
<restrictedProfileCloning>true</restrictedProfileCloning>
<userAccessPoliciesEnabled>true</userAccessPoliciesEnabled>
</UserManagementSettings>

```

The following is an example `package.xml` manifest that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>UserManagement</members>
    <name>Settings</name>
  </types>
  <version>53.0</version>
</Package>

```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## VoiceSettings

Represents an org's Sales Dialer settings, such as call recording, conferencing, and voicemail. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for details.

## File Suffix and Directory Location

VoiceSettings values are stored in the `Voice.settings` file in the `settings` directory. The `.settings` files are different from other named components because there's only one settings file for each settings component.

## Version

VoiceSettings is available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableCallDisposition</code>	boolean	Indicates whether call disposition is enabled ( <code>true</code> ) or not ( <code>false</code> ). With call disposition, also called Call Result, sales reps can track whether a call was connected and how it went.  Default value is <code>false</code> . To use this feature, enable Dialer in Lightning Experience.
<code>enableConsentReminder</code>	boolean	Indicates whether the consent reminder is enabled ( <code>true</code> ) or not ( <code>false</code> ). With the consent reminder, prior to recording a call, users see a prompt reminding them not to record phone calls without consent.  Default value is <code>false</code> . To use this feature, enable Dialer in Lightning Experience.
<code>enableVoiceCallList</code>	boolean	Indicates whether Call List is enabled ( <code>true</code> ) or not ( <code>false</code> ). Sales reps can use call list to keep a running list of the calls they want to make.  Default value is <code>false</code> . To use this feature, enable Dialer in Lightning Experience.
<code>enableVoiceCallRecording</code>	boolean	Indicates whether Call Recording is enabled ( <code>true</code> ) or not ( <code>false</code> ). Sales reps can record important calls directly from the call panel in Sales Dialer.  Default value is <code>false</code> . To use this feature, enable Dialer in Lightning Experience.
<code>enableVoiceCoaching</code>	boolean	Indicates whether Call Monitoring is enabled ( <code>true</code> ) or not ( <code>false</code> ). Using the Monitor tab in the call panel, managers can listen to the calls of their sales reps for personalized coaching.  Default value is <code>false</code> . To use this feature, enable Dialer in Lightning Experience.
<code>enableVoiceConferencing</code>	boolean	Reserved for future use.
<code>enableVoiceLocalPresence</code>	boolean	Indicates whether Local Presence is enabled ( <code>true</code> ) or not ( <code>false</code> ). Local Presence displays phone numbers with the same area code as the prospects your reps are calling, so more calls are answered.  Default value is <code>false</code> . To use this feature, enable Dialer in Lightning Experience.
<code>enableVoiceMail</code>	boolean	Indicates whether voicemail is enabled ( <code>true</code> ) or not ( <code>false</code> ). Sales reps can receive and store up to 20 personal voicemail messages in Salesforce.  Default value is <code>false</code> . To use this feature, enable Dialer in Lightning Experience.

Field Name	Field Type	Description
enableVoiceMailDrop	boolean	Indicates whether Voicemail Drop is enabled ( <code>true</code> ) or not ( <code>false</code> ). Sales reps can “drop” (or send) prerecorded messages to recipients’ voicemail boxes.  Default value is <code>false</code> . To use this feature, enable Dialer in Lightning Experience.

## Declarative Metadata Sample Definition

The following is an example of the package file.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
  </types>
  <version>28.0</version>
</Package>
```

The package file references the following `Voice.settings` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<VoiceSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableCallDisposition>true</enableCallDisposition>
  <enableVoiceCallList>true</enableVoiceCallList>
  <enableVoiceCallRecording>true</enableVoiceCallRecording>
  <enableVoiceCoaching>true</enableVoiceCoaching>
  <enableVoiceConferencing>true</enableVoiceConferencing>
  <enableVoiceLocalPresence>true</enableVoiceLocalPresence>
  <enableVoiceMail>true</enableVoiceMail>
  <enableVoiceMailDrop>true</enableVoiceMailDrop>
</VoiceSettings>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn’t apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## WarrantyLifeCycleMgmtSettings

Represents settings that control the Warranty Administration for your org.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for more details.

## File Suffix and Directory Location

WarrantyLifeCycleMgmtSettings values are stored in the `WarrantyLifeCycleMgmt.settings` file in the `settings` directory.

## Version

WarrantyLifeCycleMgmtSettings components are available in API version 54.0 and later.

## Fields

Field Name	Field Type	Description
enableWarrantyLCMgmt	boolean	Indicates whether warranty life-cycle management is enabled in your org ( <code>true</code> ) or not ( <code>false</code> ).

## Declarative Metadata Sample Definition

The following is an example of WarrantyLifeCycleMgmtSettings component.

```
<!--
  ~ Copyright 2022 salesforce.com, inc.
  ~ All Rights Reserved
  ~ Company Confidential
-->
<WarrantyLifecycleMgmtSettings
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableWarrantyLCMgmt>true</enableWarrantyLCMgmt>
</WarrantyLifecycleMgmtSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<!--
  ~ Copyright 2022 salesforce.com, inc.
  ~ All Rights Reserved
  ~ Company Confidential
-->
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>WarrantyLifecycleMgmt</members>
    <name>Settings</name>
  </types>
  <version>54.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## WorkDotComSettings

Represents WorkDotCom settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Version

WorkDotComSettings components are available in API version 31.0 and later.

## Fields

Field Name	Field Type	Description
<code>enableCoachingManagerGroupAccess</code>	boolean	Indicates whether Coaching Manager Group Access is available to users ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>true</code> . Deprecated.
<code>enableGoalManagerGroupAccess</code>	boolean	Indicates whether Goal Manager Group Access is available to users ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>true</code> . Deprecated.
<code>enableProfileSkills</code>	boolean	Indicates whether Profile Skills is available to users ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>true</code> .
<code>enableProfileSkillsAddFeedPost</code>	boolean	Indicates whether Add Skills as Feed Posts is available to users ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>true</code> .
<code>enableProfileSkillsAutoSuggest</code>	boolean	Indicates whether Profile Skills Auto Suggest is available to users ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>true</code> .
<code>enableProfileSkillsUsePlatform</code>	boolean	Indicates whether Profile Skills Use Platform is available to users ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>true</code> .
<code>enableWorkBadgeDefRestrictPref</code>	boolean	Indicates whether Badge Definition Restriction is available to users ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>true</code> . Deprecated.
<code>enableWorkCalibration</code>	boolean	Indicates whether Calibration is available to users ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> . Deprecated.
<code>enableWorkCanvasPref</code>	boolean	Indicates whether Canvas is available to users ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>true</code> . Deprecated.
<code>enableWorkCertification</code>	boolean	Indicates whether Certification is available to users ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>true</code> . Deprecated.
<code>enableWorkCertificationNotification</code>	boolean	Indicates whether Certification Notification is available to users ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> . Deprecated.

Field Name	Field Type	Description
enableWorkRewardsPref	boolean	Indicates whether Rewards is available to users ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>true</code> .  Deprecated.
enableWorkThanksPref	boolean	Indicates whether Thanks is available to users ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>true</code> .

## Declarative Metadata Sample Definition

The following is an example of a WorkDotComSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<WorkDotComSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableCoachingManagerGroupAccess>true</enableCoachingManagerGroupAccess>
  <enableGoalManagerGroupAccess>true</enableGoalManagerGroupAccess>
  <enableProfileSkills>true</enableProfileSkills>
  <enableProfileSkillsAddFeedPost>true</enableProfileSkillsAddFeedPost>
  <enableProfileSkillsAutoSuggest>true</enableProfileSkillsAutoSuggest>
  <enableProfileSkillsUsePlatform>true</enableProfileSkillsUsePlatform>
  <enableWorkBadgeDefRestrictPref>true</enableWorkBadgeDefRestrictPref>
  <enableWorkCalibration>true</enableWorkCalibration>
  <enableWorkCanvasPref>true</enableWorkCanvasPref>
  <enableWorkCertification>true</enableWorkCertification>
  <enableWorkCertificationNotification>true</enableWorkCertificationNotification>
  <enableWorkRewardsPref>true</enableWorkRewardsPref>
  <enableWorkThanksPref>true</enableWorkThanksPref>
</WorkDotComSettings>
```

## WorkforceEngagementSettings

Represents settings for Workforce Engagement Management.

### File Suffix and Directory Location

WorkforceEngagementSettings components are stored in the `WorkforceEngagement.settings` folder.

### Version

WorkforceEngagementSettings is available in API version 52.0 and later.

### Special Access Rules

To use Workforce Engagement settings, the org requires a Workforce Engagement license.

### Fields

Field Type

Field Name	Field Type	Description
<code>enableMachineLearningForecasting</code>	boolean	Indicates whether machine learning-based forecasting is used ( <code>true</code> ) or not used ( <code>false</code> ).
<code>enableWorkforceEngagement</code>	boolean	Indicates whether Workforce Engagement is enabled ( <code>true</code> ) or not enabled ( <code>false</code> ).
<code>enableWorkforceEngagementConfiguration</code>	boolean	Indicates whether the Workforce Engagement Configuration App is installed or enabled ( <code>true</code> ) or not ( <code>false</code> ). If <code>true</code> , it grants access to the Lightning App as well as the app's Job Profile Mapping tab. It also defaults the standard and custom profile tab settings to On. If <code>false</code> , it removes access to the app and tab but doesn't delete the app metadata. This field is available in API version 53.0 and later.
<code>enableHistoricalAdherence</code>	boolean	Indicates whether historical adherence is enabled ( <code>true</code> ) or not enabled ( <code>false</code> ). This field is available in API version 54.0 and later.
<code>enableIndividualAdherence</code>	boolean	Indicates whether individual adherence is enabled ( <code>true</code> ) or not enabled ( <code>false</code> ). This field is available in API version 54.0 and later.
<code>enableIntradayManagement</code>	boolean	Indicates whether the intraday management dashboard is enabled ( <code>true</code> ) or not enabled ( <code>false</code> ). This field is available in API version 55.0 and later.
<code>enableRealTimeAdherence</code>	boolean	Indicates whether real-time adherence is enabled ( <code>true</code> ) or not enabled ( <code>false</code> ). To use real-time adherence, you must also enable Omni-Channel. This field is available in API version 55.0 and later.

## Declarative Metadata Sample Definition

The following is an example of a `WorkforceEngagement.settings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<WorkforceEngagementSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableMachineLearningForecasting>true</enableMachineLearningForecasting>
  <enableWorkforceEngagement>true</enableWorkforceEngagement>
  <enableWorkforceEngagementConfiguration>true</enableWorkforceEngagementConfiguration>
  <enableHistoricalAdherence>true</enableHistoricalAdherence>
  <enableenableIndividualAdherence>true</enableIndividualAdherence>
  <enableIntradayManagement>true</enableIntradayManagement>
  <enableRealTimeAdherence>true</enableRealTimeAdherence>
</WorkforceEngagementSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
2 <Package xmlns="http://soap.sforce.com/2006/04/metadata">
3   <types>
4     <members>WorkforceEngagement</members>

6   </types>
```

```

7     <55.0>[fctest]</55.0>
8 </Package>

```

## Usage

When `enableMachineLearningForecasting` is set to `false`, we clean up data from our Ofek forecasting platform. The original copy of the same set of data is stored in the Core app, so no data is lost.

## SharedTo

---

`SharedTo` defines the sharing access for a list view or a folder. It can be used to specify the target and source for owner-based sharing rules.

See [Sharing Considerations](#) and [Public and Personal Groups](#) in Salesforce Help.

**Note:** `SharedTo` on page 2002 is included in the metadata for shared and private list views. `SharedTo` on page 2002 isn't in the metadata for public list views.

## Declarative Metadata File Suffix and Directory Location

`SharedTo` on page 2002 is used with [ListView](#), [Folder](#), and [SharingRules](#).

## Version

`SharedTo` on page 2002 is available in API version 17.0 and later.

## Fields

Field	Field Type	Description
<code>allCustomerPortalUsers</code>	string	A group containing all customer portal users. This field is available in API version 24.0 and later.
<code>allInternalUsers</code>	string	A group containing all internal and nonportal users. This field is available in API version 24.0 and later.
<code>allPartnerUsers</code>	string	A group containing all partner users. This field is available in API version 24.0 and later.
<code>channelProgramGroup</code>	string	A system-managed group with sharing access containing all partner members of the corresponding channel program or level. This field is available in API version 41.0 and later.

Field	Field Type	Description
<code>channelProgramGroups</code>	<code>string[]</code>	A list of system-managed groups with sharing access containing all partner members of the corresponding channel programs or levels.  This field is available in API version 41.0 and later.
<code>group</code>	<code>string[]</code>	A list of groups with sharing access. Use this field instead of the <code>groups</code> field.  This field is available in API version 22.0 and later.
<code>guestUser</code>	<code>string[]</code>	A list of guest user nicknames with sharing access. This field can be used only with <code>SharingGuestRule</code> .  This field is available in API version 47.0 and later.
<code>groups</code>	<code>string[]</code>	A list of groups with sharing access.  Use the <code>group</code> field instead for API version 22.0 and later.
<code>managerSubordinates</code>	<code>string[]</code>	A list of users whose direct and indirect subordinates receive sharing access. This field is available in API version 24.0 and later.
<code>managers</code>	<code>string[]</code>	A list of users whose direct and indirect managers receive sharing access. This field is available in API version 24.0 and later.
<code>portalRole</code>	<code>string[]</code>	A list of groups with sharing access containing all users in a portal role.  This field is available in API version 24.0 and later.
<code>portalRoleandSubordinates</code>	<code>string[]</code>	A list of groups with sharing access containing all users in a portal role or any users under that role.  This field is available in API version 24.0 and later.
<code>role</code>	<code>string[]</code>	A list of roles with sharing access. Use this field instead of the <code>roles</code> field.  This field is available in API version 22.0 and later.
<code>roleAndSubordinates</code>	<code>string[]</code>	A list of roles with sharing access. All roles below each of these roles in the role hierarchy also have sharing access. If portal accounts are enabled, then all roles and portal accounts below each of these roles in the role hierarchy also have sharing access. Use this field instead of the <code>rolesAndSubordinates</code> field.  This field is available in API version 22.0 and later. In production orgs created before February 8, 2024 and in non-preview sandboxes, this field is available by default. In orgs created on February 8, 2024 or later and in preview sandboxes, this field is only available after digital experiences is enabled.

Field	Field Type	Description
<code>roleAndSubordinatesInternal</code>	<code>string[]</code>	<p>A list of roles with sharing access. All roles below each of these roles in the role hierarchy also have sharing access.</p> <p>This field is available in API version 22.0 and later. In orgs created on February 8, 2024 or later and in preview sandboxes, this field is available by default. In production orgs created before February 8, 2024 and in non-preview sandboxes, this field is available after digital experiences or portals are enabled.</p>
<code>roles</code>	<code>string[]</code>	<p>A list of roles with sharing access.</p> <p>Use the <code>role</code> field instead for API version 22.0 and later.</p>
<code>rolesAndSubordinates</code>	<code>string[]</code>	<p>A list of roles with sharing access. All roles below each of these roles in the role hierarchy also have sharing access. If portal accounts are enabled, then all roles and portal accounts below each of these roles in the role hierarchy also have sharing access.</p> <p>Use the <code>roleAndSubordinates</code> field instead for API version 22.0 and later.</p>
<code>territories</code>	<code>string[]</code>	<p>A list of territories with sharing access.</p> <p>Use the <code>territory</code> field instead for API version 22.0 and later.</p>
<code>territoriesAndSubordinates</code>	<code>string[]</code>	<p>A list of territories with sharing access. All territories below each of these territories in the territory hierarchy also have sharing access.</p> <p>Use the <code>territoryAndSubordinates</code> field instead for API version 22.0 and later.</p>
<code>territory</code>	<code>string[]</code>	<p>A list of territories with sharing access. Use this field instead of the <code>territories</code> field.</p> <p>If you're using Enterprise Territory Management, use <code>modelName.territoryName</code> for the shared-to and shared-from <code>territory</code> values, where:</p> <ul style="list-style-type: none"> <li><code>modelName</code> equals the name of the active territory model in the API.</li> <li><code>territoryName</code> equals the territory's name in the API.</li> </ul> <p>This field is available in API version 22.0 and later.</p>
<code>territoryAndSubordinates</code>	<code>string[]</code>	<p>A list of territories with sharing access. All territories below each of these territories in the territory hierarchy also have sharing access. Use this field instead of the <code>territoriesAndSubordinates</code> field.</p> <p>If you're using Enterprise Territory Management, use <code>modelName.territoryName</code> for the shared-to and</p>

Field	Field Type	Description
		shared-from <code>territoryAndSubordinates</code> values, where: <ul style="list-style-type: none"> <li>• <code>modelName</code> equals the name of the active territory model in the API.</li> <li>• <code>territoryName</code> equals the territory's name in the API.</li> </ul> This field is available in API version 22.0 and later.
<code>queue</code>	<code>string[]</code>	A list of queues with sharing access. Applies only to lead, case, and CustomObject sharing rules. This field is available in API version 24.0 and later.

## SharingBaseRule

Represents sharing rule settings such as access level and to whom access is granted.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

**Note:** You can't create a [SharingBaseRule](#) on page 2005 component directly. Use the components under [SharingRules](#) instead.

## Version

[SharingBaseRule](#) on page 2005 replaces [BaseSharingRule](#) and is available in API version 33.0 and later.

## Fields

Field	Field Type	Description
<code>accessLevel</code>	<code>string</code>	Required. The access level that the sharing rule grants.
<code>accountSettings</code>	<a href="#">AccountSharingRuleSettings[]</a>	The access level for the account's children (case, contact, and opportunity).
<code>description</code>	<code>string</code>	Describes the sharing rule. Maximum of 1000 characters.
<code>label</code>	<code>string</code>	Required. Label for the sharing rule.
<code>sharedTo</code>	<a href="#">SharedTo</a>	Required. Specifies who the record is shared with.

## AccountSharingRuleSettings

Defines the access level for the case, contact, and opportunity associated with the account.

Field	Field Type	Description
<code>caseAccessLevel</code>	string	Required. The access level that the user or group has to cases associated with the account. Possible values are: <ul style="list-style-type: none"> <li>• None</li> <li>• Read</li> <li>• Edit</li> </ul>
<code>contactAccessLevel</code>	string	Required. The access level that the user or group has to contacts associated with the account. Possible values are: <ul style="list-style-type: none"> <li>• None</li> <li>• Read</li> <li>• Edit</li> </ul>
<code>opportunityAccessLevel</code>	string	Required. The access level that the user or group has to opportunities associated with the account. Possible values are: <ul style="list-style-type: none"> <li>• None</li> <li>• Read</li> <li>• Edit</li> </ul>

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SharingRules

Represents the base container for sharing rules, which can be criteria-based, ownership-based, territory-based, or for guest user access. SharingRules enables you to share records with a set of users, using rules that specify the access level for the target user group.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field. For more information, see "Sharing Rules" in Salesforce Help.

In API version 33.0 and later, retrieving, deleting, or deploying of all sharing rules in an organization is available. Wildcard support is also available. You can't retrieve, delete, or deploy manual sharing rules or sharing rules by their type (owner, criteria-based, territory, or guest user).

## Declarative Metadata File Suffix and Directory Location

In API version 33.0 and later, components are stored in the `sharingRules` folder and their file name matches the object name with the suffix `.sharingRules`. Criteria-based, owner-based, territory-based, and guest user sharing rules are all contained in a `object.sharingRule` file.

Before API version 33.0, SharingRules components are stored in their corresponding object directory and the file name matches the object name. For example, the `accountSharingRules` directory contains an `Account.sharingRules` file for account sharing rules. SharingRules for custom objects are stored in the `customObjectSharingRules` directory, which contains files with the `.sharingRules` extension such as `ObjA__c.sharingRules`, where `ObjA` refers to the developer name of a custom object type.

## Version

SharingRules components are available in API version 24.0 and later, but these components are no longer available in API version 33.0 and later: `AccountSharingRules`, `CampaignSharingRules`, `CaseSharingRules`, `ContactSharingRules`, `LeadSharingRules`, `OpportunitySharingRules`, `AccountTerritorySharingRules`, `CustomObjectSharingRules`, `UserSharingRules`.

In API version 33.0 and later, use [SharingCriteriaRule](#), [SharingOwnerRule](#) and [SharingTerritoryRule](#).

## Special Access Rules

As of Spring '20 and later, only users with the View Setup and Configuration permission can access this object, and only users with the Manage Sharing permission can edit this object.

## Fields

The following information assumes that you're familiar with implementing sharing rules for standard objects and custom objects. For more information on these fields, see "Sharing Settings" in Salesforce Help.

Field	Field Type	Description
<code>sharingCriteriaRules</code>	<a href="#">SharingCriteriaRule</a> []	An array of criteria-based sharing rules. Available in API version 33.0 and later.
<code>sharingGuestRules</code>	<a href="#">SharingGuestRule</a> []	An array of guest user sharing rules. Available in API version 47.0 and later.
<code>sharingOwnerRules</code>	<a href="#">SharingOwnerRule</a> []	An array of ownership-based sharing rules. Available in API version 33.0 and later.
<code>sharingTerritoryRules</code>	<a href="#">SharingTerritoryRule</a> []	An array of territory-based sharing rules. Available in API version 33.0 and later.

## SharingCriteriaRule

Defines a criteria-based sharing rule. It extends [SharingBaseRule](#) and inherits all its fields. Available in API version 33.0 and later.

Field	Field Type	Description
<code>booleanFilter</code>	string	Advanced filter conditions that are specified for the sharing rule.
<code>criteriaItems</code>	<a href="#">FilterItem</a> []	An array of the boolean criteria (conditions) for the sharing rule.

Field	Field Type	Description
<code>includeRecordsOwnedByAll</code>	boolean	Required. Indicates whether records owned by users who can't have an assigned role are included in the records shared ( <code>true</code> ) or not ( <code>false</code> ). Examples of users who can't have an assigned role are high-volume users and system users such as automated process users or Salesforce system users.  You can't edit this field after the sharing rule is created.

## SharingGuestRule

Defines a guest user sharing rule. It extends [SharingBaseRule](#) and inherits all its fields, except `accountSettings`. Available in API version 47.0 and later.

 **Note:** For `SharingGuestRule`, the `accessLevel` field can be set only to `Read`.

Field	Field Type	Description
<code>booleanFilter</code>	string	Advanced filter conditions that are specified for the sharing rule. Available in API version 48.0 and later.
<code>criteriaItems</code>	<a href="#">FilterItem</a> []	An array of the boolean criteria (conditions) for the sharing rule. Available in API version 48.0 and later.
<code>includeHVVUOwnedRecords</code>	boolean	Required. Indicates whether records owned by high-volume community or site users are included in the records shared ( <code>true</code> ) or not ( <code>false</code> ). By default, only records owned by authenticated users, guest users, and queues are included in sharing rules. This field has a default value of <code>false</code> . Available in API version 52.0 and later.  You can't edit this field after the sharing rule is created.

## SharingOwnerRule

Defines an ownership-based sharing rule. It extends [SharingBaseRule](#) and inherits all its fields. Available in API version 33.0 and later.

Field	Field Type	Description
<code>sharedFrom</code>	<a href="#">SharedTo</a>	Required. Specifies the record owners.  If you're using Enterprise Territory Management, use <code>modelName.territoryName</code> for the shared-to and shared-from <code>territory</code> and <code>territoryAndSubordinates</code> values on the <code>SharedTo</code> type, where: <ul style="list-style-type: none"> <li><code>modelName</code> equals the name of the active territory model in the API.</li> </ul>

Field	Field Type	Description
		<ul style="list-style-type: none"> <li><code>territoryName</code> equals the territory's name in the API.</li> </ul>

## SharingTerritoryRule

Defines a territory-based sharing rule. It extends [SharingOwnerRule](#) and inherits all its fields. Available in API version 33.0 and later.

## AccountSharingRules

Represents the sharing rules for accounts. It extends the [SharingRules](#) metadata type and inherits its `fullName` field. Only available in API version 32.0 and earlier.

Field	Field Type	Description
<code>criteriaBasedRules</code>	<a href="#">AccountCriteriaBasedSharingRule[]</a>	List that defines user criteria-based rules.
<code>ownerRules</code>	<a href="#">AccountOwnerSharingRule[]</a>	List that defines user membership-based rules.

## CampaignSharingRules

Represents the sharing rules for campaigns. It extends the [SharingRules](#) metadata type and inherits its `fullName` field. Only available in API version 32.0 and earlier.

Field	Field Type	Description
<code>criteriaBasedRules</code>	<a href="#">CampaignCriteriaBasedSharingRule[]</a>	List that defines user criteria-based rules.
<code>ownerRules</code>	<a href="#">CampaignOwnerSharingRule[]</a>	List that defines user membership-based rules.

## CaseSharingRules

Represents the sharing rules for cases. It extends the [SharingRules](#) metadata type and inherits its `fullName` field. Only available in API version 32.0 and earlier.

Field	Field Type	Description
<code>criteriaBasedRules</code>	<a href="#">CaseCriteriaBasedSharingRule[]</a>	List that defines user criteria-based rules.
<code>ownerRules</code>	<a href="#">CaseOwnerSharingRule[]</a>	List that defines user membership-based rules.

## ContactSharingRules

Represents the sharing rules for contacts. It extends the [SharingRules](#) metadata type and inherits its `fullName` field. Only available in API version 32.0 and earlier.

Field	Field Type	Description
criteriaBasedRules	<a href="#">ContactCriteriaBasedSharingRule[]</a>	List that defines user criteria-based rules.
ownerRules	<a href="#">ContactOwnerSharingRule[]</a>	List that defines user membership-based rules.

## LeadSharingRules

Represents the sharing rules for leads. It extends the SharingRules metadata type and inherits its `fullName` field. Only available in API version 32.0 and earlier.

Field	Field Type	Description
criteriaBasedRules	<a href="#">LeadCriteriaBasedSharingRule[]</a>	List that defines user criteria-based rules.
ownerRules	<a href="#">LeadOwnerSharingRule[]</a>	List that defines user membership-based rules.

## OpportunitySharingRules

Represents the sharing rules for opportunities. It extends the SharingRules metadata type and inherits its `fullName` field. Only available in API version 32.0 and earlier.

Field	Field Type	Description
criteriaBasedRules	<a href="#">OpportunityCriteriaBasedSharingRule[]</a>	List that defines user criteria-based rules.
ownerRules	<a href="#">OpportunityOwnerSharingRule[]</a>	List that defines user membership-based rules.

## AccountTerritorySharingRules

Represents the sharing rules for account territories in the original territory management feature. It extends the SharingRules metadata type and inherits its `fullName` field. Only available in API version 32.0 and earlier.

Field	Field Type	Description
rules	<a href="#">AccountTerritorySharingRule[]</a>	List that defines user membership-based rules. The list of acceptable values for the <code>sharedFrom</code> fields are: <ul style="list-style-type: none"> <li>• <code>territory</code></li> <li>• <code>territoryAndSubordinates</code></li> </ul>

## CustomObjectSharingRules

Represents the sharing rules for custom objects. It extends the SharingRules metadata type and inherits its `fullName` field. Only available in API version 32.0 and earlier.

Field	Field Type	Description
criteriaBasedRules	<a href="#">CustomObjectCriteriaBasedSharingRule[]</a>	List that defines user criteria-based rules.
ownerRules	<a href="#">CustomObjectOwnerSharingRule[]</a>	List that defines user membership-based rules.

## UserSharingRules

Represents the sharing rules for users. With user sharing rules, you can share members of a group with members of another group. It extends the SharingRules metadata type and inherits its `fullName` field. Only available in API version 32.0 and earlier.

Field	Field Type	Description
criteriaBasedRules	<a href="#">UserCriteriaBasedSharingRule[]</a>	List that defines user criteria-based rules.
membershipRules	<a href="#">UserMembershipSharingRule[]</a>	List that defines user membership-based rules.

## Declarative Metadata Sample Definition

For retrieving sharing rules, see `package.xml` sample at SharingRules.

The following sample XML definition represents a criteria-based sharing rule in API version 33.0.

```
<?xml version="1.0" encoding="UTF-8"?>
<SharingRules xmlns="http://soap.sforce.com/2006/04/metadata">
  <sharingCriteriaRules>
    <fullName>AccountCriteriaShareWithCEO</fullName>
    <accessLevel>Edit</accessLevel>
    <accountSettings>
      <caseAccessLevel>Read</caseAccessLevel>
      <contactAccessLevel>Edit</contactAccessLevel>
      <opportunityAccessLevel>Edit</opportunityAccessLevel>
    </accountSettings>
    <criteriaItems>
      <field>Name</field>
      <operation>startsWith</operation>
      <value>Test</value>
    </criteriaItems>
    <description>my account criteria rule description</description>
    <label>AccountCriteriaShareWithCEO</label>
    <sharedTo>
      <role>CEO</role>
    </sharedTo>
  </sharingCriteriaRules>
</SharingRules>
```

The following sample XML definition represents an ownership-based sharing rule in API version 33.0.

```
<?xml version="1.0" encoding="UTF-8"?>
<SharingRules xmlns="http://soap.sforce.com/2006/04/metadata">
  <sharingOwnerRules>
    <fullName>MyCase</fullName>
    <accessLevel>Edit</accessLevel>
  </sharingOwnerRules>
</SharingRules>
```

```

    <description>my case test owner sharing rule desc</description>
    <label>MyCase</label>
    <sharedFrom>
      <role>COO</role>
    </sharedFrom>
    <sharedTo>
      <role>CEO</role>
    </sharedTo>
  </sharingOwnerRules>
</SharingRules>

```

The following sample XML definition represents a territory-based sharing rule in API version 33.0.

```

<?xml version="1.0" encoding="UTF-8"?>
<SharingRules xmlns="http://soap.sforce.com/2006/04/metadata">
  <sharingTerritoryRules>
    <fullName>MyAccountTerritoryRule</fullName>
    <accessLevel>Read</accessLevel>
    <accountSettings>
      <caseAccessLevel>None</caseAccessLevel>
      <contactAccessLevel>Read</contactAccessLevel>
      <opportunityAccessLevel>None</opportunityAccessLevel>
    </accountSettings>
    <description>MyAccountTerritoryRule desc</description>
    <label>MyAccountTerritoryRule</label>
    <sharedFrom>
      <territory>My_territory</territory>
    </sharedFrom>
    <sharedTo>
      <role>CEO</role>
    </sharedTo>
  </sharingTerritoryRules>
</SharingRules>

```

The following is the definition of two account owner-based sharing rules in API version 32.0 and earlier. The file name corresponds to `Account.sharingRules` under the `accountSharingRules` directory. In this definition, `ownerRules` corresponds to [AccountOwnerSharingRule](#).

```

<?xml version="1.0" encoding="UTF-8"?>
<AccountSharingRules xmlns="http://soap.sforce.com/2006/04/metadata">
  <ownerRules>
    <fullName>G1Dev_G2New</fullName>
    <sharedFrom>
      <group>G1Dev</group>
    </sharedFrom>
    <sharedTo>
      <group>G2New</group>
    </sharedTo>
    <accountAccessLevel>Read</caseAccessLevel>
    <caseAccessLevel>None</caseAccessLevel>
    <contactAccessLevel>Read</contactAccessLevel>
    <name>G1Dev_G2New</name>
    <opportunityAccessLevel>Edit</opportunityAccessLevel>
  </ownerRules>
<ownerRules>

```

```

    <fullName>G2New_R1New</fullName>
    <sharedFrom>
      <group>G2New</group>
    </sharedFrom>
    <sharedTo>
      <roleAndSubordinates>R1New</roleAndSubordinates>
    </sharedTo>
    <accountAccessLevel>Edit</accountAccessLevel>
    <caseAccessLevel>Read</caseAccessLevel>
    <contactAccessLevel>Edit</contactAccessLevel>
    <name>G2New_R1New</name>
    <opportunityAccessLevel>None</opportunityAccessLevel>
  </ownerRules>
</AccountSharingRules>

```

The following is the definition of a user criteria-based sharing rule and a user membership-based sharing rule in API version 32.0 and earlier. The file name corresponds to `UserSharingRules` under the `userSharingRules` directory.

```

<?xml version="1.0" encoding="UTF-8"?>
<UserSharingRules xmlns="http://soap.sforce.com/2006/04/metadata">
  <criteriaBasedRules>
    <fullName>shareUsers2</fullName>
    <sharedTo>
      <group>Asia_Division</group>
    </sharedTo>
    <criteriaItems>
      <field>FirstName</field>
      <operation>equals</operation>
      <value>John</value>
    </criteriaItems>
    <name>shareUsers2</name>
    <userAccessLevel>Read</userAccessLevel>
  </criteriaBasedRules>
  <membershipRules>
    <fullName>shareUsers1</fullName>
    <sharedTo>
      <group>South_America_Division</group>
    </sharedTo>
    <sharedFrom>
      <group>Asia_Division</group>
    </sharedFrom>
    <name>shareUsers1</name>
    <userAccessLevel>Read</userAccessLevel>
  </membershipRules>
</UserSharingRules>

```

The following shows a sample `package.xml` file.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>ObjA__c.*</members>
    <name>SharingCriteriaRule</name>
  </types>
</Package>

```

```

    <members>ObjA__c.*</members>
    <name>SharingOwnerRule</name>
  </types>
  <version>62.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

### 1. [BaseSharingRule](#)

This component is removed as of API version 33.0 and is available in earlier versions only. Use [SharingBaseRule](#) instead. Represents the base container for criteria-based and owner-based sharing rules.

### 2. [CriteriaBasedSharingRule](#)

This component is removed as of API version 33.0 and is available in earlier versions only. Use [SharingRules](#) instead. Represents a criteria-based sharing rule. [CriteriaBasedSharingRule](#) enables you to share records based on specific criteria.

### 3. [OwnerSharingRule](#)

Represents an ownership-based sharing rule. [OwnerSharingRule](#) enables you to share records owned by a set of users with another set, using rules that specify the access level of the target user group. This component is removed as of API version 33.0 and is available in earlier versions only.

## BaseSharingRule

This component is removed as of API version 33.0 and is available in earlier versions only. Use [SharingBaseRule](#) instead. Represents the base container for criteria-based and owner-based sharing rules.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Note:** You can't create a [BaseSharingRule](#) component directly. Use the components under the [CriteriaBasedSharingRule](#) or [OwnerSharingRule](#) metadata types instead.

## Version

[BaseSharingRule](#) on page 2014 components are available in API version 24.0 and later.

## Fields

Field	Field Type	Description
<code>sharedTo</code>	<a href="#">SharedTo</a>	Required. Specifies who the record is shared with.
<code>fullName</code>	string	The unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two

Field	Field Type	Description
		consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CriteriaBasedSharingRule

This component is removed as of API version 33.0 and is available in earlier versions only. Use [SharingRules](#) instead. Represents a criteria-based sharing rule. `CriteriaBasedSharingRule` enables you to share records based on specific criteria.

It extends the [BaseSharingRule](#) metadata type and inherits its `sharedTo` field. For more information, see “Criteria-Based Sharing Rules Overview” in Salesforce Help.

 **Note:** You can't create a `CriteriaBasedSharingRule` component directly. Use the child components instead.

## Declarative Metadata File Suffix and Directory Location

`CriteriaBasedSharingRule` components are stored within the `SharingRules` component in the `criteriaBasedRules` field.

## Version

`CriteriaBasedSharingRule` components are available in API version 24.0 and later.

## Special Access Rules

As of Spring '20 and later, only users with the View Setup and Configuration permission can access this object, and only users with the Manage Sharing permission can edit this object.

## Fields

The following information assumes that you're familiar with implementing sharing rules for standard objects and custom objects. For more information on these fields, see [Sharing Settings](#) in Salesforce Help.

Field	Field Type	Description
<code>criteriaItems</code>	<a href="#">FilterItem</a> []	List that represents the criteria for the sharing rule. The possible values are: <ul style="list-style-type: none"> <li><code>field</code></li> <li><code>operation</code></li> <li><code>value</code></li> </ul>

## AccountCriteriaBasedSharingRule

Represents a criteria-based sharing rule for accounts. It extends the `CriteriaBasedSharingRule` metadata type and inherits its `criteriaItems` field.

`AccountCriteriaBasedSharingRule` is used by the `criteriaBasedRules` field in [AccountSharingRules](#).

Field	Field Type	Description
<code>accountAccessLevel</code>	<code>ShareAccessLevelNoNone</code> (enumeration of type string)	Required. A value that represents the level of access that the user or group has to the account. The possible values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> <li>• All</li> </ul>
<code>booleanFilter</code>	string	Represents the filter logic of the sharing rule.
<code>caseAccessLevel</code>	<code>ShareAccessLevelNoAll</code> (enumeration of type string)	Required. A value that represents the level of access that the user or group has to cases associated with the account. The possible values are: <ul style="list-style-type: none"> <li>• None</li> <li>• Read</li> <li>• Edit</li> </ul>
<code>contactAccessLevel</code>	<code>ShareAccessLevelNoAll</code> (enumeration of type string)	Required. A value that represents the level of access that the user or group has to contacts associated with the account. The possible values are: <ul style="list-style-type: none"> <li>• None</li> <li>• Read</li> <li>• Edit</li> </ul>
<code>description</code>	string	Represents the description of the sharing rule. Maximum of 1000 characters.  This field is available in API version 29.0 and later.
<code>name</code>	string	Required. Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.
<code>opportunityAccessLevel</code>	<code>ShareAccessLevelNoAll</code> (enumeration of type string)	Required. A value that represents the level of access that a target group is granted for any associated opportunity. The possible values are: <ul style="list-style-type: none"> <li>• None</li> <li>• Read</li> <li>• Edit</li> </ul>

## CampaignCriteriaBasedSharingRule

Represents a criteria-based sharing rule for campaigns. It extends the `CriteriaBasedSharingRule` metadata type and inherits its `criteriaItems` field.

`CampaignCriteriaBasedSharingRule` is used by the `criteriaBasedRules` field in [CampaignSharingRules](#).

Field	Field Type	Description
<code>booleanFilter</code>	string	Represents the filter logic of the sharing rule.
<code>description</code>	string	Represents the description of the sharing rule. Maximum of 1000 characters. This field is available in API version 29.0 and later.
<code>campaignAccessLevel</code>	<code>ShareAccessLevelNoNone</code> (enumeration of type string)	Required. A value that represents the level of access that a target group is granted for a campaign. The possible values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> <li>• All</li> </ul>
<code>name</code>	string	Required. Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.

## CaseCriteriaBasedSharingRule

Represents a criteria-based sharing rule for cases. It extends the `CriteriaBasedSharingRule` metadata type and inherits its `criteriaItems` field.

`CaseCriteriaBasedSharingRule` is used by the `criteriaBasedRules` field in [CaseSharingRules](#).

Field	Field Type	Description
<code>booleanFilter</code>	string	Represents the filter logic of the sharing rule.
<code>description</code>	string	Represents the description of the sharing rule. Maximum of 1000 characters. This field is available in API version 29.0 and later.
<code>caseAccessLevel</code>	<code>ShareAccessLevelReadEdit</code> (enumeration of type string)	Required. A value that represents the level of access being granted for a case. The possible values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> </ul>
<code>name</code>	string	Required. Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.

## ContactCriteriaBasedSharingRule

Represents a criteria-based sharing rule for contacts. It extends the `CriteriaBasedSharingRule` metadata type and inherits its `criteriaItems` field.

ContactCriteriaBasedSharingRule is used by the `criteriaBasedRules` field in [ContactSharingRules](#).

Field	Field Type	Description
<code>booleanFilter</code>	string	Represents the filter logic of the sharing rule.
<code>description</code>	string	Represents the description of the sharing rule. Maximum of 1000 characters.  This field is available in API version 29.0 and later.
<code>contactAccessLevel</code>	ShareAccessLevelReadEdit (enumeration of type string)	Required. A value that represents the level of access being granted to the target group, role, or user for a contact. The possible values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> </ul>
<code>name</code>	string	Required. Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.

## LeadCriteriaBasedSharingRule

Represents a criteria-based sharing rule for leads. It extends the CriteriaBasedSharingRule metadata type and inherits its `criteriaItems` field.

LeadCriteriaBasedSharingRule is used by the `criteriaBasedRules` field in [LeadSharingRules](#).

Field	Field Type	Description
<code>booleanFilter</code>	string	Represents the filter logic of the sharing rule.
<code>description</code>	string	Represents the description of the sharing rule. Maximum of 1000 characters. This field is available in API version 29.0 and later.
<code>leadAccessLevel</code>	ShareAccessLevelReadEdit (enumeration of type string)	Required. A value that represents the level of allowed access. The possible values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> </ul>
<code>name</code>	string	Required. Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.

## OpportunityCriteriaBasedSharingRule

Represents a criteria-based sharing rule for opportunities. It extends the CriteriaBasedSharingRule metadata type and inherits its `criteriaItems` field.

OpportunityCriteriaBasedSharingRule is used by the `criteriaBasedRules` field in [OpportunitySharingRules](#).

Field	Field Type	Description
<code>booleanFilter</code>	string	Represents the filter logic of the sharing rule.
<code>description</code>	string	Represents the description of the sharing rule. Maximum of 1000 characters.  This field is available in API version 29.0 and later.
<code>opportunityAccessLevel</code>	ShareAccessLevelReadEdit (enumeration of type string)	Required. A value that represents the level of allowed access. The possible values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> </ul>
<code>name</code>	string	Required. Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.

## CustomObjectCriteriaBasedSharingRule

Represents a criteria-based sharing rule for custom objects. It extends the `CriteriaBasedSharingRule` metadata type and inherits its `criteriaItems` field.

`CustomObjectCriteriaBasedSharingRule` is used by the `criteriaBasedRules` field in [CustomObjectSharingRules](#).

Field	Field Type	Description
<code>accessLevel</code>	string	Required. A value that represents the type of allowed sharing. The possible values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> <li>• All</li> </ul>
<code>booleanFilter</code>	string	Represents the filter logic of the sharing rule.
<code>description</code>	string	Represents the description of the sharing rule. Maximum of 1000 characters.  This field is available in API version 29.0 and later.
<code>name</code>	string	Required. Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.

## UserCriteriaBasedSharingRule

Represents a criteria-based sharing rule for users. It extends the `CriteriaBasedSharingRule` metadata type and inherits its `criteriaItems` field.

`UserCriteriaBasedSharingRule` is used by the `criteriaBasedRules` field in [UserSharingRules](#).

Field	Field Type	Description
booleanFilter	string	Represents the filter logic of the sharing rule.
description	string	Represents the description of the sharing rule. Maximum of 1000 characters.  This field is available in API version 29.0 and later.
name	string	Required. Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.
userAccessLevel	ShareAccessLevelReadEdit (enumeration of type string)	Required. A value that represents the type of allowed sharing. The possible values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> </ul>

## Declarative Metadata Sample Definition

The following is the definition of two owner-based sharing rules and one criteria-based sharing rule containing two criteria items. The file name corresponds to the Account.sharingRules file under the accountSharingRules directory.

```
<?xml version="1.0" encoding="UTF-8"?>
<AccountSharingRules xmlns="http://soap.sforce.com/2006/04/metadata">
  <ownerRules>
    <fullName>G1Dev_G2New</fullName>
    <sharedTo>
      <group>G2New</group>
    </sharedTo>
    <sharedFrom>
      <group>G1Dev</group>
    </sharedFrom>
    <accountAccessLevel>Read</accountAccessLevel>
    <caseAccessLevel>None</caseAccessLevel>
    <contactAccessLevel>Read</contactAccessLevel>
  </ownerRules>
  <fullName>G2New_R1New</fullName>
  <sharedTo>
    <roleAndSubordinates>R1New</roleAndSubordinates>
  </sharedTo>
  <sharedFrom>
    <group>G2New</group>
  </sharedFrom>
  <accountAccessLevel>Edit</accountAccessLevel>
  <caseAccessLevel>Read</caseAccessLevel>
  <contactAccessLevel>Edit</contactAccessLevel>
  <name>G2New_R1New</name>
  <opportunityAccessLevel>None</opportunityAccessLevel>
</ownerRules>
<criteriaBasedRules>
  <fullName>AccountCriteria</fullName>
  <sharedTo>
    <group>G1</group>
```

```

</sharedTo>
<criteriaItems>
  <field>BillingCity</field>
  <operation>equals</operation>
  <value>San Francisco</value>
</criteriaItems>
<criteriaItems>
  <field>MyChkBox__c</field>
  <operation>notEqual</operation>
  <value>False</value>
</criteriaItems>
<accountAccessLevel>Read</accountAccessLevel>
<booleanFilter>1 OR 2</booleanFilter>
<caseAccessLevel>None</caseAccessLevel>
<contactAccessLevel>Read</contactAccessLevel>
<name>AccountCriteria</name>
<opportunityAccessLevel>None</opportunityAccessLevel>
</criteriaBasedRules>
</AccountSharingRules>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## OwnerSharingRule

Represents an ownership-based sharing rule. `OwnerSharingRule` enables you to share records owned by a set of users with another set, using rules that specify the access level of the target user group. This component is removed as of API version 33.0 and is available in earlier versions only.

`OwnerSharingRule` extends the [BaseSharingRule](#) metadata type and inherits its `SharedTo` field. For more information, see “Sharing Rules” in the Salesforce online help.

**Note:** You can't create a `OwnerSharingRule` component directly. Use the child components instead.

## Declarative Metadata File Suffix and Directory Location

`OwnerSharingRules` components are stored within the `SharingRules` component in the `ownerRules` field.

## Version

`OwnerSharingRules` components are available in API version 24.0 and later.

## Special Access Rules

As of Spring '20 and later, only users with the View Setup and Configuration permission can access this object, and only users with the Manage Sharing permission can edit this object.

## Fields

The following information assumes that you are familiar with implementing sharing rules for standard objects and custom objects. For more information on these fields, see “Sharing Settings” in the Salesforce online help.

Field	Field Type	Description
<code>sharedFrom</code>	<a href="#">SharedTo</a>	Required. Specifies the record owners.
<code>sharedTo</code>	<a href="#">SharedTo</a>	Required. Specifies who the record should be shared with.
<code>fullName</code>	string	The unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component.

## AccountOwnerSharingRule

Represents a sharing rule for an account with users other than the owner. It extends the `OwnerSharingRule` metadata type and inherits its `fullName`, `sharedFrom`, and `sharedTo` fields.

`AccountOwnerSharingRule` is used by the `ownerRules` field in [AccountSharingRules](#).

Field	Field Type	Description
<code>accountAccessLevel</code>	<code>ShareAccessLevelNoNone</code> (enumeration of type string)	Required. A value that represents the level of access that a group or role has to the account. The possible values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> <li>• All</li> </ul>
<code>caseAccessLevel</code>	<code>ShareAccessLevelNoAll</code> (enumeration of type string)	Required. A value that represents the level of access that a group or role has to cases associated with the account. The possible values are: <ul style="list-style-type: none"> <li>• None</li> <li>• Read</li> <li>• Edit</li> </ul>
<code>contactAccessLevel</code>	<code>ShareAccessLevelNoAll</code> (enumeration of type string)	Required. A value that represents the level of access that a group or role has to contacts associated with the account. The possible values are: <ul style="list-style-type: none"> <li>• None</li> <li>• Read</li> <li>• Edit</li> </ul>

Field	Field Type	Description
description	string	Represents the description of the sharing rule. Maximum of 1000 characters. This field is available in API version 29.0 and later.
name	string	Required. Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.
opportunityAccessLevel	ShareAccessLevelNoAll (enumeration of type string)	Required. A value that represents the level of access that a group or role is granted for any associated opportunity. The possible values are: <ul style="list-style-type: none"> <li>• None</li> <li>• Read</li> <li>• Edit</li> </ul>

## CampaignOwnerSharingRule

Represents a sharing rule for a campaign with users other than the owner. It extends the OwnerSharingRule metadata type and inherits its `fullName`, `sharedFrom`, and `sharedTo` fields.

CampaignOwnerSharingRule is used by the `ownerRules` field in [CampaignSharingRules](#).

Field	Field Type	Description
campaignAccessLevel	ShareAccessLevelNoNone (enumeration of type string)	A value that represents the level of access that a group or role is granted for a campaign. The possible values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> <li>• All</li> </ul>
description	string	Represents the description of the sharing rule. Maximum of 1000 characters. This field is available in API version 29.0 and later.
name	string	Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.

## CaseOwnerSharingRule

Represents a sharing rule for a case with users other than the owner. It extends the OwnerSharingRule metadata type and inherits its `fullName`, `sharedFrom`, and `sharedTo` fields.

CaseOwnerSharingRule is used by the `ownerRules` field in [CaseSharingRules](#). All the following fields are required.

Field	Field Type	Description
caseAccessLevel	ShareAccessLevelReadEdit (enumeration of type string)	Required. A value that represents the level of access that a group or role is granted for a case. The possible values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> </ul>

Field	Field Type	Description
description	string	Represents the description of the sharing rule. Maximum of 1000 characters.This field is available in API version 29.0 and later.
name	string	Required. Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.

## ContactOwnerSharingRule

Represents a sharing rule for a contact with users other than the owner. It extends the OwnerSharingRule metadata type and inherits its `fullName`, `sharedFrom`, and `sharedTo` fields.

ContactOwnerSharingRule is used by the `ownerRules` field in [ContactSharingRules](#).

Field	Field Type	Description
contactAccessLevel	ShareAccessLevelReadEdit (enumeration of type string)	Required. A value that represents the level of access that a group or role is granted for a contact. The possible values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> </ul>
description	string	Represents the description of the sharing rule. Maximum of 1000 characters.This field is available in API version 29.0 and later.
name	string	Required. Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.

## LeadOwnerSharingRule

Represents a sharing rule for a lead with users other than the owner. It extends the OwnerSharingRule metadata type and inherits its `fullName`, `sharedFrom`, and `sharedTo` fields.

LeadOwnerSharingRule is used by the `ownerRules` field in [LeadSharingRules](#).

Field	Field Type	Description
leadAccessLevel	ShareAccessLevelReadEdit (enumeration of type string)	Required. A value that represents the level of access that a group or role is granted for a lead. The possible values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> </ul>
description	string	Represents the description of the sharing rule. Maximum of 1000 characters.This field is available in API version 29.0 and later.
name	string	Required. Required. Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.

## OpportunityOwnerSharingRule

Represents a sharing rule for an opportunity with users other than the owner. It extends the OwnerSharingRule metadata type and inherits its `fullName`, `sharedFrom`, and `sharedTo` fields.

OpportunityOwnerSharingRule is used by the `ownerRules` field in [OpportunitySharingRules](#).

Field	Field Type	Description
<code>name</code>	string	Required. Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.
<code>description</code>	string	Represents the description of the sharing rule. Maximum of 1000 characters. This field is available in API version 29.0 and later.
<code>opportunityAccessLevel</code>	ShareAccessLevelReadEdit (enumeration of type string)	Required. A value that represents the level of access that a group or role is granted for an opportunity. The possible values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> </ul>

## AccountTerritorySharingRule

Represents a rule for sharing an account within a territory. It extends the OwnerSharingRule metadata type and inherits its `fullName`, `sharedFrom`, and `sharedTo` fields.

AccountTerritorySharingRule is used by the `ownerRules` field in [AccountTerritorySharingRules](#).

Field	Field Type	Description
<code>accountAccessLevel</code>	ShareAccessLevelNoNone (enumeration of type string)	Required. A value that represents the level of access that a Territory or TerritoryAndSubordinates group is granted for an account territory. The possible values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> <li>• All</li> </ul>
<code>caseAccessLevel</code>	ShareAccessLevelNoAll (enumeration of type string)	Required. A value that represents the level of access that a Territory or TerritoryAndSubordinates group is granted for all child cases to an account. The possible values are: <ul style="list-style-type: none"> <li>• None</li> <li>• Read</li> <li>• Edit</li> </ul>
<code>contactAccessLevel</code>	ShareAccessLevelNoAll (enumeration of type string)	Required. A value that represents the level of access that a Territory or TerritoryAndSubordinates group is granted for all related contacts on an account. The possible values are: <ul style="list-style-type: none"> <li>• None</li> <li>• Read</li> </ul>

Field	Field Type	Description
		<ul style="list-style-type: none"> <li>Edit</li> </ul>
description	string	Represents the description of the sharing rule. Maximum of 1000 characters. This field is available in API version 29.0 and later.
name	string	Required. Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.
opportunityAccessLevel	ShareAccessLevelNoAll (enumeration of type string)	<p>Required. A value that represents the level of access that a Territory or TerritoryAndSubordinates group is granted for all opportunities associated with an account. The possible values are:</p> <ul style="list-style-type: none"> <li>None</li> <li>Read</li> <li>Edit</li> </ul>

## CustomObjectOwnerSharingRule

Represents a sharing rule for custom objects. It extends the OwnerSharingRule metadata type and inherits its `fullName`, `sharedFrom`, and `sharedTo` fields.

CustomObjectOwnerSharingRule is used by the `ownerRules` field in [CustomObjectSharingRules](#).

Field	Field Type	Description
accessLevel	string	<p>Required. A value that represents the level of access that a group or role is granted to a custom object. The possible values are:</p> <ul style="list-style-type: none"> <li>Read</li> <li>Edit</li> <li>All</li> </ul>
description	string	<p>Represents the description of the sharing rule. Maximum of 1000 characters.</p> <p>This field is available in API version 29.0 and later.</p>
name	string	Required. Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.

## UserMembershipSharingRule

Represents a sharing rule to share members of a group with another group of users. It extends the OwnerSharingRule metadata type and inherits its `fullName`, `sharedFrom`, and `sharedTo` fields.

UserMembershipSharingRule is used by the `ownerRules` field in [UserSharingRules](#) on page 2011.

Field	Field Type	Description
<code>description</code>	string	Represents the description of the sharing rule. Maximum of 1000 characters. This field is available in API version 29.0 and later.
<code>name</code>	string	Required. Name for the sharing rule. Corresponds to <b>Label</b> in the user interface.
<code>userAccessLevel</code>	ShareAccessLevelReadEdit (enumeration of type string)	Required. A value that represents the level of access that a group or role is granted for a user. The possible values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> </ul>

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SharingSet

Represents a sharing set. A sharing set defines an access mapping that grants portal or community users access to objects that are associated with their accounts or contacts.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

For example, you can grant portal or community users access to all cases related to their account record. Similarly, you can grant portal or community users access to all cases related to a parent account that is identified on the user's account record.

## File Suffix and Directory Location

SharingSet components have the suffix `.sharingSet` and are stored in the `sharingSets` folder.

## Version

SharingSet components are available in API version 30.0 and later.

## Special Access Rules

As of Spring '20 and later, only users with the View Setup and Configuration permission can access this object, and only users with the Manage Sharing permission can edit this object. To create or update sharing sets, you need the Customize Application permission.

Sharing sets are available with these licenses.

- Authenticated Website
- Customer Community Login
- Customer Community Plus
- Partner Community
- Customer Community User

- High Volume Customer Portal
- High Volume Portal
- Overage Authenticated Website User
- Overage High Volume Customer Portal User

## Fields

Field Name	Field Type	Description
accessMappings	<a href="#">AccessMapping</a> []	A list of access mappings on a sharing set.
description	string	The sharing set description. Limit: 255 characters.
name	string	Required. The unique identifier for API access. Corresponds to <b>Sharing Set Name</b> on the user interface.
profiles	string[]	The profiles of users that are granted access to the target objects. Profiles must be associated with a license that can use sharing sets. See <a href="#">Special Access Rules</a> for more information.

## AccessMapping

AccessMapping represents an access mapping in the sharing set, which grants access to a target object by looking up to an account or contact associated with the user.

You can grant portal users access to a target object, or to both a target object and its associated objects, such as an account and its contacts and cases.

Field Name	Field Type	Description
accessLevel	string	Required. The target object access level granted to the portal user. Valid values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> </ul>
objectField	string	Required. A lookup to the target object, which supports standard or custom fields, or an ID. For accounts or cases associated with entitlements, use <code>Entitlement.Account</code> or <code>Entitlement.Case</code> .
object	string	Required. The target object to which the portal user is gaining access, and refers to one of the following: <ul style="list-style-type: none"> <li>• Account</li> <li>• Campaign</li> <li>• Contact</li> <li>• Case</li> <li>• Custom Objects (for example, <code>ObjA__c</code>)</li> <li>• Opportunity</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>Order</li> <li>ServiceContract</li> <li>User</li> <li>WorkOrder</li> </ul> <p>Portal users gain access to all order entitlements and order items under an account to which they have access.</p>
userField	string	<p>Required. The user's lookup to an account, contact, or a standard or custom field derived from an account or contact. Either the user or the user's manager can be used in the lookup. Valid values are:</p> <ul style="list-style-type: none"> <li>Account</li> <li>Account.<b>Field</b></li> <li>Contact</li> <li>Contact.<b>Field</b></li> <li>Contact.RelatedAccount</li> <li>Manager.Account</li> <li>Manager.Contact</li> </ul> <p><b>Field</b> refers to a standard or custom field based on an account or contact.</p>

## Declarative Metadata Sample Definition

The following is an example of a SharingSet component that grants users access to all contacts whose ReportsTo fields match the users' contacts.

```
<?xml version="1.0" encoding="UTF-8"?>
<SharingSet xmlns="http://soap.sforce.com/2006/04/metadata">
  <accessMappings>
    <accessLevel>Read</accessLevel>
    <objectField>ReportsTo</objectField>
    <object>Contact</object>
    <userField>Contact</userField>
  </accessMappings>
  <description>User Access Mapping</description>
  <name>User</name>
  <profiles>customer community user</profiles>
</SharingSet>
```

The following is an example of a SharingSet component that grants users access to all cases that are related to an entitlement, which is associated with the user's account.

```
<?xml version="1.0" encoding="UTF-8"?>
<SharingSet xmlns="http://soap.sforce.com/2006/04/metadata">
  <name>Case</name>
  <accessMappings>
    <accessLevel>Edit</accessLevel>
    <objectField>Entitlement.Account</objectField>
  </accessMappings>
</SharingSet>
```

```

    <object>Case</object>
    <userField>Account</userField>
  </accessMappings>
</SharingSet>

```

The following is an example of a SharingSet component with a list of access mappings.

```

<?xml version="1.0" encoding="UTF-8"?>
<SharingSet xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>This is a basic sharing set with several access mappings.</description>
  <name>Basic</name>
  <profiles>customer community user</profiles>
  <accessMappings>
    <accessLevel>Read</accessLevel>
    <objectField>Id</objectField>
    <object>Account</object>
    <userField>Account</userField>
  </accessMappings>
  <accessMappings>
    <accessLevel>Edit</accessLevel>
    <objectField>Account</objectField>
    <object>Contact</object>
    <userField>Account</userField>
  </accessMappings>
  <accessMappings>
    <accessLevel>Edit</accessLevel>
    <objectField>Contact</objectField>
    <object>Case</object>
    <userField>Contact</userField>
  </accessMappings>
  <accessMappings>
    <accessLevel>Read</accessLevel>
    <objectField>AccountLookup__c</objectField>
    <object>HVPUIAccessible__c</object>
    <userField>Account</userField>
  </accessMappings>
</SharingSet>

```

The following is an example package.xml that references the previous definition.

```

<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>SharingSetBasic</fullName>
  <types>
    <members>HVPUIAccessible__c.AccountLookup__c</members>
    <members>HVPUIAccessible__c.ContactLookup__c</members>
    <name>CustomField</name>
  </types>
  <types>
    <members>HVPUIAccessible__c</members>
    <name>CustomObject</name>
  </types>
  <types>
    <members>Basic</members>
    <name>SharingSet</name>
  </types>

```

```
<version>30.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SiteDotCom

---

Represents a site for deployment.

SiteDotCom extends the [MetadataWithContent](#) type and inherits its `fullName` and `content` fields.

## Declarative Metadata File Suffix and Directory Location

SiteDotCom components are stored in the `siteDotComSites` directory of the corresponding package directory.

The file name for the metadata `.xml` file is `[sitename]1.site-meta.xml`. The file name for the site file is `[sitename]1.site`.

When a Lightning site is created, two sites are made behind the scenes: `CustomSite` (of type `ChatterNetwork`) and `SiteDotComSite` (of type `ChatterNetworkPicasso`). These sites are named, respectively, `<site_name>` and `<site_name>1`. The corresponding MDAPI file names are `<site_name>.site-meta.xml` and `<site_name>1.site-meta.xml`. `1` is appended to the `SiteDotComSite` type to keep the name unique from the corresponding `CustomSite` site.

 **Note:** There is a file size limitation when using the Metadata API to deploy a site from sandbox to production. The assets in the `.site` file can't be larger than 40 MB. The site gets created, but the assets show in the new site as broken. To fix the assets, export the assets from the sandbox environment separately and then import them into your new site.

## Version

SiteDotCom components are available in API version 30.0 and later.

## Fields

Field	Field Type	Description
<code>label</code>	string	The name of the site that you're deploying.
<code>siteType</code>	(enumeration of type string)	Required. Identifies whether the site is a <code>ChatterNetworkPicasso</code> site for Experience Cloud Sites, or a <code>Siteforce</code> site for Site.com sites.

## Declarative Metadata Sample Definition

Here are two examples of a SiteDotCom XML definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<SiteDotCom xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>testsite</label>
  <siteType>Siteforce</siteType>
</SiteDotCom>

<?xml version="1.0" encoding="UTF-8"?>
<SiteDotCom xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>testCommunity</label>
  <siteType>ChatterNetworkPicasso</siteType>
</SiteDotCom>
```

## Usage

You can only deploy a `.site` file retrieved in Summer '19 or later. Older files aren't supported.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Skill

Represents the settings for a skill used for field service or to route chats to agents in Chat, such as the name of the skill and which agents the skills are assigned to.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

Skill values are stored in the `<developer_name>.skill` file in the `skills` directory.

## Version

Skill is available in API version 28.0 and later.

## Fields

Field Name	Field Type	Description
<code>assignments</code>	<a href="#">SkillAssignments</a>	Specifies how skills are assigned to Chat users. Skills can be assigned to sets of users or sets of profiles.

Field Name	Field Type	Description
description	string	Specifies the description of the skill. This field is available in API version 38.0 and later.
label	string	Specifies the name of the skill.
skillType	string	Specifies the skill type, such as language or department, associated with the skill. This field is available in API version 58.0 and later.

## SkillAssignments

Represents which users and user profiles to whom specific skills are assigned.

### Fields

Field Name	Field Type	Description
profiles	<a href="#">SkillProfileAssignments</a>	Specifies the profiles that are associated with a specific skill.
users	<a href="#">SkillUserAssignments</a>	Specifies the users that are associated with a specific skill.

## SkillProfileAssignments

Represents the profiles that are associated with a specific skill.

### Fields

Field Name	Field Type	Description
profile	string	Specifies the custom name of the profile associated with a specific skill.

## SkillUserAssignments

Represents the users that are associated with a specific skill.

### Fields

Field Name	Field Type	Description
user	string	Specifies the username of the user associated with a specific skill.

## Declarative Metadata Sample Definition

This is a sample of a `skill` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<Skill xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>My Skill 1</label>
  <assignments>
    <profiles>
      <profile>LiveAgentOperator</profile>
      <profile>LiveAgentSupervisor</profile>
    </profiles>
    <users>
      <user>jdoe@acme.com</user>
    </users>
  </assignments>
</Skill>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## StandardValueSet

---

Represents the set of values in a standard picklist field. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

StandardValueSet components have the suffix `.standardValueSet` and are stored in the `standardValueSets` folder.

## Version

StandardValueSet components are available in API version 38.0 and later.

## Fields

Field Name	Field Type	Description
<code>groupingStringEnum</code>	string	Groups picklist and enumerated values. For example, for the picklist values of the <code>Status</code> field on the Service Appointment object, <code>Done</code> and <code>Finished</code> can both have a grouping string of <code>Completed</code> . Available in API version 41.0 and later.
<code>sorted</code>	boolean	Required. Indicates whether a global value set is sorted in alphabetical order. By default, this value is <code>false</code> .

Field Name	Field Type	Description
standardValue	<a href="#">StandardValue[]</a>	<p>Defines each value in a standard picklist's value set. The <code>groupingString</code> value is available in API version 38.0 and later.</p> <p>When you deploy a <code>StandardValueSet</code>, this array must contain at least one picklist value. Otherwise, you receive an error.</p> <p> <b>Note:</b> When setting <code>standardValue</code> on Record Types, including person account record types, new picklist values loaded into your organization through the Metadata API don't display in the picklist UI by default. For users to see the new values, go to the Record Types list for the object containing the picklist field, click <b>Edit</b>, and add the new value to the Selected Fields list.</p>

## Declarative Metadata Sample Definition

The following example shows a `StandardValueSet` component that's defined as the Stage standard picklist on a customized opportunity object.

```
<?xml version="1.0" encoding="UTF-8"?>
<StandardValueSet xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>OpportunityStage</fullName> <!-- Enum name -->
  <standardValue>
    <fullName>Closed Abandoned</fullName>
  </standardValue>
  <standardValue>
    <fullName>Closed Won</fullName>
  </standardValue>
  <standardValue>
    <fullName>Closed Lost</fullName>
  </standardValue>
</StandardValueSet>

<CustomObject>
  <fullName>Opportunity</fullName>
  <fields>
    <fullName>StageName</fullName> <!-- field name -->
    <label>Stage</label>
    <type>Picklist</type>
  </fields>
  <label>ObjectWithValueSet</label>
  <pluralLabel>ObjectWithValueSet</pluralLabel>
  <sharingModel>ReadWrite</sharingModel>
</CustomObject>
```

For a list of standard value set names for standard picklists, see [StandardValueSet Names and Standard Picklist Fields](#).

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## StandardValueSetTranslation

Contains details for a standard picklist translation. It returns a translated standard value set. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

`StandardValueSetTranslation` components have the suffix `.standardValueSetTranslation` and are stored in the `standardValueSetTranslations` folder.

Translations are stored in a file with a format of `ValueSetName-lang.standardValueSetTranslation`, where `ValueSetName` is the global value set's name, and `lang` is the translation language.

## Version

`StandardValueSetTranslation` components are available in API version 38.0 and later.

## Fields

Field	Field Type	Description
<code>valueTranslation</code>	<a href="#">ValueTranslation[]</a>	A list of values from global value sets to be translated.

## Declarative Metadata Sample Definition

The following is an example of a `StandardValueSetTranslation` component. When a value isn't translated, its translation becomes a comment that's paired with its label.

```
<?xml version="1.0" encoding="UTF-8"?>
<StandardValueSetTranslation xmlns="http://soap.sforce.com/2006/04/metadata">
  <valueTranslation>
    <masterLabel>Cold</masterLabel>
    <translation><!-- Cold --></translation>
  </valueTranslation>
  <valueTranslation>
    <masterLabel>Hot</masterLabel>
    <translation><!-- Hot --></translation>
  </valueTranslation>
  <valueTranslation>
    <masterLabel>Warm</masterLabel>
    <translation><!-- Warm --></translation>
  </valueTranslation>
</StandardValueSetTranslation>
```

```
</valueTranslation>  
</StandardValueSetTranslation>
```

The following is an example `package.xml` that references the `StandardValueSetTranslation` definition.

```
<?xml version="1.0" encoding="UTF-8"?>  
<Package xmlns="http://soap.sforce.com/2006/04/metadata">  
  <types>  
    <members>AccountRating-fr</members>  
    <name>StandardValueSetTranslation</name>  
  </types>  
  <version>38.0</version>  
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Translations](#)

## StaticResource

---

Represents a static resource file, often a code library in a ZIP file. Static resources allow you to upload content that you can reference in a Visualforce page, including archives (such as .zip and .jar files), images, style sheets, JavaScript, and other files. Static resources can be used only within your Salesforce org, so you can't host content here for other apps or websites.

This type extends the [MetadataWithContent](#) metadata type and inherits its `content` and `fullName` fields.

## File Suffix and Directory Location

The file suffix is `.resource` for the template file. The accompanying metadata file is named `resource-meta.xml`.

Static resource components are stored in the `staticresources` folder in the corresponding package directory.

## Version

Static resources are available in API version 12.0 and later.

## Fields

This metadata type contains the following fields:

Field Name	Field Type	Description
cacheControl	StaticResourceCacheControl (enumeration of type string)	Required. Indicates whether the static resource is marked with a public caching tag so that a third-party delivery client can cache the content. This field is available in API version 14.0. The valid values are: <ul style="list-style-type: none"> <li>• Private</li> <li>• Public</li> </ul>
content	base64Binary	The static resource content. Base 64-encoded binary data. Before making an API call, client applications must encode the binary attachment data as base64. Upon receiving a response, client applications must decode the base64 data to binary. This conversion is handled for you by a SOAP client. This field is inherited from the <a href="#">MetadataWithContent</a> component.
contentType	string	Required. The content type of the file, for example text/plain.
description	string	The description of the static resource.
fullName	string	The static resource name. The name can only contain characters, letters, and the underscore ( _ ) character. The name must start with a letter, and can't end with an underscore or contain two consecutive underscore characters.  Inherited from the <a href="#">Metadata</a> component, this field isn't defined in the WSDL for this component. It must be specified when creating, updating, or deleting. See <a href="#">create()</a> to see an example of this field specified for a call.

## Declarative Metadata Sample Definition

```
<?xml version="1.0" encoding="UTF-8"?>
<StaticResource xmlns="http://soap.sforce.com/2006/04/metadata">
  <contentType>text/plain</contentType>
  <description>Test Resource</description>
</StaticResource>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SustainabilityUom

Represents the unit of measure (UOM) values for custom fuel types in an org. Track fuel consumption and emission results with the flexibility to add custom fuel types and UOM values.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

SustainabilityUom components have the suffix `.sustainabilityUom` and are stored in the `sustainabilityUoms` folder.

## Version

SustainabilityUom components are available in API version 56.0 and later.

## Special Access Rules

The Net Zero Cloud permission set license is required to access this object along with the user access for carbon accounting and org access for custom fuels and UOMs.

## Fields

Field Name	Description
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of the unit of measure.</p>
<code>isProductUom</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the unit of measure is for a product that the company has procured in its supply chain operations (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>isProtected</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type. The default value is <code>false</code>.</p>
<code>isStationaryAssetUom</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the unit of measure is used in the stationary asset calculations (<code>true</code>) or (<code>false</code>).</p>

Field Name	Description
	The default value is <code>false</code> .
<code>isVehicleAssetUom</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the unit of measure is used in the vehicle asset calculations (<code>true</code>) or (<code>false</code>). The default value is <code>false</code>.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The label assigned to this object.</p>
<code>unitType</code>	<p><b>Field Type</b> UnitType (enumeration of type string)</p> <p><b>Description</b> Required. The type of unit used for conversions or calculations. Values are:</p> <ul style="list-style-type: none"> <li>• Energy</li> <li>• Other</li> <li>• Volume</li> <li>• Weight</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a SustainabilityUom component.

```
<?xml version="1.0" encoding="UTF-8"?>
<SustainabilityUom xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>Weight in Grams</description>
  <isProductUom>true</isProductUom>
  <isProtected>false</isProtected>
  <isStationaryAssetUom>false</isStationaryAssetUom>
  <isVehicleAssetUom>false</isVehicleAssetUom>
  <masterLabel>Grams</masterLabel>
  <unitType>Weight</unitType>
</SustainabilityUom>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>Pkg</fullName>
  <types>
    <members>Grams</members>
    <name>SustainabilityUom</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SustnUomConversion

---

Represents information about the unit of measure (UOM) conversion for the custom fuel types defined by a customer in an org.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`SustnUomConversion` components have the suffix `sustnUomConversion` and are stored in the `sustnUomConversions` folder.

## Version

`SustnUomConversion` components are available in API version 57.0 and later.

## Special Access Rules

The Net Zero Cloud permission set license is required to access this object along with the user access for carbon accounting and org access for custom fuels and UOMs.

## Fields

Field Name	Description
conversionFactor	<p><b>Field Type</b> double</p> <p><b>Description</b> Required. The conversion factor that's used to convert values from one unit of measure to another for the fuel type.</p>
fuelType	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the fuel type. Possible values are:</p> <ul style="list-style-type: none"> <li>• AutogasLPG</li> <li>• Biodiesel</li> <li>• Biomass</li> <li>• CityGas</li> <li>• CompressedNaturalGasCNG</li> <li>• Cooling</li> <li>• Diesel</li> <li>• Electricity</li> <li>• Ethanol</li> <li>• FuelOil</li> <li>• Gasoline</li> <li>• Heat</li> <li>• HeavyOil</li> <li>• ITElectricity</li> <li>• JetFuel</li> <li>• Kerosene</li> <li>• LightOil</li> <li>• LiquidNaturalGasLNG</li> <li>• MobileDiesel</li> <li>• NaturalGas</li> <li>• Propane</li> <li>• Refrigerant</li> <li>• Steam</li> </ul>

Field Name	Description
isProtected	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type. The default value is <code>false</code>.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> A user-friendly name for SustnUomConversion, which is defined when the SustnUomConversion is created.</p>
sourceUom	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The source unit of measure for the fuel type. Possible values are:</p> <ul style="list-style-type: none"><li>• 1000m3</li><li>• GJ</li><li>• GWh</li><li>• Kiloliters</li><li>• Liters</li><li>• MJ</li><li>• MMBtu</li><li>• MWh</li><li>• Therms</li><li>• Tonnes</li><li>• UkGallons</li><li>• UsGallons</li><li>• ccf</li><li>• kG</li><li>• kWh</li><li>• kcal</li><li>• lbs</li><li>• longTons</li><li>• m3</li><li>• shortTons</li></ul>

Field Name	Description
targetUom	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The target unit of measure for the fuel type.</p>
uomsKey	<p><b>Field Type</b> string</p> <p><b>Description</b> The key associated with a unit of measure for the fuel type.</p>

## Declarative Metadata Sample Definition

The following is an example of a SustnUomConversion component.

```
<?xml version="1.0" encoding="UTF-8"?>
<SustnUomConversion xmlns="http://soap.sforce.com/2006/04/metadata">
  <conversionFactor>0.9</conversionFactor>
  <fuelType>Diesel</fuelType>
  <isProtected>>false</isProtected>
  <masterLabel>KG_Liters</masterLabel>
  <sourceUom>KG</sourceUom>
  <targetUom>Liters</targetUom>
  <uomsKey>uomsKey</uomsKey>
</SustnUomConversion>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>Pkg</fullName>
  <types>
    <members>US_UK_Gallons</members>
    <members>Therms_kWh</members>
    <members>KG_Liters</members>
    <name>SustnUomConversion</name>
  </types>
  <version>57.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

# SvcCatalogCategory

---

Represents the grouping of individual catalog items in Service Catalog.

## File Suffix and Directory Location

`SvcCatalogCategory` components have the suffix `category` and are stored in the `svcCatalogCategories` folder.

## Version

`SvcCatalogCategory` components are available in API version 53.0 and later.

## Fields

Field Name	Description
<code>image</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The developer name of a content document to be displayed in the Service Catalog for this category.</p>
<code>isActive</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates if a catalog category is active.</p>
<code>isProtected</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value. This value currently has no impact.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The primary label for the catalog category record.</p>
<code>parentCategory</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> If provided, the name of another <code>SvcCatalogCategory</code> that this category should appear under. The parent category in this field can't have its own parent category. Categories can't have more than one level of nesting.</p>

Field Name	Description
sortOrder	<p><b>Field Type</b> int</p> <p><b>Description</b> Displays a set order for catalog category entities.</p>

## Declarative Metadata Sample Definition

The following is an example of a SvcCatalogCategory component.

```
<?xml version="1.0" encoding="UTF-8"?>
<SvcCatalogCategory xmlns="http://soap.sforce.com/2006/04/metadata">
  <image>AdobeStock_287068722</image>
  <isActive>true</isActive>
  <isProtected>false</isProtected>
  <masterLabel>Workplace Services</masterLabel>
  <sortOrder>4</sortOrder>
</SvcCatalogCategory>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SvcCatalogFulfillmentFlow

Represents the flow associated with a specific catalog item in the Service Catalog.

## File Suffix and Directory Location

SvcCatalogFulfillmentFlow components have the suffix fulfillmentFlow and are stored in the svcCatalogFulfillmentFlows folder.

## Version

SvcCatalogFulfillmentFlows components are available in API version 53.0 and later.

## Fields

Field Name	Description
description	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b> Required. Free-text description of the fulfillment flow.</p>
flow	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the flow represented by this SvcCatalogFulfillmentFlow.</p>
icon	<p><b>Field Type</b> string</p> <p><b>Description</b> Represents the details of an icon.</p>
isProtected	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value. This value currently has no impact.</p>
items	<p><b>Field Type</b> <a href="#">SvcCatalogFulfillFlowItem</a> on page 2047[]</p> <p><b>Description</b> The list of variables in the flow that can accept a value as input.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The primary label for the fulfillment flow record.</p>

## SvcCatalogFulfillFlowItem

Represents a variable in a fulfillment flow that can accept input. Describes what type of value it accepts.

Field Name	Description
catalogInputVariable	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The FlowVariable the fulfillment flow property represents.</p>

Field Name	Description
displayType	<p><b>Field Type</b> PropertyDisplayType (enumeration of type string)</p> <p><b>Description</b> The display options available. Values are:</p> <ul style="list-style-type: none"> <li>• Checkbox</li> <li>• Date (available in API version 59.0 and later)</li> <li>• DateTime (available in API version 59.0 and later)</li> <li>• Lookup</li> <li>• Number</li> <li>• Picklist</li> <li>• Queue (available in API version 57.0 and later)</li> <li>• Text</li> </ul>
fieldDefinition	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of a field in the object provided in <code>objectLookupDomain</code> that specifies the value for this variable. If <code>displayType</code> is <code>Picklist</code>, this value must be the name of a picklist field. If <code>displayType</code> is <code>Lookup</code> and <code>fieldLookupDomain</code> is <code>FieldDefinition</code>, this value must be the name of a relationship field.</p>
fieldLookupDomain	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of a standard or custom object that specifies the domain of that lookup or picklist. This value is relevant only if <code>displayType</code> is <code>Lookup</code> or <code>Picklist</code>.</p>
isAdditionalQuestionsInputVariable	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Determines if this variable accepts input for all additional questions that were asked to a user. This value can only be <code>true</code> if the <code>displayType</code> for this item is <code>Text</code>. Only one item per <code>SvcCatalogFulfillmentFlow</code> component can set this attribute to <code>true</code>.</p>
isRequired	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Determines if the field is required for the related fulfillment flow to be executed.</p>

Field Name	Description
lookupDomainFieldType	<p><b>Field Type</b> string</p> <p><b>Description</b> This value specifies the fields for the object specified by <code>objectLookupDomain</code> that are displayed in the Catalog Builder by type. This value is only relevant if <code>displayType</code> is <code>Lookup</code> and <code>fieldLookupDomain</code> is <code>FieldDefinition</code>.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  The primary label for the fulfillment flow record.</p>
objectLookupDomain	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of a custom or standard object. If <code>displayType</code> is <code>Lookup</code> or <code>Picklist</code>, this value filters the available options to a specific object.</p>

## Declarative Metadata Sample Definition

The following is an example of a `SvcCatalogFulfillmentFlow` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<SvcCatalogFulfillmentFlow xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>Creates a Case record related to the Contact belonging to the current
  User. If this will be used by Users without related Contacts, provide an Account Id below.
  This Account Id will be used instead of a Contact.</description>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

# SvcCatalogItemDef

---

Represents the entity associated with a specific, individual service available in the Service Catalog.

## File Suffix and Directory Location

SvcCatalogItemDef components have the suffix `catalogItem` and are stored in the `svcCatalogItems` folder.

## Version

SvcCatalogItemDef components are available in API version 53.0 and later.

## Fields

Field Name	Description
<code>apiVersion</code>	<p><b>Field Type</b> double</p> <p><b>Description</b> The API version in which this catalog item was created. The value for this field updates based on the value of <code>fulfillmentFlow</code>. For catalog items created before version 57.0, the value for this field is <code>null</code>. Available in version 57.0 and later.</p>
<code>catalogFilterCriteria</code>	<p><b>Field Type</b> <a href="#">SvcCatalogItemDefFiltrCrit[]</a></p> <p><b>Description</b> The eligibility rule associated with a catalog item. Eligibility rules customize access to catalog items for different audiences, based on the User object. Available in API version 59.0 and later.</p>
<code>categories</code>	<p><b>Field Type</b> <a href="#">SvcCatalogCategoryItem[]</a></p> <p><b>Description</b> A list of catalog categories that contain this catalog item.</p>
<code>dataCategories</code>	<p><b>Field Type</b> <a href="#">SvcCatalogItemDefDataCategorySelection[]</a></p> <p><b>Description</b> A list of data categories for this catalog item. Available in API version 59.0 and later.</p>
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Description of the catalog item.</p>

Field Name	Description
flow	<b>Field Type</b> string <b>Description</b> The screen flow associated with the catalog item. Available in API version 53.0 to 58.0.
fulfillmentFlow	<b>Field Type</b> string <b>Description</b> Name of the related <a href="#">SvcCatalogFulfillmentFlow</a> on page 2046, which represents the flow associated with a specific catalog item in the Service Catalog. Available in API version 56.0 and later.
image	<b>Field Type</b> string <b>Description</b> The developer name of a content document to be displayed in the Service Catalog for this item.
inputs	<b>Field Type</b> <a href="#">SvcCatalogItemAttribute</a> [] <b>Description</b> Represents attributes of a catalog item version. Available in API version 57.0 and later.
internalNotes	<b>Field Type</b> string <b>Description</b> Intended to describe what the catalog item does and its implementation. That value is meant for other catalog builders.
isAvailableToAllCustomers	<b>Field Type</b> boolean <b>Description</b> Required. Controls catalog item access for internal users. To share with all internal users, set the value to <code>True</code> . This value corresponds to the <b>Allow Access for All Users</b> option for Internal Access in the Catalog Item Builder. Available in API version 61.0 and later.
isFeatured	<b>Field Type</b> boolean <b>Description</b> Determines if the catalog item is part of the featured catalog items.

Field Name	Description
isGuestAccessible	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Controls catalog item access for guest users. To share with guests, set the value to <code>True</code>. This value corresponds to <b>Guest Visibility</b> option for External Access in the Catalog Item Builder. Available in API version 61.0 and later.</p>
isProtected	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value. This value has no impact.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The primary label for the catalog item record.</p>
sharedTo	<p><b>Field Type</b> <a href="#">SharedTo</a> on page 2002</p> <p><b>Description</b> Describes how the catalog item is shared across multiple catalog categories. SvcCatalogItemDef only supports sharing with groups.</p>
status	<p><b>Field Type</b> PublishStatusType (enumeration of type string)</p> <p><b>Description</b> Required. Displays the publishing status of a catalog item. Values are:</p> <ul style="list-style-type: none"> <li>• <code>Deprecated</code></li> <li>• <code>Draft</code></li> <li>• <code>PendingChanges</code></li> <li>• <code>Published</code></li> </ul>

## SvcCatalogItemDefFiltrCrit

Represents the association of an eligibility rule with a catalog item. Eligibility rules customize access to catalog items for different audiences, based on the User object. Available in version 59.0 and later.

Field Name	Description
svcCatalogFilterCriteria	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the associated <code>catalogFilterCriteria</code> eligibility filter.</p>

## SvcCatalogCategoryItem

Represents the assignment of this service to a category within the Service Catalog.

Field Name	Description
isPrimaryCategory	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Determines if the catalog category (<code>svcCatalogCategory</code>) is the primary category for this catalog item. Exactly one category per <code>SvcCatalogItemDef</code> component must set this attribute to true.</p>
sortOrder	<p><b>Field Type</b> int</p> <p><b>Description</b> The position of the catalog item relative to other catalog items in the catalog category.</p>
svcCatalogCategory	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The catalog category the catalog item is assigned to.</p>

## SvcCatalogItemDefDataCategorySelection

Represents a list of data categories for this catalog item. This subtype is available in API version 59.0 and later.

Field Name	Description
category	<p><b>Field Type</b> string</p> <p><b>Description</b> API name of a data category.</p>
categoryGroup	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>API Name of a data category group.</p>

## SvcCatalogItemAttribute

Represents an attribute of a catalog item version. It can be a static input filled by the catalog builder user or additional questions that end users answer at runtime. Available in API version 57.0 and later.

Field Name	Description
field	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Applicable when the display type is Lookup/Reference.</p>
inputType	<p><b>Field Type</b></p> <p>SvcCatalogItemAttrDataType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• Attachment</li> <li>• Checkbox</li> <li>• Currency</li> <li>• Date</li> <li>• Datetime</li> <li>• DisplayText</li> <li>• Email</li> <li>• IPAddress</li> <li>• Integer</li> <li>• ListOfBoolean</li> <li>• ListOfDouble</li> <li>• ListOfInteger</li> <li>• ListOfMaps</li> <li>• ListOfString</li> <li>• Lookup</li> <li>• Map</li> <li>• MultilineText</li> <li>• Number</li> <li>• NumericScale</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• Percentage</li> <li>• Picklist</li> <li>• Queue</li> <li>• SingleCheckbox (available in API version 59.0 and later)</li> <li>• SinglelineText</li> <li>• Text</li> <li>• Toggle (available in API version 59.0 and later)</li> <li>• URL</li> </ul>
inputVariable	<p><b>Field Type</b> string</p> <p><b>Description</b> References the input variable to which the attribute value is forwarded.</p>
isRequired	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Determines if an answer is required for this question.</p>
label	<p><b>Field Type</b> string</p> <p><b>Description</b> A translatable label for rendering the attribute to users.</p>
maxValue	<p><b>Field Type</b> double</p> <p><b>Description</b> Applicable when the display type is slider.</p>
minValue	<p><b>Field Type</b> double</p> <p><b>Description</b> Applicable when the display type is slider.</p>
name	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Applicable when the display type is Lookup/Reference.</p>

Field Name	Description
object	<p><b>Field Type</b> string</p> <p><b>Description</b> A picklist object's custom API Name. Applies when <code>inputType</code> is set to <code>Picklist</code>.</p>
options	<p><b>Field Type</b> SvcCatalogItemAttrDetail</p> <p><b>Description</b> The values attached to an attribute of an item version.</p>
type	<p><b>Field Type</b> SvcCatalogItemAttrType (enumeration of type string)</p> <p><b>Description</b> Required. Type of the attribute; used to determine if it's a pre-filled input or questions to ask users. Values are:</p> <ul style="list-style-type: none"> <li>• FulfillmentInput</li> <li>• UserQuestion</li> </ul>
value	<p><b>Field Type</b> string</p> <p><b>Description</b> Attribute value defined by the catalog builder.</p>

## SvcCatalogItemAttrDetail

Represents the details for an attribute of an item version. Used for options displayed in picklist or checkbox groups.

Field Name	Description
isDefault	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Marks the attribute detail as the default. Applicable when the input display type is picklist or checkbox.</p>
label	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Picklist option label when the input type is picklist or checkbox.</p>

Field Name	Description
value	<p><b>Field Type</b> string</p> <p><b>Description</b> Attribute value defined by the catalog builder.</p>

## Declarative Metadata Sample Definition

The following is an example of a SvcCatalogItemDef component.

```
<SvcCatalogItemDef xmlns="http://soap.sforce.com/2006/04/metadata">
  <apiVersion>57.0</apiVersion>
  <categories>
    <isPrimaryCategory>true</isPrimaryCategory>
    <sortOrder>3</sortOrder>
    <svcCatalogCategory>Category1</svcCatalogCategory>
  </categories>
  <dataCategories>
    <category>France</category>
    <categoryGroup>World</categoryGroup>
  </dataCategories>
  <masterLabel>Item Draft Update</masterLabel>
  <description>Item with a Draft state</description>
  <fulfillmentFlow>TestQuestions</fulfillmentFlow>
  <isFeatured>>false</isFeatured>
  <isProtected>>false</isProtected>
  <status>Published</status>
  <inputs>
    <name>Input1</name>
    <type>FulfillmentInput</type>
    <inputVariable>input1</inputVariable>
    <label>Input Static</label>
    <inputType>Text</inputType>
    <isRequired>>false</isRequired>
  </inputs>
  <inputs>
    <type>UserQuestion</type>
    <inputType>Picklist</inputType>
    <isRequired>>false</isRequired>
    <label>My First Question</label>
    <name>first_question</name>
    <options>
      <label>Option 1</label>
      <value>option_1</value>
      <isDefault>>true</isDefault>
    </options>
    <options>
      <label>Option 2</label>
      <value>option_2</value>
      <isDefault>>false</isDefault>
    </options>
  </inputs>
</SvcCatalogItemDef>
```

```

    </options>
    <options>
      <label>Option 3</label>
      <value>option_3</value>
      <isDefault>false</isDefault>
    </options>
  </inputs>
</SvcCatalogItemDef>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SynonymDictionary

---

Represents a set of synonym groups, which are groups of words or phrases that are treated as equivalent in users' searches. You can define synonym groups to optimize search results for acronyms, variations of product names, and other terminology unique to your organization.

Synonyms are available in Service Cloud features such as Salesforce Knowledge. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

SynonymDictionary components have the suffix `.synonymDictionary` and are stored in the `synonymDictionaries` folder.

## Version

SynonymDictionary components are available in API version 29.0 and later.

## Special Access Rules

Synonyms must be enabled in your organization. Only users with the "Manage Synonyms" permission can access this object.

## Fields

Field Name	Field Type	Description
<code>groups</code>	<a href="#">SynonymGroup</a>	The synonym groups defined in this dictionary.
<code>isProtected</code>	boolean	Indicates whether this component is protected ( <code>true</code> ) or not ( <code>false</code> ). Protected components cannot be linked to or referenced by components created in the installing organization.
<code>label</code>	string	Required. Specifies the display name of the synonym dictionary.

## SynonymGroup

Represents a group of synonymous words or phrases.

Field Name	Field Type	Description
languages	<a href="#">Language</a> on page 2085	Required. Specifies the languages the synonym group applies to. If synonyms are specific to a single language, specify only that language. If the synonyms apply to multiple languages, specify multiple languages for one synonym group.
terms	string	Required. A word or phrase synonymous with other terms in the group. Maximum of 50 characters. Minimum of two <code>terms</code> per group.  Synonym groups are symmetric, which means that if oranges and apples are defined in a synonym group, a search for <i>oranges</i> will return a match for <i>apples</i> , and vice versa for a search for <i>apples</i> .

## Declarative Metadata Sample Definition

The following is an example of a SynonymDictionary component:

```
<?xml version="1.0" encoding="UTF-8"?>
<SynonymDictionary xmlns="http://soap.sforce.com/2006/04/metadata">
  <groups>
    <languages>en_US</languages>
    <terms>Salesforce</terms>
    <terms>salesforce.com</terms>
    <terms>The Customer Company</terms>
    <terms>SFDC</terms>
  </groups>
  <groups>
    <languages>fr</languages>
    <terms>renault</terms>
    <terms>clio</terms>
  </groups>
  <label>Sample Dictionary</label>
</SynonymDictionary>
```

The following is an example `package.xml` that references the SynonymDictionary component.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Sample Dictionary</members>
    <name>SynonymDictionary</name>
  </types>
  <version>62.0</version>
</Package>
```

## Usage

If you have existing synonym groups defined before API version 29.0, your existing groups are associated with a default dictionary called `_Default`.

If you have a set of synonyms that require frequent updates, we recommend assigning the synonym group or groups to a dedicated dictionary with a small number of groups. Each time you deploy an existing dictionary, all of its synonym groups are overwritten. We don't support deploying updates to only a single synonym group within a dictionary.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Territory

---

Represents a territory in your organization.

## Declarative Metadata File Suffix and Directory Location

The file suffix for territory components is `.territory` and components are stored in the `territories` directory of the corresponding package directory.

## Version

Territory components are available in API version 24.0 and later.

## Fields

This metadata type extends to subtype [RoleOrTerritory](#).

Field Name	Field Type	Description
<code>accountAccessLevel</code>	string	<p>Specifies whether users in this territory can access accounts that are assigned to this territory and are otherwise inaccessible. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Read</code></li> <li>• <code>Edit</code></li> <li>• <code>All</code></li> </ul> <p>If your organization's sharing model for accounts is Public Read/Write, valid values are only <code>Edit</code> and <code>All</code>.</p> <p>If no value is set for this field, this field value uses the default access level that is specified in the Manage Territory page in Setup.</p> <p>This field is available in API version 31.0 and later.</p>
<code>fullName</code>	string	<p>The unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with</p>

Field Name	Field Type	Description
		a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component. Corresponds to <b>Territory Name</b> in the user interface.
parentTerritory	string	The territory above this territory in the territory hierarchy.

## Declarative Metadata Sample Definition

The following is the definition of a territory.

```
<?xml version="1.0" encoding="UTF-8"?>
<Territory xmlns="http://soap.sforce.com/2006/04/metadata">
  <accountAccessLevel>Edit</accountAccessLevel>
  <caseAccessLevel>Edit</caseAccessLevel>
  <contactAccessLevel>Edit</contactAccessLevel>
  <description>Sample Territory</description>
  <mayForecastManagerShare>>false</mayForecastManagerShare>
  <name>T22name</name>
  <opportunityAccessLevel>Read</opportunityAccessLevel>
</Territory>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Territory2

Represents the metadata associated with a sales territory in Territory Management 2.0. This type extends the [Metadata](#) metadata type and inherits its `fullName` field. Available only if Territory Management 2.0 has been enabled for your organization.

## File Suffix and Directory Location

Territory2 components have the suffix `territory2` and are stored in the `territories` folder under the folder for the corresponding Territory2Model.

## Version

Territory2 components are available in API version 32.0 and later.

## Special Access Rules

The Territory2Model object has a `State` field in the SOAP API. States include `Planning`, `Active`, `Archived`, and several other states, such as `Cloning`, that indicate that a process is underway. Users who do not have the Manage Territories permission can access only territories that belong to the model in `Active` state. The Manage Territories permission is required for `deploy()` calls for all territory management entities. Using `retrieve()` without the Manage Territories permission returns only entities that belong to a

Territory2Model in `Active` state. We recommend against retrieving without the Manage Territories permission because the call retrieves only partial data.

## Fields

Field Name	Field Type	Description
<code>accountAccessLevel</code>	string	<p>Specifies whether users in this territory can access accounts that are assigned to this territory and are otherwise inaccessible. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Read</code></li> <li>• <code>Edit</code></li> <li>• <code>All</code></li> </ul> <p>If your organization's sharing model for accounts is Public Read/Write, valid values are only <code>Edit</code> and <code>All</code>. If no value is set for this field, this field value uses the default access level that is specified in <code>Territory2Settings</code> as permitted by the organization's sharing settings.</p>
<code>caseAccessLevel</code>	string	<p>Specifies whether users in this territory can access cases that are assigned to this territory and are otherwise inaccessible. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>None</code></li> <li>• <code>Read</code></li> <li>• <code>Edit</code></li> </ul> <p>Specify no value if your organization's sharing model for cases/opportunities is Public Read/Write. If no value is set for this field, this field value uses the default access level that is specified in <code>Territory2Settings</code> as permitted by the organization's sharing settings.</p>
<code>contactAccessLevel</code>	string	<p>Specifies whether users in this territory can access contacts that are assigned to this territory and are otherwise inaccessible. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>None</code></li> <li>• <code>Read</code></li> <li>• <code>Edit</code></li> </ul> <p>Specify no value if your organization's sharing model for contacts is Public Read/Write or Controlled By Parent.</p>
<code>customFields</code>	<a href="#">FieldValue</a>	<p>Values for custom fields defined on the Territory2 object and used by this territory. Their metadata is captured separately in <a href="#">CustomObject</a> on page 598. Note the following:</p> <ul style="list-style-type: none"> <li>• Territory2 and Territory2Model objects do not handle values for Text Area (Long), Text Area (Rich), and text-encrypted custom fields.</li> <li>• Fields are referenced using their API names. Compound field types like Location appear as their constituent column fields. For example,</li> </ul>

Field Name	Field Type	Description
		<p><code>nnn_Latitude__s</code>, <code>nnn_Longitude__s</code> where “nnn” is the field name and the suffixes are the geolocation components.</p> <ul style="list-style-type: none"> <li>Values of required custom fields are enforced during the <code>deploy()</code> operation.</li> </ul>
<code>description</code>	string	A description of the territory.
<code>name</code>	string	Required. The user interface label for the territory.
<code>objectAccessLevels</code>	<a href="#">Territory2AccessLevel[]</a>	Represents the user access levels of an object associated to a territory. Available in API version 57.0 and later.
<code>opportunityAccessLevel</code>	string	<p>Specifies whether users in this territory can access opportunities that are assigned to this territory and are otherwise inaccessible. Valid values are:</p> <ul style="list-style-type: none"> <li>None</li> <li>Read</li> <li>Edit</li> </ul> <p>Specify no value if your organization’s sharing model for cases/opportunities is Public Read/Write. If no value is set for this field, this field value uses the default access level that is specified in <code>Territory2Settings</code> as permitted by the organization’s sharing settings.</p>
<code>parentTerritory</code>	string	The name of the territory’s parent. When you specify the parent territory, use the developer name. Do not use the “fully qualified” name. Custom fields with no values are retrieved with values of type: <code>&lt;value xsi:nil="true"/&gt;</code> . You can also use <code>&lt;value xsi:nil="true"/&gt;</code> syntax to remove existing values in custom fields.
<code>ruleAssociations</code>	<a href="#">Territory2RuleAssociation[]</a>	Represents an object assignment rule and its association to a territory. Use the developer name of the rule.
<code>territory2Type</code>	string	Required. The territory type that the territory belongs to.

## FieldValue

Represents the values of custom fields on the `Territory2` object. Available in API version 32.0 and later.

Field Name	Field Type	Description
<code>name</code>	string	Required. The user interface label for the territory.
<code>value</code>	any type	The value of the field, which can also be <code>null</code> . The field type is specified in the XML and depends on the field value.

## Territory2AccessLevel

Represents the association of an object access level to a territory. Available in API version 57.0 and later.

Field Name	Field Type	Description
accessLevel	string	<p>Required. Valid values are:</p> <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> <li>• Transfer</li> <li>• All</li> </ul> <p>If your organization's sharing model for accounts is Public Read/Write, valid values are only <code>Edit</code> and <code>All</code>. If no value is set for this field, this field value uses the default access level that is specified in <code>Territory2Settings</code> as permitted by the organization's sharing settings.</p>
objectType	string	Required. The type of object associated to the territory. For example, <code>Lead</code> .

## Territory2RuleAssociation

Represents the association of an object assignment rule to a territory. Available in API version 32.0 and later.

Field Name	Field Type	Description
inherited	boolean	<p>Required. Indicates whether the rule is inherited from a parent territory (<code>true</code>) or local to the current territory (<code>false</code>).</p> <p>Rule inheritance flows from the parent territory where the rule is created to the rule's descendent territories, if any, in the territory model hierarchy. A local rule is created within a single territory and affects that territory only.</p>
ruleName	string	Required. The name of a rule associated with the territory. It isn't necessary to fully qualify <code>ruleName</code> because Metadata API assumes that the rule belongs to the same model as the territory.

## Declarative Metadata Sample Definition

The following example shows the definition of a Territory2 component.

```
<?xml version="1.0" encoding="UTF-8"?>
<Territory2 xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:xsd="http://www.w3.org/2001/XMLSchema">
  <name>USA</name>
  <description>United States sales</description>
  <accountAccessLevel>Edit</accountAccessLevel>
  <opportunityAccessLevel>Read</opportunityAccessLevel>
  <caseAccessLevel>Edit</caseAccessLevel>
  <contactAccessLevel>Edit</contactAccessLevel>
</Territory2>
```

```

<parentTerritory>Worldwide_Sales</parentTerritory>
<territory2Type>Geo</territory2Type>
<objectAccessLevels>
  <accessLevel>All</accessLevel>
  <objectType>Lead</objectType>
</objectAccessLevels>
<ruleAssociations>
  <ruleName>AccRule1</name>
  <inherited>True</inherited>
</ruleAssociations>
<ruleAssociations>
  <ruleName>AccRule2</name>
  <inherited>False</inherited>
</ruleAssociations>
<customFields>
  <name>Activation_DateTime__c</name>
  <value xsi:type="xsd:dateTime">2014-07-16T05:05:00.000Z</value>
</customFields>
<customFields>
  <name>AutoNumber__c</name>
  <value xsi:type="xsd:string">T# 000001</value>
</customFields>
<customFields>
  <name>DeactivationDate__c</name>
  <value xsi:type="xsd:date">2016-07-12</value>
</customFields>
<customFields>
  <name>External_Id__c</name>
  <value xsi:type="xsd:string">AB2345</value>
</customFields>
<customFields>
  <name>ManagersPhone__c</name>
  <value xsi:nil="true"/>
</customFields>
</Territory2>

```

The following is a `package.xml` sample. `FY13` and `FY14` represent the names of territory models and demonstrate that rules can have identical developer names within different models. A wildcard character (\*) in place of the model name can be used to retrieve all rules in all models in an organization.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>FY13</members>
    <members>FY14</members>
    <name>Territory2Model</name>
  </types>

  <types>
    <members>FY13.USA</members>
    <members>FY13.Worldwide_Sales</members>
    <members>FY14.APAC</members>
    <members>FY14.USA</members>
    <name>Territory2</name>
  </types>

```

```
</types>

<version>62.0</version>
</Package>
```

## Usage

- Triggers defined on Territory2 do *not* fire during a `deploy()` operation unless there is a deployment failure. For example, when a child territory references a parent and deploys before the parent territory, the failed components try to deploy again one at a time, allowing triggers to run.
- Territory Management 2.0 components don't support packaging or change sets and aren't supported in [CRUD calls](#).
- For unlocked packaging, Territory2 requires packages without a namespace.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Territory2Model

---

Represents the metadata associated with a territory model in Territory Management 2.0. This type extends the [Metadata](#) metadata type and inherits its `fullName` field. Available only if Territory Management 2.0 has been enabled for your Salesforce org.

## File Suffix and Directory Location

Territory2Model components have the suffix `territory2Model` and are stored in the `territory2Models` folder.

## Version

Territory2Model components are available in API version 32.0 and later.

## Special Access Rules

The Territory2Model object has a `State` field in the SOAP API. States include `Planning`, `Active`, `Archived`, and several other states, such as `Cloning`, that indicate that a process is underway. Users who do not have the Manage Territories permission can access only models in `Active` state. The Manage Territories permission is required for `deploy()` calls for all territory management entities. Using `retrieve()` without the Manage Territories permission returns only entities that belong to a Territory2Model in `Active` state. We recommend against retrieving without the Manage Territories permission because the call retrieves only partial data.

## Fields

Field Name	Field Type	Description
customFields	FieldValue	<p>Custom fields defined on the Territory2Model object and used by this model. Their metadata is captured separately.</p> <ul style="list-style-type: none"> <li>• Territory2 and Territory2Model objects do not handle values for Text Area (Long), Text Area (Rich), and text-encrypted custom fields.</li> <li>• Fields are referenced using their API names. Compound field types like Location appear as their constituent column fields. For example, <code>nnn_Latitude__s</code>, <code>nnn_Longitude__s</code> where “nnn” is the field name and the suffixes are the geolocation components.</li> <li>• Values of required custom fields are enforced during the <code>deploy()</code> operation.</li> </ul>
description	string	A description for the territory model.
name	string	Required. The user interface label for the territory model.

## Declarative Metadata Sample Definition

The following example shows the definition of a Territory2Model component.

```
<?xml version="1.0" encoding="UTF-8"?>
  <Territory2Model xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:xsd="http://www.w3.org/2001/XMLSchema">
  <name>FY13</name>
  <description>Geographic allocation</description>
  <customFields>
    <name>Activation_DateTime__c</name>
    <value xsi:type="xsd:dateTime">2014-07-16T05:05:00.000Z</value>
  </customFields>
  <customFields>
    <name>AutoNumber__c</name>
    <value xsi:type="xsd:string">M# 000001</value>
  </customFields>
  <customFields>
    <name>DeactivationDate__c</name>
    <value xsi:type="xsd:date">2016-07-12</value>
  </customFields>
  <customFields>
    <name>External_Id__c</name>
    <value xsi:nil="true"/>
  </customFields>
</Territory2Model>
```

## Usage

- The `retrieve()` call *does not* return models in these four states: `Cloning`, `Cloning Failed`, `Deleting`, and `Deletion Failed`.
- Whenever a model is created, its initial state is `Planning`. You can only do a `deploy()` operation for models in `Planning` or `Active` state. The same requirement applies to territories and rules associated with those models. For example, sometimes you can have a model in `Planning` state on a sandbox org, and a model with the same developer name in `Archived` state on your production org. The `deploy()` operation on production fails because that model's state is `Archived` and that state prevents changes to the model.
- Because of the state restrictions, if you have territory models in different orgs with identical developer names and you attempt a `deploy()` operation, Metadata API attempts to create new models. However, that operation fails because of the developer name conflict. For example, sometimes you can have a model in `Planning` state on a sandbox org, and a model with the same developer name in `Archived` state on your production org. The `deploy()` operation on production fails because that model's state is `Archived` and that state prevents changes to the model.
- If you try to delete a model that has territories, then the `delete()` call changes the model's state to `Deleting` and cascade deletes all territories, rules, and user associations in the model. Deleting can take some time depending on the number of territories in the model.
- Whenever a model is created, its initial state is `Planning`. If a model with the same developer name already exists, it already has a state, so we do not include the `state` field in `Territory2`.
- Territory Management 2.0 components don't support packaging or change sets and aren't supported in [CRUD calls](#).
- Namespaces aren't supported for unlocked packages.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Territory2Rule

---

Represents the metadata associated with a territory assignment rule associated with an object, such as `Account`, in Territory Management 2.0. Available only if Territory Management 2.0 has been enabled for your Salesforce org.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

Territory2Rule components have the suffix `territory2Rule` and are stored in the `rules` folder under the folder for the corresponding `Territory2Model`.

## Version

Territory2Rule components are available in API version 32.0 and later.

## Special Access

The Territory2Model object has a `state` field in SOAP API. States include `Planning`, `Active`, `Archived`, and several other states, such as `Cloning`, that indicate that a process is underway. Users who don't have the Manage Territories permission can access only rules that belong to the model in `Active` state. The Manage Territories permission is required for `deploy()` calls for all territory management entities, in addition to the permissions required by Metadata API. Using `retrieve()` without the Manage Territories permission returns only entities that belong to a Territory2Model in `Active` state. We recommend against retrieving without the Manage Territories permission because the call retrieves only partial data. The SOAP API and the user interface require that a user attempting to create or edit a rule has field-level security access to the fields referenced in the rule item. This restriction is relaxed for Metadata API `deploy()` operations, as they require both Manage Territories and either the Modify Metadata Through Metadata API Functions or Modify All Data permissions.

## Fields

Field Name	Field Type	Description
<code>active</code>	boolean	Required. Indicates whether the rule is active ( <code>true</code> ) or inactive ( <code>false</code> ). Via the API, active rules run automatically when object records are created and edited. The exception is when the value of the <code>IsExcludedFromRealign</code> field on an object record is <code>true</code> , which prevents record assignment rules from evaluating that record.
<code>booleanFilter</code>	string	An advanced filter condition. For example: <code>(1 AND 2) OR 3</code> . Numbering must start at 1 and must be contiguous.
<code>name</code>	string	Required. The user interface label for the rule.
<code>objectType</code>	string	Required. The object that the rule is defined for. For API version 32.0, the only available object is <code>Account</code> .
<code>ruleItems</code>	<a href="#">Territory2RuleItem</a> on page 2070	The items that define a rule's the selection criteria, such as <code>Billing State equals California</code> .

## Territory2RuleItem

Represents the association of a rule item to a rule. Available in API version 32.0 and later.

Field Name	Field Type	Description
<code>field</code>	string	The standard or custom object field that the rule item operates on.
<code>operation</code>	FilterOperation (enumeration of type string)	The criterion to apply for the rule item. For example: <code>equals</code> or <code>starts with</code> . Valid values are: <ul style="list-style-type: none"> <li><code>equals</code></li> <li><code>notEqual</code></li> <li><code>lessThan</code></li> <li><code>greaterThan</code></li> <li><code>lessOrEqual</code></li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>greaterOrEqual</li> <li>contains</li> <li>notContain</li> <li>startsWith</li> <li>includes</li> <li>excludes</li> <li>within (DISTANCE criteria only)</li> </ul>
value	string	The field value or values to evaluate. For example: if the field is <code>Billing ZIP/Postal Code</code> , a value could be <code>94105</code> .

## Declarative Metadata Sample Definition

The following example shows the definition of a `Territory2RuleItem` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<Territory2Rule xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>Northern CA</label>
  <description>To capture northern CA based accounts</description>
  <objectType>Account</objectType>
  <active>True</active>
  <ruleItems>
    <field>BillingZip</field>
    <operation>contains</operation>
    <value><94105,94404,94536/value>
  </ruleItems>
  <ruleItems>
    <field>Industry</field>
    <operation>equals</operation>
    <value>IT</value>
  </ruleItems>
  <ruleItems>
    <field>someCustomField__c</field>
    <operation>greater_than</operation>
    <value>50000</value>
  </ruleItems>
  <booleanFilter>(1 OR 2) AND 3</booleanFilter>
</Territory2Rule>
```

The following is a `package.xml` sample. `FY13` and `FY14` represent names of territory models and demonstrate that rules can have *identical* developer names within *different* models. A wildcard character (\*) in place of the model name can be used to retrieve all rules in all models in an org.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>FY13</members>
```

```
<members>FY14</members>
<name>Territory2Model</name>
</types>

<types>
  <members>FY13.AccRule1</members>
  <members>FY14.AccRule1</members>
  <name>Territory2Rule</name>
</types>

<version>62.0</version>
</Package>
```

## Usage

- A territory rule can have up to 10 rule items.
- The sort order of rule items is implicitly derived from the position of the rule items in the XML
- Rules can't be run via Metadata API.
- Territory Management 2.0 components don't support packaging or change sets and aren't supported in [CRUD calls](#).

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Territory2Type

---

Represents the metadata for a category of territories in Territory Management 2.0. Every Territory2 must have a Territory2Type. This type extends the [Metadata](#) metadata type and inherits its `fullName` field. Available only if Enterprise Territory Management has been enabled for your Salesforce org.

## File Suffix and Directory Location

Territory2Type components have the suffix `territory2Type` and are stored in the `territory2Types` folder.

## Version

Territory2Type components are available in API version 32.0 and later.

## Special Access Rules

The Manage Territories permission is required for the `deploy()` operation, but not `retrieve()`. The `retrieve()` operation retrieves all the Territory2Type components in the org.

## Fields

Field Name	Field Type	Description
<code>description</code>	string	A description of the territory type.
<code>name</code>	string	Required. The user interface label for the territory type.
<code>priority</code>	int	Required. Used for Filter-Based Opportunity Territory Assignment (Pilot in Spring '15 / Metadata API version 33). Lets you specify a priority for a territory type. For opportunity assignments, the filter examines all territories assigned to the account that the opportunity is assigned to. The account-assigned territory whose territory type priority is highest is then assigned to the opportunity. The <code>priority</code> field value on each territory type must be unique. Further, if there are multiple territories with the same territory type, and therefore the same priority, assigned to the account, no territory is not assigned to the opportunity.

## Declarative Metadata Sample Definition

The following example shows the definition of a Territory2Type component.

```
<?xml version="1.0" encoding="UTF-8"?>
<Territory2Type xmlns="http://soap.sforce.com/2006/04/metadata">
  <name>Geo</name>
  <description>Geographic allocation</description>
</Territory2Type>
```

## Usage

Territory Management 2.0 components don't support packaging or change sets and aren't supported in [CRUD calls](#).

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## TimelineObjectDefinition

Represents the container that stores the details of a timeline configuration. You can use this resource with Salesforce objects to see their records' related events in a linear time-sorted view.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

TimelineObjectDefinition components have the suffix `.timelineObjectDefinition` and are stored in the `timelineObjectDefinitions` folder.

## Version

TimelineObjectDefinition components are available in API version 55.0 and later.

## Special Access Rules

The Health Cloud or Life Sciences Cloud license is required to use this metadata type.

## Fields

Field Name	Description
<code>baseObject</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>The object on which a timeline is based. Information displayed in a timeline comes from objects that are related to the base object. The base object can be a Salesforce object or custom object.</p>
<code>definition</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>The timeline definition in JSON format.</p>
<code>isActive</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the timeline is active (<code>true</code>) or not (<code>false</code>).</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p>

```
<name>TimelineObjectDefinition</name>
</types>
<version>55.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## TimeSheetTemplate

Represents a template for creating time sheets in Field Service. This type extends the Metadata metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

TimeSheetTemplate components have the suffix `timeSheetTemplate` and are stored in the `timeSheetTemplates` folder.

## Version

TimeSheetTemplate components are available in API version 46.0 and later.

## Special Access Rules

Field Service must be enabled. Users must have the Customize Application and Time Sheet Template permissions.

## Fields

Field Name	Field Type	Description
<code>active</code>	boolean	Required. Indicates whether the time sheet template is active ( <code>true</code> ) or not ( <code>false</code> ).
<code>description</code>	string	The time sheet template's description.
<code>frequency</code>	TimeSheetFrequency (enumeration of type string)	Required. Defines the frequency of the time sheet creation period. One of the following values: <ul style="list-style-type: none"> <li>Daily</li> <li>Weekly</li> <li>EveryTwoWeeks</li> <li>TwiceAMonth</li> <li>Monthly</li> </ul>

Field Name	Field Type	Description
masterLabel	string	Required. The name of the time sheet template.
startDate	date	Required. The date when the time sheet takes effect.
timeSheetTemplateAssignments	<a href="#">TimeSheetTemplateAssignment</a>	A list of profiles that the template is assigned to.
workWeekEndDay	DaysOfWeek (enumeration of type string)	Required. The end day of the template's work week. One of the following values: <ul style="list-style-type: none"> <li>Monday</li> <li>Tuesday</li> <li>Wednesday</li> <li>Thursday</li> <li>Friday</li> <li>Saturday</li> <li>Sunday</li> </ul>
workWeekStartDay	DaysOfWeek (enumeration of type string)	Required. The start day of the template's work week. One of the following values: <ul style="list-style-type: none"> <li>Monday</li> <li>Tuesday</li> <li>Wednesday</li> <li>Thursday</li> <li>Friday</li> <li>Saturday</li> <li>Sunday</li> </ul>

## TimeSheetTemplateAssignment

Returns a quick action that's associated with an EmbeddedServiceLiveAgent setup. The quick action includes the pre-chat form fields that the embedded chat window displays and shows the order in which the fields are displayed.

Field Name	Field Type	Description
assignedTo	string	The IDs of the user profiles that a time sheet template is assigned to.

## Declarative Metadata Sample Definition

The following is an example of a TimeSheetTemplate file.

```
<?xml version="1.0" encoding="UTF-8"?>
<TimeSheetTemplate xmlns="http://soap.sforce.com/2006/04/metadata">
  <active>true</active>
  <description>Time Sheet Template description</description>
  <frequency>Daily</frequency>
```

```

<masterLabel>label</masterLabel>
<startDate>2018-10-18</startDate>
<timeSheetTemplateAssignments>
  <assignedTo>admin</assignedTo>
</timeSheetTemplateAssignments>
<timeSheetTemplateAssignments>
  <assignedTo>standard</assignedTo>
</timeSheetTemplateAssignments>
<workWeekEndDay>Tuesday</workWeekEndDay>
<workWeekStartDay>Monday</workWeekStartDay>
</TimeSheetTemplate>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>TimeSheetTemplate</name>
  </types>
  <version>46.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## TopicsForObjects

---

Represents the ability to assign topics to objects or to remove topic assignments.

### File Suffix and Directory Location

TopicsForObjects components have the suffix `.topicsForObjects` and are stored in the `topicsForObjects` folder of the corresponding package directory.

### Version

TopicsForObjects components are available in API version 41.0 and later.

## Fields

Field Name	Field Type	Description
enableTopics	boolean	<p>Required. When true, indicates whether users can assign topics or remove topic assignments. When false, users can't assign or remove topics.</p> <p>Upon org creation, this value is true for the following objects:</p> <ul style="list-style-type: none"> <li>• Account</li> <li>• Asset</li> <li>• Campaign</li> <li>• Case</li> <li>• Contact</li> <li>• Content Document</li> <li>• Contract</li> <li>• Event</li> <li>• Lead</li> <li>• Opportunity</li> <li>• Order</li> <li>• Solution</li> <li>• Task</li> </ul> <p>For all remaining standard objects and custom objects, the default is false.</p>
entityApiName	string	Required. Indicates the object's API name for enabling topics.

## Declarative Metadata Sample Definition

The following is an example of a TopicsForObjects component.

```
<?xml version="1.0" encoding="UTF-8"?>
<TopicsForObjects xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableTopics>false</enableTopics>
  <entityApiName>Account</entityApiName>
</TopicsForObjects>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>TopicsForObjects</name>
  </types>
  <version>41.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## TransactionSecurityPolicy

---

Represents a transaction security policy definition. Transaction security policies give you a way to look through events in your organization and specify actions to take when certain combinations occur.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

TransactionSecurityPolicy components have the suffix `.transactionSecurityPolicy` and are stored in the `transactionSecurityPolicies` folder.

## Version

TransactionSecurityPolicy components are available in API version 35.0 and later.

## Fields

Field Name	Field Type	Description
<code>action</code>	<a href="#">TransactionSecurityAction</a>	Required. Describes the action to take when the matching Transaction Security policy is triggered.
<code>active</code>	boolean	Required. If <code>true</code> , the policy is enabled and actively monitors its event.
<code>apexClass</code>	string	Required for Apex-based policies, and optional for all other policies. The name of the class that implements the <code>TxnSecurity.PolicyCondition</code> or <code>TxnSecurity.EventCondition</code> interface for this policy. Available in API version 46.0 and later.
<code>blockMessage</code>	string	The custom message sent to a user when a policy blocks their action. Used in Real-Time Event Monitoring only. Maximum of 1000 characters. This field is null when the default message option is selected in the UI. Available only when <code>eventName</code> is set to <code>ApiEvent</code> , <code>ListViewEvent</code> , <code>BulkApiResponseEventStore</code> , or <code>ReportEvent</code> . Available in API version 49.0 and later.  Include org- or policy-specific information in your custom message, such as the name of the responsible administrator or the business

Field Name	Field Type	Description
		<p>unit. Be careful about what you include. Too much information on how the policy was designed. can aid a malicious user.</p> <p>Two-factor authentication (2FA) isn't supported in Lightning Experience, so events like <code>Listview</code> and <code>ReportEvent</code> are upgraded to <code>Block</code> in Lightning.</p> <p>Custom messages aren't translatable.</p>
<code>customEmailContent</code>	string	<p>The administrator-created custom email content sent when a policy is triggered. Used in Real-Time Event Monitoring only. Maximum of 1333 characters. This field is null when the Custom Email Content setting is selected in the UI but no message content is entered. Available in API version 54.0 and later.</p> <p>Custom messages aren't translatable.</p>
<code>description</code>	string	A description of the policy.
<code>developerName</code>	string	<p>This unique name prevents conflicts with other policies that have the same <code>masterLabel</code>. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p> <p>Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
<code>eventName</code>	TransactionSecurityEventName (enumeration of type string)	<p>Used in Real-Time Event Monitoring only. Indicates the name of the event the policy monitors. This field is available in API 45.0 and later. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>ApiEvent</code>—Tracks these user-initiated read-only API calls: <code>query()</code>, <code>queryMore()</code>, and <code>count()</code>. Captures API requests through SOAP API and Bulk API for the Enterprise and Partner WSDLs. Tooling API calls and API calls originating from a Salesforce mobile app aren't captured.</li> <li>• <code>ApiAnomalyEventStore</code>—Tracks anomalies in how users make API calls. <code>ApiAnomalyEventStore</code> is an object that stores the event data of <code>ApiAnomalyEvent</code>. This object is available in API version 50.0 and later.</li> <li>• <code>BulkApiResponseEventStore</code>—Tracks when a user downloads the results of a Bulk API request. <code>BulkApiResponseEventStore</code> is a big object that stores the event data of <code>BulkApiResponseEvent</code>. This object is available in API version 50.0 and later.</li> <li>• <code>CredentialStuffingEventStore</code>—Tracks when a user successfully logs into Salesforce during an identified credential stuffing attack. Credential stuffing refers to</li> </ul>

Field Name	Field Type	Description
		<p>large-scale automated login requests using stolen user credentials. This value is available in API version 49.0 and later.</p> <ul style="list-style-type: none"> <li>• <code>FileEventStore</code> (beta)—Tracks when a user downloads, previews, or uploads a file. <code>FileEventStore</code> is a big object that stores the event data of <code>FileEvent</code>. This object is available in API version 57.0 and later.</li> <li>• <code>ListViewEvent</code>—Tracks when users access data with list views using Lightning Experience, Salesforce Classic, or the API. It doesn't track list views of Setup entities.</li> <li>• <code>LoginEvent</code>—<code>LoginEvent</code> tracks the login activity of users who log in to Salesforce.</li> <li>• <code>PermissionSetEventStore</code> —Tracks changes to permission sets and permission set groups.</li> <li>• <code>ReportAnomalyEventStore</code>—Tracks anomalies in how users run or export reports, including unsaved reports. This value is available in API version 49.0 and later.</li> <li>• <code>ReportEvent</code>—Tracks when reports are run in your org.</li> <li>• <code>SessionHijackingEventStore</code>—Tracks when unauthorized users gain ownership of a Salesforce user's session with a stolen session identifier. To detect such an event, Salesforce evaluates how significantly a user's current browser fingerprint diverges from the previously known fingerprint using a probabilistically inferred significance of change. Available in API version 49.0 and later.</li> </ul>
<code>eventType</code>	MonitoredEvents (enumeration of type string)	<p>Used in Legacy Transaction Security only. Required for Apex-based policies, and optional for all other policies. Indicates which type of event is being monitored. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>AccessResource</code>—Notifies you when the selected resource has been accessed.</li> <li>• <code>AuditTrail</code>—Reserved for future use.</li> <li>• <code>DataExport</code>—Notifies you when the selected object type has been exported using the Data Loader API client.</li> <li>• <code>Entity</code>—Notifies you on use of an object type such as an authentication provider or Chatter comment.</li> <li>• <code>Login</code>—Notifies you when a user logs in.</li> </ul> <p>As of Summer '20, Legacy Transaction Security is a retired feature in all Salesforce orgs.</p>
<code>executionUser</code>	string	<p>Used in Legacy Transaction Security only. The name or ID of an active user who is assigned the Modify All Data and View Setup user permissions.</p> <p>As of Summer '20, Legacy Transaction Security is a retired feature in all Salesforce orgs.</p>

Field Name	Field Type	Description
flow	string	Required only for policies of type <code>CustomConditionBuilderPolicy</code> . The ID of the Flow object that contains the logic the Condition Builder transaction security policy. Available in API version 46.0 and later.
masterLabel	string	The label for this object. This display value is the internal label that isn't translated.  Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.
resourceName	string	Used in Legacy Transaction Security only. Required for Apex-based policies, and optional for all other policies. A resource used to narrow down the conditions under which the policy triggers. For example, with a <code>DataExport</code> event, you can select a resource <code>Lead</code> to specifically monitor export activity occurring on your Lead entities. The resources available depend on the <a href="#">Event Type</a> field. The following valid resources are grouped by event type. <ul style="list-style-type: none"> <li>• <code>AccessResource</code>—<code>ConnectedApplication</code>, <code>Reports</code></li> <li>• <code>DataExport</code>—<code>Account</code>, <code>Case</code>, <code>Contact</code>, <code>Lead</code>, <code>Opportunity</code></li> <li>• <code>Entity</code>—<code>AuthProvider</code>, <code>ChatterMessage</code>, <code>FeedComment</code>, <code>FeedItem</code>, <code>Idea</code>, <code>Question</code></li> <li>• <code>Login</code>—<code>LoginHistory</code></li> </ul> As of Summer '20, Legacy Transaction Security is a retired feature in all Salesforce orgs.
type	<code>TxnSecurityPolicyType</code> ( <a href="#">enumeration</a> of type string)	The type of validation that the policy uses. The valid values are: <ul style="list-style-type: none"> <li>• <code>CustomApexPolicy</code>— Created with Apex editor.</li> <li>• <code>CustomConditionBuilderPolicy</code>— Created with Condition Builder.</li> </ul> The default value is <code>CustomApexPolicy</code> .

## TransactionSecurityAction

Describes the action to take when the matching Transaction Security policy is triggered.

Field Name	Field Type	Description
block	boolean	If <code>true</code> , the requested operation is blocked. This action only applies to <code>Login</code> and <code>AccessResource</code> events.

Field Name	Field Type	Description
endSession	boolean	Used in Legacy Transaction Security only. If <code>true</code> , a current session must be closed before a new session can be started. This action only applies to Login events.  As of Summer '20, Legacy Transaction Security is a retired feature in all Salesforce orgs.
freezeUser	boolean	Used in Legacy Transaction Security only. If <code>true</code> , the user that triggered the policy is frozen. This action only applies to Chatter resources for Entity events.  As of Summer '20, Legacy Transaction Security is a retired feature in all Salesforce orgs.
notifications	<a href="#">TransactionSecurityNotification</a> []	Specifies how to notify the Salesforce administrator when the action is triggered. There can be none, one, or multiple notifications.
twoFactorAuthentication	boolean	If <code>true</code> , multi-factor authentication (MFA) is required for a higher level of access before the requested operation can continue. This action only applies to Login and AccessResource events.  Multi-factor authentication was formerly called two-factor authentication.

## TransactionSecurityNotification

Describes who to notify and how to notify them when the matching Transaction Security policy is triggered.

Field Name	Field Type	Description
inApp	boolean	True if an in-app notification is selected.
sendEmail	boolean	True if an email notification is selected.
user	string	The user to receive the notification.

## Declarative Metadata Sample Definition

The following is an example of a Real-Time Event Monitoring TransactionSecurityPolicy component.

```
<?xml version="1.0" encoding="UTF-8"?>
<TransactionSecurityPolicy xmlns="http://soap.sforce.com/2006/04/metadata">
  <action>
    <block>true</block>
    <notifications>
      <inApp>true</inApp>
      <sendEmail>true</sendEmail>
      <user>user@your.org</user>
    </notifications>
    <twoFactorAuthentication>false</twoFactorAuthentication>
  </action>
</TransactionSecurityPolicy>
```

```

</action>
<active>true</active>
<apexClass>TxnSecMDApiPolicyEventCondition</apexClass>
<blockMessage>You cannot view this report.</blockMessage>
<developerName>TxnSecPolicyMDApi</developerName>
<eventName>ReportEvent</eventName>
<masterLabel>Txn Sec MD Api Policy</masterLabel>
<type>CustomApexPolicy</type>
</TransactionSecurityPolicy>

```

The following is an example package manifest used to deploy or retrieve the transaction security metadata for an organization.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>MySecurityPolicy</members>
    <name>TransactionSecurityPolicy</name>
  </types>
  <version>35.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Translations

Metadata type that enables work with translations for various supported languages. The ability to translate component labels is part of the Translation Workbench.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Language

A two-character language code identifies each language, such as `en`. A five-character code is used for languages that differ depending on location. For example, `en_AU`.

 **Note:** Setting a default language is different from setting a default locale. For more information, see [Select Your Language, Locale, and Currency in Salesforce Help](#).

Salesforce offers full support for these languages.

- Chinese (Simplified): `zh_CN`
- Chinese (Traditional): `zh_TW`
- Danish: `da`
- Dutch: `n1_NL`
- English: `en_US`

- Finnish: `fi`
- French: `fr`
- German: `de`
- Italian: `it`
- Japanese: `ja`
- Korean: `ko`
- Norwegian: `no`
- Portuguese (Brazil): `pt_BR`
- Russian: `ru`
- Spanish: `es`
- Spanish (Mexico): `es_MX` Spanish (Mexico) defaults to Spanish for customer-defined translations.
- Swedish: `sv`
- Thai: `th` The Salesforce user interface is fully translated to Thai, but Help is in English.

End-user languages are useful if you have a multilingual organization or partners who speak languages other than your company's default language. For end-user languages, Salesforce provides translated labels for standard objects and pages, except admin pages, Setup, and Help. Some clouds and features support a subset of these languages in the UI. For details, see [User Interface Language Support](#) in Salesforce Help. When you select an end-user language, labels that aren't translated and Salesforce Help appear in English. End-user languages are intended only for personal use by end users. Don't use end-user languages as corporate languages. Salesforce doesn't provide customer support in end-user languages.

End-user languages include:

- Arabic: `ar`
- Bulgarian: `bg`
- Croatian: `hr`
- Czech: `cs`
- English (UK): `en_GB`
- Greek: `el`
- Hebrew: `iw`
- Hungarian: `hu`
- Indonesian: `in`
- Polish: `pl`
- Portuguese (European): `pt_PT`
- Romanian: `ro`
- Slovak: `sk`
- Slovenian: `sl`
- Turkish: `tr`
- Ukrainian: `uk`
- Vietnamese: `vi`

 **Important:** Before enabling end-user languages Arabic and Hebrew, review the right-to-left language support limitations.

In situations where Salesforce doesn't provide default translations, use platform-only languages to localize apps and custom functionality that you build on the Salesforce Platform. You can translate items such as custom labels, custom objects, and field names. You can also rename most standard objects, labels, and fields. Informational text and non-field label text aren't translatable.

Platform-only languages are available in all places where you can select a language in the application. However, when you select a platform-only language, all standard Salesforce labels default to English or, in select cases, to an end-user or fully supported language.

 **Note:** Language support is closely tied to the API version. For example, we introduced support for Belgian Dutch (nl\_BE) in API version 40.0. To take advantage of this language, you must use API version 40.0 or later. In general, we recommend using the most recent version of the API to make the most of our language features.

Platform-only languages include:

- Albanian: `sq`
- Afrikaans: `af`
- Amharic: `am`
- Arabic (Algeria): `ar_DZ`
- Arabic (Bahrain): `ar_BH`
- Arabic (Egypt): `ar_EG`
- Arabic (Iraq): `ar_IQ`
- Arabic (Jordan): `ar_JO`
- Arabic (Kuwait): `ar_KW`
- Arabic (Lebanon): `ar_LB`
- Arabic (Libya): `ar_LY`
- Arabic (Morocco): `ar_MA`
- Arabic (Oman): `ar_OM`
- Arabic (Qatar): `ar_QA`
- Arabic (Saudi Arabia): `ar_SA`
- Arabic (Sudan): `ar_SD`
- Arabic (Syria): `ar_SY`
- Arabic (Tunisia): `ar_TN`
- Arabic (United Arab Emirates): `ar_AE`
- Arabic (Yemen): `ar_YE`
- Armenian: `hy`
- Basque: `eu`
- Bosnian: `bs`
- Bengali: `bn`
- Burmese: `my`
- Catalan: `ca`
- Chinese (Hong Kong): `zh_HK`
- Chinese (Singapore): `zh_SG`
- Chinese (Malaysia): `zh_MY`
- Dutch (Belgium): `nl_BE`
- English (Australia): `en_AU`

- English (Belgium): en\_BE
- English (Canada): en\_CA
- English (Cyprus): en\_CY
- English (Germany): en\_DE
- English (Hong Kong): en\_HK
- English (India): en\_IN
- English (Ireland): en\_IE
- English (Israel): en\_IL
- English (Malaysia): en\_MY
- English (Malta): en\_MT
- English (Netherlands): en\_NL
- English (New Zealand): en\_NZ
- English (Philippines): en\_PH
- English (Singapore): en\_SG
- English (South Africa): en\_ZA
- English (United Arab Emirates): en\_AE
- Estonian: et
- Farsi: fa
- French (Belgium): fr\_BE
- French (Canada): fr\_CA
- French (Luxembourg): fr\_LU
- French (Morocco): fr\_MA
- French (Switzerland): fr\_CH
- Georgian: ka
- German (Austria): de\_AT
- German (Belgium): de\_BE
- German (Luxembourg): de\_LU
- German (Switzerland): de\_CH
- Greek (Cyprus): el\_CY
- Greenlandic: kl
- Gujarati: gu
- Hawaiian: haw
- Haitian Creole: ht
- Hindi: hi
- Hmong: hmn
- Icelandic: is
- Irish: ga
- Italian (Switzerland): it\_CH
- Kannada: kn
- Kazakh: kk

- Khmer: km
- Latvian: lv
- Lithuanian: lt
- Luxembourgish: lb
- Macedonian: mk
- Malay: ms
- Malayalam: ml
- Maltese: mt
- Marathi: mr
- Montenegrin: sh\_ME
- Punjabi: pa
- Romanian (Moldova): ro\_MD
- Romansh: rm
- Russian (Armenia): ru\_AM
- Russian (Belarus): ru\_BY
- Russian (Kazakhstan): ru\_KZ

- Russian (Lithuania): ru\_LT
- Russian (Moldova): ru\_MD
- Russian (Poland): ru\_PL
- Russian (Ukraine): ru\_UA
- Samoan: sm
- Serbian (Cyrillic): sr
- Serbian (Latin): sh
- Spanish (Argentina): es\_AR
- Spanish (Bolivia): es\_BO
- Spanish (Chile): es\_CL
- Spanish (Colombia): es\_CO
- Spanish (Costa Rica): es\_CR
- Spanish (Dominican Republic): es\_DO
- Spanish (Ecuador): es\_EC
- Spanish (El Salvador): es\_SV
- Spanish (Guatemala): es\_GT
- Spanish (Honduras): es\_HN
- Spanish (Nicaragua): es\_NI
- Spanish (Panama): es\_PA
- Spanish (Paraguay): es\_PY
- Spanish (Peru): es\_PE
- Spanish (Puerto Rico): es\_PR
- Spanish (United States): es\_US

- Spanish (Uruguay): `es_UY`
- Spanish (Venezuela): `es_VE`
- Swahili: `sw`
- Tagalog: `tl`
- Tamil: `ta`
- Te reo: `mi`
- Telugu: `te`
- Urdu: `ur`
- Welsh: `cy`
- Xhosa: `xh`
- Yiddish: `ji`
- Zulu: `zu`

 **Important:** Before enabling Urdu as a platform-only language, review the right-to-left language support limitations.

## Declarative Metadata File Suffix and Directory Location

Local translations are stored in a file with a format of `localeCode.translation`, where `localeCode` is the locale code of the translation language. For example, the file name for German translations is `de.translation`. Packaged translations are stored in a file with a format of `pkgNamespace__localeCode.translation`. For example, if the package namespace is `Acme`, the file name for German translations installed by the package is `Acme__de.translation`. The supported locale codes are listed in [Language](#).

Custom object translations are stored in the `objectTranslations` folder in the corresponding package directory.

## Version

Translations components are available in API version 14.0 and later.

## Fields

Field	Field Type	Description
<code>bots</code>	<a href="#">BotTranslation[]</a>	A list of bot translations. Available in API version 53.0 and later.
<code>customApplications</code>	<a href="#">CustomApplicationTranslation[]</a>	A list of custom application translations.
<code>customLabels</code>	<a href="#">CustomLabelTranslation[]</a>	A list of custom label translations.
<code>customPageWebLinks</code>	<a href="#">CustomPageWebLinkTranslation[]</a>	A list of translations for web links defined in a home page component.
<code>customTabs</code>	<a href="#">CustomTabTranslation[]</a>	A list of custom tab translations.
<code>desFieldTemplateMessages</code>	<a href="#">ExplainabilityMsgTemplateFieldTranslation[]</a>	A list of admin-configured explainability message templates.

Field	Field Type	Description
flowDefinitions	<a href="#">FlowDefinitionTranslation[]</a>	A list of flow translations. Only Flow and AutolaunchedFlow types are supported for translation. This field is available in API version 41.0 and later.
identityVerificationCustomFieldLabels	<a href="#">IdentityVerificationFieldTranslation</a>	A list of identity verification translation fields. This field is available in API version 54.0 and later.
fullName	string	Required. The language code. For example, de for German.  Inherited from <a href="#">Metadata</a> , this field is defined in the WSDL for this metadata type. It must be specified when creating, updating, or deleting. For an example of this field specified for a call, see <a href="#">createMetadata()</a> .
globalPicklists	<a href="#">GlobalPicklistTranslation[]</a>	A list of global picklist translations. A global picklist's value set is inherited by all the custom picklist fields that are based on it.  This field is available in API version 37.0 only and is removed from later versions.
pipelineInspMetricConfigs	<a href="#">PipelineInspMetricConfigTranslation</a>	A list of translations of Pipeline Inspection forecast category metric settings. This field is available in API version 57.0 and later.
prompts	<a href="#">PromptTranslation</a>	A list of In-App Guidance prompt translations. This field is available in API version 48.0 and later.
quickActions	<a href="#">GlobalQuickActionTranslation[]</a>	A list of global rather than object-specific quick actions.
reportTypes	<a href="#">ReportTypeTranslation[]</a>	A list of report type translations.
scontrols	<a href="#">ScontrolTranslation[]</a>	A list of s-control translations.

## BotTranslation

BotTranslation contains details for a translation of a bot. Available in API version 53.0 and later.

Field	Field Type	Description
botVersions	<a href="#">BotVersionTranslation[]</a>	A list of bot version translations.
fullName	string	Required. Name of the bot.  The <code>fullName</code> for the translation must match the <code>fullName</code> inherited by the original Bot type.

## BotVersionTranslation

BotVersionTranslation contains details for a translation of a bot version. Available in API version 53.0 and later.

Field	Field Type	Description
botDialogs	<a href="#">BotDialogTranslation</a> []	A translated list of dialogs in this bot version.
fullName	string	Required. Name of a bot version. The <code>fullName</code> for the translation must match the <code>fullName</code> inherited by the original BotVersion type.

## BotDialogTranslation

BotDialogTranslation contains details for a translation of a bot dialog. Available in API version 53.0 and later.

Field	Field Type	Description
botSteps	<a href="#">BotStepTranslation</a> []	A translated list of steps that are executed as part of the dialog.
developerName	string	Required. This unique name prevents conflicts with other dialogs associated with the same bot version. The <code>developerName</code> for the translation must match the <code>developerName</code> on the original BotDialog subtype of BotVersion.
label	string	A translated label that identifies the dialog throughout the Salesforce user interface.

**Note:** In Metadata Deployment of Translations, it's expected that blank values cannot be used to delete existing translations. If a translation label is left blank, it's skipped during deployment, and no error will be shown.

## BotStepTranslation

BotStepTranslation contains details for a translation of a bot step. Available in API version 53.0 and later.

Field	Field Type	Description
botMessages	<a href="#">BotMessageTranslation</a> []	A translated list of bot messages used by a BotStep of type Message.
botSteps	<a href="#">BotStepTranslation</a> []	A translated list of bot steps associated with a BotStep of type Group.
botVariableOperation	<a href="#">BotVariableOperationTranslation</a>	A translated bot variable operation used by a BotStep of type VariableOperation.
stepIdentifier	string	Required. A unique key that identifies a step within a dialog. This key is used to link translated labels to labels within the step. This

Field	Field Type	Description
		field is recommended for all step records and is required for translated step labels.  The <code>stepIdentifier</code> for the translation must match the <code>stepIdentifier</code> on the original BotStep subtype of BotVersion.
<code>type</code>	BotStepType (enumeration of type string)	Required. Valid values are: <ul style="list-style-type: none"> <li>• Navigation</li> <li>• Invocation</li> <li>• VariableOperation</li> <li>• Message</li> <li>• Wait</li> <li>• Group</li> <li>• RecordLookup (Available in API version 48.0 and later.)</li> </ul> The <code>type</code> for the translation must match the <code>type</code> on the original BotStep subtype of BotVersion.

## BotMessageTranslation

BotMessageTranslation contains details for a translation of a bot message step. Available in API version 53.0 and later.

Field	Field Type	Description
<code>message</code>	string	A translated message to display as part of an outgoing message from the bot to the customer.
<code>messageIdentifier</code>	string	Required. A unique key that identifies a message within a dialog. This key is used to link translated labels to labels within the message. This field is recommended for all message records and is required for translated message labels.  The <code>messageIdentifier</code> for the translation must match the <code>messageIdentifier</code> on the original BotMessage subtype of BotVersion.

## BotVariableOperationTranslation

BotVariableOperationTranslation contains details for a translation of a bot variable operation (question) step. Available in API version 53.0 and later.

Field	Field Type	Description
<code>botMessages</code>	<a href="#">BotMessageTranslation</a> on page 2093[]	A translated list of bot messages used as prompt messages by a BotVariableOperation of type <code>Collect</code> .

Field	Field Type	Description
<code>botQuickReplyOptions</code>	<a href="#">BotQuickReplyOptionTranslation</a> on page 2094[]	A translated list of static choice options used by a <code>BotVariableOperation</code> of type <code>Collect</code> and <code>quickReplyType</code> of <code>Static</code> .
<code>quickReplyOptionTemplate</code>	string	A translated formula template used to resolve a label for Dynamic choice options of type <code>Object</code> .
<code>retryMessages</code>	<a href="#">BotMessageTranslation</a> on page 2093[]	In <a href="#">Conversation Repair</a> , the translated messages assigned to repair attempts.
<code>successMessages</code>	<a href="#">BotMessageTranslation</a> on page 2093[]	In a File dialog step, the translated message displayed to the customer as part of type <code>CollectAttachment</code> to confirm a successful file upload. Available in API version 57.0 and later.
<code>type</code>	<code>BotVariableOperationType</code> (enumeration of type string)	Required. Valid values are: <ul style="list-style-type: none"> <li>• <code>Set</code></li> <li>• <code>Unset</code></li> <li>• <code>Collect</code></li> <li>• <code>SetConversationLanguage</code></li> </ul>
<code>variableOperationIdentifier</code>	string	Required. A unique key that identifies a variable operation within a dialog. This key is used to link translated labels to labels within the variable operation. This field is recommended for all variable operation records and is required for translated variable operation labels.  The <code>variableOperationIdentifier</code> for the translation must match the <code>variableOperationIdentifier</code> on the original <code>BotVariableOperation</code> subtype of <code>BotVersion</code> .

## BotQuickReplyOptionTranslation

`BotQuickReplyOptionTranslation` contains details for a translation of a bot quick reply option within a bot variable operation (question) step. Available in API version 53.0 and later.

Field	Field Type	Description
<code>literalValue</code>	string	A translated value to be displayed as a menu or button choice to your customer.
<code>quickReplyOptionIdentifier</code>	string	Required. A unique key that identifies a quick reply option within a dialog. This key is used to link translated labels to labels within the quick reply option. This field is recommended for all quick reply option records and is required for translated quick reply option labels.

Field	Field Type	Description
		The <code>quickReplyOptionIdentifier</code> for the translation must match the <code>quickReplyOptionIdentifier</code> on the original <code>BotQuickReplyOption</code> subtype of <code>BotVersion</code> .

## CustomApplicationTranslation

`CustomApplicationTranslation` contains details for a custom application translation. For more details, see [CustomApplication](#).

Field	Field Type	Description
<code>description</code>	string	The optional description text of the application translation.
<code>label</code>	string	Required. The translated custom application name. Maximum of 765 characters.
<code>name</code>	string	Required. The name of the custom application.

## CustomLabelTranslation

`CustomLabelTranslation` contains details for a custom label translation. For more details, see [CustomLabels](#).

Field	Field Type	Description
<code>label</code>	string	Required. The translated custom label name. Maximum of 765 characters.
<code>name</code>	string	Required. The custom label name.

## CustomPageWebLinkTranslation

`CustomPageWebLinkTranslation` contains details for a translation of a web link defined in a home page component. For more details, see [CustomPageWebLink](#).

Field	Field Type	Description
<code>label</code>	string	Required. The translated web link.
<code>name</code>	string	Required. The name of the web link.

## CustomTabTranslation

`CustomTabTranslation` contains details for a translation of a custom tab. For more details, see [CustomTab](#).

Field	Field Type	Description
<code>label</code>	string	Required. The translated custom tab name.

Field	Field Type	Description
name	string	Required. The custom tab name.

## ExplainabilityMsgTemplateFieldTranslation

Represents the template that contains the decision explanation message for a specified step element type.

Field Name	Field Type	Description
description	string	The explainability message field description.
label	string	A user-friendly name for ExplainabilityMsgTemplateFieldTranslation.
name	string	Required. The name of the decision explanation message for a specified step element type.
templateMessage	string	The message associated with the template for a specific expression set step type.

## Declarative Metadata Sample Definition

This is an example of an ExplainabilityMsgTemplateFieldTranslation component.

```
<?xml version="1.0" encoding="UTF-8"?>
<Translations xmlns="http://soap.sforce.com/2006/04/metadata">
  <desFieldTemplateMessages>
    <description>Calc Blitz Message</description>
    <label>CALBLITZ</label>
    <name>CALBLITZ</name>
    <templateMessage>CALBLITZ</templateMessage>
  </desFieldTemplateMessages>
</Translations>
```

## FlowDefinitionTranslation

FlowDefinitionTranslation contains details for a translation of a flow definition. For more details, see [FlowDefinition](#).

Available in API version 41.0 and later.

Field	Field Type	Description
flows	<a href="#">FlowTranslation</a> []	A list of flow version translations for the flow definition.
fullName	string	Required. The API name for the flow definition.

Field	Field Type	Description
label	string	A translated label for the flow definition.  By default, flow definitions inherit the label of the active flow version. If you provide a label here, the definition label no longer inherits changes to the active version label.

## FlowTranslation

FlowTranslation contains details for a translation of a flow version. For more details, see [Flow](#).

Available in API version 41.0 and later.

Field	Field Type	Description
choices	<a href="#">FlowChoiceTranslation</a> []	A list of choice translations for the flow version.
fullName	string	The API name for the flow version.  A unique name for the flow that contains only underscores and alphanumeric characters. The name must be unique across the org, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.  To deploy or retrieve a version, you can specify the version number. For example, <code>sampleFlow-3</code> specifies version 3 of the flow whose unique name is <code>sampleFlow</code> . If you don't specify a version number, the flow is the latest version.  In API version 43.0 and earlier, this field included the version number. In API version 44 and later, this field no longer includes the version number.
label	string	A translated label for the flow version.
screens	<a href="#">FlowScreenTranslation</a> []	A list of screen translations for the flow version.
stages	<a href="#">FlowStageTranslation</a> on page 2099[]	A list of stage translations for the flow version. Available in API version 43.0 and later.

## FlowChoiceTranslation

FlowChoiceTranslation contains details for a translation of a choice in a flow version. For more details, see [FlowChoice](#) in [Flow](#).

Available in API version 41.0 and later.

Field	Field Type	Description
choiceText	string	A translated label for the choice.
name	string	Required. A unique name for the choice.
userInput	<a href="#">FlowChoiceUserInputTranslation</a>	A translated choice input for the choice.

## FlowChoiceUserInputTranslation

FlowChoiceUserInputTranslation contains details for a translation of a choice input. For more details, see FlowChoiceUserInput in [Flow](#). Available in API version 41.0 and later.

Field	Field Type	Description
promptText	string	A translated label for the choice input.
validationRule	<a href="#">FlowInputValidationRuleTranslation</a>	A translated validation rule for the choice input.

## FlowInputValidationRuleTranslation

FlowInputValidationRuleTranslation contains details for a translation of a validation rule. For more details, see FlowInputValidationRule in [Flow](#).

Available in API version 41.0 and later.

Field	Field Type	Description
errorMessage	string	A translated error message for the validation rule.

## FlowScreenTranslation

FlowScreenTranslation contains details for a translation of a screen. For more details, see FlowScreen in [Flow](#).

Available in API version 41.0 and later.

Field	Field Type	Description
backButtonLabel	string	A translated label for the Back button. Available in API version 54.0 and later.
fields	<a href="#">FlowScreenFieldTranslation</a> []	A list of screen component translations for the screen.
helpText	string	Translated help text for the screen.
name	string	Required. An API name for the screen.
nextOrFinishButtonLabel	string	A translated label for the Next or Finish button. Available in API version 54.0 and later.
pauseButtonLabel	string	A translated label for the Pause button. Available in API version 54.0 and later.
pausedText	string	A translated pause confirmation message for the screen.

## FlowScreenFieldTranslation

FlowScreenFieldTranslation contains details for a translation of a screen component. For more details, see FlowScreenField in [Flow](#).

Available in API version 41.0 and later.

 **Note:** Translation isn't supported for screen components that require Lightning runtime.

Field	Field Type	Description
fieldText	string	A translated label for the screen component.
helpText	string	Translated help text for the screen component.
inputParameters	<a href="#">FlowInputParameterTranslation</a>	Reserved for internal use.
name	string	Required. An API name for the screen component.
validationRule	<a href="#">FlowInputValidationRuleTranslation</a>	Translated validation rule for the screen component.

## FlowInputParameterTranslation

FlowInputParameterTranslation is reserved for internal use.

Field	Field Type	Description
name	string	Reserved for internal use.
value	<a href="#">FlowFeroVTranslation</a>	Reserved for internal use.

## FlowFeroVTranslation

FlowFeroVTranslation is reserved for internal use.

Field	Field Type	Description
complexValues	<a href="#">FlowComplexLiteralTranslation</a>	Reserved for internal use.
stringValue	string	Reserved for internal use.

## FlowComplexLiteralTranslation

FlowComplexLiteralTranslation is reserved for internal use.

Field	Field Type	Description
customAspectKey	string	Reserved for internal use.
value	string	Reserved for internal use.

## FlowStageTranslation

FlowStageTranslation contains details for a translation of a stage in a flow version. For more details, see FlowStage in [Flow](#).

Available in API version 43.0 and later.

Field	Field Type	Description
label	string	A translated label for the stage.
name	string	Required. An API name for the stage.

## FlowTextTemplateTranslation

FlowTextTemplateTranslation is available only in flows created via Salesforce Surveys and represents the translation details for the text on all the pages of a survey.

Available in API version 45.0 and later.

Field	Field Type	Description
name	string	Required. Unique name for the text template.
text	string	Translated text for the text template.

## IdentityVerificationFieldTranslation

Translates the UI components associated with identity verification fields.

Available in API version 54.0 and later.

Field	Field Type	Description
customFieldLabel	string	The custom label for the field that contains the verification data.
description	string	The identity verification field description.
label	string	A user-friendly name for IdentityVerificationFieldTranslation.
name	string	Required. The name of the identity verification field.

## Declarative Metadata Sample Definition

This is an example of an IdentityVerificationFieldTranslation component.

```
<?xml version="1.0" encoding="UTF-8"?>
<Translations
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <identityVerificationCustomFieldLabels>
    <description>Telefono Numero</description>
    <label>Telefono Numero</label>
    <name>Sample93Phone</name>
  </identityVerificationCustomFieldLabels>
  <identityVerificationCustomFieldLabels>
    <description>Nombre de la Cuenta</description>
    <label>Nombre de la Cuenta</label>
    <name>Sample93Account</name>
  </identityVerificationCustomFieldLabels>
```

```

<identityVerificationCustomFieldLabels>
  <name>Sample93PostalCode</name>
</identityVerificationCustomFieldLabels>
<identityVerificationCustomFieldLabels>
  <name>Sample93AccountName</name>
  <description>Nombre</description>
  <label>Nombre</label>
</identityVerificationCustomFieldLabels>
</Translations>

```

## GlobalPicklistTranslation

 **Note:** GlobalPicklistTranslation is available in API version 37.0 only and is removed from later versions.

GlobalPicklistTranslation contains details for a global picklist translation.

Translations are stored in a file with a format of *globalPicklistName\_\_e-lang.objectTranslation*, where *globalPicklistName\_\_e* is the global picklist name and *lang* is the translation language. To reference a global picklist translation value, use *globalPicklistName\_\_e.value1*, where *value1* is the translated value for the user interface.

Here's what translations look like for a global picklist.

```

<?xml version="1.0" encoding="UTF-8"?>
<Translations xmlns="http://soap.sforce.com/2006/04/metadata">
<globalPicklists>
  <name>transpicklist</name>
  <picklistValues>
    <masterLabel>Three</masterLabel>
    <translation>Trois</translation>
  </picklistValues>
  <picklistValues>
    <masterLabel>Four</masterLabel>
    <translation>Quatre</translation>
  </picklistValues>
</globalPicklists>
</Translations>

```

Field	Field Type	Description
name	string	Required. Represents the name of a global picklist to be translated.
picklistValues	<a href="#">PicklistValueTranslation</a> []	A list of picklist values from global picklists to be translated.

## GlobalQuickActionTranslation

GlobalQuickActionTranslation contains details for the global translation of a quick action. For more information, see [QuickAction](#).

Field	Field Type	Description
aspect	string	Identifies which quick action label the translated text belongs to. Use this field only when you want to use different strings for

Field	Field Type	Description
		the quick action's field label and informational message. Valid values are <code>Master</code> and <code>InfoMessage</code> . Available in API version 53.0 and later.
<code>label</code>	string	Required. The translated quick action name, globally.
<code>name</code>	string	Required. The quick action name.

## PipelineInspMetricConfigTranslation

PipelineInspMetricConfigTranslation contains details for the translation of Pipeline Inspection forecast category metric settings. Available in API version 57.0 and later.

Field	Field Type	Description
<code>label</code>	string	Required. The translated Pipeline Inspection metric configuration name.
<code>name</code>	string	Required. The name of the Pipeline Inspection metric configuration.

## PromptTranslation

PromptTranslation contains metadata for the translation of a prompt, which is part of In-App Guidance. Available in API Version 48.0 and later.

Field	Field Type	Description
<code>description</code>	string	The prompt description.
<code>label</code>	string	The translated prompt name.
<code>name</code>	string	Required. The name of the prompt.
<code>promptVersions</code>	PromptVersionTranslation	A list of the prompt version translations.

## PromptVersionTranslation

PromptVersionTranslation contains details for translation of a prompt, which is part of In-App Guidance. Available in API Version 48.0 and later.

Field	Field Type	Description
<code>actionButtonLabel</code>	string	The label for the prompt's action button.
<code>actionButtonLink</code>	string	The URL for the prompt's action button.
<code>body</code>	string	The body text of the prompt.

Field	Field Type	Description
description	string	The prompt description.
dismissButtonLabel	string	The label for the floating prompt's dismiss button.
header	string	The header for the docked prompt.
imageAltText	string	The alt text for a prompt's image. Available in API version 53.0 and later.
imageLink	string	The URL for a prompt's image. Available in API version 53.0 and later.
label	string	The translated prompt name.
name	string	Required. The name of the prompt.
title	string	The title of the prompt.
videoLink	string	The URL for the docked prompt's video.

## ReportTypeTranslation

ReportTypeTranslation contains details for a translation of a custom report type. For more details, see [ReportType](#).

Field	Field Type	Description
description	string	The translated report type description.
label	string	The translated report type name.
name	string	Required. The name of the report type.
sections	<a href="#">ReportTypeSectionTranslation</a> []	A list of report type section translations.

## ReportTypeSectionTranslation

ReportTypeSectionTranslation contains details for a report type section translation.

Field	Field Type	Description
columns	<a href="#">ReportTypeColumnTranslation</a> []	A list of report type column translations.
label	string	The translated report type section name.
name	string	Required. The name of the report type section.

## ReportTypeColumnTranslation

ReportTypeColumnTranslation contains details for a report type column translation.

Field	Field Type	Description
label	string	Required. The translated report type column name.
name	string	Required. The report type column name.

## ScontrolTranslation

**Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected and can still be edited.

ScontrolTranslation contains details for a translation of an s-control. For more information, see "About S-Controls" in Salesforce Help.

Field	Field Type	Description
label	string	Required. The translated s-control name.
name	string	Required. The name of the s-control.

## Declarative Metadata Sample Definition

This sample XML definition shows a translations component.

```
<?xml version="1.0" encoding="UTF-8"?>
<Translations xmlns="http://soap.sforce.com/2006/04/metadata">
  <customApplications>
    <label>Angebot-Manager</label>
    <name>Quote Manager</name>
  </customApplications>
  <customLabels>
    <label>Dieses ist ein manuelles Angebot</label>
    <name>quoteManual</name>
  </customLabels>
</Translations>
```

## Usage

When you use the `retrieve()` call to get translations, the files returned in the `.translations` folder only include translations for the other metadata types referenced in `package.xml`. For example, this `package.xml` file contains `types` elements that match all custom applications, custom labels, web links defined in home page components, custom tabs, report types, and s-controls. Translations for all these metadata types are returned because each metadata type is explicitly listed in `package.xml`.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>CustomApplication</name>
  </types>
  <types>
    <members>*</members>
    <name>CustomLabels</name>
  </types>
</Package>
```

```

</types>
<types>
  <members>*</members>
  <name>CustomPageWebLink</name>
</types>
<types>
  <members>*</members>
  <name>CustomTab</name>
</types>
<types>
  <members>*</members>
  <name>ReportType</name>
</types>
<types>
  <members>*</members>
  <name>Scontrol</name>
</types>
<types>
  <members>*</members>
  <name>Translations</name>
</types>
<version>62.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

[CustomLabels](#)

## UiFormatSpecificationSet

---

Represents a set of rules that define the style and visibility of conditional field formatting on Dynamic Forms-enabled Lightning page field instances.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Note:** A `UiFormatSpecificationSet` is referred to as a conditional formatting ruleset in the rest of the Salesforce documentation and UI.

## File Suffix and Directory Location

UiFormatSpecificationSet components have the suffix `.uiFormatSpecificationSet` and are stored in the `uiFormatSpecificationSets` folder.

## Version

UiFormatSpecificationSet components are available in API version 62.0 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
<code>field</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The object field that the conditional formatting is associated with.</p>
<code>formatType</code>	<p><b>Field Type</b> FormatType (enumeration of type string)</p> <p><b>Description</b> Required. The type of conditional formatting associated with the field. Values are:</p> <ul style="list-style-type: none"> <li>• ICON</li> </ul>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The label for the conditional formatting ruleset, which displays in Setup.</p>
<code>subjectType</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The object the ruleset is associated with.</p>
<code>uiFormatSpecifications</code>	<p><b>Field Type</b> <a href="#">UiFormatSpecification[]</a></p> <p><b>Description</b> The list of rules contained in the ruleset.</p>

## UiFormatSpecification

A single rule in the ruleset.

Field Name	Description
<code>formatProperties</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The properties for a given <code>formatType</code> in JSON format.</p>
<code>formatType</code>	<p><b>Field Type</b> FormatType (enumeration of type string)</p> <p><b>Description</b> Required. The type of conditional formatting associated with the field when the rule evaluates to <code>true</code>.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• <code>ICON</code></li> </ul>
<code>order</code>	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. A numerical value representing the conditional formatting rule's position in the evaluation order.</p>
<code>visibilityRule</code>	<p><b>Field Type</b> <a href="#">UiFormulaRule</a></p> <p><b>Description</b> A set of one or more filters that define the conditions under which the conditional formatting appears on the field.</p> <p>If the visibility rule evaluates to <code>true</code>, the formatting displays on the field. If <code>false</code>, it doesn't display. If this field is <code>null</code>, the formatting displays by default.</p>

## UiFormulaRule

A set of one or more filters that define the conditions under which conditional field formatting displays on a Dynamic Forms-enabled Lightning page field instance. For example, you could construct a filter that causes conditional formatting to display only when the Amount field is greater than \$1,000,000.

Field Name	Description
<code>booleanFilter</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Specifies advanced filter conditions such as 1 AND 2.</p>
criteria	<p><b>Field Type</b></p> <p><a href="#">UiFormulaCriterion[]</a></p> <p><b>Description</b></p> <p>List of one or more filters that, when evaluated, determine conditional field formatting visibility.</p>

## UiFormulaCriterion

A single filter that when evaluated, helps define conditional formatting visibility on a Dynamic Forms-enabled Lightning page field instance.

Field Name	Description
leftValue	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The field upon which the filter is based. For example, AMOUNT.</p>
operator	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. Defines the operator used to filter the data. Valid values are:</p> <ul style="list-style-type: none"> <li>CONTAINS</li> <li>EQUAL</li> <li>NE—not equal</li> <li>GT—greater than</li> <li>GE—greater than or equal</li> <li>LE—less than or equal</li> <li>LT—less than</li> </ul>
rightValue	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The value by which you want to evaluate the formatting visibility. For example, 1000000.</p>

## Declarative Metadata Sample Definition

The following is an example of an UiFormatSpecificationSet component.

```
<?xml version="1.0" encoding="UTF-8"?>
<UiFormatSpecificationSet xmlns="http://soap.sforce.com/2006/04/metadata">
  <field>Contact.Customer_Sentiment__c</field>
  <formatType>ICON</formatType>
  <masterLabel>Sentiment Score</masterLabel>
  <subjectType>Contact</subjectType>
  <uiFormatSpecifications>
    <formatProperties>{&quot;icon&quot;:&quot;happy_face&quot;;,
&quot;iconColor&quot;:&quot;green&quot;}</formatProperties>
    <formatType>ICON</formatType>
    <order>1</order>
    <visibilityRule>
      <criteria>
        <leftValue>{!Record.Customer_Sentiment__c}</leftValue>
        <operator>EQUAL</operator>
        <rightValue>Happy</rightValue>
      </criteria>
    </visibilityRule>
  </uiFormatSpecifications>
  <uiFormatSpecifications>
    <formatProperties>{&quot;icon&quot;:&quot;neutral_face&quot;;,
&quot;iconColor&quot;:&quot;gray&quot;}</formatProperties>
    <formatType>ICON</formatType>
    <order>2</order>
    <visibilityRule>
      <criteria>
        <leftValue>{!Record.Customer_Sentiment__c}</leftValue>
        <operator>EQUAL</operator>
        <rightValue>Neutral</rightValue>
      </criteria>
    </visibilityRule>
  </uiFormatSpecifications>
  <uiFormatSpecifications>
    <formatProperties>{&quot;icon&quot;:&quot;sad_face&quot;;,
&quot;iconColor&quot;:&quot;red&quot;}</formatProperties>
    <formatType>ICON</formatType>
    <order>3</order>
    <visibilityRule>
      <criteria>
        <leftValue>{!Record.Customer_Sentiment__c}</leftValue>
        <operator>EQUAL</operator>
        <rightValue>Unhappy</rightValue>
      </criteria>
    </visibilityRule>
  </uiFormatSpecifications>
</UiFormatSpecificationSet>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
```

```

<types>
  <members>Sentiment_Score</members>
  <name>UiFormatSpecificationSet</name>
</types>
<version>62.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## UIObjectRelationConfig

---

Represents the admin-created configuration of the object relation UI component.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

UIObjectRelationConfig components have the suffix `.uiObjectRelationConfig` and are stored in the `uiObjectRelationConfigs` folder.

### Version

UIObjectRelationConfig components are available in API version 54.0 and later.

### Special Access Rules

You must be a Health Cloud or Life Sciences Cloud customer to use this metadata type

### Fields

Field Name	Description
<code>contextObject</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The object that provides the context for this object relation configuration.</p>

Field Name	Description
<code>contextObjectRecordType</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The record type of the context object for this configuration, if applicable.</p>
<code>directRelationshipField</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> For direct relationships, the child relationship field on the related object that matches the context object.</p>
<code>indirectObjectContextField</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> For indirect relationships, the field on the junction object that matches the context object.</p>
<code>indirectObjectRelatedField</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> For indirect relationships, the field on the junction object that matches the related object.</p>
<code>indirectRelationshipObject</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> For indirect relationships, the junction object representing the relationship between the related object and its context object.</p>
<code>isActive</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the configuration is active (<code>true</code>) or not (<code>false</code>).</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Label for the UIObjectRelationConfig. In the UI, this field is UI Object Relation Config.</p>
<code>relatedObject</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>The object containing the data that this object relation configuration displays.</p>
<code>relatedObjectRecordType</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The record type of the related object for this configuration.</p>
<code>relationshipType</code>	<p><b>Field Type</b></p> <p>ObjectRelationshipType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>A string indicating the type of relationship between the related object and context object.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• Direct</li> <li>• Indirect</li> <li>• InverseDirect</li> <li>• Self</li> </ul>
<code>UIObjectRelationFieldConfigs</code>	<p><b>Field Type</b></p> <p><a href="#">UIObjectRelationFieldConfig[]</a></p> <p><b>Description</b></p> <p>Provides a configuration for an object relation field on a specific row of content.</p>

## UIObjectRelationFieldConfig

Represents a configuration for a single row of content on a specific object relation configuration.

Field Name	Description
<code>displayLabel</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>A string containing the user-defined label for this field, to be displayed on each object relation of this type.</p>

Field Name	Description
queryText	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A case-insensitive template query for generating the content in this field.</p>
rowOrder	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. Determines the top-to-bottom display order of this field on the object relation UI.</p>

## Declarative Metadata Sample Definition

This is an example of a UIObjectRelationConfig component.

```
<?xml version="1.0" encoding="UTF-8"?>
<UIObjectRelationConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <UIObjectRelationFieldConfigs>
    <displayLabel>Address:</displayLabel>
    <queryText>{
      "startNode": {
        "initialObject": "RelatedObject"
      },
      "traversalNodes": [],
      "fieldNode": {
        "fieldEnumOrId": "ShippingAddress"
      }
    }
  </queryText>
  <rowOrder>1</rowOrder>
</UIObjectRelationFieldConfigs>
<UIObjectRelationFieldConfigs>
  <displayLabel>Phone:</displayLabel>
  <queryText>{
    "startNode": {
      "initialObject": "RelatedObject"
    },
    "traversalNodes": [],
    "fieldNode": {
      "fieldEnumOrId": "Phone"
    }
  }
</queryText>
  <rowOrder>2</rowOrder>
</UIObjectRelationFieldConfigs>
<UIObjectRelationFieldConfigs>
  <displayLabel>Fax:</displayLabel>
  <queryText>{
```

```

    "startNode": {
      "initialObject": "RelatedObject"
    },
    "traversalNodes": [],
    "fieldNode": {
      "fieldEnumOrId": "Fax"
    }
  }</queryText>
  <rowOrder>3</rowOrder>
</UIObjectRelationFieldConfigs>
<UIObjectRelationFieldConfigs>
  <displayLabel>Parent Organization:</displayLabel>
  <queryText>{
    "startNode": {
      "initialObject": "RelatedObject"
    },
    "traversalNodes": [
      {
        "destinationObjectEnumOrId": "Account",
        "fieldEnumOrId": "ParentId",
        "traversalDirection": "parent"
      }
    ],
    "fieldNode": {
      "fieldEnumOrId": "Name"
    }
  }</queryText>
  <rowOrder>4</rowOrder>
</UIObjectRelationFieldConfigs>
<contextObject>Contact</contextObject>
<directRelationshipField>AccountId</directRelationshipField>
<isActive>true</isActive>
<masterLabel>Sample Primary Account Configuration</masterLabel>
<relatedObject>Account</relatedObject>
<relationshipType>Direct</relationshipType>
<indirectObjectRelatedField></indirectObjectRelatedField>
<indirectObjectContextField></indirectObjectContextField>
<contextObjectRecordType></contextObjectRecordType>
<indirectRelationshipObject></indirectRelationshipObject>
<relatedObjectRecordType></relatedObjectRecordType>
</UIObjectRelationConfig>

```

This is an example package.xml that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>UIObjectRelationConfig</name>
  </types>
  <version>54.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## UserAccessPolicy

---

Represents a user access policy.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

UserAccessPolicy components have the suffix `.useraccesspolicy` and are stored in the `useraccesspolicies` folder.

## Version

UserAccessPolicy components are available in API version 57.0 and later.

## Special Access Rules

To create or modify user access policies, users must have the Manage User Access Policies permission.

## Fields

Field Name	Description
<code>booleanFilter</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The logic that determines how your user criteria filters are applied in the user access policy. For example, if you have two user access policy filters with the <code>sortOrder</code> equal to 1 and 2, respectively, the <code>booleanFilter</code> can be <code>1 AND 2</code> or <code>1 OR 2</code>.</p>
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Description of the user access policy.</p>

Field Name	Description
<code>isProtected</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type. The default value is <code>false</code>.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for the user access policy, which is defined when the user access policy is created.</p>
<code>order</code>	<p><b>Field Type</b> int</p> <p><b>Description</b> Indicates the order for which active policy is applied when a user meets the criteria for multiple policies. Must be an integer from 0 to 10,000. Only the active policy with the lowest <code>order</code> value is applied. This field is required only if the <code>status</code> field is set to <code>Active</code>.</p> <p>Available in API version 61.0 and later.</p>
<code>status</code>	<p><b>Field Type</b> UserAccessPolicyStatus (enumeration of type string)</p> <p><b>Description</b> Required. The status of the user access policy.</p> <p>Values are:</p> <ul style="list-style-type: none"><li>• <code>Active</code></li><li>• <code>Completed</code></li><li>• <code>Design</code></li><li>• <code>Failed</code></li><li>• <code>Migrate</code></li><li>• <code>Testing</code></li><li>• <code>Updating</code></li></ul> <p>If you deploy a policy with a status of <code>Active</code>, the status is changed to <code>Design</code>. A Salesforce admin can then set the status to <code>Active</code> by automating the policy in Setup.</p>
<code>triggerType</code>	<p><b>Field Type</b> UserAccessPolicyTriggerType (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>The type of user record trigger for which this user access policy runs.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• <code>Create</code>—The user access policy runs when a user who matches the policy criteria is created.</li> <li>• <code>CreateAndUpdate</code>—The user access policy runs when a user who matches the policy criteria is either created or updated.</li> <li>• <code>Update</code>—The user access policy runs when a user who matches the policy criteria is updated.</li> </ul>
<code>userAccessPolicyActions</code>	<p><b>Field Type</b></p> <p><a href="#">UserAccessPolicyAction[]</a></p> <p><b>Description</b></p> <p>The actions applied by the user access policy to grant access to or revoke access from an access mechanism.</p>
<code>userAccessPolicyFilters</code>	<p><b>Field Type</b></p> <p><a href="#">UserAccessPolicyFilter[]</a></p> <p><b>Description</b></p> <p>The filters used to define the users that the user access policy is applied to.</p>

## UserAccessPolicyAction

Represents an action applied by a user access policy.

Field Name	Description
<code>action</code>	<p><b>Field Type</b></p> <p><code>UserAccessPolicyActionType</code> (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. Indicates whether the user access policy grants or revokes the target access mechanism.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• <code>Grant</code></li> <li>• <code>Revoke</code></li> </ul>
<code>target</code>	<p><b>Field Type</b></p> <p><code>string</code></p> <p><b>Description</b></p> <p>Required. Developer name of the access mechanism that the user access policy applies.</p>

Field Name	Description
<code>type</code>	<p><b>Field Type</b> UserAccessPolicyActionTargetType (enumeration of type string)</p> <p><b>Description</b> Required. The type of access mechanism that the user access policy applies. Values are:</p> <ul style="list-style-type: none"> <li>• Group</li> <li>• PackageLicense</li> <li>• PermissionSet</li> <li>• PermissionSetGroup</li> <li>• PermissionSetLicense</li> <li>• Queue</li> </ul>

## UserAccessPolicyFilter

Represents a user criteria filter for a user access policy.

Field Name	Description
<code>columnName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> If <code>type</code> is set to <code>User</code>, this is the user field that your user criteria filter is based on. If you set <code>type</code> to any value other than <code>User</code>, then this field isn't used.</p>
<code>operation</code>	<p><b>Field Type</b> UserAccessPolicyFilterOperation (enumeration of type string)</p> <p><b>Description</b> Required. The operator of the user criteria filter. Values are:</p> <ul style="list-style-type: none"> <li>• <code>equals</code></li> <li>• <code>equalsIgnoreCase</code>—Available in API version 59.0 and later.</li> <li>• <code>in</code>— Available in API version 58.0 and later.</li> <li>• <code>includes</code>—Available in API version 59.0 and later.</li> <li>• <code>notEquals</code></li> </ul> <p>Select <code>in</code> if you want to reference multiple profiles or roles in the same user criteria filter via the <code>target</code> field.</p>
<code>sortOrder</code>	<p><b>Field Type</b> int</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. The numeric reference used to identify the specific user criteria filter.</p>
target	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. If <code>type</code> is set to <code>User</code>, then set this field to <code>User</code> as well. If <code>type</code> is set to any other value, then set this field to the developer name of the specific resource used in the user criteria filter.</p>
type	<p><b>Field Type</b></p> <p>UserAccessPolicyFilterTargetType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. The type of resource that the user criteria filter is based on.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• Group</li> <li>• PackageLicense</li> <li>• PermissionSet</li> <li>• PermissionSetGroup</li> <li>• PermissionSetLicense</li> <li>• Profile</li> <li>• Queue</li> <li>• User</li> <li>• UserRole</li> </ul>
value	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>If <code>type</code> is set to <code>User</code>, this field is the value of the user field specified in <code>columnName</code> that your user filter is operating on. If you set <code>type</code> to any value other than <code>User</code>, then this field isn't used.</p>

## Declarative Metadata Sample Definition

The following is an example of a UserAccessPolicy component.

```
<?xml version="1.0" encoding="UTF-8"?>
<UserAccessPolicy xmlns="http://soap.sforce.com/2006/04/metadata">
  <booleanFilter>1 AND 2</booleanFilter>
  <description>Policy to assign Sales Rep PSG to active Sales Reps.</description>
  <masterLabel>Sales Rep Migration</masterLabel>
</UserAccessPolicy>
```

```

<order>3</order>
<status>Design</status>
<triggerType>CreateAndUpdate</triggerType>
<userAccessPolicyActions>
  <action>Grant</action>
  <target>SalesRepPSG</target>
  <type>PermissionSetGroup</type>
</userAccessPolicyActions>
<userAccessPolicyFilters>
  <operation>equals</operation>
  <sortOrder>1</sortOrder>
  <target>SalesRepCustomProfile</target>
  <type>Profile</type>
</userAccessPolicyFilters>
<userAccessPolicyFilters>
  <columnName>IsActive</columnName>
  <operation>equals</operation>
  <sortOrder>2</sortOrder>
  <target>User</target>
  <type>User</type>
  <value>>true</value>
</userAccessPolicyFilters>
</UserAccessPolicy>

```

To reference multiple profiles or roles, in `UserAccessPolicyFilter`, set the `operator` field to `in`. Then, reference the resources' developer names in the `target` field, separated by commas.

```

<?xml version="1.0" encoding="UTF-8"?>
<UserAccessPolicy xmlns="http://soap.sforce.com/2006/04/metadata">
  <booleanFilter>1</booleanFilter>
  <description>Policy to remove AMER Sales group from employees with one of two
roles</description>
  <masterLabel>Remove AMER Sales Group</masterLabel>
  <status>Design</status>
  <userAccessPolicyActions>
    <action>Revoke</action>
    <target>AMERSalesPublicGroup</target>
    <type>Group</type>
  </userAccessPolicyActions>
  <userAccessPolicyFilters>
    <operation>in</operation>
    <sortOrder>1</sortOrder>
    <target>SalesOps, InsideSalesRep</target>
    <type>UserRole</type>
  </userAccessPolicyFilters>
</UserAccessPolicy>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>UserAccessPolicy</name>
  </types>

```

```
<version>61.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## UserAuthCertificate

Represents a PEM-encoded user certificate. These certificates are associated with a user, and externally uploaded. The uploaded certificate is used to authenticate the user.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

UserAuthCertificate components have the suffix `.userAuthCertificate` and are stored in the `userAuthCertificates` folder.

## Version

UserAuthCertificate components are available in API version 50.0 and later.

## Fields

Field Name	Field Type	Description
<code>developerName</code>	string	Required: The name of the certificate with an underscore between words.  <b>Note:</b> Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.
<code>expirationDate</code>	dateTime	Required. The date on which the certificate expires.
<code>masterLabel</code>	string	Required. A user-friendly name that you create for the certificate. Limited to 64 characters.
<code>serialNumber</code>	string	Required. The serial number for the certificate.
<code>user</code>	string	Required: The user's name.

## Declarative Metadata Sample Definition

The following is an example of a UserAuthCertificate component.

```
<UserAuthCertificate xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <content xsi:nil="true"/>
  <developerName>ND_user_cert</developerName>
  <expirationDate>2030-10-01T08:30:00.000Z</expirationDate>
  <masterLabel>ND user cert</masterLabel>
  <serialNumber>1401</serialNumber>
  <user>005RM000001Zn1E</user>
</UserAuthCertificate>
```

The following is an example package.xml that references the previous definition.

```
Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>UserAuthCertificate</name>
  </types>
  <version>50.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## UserCriteria

---

Represents the member criteria to use in Experience Cloud site moderation rules. This type extends the [Metadata](#) metadata type and inherits its fullName field..

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

UserCriteria components have the suffix site\_name.user\_criteria\_developer\_name.userCriteria and are stored in the UserCriteria folder.

## Version

UserCriteria components are available in API version 39.0 and later.

## Special Access Rules

To view, create, edit, and delete moderation rules, you need the Manage Experiences or Create and Set Up Experiences permission. As of Spring '20 and later, only users with permission to edit moderation rules can access this object.

## Fields

Field Name	Field Type	Description
creationAgeInSeconds	int	If specified, includes only users that were created within a specific time frame.
description	string	The description of the user criteria.
lastChatterActivityAgeInSeconds	int	If specified, includes only members that have posted or commented in the Experience Cloud site within a specific time frame.
masterLabel	string	Name of the user criteria.
userTypes	NetworkUserType enumeration (of type string)	The member type to use in moderation rules. Valid values are: <ul style="list-style-type: none"> <li>• Internal</li> <li>• Customer</li> <li>• Partner</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a UserCriteria component.

```
<?xml version="1.0" encoding="UTF-8"?>
<UserCriteria xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>Customer and Partner Members</masterLabel>
  <description>Member criteria matches customer and partner member</description>
  <userTypes>Partner</userTypes>
  <userTypes>Customer</userTypes>
</UserCriteria>
```

## UserProfileSearchScope

Reserved for internal use.

## UserProvisioningConfig

Represents information to use during a user provisioning request flow, such as the attributes for an update. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

UserProvisioningConfig components have the suffix `.userProvisioningConfig` and are stored in the `UserProvisioningConfigs` directory.

## Version

UserProvisioningConfig components are available in API version 49.0 and later.

## Fields

Field Name	Field Type	Description
<code>approvalRequired</code>	string	Indicates whether approvals are required for provisioning users for the associated connected app. If the value is null, no approval is required.
<code>connectedApp</code>	string	The ID of the connected app for which users are being provisioned.
<code>enabled</code>	boolean	Indicates whether user provisioning is enabled for the associated connected app ( <code>true</code> ) or not ( <code>false</code> ). Default setting is <code>false</code> .
<code>enabledOperations</code>	string	Lists the operations, as comma-separated values, that create a user provisioning request for the associated connected app. Allowed values are: <ul style="list-style-type: none"> <li>• <code>Create</code></li> <li>• <code>Update</code></li> <li>• <code>EnableAndDisable</code> (activation and deactivation)</li> <li>• <code>SuspendAndRestore</code> (freeze and unfreeze)</li> </ul>
<code>flow</code>	string	User Provisioning flow type which includes a reference to the Apex <code>UserProvisioningPlugin</code> class. The flow calls the third-party service's API to manage user account provisioning on that system.
<code>masterLabel</code>	string	The primary label for this object. This value is the internal label that doesn't get translated.
<code>namedCredential</code>	string	The Salesforce ID of the named credential that's used for a request. The named credential identifies the third-party system and the third-party authentication settings.
<code>notes</code>	string	Serves as a place for admins to add any additional information about the configuration. This field is for internal reference only, and is not used by any process.
<code>onUpdateAttributes</code>	string	Lists the user attributes, as comma-separated values, that generate a user provisioning request during an update.
<code>reconFilter</code>	string	When collecting and analyzing users on a third-party system, the plug-in uses this filter to limit the scope of the collection.
<code>userAccountMapping</code>	string	Stores the attributes used to link the Salesforce user to the account on the third-party system, in JSON format. For example: <pre> {"linkingSalesforceUserAttribute": "Username", "linkingTargetUserAttribute": "Email"} </pre>

## Declarative Metadata Sample Definition

The following is an example of a UserProvisioningConfig component.

```
<?xml version="1.0" encoding="UTF-8"?>
<UserProvisioningConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <approvalRequired>True</approvalRequired>
  <enabled>true</enabled>
  <enabledOperations>NA</enabledOperations>
  <connectedApp>ExampleApp</connectedApp>
  <masterLabel>label</masterLabel>
  <notes>note</notes>
  <onUpdateAttributes>attri</onUpdateAttributes>
  <reconFilter>filter</reconFilter>
  <userAccountMapping>mapping</userAccountMapping>
</UserProvisioningConfig>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>UPC</members>
    <name>UserProvisioningConfig</name>
  </types>
  <version>49.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## VirtualVisitConfig

---

Represents an external video provider configuration, which relays events from Salesforce to the provider.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

VirtualVisitConfig components have the suffix `.virtualVisitConfig` and are stored in the `VirtualVisitConfigs` folder.

## Version

VirtualVisitConfig components are available in API version 54.0 and later.

## Special Access Rules

Access to this metadata type requires at least one of these preferences:

- Video Calls: Org Pref (VideoVisits) Org preference
- Industries Einstein: Intelligent Form Reader (EinsteinDocReader)
- Industries Einstein: Sentiment Insights Account (IESentimentAnalysis)
- Natural Language Processing: Key phrase extraction and entity detection (NLPServiceEnabled) Org Preference and the NLP: Key phrase extraction (KeyPhrasePrefEnabled) Org Preference
- Natural Language Processing (NLPServicePrefEnabled) Org Preference

## Fields

Field Name	Description
comprehendServiceType	<p><b>Field Type</b> VirtualVisitComprehendServiceType (enumeration of type string)</p> <p><b>Description</b> Specifies the type of service used to convert speech into text or to analyze the converted speech text.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• ComprehendMedicalService</li> <li>• ComprehendService</li> </ul>
developerName	<p><b>Type</b> string</p> <p><b>Properties</b> Filter, Group, Sort</p> <p><b>Description</b> The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is Record Type Name. This field is automatically generated, but you can supply your own value if you create the record using the API.</p>
experienceCloudSiteUrl	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>The URL of the Digital Experience site where the Video Call component is available to portal or guest users.</p>
externalMsgServiceIdentifier	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>For internal use only.</p>
externalRoleIdentifier	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The ID of the role that's used to allow users to join a video call and to grant them temporary access to certain functions needed to participate in the call.</p>
externalUserIdentifier	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>For internal use only.</p>
fullName	<p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Create, Group, Nillable</p> <p><b>Description</b></p> <p>The full name of the VirtualVisitConfig type in Metadata API. The full name can include a namespace prefix. Query this field only if the query result contains no more than one record. Otherwise, an error is returned. If more than one record exists, use multiple queries to retrieve the records. This limit protects performance.</p>
isProtected	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>An auto-generated value that doesn't currently impact the behavior of the metadata type.</p>
masterLabel	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>A user-friendly name for VirtualVisitConfig, which is defined when the VirtualVisitConfig is created.</p>

Field Name	Description
messagingRegion	<p><b>Field Type</b> string</p> <p><b>Description</b> The region where the waiting room and messaging channel data is processed and stored. Available in API version 57.0 and later.</p>
namedCredential	<p><b>Field Type</b> string</p> <p><b>Description</b> The named credential record used to authenticate and authorize a video call vendor's account.</p>
storageBucketName	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the storage bucket that stores the meeting transcript.</p>
usageType	<p><b>Field Type</b> VirtualVisitUsageType (enumeration of type string)</p> <p><b>Description</b> The name of the Salesforce feature for which the video call configuration record is created.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• CHIME</li> <li>• ENTITY_DETECTION</li> <li>• INTELLIGENT_FORM_READER</li> <li>• KEY_PHRASE_EXTRACTION</li> <li>• SENTIMENT_ANALYSIS</li> </ul>
videoCallApptTypeValue	<p><b>Field Type</b> string</p> <p><b>Description</b> The default Appointment Type picklist values from the Service Appointment object that represent a video appointment type. Use semicolons to separate multiple values.</p>
videoControlRegion	<p><b>Field Type</b> string</p> <p><b>Description</b> The region where API calls related to Video Calls are made. Available in API version 57.0 and later.</p>

Field Name	Description
visitRegion	<p><b>Field Type</b> VirtualVisitVisitRegion (enumeration of type string)</p> <p><b>Description</b> The region where the Video Call audio and video data is processed.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• af-south-1</li> <li>• ap-east-1</li> <li>• ap-northeast-1</li> <li>• ap-northeast-2</li> <li>• ap-northeast-3</li> <li>• ap-south-1</li> <li>• ap-southeast-1</li> <li>• ap-southeast-2</li> <li>• ca-central-1</li> <li>• eu-central-1</li> <li>• eu-north-1</li> <li>• eu-south-1</li> <li>• eu-west-1</li> <li>• eu-west-2</li> <li>• eu-west-3</li> <li>• me-south-1</li> <li>• sa-east-1</li> <li>• us-east-1</li> <li>• us-east-2</li> <li>• us-west-1</li> <li>• us-west-2</li> </ul>

## Declarative Metadata Sample Definition

This is an example of a VirtualVisitConfig component.

```
<?xml version="1.0" encoding="UTF-8"?>
<VirtualVisitConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <usageType>CHIME</usageType>
  <visitRegion>us-east-1</visitRegion>
  <masterLabel>vvconfig1</masterLabel>
  <experienceCloudSiteUrl>videocall_c@testcloudurl.com</experienceCloudSiteUrl>
  <namedCredential>SampleNamedCredential</namedCredential>
  <comprehendServiceType>ComprehendService</comprehendServiceType>
  <storageBucketName>comprehendbucket</storageBucketName>
</VirtualVisitConfig>
```

```
<isProtected>>false</isProtected>
</VirtualVisitConfig>
```

This is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <namespacePrefix>[namespacePrefix]</namespacePrefix>
  <fullName>deployPackage</fullName>
  <types>
    <members>*</members>
    <name>VirtualVisitConfig</name>
  </types>
  <types>
    <members>*</members>
    <name>NamedCredential</name>
  </types>
  <version>55.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## WaveAnalyticAssetCollection

Represents a collection of Analytics assets. This type extends the Metadata metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

WaveAnalyticsAssetCollection components have the suffix `.collection` and are stored in the `wave` folder.

## Version

WaveAnalyticsAssetCollection components are available in API version 58.0 and later.

## Fields

Field Name	Field Type	Description
<code>collectionType</code>	string	The collection type.
<code>color</code>	string	The display color for the collection.
<code>description</code>	string	The description that appears in the user interface.

Field Name	Field Type	Description
folder	string	The internal API name of the folder or application.
items	<a href="#">WaveAnalyticsAssetCollectionItem</a>	A list of Analytics asset items.
label	string	The label for the collection.
shares	<a href="#">FolderShare</a>	The folder sharing rules.

## Declarative Metadata Sample Definition

The following is an example of a WaveAnalyticsAssetCollection component.

```
<?xml version="1.0" encoding="UTF-8"?>
<WaveAnalyticsAssetCollection xmlns="http://soap.sforce.com/2006/04/metadata">
  <collectionType>static</collectionType>
  <color>#1b96ff</color>
  <description>A collection of my Dashboards</description>
  <folder>Shared</folder>
  <label>My Dashboard Collection</label>
  <items>
    <item>
      <asset>Dashboard One</asset>
      <assetType>dashboard</assetType>
      <sortOrder>1</sortOrder>
    </item>
    <item>
      <asset>Dashboard Two</asset>
      <assetType>dashboard</assetType>
      <sortOrder>2</sortOrder>
    </item>
  </items>
  <shares>
    <accessLevel>EditAllContents</accessLevel>
    <sharedTo>shareswith@org.ee</sharedTo>
    <sharedToType>User</sharedToType>
  </shares>
</WaveAnalyticsAssetCollection>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## WaveAnalyticsAssestCollectionItem

WaveAnalyticsAssestCollectionItem represents an Analytics asset item.

Field	Field Type	Description
asset	string	The asset name.

Field	Field Type	Description
assetType	string	The asset type.
sortOrder	int	The sort order for the asset.

## WaveApplication

Represents the Analytics application. This type extends the Metadata metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

WaveApplication components have the suffix `.wapp` and are stored in the `wave` folder.

## Version

WaveApplication components are available in API version 37.0 and later.

## Fields

Field Name	Field Type	Description
assetIcon	string	The icon that represents the Analytics application.
description	string	The description that appears in the user interface.
folder	string	The internal api name of the folder or application.
masterLabel	string	The user interface label name of the folder or application.
shares	FolderShare	The folder sharing rules.
templateOrigin	string	The internal (unique) name of the template used to create the application. This field is blank if the application wasn't created from a template.
templateVersion	string	The version assigned to the application template by the template's creator. This field is blank if the application wasn't created from a template.

## Declarative Metadata Sample Definition

The following is an example of a WaveApplication component.

```
<?xml version="1.0" encoding="UTF-8"?>
<WaveApplication xmlns="http://soap.sforce.com/2006/04/metadata">
```

```

<assetIcon>/analytics/wave/web/proto/images/app/icons/11.png</assetIcon>
<description>Application that shows my sales</description>
<folder>edit</folder>
<masterLabel>Sales Application</masterLabel>
<shares>
  <accessLevel>EditAllContents</accessLevel>
  <sharedTo>shareswith@org.ee</sharedTo>
  <sharedToType>User</sharedToType>
</shares>
</WaveApplication>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## WaveComponent

---

Represents the WaveComponent object in the Analytics application. This type extends the MetadataWithContent metadata type and inherits its `content` and `fullName` fields.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

When using Metadata API to work with Analytics components, consider that:

- Modifications to the `.wcomp` component are unsupported.

## File Suffix and Directory Location

WaveComponent components have the suffix `.wcomp` and are stored in the `wave` folder.

## Version

WaveComponent components are available in API version 51.0 and later.

## Fields

Field Name	Field Type	Description
<code>application</code>	string	Required. The internal name of the application.
<code>description</code>	string	The component description that appears in the user interface.
<code>masterLabel</code>	string	Required. The component name that appears in the user interface.
<code>templateAssetSourceName</code>	string	Links the component to the template used to create it. Null for assets not created from a template.

## Declarative Metadata Sample Definition

The following is an example of a WaveComponent component.

```
<?xml version="1.0" encoding="UTF-8"?>
<WaveComponent xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <content xsi:nil="true"/>
  <application>dev__app</application>
  <masterLabel>Component1</masterLabel>
  <description>Component description</description>
</WaveComponent>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## WaveDataflow

Represents the WaveDataflow object in the Analytics application. This type extends the MetadataWithContent metadata type and inherits its `content` and `fullName` fields.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

WaveDataflow components have the suffix `.wdf` and are stored in the `wave` folder.

## Version

WaveDataflow components are available in API version 37.0 and later.

## Fields

Field Name	Field Type	Description
<code>application</code>	string	The name of the Analytics application the dataflow is connected to. This field is available in API version 48.0 and later.
<code>dataflowType</code>	string	The type of the dataflow. Supported types are <code>User</code> and <code>Prepared</code> . The default value is <code>User</code> . This field is available in API version 41.0 and later.
<code>description</code>	string	The dataflow description that appears in the user interface.
<code>masterLabel</code>	string	Required. The dataflow name that appears in the user interface.

## Declarative Metadata Sample Definition

The following is an example of a WaveDataflow component.

```
<?xml version="1.0" encoding="UTF-8"?>
<WaveDataflow xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" <content xsi:nil="true"/>
  <description>flow1</description>
  <masterLabel>flow1</masterLabel>
</WaveDataflow>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## WaveDashboard

Represents the WaveDashboard object in the Analytics application. This type extends the MetadataWithContent metadata type and inherits its `content` and `fullName` fields.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

When using Metadata API to work with Analytics dashboards, consider that:

- Modifications to the `.wdash` component are unsupported.
- Modifying or removing conditional formatting from the source org or `.wdash` component doesn't cause issues while deploying.
- Removing steps from the `.wdash` component causes deployment to the destination org to fail because the source dashboard fails validation.

## File Suffix and Directory Location

WaveDashboard components have the suffix `.wdash` and are stored in the `wave` folder.

## Version

WaveDashboard components are available in API version 37.0 and later.

## Fields

Field Name	Field Type	Description
<code>application</code>	string	Required. The internal name of the application.
<code>dateVersion</code>	integer	The date version for the dashboard. Only available in v55.0 and above.
<code>description</code>	string	The dashboard description that appears in the user interface.
<code>masterLabel</code>	string	Required. The dashboard name that appears in the user interface.

Field Name	Field Type	Description
templateAssetSourceName	string	Links the dashboard to the template used to create it. Null for assets not created from a template.

## Declarative Metadata Sample Definition

The following is an example of a WaveDashboard component.

```
<?xml version="1.0" encoding="UTF-8"?>
<WaveDashboard xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <content xsi:nil="true"/>
  <application>dev__app</application>
  <masterLabel>Dashboard1</masterLabel>
  <description>somedesc</description>
</WaveDashboard>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## WaveDataset

Represents the WaveDataset object in the Analytics application. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

WaveDataset components have the suffix `.wds` and are stored in the `wave` folder.

## Version

WaveDataset components are available in API version 37.0 and later.

## Fields

Field Name	Field Type	Description
application	string	Required. The internal name of the application.
description	string	The dataset description that appears in the user interface.
masterLabel	string	Required. The user interface label name of the dataset.

Field Name	Field Type	Description
templateAssetSourceName	string	Links the dataset to the template used to create it. Null for assets not created from a template.
type	string	The type of the dataset. Dataset types include <code>Default</code> , <code>LiveStagedData</code> , and <code>Trended</code> .

## Declarative Metadata Sample Definition

The following is an example of a `WaveDataset` component.

```
<WaveDataset>
  <application>SharedApp</application>
  <description>description</description>
  <masterLabel>datasetLabel</masterLabel>
  <type>Default</type>
</WaveDataset>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## WaveLens

Represents the `WaveLens` object in the Analytics application.

This type extends to `MetadataWithContent` metadata type and inherits its `content` and `fullName` fields.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

`WaveLens` components have the suffix `.wLens` and are stored in the `wave` folder.

## Version

`WaveLens` components are available in API version 37.0 and later.

## Fields

Field Name	Field Type	Description
application	string	Required. The internal name of the application.
datasets	string	A reference to the dataset used to create this lens.

Field Name	Field Type	Description
dateVersion	int	The date version used for this lens.
description	string	The dashboard description that appears in the user interface.
masterLabel	string	Required. The user interface label name of the dashboard.
templateAssetSourceName	string	Links the lens to the template used to create it. Null for assets not created from a template.
visualizationType	string	Required. The visualization type to be used for this lens. Valid values are: <ul style="list-style-type: none"> <li>• calheatmap—Calendar heat map</li> <li>• comparisontable—Comparison table</li> <li>• heatmap—Heat map</li> <li>• hbar—Horizontal bar</li> <li>• hbarhdot—Horizontal dot plot</li> <li>• matrix—Matrix</li> <li>• parallelcoords—Parallel coordinates</li> <li>• pie—Donut</li> <li>• pivottable—Pivot table</li> <li>• scatter—Scatter plot</li> <li>• stackhbar—Stacked horizontal bar</li> <li>• stackvbar—Stacked vertical bar</li> <li>• time—Time line</li> <li>• valuestable—Values table</li> <li>• vbar—Vertical bar</li> <li>• vdot—Vertical dot plot</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a WaveLens component.

```
<?xml version="1.0" encoding="UTF-8"?>
<WaveLens xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <content xsi:nil="true"/>
  <application>dev__app</application>
  <datasets>dev__abc</datasets>
  <masterLabel>lens1</masterLabel>
  <description>lens in shared app</description>
  <visualizationType>hbar</visualizationType>
</WaveLens>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## WaveRecipe

Represents the WaveRecipe type in an Analytics application. A recipe is a saved set of steps to perform on a specific source dataset or connected data. This type extends the `MetadataWithContent` metadata type and inherits its `content` and `fullName` fields.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

WaveRecipe components have the suffix `.wdr` and are stored in the `wave` folder.

## Version

WaveRecipe components are available in API version 41.0 and later.

## Fields

Field Name	Field Type	Description
<code>application</code>	string	The internal name of the application.
<code>dataflow</code>	string	Required. The dataflow ID for the Analytics recipe.
<code>format</code>	string	The format of the current recipe definition. Valid values are: <ul style="list-style-type: none"> <li>R2 - recipes created with Data Prep</li> <li>R3 - recipes created with Data Prep (API version 49.0)</li> </ul>
<code>masterLabel</code>	string	Required. The recipe name that appears in the user interface.
<code>securityPredicate</code>	string	A filter condition that defines row-level access to records in a recipe.
<code>targetDatasetAlias</code>	string	The name of the dataset the recipe saves data results into.
<code>templateAssetSourceName</code>	string	Links the recipe to the template used to create it. Null for assets not created from a template.

## Declarative Metadata Sample Definition

The following is an example of a WaveRecipe component.

```
<?xml version="1.0" encoding="UTF-8"?>
<WaveRecipe xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" <content xsi:nil="true"/>
```

```

<dataflow>02KB000000b5c7MAA</dataflow>
<format>R3</format>
<masterLabel>recipe1</masterLabel>
<securityPredicate>'UserId' == "$User.Id"</securityPredicate>
<targetDatasetAlias>Dataset One</targetDatasetAlias>
</WaveRecipe>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

 **Note:** Use of the wildcard character doesn't return the recipe's associated dataflows.

## WaveTemplateBundle

Represents an Analytics template bundle, which can be used to create Analytics apps. A bundle contains an Analytics template definition and all its related resources. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

An Analytics template bundle is a folder that contains definition files for a template. Unlike other metadata components, a `WaveTemplateBundle` component isn't represented by a single component file, but instead by a collection of JSON and CSV definition files. Each definition file represents a resource in a template, such as lenses, dashboards, dataflows, and comma-separated values. For example, this directory structure shows the hierarchy of the folders and files for one Analytics Template definition, `template1`.

```

waveTemplates
  template1
    template-info.json
    variables.json
    ui.json
    extFiles
      PostalCodes.csv

```

Analytics template bundles must be under a top-level folder that's named `waveTemplates`. Each bundle must have its own subfolder under the `waveTemplates` folder and be named with the template's fully qualified API name. The bundle folder must contain a `template-info.json` file to specify the metadata about the template and the references to other definition files. An entire bundle doesn't have a suffix and definition files can have one of the following suffixes.

Suffix	Component Type
.json	JavaScript Object Notation
.csv	Comma-Separated Values

## Version

`WaveTemplateBundle` components are available in API version 35.0 and later.

## Special Access Rules

Definitions can be created in both managed and unmanaged packages.

## Fields

Field Name	Field Type	Description
<code>assetIcon</code>	string	The icon to use by default for new Analytics apps based on this template. Valid values are 1 .png through 20 .png.
<code>description</code>	string	The specification of the template.
<code>label</code>	string	Required. The label of the template.
<code>templateType</code>	string	Required. The type of the template. Valid values are: <ul style="list-style-type: none"> <li>• App</li> <li>• Dashboard</li> <li>• Lens</li> </ul>

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## WaveXmd

Represents the WaveXmd object in the Analytics application. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

WaveXmd components have the suffix `.xmd` and are stored in the `wave` folder.

## Version

WaveXmd components are available in API version 39.0 and later.

## Fields

Field Name	Field Type	Description
<code>application</code>	string	The name of the Analytics application the XMD is associated with. Available in API version 43.0 and later.
<code>dataset</code>	string	Required. Specifies the dataset associated with this XMD.

Field Name	Field Type	Description
<code>datasetConnector</code>	string	The name of the connector source for the dataset.
<code>datasetFullyQualifiedName</code>	string	Specifies the fully qualified name of the dataset version associated with this XMD.
<code>dates</code>	<a href="#">WaveXmdDate</a>	List of dates, with formatting information.
<code>dimensions</code>	<a href="#">WaveXmdDimension</a>	List of dimensions, with formatting information.
<code>measures</code>	<a href="#">WaveXmdMeasure</a>	List of measures, with formatting information.
<code>organizations</code>	<a href="#">WaveXmdOrganization</a>	List of organizations, for multi-organization support.
<code>origin</code>	string	The origin of the dataset version.
<code>type</code>	string	The XMD type. Valid values are: <ul style="list-style-type: none"> <li>• <code>System</code></li> <li>• <code>User</code></li> <li>• <code>Main</code></li> <li>• <code>Asset</code></li> </ul> Available in API version 43.0 and later.
<code>waveVisualization</code>	string	The visualization behavior for Analytics assets. Valid values are: <ul style="list-style-type: none"> <li>• <code>dashboard</code></li> <li>• <code>lens</code></li> </ul> Available in API version 43.0 and later.

## WaveXmdDate

WaveXmdDate represents a date.

Field	Field Type	Description
<code>alias</code>	string	Required. Alias of the Date column.
<code>compact</code>	boolean	Indicates whether the date is displayed in compact form ( <code>true</code> ) or not ( <code>false</code> ).
<code>dateFieldDay</code>	string	The day field.
<code>dateFieldEpochDay</code>	string	The epoch day field.
<code>dateFieldEpochSecond</code>	string	The epoch second field.
<code>dateFieldFiscalMonth</code>	string	The fiscal month field.
<code>dateFieldFiscalQuarter</code>	string	The fiscal quarter field.
<code>dateFieldFiscalWeek</code>	string	The fiscal week field.
<code>dateFieldFiscalYear</code>	string	The fiscal year field.

Field	Field Type	Description
<code>dateFieldFullYear</code>	string	The full year field.
<code>dateFieldHour</code>	string	The hour field.
<code>dateFieldMinute</code>	string	The minute field.
<code>dateFieldMonth</code>	string	The month field.
<code>dateFieldQuarter</code>	string	The quarter field.
<code>dateFieldSecond</code>	string	The second field.
<code>dateFieldWeek</code>	string	The week field.
<code>dateFieldYear</code>	string	The year field.
<code>description</code>	string	The description of the date column.
<code>firstDayOfWeek</code>	int	Required. Represents the first day of the week.
<code>fiscalMonthOffset</code>	int	Required. Offset number of months for the fiscal year in relation to the calendar year.
<code>isYearEndFiscalYear</code>	boolean	Indicates whether the year end is the fiscal year ( <code>true</code> ) or not ( <code>false</code> ).
<code>label</code>	string	The label of the date column.
<code>showInExplorer</code>	boolean	Indicates whether the date is displayed in the explorer ( <code>true</code> ) or not ( <code>false</code> ).
<code>sortIndex</code>	int	Required. The index value the system assigns to indicate where the item appears in a list.
<code>type</code>	string	Required. The type of date. Valid values are: <ul style="list-style-type: none"> <li><code>Date</code>—A legacy date type. Available when the time zone isn't enabled.</li> <li><code>DateOnly</code>—A date type without an associated time. Available when the time zone is enabled.</li> <li><code>DateTime</code>—A date type that contains both date and time parts. Available when the time zone is enabled.</li> </ul>

## WaveXmdDimension

WaveXmdDimension represents a dimension.

Field	Field Type	Description
<code>conditionalFormatting</code>	<a href="#">WaveXmdFormattingProperty</a>	The conditional formatting property for the dimension. Available in API version 43.0 and later.
<code>customActions</code>	<a href="#">WaveXmdDimensionCustomAction</a>	Custom actions linked to this dimension.

Field	Field Type	Description
customActionsEnabled	boolean	Indicates whether the dimension has custom actions enabled ( <code>true</code> ) or not ( <code>false</code> ).
dateFormat	string	The format used for a date that is a dimension.
defaultAction	string	The default action assigned to a dimension. An action for a dimension can be <code>openSfdcRecord</code> , <code>openActionsMenu</code> , <code>none</code> , or a valid API name with dot notation like <code>Global.LogACall</code> or <code>FeedItem.Post</code> .
description	string	The description of the dimension.
field	string	Required. The field name of the dimension (used in queries).
fullyQualifiedName	string	The fully qualified name of the dimension.
imageTemplate	string	The image template.
isDerived	boolean	Required. Indicates whether the dimension is derived ( <code>true</code> ) or not ( <code>false</code> ).
isMultiValue	boolean	Indicates whether the dimension is multi-value ( <code>true</code> ) or not ( <code>false</code> ).
label	string	The label for the dimension.
linkTemplate	string	The template for formatting a link.
linkTemplateEnabled	boolean	Indicates whether the dimension has link templates enabled ( <code>true</code> ) or not ( <code>false</code> ).
linkTooltip	string	The tooltip to be displayed for links.
members	<a href="#">WaveXmdDimensionMember</a>	The member overrides for a dimension.
origin	string	The origin of this dimension.
recordDisplayFields	<a href="#">WaveXmdRecordDisplayLookup</a>	Ordered list of dimensions. The list defines the default order in which to display the dimensions in the user interface.
recordIdField	string	The record ID for this dimension.
recordOrganizationIdField	string	The record organization ID for this dimension.
salesforceActions	<a href="#">WaveXmdDimensionSalesforceAction</a>	Salesforce actions linked to this dimension.
salesforceActionsEnabled	boolean	Indicates whether the dimension has Salesforce actions enabled ( <code>true</code> ) or not ( <code>false</code> ).
showDetailsDefaultFieldIndex	int	Default order in which to show the dimensions in the user interface.
showInExplorer	boolean	Indicates whether the dimension is displayed in the explorer ( <code>true</code> ) or not ( <code>false</code> ).
sortIndex	int	Required. The index value the system assigns to indicate where the item appears in a list.

## WaveXmdFormattingProperty

WaveXmdFormattingProperty represents an XMD formatting property for conditional formatting.

Field	Field Type	Description
formattingBins	<a href="#">WaveXmdFormattingBin</a>	The formatting bins for this property.
formattingPredicates	<a href="#">WaveXmdFormattingPredicate</a>	The formatting predicates for this property.
property	string	Required. The property name.
referenceField	string	Required. The reference field for this property.
sortIndex	int	Required. The index value the system assigns to indicate where the item appears in a list.
type	string	Required. The property type.

## WaveXmdFormattingBin

WaveXmdFormattingBin represents an XMD formatting bin for conditional formatting.

Field	Field Type	Description
bin	string	Required. The formatting bin.
formatValue	string	Required. The format value for the bin.
label	string	Required. The label for the bin.
sortIndex	int	Required. The index value the system assigns to indicate where the item appears in a list.

## WaveXmdFormattingPredicate

WaveXmdFormattingPredicate represents an XMD formatting predicate for conditional formatting.

Field	Field Type	Description
formatValue	string	Required. The format value for the predicate.
operator	string	Required. The operator for the predicate.
sortIndex	int	Required. The index value the system assigns to indicate where the item appears in a list.
value	string	Required. The value for the predicate.

## WaveXmdDimensionCustomAction

WaveXmdDimensionCustomAction represents a custom action in a dimension.

Field	Field Type	Description
customActionName	string	Required. The name of this custom action.
enabled	boolean	Required. Indicates whether the action is enabled for a specific dimension ( <code>true</code> ) or not ( <code>false</code> ).
icon	string	The icon for the action.
method	string	The method for the action.
sortIndex	int	Required. The index value the system assigns to indicate where the item appears in a list.
target	string	The target for the action.
tooltip	string	The tooltip for the action.
url	string	The URL for the action.

## WaveXmdDimensionMember

WaveXmdDimensionMember represents a dimension.

Field	Field Type	Description
color	string	The color for the member.
label	string	The label for the member.
member	string	Required. The member value.
sortIndex	int	Required. The index value the system assigns to indicate where the item appears in a list.

## WaveXmdRecordDisplayLookup

WaveXmdDimensionRecordDisplayLookup represents a record display field.

Field	Field Type	Description
recordDisplayField	string	Required. The field to display.
sortIndex	int	Required. The index value the system assigns to indicate where the item appears in a list.

## WaveXmdDimensionSalesforceAction

WaveXmdDimensionSalesforceAction represents an action in a dimension.

Field	Field Type	Description
enabled	boolean	Required. Indicates whether the action is enabled for a specific dimension ( <code>true</code> ) or not ( <code>false</code> ).
salesforceActionName	string	Required. The name of the action.
sortIndex	int	Required. The index value the system assigns to indicate where the item appears in a list.

## WaveXmdMeasure

WaveXmdMeasure represents a measure.

Field	Field Type	Description
conditionalFormatting	<a href="#">WaveXmdFormattingProperty</a>	The conditional formatting for the measure. Available in API version 43.0 and later.
currencies	WaveXmdMeasure[]	The list of currency formats for multiple currencies. Use this field to set the format for each currency used in the dataset.
currencyCode	String	The default currency code for the dataset.
dateFormat	string	The format used for a date that is a measure.
description	string	The description of the measure.
field	string	Required. The field name of the measure (used in queries).
formatCustomFormat	string	The original (XMD 1.1) format array as a single string.
formatDecimalDigits	int	The number of digits displayed after the decimal place.
formatDecimalSeparator	string	The custom separator for the decimal place. Available in API version 48.0 and later.
formatIsNegativeParens	boolean	Indicates whether to display negative numbers with parentheses, rather than a minus sign ( <code>true</code> ) or not ( <code>false</code> ).
formatPrefix	string	The prefix placed before the field value.
formatSuffix	string	The suffix placed after the field value.
formatThousandsSeparator	string	The custom separator for the thousands place. Available in API version 48.0 and later.
formatUnit	string	The unit string for the measure. For example, 'cm'.
formatUnitMultiplier	double	The multiplier for the unit.
fullyQualified_name	string	The fully qualified name of the measure.
isDerived	boolean	Required. Indicates whether the measure is derived ( <code>true</code> ) or not ( <code>false</code> ).

Field	Field Type	Description
isMultiCurrency	boolean	Indicates whether multiple currencies are available for this dataset ( <code>true</code> ) or not ( <code>false</code> ).
label	string	The label for the measure.
origin	string	The origin of the measure.
showDetailsDefaultFieldIndex	int	Default order in which to show the measures in the user interface.
showInExplorer	boolean	Indicates whether the measure is displayed in the explorer ( <code>true</code> ) or not ( <code>false</code> ).
sortIndex	int	Required. The index value the system assigns to indicate where the item appears in a list.

## WaveXmdOrganization

WaveXmdOrganization represents a Salesforce organization.

Field	Field Type	Description
instanceUrl	string	Required. The instance URL for the organization.
label	string	Required. The label for the organization.
organizationIdentifier	string	Required. The ID of the organization.
sortIndex	int	Required. The index value the system assigns to indicate where the item appears in a list.

## Declarative Metadata Sample Definition

The following is an example of a WaveXmd component for an Asset XMD belonging to a dashboard.

```
<WaveXmd>
  <dataset xsi:nil="true"/>
  <dimensions>
    <conditionalFormatting>
      <formattingBins>
        <bin>*</bin>
        <formatValue>#FFFFFF</formatValue>
        <label xsi:nil="true"/>
        <sortIndex>0</sortIndex>
      </formattingBins>
      <formattingBins>
        <bin>0</bin>
        <formatValue>#000000</formatValue>
        <label xsi:nil="true"/>
        <sortIndex>1</sortIndex>
      </formattingBins>
    </conditionalFormatting>
  </dimensions>
</WaveXmd>
```

```

        <property>chartColor</property>
        <referenceField>count</referenceField>
        <sortIndex xsi:nil="true"/>
        <type>multiple</type>
    </conditionalFormatting>
    <field>all_1.ALL</field>
    <isDerived>>false</isDerived>
    <sortIndex>0</sortIndex>
</dimensions>
<measures>
    <conditionalFormatting>
        <formattingBins>
            <bin>*</bin>
            <formatValue>#FFFFFF</formatValue>
            <label xsi:nil="true"/>
            <sortIndex>0</sortIndex>
        </formattingBins>
        <formattingBins>
            <bin>0</bin>
            <formatValue>#000000</formatValue>
            <label xsi:nil="true"/>
            <sortIndex>1</sortIndex>
        </formattingBins>
        <property>chartColor</property>
        <referenceField>count</referenceField>
        <sortIndex xsi:nil="true"/>
        <type>multiple</type>
    </conditionalFormatting>
    <field>all_1.count</field>
    <formatCustomFormat>["&quot;#,###.##%&quot;;,1]</formatCustomFormat>
    <isDerived>>false</isDerived>
    <sortIndex>0</sortIndex>
</measures>
<type>Asset</type>
<waveVisualization>dashboard</waveVisualization>
</WaveXmd>

```

## WebStoreBundle

---

Represents the configuration of a webstore.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

WebStoreBundle components have the suffix `webstore` and are stored in the `.webStoreBundle` folder.

## Version

WebStoreBundle components are available in API version 49.0 and later.

## Special Access Rules

A B2B Commerce or D2C Commerce license and access to Commerce objects is required.

## Fields

Field Name	Description
<code>autoFacetingEnabled</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether auto faceting is enabled (<code>true</code>) or not (<code>false</code>). If enabled (<code>True</code>), the most relevant search facets are automatically returned, in addition to the configured search facets, in the product search results. If disabled (<code>False</code>), only the configured search facets are returned. The default is <code>False</code>. See <a href="#">Add Product Search Filters (Facets)</a> for more information. This field is available in API version 50.0 or later.</p>
<code>cartToOrderAutoCustomFieldMapping</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether custom field mapping for cart and order objects is enabled (<code>True</code>) or not (<code>False</code>). The default value is <code>True</code>. This field is available in API version 57.0 or later.</p>
<code>commerceEinsteinActivitiesTracked</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether Commerce Einstein activities tracking is enabled (<code>true</code>) or not (<code>false</code>).</p>
<code>commerceEinsteinDeployed</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether Commerce Einstein is deployed (<code>true</code>) or not (<code>false</code>).</p>
<code>country</code>	<p><b>Field Type</b> CountryIsoCode (enumeration of type string)</p> <p><b>Description</b> Two-digit ISO code of the store's country. Purchases can be shipped only to the country assigned to the store. Valid for only D2C stores. This field is available in API version 56.0 and later.</p>

Field Name	Description
defaultCurrency	<b>Field Type</b> string <b>Description</b> The store's default currency setting for new records.
defaultLanguage	<b>Field Type</b> string <b>Description</b> Required. The store's default language setting for new records.
defaultTaxLocaleType	<b>Field Type</b> TaxLocaleType (enumeration of type string) <b>Description</b> Required. The default tax type for the store. Possible values are: <ul style="list-style-type: none"><li>• Automatic</li><li>• Gross</li><li>• Net</li></ul>
description	<b>Field Type</b> string <b>Description</b> Description of the store.
guestBrowsingEnabled	<b>Field Type</b> boolean <b>Description</b> Indicates whether guest browsing is enabled ( <code>true</code> ) or not ( <code>false</code> ).
guestCartTimeToLive	<b>Field Type</b> int <b>Description</b> Amount of time in minutes that a guest cart stays active and doesn't expire. This field is available in API version 52.0 and later.
label	<b>Field Type</b> string <b>Description</b> Required. The store's label.

Field Name	Description
orderLifeCycleType	<p><b>Field Type</b> OrderLifeCycleType (enumeration of type string)</p> <p><b>Description</b> The order life cycle type. Possible values are:</p> <ul style="list-style-type: none"> <li>• MANAGED</li> <li>• UNMANAGED</li> </ul> <p>This field is available in API version 55.0 and later.</p>
pricingStrategy	<p><b>Field Type</b> PricingStrategy (enumeration of type string)</p> <p><b>Description</b> Required. The price selected to display to buyers. Possible values are:</p> <ul style="list-style-type: none"> <li>• LowestPrice</li> <li>• Priority</li> </ul> <p>The default value is <code>LowestPrice</code>.</p>
productGrouping	<p><b>Field Type</b> ProductGrouping (enumeration of type string)</p> <p><b>Description</b> Determines whether product variations are listed individually in search results or are represented by the parent product, which links to its children.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• NoGrouping—Variations are listed individually in search results.</li> <li>• VariationParent—The parent product is returned in search results with a link to its children.</li> </ul> <p>The default value is <code>VariationParent</code>. This field is available in API version 52.0 and later.</p>
skipAdditionalEntitlementCheckForSearch	<p><b>Field Type</b> boolean</p> <p><b>Description</b> By default, user entitlement checks are run as part of a search index rebuild and again when product search results are returned. Skips the second check to promote faster search performance. Set the option to <code>True</code> to skip additional entitlement checks on a search. This field is available in API version 52.0 and later.</p>
skuDetectionEnabled	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether SKU detection is enabled (<code>true</code>) or not (<code>false</code>).</p>

Field Name	Description
storeName	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the store.</p>
supportedCurrencies	<p><b>Field Type</b> string</p> <p><b>Description</b> Currencies supported by the store.</p>
supportedLanguages	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Languages supported by the store.</p>
supportedShipToCountries	<p><b>Field Type</b> string</p> <p><b>Description</b> Countries that the store can ship to.</p>
type	<p><b>Field Type</b> WebStoreType (enumeration of type string)</p> <p><b>Description</b> Required. The type of store configuration, B2C, B2B, or B2CE. Default is B2B.</p>

## Declarative Metadata Sample Definition

The following is an example of a WebStoreBundle component.

```
<?xml version="1.0" encoding="UTF-8"?>
<WebStoreBundle xmlns="http://soap.sforce.com/2006/04/metadata">
  <autoFacetingEnabled>>false</autoFacetingEnabled>
  <commerceEinsteinActivitiesTracked>>false</commerceEinsteinActivitiesTracked>
  <commerceEinsteinDeployed>>false</commerceEinsteinDeployed>
  <defaultTaxLocaleType>Net</defaultTaxLocaleType>
  <guestBrowsingEnabled>>true</guestBrowsingEnabled>
  <pricingStrategy>Priority</pricingStrategy>
  <skipAdditionalEntitlementCheckForSearch>>true</skipAdditionalEntitlementCheckForSearch>

  <skuDetectionEnabled>>false</skuDetectionEnabled>
  <type>B2B</type>
  <cartToOrderAutoCustomFieldMapping>>true</cartToOrderAutoCustomFieldMapping>
  <country>US</country>
  <description>WebStore description</description>
  <guestCartTimeToLive>10</guestCartTimeToLive>
</WebStoreBundle>
```

```

<orderLifeCycleType>MANAGED</orderLifeCycleType>
<productGrouping>VariationParent</productGrouping>
<supportedCurrencies>USD</supportedCurrencies>
<supportedShipToCountries>CA;US</supportedShipToCountries>
<label>WebStore</label>
<supportedLanguages>en_US</supportedLanguages>
<defaultLanguage>en_US</defaultLanguage>
<defaultCurrency>000</defaultCurrency>
<storeName>WebStore</storeName>
</WebStoreBundle>

```

The following is an example `package.xml` that references the previous definition.

```

<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <name>WebStoreBundle</name>
    <members>WebStore</members>
  </types>
  <version>60.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## WebStoreTemplate

---

Represents a configuration for creating commerce stores.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

WebStoreTemplate components have the suffix `.webstoretemplate` and are stored in the `webstoretemplate` folder.

## Version

WebStoreTemplate components are available in API version 49.0 and later.

## Special Access Rules

A B2B Commerce or D2C Commerce license and access to Commerce objects is required.

## Fields

Field Name	Field Type	Description
<code>autoFacetingEnabled</code>	boolean	Indicates whether auto faceting is enabled ( <code>true</code> ) or not ( <code>false</code> ). If enabled ( <code>True</code> ), the most relevant search facets are automatically returned, in addition to the configured search facets, in the product search results. If disabled ( <code>False</code> ), only the configured search facets are returned. The default is <code>False</code> . See <a href="#">Add Product Search Filters (Facets)</a> for more information. This field is available in API version 50.0 or later.
<code>cartAsyncProcessingEnabled</code>	boolean	Indicates whether add-to-cart requests are processed asynchronously ( <code>True</code> ) or not ( <code>False</code> ). The default value is <code>True</code> . This field is available in API version 59.0 or later.
<code>cartCalculateEnabled</code>	boolean	Indicates whether the cart calculate extension is enabled ( <code>True</code> ) or not ( <code>False</code> ). The default value is <code>False</code> . This field is available in API version 59.0 or later.
<code>cartToOrderAutoCustomFieldMapping</code>	boolean	Indicates whether custom field mapping for cart and order objects is enabled ( <code>True</code> ) or not ( <code>False</code> ). The default value is <code>True</code> . This field is available in API version 57.0 or later.
<code>checkoutTimeToLive</code>	int	Amount of time in minutes that a checkout stays active and doesn't expire. This field is available in API version 52.0 and later.
<code>checkoutValidAfterDate</code>	dateTime	A timestamp in the default server timezone (GMT). All checkouts that start before this date are considered expired. This field is available in API version 52.0 and later.
<code>commerceEinsteinActivitiesTracked</code>	boolean	Indicates whether Commerce Einstein activities tracking is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>commerceEinsteinDeployed</code>	boolean	Indicates whether Commerce Einstein is deployed ( <code>true</code> ) or not ( <code>false</code> ).
<code>country</code>	string	Two-digit ISO code of the store's country. Purchases can be shipped only to the country assigned to the store. Valid for only D2C stores. This field is available in API version 56.0 and later.
<code>defaultCurrency</code>	string	The template's default currency setting for new records.
<code>defaultLanguage</code>	string	Required. The template's default language setting for new records.
<code>defaultTaxLocaleType</code>	TaxLocaleType (enumeration of type string)	Required. The template's default tax type for your webstore. Possible values include: <ul style="list-style-type: none"> <li>• <code>Automatic</code></li> <li>• <code>Gross</code></li> <li>• <code>Net</code></li> </ul>
<code>description</code>	string	The description of the template.

Field Name	Field Type	Description
<code>duplicateCartItemsEnabled</code>	boolean	Indicates whether a cart can include multiple items with the same product ID ( <code>True</code> ) or not ( <code>False</code> ). The default value is <code>False</code> . This field is available in API version 59.0 or later.
<code>guestBrowsingEnabled</code>	boolean	Indicates whether guest browsing is enabled for this store. Set the option to <code>True</code> to allow guest buyers access to products in the store.
<code>guestCartEnabled</code>	boolean	Required. Indicates whether guest cart access is enabled for a store created with an LWR template. Set the option to <code>True</code> to allow guest buyers access to products in the store.  This field is available in API version 58.0 and later.
<code>guestCheckoutEnabled</code>	boolean	Required. Indicates whether guest checkout access is enabled for a store created with an LWR template. Set the option to <code>True</code> to allow guest buyers access to products in the store.  This field is available in API version 58.0 and later.
<code>masterLabel</code>	string	Required. The original (untranslated) name of a label. Each translated label is paired with its original untranslated version.
<code>maxValuesPerFacet</code>	int	Maximum number of values that can be added to a facet.
<code>orderActivationStatus</code>	string	Status of the order. Possible values include: <ul style="list-style-type: none"> <li>• <code>Activated</code></li> <li>• <code>Draft</code></li> </ul> This field is available in API version 55.0 and later.
<code>orderLifeCycleType</code>	OrderLifeCycleType (enumeration of type string)	The order life cycle type. Possible values include: <ul style="list-style-type: none"> <li>• <code>MANAGED</code></li> <li>• <code>UNMANAGED</code></li> </ul> This field is available in API version 55.0 and later.
<code>paginationSize</code>	int	Number of results displayed per search results page.
<code>preserveGuestCartEnabled</code>	boolean	Required. Indicates whether cart contents are preserved when a guest logs in to the store. Set the option to <code>True</code> to preserve guest carts.  This field is available in API version 60.0 and later.
<code>pricingStrategy</code>	PricingStrategy (enumeration of type string)	Required. The price selected to display to buyers. Possible values include: <ul style="list-style-type: none"> <li>• <code>LowestPrice</code></li> <li>• <code>Priority</code></li> </ul> The default value is <code>LowestPrice</code> .
<code>productGrouping</code>	ProductGrouping (enumeration of type string)	Determines whether product variations are listed individually in search results or are represented by the parent product, which links to its children. Possible values are: <ul style="list-style-type: none"> <li>• <code>NoGrouping</code>—Variations are listed individually in search results.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li><code>VariationParent</code>—The parent product is returned in search results with a link to its children.</li> </ul> <p>The default value is <code>VariationParent</code>. This field is available in API version 52.0 and later.</p>
<code>skipAdditionalEntitlementCheckForSearch</code>	boolean	By default, user entitlement checks are run as part of a search index rebuild and again when product search results are returned. Skips the second check to promote faster search performance. Set the option to <code>True</code> to skip additional entitlement checks on a search. This field is available in API version 52.0 and later.
<code>skuDetectionEnabled</code>	boolean	Indicates whether SKU detection is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>splitShipmentEnabled</code>	boolean	Required. Indicates whether split shipments are enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>supportedCurrencies</code>	string	Currencies supported for store template.
<code>supportedLanguages</code>	string	Required. Languages supported for store template.
<code>supportedShipToCountries</code>	string	Countries that a store created from the template can ship to.
<code>type</code>	WebStoreType (enumeration of type string)	Required. The type of store configuration, <code>B2C</code> , <code>B2B</code> , or <code>B2CE</code> . Default is <code>B2B</code> .

## Declarative Metadata Sample Definition

The following is an example of a web store template component.

```
<?xml version="1.0" encoding="UTF-8"?>
<WebStoreTemplate xmlns="http://soap.sforce.com/2006/04/metadata">
  <autoFacetingEnabled>true</autoFacetingEnabled>
  <cartAsyncProcessingEnabled>true</cartAsyncProcessingEnabled>
  <cartCalculateEnabled>false</cartCalculateEnabled>
  <cartToOrderAutoCustomFieldMapping>true</cartToOrderAutoCustomFieldMapping>
  <checkoutTimeToLive>10</checkoutTimeToLive>
  <checkoutValidAfterDate>2020-08-10T09:26:50</checkoutValidAfterDate>
  <commerceEinsteinActivitiesTracked>false</commerceEinsteinActivitiesTracked>
  <commerceEinsteinDeployed>false</commerceEinsteinDeployed>
  <country>US</country>
  <defaultCurrency>USD</defaultCurrency>
  <defaultLanguage>ENGLISH</defaultLanguage>
  <defaultTaxLocaleType>Net</defaultTaxLocaleType>
  <description>WebStore description</description>
  <duplicateCartItemsEnabled>false</duplicateCartItemsEnabled>
  <guestBrowsingEnabled>true</guestBrowsingEnabled>
  <guestCartEnabled>false</guestCartEnabled>
  <guestCartTimeToLive>10</guestCartTimeToLive>
  <guestCheckoutEnabled>false</guestCheckoutEnabled>
  <masterLabel>WebStore</masterLabel>
</WebStoreTemplate>
```

```

<maxValuesPerFacet>99</maxValuesPerFacet>
<orderActivationStatus>Activated</orderActivationStatus>
<orderLifeCycleType>MANAGED</orderLifeCycleType>
<paginationSize>9</paginationSize>
<preserveGuestCartEnabled>false</preserveGuestCartEnabled>
<pricingStrategy>Priority</pricingStrategy>
<productGrouping>VariationParent</productGrouping>
<skipAdditionalEntitlementCheckForSearch>true</skipAdditionalEntitlementCheckForSearch>

<skuDetectionEnabled>false</skuDetectionEnabled>
<supportedCurrencies>USD</supportedCurrencies>
<supportedLanguages>en_us</supportedLanguages>
<supportedShipToCountries>CA;US</supportedShipToCountries>
<splitShipmentEnabled>false</splitShipmentEnabled>
<type>B2B</type>
</WebStoreTemplate>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>WebStoreTemplate</name>
  </types>
  <version>60.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Workflow

---

Represents the metadata associated with a workflow rule. A workflow rule sets workflow actions into motion when its designated conditions are met. You can configure workflow actions to execute immediately when a record meets the conditions in your workflow rule, or set time triggers that execute the workflow actions on a specific day. Use this metadata type to create, update, or delete workflow rule definitions.

For more information, see Workflow in Salesforce Help. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

When using a manifest file, retrieve all workflow components using this code.

```

<types>
  <members>*</members>
  <name>Workflow</name>
</types>

```

## Declarative Metadata File Suffix and Directory Location

Workflow files have the suffix `.workflow`. There's one file per standard or custom object that has workflow. These files are stored in the `workflows` directory of the corresponding package.

## Version

Workflow rules are available in API version 13.0 and later.

## Workflow

This metadata type represents the valid types of workflow rules and actions associated with a standard or custom object.

Field Name	Field Type	Description
<code>alerts</code>	<a href="#">WorkflowAlert[]</a>	An array of all alerts for the object associated with the workflow.
<code>fieldUpdates</code>	<a href="#">WorkflowFieldUpdate[]</a>	An array of all field updates for the object associated with the workflow.
<code>flowActions</code>	<a href="#">WorkflowFlowAction[]</a>	<p>An array of flow triggers for the object associated with the workflow. Available in API version 30.0 and later.</p> <p>The pilot program for flow trigger workflow actions is closed. If you already enabled the pilot in your org, you can continue to create and edit flow trigger workflow actions. If you didn't enable the pilot, use Flow Builder to create a record-triggered flow, or use Process Builder to launch a flow from a process.</p>
<code>fullName</code>	string	<p>The developer name used as a unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component.</p>
<code>knowledgePublishes</code>	<a href="#">WorkflowKnowledgePublish[]</a>	An array of Salesforce Knowledge Workflow Publishes associated with the workflow. Available in API version 27.0 and later.
<code>outboundMessages</code>	<a href="#">WorkflowOutboundMessage[]</a>	An array of all the outbound messages for the object associated with the workflow.
<code>rules</code>	<a href="#">WorkflowRule[]</a>	An array of all the objects associated with the workflow.
<code>tasks</code>	<a href="#">WorkflowTask[]</a>	An array of all the tasks for the object associated with the workflow.

## WorkflowActionReference

WorkflowActionReference represents one of the workflow actions.

Field Name	Field Type	Description
name	string	Required. The name of the workflow action.
type	WorkflowActionType (enumeration of type string)	<p>Required. Available types of workflow actions:</p> <ul style="list-style-type: none"> <li>Alert</li> <li>FieldUpdate</li> <li>FlowAction—Available in API version 30.0 and later</li> <li>OutboundMessage</li> <li>Task</li> </ul> <p>The pilot program for flow trigger workflow actions is closed. If you already enabled the pilot in your org, you can continue to create and edit flow trigger workflow actions. If you didn't enable the pilot, use Flow Builder to create a record-triggered flow, or use Process Builder to launch a flow from a process.</p>

## WorkflowAlert

WorkflowAlert represents an email alert associated with a workflow rule.

Field Name	Field Type	Description
ccEmails	string[]	<p>Additional email addresses. This field is similar to the CC field in email clients.</p> <p>For the email to be sent successfully, set a value for <code>ccEmails</code> or <code>recipients</code>. You can set values for both fields. The value of <code>ccEmails</code> can include up to 5 different email addresses.</p>
description	string	Required. A description of the email alert. Available in API version 16.0 and later.
fullName	string	Required. The developer name used as a unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component.
protected	boolean	Required. Indicates whether this component is protected ( <code>true</code> ) or not ( <code>false</code> ). Protected components can't be linked to or referenced by components created in the installing organization.
recipients	<a href="#">WorkflowEmailRecipient</a> []	<p>The recipients for the email.</p> <p>For the email to be sent successfully, set a value for <code>ccEmails</code> or <code>recipients</code>. You can set values for both fields.</p>

Field Name	Field Type	Description
<code>senderAddress</code>	string	The address in the From field for the email alert. With this address, you can use a standard global email address for your organization, such as <code>support@company.com</code> , instead of the default From field, which is the email address of the person who updates the record. You can only specify a value in this field if the <code>senderType</code> is set to <code>OrgWideEmailAddress</code> . See Organization-Wide Email Addresses in Salesforce Help.
<code>senderType</code>	ActionEmailSenderType (enumeration of type string)	The email used as the sender's From and Reply-To addresses. These values are valid. <ul style="list-style-type: none"> <li><code>CurrentUser</code>—The email address of the person updating the record. This value is the default setting.</li> <li><code>DefaultWorkflowUser</code>—The email address of the default workflow user. If the email alert is installed from a package, this field value is changed to <code>CurrentUser</code>.</li> <li><code>OrgWideEmailAddress</code>—A verified global email address for your organization, such as <code>support@company.com</code>.</li> </ul>
<code>template</code>	string	Required. Named reference to an EmailTemplate. This email template isn't required to exist in the zip file, but it must exist in Metadata API.  Lightning email templates aren't packageable. We recommend using a Classic email template.

## WorkflowEmailRecipient

WorkflowEmailRecipient represents a recipient for an email alert associated with a workflow rule.

Field Name	Field Type	Description
<code>field</code>	string	Name of the field referenced in <code>type</code> . The field named is of the type specified in <code>type</code> .
<code>recipient</code>	string	The recipients for the email. Depending on the type selected, this field is required.
<code>type</code>	ActionEmailRecipientTypes (enumeration of type string)	Named reference to an EmailTemplate component. Valid values are: <ul style="list-style-type: none"> <li><code>accountOwner</code>—The email is sent to the record's account owner. For example, the Account owner for an Opportunity.</li> <li><code>accountTeam</code>—Only applicable on the Account object. The email is sent to everyone on that Account's account team.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>campaignMemberDerivedOwner</code>—Emails are sent to lead and contact owners when contacts are added to a campaign or in response to a campaign.</li> <li>• <code>contactLookup</code>—The email is sent to a contact whose value is looked up from a field on the record. For this value, the <code>field</code> field must reference a Contact.</li> <li>• <code>creator</code>—The email is sent to the record’s creator.</li> <li>• <code>customerPortalOwner</code>—The email is sent to a specific self-service portal user. For this value, the recipient field must reference a self-service portal user by their username.</li> <li>• <code>email</code>—The email is sent to an email address whose value is looked up from a field on the record. For this value, the <code>field</code> field must reference an email field.</li> <li>• <code>group</code>—The email is sent to all users in a group. For this value, the recipient field must reference a group by group name.</li> <li>• <code>opportunityTeam</code>—Only applicable on the Opportunity object. The email is sent to everyone on that Opportunity’s opportunity team.</li> <li>• <code>owner</code>—The email is sent to the record’s owner.</li> <li>• <code>partnerUser</code>—The email is sent to a specific partner user. For this value, the recipient field must reference a partner user by username.</li> <li>• <code>portalRole</code> - Like <code>role</code>, but for portal roles only.</li> <li>• <code>portalRoleSubordinates</code> - Like <code>roleSubordinates</code>, but for portal roles only.</li> <li>• <code>role</code>—The email is sent to all users in a role. For this value, the recipient field must reference a role name in the role hierarchy.</li> <li>• <code>roleSubordinates</code>—The email is sent to all users in a role subordinate. For this value, the recipient field must reference a role.</li> <li>• <code>roleSubordinatesInternal</code>—Like <code>roleSubordinates</code>, but for internal portal roles only.</li> <li>• <code>user</code>—The email is sent to a specific user. For this value, the recipient field must reference a user by username.</li> <li>• <code>userLookup</code>—The email is sent to a user whose value is looked up from a field on the record. For this value, the <code>field</code> field must reference a user foreign key field.</li> </ul>

## WorkflowFieldUpdate

WorkflowFieldUpdate represents a workflow field update. With field updates, you can automatically update a field value to one that you specify when a workflow rule is triggered.

Field Name	Field Type	Description
<code>description</code>	string	The description of the field update. This information is useful to track the reasoning for initially configuring the field update.
<code>field</code>	string	Required. The field on the object for the workflow to be updated.
<code>formula</code>	string	If the <code>operation</code> field value is <code>Formula</code> , the formula used to compute the new field value.
<code>fullName</code>	string	Required. The developer name used as a unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component.
<code>literalValue</code>	string	If the <code>operation</code> field value is <code>Literal</code> , the literal value for the field.
<code>lookupValue</code>	string	If the <code>operation</code> field value is <code>lookupValue</code> , the lookup value that is referenced.
<code>lookupValueType</code>	LookupValueType (enumeration of type string)	The type of object that the <code>lookupValue</code> field value is referencing. The valid values are: <ul style="list-style-type: none"> <li>• <code>Queue</code></li> <li>• <code>RecordType</code></li> <li>• <code>User</code></li> </ul>
<code>name</code>	string	Required. A name for the component. Available in version API 16.0 and later.
<code>notifyAssignee</code>	boolean	Required. Notify the assignee when the field is updated.
<code>operation</code>	FieldUpdateOperation (enumeration of type string)	Required. The operation that computes the value with which to update the field. Valid values are: <ul style="list-style-type: none"> <li>• <code>Formula</code>—Indicates the field is set to a formula. If set, the formula must be a valid formula.</li> <li>• <code>Literal</code>—Indicates the field is set to a literal value. If set, the <code>literalValue</code> must be a valid literal value for this field.</li> <li>• <code>LookupValue</code>—Similar to <code>Literal</code>, but for an object reference, such as a contact, user, or account. If set, the <code>lookupValue</code> element must be set. Only <code>User</code> is supported in the current API.</li> <li>• <code>NextValue</code>—Indicates that the field will be set to its next value. Only allowed when the field update references a picklist.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li><code>Null</code>—Indicates that the field is set to null.</li> <li><code>PreviousValue</code>—Indicates that the field is set to its previous value. Only allowed when the field update references a picklist.</li> </ul>
<code>protected</code>	boolean	Required. Indicates whether this component is protected ( <code>true</code> ) or not ( <code>false</code> ). Protected components can't be linked to or referenced by components created in the installing organization.
<code>reevaluateOnChange</code>	boolean	<p>When set to <code>true</code>, if the field update changes the field's value, all workflow rules on the associated object are reevaluated. Any workflow rules whose criteria are met as a result of the field value change are triggered.</p> <p>If any of the triggered workflow rules result in another field update that's also enabled for workflow rule reevaluation, a domino effect occurs, and more workflow rules can be reevaluated as a result of the newly triggered field update. This cascade of workflow rule reevaluation and triggering can happen up to 5 times after the initial field update that started it.</p>
<code>targetObject</code>	string	Object set if the change is detected on a child record. If set, the object points to the foreign key reference on the child object that points to the parent. For example, if <code>EmailMessage</code> child record is changed, <code>EmailMessage.ParentId</code> points to the <code>Case</code> parent. This field is named <code>sourceField</code> before version 14.0. The field name change is automatically handled between versions and doesn't require any manual editing of existing XML component files.

## WorkflowFlowAction

Represents a flow trigger, which is a workflow action that launches a flow. Available in API version 30.0 and later. For more information, see these topics in Salesforce Help.

- Define a Flow Trigger for Workflow (Pilot)
- Flow Trigger Considerations (Pilot)

### Note:

- The pilot program for flow trigger workflow actions is closed. If you already enabled the pilot in your org, you can continue to create and edit flow trigger workflow actions. If you didn't enable the pilot, use Flow Builder to create a record-triggered flow, or use Process Builder to launch a flow from a process.
- Test mode for flow triggers isn't supported in the Metadata API. If you want a flow trigger to run the latest flow version when an administrator causes the workflow rule to fire, enable test mode via the user interface after deployment.

Field Name	Field Type	Description
<code>description</code>	string	Describes the flow trigger.

Field Name	Field Type	Description
flow	string	Required. API name of the flow that this workflow action launches.
flowInputs	<a href="#">WorkflowFlowActionParameter[]</a>	An array of values to pass into flow variables when launching the flow.
label	string	Required. Name of the flow trigger.
language	string	Reserved for future use.
protected	boolean	Reserved for future use.

## WorkflowFlowActionParameter

Represents a value specified in the flow trigger that is passed into a variable when launching the flow.

 **Note:** The pilot program for flow trigger workflow actions is closed. If you already enabled the pilot in your org, you can continue to create and edit flow trigger workflow actions. If you didn't enable the pilot, use Flow Builder to create a record-triggered flow, or use Process Builder to launch a flow from a process.

Field Name	Field Type	Description
name	string	Required. API name of the flow variable. The flow variable must have <code>isInput</code> set to <code>True</code> .
value	string	Required. Value to assign to the flow variable when launching the flow. If the variable's data type is <code>sObject</code> , <code>value</code> must be a merge field that identifies a record—or a lookup relationship field that references a record—of the same object type as the variable. For example: <ul style="list-style-type: none"> <li><code>{!this}</code>—Identifies the record that fired the workflow rule.</li> <li><code>{!Contact}</code>—Identifies the contact associated with the record that fired the workflow rule.</li> <li><code>{!Asset.Account}</code>—Identifies the account associated with the asset that is associated with the record that fired the workflow rule.</li> <li><code>{!SomeObject__r}</code>—Uses a lookup relationship field to identify a custom object record associated with the record that fired the workflow rule.</li> </ul> For variables of other data types, you can enter a merge field or a literal value. Manually enter a literal value when the variable requires the same value every time the flow is launched, regardless of which record fired the workflow rule. For example, you can enter <code>true</code> or <code>false</code> for a variable of type <code>Boolean</code> . Supported merge fields identify a global variable or a field of the same data type as the flow variable. For example: <ul style="list-style-type: none"> <li><code>{!Id}</code>—ID of the record that fired the workflow rule.</li> <li><code>{!Account.Owner.Email}</code>—Email address of the account owner for the account associated with the record that fired the workflow rule.</li> <li><code>{!\$Organization.Country}</code>—Country of the organization.</li> </ul>

## WorkflowKnowledgePublish

WorkflowKnowledgePublish represents Salesforce Knowledge article publishing actions and information. Available in API version 27.0 and later.

Field Name	Field Type	Description
<code>action</code>	KnowledgeWorkflowAction (enumeration of type string)	Required. The article publishing actions available when this rule fires. Valid values are: <ul style="list-style-type: none"> <li><code>PublishAsNew</code>—Publishes the article as a new article.</li> <li><code>Publish</code>—Publishes the article as a version of a previously published article.</li> </ul>
<code>description</code>	string	A brief article description.
<code>label</code>	string	Required. Label that represents the article throughout the Salesforce user interface.
<code>language</code>	string	The language of the article.
<code>protected</code>	boolean	Required. Indicates whether this component is protected ( <code>true</code> ) or not ( <code>false</code> ). Protected components can't be linked to or referenced by components created in the installing organization.

## WorkflowOutboundMessage

WorkflowOutboundMessage represents an outbound message associated with a workflow rule. Outbound messages are workflow and approval actions that send the information you specify to an endpoint you designate, such as an external service. An outbound message sends the data in the specified fields in the form of a SOAP message to the endpoint. For more information, see Outbound Message Actions in Salesforce Help.

Field Name	Field Type	Description
<code>apiVersion</code>	double	Required. The API version of the outbound message. Automatically set to the current API version when the outbound message is created. Valid API versions for outbound messages are 8.0 and 18.0 or later.  This API version is used in API calls back to Salesforce using the enterprise or partner WSDLs. The <code>APIVersion</code> can only be modified by using Metadata API. It can't be modified using the Salesforce user interface.  This field is available in API version 18.0 and later.  If you change the <code>apiVersion</code> to a version that doesn't support one of the <code>fields</code> configured for the outbound message, the messages fail until you update your outbound message listener to consume the updated WSDL.

Field Name	Field Type	Description
		To monitor the status of outbound messages, from Setup, in the Quick Find box, enter <i>Outbound Messages</i> , and then select <b>Outbound Messages</b> in Salesforce.
<code>description</code>	string	Describes the outbound message.
<code>endpointUrl</code>	string	Required. The endpoint URL to which the outbound message is sent.
<code>fields</code>	string[]	The named references to the fields to be sent.
<code>fullName</code>	string	Required. The developer name used as a unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component.
<code>includeSessionId</code>	boolean	Required. Set if you want the Salesforce <i>session ID</i> included in the outbound message. Useful if you intend to make API calls and you don't want to include a username and password.
<code>integrationUser</code>	string	Required. The named reference to the user under which this message is sent.
<code>name</code>	string	Required. A name for the component. Available in version API 16.0 and later.
<code>protected</code>	boolean	Required. Indicates whether this component is protected ( <code>true</code> ) or not ( <code>false</code> ). Protected components can't be linked to or referenced by components created in the installing organization.
<code>useDeadLetterQueue</code>	boolean	This field is only available for organizations with dead letter queue permissions turned on. If set, this outbound message uses the dead letter queue if normal delivery fails.

## WorkflowRule

This metadata type represents a workflow rule. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

Field Name	Field Type	Description
<code>actions</code>	<a href="#">WorkflowActionReference</a> []	An array of references for the actions that happen when this rule fires.
<code>active</code>	boolean	Required. Determines if this rule is active.
<code>booleanFilter</code>	string	For advanced criteria filter, the boolean formula. For example, (1 AND 2) OR 3.
<code>criteriaItems</code>	<a href="#">FilterItem</a> []	An array of the boolean criteria (conditions) under which this rule fires. Either

Field Name	Field Type	Description
		<code>criteriaItems</code> or <code>formula</code> must be set.
<code>description</code>	string	The description of the workflow rule.
<code>failedMigrationToVersion</code>	string	The API version in which a migration fails. Used as a reference to admins to retry the migration when the next version is released.  Available in API version 54.0 and later.
<code>formula</code>	string	The formula condition under which this rule first must be set, either <code>formula</code> or <code>criteriaItems</code> .
<code>fullName</code>	string	The developer name used as a unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component.
<code>triggerType</code>	WorkflowTriggerTypes (enumeration of type string)	Under what conditions the trigger fires. Valid values are: <ul style="list-style-type: none"> <li>• <code>onAllChanges</code>—The workflow rule is considered on all changes.</li> <li>• <code>onCreateOnly</code>—The workflow rule is considered only on create.</li> <li>• <code>onCreateOrTriggeringUpdate</code>—The workflow rule is considered on create and triggering updates.</li> </ul>
<code>workflowTimeTriggers</code>	<a href="#">WorkflowTimeTrigger</a>	Represents a set of Workflow actions, including Field Updates, Email Alerts, Outbound Messages, and Tasks, that executes before or after a specified interval of time.

## WorkflowTask

This metadata type references an assigned workflow task.

Field Name	Field Type	Description
<code>assignedTo</code>	string	Specifies the user, role, or team to which the workflow rule or action is assigned. The field corresponding to the value specified here must be the same as the specified <code>assignedToType</code> .
<code>assignedToType</code>	ActionTaskAssignedToTypes (enumeration of type string)	Valid string values for this type are: <ul style="list-style-type: none"> <li><code>accountCreator</code>—When set, the task is assigned to the record's account's creator.</li> <li><code>accountOwner</code>—When set, the task is assigned to the record's account owner (Opportunity).</li> <li><code>accountTeam</code>—Same as WorkflowAlert type</li> <li><code>creator</code>—When set, the task is assigned to the record's creator.</li> <li><code>opportunityTeam</code>—Same as WorkflowAlert type</li> <li><code>owner</code>—When set, the task is assigned to the record's owner.</li> <li><code>partnerUser</code>—When set, the <code>assignedTo</code> field references a partner user by username.</li> <li><code>portalRole</code>—When set, the <code>assignedTo</code> field references a Role by role name, a portal role.</li> <li><code>role</code>—When set, the <code>assignedTo</code> field references a Role by role name.</li> <li><code>user</code>—When set, the <code>assignedTo</code> field references a User by username.</li> </ul>
<code>description</code>	string	The description of this workflow task.
<code>dueDateOffset</code>	int	Required. The offset, in days, from either the trigger date, or the date specified in the (optional) <code>offsetFromField</code> . The offset can be a negative number.
<code>fullName</code>	string	Required. The developer name used as a unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component.
<code>notifyAssignee</code>	boolean	Required. Set to send an email notification when the task is assigned.
<code>offsetFromField</code>	string	Optional field reference of the date field from which the <code>dueDate</code> is computed.
<code>priority</code>	string	Required. The priority to assign the created task.

Field Name	Field Type	Description
protected	boolean	Required. Indicates whether this component is protected ( <code>true</code> ) or not ( <code>false</code> ). Protected components can't be linked to or referenced by components created in the installing organization.
status	string	Required. The status to assign the created task.
subject	string	Required. A subject for the workflow task that's used if an email notification is sent when the task is assigned. Available in API version 16.0 and later.

## WorkflowTimeTrigger

Represents a set of Workflow actions, including Field Updates, Email Alerts, Outbound Messages, and Tasks, that execute before or after a specified interval of time.

Field Name	Field Type	Description
actions	<a href="#">WorkflowActionReference</a> []	An array of references for the actions that happen when this trigger fires.
offsetFromField	string	The date type field name that the time-based workflow triggers from, such as <code>Created Date</code> , <code>Last Modified Date</code> , <code>Rule Trigger Date</code> , or a custom date field on the object for which the workflow rule is defined.
timeLength	string	The numeric value of the time after or before the workflow triggers. A negative value represents the time length before the trigger fires. The <code>timeLength</code> is measured in either hours or days, as specified by <a href="#">workflowTimeTriggerUnit</a> .
workflowTimeTriggerUnit	WorkflowTimeUnits (enumeration of type string)	The unit of time before or after which the time-based workflow triggers. Valid string values are: <ul style="list-style-type: none"> <li>• Hours</li> <li>• Days</li> </ul>

## Declarative Metadata Sample Definition

Here's the definition of a workflow rule.

```
<?xml version="1.0" encoding="UTF-8"?>
<Workflow xmlns="http://soap.sforce.com/2006/04/metadata">
  <alerts>
    <fullName>Another_alert</fullName>
    <description>Another alert</description>
    <protected>>false</protected>
    <recipients>
      <type>accountOwner</type>
    </recipients>
  </alerts>
</Workflow>
```

```

    </recipients>
  <recipients>
    <field>Contact__c</field>
    <type>contactLookup</type>
  </recipients>
  <recipients>
    <field>Email__c</field>
    <type>email</type>
  </recipients>
  <template>TestEmail/Email Test</template>
</alerts>
<fieldUpdates>
  <fullName>Enum_Field_Update</fullName>
  <description>Blah</description>

  <subject>User task was completed</subject>
</tasks>
</Workflow>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## WorkSkillRouting

---

Represents a setup object that stores a set of `WorkSkillRoutingAttribute` objects. These objects are used to route a work item to an agent who has the skills necessary to take the work. This type extends the `Metadata` metadata type and inherits its `fullName` field.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### File Suffix and Directory Location

`WorkSkillRouting` components have the suffix `workSkillRouting` and are stored in the `workSkillRoutings` folder.

### Version

`WorkSkillRouting` components are available in API version 46.0 and later.

### Fields

Field Name	Field Type	Description
<code>isActive</code>	boolean	Required. Indicates whether assignment rules are active and can be evaluated.
<code>masterLabel</code>	string	Required. The label for this object. This display value is the internal label that is not translated.
<code>relatedEntity</code>	string	Required. Type of Salesforce object that the attributes are associated with.
<code>workSkillRoutingAttributes</code>	<a href="#">WorkSkillRoutingAttribute</a> []	A set of mappings between work-item field values and skills. Create one attribute mapping set for each object.

### WorkSkillRoutingAttribute

Represents the routing assignments between object attributes and skills. Attributes are used to route a work item to an agent who has the skills necessary to take the work.

### Fields

Field Name	Field Type	Description
<code>field</code>	string	Required. Field that this attribute applies to.
<code>isAdditionalSkill</code>	boolean	After a designated timeout period, additional skills are dropped from Omni-Channel routing. The case is then routed to the best-matched agent even if they don't have all the skills.

Field Name	Field Type	Description
skill	string	Required. Skill used to route the work item when the attribute maps to the value selected.
skillLevel	int	Level of the skill required. This value can range from 0 to 10.
skillPriority	int	For additional skills, specify the order in which a skill is dropped if after the Drop Additional Skills Timeout on the routing configuration, no agent with that skill is available. Skills with a lower priority rank (9 or 10) are dropped first. Skills with a higher priority rank (0 or 1) are dropped last. Skills with the same priority value are dropped as a group. You can set skill priority using attribute setup for skills-based routing or Apex code. Available in API version 49.0 and later.
value	string	Attribute value that is assigned to the selected skill.

## Declarative Metadata Sample Definition

The following is an example of a WorkSkillRouting component.

```
<?xml version="1.0" encoding="UTF-8"?>
<WorkSkillRouting xmlns="http://soap.sforce.com/2006/04/metadata">
  <isActive>true</isActive>
  <masterLabel>Attribute setup for skills-based routing for Case object</masterLabel>
  <relatedEntity>Case</relatedEntity>
  <workSkillRoutingAttributes>
    <field>Case.Origin</field>
    <isAdditionalSkill>>false</isAdditionalSkill>
    <skill>Technical_Skill</skill>
    <skillLevel>3</skillLevel>
    <skillPriority>2</skillPriority>
    <value>Web</value>
  </workSkillRoutingAttributes>
</WorkSkillRouting>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CHAPTER 13 Headers

Use headers in Metadata API calls to set options for each call.

### [AllOrNoneHeader](#)

Indicates whether to roll back all metadata changes when some of the records in a call result in failures.

### [CallOptions](#)

Specifies the API client identifier.

### [DebuggingHeader](#)

Specifies that the deployment result contains the debug log output, and specifies the level of detail included in the log. The debug log contains the output of Apex tests that are executed as part of a deployment.

### [SessionHeader](#)

Specifies the session ID that the login call returns. This session ID is used to authenticate all subsequent Metadata API calls.

## AllOrNoneHeader

---

Indicates whether to roll back all metadata changes when some of the records in a call result in failures.

## Version

This header is available in API version 34.0 and later.

## Supported Calls

[createMetadata\(\)](#), [updateMetadata\(\)](#), [upsertMetadata\(\)](#), [deleteMetadata\(\)](#)

## Usage

If this header isn't used in API version 34.0 and later, by default a call can save a partial set of records (equivalent to `AllOrNoneHeader=false`)—the records that are processed successfully are saved and records that have failures aren't saved.

## Fields

Field Name	Type	Description
<code>allOrNone</code>	boolean	Set to <code>true</code> to cause all metadata changes to be rolled back if any records in the call cause failures. Set to <code>false</code> to enable

Field Name	Type	Description
		saving only the records that are processed successfully when other records in the call cause failures.

## Sample Code—Java

Add the `AllOrNoneHeader` to the metadata connection before you perform a call as follows:

```
metadataConnection.setAllOrNoneHeader(true);
```

This next example shows how to use the `AllOrNoneHeader` when creating two custom objects. Because the second custom object doesn't have the required `Name` field, the `create()` call can't create this custom object and rolls back the first custom object. The output is shown after this code sample.

```
import com.sforce.soap.metadata.*;
import com.sforce.soap.metadata.Error;
import com.sforce.ws.ConnectionException;

public class CallWithHeader {

    MetadataConnection metadataConnection = null;

    public static void main(String[] args) throws ConnectionException {
        CallWithHeader samples = new CallWithHeader();
        samples.createWithHeader();
    }

    public CallWithHeader() throws ConnectionException {
        metadataConnection = MetadataLoginUtil.login();
    }

    public void createWithHeader() throws ConnectionException {
        // Define two custom objects to be inserted.
        CustomObject col = new CustomObject();
        String name1 = "MyCustomObject1";
        col.setFullName(name1 + "__c");
        col.setDeploymentStatus(DeploymentStatus.Deployed);
        col.setDescription("Created by the Metadata API");
        col.setEnableActivities(true);
        col.setLabel(name1 + " Object");
        col.setPluralLabel(col.getLabel() + "s");
        col.setSharingModel(SharingModel.ReadWrite);

        CustomField nf = new CustomField();
        nf.setType(FieldType.Text);
        nf.setLabel(col.getFullName() + " Name");
        col.setNameField(nf);

        // The second custom object doesn't have a Name field
        CustomObject co2 = new CustomObject();
        String name2 = "MyCustomObject2";
        co2.setFullName(name2 + "__c");
```

## Supported Calls

All Metadata API calls.

## Fields

Field Name	Type	Description
client	string	A value that identifies an API client.

## Sample Code—Java

To change the API client ID, add the `callOptions` header to the metadata connection before you perform a call as follows:

```
metadataConnection.setCallOptions("client ID");
```

## DebuggingHeader

---

Specifies that the deployment result contains the debug log output, and specifies the level of detail included in the log. The debug log contains the output of Apex tests that are executed as part of a deployment.

## Version

This header is available in all API versions.

## Supported Calls

`deploy()`

## Fields

Field Name	Type	Description
categories	<a href="#">LogInfo[]</a>	A list of log categories with their associated log levels.
debugLevel	LogType (enumeration of type string)	<p>Deprecated. This field is provided only for backward compatibility. If you provide values for both <code>debugLevel</code> and <code>categories</code>, the <code>categories</code> value is used.</p> <p>The <code>debugLevel</code> field specifies the type of information returned in the debug log. The values are listed from the least amount of information returned to the most information returned. Valid values include:</p> <ul style="list-style-type: none"> <li>• None</li> <li>• Debugonly</li> </ul>

Field Name	Type	Description
		<ul style="list-style-type: none"> <li>• Db</li> <li>• Profiling</li> <li>• Callout</li> <li>• Detail</li> </ul>

## LogInfo

Specifies the type and amount of information to be returned in the debug log. The `categories` field takes a list of these objects. LogInfo is a mapping of `category` to `level`.

Element Name	Type	Description
<code>category</code>	LogCategory	Specify the type of information returned in the debug log. Valid values are: <ul style="list-style-type: none"> <li>• Db</li> <li>• Workflow</li> <li>• Validation</li> <li>• Callout</li> <li>• Apex_code</li> <li>• Apex_profiling</li> <li>• Visualforce</li> <li>• System</li> <li>• All</li> </ul>
<code>level</code>	LogCategoryLevel	Specifies the level of detail returned in the debug log. Valid log levels are (listed from lowest to highest): <ul style="list-style-type: none"> <li>• NONE</li> <li>• ERROR</li> <li>• WARN</li> <li>• INFO</li> <li>• DEBUG</li> <li>• FINE</li> <li>• FINER</li> <li>• FINEST</li> </ul>

## Sample Code—Java

Add the `DebuggingHeader` to the metadata connection before you perform the `deploy()` call as follows.

```
LogInfo[] logs = new LogInfo[1];
logs[0] = new LogInfo();
```

```
logs[0].setCategory(LogCategory.Apex_code);  
logs[0].setLevel(LogCategoryLevel.Fine);  
metadataConnection.setDebuggingHeader(logs);
```

The result of the `deploy()` call is obtained by calling `checkDeployStatus()`. After the deployment finishes, and if tests were run, the response of `checkDeployStatus()` contains the debug log output in the `debugLog` field of a `DebuggingInfo` output header.

## SessionHeader

---

Specifies the session ID that the login call returns. This session ID is used to authenticate all subsequent Metadata API calls.

### Version

This header is available in all API versions.

### Supported Calls

All Metadata API calls.

### Fields

Field Name	Type	Description
<code>sessionId</code>	string	The session ID that the login call returns.

### Sample Code—Java

Add the `SessionHeader` to the metadata connection before you perform a call as follows:

```
metadataConnection.setSessionHeader("<session_ID>");
```

# APPENDICES

## APPENDIX A CustomObjectTranslation Language Support: Fully Supported Languages

Not every language supports all the possible values for the fields in [CustomObjectTranslation](#). Use this appendix to determine which field values a language supports.

 **Note:** Salesforce offers three levels of language support: fully supported languages, end-user languages, and platform-only languages. This appendix provides information only for fully supported languages.

## APPENDIX C StandardValueSet Names and Standard Picklist Fields

In API version 38.0 and later, standard picklists are represented by the StandardValueSet type. In previous versions, standard picklists are represented by the CustomField type. This table lists the names of standard picklists as standard value sets and their corresponding field names.

 **Note:** The names of standard value sets and picklist fields are case-sensitive.

Standard Value Set Name (API version 38.0 and later)	Field Name (API version 37.0 and earlier)
AAccreditationRating <sup>1</sup>	Accreditation.AccreditationRating <sup>1</sup>
