# Metadata API Developer Guide

Version 62.0, Winter '25

Last updated: November 29, 2024

# CONTENTS

<b>INTRODUCTION TO METADATA API</b> .....	<b>1</b>
<b>Chapter 1: Understanding Metadata API</b> .....	<b>1</b>
Use Cases for Metadata API .....	<b>2</b>
Move Metadata from Production to Your Local File System .....	<b>3</b>
Move Metadata Changes to and from a Scratch Org .....	<b>3</b>
Move Metadata to a Sandbox at Integration Points .....	<b>4</b>
Deploy Metadata to Production .....	<b>4</b>
Move Metadata for Production-Level Changes .....	<b>5</b>
Make Large Metadata Configuration Changes .....	<b>5</b>
Release Notes .....	<b>5</b>
Metadata API Developer Tools .....	<b>5</b>
Supported Salesforce Editions .....	<b>6</b>
Metadata API Edit Access .....	<b>7</b>
Development Platforms .....	<b>7</b>
Standards Compliance .....	<b>8</b>
Metadata API Support Policy .....	<b>8</b>
API End-of-Life Policy .....	<b>8</b>
Related Resources .....	<b>9</b>
<b>Chapter 2: Quick Start: Metadata API</b> .....	<b>10</b>
Prerequisites .....	<b>11</b>
Step 1: (Optional) Add Metadata Components to an Org Using the UI .....	<b>11</b>
Step 2: Build a Package.xml Manifest .....	<b>11</b>
Step 3: Retrieve Components with Metadata API .....	<b>12</b>
<b>Chapter 3: Build Client Applications</b> .....	<b>14</b>
Prerequisites .....	<b>14</b>
Step 1: Generate or Obtain the Web Service WSDLs for Your Organization .....	<b>15</b>
Step 2: Import the WSDL Files Into Your Development Platform .....	<b>15</b>
Step 3: Walk Through the Java Sample Code .....	<b>16</b>
<b>USING METADATA API</b> .....	<b>25</b>
<b>Chapter 4: Declarative (File-Based) Metadata API Calls</b> .....	<b>25</b>
Deploying and Retrieving Metadata with the Zip File .....	<b>25</b>
Slow Deployments .....	<b>27</b>
Does a Retrieve Job Have a Status of Pending? .....	<b>27</b>
Sample package.xml Manifest Files .....	<b>27</b>
Running Tests in a Deployment .....	<b>34</b>

## Contents

Running a Subset of Tests in a Deployment	35
Run the Same Tests in Sandbox and Production Deployments	36
Maintaining User References	36
<b>Chapter 5: CRUD-Based Metadata API Calls</b>	<b>38</b>
<b>Chapter 6: REST Resources</b>	<b>43</b>
Deploy Metadata with Apex Testing Using REST	45
Check the Status of Your Deployment Using REST Resources	49
Deploy a Recently Validated Component Set Without Tests	51
Cancel a Deployment in Progress Using REST	52
Deploy Metadata with REST API in Salesforce CLI	54
<b>Chapter 7: Error Handling</b>	<b>55</b>
Error Handling for Session Expiration	55
<b>REFERENCE</b>	<b>56</b>
<b>Chapter 8: File-Based Calls</b>	<b>56</b>
deploy()	56
Deleting Components from an Organization	66
checkDeployStatus()	68
cancelDeploy()	69
deployRecentValidation()	70
retrieve()	75

# INTRODUCTION TO METADATA API

## CHAPTER 1 Understanding Metadata API

### Salesforce Metadata

---

Metadata is data that describes other data. To understand how Salesforce defines metadata, contrast business data with Salesforce metadata. Business data includes the records that directly correspond to your company's business such as an address, account, or product. Salesforce metadata describes the schema, process, presentation, authorization, and general configuration of your Salesforce org.

To contrast Salesforce metadata with business data, first examine how schema metadata describes the properties of business data. For example, the Salesforce standard object [Address](#) has schema metadata and business data. Address fields such as *Address Type*, *City*, and *Postal Code*, are all schema metadata. The corresponding values in each field, such as Mailing address, Chicago, IL, and 60106, are all data. While personally identifiable information (PII) is usually found in business data, metadata can also include PII, such as custom object names, report names, etc.

Metadata in Salesforce also defines how your org functions. For example, process metadata describes what happens when a user presses the Save button. Presentation metadata concerns the layout of your org, and authorization metadata determines user access. Salesforce metadata also describes your org's general configuration. For example, you can configure Chatter to block emoticons in posts.

Metadata API works with metadata types and components. A metadata type defines the structure of application metadata. A metadata component is an instance of a metadata type. The fields and values of a metadata type are all metadata. For example, the metadata type [CustomTab](#) on page 691 represents a custom tab that displays content. The CustomTab field *hasSidebar* indicates if the tab is on the sidebar panel, which is an example of metadata determining presentation. Metadata types like CustomTab build the metadata model that describe how your org is structured, displayed, or functions. Use Metadata API to develop customizations and build tools that manage the metadata model, not the data itself.

### Metadata API Functionality

---

The main purpose of Metadata API is to move metadata between Salesforce orgs during the development process. Use Metadata API to deploy, retrieve, create, update, or delete customization information, such as custom object definitions and page layouts. Metadata API doesn't work directly with business data. To create, retrieve, update, or delete records such as accounts or leads, use [SOAP API](#) or [REST API](#).

You can move metadata with one of two ways. The first method is with Metadata API `deploy()` and `retrieve()` calls. Admins often use the `deploy()` and `retrieve()` calls to move the full metadata model. These calls are best fit for the final stages of development, such as deploying tested customizations to the production org.

The second method is source push and pull commands that move only changes in metadata. These commands use source tracking, which makes them friendlier for developers and better for intermediary stages of development.

[Metadata Components and Types](#)  
[Deploying and Retrieving Metadata](#)  
[source Commands](#)

## Use Cases for Metadata API

---

Use Metadata API to move metadata between orgs during the development cycle. Metadata API is also used for deploying large metadata configuration changes from development.

To understand how to use Metadata API, let's imagine you're a Salesforce developer at Zephyrus Relocation Services. Zephyrus is a talent-mobility firm that helps companies develop processes for domestic and international employee relocation. Zephyrus is expanding into Asia and South America and wants to add orientation services for both regions. Orientation services include in-country assistance in housing and school searches, area tours, and transportation information.

Your development team must add these new orientation services to their existing org. Products such as in-country orientations are objects that can be customized in Salesforce. When you add objects and customize your org, you change its metadata. The development process of creating a custom product is where Metadata API can help.

## Use Metadata API in the Development Process

Currently, Zephyrus has production metadata and orientation services tailored to other countries. To begin building the new product customizations, you need the existing configurations from Zephyrus' production Salesforce org in a separate repository. The configuration of the production org is all metadata. To save production metadata in a repository, move the metadata from the Zephyrus production org to your local file system.

[Move Metadata from Production to Your Local File System](#) on page 3

To make development changes without affecting your existing configurations, use Metadata API to move metadata to your local file system. Next, push metadata from your local file system to a shareable repository for development.

With all the Zephyrus metadata retrieved, you can develop locally or in a scratch org. Scratch orgs are disposable Salesforce environments with no data. Many developers use both tools together. Loading files and making changes are much faster locally than doing so in a scratch org. Developers often build customizations on their local file system and run tests in a scratch org. Move changes between your local file system and scratch org as you test and develop.

[Move Metadata Changes to and from a Scratch Org](#) on page 3

You can use a scratch org along with your local file system to develop and test changes to metadata. To move the changes you make locally to and from the scratch org, use Metadata API.

The rest of the Zephyrus development team has their own customizations. After developing and testing on your own, it's time for the team to integrate changes and run tests in sandboxes. Sandboxes are development environments used for developing and testing integrations.

[Move Metadata to a Sandbox at Integration Points](#) on page 4

During development, use Metadata API to move metadata to sandboxes for integrating changes, testing, and collaborating with your team.

After your team builds the orientation service customization and completes testing, deploy these components to production with Metadata API.

[Deploy Metadata to Production](#) on page 4

In the final step of the development cycle, move customizations from a source control system such as Git into production with Metadata API.

## Other Use Cases

You can use Metadata API for larger changes in Salesforce, such as splitting and merging production orgs.

For example, Zephyrus wants to split the company into two divisions, one that specializes in domestic relocation and another for international relocation. In this case, you split Zephyrus' Salesforce org and decide which metadata belongs in which org. Metadata API can move metadata to the new org.

Then, let's say Zephyrus acquires Apollo Global Relocation and both companies use Salesforce. To consolidate information, you use Metadata API to merge the Apollo org into the Zephyrus org.

[Move Metadata for Production-Level Changes](#) on page 5

Use Metadata API to move metadata during large changes, such as merging or splitting Salesforce orgs.

You can use Metadata API to make configuration changes during the development process that are too large for alternative API calls. For example, Zephyrus supports many languages for their global clients. To translate different languages for your objects, you include an object translation file for each language.

[Make Large Metadata Configuration Changes](#) on page 5

Metadata is better suited than other APIs for deploying large changes to your org.

## Move Metadata from Production to Your Local File System

To make development changes without affecting your existing configurations, use Metadata API to move metadata to your local file system. Next, push metadata from your local file system to a shareable repository for development.

When you build customizations on Salesforce, you must preserve the functionality of your existing org during the development cycle. To build customizations without affecting your production org, save your production metadata in a version control system. Git integrates best with SFDX tools.

First, move the required metadata from the production org to your local file system. To move metadata to your local machine, use a retrieve call instead of a source pull. Next, push your files to a repository that is accessible to your team members with Git commands. The repository is now the original source of production metadata for your team's development cycle.

Now that your production metadata is stored in a repository, move the necessary metadata back to your local file system to begin development work.

SEE ALSO:

[retrieve\(\)](#)

[source Commands](#)

## Move Metadata Changes to and from a Scratch Org

Use a scratch org to develop and test changes to metadata. You can perform your development within or outside the scratch org using Salesforce CLI or Salesforce Extensions for VS Code, which leverage the power of Metadata API.

Scratch orgs are created empty so that developers can specify the exact metadata and data to include from the source control system. The lifespan of a scratch org is indicated during creation, 1–30 days. They're ephemeral to ensure the source of truth is always the source control system, and not the org itself.

You can move metadata from the source control system or to the scratch org using Salesforce CLI. Because scratch orgs use source tracking to identify changes, the CLI is the most efficient way to move metadata between your local repository and the scratch org. Continue to iterate through this process of moving metadata between your local file system and your scratch org until development is complete.

SEE ALSO:

[Push Source to the Scratch Org](#)

[Pull Source from the Scratch Org to Your Project](#)

## Move Metadata to a Sandbox at Integration Points

During development, use Metadata API to move metadata to sandboxes for integrating changes, testing, and collaborating with your team.

After developing on your own in a scratch org or your local file system, combine work from your team at integration points in a sandbox. Sandboxes are development environments that you can use to integrate and test changes from multiple developers. Admins often create and assign sandboxes. To create a sandbox on the Salesforce UI, navigate to Setup. Next, in the Quick Find box, search for sandboxes.

You have several levels of sandboxes to choose from with differing amounts of data. The Developer sandbox and Developer Pro sandbox are development environments where you build customizations and test changes on fictional data. The Partial Copy sandbox and Full sandbox are testing environments loaded with copies of production data. Move metadata to different sandboxes with a Metadata API deploy command depending on your development and testing needs.

Outside of Metadata API, admins typically use change sets to send customizations from one sandbox to another. Unlike Metadata API calls, you must build change sets manually. To add components to a continuous integration system more easily, you can automate Metadata API calls on Salesforce CLI.

SEE ALSO:

[Sandbox Types and Templates](#)

[Change Sets](#)

[Continuous Integration](#)

## Deploy Metadata to Production

In the final step of the development cycle, move customizations from a source control system such as Git into production with Metadata API.

When your team finishes integration tests and is ready to deploy to production, move the completed customizations from a local environment to the repository. For the release, move metadata from the repository to production by pulling the updated repository back to the local environment with Git commands. Next, deploy metadata to production with Metadata API deploy call.

Moving metadata to production requires a deploy call instead of a push command because the deploy call deploys the entire metadata model and not just changes in the metadata.

## Deploy Recent Validation

A regular deploy call executes automated Apex tests that can take a long time to complete. To skip tests for validated components and deploy components to production quickly, use the deploy recent validation option.

SEE ALSO:

[deploy\(\)](#)

[force:source:push Command](#)

[Deploy a Recently Validated Component Set Without Tests](#)

## Move Metadata for Production-Level Changes

Use Metadata API to move metadata during large changes, such as merging or splitting Salesforce orgs.

To split an org, first retrieve the metadata to be moved. Then, use a deploy call to push those configurations to the new org. Similarly, to merge two orgs, retrieve existing metadata from one org. Next, use a deploy call to migrate metadata from one org to another.

SEE ALSO:

[retrieve\(\)](#)

[deploy\(\)](#)

## Make Large Metadata Configuration Changes

Metadata API is better suited than other APIs for deploying large changes to your Salesforce org.

Metadata API `deploy()` and `retrieve()` calls are file-based and therefore asynchronous. With synchronous commands, large configuration changes require unreasonably long load times. Instead, deploy and retrieve calls begin an asynchronous process that notifies you when it's complete. Because file-based calls are asynchronous, Metadata API can also handle a queue of deploy requests.

SEE ALSO:

[deploy\(\)](#)

[retrieve\(\)](#)

## Metadata API Release Notes

---

Use the Salesforce Release Notes to learn about the most recent updates and changes to Metadata API.

For updates and changes that impact the Salesforce Platform, including Metadata API, see the [API Release Notes](#).

For new, changed, and deprecated metadata types and other changes specific to Metadata API, see [Metadata API](#) in the Salesforce Release Notes.

## Metadata API Developer Tools

---

Use the Salesforce Extensions for Visual Studio Code on Salesforce CLI to access Metadata API commands. Salesforce CLI and the Salesforce Extensions for Visual Studio Code streamline the process of using Metadata API.

The easiest way to access the functionality in Metadata API is to use the Salesforce Extensions for Visual Studio Code or Salesforce CLI. Both tools are built on top of Metadata API and use the standard tools to simplify working with Metadata API.

- The Salesforce Extensions for Visual Studio Code includes tools for developing on the Salesforce platform in the lightweight, extensible VS Code editor. These tools provide features for working with development orgs (scratch orgs, sandboxes, and DE orgs), Apex, Aura components, and Visualforce.
- Salesforce CLI is ideal if you use scripting or the command line for moving metadata between a local directory and a Salesforce org.

For more information about the Salesforce Extensions for Visual Studio Code or Salesforce CLI, see [Salesforce Tools and Toolkits](#).

If you prefer to build your own client applications, the underlying calls of Metadata API have been exposed for you to use directly. This guide gives you more information about working directly with Metadata API.

You can use the Metadata API to manage setup and customization information (metadata) in Salesforce. For example:

- Export customizations as XML metadata files. See [Working with the Zip File](#) and `retrieve()`.
- Migrate configuration changes between orgs. See `deploy()` and `retrieve()`.
- Modify existing customizations using XML metadata files. See `deploy()` and `retrieve()`.
- Manage customizations programmatically. See [CRUD-Based Metadata Development](#).

You can modify metadata in test orgs in Developer Edition or sandboxes, and then deploy tested changes to production orgs in Enterprise, Unlimited, or Performance Editions. You can also create scripts to populate a new org with your custom objects, custom fields, and other components.

SEE ALSO:

[Deploying and Retrieving Metadata](#)

## Supported Salesforce Editions

---

To use Metadata API, your organization must use **Enterprise Edition, Unlimited Edition, Performance Edition, or Developer Edition**. If you're an existing Salesforce customer and want to upgrade to Enterprise, Unlimited, or Performance Edition, contact your account representative.

We strongly recommend that you use a sandbox, which is an exact replica of your production organization. Enterprise, Unlimited, and Performance Editions come with free developer sandboxes. For more information, see <http://www.salesforce.com/platform/cloud-infrastructure/sandbox.jsp>.

Alternatively, you can use a Developer Edition (DE) org. A DE org provides access to all features that are available with Enterprise Edition, but is limited by the number of users and the amount of storage space. A DE org isn't a copy of your production org/ It provides an environment where you can build and test your solutions without affecting your organization's data. Developer Edition accounts are available for free at <https://developer.salesforce.com/signup>.

 **Note:** A metadata component must be visible in the org for Metadata API to act on it. Also, a user must have the API Enabled permission to have access to metadata components.

## Metadata API Access for Professional Edition

ISV partners can request Metadata API access to Professional Edition orgs for apps that have passed AppExchange Security Review. Access is granted through an API token (client ID). This special key enables the app to make Metadata API calls to customers' Professional Edition orgs.

As an ISV partner, you can request Metadata API access by following these steps.

1. Submit your app for security review. See [Steps in the Security Review](#) in the *ISVForce Guide*.
2. After your app is approved, log a case in the [Partner Community](#) in **AppExchange and Feature Requests > API Token Request**, and specify SOAP for the type of token.

To make calls to the Metadata API, append the API token to the [CallOptions](#) SOAP header in your calls.

## Metadata API Edit Access

---

To use Metadata API, a user must have these things.

- One of these editions: Enterprise, Unlimited, or Developer
- Either the Modify Metadata Through Metadata API Functions OR Modify All Data permission
- Permission that enables use of the feature supported by the metadata that they want to modify
- Permission that enables their deployment tool, such as Salesforce CLI, change sets, or the Ant Migration Tool

With the Modify Metadata Through Metadata API Functions permission, a user can access and edit metadata via Metadata API as long as the user has any additional permission needed to access certain metadata types. This additional permission information is listed in the *Metadata API Developer Guide* for each metadata type. With the Modify All Data permission, a user can access and edit all data.

The Modify Metadata Through Metadata API Functions permission doesn't affect direct customization of metadata using Setup UI pages because those pages don't use Metadata API for updates.

Some metadata, such as Apex, executes in system context, so be careful how you delegate the Modify Metadata Through Metadata API Functions permission. The Modify Metadata Through Metadata API Functions permission allows deployment of Apex metadata, but it doesn't allow certain Apex development and debugging features that still require the Modify All Data permission.

The Modify Metadata Through Metadata API Functions permission is enabled automatically when either the Deploy Change Sets OR Author Apex permission is selected.

When the Manage Prompts user permission and the Modify Metadata Through Metadata API Functions permission are combined, users can manage In-App Guidance in Lightning Experience.

## Development Platforms

---

Metadata API supports both file-based and CRUD-based development.

### File-Based Development

The declarative or file-based asynchronous Metadata API `deploy()` and `retrieve()` operations deploy or retrieve a `.zip` file that holds components in a set of folders, and a manifest file named `package.xml`. For more information, see [Deploying and Retrieving Metadata](#) on page 25. The easiest way to access the file-based functionality is to use the Salesforce Extensions for Visual Studio Code or the Ant Migration Tool.

### CRUD-Based Development

The [CRUD Metadata API calls](#) act upon the metadata components in a manner similar to the way synchronous API calls in the *enterprise WSDL* act upon objects. For more information about the enterprise WSDL, see the [SOAP API Developer Guide](#).

## Standards Compliance

---

Metadata API is implemented to comply with the following specifications:

Standard Name	Website
Simple Object Access Protocol (SOAP) 1.1	<a href="http://www.w3.org/TR/2000/NOTE-SOAP-20000508/">http://www.w3.org/TR/2000/NOTE-SOAP-20000508/</a>
Web Service Description Language (WSDL) 1.1	<a href="http://www.w3.org/TR/2001/NOTE-wsdl-20010315">http://www.w3.org/TR/2001/NOTE-wsdl-20010315</a>
WS-I Basic Profile 1.1	<a href="http://www.ws-i.org/Profiles/BasicProfile-1.1-2004-08-24.html">http://www.ws-i.org/Profiles/BasicProfile-1.1-2004-08-24.html</a>

## Metadata API Support Policy

---

Salesforce supports previous versions of Metadata API. However, your new client applications should use the most recent version of the Lightning Platform Metadata API WSDL file to fully exploit the benefits of richer features and greater efficiency.

## Backward Compatibility

Salesforce strives to make backward compatibility easy when using the Lightning Platform.

Each new Salesforce release consists of two components:

- A new release of platform software that resides on Salesforce systems
- A new version of the API

For example, the Spring '07 release included API version 9.0 and the Summer '07 release included API version 10.0.

We maintain support for each API version across releases of the platform software. The API is backward compatible in that an application created to work with a given API version will continue to work with that same API version in future platform software releases.

Salesforce does not guarantee that an application written against one API version will work with future API versions: Changes in method signatures and data representations are often required as we continue to enhance the API. However, we strive to keep the API consistent from version to version with minimal, if any, changes required to port applications to newer API versions.

For example, an application written using API version 9.0, which shipped with the Spring '07 release, will continue to work with API version 9.0 on the Summer '07 release, and on future releases beyond that. However, that same application might not work with API version 10.0 without modifications to the application.

## API End-of-Life Policy

---

See which Metadata REST and SOAP API versions are supported, unsupported, or unavailable.

Salesforce is committed to supporting each API version for a minimum of 3 years from the date of first release. To improve the quality and performance of the API, versions that are over 3 years old sometimes are no longer supported.

Salesforce notifies customers who use an API version scheduled for deprecation at least 1 year before support for the version ends.

Salesforce API Versions	Version Support Status	Version Retirement Info
Versions 31.0 through 62.0	Supported.	

Salesforce API Versions	Version Support Status	Version Retirement Info
Versions 21.0 through 30.0	As of Summer '22, these versions have been deprecated and no longer supported by Salesforce.  Starting Summer '25, these versions will be retired and unavailable.	<a href="#">Salesforce Platform API Versions 21.0 through 30.0 Retirement</a>
Versions 7.0 through 20.0	As of Summer '22, these versions are retired and unavailable.	<a href="#">Salesforce Platform API Versions 7.0 through 20.0 Retirement</a>

If you request any resource or use an operation from a retired API version, REST API returns the `410 : GONE` error code.

If you request any resource or use an operation from a retired API version, SOAP API returns `500 : UNSUPPORTED_API_VERSION` error code.

To identify requests made from old or unsupported API versions, use the [API Total Usage](#) event type.

## Related Resources

---

The Salesforce developer website provides a full suite of developer toolkits, sample code, sample SOAP messages, community-based support, and other resources to help you with your development projects. Be sure to visit

[https://developer.salesforce.com/page/Getting\\_Started](https://developer.salesforce.com/page/Getting_Started) for more information, or visit <https://developer.salesforce.com/signup> to sign up for a free Developer Edition account.

You can visit these websites to find out more about Salesforce applications:

- [Salesforce Developers](#) provides useful information for developers.
- [Salesforce](#) for information about the Salesforce application.
- [Lightning Platform AppExchange](#) for access to apps created for Salesforce.
- [Trailblazer Community](#) for services to ensure Salesforce customer success.

## CHAPTER 2 Quick Start: Metadata API

### In this chapter ...

- [Prerequisites](#)
- [Step 1: \(Optional\) Add Metadata Components to an Org Using the UI](#)
- [Step 2: Build a Package.xml Manifest](#)
- [Step 3: Retrieve Components with Metadata API](#)

Get started with Metadata API by retrieving a small set of metadata components from your org on the Salesforce CLI.

### Resources for Beginner Developers

---

If you're a beginner developer and haven't used Salesforce CLI before, learn how to set up your environment and practice with a sample application. These Trailheads guide you through setup with SFDX and introduce you to Metadata API.

[App Development with Salesforce DX](#)

Walk through setting up your environment and developing with Salesforce CLI using the Dreamhouse sample app. After you add a feature to your Dreamhouse app, you deploy metadata to your Dev Hub org with Salesforce CLI.

[Package.xml Metadata Management](#)

Learn more about metadata and package.xml files. Build a package.xml file to deploy changes from a scratch org to your Trailhead Playground.

### Quick Start for Developing with Metadata API

---

If you have some experience in Salesforce development but want to get started with Metadata API, use this quick start. The quick start walks you through a retrieval of metadata components, which is the first step of the development process.

SEE ALSO:

[Move Metadata from Production to Your Local File System](#)

## Prerequisites

---

Complete these prerequisites before you start developing with Metadata API.

- To access Metadata API through the command line, [install Salesforce CLI](#).
- To create a development environment, [sign up for Salesforce Developer Edition](#). A Developer Edition org is a free development environment for building and testing solutions independent of production data.
- Install [Salesforce Extensions for Visual Studio Code](#). These tools provide features for working with development orgs (scratch orgs, sandboxes, and DE orgs), Apex, Aura components, and Visualforce.
- Confirm that you have API Enabled permission and Modify Metadata Through Metadata API Functions permission or Modify All Data permission. If you don't have these permissions set, [modify your metadata permissions](#).
- [Enable Dev Hub in your org](#). Dev Hub allows you to create and manage scratch orgs so that you can develop without affecting your production data or metadata.
- To allow access to protected resources such as production data and metadata, [authorize your org](#).

## Step 1: (Optional) Add Metadata Components to an Org Using the UI

---

If you're starting with a new practice org that doesn't have customizations, you only have standard metadata that can't be retrieved. To use the Metadata API retrieve call, add a component on the Salesforce UI to your practice org. If you're working on an existing project, you already have components to retrieve and can skip this step.

1. From Setup, click **Create**.
2. Select **Custom Object**.
3. Enter an arbitrary name for **Label** and **Plural Label**.
4. Save the component.

## Step 2: Build a Package.xml Manifest

---

The package.xml manifest file lists the components to retrieve from your org.

### Package.xml Manifest Structure

The package.xml manifest uses Extensible Markup Language (XML) to identify and migrate metadata components. The basic framework of the package.xml manifest is built with `<types>` elements. A `<types>` element specifies which metadata type you want to work with. You can add multiple `<types>` to a package.xml file.

Inside the `<types>` element is the `<name>` element and the `<members>` element. The `<members>` element selects for individual components of a specific type, and the `<name>` element selects for metadata component types. To work with a specific component, input the `fullName` of the component in the `<members>` element.

For example, to retrieve Account components, add Account in the `<members>` element and CustomObject in the `<name>` element in your package.xml. When you issue a retrieve call, you retrieve only the Account component from your org.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Account</members>
```

```

    <name>CustomObject</name>
  </types>
  <version>62.0</version>
</Package>

```

## Retrieve Custom Objects

To retrieve all components of a metadata type, you don't specify the *fullName* of a component. Instead, use the wildcard character \* (asterisk) in the `<members>` tag. Some components, such as standard objects, don't support \* (asterisk) as a specifier.

To retrieve all custom objects from your org:

1. (Optional) If you do not have a project folder, use Salesforce CLI to create a new directory that organizes your project. Run this command with your specified project name:

```
sf project generate --name YourProjectName
```

2. Create a file called `package.xml` in your project.
3. In your text editor, open the file and paste in this script:

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>CustomObject</name>
  </types>
  <version>62.0</version>
</Package>

```

Now you have a `package.xml` file that we can use to retrieve all custom objects. When you develop more on your own, you can retrieve more components from your org with multiple `<types>` elements.

SEE ALSO:

[Sample package.xml Manifest Files](#)

[Deploying and Retrieving Metadata with the Zip File](#)

## Step 3: Retrieve Components with Metadata API

---

With Salesforce CLI, retrieve a file representation of the specified components in your `package.xml` manifest.

### Two Options for Metadata API Retrieve

You can use one of two commands to retrieve metadata components.

1. To retrieve the components specified in your `package.xml` manifest, issue a retrieve call using a Salesforce CLI command. On the command line, run this call with the appropriate file path:

```
sf project retrieve start --manifest path/to/package.xml
```

`Metadata retrieve()` is an asynchronous, file-based command. You can issue multiple retrieve or deploy requests that run on their own when resources are available.

With this command, you send a request to retrieve all custom objects as specified in your package.xml manifest. Your requests are queued until our systems are ready to process your retrieve call. After your request is dequeued, your retrieve call is run. The client checks the status of the retrieve and notifies you when the call is complete. The call returns a file representation of the chosen components. When you use Salesforce CLI to issue a retrieve call, all these processes are automated.

The `project retrieve start` command allows for source tracking. Source tracking includes information about which revision you're working on and when the last changes were made, which makes source commands more developer-friendly. To use source tracking, ensure that it's enabled in your org.

2. Alternatively, run this command in your terminal:

```
sf project retrieve start --manifest path/to/package.xml --target-metadata-dir  
path/to/retrieve/dir
```

This command retrieves components in mdapi format rather than source format, and doesn't allow for source tracking. In practice, admins use mdapi commands more often because the commands don't include source tracking.

#### SEE ALSO:

[retrieve\(\)](#)

[source Commands](#)

[Source Tracking](#)

[mdapi Commands](#)

## CHAPTER 3 Build Client Applications for Metadata API

Use Metadata API to retrieve, deploy, create, update, or delete customizations for your org. The most common use is to migrate changes from a sandbox or testing org to your production environment. Metadata API is intended for managing customizations and for building tools that can manage the metadata model, not the data itself.

Salesforce CLI automates the underlying calls of Metadata API. However, you can use these calls directly with your own client application. This guide gives you all the information you require to start writing applications that directly use Metadata API to manage customizations for your organization. It shows you how to get started with File-Based Development. For an example of CRUD-Based Development, see [Java Sample for CRUD-Based Development with Synchronous Calls](#).

### Prerequisites

---

Make sure that you complete these prerequisites before you start using Metadata API.

- Create a development environment.

We strongly recommend that you use a sandbox, which is an exact replica of your production organization. Enterprise, Unlimited, and Performance Editions come with free developer sandboxes. For more information, see <http://www.salesforce.com/platform/cloud-infrastructure/sandbox.jsp>.

Alternatively, you can use a Developer Edition (DE) org. A DE org provides access to all features that are available with Enterprise Edition, but is limited by the number of users and the amount of storage space. A DE org isn't a copy of your production org/ It provides an environment where you can build and test your solutions without affecting your organization's data. Developer Edition accounts are available for free at <https://developer.salesforce.com/signup>.

- Identify a user that has the API Enabled permission and the Modify Metadata Through Metadata API Functions permission or Modify All Data permission. These permissions are required to access Metadata API calls.

**Note:** If a user requires access to metadata but not to data, enable the [Modify Metadata Through Metadata API Functions](#) on page 7 permission. Otherwise, enable the Modify All Data permission.

- Install a SOAP client. Metadata API works with current SOAP development environments, including, but not limited to, Visual Studio® .NET and the Web Service Connector (WSC).

In this document, we provide Java examples based on WSC and JDK 6 (Java Platform Standard Edition Development Kit 6). To run the samples, first download the latest force-wsc JAR file and its dependencies from [mvnrepository.com/artifact/com.force.api/force-wsc/](http://mvnrepository.com/artifact/com.force.api/force-wsc/). Dependencies are listed on the page when you select a version.

**Note:** Development platforms vary in their SOAP implementations. Implementation differences in certain development platforms can prevent access to some or all features in Metadata API.

## Step 1: Generate or Obtain the Web Service WSDLs for Your Organization

---

To access Metadata API calls, you need a Web Service Description Language (WSDL) file. The WSDL file defines the Web service that is available to you. Your development platform uses this WSDL to generate stub code to access the Web service it defines. You can obtain the WSDL file from your organization's Salesforce administrator, or if you have access to the WSDL download page in the Salesforce user interface, you can generate it yourself. For more information about WSDL, see <http://www.w3.org/TR/wsdl>.

Before you can access Metadata API calls, you must authenticate to use the Web service using the `login()` call, which is defined in the enterprise WSDL and the partner WSDL. Therefore, you must also obtain one of these WSDLs.

Any user with the Modify Metadata Through Metadata API Functions or Modify All Data permission can download the WSDL file to integrate and extend the Salesforce platform.

 **Note:** If a user requires access to metadata but not to data, enable the [Modify Metadata Through Metadata API Functions](#) on page 7 permission. Otherwise, enable the Modify All Data permission.

The sample code in [Step 3: Walk Through the Java Sample Code](#) on page 16 uses the enterprise WSDL, though the partner WSDL works equally well.

To generate the metadata and enterprise WSDL files for your organization:

1. Log in to your Salesforce account. You must log in as an administrator or as a user who has the "Modify All Data" permission.
2. From Setup, enter `API` in the `Quick Find` box, then select **API**.
3. Click **Generate Metadata WSDL**, and save the XML WSDL file to your file system.
4. Click **Generate Enterprise WSDL**, and save the XML WSDL file to your file system.

## Step 2: Import the WSDL Files Into Your Development Platform

---

Once you have the WSDL files, import them into your development platform so that your development environment can generate the necessary objects for use in building client Web service applications. This section provides sample instructions for WSC. For instructions about other development platforms, see your platform's product documentation.

 **Note:** The process for importing WSDL files is identical for the metadata and enterprise WSDL files.

### Instructions for Java Environments (WSC)

Java environments access the API through Java objects that serve as proxies for their server-side counterparts. Before using the API, you must first generate these objects from your organization's WSDL file.

Each SOAP client has its own tool for this process. For WSC, use the `wsdlc` utility.

 **Note:** Before you run `wsdlc`, you must have the WSC JAR file installed on your system and referenced in your classpath. You can download the latest force-wsc JAR file and its dependencies (dependencies are listed on the page when you select a version) from [mvnrepository.com/artifact/com.force.api/force-wsc/](https://mvnrepository.com/artifact/com.force.api/force-wsc/).

The basic syntax for `wsdlc` is:

```
java -classpath pathToWsc;pathToWscDependencies com.sforce.ws.tools.wsdlc
pathToWsd1/Wsd1Filename pathToOutputJar/OutputJarFilename
```

For example, on Windows:

```
java -classpath force-wsc-30.0.0.jar;ST4-4.0.7.jar;antlr-runtime-3.5.jar
com.sforce.ws.tools.wsdlc metadata.wSDL metadata.jar
```

On Mac OS X and Unix, use a colon instead of a semicolon in between items in the classpath:

```
java -classpath force-wsc-30.0.0.jar:ST4-4.0.7.jar:antlr-runtime-3.5.jar
com.sforce.ws.tools.wsdlc metadata.wSDL metadata.jar
```

`wsdlc` generates a JAR file and Java source code and bytecode files for use in creating client applications. Repeat this process for the enterprise WSDL to create an enterprise.JAR file.

## Step 3: Walk Through the Java Sample Code

When you have imported the WSDL files, you can build client applications that use Metadata API. The sample is a good starting point for writing your own code.

Before you run the sample, modify your project and the code to:

1. Include the WSC JAR, its dependencies, and the JAR files you generated from the WSDLs.

**Note:** Although WSC has other dependencies, the following sample only requires Rhino (`js-1.7R2.jar`), which you can download from [mvnrepository.com/artifact/rhino/js](http://mvnrepository.com/artifact/rhino/js).

2. Update `USERNAME` and `PASSWORD` variables in the `MetadataLoginUtil.login()` method with your user name and password. If your current IP address isn't in your organization's trusted IP range, you'll need to append a security token to the password.
3. If you are using a sandbox, be sure to change the login URL.

## Login Utility

Java users can use `ConnectorConfig` to connect to Enterprise, Partner, and Metadata SOAP API. `MetadataLoginUtil` creates a `ConnectorConfig` object and logs in using the Enterprise WSDL login method. Then it retrieves `sessionId` and `metadataServerUrl` to create a `ConnectorConfig` and connects to Metadata API endpoint. `ConnectorConfig` is defined in WSC.

The `MetadataLoginUtil` class abstracts the login code from the other parts of the sample, allowing portions of this code to be reused without change across different Salesforce APIs.

```
import com.sforce.soap.enterprise.EnterpriseConnection;
import com.sforce.soap.enterprise.LoginResult;
import com.sforce.soap.metadata.MetadataConnection;
import com.sforce.ws.ConnectionException;
import com.sforce.ws.ConnectorConfig;

/**
 * Login utility.
 */
public class MetadataLoginUtil {

    public static MetadataConnection login() throws ConnectionException {
        final String USERNAME = "user@company.com";
        // This is only a sample. Hard coding passwords in source files is a bad practice.
    }
}
```

```

    final String PASSWORD = "password";
    final String URL = "https://login.salesforce.com/services/Soap/c/62.0";
    final LoginResult loginResult = loginToSalesforce(USERNAME, PASSWORD, URL);
    return createMetadataConnection(loginResult);
}

private static MetadataConnection createMetadataConnection(
    final LoginResult loginResult) throws ConnectionException {
    final ConnectorConfig config = new ConnectorConfig();
    config.setServiceEndpoint(loginResult.getMetadataServerUrl());
    config.setSessionId(loginResult.getSessionId());
    return new MetadataConnection(config);
}

private static LoginResult loginToSalesforce(
    final String username,
    final String password,
    final String loginUrl) throws ConnectionException {
    final ConnectorConfig config = new ConnectorConfig();
    config.setAuthEndpoint(loginUrl);
    config.setServiceEndpoint(loginUrl);
    config.setManualLogin(true);
    return (new EnterpriseConnection(config)).login(username, password);
}
}

```

 **Note:** This example uses user and password authentication to obtain a session ID, which is then used for making calls to Metadata API. Alternatively, you can use OAuth authentication. After you authenticate with OAuth to Salesforce, pass the returned access token instead of the session ID. For example, pass the access token to the `setSessionId()` call on `ConnectorConfig`. To learn how to use OAuth authentication in Salesforce, see [Authenticating Apps with OAuth](#) in the Salesforce Help.

## Java Sample Code for File-Based Development

The sample code logs in using the [login utility](#). Then it displays a menu with retrieve, deploy, and exit.

The `retrieve()` and `deploy()` calls both operate on a zip file named `components.zip`. The `retrieve()` call retrieves components from your organization into `components.zip`, and the `deploy()` call deploys the components in `components.zip` to your organization. If you save the sample to your computer and execute it, run the retrieve option first so that you have a `components.zip` file that you can subsequently deploy. After a retrieve call, the sample calls `checkRetrieveStatus()` in a loop until the operation is completed. Similarly, after a deploy call, the sample checks `checkDeployStatus()` in a loop until the operation is completed.

The `retrieve()` call uses a manifest file to determine the components to retrieve from your organization. A sample `package.xml` manifest file follows. For more details on the manifest file structure, see [Deploying and Retrieving Metadata with the Zip File](#). For this sample, the manifest file retrieves all custom objects, custom tabs, and page layouts.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>CustomObject</name>
  </types>
</Package>

```

```

        <name>CustomTab</name>
    </types>
    <types>
        <members>*</members>
        <name>Layout</name>
    </types>
    <version>62.0</version>
</Package>

```

Note the error handling code that follows each API call.

**Note:** This sample requires API version 34.0 or later.

```

# USING METADATA API

## CHAPTER 4 Deploying and Retrieving Metadata

Use the `deploy()` and `retrieve()` calls to move metadata (XML files) between a Salesforce organization and a local file system. After you retrieve your XML files into a file system, you can manage changes in a source-code control system, copy and paste code or setup configurations, diff changes to components, and perform many other file-based development operations. At any time you can deploy those changes to another Salesforce organization.

 **Note:** The Ant Migration Tool uses the `deploy()` and `retrieve()` calls to move metadata. If you use these tools, interaction with Metadata API is seamless and invisible. Therefore, most developers find it much easier to use these tools than write code that calls `deploy()` and `retrieve()` directly.

Data in XML files is formatted using the English (United States) locale. This formatting ensures that fields that depend on locale, such as date fields, are interpreted consistently during data migrations between organizations using different languages. Organizations can support multiple languages for presentation to their users.

The `deploy()` and `retrieve()` calls are used primarily for the following development scenarios:

- Development of a custom application (or customization) in a sandbox organization. After development and testing are completed, the application or customization is then deployed into a production organization using Metadata API.
- Team development of an application in a Developer Edition organization. After development and testing are completed, you can then distribute the application via Lightning Platform AppExchange.

You receive an API notification each time you retrieve 90% or more of the maximum number of custom fields that you can deploy at once with Metadata API. The maximum number of custom fields for one deployment is 45,000. The custom fields retrieved in one `package.xml` file are: 1) the sum of the fields on each object in the `CustomObjects` section of `package.xml` and 2) the sum of the custom fields in the `CustomFields` section of `package.xml`.

You can still retrieve above the deployable maximum up to [the limit on total size of retrieved files](#). But you must use more than one deployment to deploy all of the custom fields.

 **Example:** Warning: You've retrieved 47,000 instances of CustomField. You can't redeploy all these instances at the same time; the maximum is 45,000.

[Metadata Components and Types](#)

[Unsupported Metadata Types](#)

## Deploying and Retrieving Metadata with the Zip File

---

The `deploy()` and `retrieve()` calls are used to deploy and retrieve a .zip file. Within the .zip file is a project manifest (`package.xml`) that lists what to retrieve or deploy, and one or more XML components that are organized into folders.

 **Note:** A component is an instance of a metadata type. For example, `CustomObject` is a metadata type for custom objects, and the `MyCustomObject__c` component is an instance of a custom object.

The files that are retrieved or deployed in a .zip file might be unpackaged components that reside in your org (such as *standard objects*) or packaged components that reside within named packages.

-  **Note:** You can deploy or retrieve up to 10,000 files at once. AppExchange packages use different limits: They can contain up to 35,000 files. The maximum size of the deployed or retrieved .zip file is 39 MB. If the files are uncompressed in an unzipped folder, the size limit is 600 MB.
- If using the Ant Migration Tool to deploy an unzipped folder, all files in the folder are compressed first. The maximum size of uncompressed components in an unzipped folder is 600 MB or less depending on the compression ratio. If the files have a high compression ratio, you can migrate a total of approximately 600 MB because the compressed size would be under 39 MB. However, if the components can't be compressed much, like binary static resources, you can migrate less than 600 MB.
  - Metadata API base-64 encodes components after they're compressed. The resulting .zip file can't exceed 50 MB, which is the limit for SOAP messages. Base-64 encoding increases the size of the payload, so your compressed payload can't exceed approximately 39 MB before encoding.
  - You can perform a `retrieve()` call for a big object only if its index is defined. If a big object is created in Setup and doesn't yet have an index defined, you can't retrieve it.
  - Limits can change without notice.

Every .zip file contains a project manifest, a file that's named `package.xml`, and a set of directories that contain the components. The manifest file defines the components that you're trying to retrieve or deploy in the .zip file. The manifest also defines the API version that's used for the deployment or retrieval.

-  **Note:** You can edit the project manifest, but be careful if you modify the list of components it contains. When you deploy or retrieve components, Metadata API references the components listed in the manifest, not the directories in the .zip file.

The following is a sample `package.xml` file. You can retrieve an individual component for a metadata type by specifying its `fullName` field value in a `members` element. You can also retrieve all components of a metadata type by using `<members>*</members>`.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>MyCustomObject__c</members>
    <name>CustomObject</name>
  </types>
  <types>
    <members>*</members>
    <name>CustomTab</name>
  </types>
  <types>
    <members>Standard</members>
    <name>Profile</name>
  </types>
  <version>62.0</version>
</Package>
```

The following elements can be defined in `package.xml`.

- `<fullName>` contains the name of the server-side package. If no `<fullName>` exists, the `package.xml` defines a client-side unpackaged package.
- `<types>` contains the name of the metadata type (for example, `CustomObject`) and the named members (for example, `myCustomObject__c`) to be retrieved or deployed. You can add multiple `<types>` elements in a manifest file.

- `<members>` contains the `fullName` of the component, for example `MyCustomObject__c`. The `listMetadata()` call is useful for determining the `fullName` for components of a particular metadata type if you want to retrieve an individual component. For many metadata types, you can replace the value in `members` with the wildcard character `*` (asterisk) instead of listing each member separately. See the reference topic for a specific type to determine whether that type supports wildcards.

 **Note:** You specify Security in the `<members>` element and Settings in the name element when retrieving the SecuritySettings component type.

- `<name>` contains the metadata type, for example `CustomObject` or `Profile`. There is one name defined for each metadata type in the directory. Any metadata type that extends `Metadata` is a valid value. The name that's entered must match a metadata type that's defined in the Metadata API WSDL. See [Metadata Types](#) for a list.
- `<version>` is the API version number that's used when the .zip file is deployed or retrieved. Currently the valid value is `62.0`.

For more sample `package.xml` manifest files that show you how to work with different subsets of metadata, see [Sample package.xml Manifest Files](#).

To delete components, see [Deleting Components from an Organization](#).

SEE ALSO:

[Metadata Types](#)

## Slow Deployments

---

If a file-based Metadata API deployment occurs during server downtime, such as a Salesforce service upgrade, the deployment can take longer than expected. This behavior happens because both component deployment and validation are retried from the beginning after the service is restored. However, if Apex tests were part of the deployment, only tests that weren't run before the downtime are run.

This behavior affects file-based deployment and retrieval, change sets, some package installs and upgrades, second-generation managed package creation, and deploys and retrieves started from the Salesforce CLI or the Salesforce VS Code extensions. It doesn't affect CRUD-based metadata operations.

If your instance is due for a planned service upgrade, avoid running deployments during the service upgrade. To check whether your Salesforce instance is due for an upgrade, check Salesforce Trust. Salesforce performs major service upgrades three times per year and other maintenance updates throughout the year.

## Does a Retrieve Job Have a Status of Pending?

---

If you initiate several concurrent retrieve operations for a single org, Metadata API automatically puts some of those jobs in a queue, if that becomes necessary for service protection. If a retrieve job has a status of `Pending`, it's in the queue. When one of the active retrieve jobs completes, Metadata API takes a pending job from the queue and activates it. If a retrieve job has a status of `InProgress`, it's active. The process repeats until the job queue is cleared.

For more information, see Metadata Limits in the *Salesforce Developer Limits and Allocations Quick Reference*.

## Sample `package.xml` Manifest Files

---

This section includes sample `package.xml` manifest files that show you how to work with different subsets of metadata. A manifest file can include multiple `<types>` elements so you could combine the individual samples into one `package.xml` manifest file if you want to work with all the metadata in one batch.

The following samples are listed:

- [Standard Objects](#) on page 28
- [All Custom Objects](#) on page 28
- [Standard Picklist Fields](#) on page 29
- [Custom and Standard Fields](#) on page 30
- [List Views for Standard Objects](#) on page 30
- [Packages](#) on page 31
- [Security Settings](#) on page 31
- [Assignment Rules, Auto-Response Rules, Escalation Rules](#) on page 32
- [Sharing Rules](#) on page 32
- [Managed Component Access](#) on page 33

For more information about the structure of a manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Standard Objects

This sample `package.xml` manifest file illustrates how to work with the standard Account object. Retrieving or deploying a standard object includes all custom and standard fields except for standard fields that aren't customizable. All custom fields are supported. Only standard fields that you can customize are supported, that is, standard fields to which you can add help text or enable history tracking or Chatter feed tracking. Other standard fields aren't supported, including system fields (such as `CreatedById` or `LastModifiedDate`) and autonumber fields.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Account</members>
    <name>CustomObject</name>
  </types>
  <version>62.0</version>
</Package>
```

Note how you work with the standard Account object by specifying it as a member of a CustomObject type. However, you can't use an asterisk wildcard to work with all standard objects; each standard object must be specified by name.

## All Custom Objects

This sample `package.xml` manifest file illustrates how to work with all custom objects.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>CustomObject</name>
  </types>
  <version>62.0</version>
</Package>
```

This manifest file can be used to retrieve or deploy all custom objects, but not all standard objects.

## Standard Picklist Fields

In API version 38.0 and later, the StandardValueSet type represents standard picklists. Picklists are no longer represented by fields as in earlier versions. This sample `package.xml` represents the `Industry` standard picklist as a StandardValueSet type.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Industry</members>
    <name>StandardValueSet</name>
  </types>
  <version>62.0</version>
</Package>
```

 **Note:** The name of a standard value set is case-sensitive.

The `Industry` standard value set corresponds to the `Account.Industry` or `Lead.Industry` field in API version 37.0 and earlier. This example shows a `package.xml` sample for the `Account.Industry` picklist.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Account.Industry</members>
    <name>CustomField</name>
  </types>
  <version>37.0</version>
</Package>
```

 **Note:** The name of a picklist field is case-sensitive.

Note the **`objectName.picklistField`** syntax in the `<members>` field where `objectName` is the name of the object, such as `Account`, and `picklistField` is the name of the standard picklist field, such as `Industry`.

This next `package.xml` sample represents opportunity team roles in API version 38.0 and later. Specify opportunity team roles as a `SalesTeamRole` standard value set. Opportunity team roles have the same picklist values as the account team roles.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>SalesTeamRole</members>
    <name>StandardValueSet</name>
  </types>
  <version>62.0</version>
</Package>
```

The `SalesTeamRole` standard value set corresponds to one of these field names in API version 37.0 and earlier: `OpportunityTeamMember.TeamMemberRole`, `UserAccountTeamMember.TeamMemberRole`, `UserTeamMember.TeamMemberRole`, and `AccountTeamMember.TeamMemberRole`. Opportunity team roles are represented in this sample `package.xml` as the `OpportunityTeamMember.TeamMemberRole` field.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>OpportunityTeamMember.TeamMemberRole</members>
    <name>CustomField</name>
```

```

    </types>
    <version>37.0</version>
</Package>

```

To learn about the names of standard value sets and how they map to picklist field names, see [Standard Value Set Names and Standard Picklist Fields](#).

## Custom and Standard Fields

This sample `package.xml` manifest file illustrates how to work with custom fields in custom and standard objects and standard fields in a standard object.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>MyCustomObject__c.MyCustomField__c</members>
    <name>CustomField</name>
  </types>
  <types>
    <members>Account.SLA__c</members>
    <members>Account.Phone</members>
    <name>CustomField</name>
  </types>
  <version>62.0</version>
</Package>

```

Note the **`objectName.field`** syntax in the `<members>` field where `objectName` is the name of the object, such as `Account`, and `field` is the name of the custom or standard field, such as an `SLA` picklist field representing a service-level agreement option. The `MyCustomField` custom field in the `MyCustomObject` custom object is uniquely identified by its full name `MyCustomObject__c.MyCustomField__c`. Similarly, the `Phone` standard field in the `Account` standard object is uniquely identified by its full name `Account.Phone`.

All custom fields are supported. Only standard fields that you can customize are supported, that is, standard fields to which you can add help text or enable history tracking or Chatter feed tracking. Other standard fields aren't supported, including system fields (such as `CreatedById` or `LastModifiedDate`) and autonumber fields.

## List Views for Standard Objects

The easiest way to retrieve list views for a standard object is to retrieve the object. The list views are included in the retrieved component. See the section of this topic on Standard Objects.

You can also work with individual list views if you don't want to retrieve all the details for the object. This sample `package.xml` manifest file illustrates how to work with a list view for the standard `Account` object.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Account.AccountTeam</members>
    <name>ListView</name>
  </types>
  <version>62.0</version>
</Package>

```

Note the ***objectName.listViewUniqueName*** syntax in the `<members>` field where *objectName* is the name of the object, such as Account, and *listViewUniqueName* is the View Unique Name for the list view. If you retrieve this list view, the component is stored in `objects/Account.object`.

## Packages

To retrieve a package, set the name of the package in the `packageNames` field in `RetrieveRequest` when you call `retrieve()`. The `package.xml` manifest file is automatically populated in the retrieved `.zip` file. The `<fullName>` element in `package.xml` contains the name of the retrieved package.

If you use an asterisk wildcard in a `<members>` element to retrieve all the components of a particular metadata type, the retrieved contents don't include components in managed packages.

For more information about managed packages, see the [Second-Generation Managed Packaging Developer Guide](#).

The easiest way to retrieve a component in a managed package is to retrieve the complete package by setting the name of the package in the `packageNames` field in `RetrieveRequest`, as described earlier. The following sample `package.xml` manifest file illustrates an alternative to retrieve an individual component in a package.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>myns__MyCustomObject__c</members>
    <name>CustomObject</name>
  </types>
  <version>62.0</version>
</Package>
```

Note the ***namespacePrefix\_\_objectName*** syntax in the `<members>` field where *namespacePrefix* is the namespace prefix of the package and *objectName* is the name of the object. A namespace prefix is a 1-character to 15-character alphanumeric identifier that distinguishes your package and its contents from other publishers' packages. For more information, see [Create and Register Your Namespace for Second-Generation Managed Packages](#).

**Note:** The namespace prefix is important to help identify the source of items like fields, custom objects, and more from different managed packages. For example, when working with FlexiPages in your org, we recommend against removing namespaces for object fields, because it can cause unexpected results such as name collisions.

## Security Settings

This sample `package.xml` manifest file illustrates how to work with an org's security settings. You specify Security in the `<members>` element and Settings in the name element when retrieving the SecuritySettings component type.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Security</members>
    <name>Settings</name>
  </types>
  <version>62.0</version>
</Package>
```

## Assignment Rules, Auto-Response Rules, Escalation Rules

Assignment rules, auto-response rules, and escalation rules use different `package.xml` type names to access sets of rules or individual rules for object types. For example, this sample `package.xml` manifest file illustrates how to access an org's assignment rules for just Cases and Leads.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Case</members>
    <members>Lead</members>
    <name>AssignmentRules</name>
  </types>
  <version>62.0</version>
</Package>
```

The following sample `package.xml` manifest file illustrates how to access just the "samplerule" Case assignment rule and the "newrule" Lead assignment rule. Notice that the type name is `AssignmentRule` and not `AssignmentRules`.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Case.samplerule</members>
    <members>Lead.newrule</members>
    <name>AssignmentRule</name>
  </types>
  <version>62.0</version>
</Package>
```

Similarly, for accessing individual auto-response rules and escalation rules, use `AutoResponseRule` and `EscalationRule` instead of `AutoResponseRules` and `EscalationRules`.

## Sharing Rules

In API version 33.0 and later, you can retrieve and deploy sharing rules for all standard and custom objects. This sample `package.xml` manifest file illustrates how to work with an org's sharing rules, such as retrieving a specific criteria-based sharing rule for the lead object, retrieving all ownership-based sharing rules for all objects, and retrieving all territory-based sharing rules for the account object.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Lead.testShareRule</members>
    <name>SharingCriteriaRule</name>
  </types>
  <types>
    <members>*</members>
    <name>SharingOwnerRule</name>
  </types>
  <types>
    <members>Account.*</members>
    <name>SharingTerritoryRule</name>
  </types>
  <version>33.0</version>
</Package>
```

## Managed Component Access

In API version 29.0 and later, you can retrieve and deploy access settings for these managed components in profiles and permission sets:

- Apex classes
- Apps
- Custom field permissions
- Custom object permissions
- Custom tab settings
- External data sources
- Record types
- Visualforce pages

In API version 51.0 and later, you can retrieve and deploy access settings for login flows.

When retrieving and deploying managed component permissions, specify the namespace followed by two underscores. Wildcards aren't supported.

For example, let's say you install a managed package with the namespace `MyNamespace` and the custom object `JobRequest__c`. To set object permissions for `JobRequest__c` in the package to the custom profile `MyProfile`, you would add the following to the `.profile` file.

To deploy:

```
<objectPermissions>
  <allowCreate>true</allowCreate>
  <allowDelete>true</allowDelete>
  <allowEdit>true</allowEdit>
  <allowRead>true</allowRead>
  <viewAllRecords>>false</viewAllRecords>
  <modifyAllRecords>>false</modifyAllRecords>
  <object>MyNamespace__JobRequest__c</object>
</objectPermissions>
```

To retrieve:

```
<types>
  <members>MyNamespace__JobRequest__c</members>
  <name>CustomObject</name>
</types>
<types>
  <members>MyProfile</members>
  <name>Profile</name>
</types>
```

When retrieving permission sets and profiles, make sure that you also retrieve any components that are related to the permissions and settings. For example, when retrieving app visibilities, you must also retrieve the associated app, and when retrieving object or field permissions, you must also retrieve the associated object.

# Running Tests in a Deployment

---

## Default Test Execution in Production

When no test level is specified in the deployment options, the default test execution behavior depends on the contents of your deployment package. When deploying to production, all tests, except those that originate from managed packages, are executed if your deployment package contains Apex classes or triggers. If your package doesn't contain Apex components, no tests are run by default.

In API version 33.0 and earlier, tests were run for components that required tests, such as custom objects, and not only for Apex components. For example, if your package contains a custom object, all tests are run in API version 33.0 and earlier. In contrast, starting with API version 34.0, no tests are run for this package. The API version corresponds to the version of your API client or the version of the tool you're using (Ant Migration Tool).

You can run tests for a deployment of non-Apex components. You can override the default test execution behavior by setting the test level in your deployment options. Test levels are enforced regardless of the types of components present in your deployment package. We recommend that you run all local tests in your development environment, such as sandbox, before deploying to production. Running tests in your development environment reduces the number of tests needed to run in a production deployment.

## Default Test Execution in Production for API Version 33.0 and Earlier

For deployment to a production organization, all local tests in your organization are run by default. Tests that originate from installed managed packages aren't run by default. If any test fails, the entire deployment is rolled back.

If the deployment includes components for the following metadata types, all local tests are run.

- ApexClass
- ApexComponent
- ApexPage
- ApexTrigger
- ArticleType
- BaseSharingRule
- CriteriaBasedSharingRule
- CustomField
- CustomObject
- DataCategoryGroup
- Flow
- InstalledPackage
- NamedFilter
- OwnerSharingRule
- PermissionSet
- Profile
- Queue
- RecordType
- RemoteSiteSetting
- Role
- SharingReason

- Territory
- Validation Rules
- Workflow

For example, no tests are run for the following deployments:

- 1 CustomApplication component
- 100 Report components and 40 Dashboard components

But all local tests are run for any of the following example deployments, because they include at least one component from the list above:

- 1 CustomField component
- 1 ApexComponent component and 1 ApexClass component
- 5 CustomField components and 1 ApexPage component
- 100 Report components, 40 Dashboard components, and 1 CustomField component

SEE ALSO:

[deploy\(\)](#)

## Running a Subset of Tests in a Deployment

---

Test levels enable you to have more control over which tests are run in a deployment. To shorten deployment time to production, run a subset of tests when deploying Apex components. The default test execution behavior in production has also changed. By default, if no test level is specified, no tests are executed, unless your deployment package contains Apex classes or triggers.

If the code coverage of an Apex component in the deployment is less than 75%, the deployment fails. If one of the specified tests fails, the deployment also fails. We recommend that you test your deployment in sandbox first to ensure that the specified tests cover each component sufficiently. Even if your organization's overall code coverage is 75% or more, the individual coverage of the Apex components being deployed can be less. If the code coverage requirement isn't met, write more tests and include them in the deployment.

To run a subset of tests, set the `RunSpecifiedTests` test level on the `DeployOptions` object. Next, specify each test class to run in `DeployOptions`. Finally, pass `DeployOptions` as an argument to the `deploy()` call. The following example performs those steps to run only the specified test classes.

```
// Create the DeployOptions object.
DeployOptions deployOptions = new DeployOptions();

// Set the appropriate test level.
deployOptions.setTestLevel(TestLevel.RunSpecifiedTests);

// Specify the test classes to run.
// String array contains test class names.
String[] tests = {"TestClass1", "TestClass2", "TestClass3"};
// Add the test class names array to the deployment options.
deployOptions.setRunTests(tests);

// Call deploy() by passing the deployment options object as an argument.
AsyncResult asyncResult = metadatabinding.deploy(zipBytes, deployOptions);
```

## Notes About Running Specific Tests

- You can specify only test classes. You can't specify individual test methods.
- We recommend that you refactor test classes to include the minimum number of tests that meet code coverage requirements. Refactoring your test classes can contribute to shorter test execution times, and as a result, shorter deployment times.
- You can deactivate a trigger in the target organization by deploying it with an inactive state. However, the trigger must have been previously deployed with an active state.

## Run the Same Tests in Sandbox and Production Deployments

Starting in API version 34.0, you can choose which tests to run in your development environment, such as only local tests, to match the tests run in production. In earlier versions, if you enabled tests in your sandbox deployment, you couldn't exclude managed package tests.

By default, no tests are run in a deployment to a non-production organization, such as a sandbox or a Developer Edition organization. To specify tests to run in your development environment, set a [testLevel deployment option](#). For example, to run local tests in a deployment and to exclude managed package tests, set `testLevel` on the `DeployOptions` object to `TestLevel.RunLocalTests`. Next, pass this object as an argument to the `deploy()` call as follows.

```
// Create the DeployOptions object.
DeployOptions deployOptions = new DeployOptions();

// Set the appropriate test level.
deployOptions.setTestLevel(TestLevel.RunLocalTests);

// Call deploy() by passing the deployment options object as an argument.
AsyncResult asyncResult = metadatabinding.deploy(zipBytes, deployOptions);
```

-  **Note:** The `RunLocalTests` test level is enforced regardless of the contents of the deployment package. In contrast, tests are executed by default in production only if your deployment package contains Apex classes or triggers. You can use `RunLocalTests` for sandbox and production deployments.

## Maintaining User References

User fields are preserved during a metadata deployment.

When a component in your deployment refers to a specific user, such as a recipient of a workflow email notification or a dashboard running user, then Salesforce attempts to locate a matching user in the destination organization by comparing usernames during the deployment.

For example, when you copy data to a sandbox, the fields containing usernames from the production organization are altered to include the sandbox name. In a sandbox named `test`, the username `user@acme.com` becomes `user@acme.com.test`. When you deploy the metadata in the sandbox to another organization, the `test` in the username is ignored.

For user references in deployments, Salesforce performs the following sequence:

1. Salesforce compares usernames in the source environment to the destination environment and adapts the organization domain name.
2. If two or more usernames match, Salesforce lists the matching names and requests one of the users in the source environment be renamed.

- 
- 
3. If a username in the source environment doesn't exist in the destination environment, Salesforce displays an error, and the deployment stops until the usernames are removed or resolved to users in the destination environment.

## CHAPTER 5 CRUD-Based Metadata Development

Use the CRUD-based metadata calls to create, update, or delete setup and configuration components for your organization or application. These configuration components include custom objects, custom fields, and other configuration metadata. The metadata calls mimic the behavior in the Salesforce user interface for creating, updating, or deleting components. Whatever rules apply there also apply to these calls.

Metadata calls are different from the core, synchronous API calls in these ways.

- Metadata API calls are available in a separate WSDL. To download the WSDL, log into Salesforce, from Setup, enter `API` in the `Quick Find` box, then select **API** and click the Download Metadata WSDL link.
- After logging in, you must send Metadata API calls to the Metadata API endpoint, which has a different URL than SOAP API. Retrieve the `metadataServerUrl` from the `LoginResult` returned by your SOAP API `login()` call. For more information about SOAP API, see the [SOAP API Developer Guide](#).
- Metadata calls are either synchronous or asynchronous. CRUD calls are synchronous in API version 30.0 and later, and similar to the API core calls the results are returned in a single call. In earlier API versions, create, update, and delete are only asynchronous, which means that the results aren't immediately returned in one call.
- There are synchronous metadata calls that map to the corresponding core SOAP API synchronous calls.
  - `createMetadata()` maps to the `create()` SOAP API call.
  - `updateMetadata()` maps to the `update()` SOAP API call.
  - `deleteMetadata()` maps to the `delete()` SOAP API call.

 **Note:** Metadata API also supports `retrieve()` and `deploy()` calls for retrieving and deploying metadata components. For more information, see [Deploying and Retrieving Metadata](#).

### Java Sample for CRUD-Based Development with Synchronous Calls

---

This section guides you through a sample Java client application that uses CRUD-based calls. This sample application performs the following main tasks.

1. Uses the `MetadataLoginUtil.java` class to create a Metadata connection. For more information, see [Step 3: Walk Through the Java Sample Code](#).
2. Calls `createMetadata()` to create a custom object. This call returns the result in one call.
3. Inspects the returned `SaveResult` object to check if the operation succeeded, and if it didn't, writes the component name, error message, and status code to the output.

```
import com.sforce.soap.metadata.*;

/**
 * Sample that logs in and creates a custom object through the metadata API
 */
public class CRUDSampleCreate {
```

```

private MetadataConnection metadataConnection;

// one second in milliseconds
private static final long ONE_SECOND = 1000;

public CRUDSampleCreate() {
}

public static void main(String[] args) throws Exception {
    CRUDSampleCreate crudSample = new CRUDSampleCreate();
    crudSample.runCreate();
}

/**
 * Create a custom object. This method demonstrates usage of the
 * create() and checkStatus() calls.
 *
 * @param uniqueName Custom object name should be unique.
 */
private void createCustomObjectSync(final String uniqueName) throws Exception {
    final String label = "My Custom Object";
    CustomObject co = new CustomObject();
    co.setFullName(uniqueName);
    co.setDeploymentStatus(DeploymentStatus.Deployed);
    co.setDescription("Created by the Metadata API Sample");
    co.setEnableActivities(true);
    co.setLabel(label);
    co.setPluralLabel(label + "s");
    co.setSharingModel(SharingModel.ReadWrite);

    // The name field appears in page layouts, related lists, and elsewhere.
    CustomField nf = new CustomField();
    nf.setType(FieldType.Text);
    nf.setDescription("The custom object identifier on page layouts, related lists
etc");
    nf.setLabel(label);
    nf.setFullName(uniqueName);
    customObject.setNameField(nf);

    SaveResult[] results = metadataConnection
        .createMetadata(new Metadata[] { co });

    for (SaveResult r : results) {
        if (r.isSuccess()) {
            System.out.println("Created component: " + r.getFullName());
        } else {
            System.out
                .println("Errors were encountered while creating "
                    + r.getFullName());
            for (Error e : r.getErrors()) {
                System.out.println("Error message: " + e.getMessage());
                System.out.println("Status code: " + e.getStatusCode());
            }
        }
    }
}

```

```

    }
}

private void runCreate() throws Exception {
    metadataConnection = MetadataLoginUtil.login();
    // Custom objects and fields must have __c suffix in the full name.
    final String uniqueObjectName = "MyCustomObject__c";
    createCustomObjectSync(uniqueObjectName);
}
}

```

## Java Sample for CRUD-Based Development with Asynchronous Calls

**⚠ Important:** The sample in this section depends on the asynchronous `create()` CRUD call. Asynchronous CRUD calls are no longer available as of API version 31.0 and are available only in earlier API versions.

This section guides you through a sample Java client application that uses asynchronous CRUD-based calls. This sample application performs the following main tasks:

1. Uses the `MetadataLoginUtil.java` class to create a Metadata connection. For more information, see [Step 3: Walk Through the Java Sample Code](#).
2. Calls `create()` to create a custom object.  
Salesforce returns an `AsyncResult` object for each component you tried to create. The `AsyncResult` object is updated with status information as the operation moves from a queue to completed or error state.
3. Calls `checkStatus()` in a loop until the status value in `AsyncResult` indicates that the create operation is completed.

Note the error handling code that follows each API call.

```

import com.sforce.soap.metadata.*;

/**
 * Sample that logs in and creates a custom object through the metadata api
 */
public class CRUDSample {
    private MetadataConnection metadataConnection;

    // one second in milliseconds
    private static final long ONE_SECOND = 1000;

    public CRUDSample() {
    }

    public static void main(String[] args) throws Exception {
        CRUDSample crudSample = new CRUDSample();
        crudSample.runCreate();
    }

    /**
     * Create a custom object. This method demonstrates usage of the
     * create() and checkStatus() calls.
     *
     * @param uniqueName Custom object name should be unique.
     */
}

```

```

*/
private void createCustomObject(final String uniqueName) throws Exception {
    final String label = "My Custom Object";
    CustomObject customObject = new CustomObject();
    customObject.setFullName(uniqueName);
    customObject.setDeploymentStatus(DeploymentStatus.Deployed);
    customObject.setDescription("Created by the Metadata API Sample");
    customObject.setLabel(label);
    customObject.setPluralLabel(label + "s");
    customObject.setSharingModel(SharingModel.ReadWrite);

    // The name field appears in page layouts, related lists, and elsewhere.
    CustomField nf = new CustomField();
    nf.setType(FieldType.Text);
    nf.setDescription("The custom object identifier on page layouts, related lists
etc");
    nf.setLabel(label);
    nf.setFullName(uniqueName);
    customObject.setNameField(nf);

    AsyncResult[] asyncResults = metadataConnection.create(
        new CustomObject[]{customObject});
    if (asyncResults == null) {
        System.out.println("The object was not created successfully");
        return;
    }

    long waitTimeMilliSecs = ONE_SECOND;

    // After the create() call completes, we must poll the results of the checkStatus()

    // call until it indicates that the create operation has completed.
    do {
        printAsyncResultStatus(asyncResults);
        waitTimeMilliSecs *= 2;
        Thread.sleep(waitTimeMilliSecs);
        asyncResults = metadataConnection.checkStatus(new
String[]{asyncResults[0].getId()});
    } while (!asyncResults[0].isDone());

    printAsyncResultStatus(asyncResults);
}

private void printAsyncResultStatus(AsyncResult[] asyncResults) throws Exception {
    if (asyncResults == null || asyncResults.length == 0 || asyncResults[0] == null)
    {
        throw new Exception("The object status cannot be retrieved");
    }

    AsyncResult asyncResult = asyncResults[0]; //we are creating only 1 metadata object

    if (asyncResult.getStatusCode() != null) {
        System.out.println("Error status code: " +

```

```
        asyncResult.getStatusCode());
        System.out.println("Error message: " + asyncResult.getMessage());
    }

    System.out.println("Object with id:" + asyncResult.getId() + " is " +
        asyncResult.getState());
}

private void runCreate() throws Exception {
    metadataConnection = MetadataLoginUtil.login();
    // Custom objects and fields must have __c suffix in the full name.
    final String uniqueObjectName = "MyCustomObject__c";
    createCustomObject(uniqueObjectName);
}
}
```

## CHAPTER 6 REST Resources

### In this chapter ...

- [Deploy Metadata with Apex Testing Using REST](#)
- [Deploy Metadata with REST API in Salesforce CLI](#)

Use the REST resource `deployRequest` to move metadata (XML files) between a Salesforce organization and a local file system.

Data in XML files is formatted using the English (United States) locale. This approach ensures that fields that depend on locale, such as date fields, are interpreted consistently during data migrations between organizations using different languages. Organizations can support multiple languages for presentation to their users.

Metadata deployment is used primarily for the following development scenarios.

- Development of a custom application (or customization) in a sandbox organization. After development and testing are completed, the application or customization is then deployed into a production organization using Metadata API.
- Team development of an application in a Developer Edition organization. After development and testing are completed, you can then distribute the application via Lightning Platform AppExchange.

## Working with the Zip File

The `deployRequest` resource is used to deploy a `.zip` file. Within the `.zip` file is a project manifest (`package.xml`) that lists what to retrieve or deploy, and one or more XML components that are organized into folders.

 **Note:** A component is an instance of a metadata type. For example, `CustomObject` is a metadata type for custom objects, and the `MyCustomObject__c` component is an instance of a custom object.

The files that are deployed in a `.zip` file can be unpackaged components that reside in your organization (such as *standard objects*). The files can also be packaged components that reside within named packages.

 **Note:** You can deploy up to 10,000 files at once. (In API version 43.0 and later, AppExchange packages can contain up to 12,500 files.) The `.zip` file size limit that applies to SOAP calls doesn't apply to the `deployRequest` REST resource. However, the 400-MB limit for components that are uncompressed into an unzipped folder after upload applies to both SOAP and REST deployments.

Every `.zip` file contains a project manifest, a file that's named `package.xml`, and a set of directories that contain the components. The manifest file defines the components that you're trying to retrieve or deploy and the API version used for the deployment or retrieval.

The following is a sample `package.xml` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
```

```

        <members>MyCustomObject__c</members>
        <name>CustomObject</name>
    </types>
    <types>
        <members>*</members>
        <name>CustomTab</name>
    </types>
    <types>
        <members>Standard</members>
        <name>Profile</name>
    </types>
    <version>62.0</version>
</Package>

```

The following elements can be defined in `package.xml`.

- `<fullName>` contains the name of the server-side package. If no `<fullName>` exists, it's a client-side unpackaged package.
- `<types>` contains the name of the metadata type (for example, `CustomObject`) and the named members (for example, `myCustomObject__c`) to be deployed. You can add multiple `<types>` elements in a manifest file.
- `<members>` contains the `fullName` of the component, such as `MyCustomObject__c`. For many metadata types, you can replace the value in `members` with the wildcard character `*` (asterisk) instead of listing each member separately. For a list of metadata types that allow the wildcard character, see the "Allows Wildcard (\*)?" column in [Metadata Types](#).

**Note:** You specify Security in the `<members>` element and Settings in the name element when retrieving the SecuritySettings component type.

- `<name>` contains the metadata type, for example `CustomObject` or `Profile`. There's one name defined for each metadata type in the directory. Any metadata type that extends [Metadata](#) is a valid value. The name that's entered must match a metadata type that's defined in the Metadata API WSDL. See [Metadata Types](#) for a list.
- `<version>` is the API version number that's used when the .zip file is deployed or retrieved. Currently the valid value is `62.0`.

For more sample `package.xml` manifest files that show you how to work with different subsets of metadata, see [Sample package.xml Manifest Files](#).

To delete components, see [Deleting Components from an Organization](#).

## Deploy Metadata with Apex Testing Using REST

---

Deploy using the `deployRequest` REST resource to initiate a request that handles all operations for the deployment.

You can deploy or retrieve up to 10,000 files at once. AppExchange packages use different limits: They can contain up to 35,000 files. The maximum size of the deployed or retrieved .zip file is 39 MB. If the files are uncompressed in an unzipped folder, the size limit is 600 MB.

### URI

`https://host/services/data/vXX.0/metadata/deployRequest`

### Formats

JSON

### HTTP Method

POST

### Authentication

Authorization: Bearer *token*

## deployOptions Parameters

 **Note:** To review the default testing behavior for deployments and approaches that can save time while still enabling you to meet testing requirements, see [Running Tests in a Deployment](#) and [Run the Same Tests in Sandbox and Production Deployments](#).

Parameter	Description
<code>allowMissingFiles</code>	Boolean. If files that are specified in <code>package.xml</code> aren't in the .zip file, specifies whether a deployment can still succeed. Don't set this argument for deployment to production orgs.
<code>autoUpdatePackage</code>	Reserved for future use.
<code>checkOnly</code>	Boolean. Defaults to <code>false</code> . Set to <code>true</code> to perform a test deployment (validation) of components without saving the components in the target org. A validation enables you to verify the results of tests that would be generated in a deployment, but doesn't commit any changes. After a validation finishes with passing tests, it can qualify for deployment without rerunning tests. See <a href="#">Deploy a Recently Validated Component Set Without Tests</a> .
<code>ignoreWarnings</code>	<p>Boolean. Indicates whether a deployment is allowed to complete successfully despite one or more warnings (<code>true</code>) or not (<code>false</code>). Defaults to <code>false</code>.</p> <p>The <code>DeployMessage</code> object for a warning contains the following values:</p> <ul style="list-style-type: none"> <li><code>problemType</code>—Warning</li> <li><code>problem</code>—The text of the warning.</li> </ul> <p>If a warning occurs and <code>ignoreWarnings</code> is set to <code>true</code>, the <code>success</code> field in <code>DeployMessage</code> is <code>true</code>. If <code>ignoreWarnings</code> is set to <code>false</code>, <code>success</code> is set to <code>false</code> and the warning is treated like an error.</p>
<code>performRetrieve</code>	Reserved for future use.

Parameter	Description
<code>purgeOnDelete</code>	<p>Boolean. If <code>true</code>, the deleted components in the <code>destructiveChanges.xml</code> manifest file aren't stored in the Recycle Bin. Instead, they become immediately eligible for deletion.</p> <p>This option only works in Developer Edition or sandbox orgs. It doesn't work in production orgs.</p>
<code>rollbackOnError</code>	<p>Boolean. Indicates whether any failure causes a complete rollback (<code>true</code>) or not (<code>false</code>). If <code>false</code>, whatever actions can be performed without errors are performed, and errors are returned for the remaining actions. This parameter must be set to <code>true</code> if you're deploying to a production org. The default is <code>false</code>.</p>
<code>runTests</code>	<p>String[]. A list of Apex tests to run during deployment. Specify the class name, one name per instance. The class name can also specify a namespace with a dot notation. For more information, see <a href="#">Running a Subset of Tests in a Deployment</a>.</p> <p>To use this option, set <code>testLevel</code> to <code>RunSpecifiedTests</code>.</p>
<code>singlePackage</code>	<p>Boolean. Indicates whether the specified <code>.zip</code> file points to a directory structure with a single package (<code>true</code>) or a set of packages (<code>false</code>).</p>
<code>testLevel</code>	<p>TestLevel (enumeration of type string). Optional. Specifies which tests are run as part of a deployment. The test level is enforced regardless of the types of components that are present in the deployment package. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>NoTestRun</code>—No tests are run. This test level applies only to deployments to development environments, such as sandbox, Developer Edition, or trial organizations. This test level is the default for development environments.</li> <li>• <code>RunSpecifiedTests</code>—Only the tests that you specify in the <code>runTests</code> option are run. Code coverage requirements differ from the default coverage requirements when using this test level. Each class and trigger in the deployment package must be covered by the executed tests for a minimum of 75% code coverage. This coverage is computed for each class and triggers individually and is different than the overall coverage percentage.</li> <li>• <code>RunLocalTests</code>—All tests in your org are run, except the ones that originate from installed managed and unlocked packages. This test level is the default for production deployments that include Apex classes or triggers.</li> <li>• <code>RunAllTestsInOrg</code>—All tests are run. The tests include all tests in your org, including tests of managed packages.</li> </ul> <p>If you don't specify a test level, the default test execution behavior is used. See <a href="#">Running Tests in a Deployment</a>.</p> <p>Apex tests that run as part of a deployment always run synchronously and serially.</p>

## Request Body: Deploy Metadata

When you deploy metadata, your request includes both the deployment parameters and the `.zip` file containing the component directories and the manifest. Set the header to `Content-Type: multipart/form-data`,

This example POST request creates a `deployRequest` object that initiates a deployment.

1. The POST request header is set to `Content-Type: multipart/form-data` and defines a `boundary` value to encapsulate different subparts of the request.
2. In the subpart after the first boundary, a JSON request creates a `deployOptions` child object for passing the deployment parameters.
3. The subpart after the second boundary specifies the `.zip` file containing the manifest and the component directories.

```
POST /services/data/v48.0/metadata/deployRequest
Authorization: Bearer 00D...
Content-Type: multipart/form-data; boundary=-----BOUNDARY
-----BOUNDARY
Content-Disposition: form-data; name="json"
Content-Type: application/json
{
  "deployOptions" :
  {
    "allowMissingFiles" : false,
    "autoUpdatePackage" : false,
    "checkOnly" : false,
    "ignoreWarnings" : false,
    "performRetrieve" : false,
    "purgeOnDelete" : false,
    "rollbackOnError" : false,
    "runTests" : null,
    "singlePackage" : true,
    "testLevel" : "RunAllTestsInOrg"
  }
}
-----BOUNDARY
Content-Disposition: form-data; name="file"; filename="deploy.zip"
Content-Type: application/zip

//Contents of deploy.zip
-----BOUNDARY--
```

## Response Body: Deploy Metadata

When an HTTP status code of 201 (Created) is returned, your request has succeeded and resulted in the creation of a deployment that is being processed.

```
{ "id" : "0Afx0000001VPCAY",
  "deployOptions" :
  { "checkOnly" : false,
    "singlePackage" : false,
    "allowMissingFiles" : false,
    "performRetrieve" : false,
    "autoUpdatePackage" : false,
    "rollbackOnError" : true,
    "ignoreWarnings" : false,
    "purgeOnDelete" : false,
    "runAllTests" : false },
  "deployResult" :
```

```
{ "id" : "0Afxx00000001VPCAY",
  "success" : false,
  "checkOnly" : false,
  "ignoreWarnings" : false,
  "rollbackOnError" : true,
  "status" : "Pending",
  "runTestsEnabled" : false,
  "done" : false } }
```

## deployResult Parameters

Parameter	Description
<code>id</code>	ID. ID of the component being deployed.
<code>canceledBy</code>	ID. The ID of the user who canceled the deployment.
<code>canceledByName</code>	String. The full name of the user who canceled the deployment.
<code>checkOnly</code>	Boolean. Indicates whether this deployment is used to check the validity of the deployed files without changing the org ( <code>true</code> ) or not ( <code>false</code> ). A check-only deployment doesn't deploy any components or change the organization in any way.
<code>completedDate</code>	DateTime. Timestamp for when the deployment process ended.
<code>createdBy</code>	ID. The ID of the user who created the deployment.
<code>createdByName</code>	String. The full name of the user who created the deployment.
<code>createdDate</code>	DateTime. Timestamp for when the deploy request was received.
<code>details</code>	DeployDetails. Provides the details of a deployment that is in-progress or ended if <code>?includeDetails=true</code> is added as a query to the GET request.
<code>done</code>	Boolean. Indicates whether the server finished processing the deploy request for the specified <code>id</code> .
<code>errorMessage</code>	String. Message corresponding to the values in the <code>errorStatusCode</code> field, if any.
<code>errorStatusCode</code>	String. If an error occurred during the deploy request, a status code is returned, and the message corresponding to the status code is returned in <code>errorMessage</code> field.
<code>ignoreWarnings</code>	Boolean. Optional. Defaults to <code>false</code> . Specifies whether a deployment continues even if the deployment generates warnings. Don't set this argument to <code>true</code> for deployments to production organizations.
<code>lastModifiedDate</code>	DateTime. Timestamp of the last update for the deployment process.
<code>numberComponentErrors</code>	Int. The number of components deployed in the deployment process. Use this value with the <code>numberComponentsTotal</code> value to get an estimate of the deployment's progress.
<code>numberComponentsTotal</code>	Int. The total number of components in the deployment. Use this value with the <code>numberComponentsDeployed</code> value to get an estimate of the deployment's progress.

Parameter	Description
<code>numberTestErrors</code>	Int. The number of Apex tests that have generated errors during this deployment.
<code>numberTestsCompleted</code>	The number of completed Apex tests for this deployment. Use this value with the <code>numberTestsTotal</code> value to get an estimate of the deployment's test progress.
<code>numberTestsTotal</code>	Int. The total number of Apex tests for this deployment. Use this value with the <code>numberTestsCompleted</code> value to get an estimate of the deployment's test progress. The value in this field isn't accurate until the deployment has started running tests for the components being deployed.
<code>runTestsEnabled</code>	Boolean. Indicates whether Apex tests were run as part of this deployment ( <code>true</code> ) or not ( <code>false</code> ). Tests are either automatically run as part of a deployment or can be set to run in the <code>deployOptions</code> child object.
<code>rollbackOnError</code>	Boolean. Defaults to <code>true</code> . Indicates whether any failure causes a complete rollback ( <code>true</code> ) or not ( <code>false</code> ). If <code>false</code> , whatever set of actions can be performed without errors are performed, and errors are returned for the remaining actions. This parameter must be set to <code>true</code> if you're deploying to a production org.
<code>startDate</code>	DateTime. Timestamp for when the deployment process began.
<code>stateDetail</code>	String. Indicates which component is being deployed or which Apex test class is running.
<code>status</code>	Indicates the current state of the deployment. The valid values are: <ul style="list-style-type: none"> <li>• Pending</li> <li>• InProgress</li> <li>• Succeeded</li> <li>• SucceededPartial</li> <li>• Failed</li> <li>• Canceling</li> <li>• Canceled</li> </ul>
<code>success</code>	Boolean. Indicates whether the deployment was successful ( <code>true</code> ) or not ( <code>false</code> ).

## Check the Status of Your Deployment Using REST Resources

Check the status of your deployment by using passing the deployment request ID in the URL. The response body is similar to that returned by the original deployment request, but it includes information about the deployment in progress.

### URI

`https://host/services/data/vXX.XX.0/metadata/deployRequest/deployRequestId`

To include more details in the response, use:

`https://host/services/data/vXX.XX.0/metadata/deployRequest/deployRequestId?includeDetails=true`

### Formats

JSON

### HTTP Method

GET

**Authentication**

Authorization: Bearer *token*

**Response Body: Deploy Metadata**

The following example shows the response when `?includeDetails=true` is added as a query to the GET request.

```
{
  "id" : "0Afxx000000001WCAQ"
  "url" :
  "https://host/services/data/vXX.0/metadata/deployRequest/0Afxx000000001WCAQ?includeDetails=true",

  "deployResult" :
  {
    "checkOnly" : "false",
    "ignoreWarnings" : "false",
    "rollbackOnError" : "false",

    "status" : "InProgress",
    "numberComponentsDeployed" : "10",
    "numberComponentsTotal" : "1032",
    "numberComponentErrors" : "0",
    "numberTestsCompleted" : "45",
    "numberTestsTotal" : "135",
    "numberTestErrors" : "0",
    "details" : {
      "componentFailures" : [],
      "componentSuccesses" : [],
      "retrieveResult" : null,
      "runTestResults" : {
        "numRun" : 0,
        "successes" : [ ... ],
        "failures" : []
      }
    },

    "createdDate" : "2017-10-10T08:22Z",
    "startDate" : "2017-10-10T08:22Z",
    "lastModifiedDate" : "2017-10-10T08:44Z",
    "completedDate" : "2017-10-10T08:44Z",

    "errorStatusCode" : null,
    "errorMessage" : null,
    "stateDetail" : "Processing Type: Apex Component",

    "createdBy" : "005xx0000001Sv1m",
    "createdByName" : "stephanie stevens",
    "canceledBy" : null,
    "canceledByName" : null,
    "isRunTestsEnabled" : null
  }

  "deployOptions": {
```

```

    "allowMissingFiles" : false,
    "autoUpdatePackage" : false,
    "checkOnly" : true,
    "ignoreWarnings" : false,
    "performRetrieve" : false,
    "purgeOnDelete" : false,
    "rollbackOnError" : false,
    "runTests" : null,
    "singlePackage" : true,
    "testLevel" : "RunAllTestsInOrg"
  }
}

```

Expect an HTTP status code of 200 (OK) to be returned.

## Deploy a Recently Validated Component Set Without Tests

You can deploy components to production in less time by skipping the execution of Apex tests when testing requirements have already been met.

- The components have been validated successfully for the target environment within the last 10 days.
- As part of the validation, Apex tests in the target org have passed.
- Code coverage requirements are met.
  - If all tests in the org or all local tests are run, overall code coverage is at least 75%, and Apex triggers have some coverage.
  - If specific tests are run with the `RunSpecifiedTests` test level, each class and trigger to be deployed is covered by at least 75% individually.

This operation is equivalent to performing a quick deployment of a recent validation on the Deployment Status page in the Salesforce user interface.

To validate but not deploy a set of components when using the `deployRequest` resource, set the `checkOnly` parameter of `deployOptions` to `true`. Note the deployment request ID in the response. Use this ID (associated with a successful validation) later to deploy the component set without repeating the validation.

### URI

`https://host/services/data/vXX.0/metadata/deployRequest/validatedDeployRequestId`

### Formats

JSON

### HTTP Method

POST

### Authentication

Authorization: Bearer *token*

## Request Body: Deploy a Recently Validated Component Set Without Tests

-  **Note:** The HTTP method for deploying a recently validated component set is POST, not PATCH. Using PATCH would create a new deployment.

```
{
```

```

    "validatedDeployRequestId" : "0Afxx000000001WCAQ"
  }

```

If there is no corresponding deployment package that meets the validation requirements, you receive an HTTP status code of 404 (Not Found). If the validated deployment package is found, the HTTP status code returned is 201 (Created).

## Response Body: Deploy a Recently Validated Component Set Without Tests

 **Note:** The response body from the deployment without validation request includes a new request ID, because it is separate from the earlier request for a validation-only deployment.

```

{
  "validatedDeployRequestId" : "0Afxx000000001WCAQ"
  "id" : "0Afxx000000001WMEM"
  "url" : "https://host/services/data/vXX.0/metadata/deployRequest/0Afxx00000001WMEM",

  "deployOptions" :
  {
    "allowMissingFiles" : false,
    "autoUpdatePackage" : false,
    "checkOnly" : true,
    "ignoreWarnings" : false,
    "performRetrieve" : false,
    "purgeOnDelete" : false,
    "rollbackOnError" : false,
    "runTests" : null,
    "singlePackage" : true,
    "testLevel" : "RunAllTestsInOrg"
  }
}

```

When an HTTP status code of 201 (Created) is returned, your request has succeeded and resulted in the creation of a deployment that is being processed. In the preceding example response body, the ID of the validation-only deployment request is 0Afxx000000001WCAQ; the ID of the deployment without validation request is 0Afxx000000001WMEM.

## Cancel a Deployment in Progress Using REST

You can request a cancellation of a deployment that's already in progress. Make the cancellation request by patching the status of an ongoing `deployRequest`. The cancellation is processed asynchronously.

### URI

`https://host/services/data/vXX.0/metadata/deployRequest/deployRequestId`

### Formats

JSON

### HTTP Method

PATCH

### Authentication

Authorization: Bearer *token*

## Request Body: Request Deployment Cancellation

The JSON request body for a deployment cancellation includes a PATCH to the status of the original `deployRequest`.

```
{
  "deployResult":
    {
      "status" : "Canceling"
    }
}
```

## Response Body: Request Deployment Cancellation

Because the cancellation request is processed asynchronously, the status shown in the response body can be either `Canceling` or `Canceled`.

```
{
  "id" : "0Afxx000000001WCAQ"
  "url" : "https://host/services/data/vXX.0/metadata/deployRequest/0Afxx000000001WCAQ",

  "deployResult":
    {
      "checkOnly" : "false",
      "ignoreWarnings" : "false",
      "rollbackOnError" : "false",
      "status" : "Canceling", // or Canceled
      "numberComponentsDeployed" : "10",
      "numberComponentsTotal" : "1032",
      "numberComponentErrors" : "0",
      "numberTestsCompleted" : "45",
      "numberTestsTotal" : "135",
      "numberTestErrors" : "0",
      "details" : {
        "componentFailures" : [],
        "componentSuccesses" : [],
        "retrieveResult" : null,
        "runTestResults" : {
          "numRun" : 0,
          "successes" : [ ... ],
          "failures" : []
        }
      }
    },

  "createdDate" : "2017-10-10T08:22Z",
  "startDate" : "2017-10-10T08:22Z",
  "lastModifiedDate" : "2017-10-10T08:44Z",
  "completedDate" : "2017-10-10T08:44Z",
  "errorStatusCode" : null,
  "errorMessage" : null,
  "stateDetail" : "Processing Type: Apex Component",
  "createdBy" : "005xx0000001Sv1m",
  "createdByName" : "steve stevens",
}
```

```

    "canceledBy" : null,
    "canceledByName" : null,
    "isRunTestsEnabled" : null
  }
}

```

When an HTTP status code of 202 (Accepted) is returned, your cancelation request is in progress or successful.

## Deploy Metadata with REST API in Salesforce CLI

By default, the Salesforce CLI `project deploy start` command uses the Metadata SOAP API to deploy source to your org. You can use the Metadata REST API instead by setting a CLI configuration value or environment variable. Compared with SOAP API, REST API offers faster deployment.

Use the `org-metadata-rest-deploy` Salesforce CLI runtime configuration variable or `SF_ORG_METADATA_REST_DEPLOY` environment variable to set REST API as the default. For more information, see the *Salesforce DX Setup Guide*.

This example uses the configuration value to set the default for your current project:

```
sf config set org-metadata-rest-deploy true
```

To set the default globally for all your projects, use the `--global` flag:

```
sf config set org-metadata-rest-deploy true --global
```

 **Note:** Only commands that deploy source, such as **project deploy start**, support REST API. Commands that retrieve source, such as **project retrieve start**, always use SOAP API.

Here are the deploy limits. Limits can change without notice.

Feature	Limit
Maximum compressed .zip folder size <sup>1</sup> (SOAP API)	Approximately 39 MB
Maximum uncompressed folder size <sup>2</sup> (SOAP API)	Approximately 600 MB
Maximum number of files in AppExchange packages (REST and SOAP API)	35,000
Maximum number of files in packages (REST and SOAP API)	10,000

<sup>1</sup> Metadata API base-64 encodes components after they're compressed. The resulting .zip file can't exceed 50 MB. Base-64 encoding increases the size of the payload by approximately 22%, so your compressed payload can't exceed approximately 39 MB before encoding.

<sup>2</sup> When using the Ant Migration Tool to deploy an unzipped project, all files in the project are compressed first. The maximum size of uncompressed components in an uncompressed project is 600 MB or less, depending on the files' compression ratio. If the files have a high compression ratio, you can migrate a total of approximately 600 MB because the compressed size would be under 39 MB. However, if the components can't be compressed much, like binary static resources, you can migrate less than 600 MB.

### USER PERMISSIONS

To work with Metadata API from Salesforce CLI:

- Modify Metadata Through Metadata API Functions

Or

Modify All Data

## CHAPTER 7 Error Handling

Metadata API calls return error information that your client application can use to identify and resolve runtime errors.

Metadata API provides these types of error handling.

- Since the Metadata API uses the enterprise or partner WSDLs to authenticate, it uses SOAP fault messages defined in those WSDLs for errors resulting from badly formed messages, failed authentication, or similar problems. Each SOAP fault has an associated `ExceptionCode`. For more details, see *Error Handling* in the *SOAP API Developer Guide*.
- For errors with the asynchronous `create()`, `update()`, and `delete()` calls, see the error status code in the `statusCode` field in the `AsyncResult` object for the associated component.
- For errors with the synchronous CRUD calls, see the error status code in the `statusCode` field of the `Error` object corresponding to each error in the array returned by the `errors` field of the appropriate result object. For example, the result object of `createMetadata()` is `SaveResult`.
- For errors with `deploy()`, see the `problem` and `success` fields in the `DeployMessage` object for the associated component.
- For errors with `retrieve()`, see the `problem` field in the `RetrieveMessage` object for the associated component.

For sample code, see [Step 3: Walk Through the Java Sample Code](#) on page 16.

### Error Handling for Session Expiration

---

When you sign on via the `login()` call, a new client session begins and a corresponding unique session ID is generated. Sessions automatically expire after the amount of time specified in the **Security Controls** setup area of the Salesforce application (default two hours). When your session expires, the exception code `INVALID_SESSION_ID` is returned. If this happens, you must invoke the `login()` call again. For more information about `login()`, see the *SOAP API Developer Guide*.

# REFERENCE

## CHAPTER 8 File-Based Calls

Use file-based calls to deploy or retrieve XML components.

- [deploy\(\)](#)
- [deployRecentValidation\(\)](#)
- [retrieve\(\)](#)

### **deploy()**

---

Uses file representations of components to create, update, or delete those components in a Salesforce org.

### Syntax

```
AsyncResult = metadatabinding.deploy(base64 zipFile, DeployOptions deployOptions)
```

### Usage

Use this call to take file representations of components and deploy them into an org by creating, updating, or deleting the components they represent.

Here are the deploy limits. Limits can change without notice.

Feature	Limit
Maximum compressed .zip folder size <sup>1</sup>	Approximately 39 MB
Maximum uncompressed folder size <sup>2</sup>	Approximately 600 MB
Maximum number of files in AppExchange packages	35,000
Maximum number of files in packages	10,000

<sup>1</sup> Metadata API base-64 encodes components after they're compressed. The resulting .zip file can't exceed 50 MB. Base-64 encoding increases the size of the payload by approximately 22%, so your compressed payload can't exceed approximately 39 MB before encoding.

<sup>2</sup> When using the Ant Migration Tool to deploy an unzipped project, all files in the project are compressed first. The maximum size of uncompressed components in an uncompressed project is 600 MB or less, depending on the files' compression ratio. If the files have a high compression ratio, you can migrate a total of approximately 600 MB because the compressed size would be under 39 MB. However, if the components can't be compressed much, like binary static resources, you can migrate less than 600 MB.

In API version 29.0, Salesforce improved the deployment status properties and removed the requirement to use `checkStatus()` after a `deploy()` call to get information about deployments. Salesforce continues to support the use of `checkStatus()` when using `deploy()` with API version 28.0 or earlier.

## Deploy Components to an Org

The `package.xml` file is a project manifest that lists all the components that you want to retrieve or deploy. You can use `package.xml` to add components. To delete components, add another manifest file. See [Deleting Components from an Organization](#).

For API version 29.0 or later, here's how to deploy (create or update) packaged or unpackaged components.

1. Issue a `deploy()` call to start the asynchronous deployment. An `AsyncResult` object is returned. Note the value in the `id` field, and use it for the next step.
2. Issue a `checkDeployStatus()` call in a loop until the `done` field of the returned `DeployResult` contains `true`, which means that the call is completed. The `DeployResult` object contains information about an in-progress or completed deployment started using the `deploy()` call. When calling `checkDeployStatus()`, pass in the `id` value from the `AsyncResult` object from the first step.

For API version 28.0 or earlier, here's how to deploy (create or update) packaged or unpackaged components.

1. Issue a `deploy()` call to start the asynchronous deployment. An `AsyncResult` object is returned. If the call is completed, the `done` field contains `true`. Most often, the call isn't completed quickly enough to be noted in the first result. If it's completed, note the value in the `id` field returned, and skip the next step.
2. If the call isn't complete, issue a `checkStatus()` call in a loop. In the loop, use the value in the `id` field of the `AsyncResult` object returned by the `deploy()` call in the previous step. Check the `AsyncResult` object, which is returned until the `done` field contains `true`. The time taken to complete a `deploy()` call depends on the size of the zip file being deployed. Therefore, use a longer wait time between iterations as the size of the zip file increases.
3. Issue a `checkDeployStatus()` call to obtain the results of the `deploy()` call, using the `id` value returned in the first step.

 **Note:** The deployment process locks write-access to resources getting deployed until deployment completes. During deployment, changes made to locked resources or related items can result in errors. Salesforce recommends deployments during off-peak usage time and limiting or postponing changes to your org while deployment is in progress.

## Check the Status of a Deployment

Check the status of a deployment using Metadata API or from Setup. You can check the status of deployments that are in progress or completed in the last 30 days.

To check the status of a deployment using Metadata API, see [checkDeployStatus\(\)](#) on page 68.

To check the status of a deployment from Setup, enter `Deployment Status` in the Quick Find box, then select **Deployment Status**.

When running a deployment, the Deployment Status page shows you the real-time progress of your current deployment. This page contains charts that provide a visual representation of the overall deployment progress. The first chart shows how many components have already been deployed out of the total and includes the number of components with errors. For example, the following chart indicates that 302 components were processed successfully out of 450 and there were 45 components with errors.

After all components have been deployed without errors, Apex tests start executing, if necessary or enabled. A second chart shows how many Apex tests have run out of the total number of tests and the number of errors returned. In addition, the chart shows the name of the currently running test. For example, in the following chart, 77 tests have completed execution out of a total of 120, and 1 test failed.

You can initiate multiple deployments, but only one deployment can run at a time. The other deployments remain in the queue waiting to be executed after the current deployment finishes. Queued deployments are listed under Pending Deployments and are not necessarily executed in the order in which they were submitted. To execute deployments in a particular order, submit them one at a time after the previous deployment has completed successfully.

## Cancel a Deployment

Cancel a deployment using the Metadata API or from Setup. You can cancel a deployment while it's in progress or in the queue.

To cancel a deployment using Metadata API, see [cancelDeploy\(\)](#).

To cancel a deployment from Setup, enter *Deployment Status* in the quick find box, then select **Deployment Status**. Click **Cancel** next to the deployment you want to cancel. The deployment has the status of `Cancel_Requested` until the cancellation completes. A canceled deployment is listed in the Failed section.

## Permissions

Your client application must be logged in with the Modify Metadata Through Metadata API Functions or Modify All Data permission.

 **Note:** If a user requires access to metadata but not to data, enable the Modify Metadata Through Metadata API Functions permission. Otherwise, enable the Modify All Data permission.

## Arguments

Name	Type	Description
<code>zipFile</code>	<code>base64</code>	Base 64-encoded binary data. Client applications must encode the binary data as base64.

Name	Type	Description
deployOptions	<a href="#">DeployOptions</a>	Encapsulates options for determining which packages or files are deployed.

## DeployOptions

The following deployment options can be selected for this call:

Name	Type	Description
allowMissingFiles	boolean	<p>If files that are specified in <code>package.xml</code> aren't in the <code>.zip</code> file, specifies whether a deployment can still succeed.</p> <p>Don't set this argument for deployment to <i>production orgs</i>.</p>
autoUpdatePackage	boolean	<p>If a file is in the <code>.zip</code> file but not specified in <code>package.xml</code>, specifies whether the file is automatically added to the package. A <code>retrieve()</code> is issued with the updated <code>package.xml</code> that includes the <code>.zip</code> file.</p> <p>Don't set this argument for deployment to <i>production orgs</i>.</p>
checkOnly	boolean	<p>Defaults to <code>false</code>. Set to <code>true</code> to perform a test deployment (validation) of components without saving the components in the target org. A validation enables you to verify the results of tests that would be generated in a deployment, but doesn't commit any changes. After a validation finishes with passing tests, sometimes it can qualify for deployment without rerunning tests. See <a href="#">deployRecentValidation()</a>.</p> <p>If you change a field type from Master-Detail to Lookup or vice versa, the change isn't supported when using the <code>checkOnly</code> option to test a deployment. This change isn't supported for test deployments to avoid permanently altering your data. If a change that isn't supported for test deployments is included in a deployment package, the test deployment fails and issues an error.</p> <p>If your deployment package changes a field type from Master-Detail to Lookup or vice versa, you can still validate the changes before you deploy to production. Perform a full deployment to another test sandbox. A full deployment includes a validation of the changes as part of the deployment process.</p> <p>A Metadata API deployment that includes Master-Detail relationships deletes all detail records in the Recycle Bin in the following cases.</p> <ol style="list-style-type: none"> <li>1. For a deployment with a new Master-Detail field, soft delete (send to the Recycle Bin) all detail records before proceeding to deploy the Master-Detail field, or the deployment fails. During the deployment, detail records</li> </ol>

Name	Type	Description
ignoreWarnings	boolean	<p>are permanently deleted from the Recycle Bin and can't be recovered.</p> <p>2. For a deployment that converts a Lookup field relationship to a Master-Detail relationship, detail records must reference a master record or be soft-deleted (sent to the Recycle Bin) for the deployment to succeed. However, a successful deployment permanently deletes any detail records in the Recycle Bin.</p>
ignoreWarnings	boolean	<p>Indicates whether deployments with warnings complete successfully (<code>true</code>) or not (<code>false</code>). Defaults to <code>false</code>.</p> <p>The <a href="#">DeployMessage</a> object for a warning contains the following values:</p> <ul style="list-style-type: none"> <li><code>problemType</code>—Warning</li> <li><code>problem</code>—The text of the warning</li> </ul> <p>If a warning occurs and <code>ignoreWarnings</code> is set to <code>true</code>, the <code>success</code> field in <a href="#">DeployMessage</a> is <code>true</code>. If <code>ignoreWarnings</code> is set to <code>false</code>, <code>success</code> is set to <code>false</code> and the warning is treated like an error.</p> <p>This field is available in API version 18.0 and later. Before version 18.0, there was no distinction between warnings and errors. All problems were treated as errors and prevented a successful deployment.</p>
performRetrieve	boolean	<p>Indicates whether a <code>retrieve()</code> call is performed immediately after the deployment (<code>true</code>) or not (<code>false</code>). Set to <code>true</code> to retrieve whatever was deployed.</p>
purgeonDelete	boolean	<p>If <code>true</code>, the deleted components in the <code>destructiveChanges.xml</code> manifest file aren't stored in the Recycle Bin. Instead, they become immediately eligible for deletion.</p> <p>This field is available in API version 22.0 and later.</p> <p>This option only works in Developer Edition or sandbox orgs. It doesn't work in production orgs.</p> <p>When you delete a roll-up summary field using Metadata API, the field isn't saved in the Recycle Bin. The field is purged even if you don't set the <code>purgeonDelete</code> deployment option to <code>true</code>.</p>
rollbackOnError	boolean	<p>Indicates whether any failure causes a complete rollback (<code>true</code>) or not (<code>false</code>). If <code>false</code>, whatever actions can be performed without errors are performed, and errors are returned for the remaining actions. This parameter must be</p>

Name	Type	Description
		set to <code>true</code> if you're deploying to a production org. The default is <code>false</code> .
<code>runAllTests</code>	boolean	(Deprecated and only available in API version 33.0 and earlier.) This field defaults to <code>false</code> . Set to <code>true</code> to run all Apex tests after deployment, including tests that originate from installed managed packages.  Apex tests that run as part of a deployment always run synchronously and serially.
<code>runTests</code>	string[]	A list of Apex tests to run during deployment. Specify the class name, one name per instance. The class name can also specify a namespace with a dot notation. For more information, see <a href="#">Running a Subset of Tests in a Deployment</a> .  To use this option, set <code>testLevel</code> to <code>RunSpecifiedTests</code> .
<code>singlePackage</code>	boolean	Indicates whether the specified <code>.zip</code> file points to a directory structure with a single package ( <code>true</code> ) or a set of packages ( <code>false</code> ).
<code>testLevel</code>	TestLevel (enumeration of type string)	Optional. Specifies which tests are run as part of a deployment. The test level is enforced regardless of the types of components that are present in the deployment package. Valid values are: <ul style="list-style-type: none"> <li>• <code>NoTestRun</code>—No tests are run. This test level applies only to deployments to development environments, such as sandbox, Developer Edition, or trial organizations. This test level is the default for development environments.</li> <li>• <code>RunSpecifiedTests</code>—Only the tests that you specify in the <code>runTests</code> option are run. Code coverage requirements differ from the default coverage requirements when using this test level. Each class and trigger in the deployment package must be covered by the executed tests for a minimum of 75% code coverage. This coverage is computed for each class and triggers individually and is different than the overall coverage percentage.</li> <li>• <code>RunLocalTests</code>—All tests in your org are run, except the ones that originate from installed managed and unlocked packages. This test level is the default for production deployments that include Apex classes or triggers.</li> <li>• <code>RunAllTestsInOrg</code>—All tests are run. The tests include all tests in your org, including tests of managed packages.</li> </ul> <p>If you don't specify a test level, the default test execution behavior is used. See <a href="#">Running Tests in a Deployment</a>.</p>

Name	Type	Description
		Apex tests that run as part of a deployment always run synchronously and serially.
		This field is available in API version 34.0 and later.

```

### 1. [Deleting Components from an Organization](#)

To delete components, perform a deployment with the `deploy()` call by using a destructive changes manifest file that lists the components to remove from your organization. You can perform a deployment that only deletes components, or a deployment that deletes and adds components. In API version 33.0 and later, you can specify components to delete before and after other components are added or updated. In earlier API versions, if deletions and additions are specified for the same deployment, the `deploy()` call performs the deletions first.

### 2. [checkDeployStatus\(\)](#)

Checks the status of declarative metadata call `deploy()`.

### 3. [cancelDeploy\(\)](#)

Cancels a deployment that hasn't completed yet.

SEE ALSO:

[Running Tests in a Deployment](#)

## Deleting Components from an Organization

To delete components, perform a deployment with the `deploy()` call by using a destructive changes manifest file that lists the components to remove from your organization. You can perform a deployment that only deletes components, or a deployment that deletes and adds components. In API version 33.0 and later, you can specify components to delete before and after other components are added or updated. In earlier API versions, if deletions and additions are specified for the same deployment, the `deploy()` call performs the deletions first.

## Deleting Components in a Deployment

To delete components, use the same procedure as with deploying components, but also include a delete manifest file that's named `destructiveChanges.xml` and list the components to delete in this manifest. The format of this manifest is the same as `package.xml` except that wildcards aren't supported.

 **Note:** You can't use `destructiveChanges.xml` to delete items that are associated with an active Lightning page, such as a custom object, a component on the page, or the page itself. First, you must remove the page's action override by deactivating it in the Lightning App Builder.

The following sample `destructiveChanges.xml` file names a single custom object to be deleted:

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>MyCustomObject__c</members>
    <name>CustomObject</name>
  </types>
</Package>

```

To deploy the destructive changes, you must also have a `package.xml` file that lists no components to deploy, includes the API version, and is in the same directory as `destructiveChanges.xml`:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <version>62.0</version>
</Package>
```

 **Note:**

- To bypass the Recycle Bin, set the `purgeOnDelete` option to `true`.
- When you delete a roll-up summary field using Metadata API, the field isn't saved in the Recycle Bin. The field is purged even if you don't set the `purgeOnDelete` deployment option to `true`.
- If you try to delete some components that don't exist in the organization, the rest of the deletions are still attempted.

## Adding and Deleting Components in a Single Deployment

You can perform a deployment that specifies components to delete in `destructiveChanges.xml` and components to add or update in `package.xml`. The process is the same as with performing a delete-only deployment except that `package.xml` contains the components to add or update.

By default, deletions are processed before component additions. In API version 33.0 and later, you can specify components to be deleted before and after component additions. The process is the same as with performing a delete-only deployment except that the name of the deletion manifest file is different.

- To delete components *before* adding or updating other components, create a manifest file that's named `destructiveChangesPre.xml` and include the components to delete.
- To delete components *after* adding or updating other components, create a manifest file that's named `destructiveChangesPost.xml` and include the components to delete.

The ability to specify when deletions are processed is useful when you're deleting components with dependencies. For example, if a custom object is referenced in an Apex class, you can't delete it unless you modify the Apex class first to remove the dependency on the custom object. In this example, you can perform a single deployment that updates the Apex class to clear the dependency and then deletes the custom object by using `destructiveChangesPost.xml`. The following are samples of the `package.xml` and `destructiveChangesPost.xml` manifests that would be used in this example.

Sample `package.xml`, which specifies the class to update:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>SampleClass</members>
    <name>ApexClass</name>
  </types>
  <version>62.0</version>
</Package>
```

Sample `destructiveChangesPost.xml`, which specifies the custom object to delete after the class update:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>MyCustomObject__c</members>
    <name>CustomObject</name>
  </types>
</Package>
```

```
</types>
</Package>
```

 **Note:** The API version that the deployment uses is the API version that's specified in `package.xml`.

## checkDeployStatus ()

Checks the status of declarative metadata call `deploy ()`.

### Syntax

```
DeployResult = metadatabinding.checkDeployStatus (ID id, includeDetails boolean);
```

### Usage

`checkDeployStatus` is used as part of the process for deploying packaged or unpackaged components to an organization:

1. Issue a `deploy ()` call to start the asynchronous deployment. An `AsyncResult` object is returned. Note the value in the `id` field, and use it for the next step.
2. Issue a `checkDeployStatus ()` call in a loop until the `done` field of the returned `DeployResult` contains `true`, which means that the call is completed. The `DeployResult` object contains information about an in-progress or completed deployment started using the `deploy ()` call. When calling `checkDeployStatus ()`, pass in the `id` value from the `AsyncResult` object from the first step.

 **Note:** Calls to `checkDeployStatus ()` don't count against the API request limits and allocations.

In API version 29.0, Salesforce improved the deployment status properties and removed the requirement to use `checkStatus ()` after a `deploy ()` call to get information about deployments. Salesforce continues to support the use of `checkStatus ()` when using `deploy ()` with API version 28.0 or earlier.

### Sample Code—Java

See the [deploy \(\) sample code](#) for sample usage of this call.

### Arguments

Name	Type	Description
<code>id</code>	ID	ID obtained from an <code>AsyncResult</code> object returned by <code>deploy()</code> or a subsequent <code>checkStatus()</code> call.
<code>includeDetails</code>	boolean	Sets the <code>DeployResult</code> object to include <code>DeployDetails</code> information ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> . Available in API version 29.0 and later.

### Response

`DeployResult`

## cancelDeploy()

Cancels a deployment that hasn't completed yet.

### Syntax

```
CancelDeployResult = metadatabinding.cancelDeploy(string id)
```

### Usage

Use the `cancelDeploy()` operation to cancel a deployment in your organization started by the `deploy()` operation, which includes deployments started by the Lightning Platform Migration Tool and the Lightning Platform IDE. The deployment can be in a queue waiting to get started, or can be in progress. This operation takes the ID of the deployment you want to cancel and returns a `CancelDeployResult` object. When the deployment is in the queue and hasn't started yet, calling `cancelDeploy()` cancels the deployment immediately. When the deployment has started and is in progress, sometimes it doesn't get canceled immediately, so call `checkDeployStatus()` to check the status of the cancellation.

Cancel a deployment using these steps.

1. Obtain the ID of the deployment you want to cancel. For example, you can obtain the ID from the `deploy()` call in the `AsyncResult` object `id` field. Alternatively, you can obtain the ID in the Salesforce user interface from Setup by entering `Deployment Status` in the `Quick Find` box, selecting **Deployment Status**, and then noting the ID of a deployment started by the API.
2. Issue a `cancelDeploy()` call to start the cancellation process. This call returns a `CancelDeployResult` object.
3. Check the value in the `done` field of the returned `CancelDeployResult`. If the `done` field value is `true`, the deployment has been canceled and you're done. If the `done` field value is `false`, the cancellation is in progress. To check the cancellation status, follow these steps.
  - a. Call `checkDeployStatus()` using the deployment ID you obtained earlier.
  - b. In the returned `DeployResult` object, check the `status` field. If the status is `Cancelling`, the cancellation is still in progress, and repeat steps a and b. Otherwise, if the status is `Canceled`, the deployment has been canceled and you're done.

The `deploy()` operation throws these API faults.

#### **INVALID\_ID\_FIELD with the message Invalid deploy ID**

The specified ID argument doesn't correspond to a valid deployment.

#### **INVALID\_ID\_FIELD with the message Deployment already completed**

The specified deployment has already completed.

### Version

Available in API version 30.0 and later.

### Permissions

Your client application must be logged in with the `Modify Metadata Through Metadata API Functions` or `Modify All Data` permission.

-  **Note:** If a user requires access to metadata but not to data, enable the `Modify Metadata Through Metadata API Functions` on page 7 permission. Otherwise, enable the `Modify All Data` permission.

## Arguments

Name	Type	Description
id	string	The ID of the deployment to cancel.

## Response

[CancelDeployResult](#)

## Sample Code—Java

This sample shows how to cancel a deployment. The sample calls `cancelDeploy()` by passing it a given deployment ID. Next, it checks whether the cancellation has completed, and if not, calls `checkDeployStatus` in a loop.

```
public void cancelDeploy(String asyncId) throws Exception {
    // Issue the deployment cancellation request
    CancelDeployResult result = metadataConnection.cancelDeploy(asyncId);

    // If the deployment cancellation completed, write a message to the output.
    if (result.isDone()) {
        System.out.println("Your deployment was canceled successfully!");
    }
    else {
        // The deployment cancellation is still in progress, so get a new status
        DeployResult deployResult = metadataConnection.checkDeployStatus(asyncId, false);

        // Check whether the deployment is done. If not done, this means
        // that the cancellation is still in progress and the status is Canceling.

        while (!deployResult.isDone()) {
            // Assert that the deployment status is Canceling
            assert deployResult.getStatus() == DeployStatus.Canceling;
            // Wait 2 seconds
            Thread.sleep(2000);
            // Get the deployment status again
            deployResult = metadataConnection.checkDeployStatus(asyncId, false);
        }

        // The deployment is done. Write the status to the output.
        // (When the deployment is done, the cancellation should have completed
        // and the status should be Canceled. However, in very rare cases,
        // the deployment can complete before it is canceled.)
        System.out.println("Final deploy status = >" + deployResult.getStatus());
    }
}
```

## **deployRecentValidation()**

Deploys a recently validated component set without running Apex tests.

## Syntax

```
string = metadatabinding.deployRecentValidation (ID validationID)
```

## Usage

Use `deployRecentValidation()` to deploy your components to production in less time by skipping the execution of Apex tests. Ensure that the following requirements are met before deploying a recent validation.

- The components have been validated successfully for the target environment within the last 10 days.
- As part of the validation, Apex tests in the target org have passed.
- Code coverage requirements are met.
  - If all tests in the org or all local tests are run, overall code coverage is at least 75%, and Apex triggers have some coverage.
  - If specific tests are run with the `RunSpecifiedTests` test level, each class and trigger that was deployed is covered by at least 75% individually.

This call is equivalent to performing a quick deployment of a recent validation on the Deployment Status page in the Salesforce user interface.

Before you call `deployRecentValidation()`, your organization must have a validation that was recently run. You can run a validation on a set of components by calling `deploy()` with the `checkOnly` property of the `deployOptions` parameter set to `true`. Note the ID that you obtained from the `deploy()` call. You'll use this ID for the `deployRecentValidation()` call in the next step.

After you've run a validation successfully, use these steps to quick-deploy the validation to the same target environment.

1. To start an asynchronous quick deployment, call `deployRecentValidation()` and pass it the ID of a recent validation. This ID is obtained from the previous `deploy()` call. The `deployRecentValidation()` call returns the ID of the quick deployment. Note this value. You'll use it in the next step.
2. Check for the completion of the call. This process is similar to that of `deploy()`. Issue a `checkDeployStatus()` call in a loop until the `done` field of the returned `DeployResult` contains `true`, which means that the call is completed. The `DeployResult` object contains information about an in-progress or completed deployment that was started by using the `deployRecentValidation()` call. When calling `checkDeployStatus()`, pass in the ID value that you obtained in the first step.

## Version

Available in API version 33.0 and later.

## Arguments

Name	Type	Description
<code>validationID</code>	string	The ID of a recent validation.

## Response

Type: string

The ID of the quick deployment.

    newConnection(metadataConfig);
}
}

```

## retrieve()

The `retrieve()` call retrieves XML file representations of components in an organization.

## Syntax

```
AsyncResult = metadatabinding.retrieve(RetrieveRequest)
```

## Usage

Use this call to retrieve file representations of components in an organization.

Here are the deploy limits. Limits can change without notice.

Feature	Limit
Maximum compressed .zip folder size <sup>1</sup>	Approximately 39 MB
Maximum uncompressed folder size <sup>2</sup>	Approximately 600 MB
Maximum number of files in AppExchange packages	35,000
Maximum number of files in packages	10,000

 **Note:** You can perform a `retrieve()` call for a big object only if its index is defined. If a big object is created in Setup and doesn't yet have an index defined, you can't retrieve it.

<sup>1</sup> Metadata API base-64 encodes components after they're compressed. The resulting .zip file can't exceed 50 MB. Base-64 encoding increases the size of the payload by approximately 22%, so your compressed payload can't exceed approximately 39 MB before encoding.

<sup>2</sup> When using the Ant Migration Tool to deploy an unzipped project, all files in the project are compressed first. The maximum size of uncompressed components in an uncompressed project is 600 MB or less, depending on the files' compression ratio. If the files have a high compression ratio, you can migrate a total of approximately 600 MB because the compressed size would be under 39 MB. However, if the components can't be compressed much, like binary static resources, you can migrate less than 600 MB.

In API version 31.0 and later, the process of making a `retrieve()` call has been simplified. You no longer have to call `checkStatus()` after a `retrieve()` call to obtain the status of the retrieve operation. Instead, make calls to `checkRetrieveStatus()` only. If the retrieve

operation is in progress, call `checkRetrieveStatus()` again until the retrieve operation is completed. The `checkStatus()` call is still supported in versions API version 30.0 or earlier, but isn't available in API version 31.0 and later.

For API version 31.0 or later, retrieve packaged or unpackaged components by using the following steps.

1. Issue a `retrieve()` call to start the asynchronous retrieval. An `AsyncResult` object is returned. Note the value in the `id` field, and use it for the next step.
2. Issue a `checkRetrieveStatus()` call, and pass in the `id` value from the `AsyncResult` object from the first step. Check the value of the `done` field of the returned `RetrieveResult`. If it's `true`, the call is completed, and you proceed to the next step. Otherwise, repeat this step to call `checkRetrieveStatus()` again until the `done` field is `true`.
3. Retrieve the zip file (`zipFile`) field and other desired fields from `RetrieveResult`, which the final call to `checkRetrieveStatus()` returned in the previous step.

For API version 30.0 or earlier, retrieve packaged or unpackaged components by using the following steps.

1. Issue a `retrieve()` call to start the asynchronous retrieval. An `AsyncResult` object is returned. If the call is completed, the `done` field contains `true`. Most often, the call isn't completed quickly enough to be noted in the result. If it's completed, note the value in the `id` field returned, and skip the next step.
2. If the call isn't completed, issue a `checkStatus()` call in a loop using the value in the `id` field of the `AsyncResult` object, returned by the `retrieve()` call in the previous step. Check the `AsyncResult` object returned until the `done` field contains `true`. The time taken to complete a `retrieve()` call depends on the size of the zip file being deployed, so use a longer wait time between iterations as the size of the zip file increases.
3. Issue a `checkRetrieveStatus()` call to obtain the results of the `retrieve()` call, using the `id` value returned in the first step.

For examples of manifest files, see [Sample package.xml Manifest Files](#).

## Permissions

Your client application must be logged in with the Modify Metadata Through Metadata API Functions or Modify All Data permission.

 **Note:** If a user requires access to metadata but not to data, enable the [Modify Metadata Through Metadata API Functions](#) on page 7 permission. Otherwise, enable the Modify All Data permission.

## Arguments

Name	Type	Description
<code>retrieveRequest</code>	<a href="#">RetrieveRequest</a>	Encapsulates options for determining which packages or files are retrieved.

## Response

[AsyncResult](#)

## Sample Code—Java

This sample shows how to retrieve components into a zip file. See the [deploy\(\) sample code](#) for details on how to deploy a zip file.

 **Note:** This sample requires API version 34.0 or later.

## RetrieveRequest

The `RetrieveRequest` parameter specified on a `retrieve()` call encapsulates options for determining which packages or files are retrieved.

The `RetrieveRequest` object consists of the following properties:

Name	Type	Description
<code>apiVersion</code>	<code>double</code>	Required. The API version for the retrieve request. The API version determines the fields retrieved for each metadata type. For example, an <code>icon</code> field was added to the <a href="#">CustomTab</a> on page 691 for API version 14.0. If you retrieve components for version 13.0 or earlier, the components don't include the <code>icon</code> field.  In API version 31.0 and later, the API version that's specified in <code>package.xml</code> is used for the <code>retrieve()</code> call and overrides the version in the <code>apiVersion</code> field. If the version isn't specified in <code>package.xml</code> , the version in this field is used.
<code>packageNames</code>	<code>string[]</code>	A list of package names to be retrieved. If you're retrieving only unpackaged components, don't specify a name here. You can retrieve packaged and unpackaged components in the same retrieve.
<code>singlePackage</code>	<code>boolean</code>	Specifies whether only a single package is being retrieved ( <code>true</code> ) or not ( <code>false</code> ). If <code>false</code> , then more than one package is being retrieved.
<code>specificFiles</code>	<code>string[]</code>	A list of file names to be retrieved. If a value is specified for this property, <code>packageNames</code> must be set to <code>null</code> and <code>singlePackage</code> must be set to <code>true</code> .

Name	Type	Description
unpackaged	Package	A list of components to retrieve that aren't in a package.

## checkRetrieveStatus ()

Checks the status of the declarative metadata call `checkRetrieveStatus ()` and returns the zip file contents.

### Syntax

In API version 34.0 and later:

```
RetrieveResult = metadatabinding.checkRetrieveStatus(ID id, boolean includeZip);
```

In API version 33.0 and earlier:

```
RetrieveResult = metadatabinding.checkRetrieveStatus(ID id);
```

### Usage

Use `checkRetrieveStatus ()` to check the progress of the metadata `retrieve ()` operation. The `RetrieveResult` object that this method returns indicates when the asynchronous `retrieve ()` call is completed. If the retrieval is completed, `RetrieveResult` contains the zip file contents by default. Use the following process to retrieve metadata components with the `retrieve ()` call.

1. Issue a `retrieve ()` call to start the asynchronous retrieval. An `AsyncResult` object is returned. Note the value in the `id` field, and use it for the next step.
2. Issue a `checkRetrieveStatus()` call, and pass in the `id` value from the `AsyncResult` object from the first step. Check the value of the `done` field of the returned `RetrieveResult`. If it's `true`, the call is completed, and you proceed to the next step. Otherwise, repeat this step to call `checkRetrieveStatus()` again until the `done` field is `true`.
3. Retrieve the zip file (`zipFile`) field and other desired fields from `RetrieveResult`, which the final call to `checkRetrieveStatus()` returned in the previous step.

In API version 31.0 and later, the process of making a `retrieve ()` call has been simplified. You no longer have to call `checkStatus()` after a `retrieve ()` call to obtain the status of the retrieve operation. Instead, make calls to `checkRetrieveStatus()` only. If the retrieve operation is in progress, call `checkRetrieveStatus()` again until the retrieve operation is completed. The `checkStatus()` call is still supported in versions API version 30.0 or earlier, but isn't available in API version 31.0 and later.

### Retrieving the Zip File in a Second Process

By default, `checkRetrieveStatus ()` returns the zip file on the last call to this operation when the retrieval is completed (`RetrieveResult.isDone () == true`) and then deletes the zip file from the server. Subsequent calls to `checkRetrieveStatus ()` for the same retrieve operation can't retrieve the zip file after it has been deleted. Starting with API version 34.0, pass a boolean value for the `includeZip` argument of `checkRetrieveStatus ()` to indicate whether to retrieve the zip file. The `includeZip` argument gives you the option to retrieve the file in a separate process after the retrieval operation is completed. For example, a service polls the retrieval status by calling `checkRetrieveStatus (id, false)` in a loop. This call returns the status of the retrieval operation, but doesn't retrieve the zip file. After the retrieval operation is completed, another process,

such as a background file transfer service, calls `checkRetrieveStatus(id, true)` to retrieve the zip file. This last call causes the zip file to be deleted from the server.

```
// First process: Poll the retrieval but don't retrieve the zip file.
AsyncResult asyncResult = metadataConnection.retrieve(retrieveRequest);
String asyncResultId = asyncResult.getId();
// Wait for the retrieve to complete
int poll = 0;
long waitTimeMilliSecs = ONE_SECOND;
RetrieveResult result = null;
do {
    Thread.sleep(waitTimeMilliSecs);
    // Check the status but don't retrieve zip file.
    result = metadataConnection.checkRetrieveStatus(asyncResultId, false);
} while (!result.isDone());

// Second process: Retrieve the zip file.
// For example, this process can be a background file transfer service.
// Retrieve the zip file.
result = metadataConnection.checkRetrieveStatus(asyncResultId, true);
// Get the zip file from the RetrieveResult (result) variable
if (result.getStatus() == RetrieveStatus.Succeeded) {
    ByteArrayInputStream bais = new ByteArrayInputStream(result.getZipFile());
    // ...
}
```

## Sample Code—Java

See the [retrieve\(\) sample code](#) for sample usage of this call.

## Arguments

Name	Type	Description
<code>id</code>	ID	ID obtained from an <a href="#">AsyncResult</a> object returned by a <a href="#">retrieve()</a> call or a subsequent <a href="#">RetrieveResult</a> object returned by a <a href="#">checkRetrieveStatus()</a> call.
<code>includeZip</code>	boolean	Set to <code>true</code> to retrieve the zip file. You can retrieve the zip file only after the retrieval operation is completed. After the zip file is retrieved, it's deleted from the server. Set to <code>false</code> to check the status of the retrieval without attempting to retrieve the zip file. If set to <code>null</code> , this argument defaults to <code>true</code> , which means that the zip file is retrieved on the last call to <a href="#">checkRetrieveStatus()</a> when the retrieval has finished.  This argument is available in API version 34.0 and later.

## Response

[RetrieveResult](#)

## CHAPTER 9 CRUD-Based Calls

Use CRUD-based calls to work with metadata components in a manner similar to how synchronous API calls in the enterprise WSDL act upon objects.

### `createMetadata()`

Adds one or more new metadata components to your organization synchronously.

### `readMetadata()`

Returns one or more metadata components from your organization synchronously.

### `updateMetadata()`

Updates one or more metadata components in your organization synchronously.

### `upsertMetadata()`

Creates or updates one or more metadata components in your organization synchronously.

### `deleteMetadata()`

Deletes one or more metadata components from your organization synchronously.

### `renameMetadata()`

Renames a metadata component in your organization synchronously.

### `create()`

Deprecated. Adds one or more new metadata components to your organization asynchronously. This call is removed as of API version 31.0 and is available in earlier versions only. Use `createMetadata()` instead.

### `delete()`

Deprecated. Deletes one or more components from your organization asynchronously. This call is removed as of API version 31.0 and is available in earlier versions only. Use `deleteMetadata()` instead.

### `update()`

Deprecated. Updates one or more components in your organization asynchronously. This call is removed as of API version 31.0 and is available in earlier versions only. Use `updateMetadata()` or `renameMetadata()` instead.

## `createMetadata()`

---

Adds one or more new metadata components to your organization synchronously.

### Syntax

```
SaveResult[] = metadatabinding.createMetadata(  
    Metadata[] metadata);
```

## Usage

Use the `createMetadata()` call to create any component that extends [Metadata](#). All components must be of the same type in the same call. For more details, see [Metadata Components and Types](#).

This call executes synchronously, which means that the call returns only when the operation completes.

Starting in API version 34.0, this call supports the `AllOrNoneHeader` header. By default, if `AllOrNoneHeader` isn't used in API version 34.0 and later, this call can save a partial set of records for records with no errors (equivalent to `AllOrNoneHeader=false`). In API version 33.0 and earlier, the default behavior is to only save all records when there are no failures in any record in the call (equivalent to `AllOrNoneHeader=true`).

## Version

Available in API version 30.0 and later.

## Permissions

Your client application must be logged in with the Modify Metadata Through Metadata API Functions or Modify All Data permission.

 **Note:** If a user requires access to metadata but not to data, enable the [Modify Metadata Through Metadata API Functions](#) on page 7 permission. Otherwise, enable the Modify All Data permission.

## Required Fields

The metadata components being created determine required fields. For more information about specific component types, see [Metadata Components and Types](#).

## Valid Data Values

You must supply values that are valid for the field's data type, such as integers for integer fields (not alphabetic characters). In your client application, follow the data formatting rules specified for your programming language and development tool. (Your development tool handles the appropriate mapping of data types in SOAP messages.)

## String Values

When storing values in string fields, the API trims any leading and trailing whitespace. For example, if the value of a `label` field is entered as `"MyObject "`, the value is stored in the database as `"MyObject"`.

## Basic Steps for Creating Metadata Components

Follow this process to create metadata components.

1. Design an array, and populate it with the components that you want to create. All components must be of the same type.
2. Call `createMetadata()` with the component array passed in as an argument.
3. A `SaveResult` object is returned for each component you tried to create. It contains information about whether the operation was successful, the name of the component created, and any errors returned if the operation wasn't successful.

## Sample Code—Java

```

public void createCustomObjectSync() {
    try {
        CustomObject co = new CustomObject();
        String name = "MyCustomObject1";
        co.setFullName(name + "__c");
        co.setDeploymentStatus(DeploymentStatus.Deployed);
        co.setDescription("Created by the Metadata API");
        co.setEnableActivities(true);
        co.setLabel(name + " Object");
        co.setPluralLabel(co.getLabel() + "s");
        co.setSharingModel(SharingModel.ReadWrite);

        CustomField nf = new CustomField();
        nf.setType(FieldType.Text);
        nf.setLabel(co.getFullName() + " Name");
        co.setNameField(nf);

        SaveResult[] results = metadataConnection
            .createMetadata(new Metadata[] { co });

        for (SaveResult r : results) {
            if (r.isSuccess()) {
                System.out.println("Created component: " + r.getFullName());
            } else {
                System.out
                    .println("Errors were encountered while creating "
                        + r.getFullName());
                for (Error e : r.getErrors()) {
                    System.out.println("Error message: " + e.getMessage());
                    System.out.println("Status code: " + e.getStatusCode());
                }
            }
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}

```

## Arguments

Name	Type	Description
metadata	<a href="#">Metadata[]</a>	<p>Array of one or more metadata components.</p> <p>Limit: 10. (For <a href="#">CustomMetadata</a> on page 591 and <a href="#">CustomApplication</a> on page 560 only, the limit is 200.)</p> <p>You must submit arrays of only one type of component. For example, you can submit an array of 10 custom objects or 10 profiles, but not a mix of both types.</p>

## Response

[SaveResult\[\]](#)

## readMetadata ()

---

Returns one or more metadata components from your organization synchronously.

## Syntax

```
ReadResult = metadataConnection.readMetadata(string metadataType, string[] fullNames);
```

## Usage

Use the `readMetadata ()` call to retrieve any component that extends [Metadata](#). All components must be of the same type in the same call. For more details, see [Metadata Components and Types](#).

This call executes synchronously, which means that the call returns only when the operation completes.

## Version

Available in API version 30.0 and later.

## Permissions

Your client application must be logged in with the Modify Metadata Through Metadata API Functions or Modify All Data permission.

 **Note:** If a user requires access to metadata but not to data, enable the [Modify Metadata Through Metadata API Functions](#) on page 7 permission. Otherwise, enable the Modify All Data permission.

## Basic Steps for Reading Metadata Components

Use the following process to read metadata components:

1. Determine the metadata type of the components you want to read and the `fullName` of each component to read.  
The full names must match one or more full names returned by the `listMetadata ()` call, which includes namespace prefixes. If you obtain the `fullName` from a package manifest file, and the component has a namespace prefix, prepend the namespace prefix to the `fullName`. Use this syntax: **`namespacePrefix__ComponentName`**. For example, for the custom object component `MyCustomObject__c` and the namespace `MyNS`, the `fullName` is `MyNS__MyCustomObject__c`. For more information about the `fullName` field, see [Metadata](#).  
You can read only components of the same type in a single call.
2. Invoke the `readMetadata ()` call. For the first argument, pass in the name of the metadata type. The metadata type must match one of the values returned by the `describeMetadata ()` call. For the second argument, pass in an array of full names corresponding to the components you wish to get.
3. A `ReadResult` is returned that contains an array of `Metadata` components. Cast each returned `Metadata` object to the metadata type you specified in the call to get the component's properties.

## Sample Code—Java

```
public void readCustomObjectSync() {
    try {
        ReadResult readResult = metadataConnection
            .readMetadata("CustomObject", new String[] {
                "MyCustomObject1__c", "MyCustomObject2__c" });
        Metadata[] mdInfo = readResult.getRecords();
        System.out.println("Number of component info returned: "
            + mdInfo.length);
        for (Metadata md : mdInfo) {
            if (md != null) {
                CustomObject obj = (CustomObject) md;
                System.out.println("Custom object full name: "
                    + obj.getFullName());
                System.out.println("Label: " + obj.getLabel());
                System.out.println("Number of custom fields: "
                    + obj.getFields().length);
                System.out.println("Sharing model: "
                    + obj.getSharingModel());
            } else {
                System.out.println("Empty metadata.");
            }
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

## Arguments

Name	Type	Description
metadataType	string	The metadata type of the components to read.
fullNames	string[]	<p>Array of full names of the components to read.</p> <p>Limit: 10. (For <a href="#">CustomMetadata</a> on page 591 and <a href="#">CustomApplication</a> on page 560 only, the limit is 200.)</p> <p>You must submit arrays of only one type of component. For example, you can submit an array of 10 custom objects or 10 profiles, but not a mix of both types.</p>

## Response

[ReadResult](#)

## updateMetadata ()

Updates one or more metadata components in your organization synchronously.

## Syntax

```
SaveResult [] = metadataConnection.updateMetadata (Metadata [] metadata);
```

## Usage

Use the `updateMetadata()` call to update any component that extends `Metadata`. All components must be of the same type in the same call. For more details, see [Metadata Components and Types](#).

This call executes synchronously, which means that the call returns only when the operation completes.

Starting in API version 34.0, this call supports the `AllOrNoneHeader` header. By default, if `AllOrNoneHeader` isn't used in API version 34.0 and later, this call can save a partial set of records for records with no errors (equivalent to `AllOrNoneHeader=false`). In API version 33.0 and earlier, the default behavior is to only save all records when there are no failures in any record in the call (equivalent to `AllOrNoneHeader=true`).

## Version

Available in API version 30.0 and later.

## Permissions

Your client application must be logged in with the `Modify Metadata Through Metadata API Functions` or `Modify All Data` permission.

 **Note:** If a user requires access to metadata but not to data, enable the [Modify Metadata Through Metadata API Functions](#) on page 7 permission. Otherwise, enable the `Modify All Data` permission.

## Required Fields

You must supply values for all the required fields in the component.

## Valid Field Values

You must supply values that are valid for the field's data type, such as integers for integer fields (not alphabetic characters). In your client application, follow the data formatting rules specified for your programming language and development tool. (Your development tool handles the appropriate mapping of data types in SOAP messages.)

## String Values

When storing values in string fields, the API trims any leading and trailing white space. For example, if the value of a `label` field is entered as `"MyObject "`, the value is stored in the database as `"MyObject"`.

## Basic Steps for Updating Metadata Components

Use this process to update metadata components.

1. Create an array of the components you want to update. All components must be of the same type.
2. Invoke the `updateMetadata()` call, passing in the array of metadata components to update.

A `SaveResult` object is returned for each component you try to update. It contains information about whether the operation was successful, the name of the component updated, and any errors returned if the operation wasn't successful.

## Sample Code—Java

```
public void updateCustomObjectSync() {
    try {
        CustomObject co = new CustomObject();
        String name = "MyCustomObject1";
        co.setFullName(name + "__c");
        co.setDeploymentStatus(DeploymentStatus.Deployed);
        co.setDescription("Updated description");
        co.setLabel(name + " Object Update");
        co.setPluralLabel(co.getLabel() + "s");
        co.setSharingModel(SharingModel.ReadWrite);

        // Name field with a type and label is required
        CustomField cf = new CustomField();
        cf.setType(FieldType.Text);
        cf.setLabel(co.getFullName() + " Name");
        co.setNameField(cf);

        SaveResult[] results = metadataConnection
            .updateMetadata(new Metadata[] { co });

        for (SaveResult r : results) {
            if (r.isSuccess()) {
                System.out.println("Updated component: " + r.getFullName());
            } else {
                System.out
                    .println("Errors were encountered while updating "
                        + r.getFullName());
                for (Error e : r.getErrors()) {
                    System.out.println("Error message: " + e.getMessage());
                    System.out.println("Status code: " + e.getStatusCode());
                }
            }
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

## Arguments

Name	Type	Description
metadata	<a href="#">Metadata[]</a>	Array of one or more metadata components you wish to update. Limit: 10. (For <a href="#">CustomMetadata</a> on page 591 and <a href="#">CustomApplication</a> on page 560 only, the limit is 200.)

Name	Type	Description
		You must submit arrays of only one type of component. For example, you can submit an array of 10 custom objects or 10 profiles, but not a mix of both types.

## Response

[SaveResult\[\]](#)

## upsertMetadata ()

Creates or updates one or more metadata components in your organization synchronously.

## Syntax

```
UpsertResult[] = metadataConnection.upsertMetadata(Metadata[] metadata);
```

## Usage

Use the `upsertMetadata ()` call to create or update any component that extends [Metadata](#). All components must be of the same type in the same call. For more details, see [Metadata Components and Types](#).

If the specified components currently exist in your organization, the `upsertMetadata ()` call updates them. Otherwise, `upsertMetadata ()` creates these components. The `fullname` field matches the components. This call executes synchronously, which means that the call returns only after the operation is completed.

Starting in API version 34.0, this call supports the [AllOrNoneHeader](#) header. By default, if `AllOrNoneHeader` isn't used in API version 34.0 and later, this call can save a partial set of records for records with no errors (equivalent to `AllOrNoneHeader=false`). In API version 33.0 and earlier, the default behavior is to only save all records when there are no failures in any record in the call (equivalent to `AllOrNoneHeader=true`).

## Version

Available in API version 31.0 and later.

## Permissions

Your client application must be logged in with the [Modify Metadata Through Metadata API Functions](#) or [Modify All Data](#) permission.

 **Note:** If a user requires access to metadata but not to data, enable the [Modify Metadata Through Metadata API Functions](#) on page 7 permission. Otherwise, enable the [Modify All Data](#) permission.

## Required Fields

You must supply values for all the required fields in the component.

## Valid Field Values

You must supply values that are valid for the field's data type, such as integers (not alphabetic characters) for integer fields. In your client application, follow the data formatting rules that are specified for your programming language and development tool. (Your development tool handles the appropriate mapping of data types in SOAP messages.)

## String Values

The API trims any leading and trailing white space when storing values in string fields. For example, if the value of a `label` field is entered as " MyObject ", the value is stored in the database as "MyObject".

## Basic Steps for Upserting Metadata Components

Use this process to upsert metadata components.

1. Create an array of `Metadata` objects that correspond to the components that you want to create or update. All components must be of the same type.
2. Invoke `upsertMetadata()`, passing in the array of metadata components that you created in the previous step.

The `upsertMetadata()` call returns an array of `UpsertResult` objects. Each returned `UpsertResult` corresponds to a component that you upserted and contains information about the upsert operation—whether the operation was successful, the name of the component that was upserted, a flag indicating whether the component was created, and any errors that were returned if the operation wasn't successful.

## Sample Code—Java

```
public void upsertMetadataSample() {
    try {
        // Create custom object to upsert
        CustomObject co = new CustomObject();
        String name = "MyCustomObject";
        co.setFullName(name + "__c");
        co.setDeploymentStatus(DeploymentStatus.Deployed);
        co.setDescription("Upserted by the Metadata API");
        co.setEnableActivities(true);
        co.setLabel(name + " Object");
        co.setPluralLabel(co.getLabel() + "s");
        co.setSharingModel(SharingModel.ReadWrite);

        CustomField nf = new CustomField();
        nf.setType(FieldType.Text);
        nf.setLabel("CustomField1");
        co.setNameField(nf);

        // Upsert the custom object
        UpsertResult[] results = metadataConnection
            .upsertMetadata(new Metadata[] { co });

        for (UpsertResult r : results) {
            if (r.isSuccess()) {
                System.out.println("Success!");
            }
        }
    }
}
```

```

        if (r.isCreated()) {
            System.out.println("Created component: "
                + r.getFullName());
        } else {
            System.out.println("Updated component: "
                + r.getFullName());
        }
    } else {
        System.out
            .println("Errors were encountered while upserting "
                + r.getFullName());
        for (Error e : r.getErrors()) {
            System.out.println("Error message: " + e.getMessage());
            System.out.println("Status code: " + e.getStatusCode());
        }
    }
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}

```

## Arguments

Name	Type	Description
metadata	<a href="#">Metadata[]</a>	<p>An array of one or more metadata components that you want to create or update</p> <p>Limit: 10.</p> <p>You must submit arrays of only one type of component. For example, you can submit an array of 10 custom objects or 10 profiles, but not a mix of both types.</p>

## Response

[UpsertResult\[\]](#)

## deleteMetadata ()

Deletes one or more metadata components from your organization synchronously.

## Syntax

```
DeleteResult[] = metadataConnection.delete(string metadataType, string[] fullNames);
```

## Usage

Use the `deleteMetadata()` call to delete any component that extends [Metadata](#). All components must be of the same type in the same call. For more details, see [Metadata Components and Types](#).

This call executes synchronously, which means that the call returns only when the operation completes.

Starting in API version 34.0, this call supports the [AllOrNoneHeader](#) header. By default, if the `AllOrNoneHeader` isn't used in any API version, this call can delete a partial set of records for records with no errors (equivalent to `AllOrNoneHeader=false`). If `AllOrNoneHeader` is set to `true`, no records are deleted if one or more records cause a failure.

## Version

Available in API version 30.0 and later.

## Permissions

Your client application must be logged in with the Modify Metadata Through Metadata API Functions or Modify All Data permission.

 **Note:** If a user requires access to metadata but not to data, enable the [Modify Metadata Through Metadata API Functions](#) on page 7 permission. Otherwise, enable the Modify All Data permission.

## Rules and Guidelines

When deleting components, consider the following rules and guidelines:

- Your client application must be logged in with sufficient access rights to delete individual components within the specified component. For more information, see [Factors that Affect Data Access](#) in the *Salesforce Object Reference*.
- In addition, sometimes you also need permission to access this component's parent component.
- To ensure referential integrity, this call supports cascading deletions. If you delete a parent component, you delete its children automatically, as long as each child component can be deleted.

## Basic Steps for Deleting Metadata Components

Use the following process to delete metadata components:

1. Determine the metadata type of the components you want to delete and the `fullName` of each component to delete. You can delete only components of the same type in a single call. The full names must match one or more full names returned by the `listMetadata()` call, which includes namespace prefixes. If you obtain the `fullName` from a package manifest file, and the component has a namespace prefix, prepend the namespace prefix to the `fullName`. Use this syntax: **`namespacePrefix__ComponentName`**. For example, for the custom object component `MyCustomObject__c` and the namespace `MyNS`, the `fullName` is `MyNS__MyCustomObject__c`. See [Metadata](#) for more details on the `fullName` field.
2. Invoke the `deleteMetadata()` call. For the first argument, pass in the name of the metadata type. For the second argument, pass in an array of full names corresponding to the components you wish to delete.

A `DeleteResult` object is returned for each component you try to delete. It contains information about whether the operation was successful, the name of the deleted component, and any errors returned if the operation wasn't successful.

## Sample Code—Java

```
public void deleteCustomObjectSync() {
    try {
        DeleteResult[] results = metadataConnection.deleteMetadata(
            "CustomObject", new String[] { "MyCustomObject1__c",
                "MyCustomObject2__c" });
        for (DeleteResult r : results) {
            if (r.isSuccess()) {
                System.out.println("Deleted component: " + r.getFullName());
            } else {
                System.out
                    .println("Errors were encountered while deleting "
                        + r.getFullName());
                for (Error e : r.getErrors()) {
                    System.out.println("Error message: " + e.getMessage());
                    System.out.println("Status code: " + e.getStatusCode());
                }
            }
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

## Arguments

Name	Type	Description
metadataType	string	The metadata type of the components to delete.
fullNames	string[]	<p>Array of full names of the components to delete.</p> <p>Limit: 10. (For <a href="#">CustomMetadata</a> on page 591 and <a href="#">CustomApplication</a> on page 560 only, the limit is 200.)</p> <p>Submit arrays of only one type of component. For example, you can submit an array of 10 custom objects or 10 profiles, but not a mix of both types.</p>

## Response

[DeleteResult\[\]](#)

## renameMetadata ()

---

Renames a metadata component in your organization synchronously.

## Syntax

```
SaveResult = metadataConnection.renameMetadata(string metadataType, String oldFullname,
String newFullname);
```

## Usage

Use the `renameMetadata()` call to rename one metadata component in your organization. This call executes synchronously, meaning the call returns only when the operation completes.

You can use this call to rename any of the objects that extend [Metadata](#). For more details, see [Metadata Components and Types](#).

## Version

Available in API version 30.0 and later.

## Permissions

Your client application must be logged in with the Modify Metadata Through Metadata API Functions or Modify All Data permission.

 **Note:** If a user requires access to metadata but not to data, enable the [Modify Metadata Through Metadata API Functions](#) on page 7 permission. Otherwise, enable the Modify All Data permission.

## Basic Steps for Renaming Metadata Components

Use this process to rename a metadata component.

1. Determine the metadata type of the component you want to rename, its current full name, and the new full name. See [Metadata](#) for more details on the `fullName` field.
2. Invoke the `renameMetadata()` call. For the first argument, pass in the name of the metadata type. Pass in the old full name as the second argument and the new full name as the last argument.

A `SaveResult` object that contains information about whether the operation was successful is returned. If successful, the object contains the name of the renamed component, which is the new name. If it wasn't successful, the object returns any errors.

## Sample Code—Java

```
public void renameCustomObjectSync() {
    try {
        SaveResult[] results = metadataConnection.renameMetadata(
            "CustomObject", "MyCustomObject1__c", "MyCustomObject1New__c");
        for (SaveResult r : results) {
            if (r.isSuccess()) {
                System.out.println("Renamed component: " + r.getName());
            }
            else {
                System.out.println("Errors were encountered while renaming " + r.getName());
                for (Error e : r.getErrors()) {
                    System.out.println("Error message: " + e.getMessage());
                    System.out.println("Status code: " + e.getStatusCode());
                }
            }
        }
    }
}
```

```

    }
  }
}
} catch (ConnectionException ce) {
  ce.printStackTrace();
} catch (InterruptedException ie) {
  ie.printStackTrace();
}
}
}

```

## Arguments

Name	Type	Description
metadataType	string	The metadata type of the components to rename.
oldFullName	string	The current component full name.
newFullName	string	The full name of the new component.

## Response

[SaveResult](#)

## create ()

Deprecated. Adds one or more new metadata components to your organization asynchronously. This call is removed as of API version 31.0 and is available in earlier versions only. Use `createMetadata ()` instead.

## Syntax

```
AsyncResult [] = metadatabinding.create(Metadata [] metadata);
```

## Usage

Use this call to add one or more metadata components to your organization.

## Version

This call is available in API version 30.0 and earlier only. This call isn't available in API version 31.0 and later. Use [createMetadata\(\)](#) instead.

## Permissions

Your client application must be logged in with the Modify Metadata Through Metadata API Functions or Modify All Data permission.

 **Note:** If a user requires access to metadata but not to data, enable the [Modify Metadata Through Metadata API Functions](#) on page 7 permission. Otherwise, enable the Modify All Data permission.

## Required Fields

The metadata components being created determine required fields. For more information about specific component types, see [Metadata Components and Types](#) on page 156.

## Valid Data Values

You must supply values that are valid for the field's data type, such as integers for integer fields (not alphabetic characters). In your client application, follow the data formatting rules specified for your programming language and development tool. (Your development tool handles the appropriate mapping of data types in SOAP messages).

## String Values

When storing values in string fields, the API trims any leading and trailing whitespace. For example, if the value of a `label` field is entered as `"MyObject "`, the value is stored in the database as `"MyObject"`.

## Basic Steps for Creating Metadata Components

Use the following process to create metadata components:

1. Design an array, and populate it with the components you want to create. All components must be of the same type.
2. Call `create()` with the component array passed in as an argument.
3. An `AsyncResult` object is returned for each component you try to create, and is updated with status information as the operation moves from a queue to completed or error state. Call `checkStatus()` in a loop until the status values in `AsyncResult` indicate that all create operations are completed. Start with a wait time of 1 second between iterations of `checkStatus()` calls, and double the wait time each time you make a subsequent call.

## Sample Code—Java

See [Step 3: Walk Through the Java Sample Code](#) on page 16 for sample Java code using the `create()` call.

## Arguments

Name	Type	Description
<code>metadata</code>	<code>Metadata[]</code>	<p>Array of one or more metadata components.</p> <p>Limit: 10.</p> <p>You must submit arrays of only one type of component. For example, you could submit an array of 10 custom objects or 10 profiles, but not a mix of both types.</p>

## Response

`AsyncResult[]`

SEE ALSO:

[createMetadata\(\)](#)

[update\(\)](#)

[delete\(\)](#)

[checkStatus\(\)](#)

## delete ()

---

Deprecated. Deletes one or more components from your organization asynchronously. This call is removed as of API version 31.0 and is available in earlier versions only. Use `deleteMetadata()` instead.

You can use this call to delete any of the objects that extend [Metadata](#). For more details, see [Metadata Components and Types](#) on page 156.

## Syntax

```
AsyncResult[] = metadataConnection.delete(Metadata[] metadata);
```

## Usage

Use this call to delete one or more components from your organization.

## Version

This call is available in API version 30.0 and earlier only. This call isn't available in API version 31.0 and later. Use [deleteMetadata\(\)](#) instead.

## Permissions

Your client application must be logged in with the [Modify Metadata Through Metadata API Functions](#) or [Modify All Data](#) permission.

 **Note:** If a user requires access to metadata but not to data, enable the [Modify Metadata Through Metadata API Functions](#) on page 7 permission. Otherwise, enable the [Modify All Data](#) permission.

## Rules and Guidelines

When deleting components, consider the following rules and guidelines:

- Your client application must be logged in with sufficient access rights to delete individual components within the specified component. For more information, see [Factors that Affect Data Access](#) in the *Salesforce Object Reference*.
- In addition, sometimes you also need permission to access this component's parent component.
- To ensure referential integrity, this call supports cascading deletions. If you delete a parent component, you delete its children automatically, as long as each child component can be deleted.

## Basic Steps for Deleting Metadata Components

Use the following process to delete metadata components:

1. Determine the [fullName](#) of each component you want to delete. See [Metadata](#) for more details on the [fullName](#) field. You can only delete components of the same type in a single call.
2. Invoke the `delete()` call, passing in the array of metadata components with [fullName](#) specified.
3. An [AsyncResult](#) object is returned for each component you try to delete, and is updated with status information as the operation moves from a queue to completed or error state. Call [checkStatus\(\)](#) in a loop until the status values in [AsyncResult](#) indicate that all the delete operations are completed. Start with a wait time of 1 second between iterations of [checkStatus\(\)](#) calls, and double the wait time each time you make a subsequent call.

## Sample Code—Java

```
public void deleteCustomObject() {
    try {
        CustomObject co = new CustomObject();
        co.setFullName("MyCustomObject_c");
        AsyncResult[] ars = metadataConnection.create(new Metadata[]
            {co});
        AsyncResult asyncResult = ars[0];
        long waitTimeMilliSecs = 1000;
        while (!asyncResult.isDone()) {
            Thread.sleep(waitTimeMilliSecs);
            // double the wait time for the next iteration
            waitTimeMilliSecs *= 2;
            asyncResult = mdConnection.checkStatus(
                new String[] {asyncResult.getId()})[0];
            System.out.println("Status is: " + asyncResult.getState());
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    } catch (InterruptedException ie) {
        ie.printStackTrace();
    }
}
```

## Arguments

Name	Type	Description
metadata	<a href="#">Metadata</a> []	<p>Array of one or more metadata components. Only set the <a href="#">fullName</a> field in the <a href="#">Metadata</a> object.</p> <p>Limit: 10.</p> <p>You must submit arrays of only one type of component. For example, you could submit an array of 10 custom objects or 10 profiles, but not a mix of both types.</p>

## Response

`AsyncResult[]`

SEE ALSO:

[deleteMetadata\(\)](#)

[create\(\)](#)

[update\(\)](#)

[checkStatus\(\)](#)

## update ()

---

Deprecated. Updates one or more components in your organization asynchronously. This call is removed as of API version 31.0 and is available in earlier versions only. Use `updateMetadata()` or `renameMetadata()` instead.

This call can be used to update any of the objects that extend [Metadata](#). For more details, see [Metadata Components and Types](#) on page 156.

## Syntax

```
AsyncResult[] = metadataConnection.update(UpdateMetadata[] metadata);
```

## Usage

Use this call to update one or more components. This call is analogous to the `ALTER TABLE` statement in SQL.

## Version

This call is available in API version 30.0 and earlier only. This call isn't available in API version 31.0 and later. Use `updateMetadata()` instead to update metadata components or `renameMetadata()` to rename a metadata component.

## Permissions

Your client application must be logged in with the Modify Metadata Through Metadata API Functions or Modify All Data permission.

 **Note:** If a user requires access to metadata but not to data, enable the [Modify Metadata Through Metadata API Functions](#) on page 7 permission. Otherwise, enable the Modify All Data permission.

## Required Fields

You must supply values for all the required fields in the component.

## Valid Field Values

You must supply values that are valid for the field's data type, such as integers for integer fields (not alphabetic characters). In your client application, follow the data formatting rules specified for your programming language and development tool. (Your development tool handles the appropriate mapping of data types in SOAP messages).

## String Values

When storing values in string fields, the API trims any leading and trailing white space. For example, if the value of a `label` field is entered as `"MyObject "`, the value is stored in the database as `"MyObject"`.

## Basic Steps for Updating Metadata Components

Use this process to update metadata components:

1. Create an array of `UpdateMetadata` components, and populate it with the components you want to update. All components must be of the same type.
2. Invoke the `update()` call, passing in the array of metadata components to update.
3. An `AsyncResult` object is returned for each component you try to update, and is updated with status information as the operation moves from a queue to completed or error state. In a loop, call `checkStatus()` until the status values in `AsyncResult` indicate that all the update operations are completed. Start with a wait time of 1 second between iterations of `checkStatus()` calls, and double the wait time each time you make a subsequent call.

## Sample Code—Java

```
public void updateCustomObject() {
    try {
        CustomObject co = new CustomObject();
        String name = "MyCustomObject";
        co.setFullName(name + "__c");
        co.setDeploymentStatus(DeploymentStatus.Deployed);
        co.setDescription("Created by the Metadata API");
        co.setEnableActivities(true);
        co.setLabel(name + " Object");
        co.setPluralLabel(co.getLabel() + "s");
        co.setSharingModel(SharingModel.ReadWrite);

        CustomField nf = new CustomField();
        nf.setType(FieldType.Text);
        nf.setLabel(co.getFullName() + " Name");

        co.setNameField(nf);

        UpdateMetadata updateMetadata = new UpdateMetadata();
        updateMetadata.setMetadata(co);
        updateMetadata.setCurrentName("TheCurrentName");

        AsyncResult[] ars = metadataConnection.update(new UpdateMetadata[]
            { updateMetadata });
        AsyncResult asyncResult = ars[0];
    }
}
```

```

// set initial wait time to one second in milliseconds
long waitTimeMilliSecs = 1000;
while (!asyncResult.isDone()) {
    Thread.sleep(waitTimeMilliSecs);
    // double the wait time for the next iteration
    waitTimeMilliSecs *= 2;
    asyncResult = metadataConnection.checkStatus(
        new String[] {asyncResult.getId()}[0]);
    System.out.println("Status is: " + asyncResult.getState());
}

if (asyncResult.getState() != AsyncRequestState.Completed) {
    System.out.println(asyncResult.getStatusCode() + " msg: " +
        asyncResult.getMessage());
}
} catch (InterruptedException ie) {
    ie.printStackTrace();
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}
}

```

## Arguments

Name	Type	Description
metadata	<a href="#">UpdateMetadata[]</a>	<p>Array of one or more <a href="#">UpdateMetadata</a> data structures that represent the components you wish to update.</p> <p>Limit: 10.</p> <p>You must submit arrays of only one type of component. For example, you could submit an array of 10 custom objects or 10 profiles, but not a mix of both types.</p>

## UpdateMetadata

One or more [UpdateMetadata](#) objects are defined in the `metadata` argument. This object can be used to update any of the objects that extend [Metadata](#). For more details, see [Metadata Components and Types](#) on page 156. Each [UpdateMetadata](#) object has the following fields:

Field	Field Type	Description
currentName	string	The API name of the component or field before the update. For example, if you wanted to update a <a href="#">CustomObject</a> named Foo, the value of this field would be <code>Foo__c</code> . This value is supplied because this call can change the name, and the value here provides mapping.
metadata	<a href="#">Metadata</a>	Full specification of the component or field you want to update.

## Response

[AsyncResult\[\]](#)

SEE ALSO:

[updateMetadata\(\)](#)

[create\(\)](#)

[delete\(\)](#)

[checkStatus\(\)](#)

## CHAPTER 10 Utility Calls

Use utility calls to gather information that is useful for working with the file-based or CRUD-based calls.

- (Deprecated) [checkStatus\(\)](#)
- [describeMetadata\(\)](#)
- [describeValueType\(\)](#)
- [listMetadata\(\)](#)

### **checkStatus ()**

---

Deprecated. Checks the status of asynchronous metadata calls `create ()`, `update ()`, or `delete ()`, or the declarative metadata call `retrieve ()`. This call is removed as of API version 31.0 and is available only in earlier versions.

 **Note:** Starting in API version 29.0, you no longer have to call [checkStatus\(\)](#) on page 105 after a [deploy\(\)](#) on page 56 call to get information about deployments. Similarly, starting in API version 31.0, you no longer have to call [checkStatus\(\)](#) on page 105 after a [retrieve\(\)](#) on page 75 call. The [checkStatus\(\)](#) on page 105 call has been replaced by [checkDeployStatus\(\)](#) and [checkRetrieveStatus\(\)](#) for deploy and retrieve operations respectively.

### Syntax

```
AsyncResult [] = metadatabinding.checkStatus (ID[] ids);
```

### Usage

Use this call to check whether an asynchronous metadata call or declarative metadata call has completed.

### Version

This call is available only in API version 30.0 and earlier. This call isn't available in API version 31.0 and later.

### Sample Code—Java

See [Step 3: Walk Through the Java Sample Code](#) on page 16 for sample Java code using this call.

## Arguments

Name	Type	Description
ids	ID[]	Array of one or more IDs. Each ID is returned in an <a href="#">AsyncResult</a> and corresponds to a component being created, updated, deleted, deployed, or retrieved.

## Response

[AsyncResult](#)[]

## describeMetadata ()

This call retrieves the metadata that describes your organization. This information includes Apex classes and triggers, custom objects, custom fields on standard objects, tab sets that define an app, and many other metadata types.

## Syntax

```
DescribeMetadataResult = metadataConnection.describeMetadata(double apiVersion);
```

## Arguments

Name	Type	Description
apiVersion	double	The API version for which you want metadata, for example, 62.0.

## Permissions

Your client application must be logged in with the Modify Metadata Through Metadata API Functions or Modify All Data permission.

 **Note:** If a user requires access to metadata but not to data, enable the [Modify Metadata Through Metadata API Functions](#) on page 7 permission. Otherwise, enable the Modify All Data permission.

## Sample Code—Java

```
public void describeMetadata() {
    try {
        double apiVersion = 21.0;
        // Assuming that the SOAP binding has already been established.
        DescribeMetadataResult res =
            metadataConnection.describeMetadata(apiVersion);
        StringBuffer sb = new StringBuffer();
        if (res != null && res.getMetadataObjects().length > 0) {
            for (DescribeMetadataObject obj : res.getMetadataObjects()) {
                sb.append("*****\n");
                sb.append("XMLName: " + obj.getXmlName() + "\n");
            }
        }
    }
}
```

```

        sb.append("DirName: " + obj.getDirectoryName() + "\n");
        sb.append("Suffix: " + obj.getSuffix() + "\n");
        sb.append("*****\n");
    }
    } else {
        sb.append("Failed to obtain metadata types.");
    }
    System.out.println(sb.toString());
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}
}

```

## Response

[DescribeMetadataResult](#)

## When to Use `describeMetadata()` and `describeValueType()`?

Use the `describeMetadata()` call to get high-level information about all the metadata types that are available for your organization, such as type names and file suffixes. Use the `describeValueType()` call to get granular information about a specific metadata type, such as fields contained within the type.

## `describeValueType()`

---

Retrieves the metadata describing a given metadata type (value type).

`describeValueType()` accepts a namespace and a type name, and returns a `DescribeValueTypeResult` object. This call is available in API version 33.0 and later.

## Syntax

```
DescribeValueTypeResult = connection.describeValueType("{namespace}type_name");
```

## Example

Describe Apex class metadata in the Metadata namespace:

```
DescribeValueTypeResult =
metadataConnection.describeValueType("{http://soap.sforce.com/2006/04/metadata}ApexClass");
```

Describe Apex class metadata in the Tooling namespace:

```
DescribeValueTypeResult =
toolingConnection.describeValueType("{urn:metadata.tooling.soap.sforce.com}ApexClass");
```

## Arguments

Name	Type	Description
type	string	The name of the metadata type for which you want metadata; for example, ApexClass. Include the namespace.

## Permissions

Your client application must be logged in with the Modify Metadata Through Metadata API Functions or Modify All Data permission.

 **Note:** If a user requires access to metadata but not to data, enable the [Modify Metadata Through Metadata API Functions](#) on page 7 permission. Otherwise, enable the Modify All Data permission.

## Sample Code—Java

The following example describes several metadata types by specifying the Metadata namespace. Each metadata type is described using the helper method, `doDescribe()`, which calls the `describeValueType()` Metadata API call. The sample retrieves information from the returned `DescribeValueTypeResult`: a property, the parent field (if any), and the fields. Next, the sample iterates through the fields and outputs information about each field.

```
public void describeValueType() throws ConnectionException {
    doDescribe("{http://soap.sforce.com/2006/04/metadata}CustomObject");
    doDescribe("{http://soap.sforce.com/2006/04/metadata}CustomField");
    doDescribe("{http://soap.sforce.com/2006/04/metadata}EmailTemplate");
}

public void doDescribe(String type) throws ConnectionException {
    DescribeValueTypeResult result = metadataConnection.describeValueType(type);
    StringBuffer sb = new StringBuffer();

    sb.append("Describing " + type + " ...\n");

    if (result.getApiCreatable() == true) {
        sb.append("Is API creatable.\n");
    } else {
        sb.append("Is not API creatable.\n");
    }

    ValueTypeField parentField = result.getParentField();
    if (parentField != null) {
        sb.append("*** Parent type fields **\n");
        if (parentField.getIsForeignKey()) {
            sb.append("This field is a foreign key.\n");
            for (String fkDomain : parentField.getForeignKeyDomain()) {
                sb.append("Foreign key domain: " + fkDomain + "\n");
            }
        }
    }

    sb.append("*** Value type fields **\n");
}
```

```

for(ValueTypeField field : result.getValueTypeFields()) {
    sb.append("*****\n");
    sb.append("Name: " + field.getName() + "\n");
    sb.append("SoapType: " + field.getSoapType() + "\n");
    if (field.getIsForeignKey()) {
        sb.append("This field is a foreign key.\n");
        for (String fkDomain : field.getForeignKeyDomain()) {
            sb.append("Foreign key domain: " + fkDomain + "\n");
        }
    }
    sb.append("*****\n");
}
System.out.println(sb.toString());
}

```

To run the previous example with the Tooling WSDL, replace the namespace with the Tooling namespace in the helper function call as follows. Also, use the Tooling connection instead of the Metadata connection to make the `describeValueType()` call.

```

doDescribe("{urn:metadata.tooling.soap.sforce.com}CustomObject");
doDescribe("{urn:metadata.tooling.soap.sforce.com}CustomField");
doDescribe("{urn:metadata.tooling.soap.sforce.com}EmailTemplate");

```

After you run the sample, the output looks similar to the following.

```

Describing {http://soap.sforce.com/2006/04/metadata}CustomObject ...
Is API creatable.
** Value type fields **
*****
Name: actionOverrides
SoapType: ActionOverride
*****
Name: allowInChatterGroups
SoapType: boolean
*****
Name: articleTypeChannelDisplay

SoapType: string

```

```

This field is a foreign key.
Foreign key domain: ApexPage
Foreign key domain: Scontrol
*****
<The rest of the output for CustomObject has been omitted for brevity.>

Describing {http://soap.sforce.com/2006/04/metadata}CustomField ...
Is API creatable.
** Parent type fields **
This field is a foreign key.
Foreign key domain: CustomObject
** Value type fields **
*****
Name: caseSensitive
SoapType: boolean
*****
*****

Name: defaultValue
SoapType: string
*****
*****

<The rest of the output has been omitted for brevity.>

```

## Response

[DescribeValueTypeResult](#)

## listMetadata()

---

This call retrieves property information about metadata components in your organization. Data is returned for the components that match the criteria specified in the queries parameter. The queries array can contain up to three `ListMetadataQuery` queries for each call. This call supports every metadata type: both top-level, such as `CustomObject` and `ApexClass`, and child types, such as `CustomField` and `RecordType`.

## Syntax

```
FileProperties[] = metadataConnection.listMetadata(ListMetadataQuery[] queries, double
asOfVersion);
```

## Usage

This call is useful when you want to identify individual components in `package.xml` for a `retrieve()` call or if you want a high-level view of particular metadata types in your organization. For example, you can use this call to return a list of names of all the `CustomObject` or `Layout` components in your organization. You can use this information to make a subsequent `retrieve()` call to return a subset of these components. For more information about working with `package.xml`, see [Deploying and Retrieving Metadata](#) on page 25.

This call is synchronous, so the results are returned in one call. This call differs from asynchronous calls, such as `retrieve()`, where at least one subsequent call is required to get the results.

## Permissions

Your client application must be logged in with the Modify Metadata Through Metadata API Functions or Modify All Data permission.

 **Note:** If a user requires access to metadata but not to data, enable the [Modify Metadata Through Metadata API Functions](#) on page 7 permission. Otherwise, enable the Modify All Data permission.

## Sample Code—Java

This sample code lists information about your custom objects. The code assumes that the SOAP binding has already been established.

```
public void listMetadata() {
    try {
        ListMetadataQuery query = new ListMetadataQuery();
        query.setType("CustomObject");
        //query.setFolder(null);
        double asOfVersion = 62.0;
        // Assuming that the SOAP binding has already been established.
        FileProperties[] lmr = metadataConnection.listMetadata(
            new ListMetadataQuery[] {query}, asOfVersion);
        if (lmr != null) {
            for (FileProperties n : lmr) {
                System.out.println("Component fullName: " + n.getFullName());
                System.out.println("Component type: " + n.getType());
            }
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

## Arguments

Name	Type	Description
queries	<a href="#">ListMetadataQuery</a> []	A list of objects that specify which components you're interested in.
asOfVersion	double	The API version for the metadata listing request. If you don't specify a value in this field, it defaults to the API version specified when you logged in. This field allows you to override the default and set another API version. For example, you can list the metadata for a metadata type that was added in a later version than the API version specified when you logged in. This field is available in API version 18.0 and later.

## Response

[FileProperties](#)

## ListMetadataQuery

The `ListMetadataQuery` parameter represents a list of objects that specify which components you are interested in.

Name	Type	Description
folder	string	The folder associated with the component. This field is required for components that use folders, such as <a href="#">Dashboard</a> , <a href="#">Document</a> , <a href="#">EmailTemplate</a> , or <a href="#">Report</a> .
type	string	Required. The metadata type, such as <code>CustomObject</code> , <code>CustomField</code> , or <code>ApexClass</code> .

## CHAPTER 11 Result Objects

Use the following objects to get the results of your [file-based](#) or [CRUD-based](#) calls.

### [AsyncResult](#)

Contains the ID of a deployment or retrieval. In API version 28.0 and earlier, contains status information of any asynchronous metadata call.

### [CancelDeployResult](#)

Contains information about a deployment cancellation—whether the cancellation completed and the deployment ID.

### [DeployResult](#)

Contains information about the success or failure of the associated `deploy()` call.

### [DescribeMetadataResult](#)

Contains information about the organization that is useful for developers working with declarative metadata.

### [DescribeValueTypeResult](#)

Contains information about a value type that is useful for developers working with declarative metadata.

### [ReadResult](#)

Contains result information for the `readMetadata` call.

### [RetrieveResult](#)

The `retrieve()` call returns an array of `RetrieveResult` objects.

### [SaveResult](#)

Contains result information for the `createMetadata`, `updateMetadata`, or `renameMetadata` call.

### [DeleteResult](#)

Contains result information for the `deleteMetadata` call.

### [UpsertResult](#)

Contains information about the result of the associated `upsertMetadata()` call.

### [Error](#)

Represents an error that occurred during a synchronous CRUD (`createMetadata()`, `updateMetadata()`, or `deleteMetadata()`) operation.

## AsyncResult

---

Contains the ID of a deployment or retrieval. In API version 28.0 and earlier, contains status information of any asynchronous metadata call.

## API Version 31.0 and Later

In API version 31.0, the process of retrieving metadata has been simplified and retrieval properties have been moved to [RetrieveResult](#). Also, the asynchronous [create\(\)](#) on page 97, [update\(\)](#) on page 101, and [delete\(\)](#) on page 99 calls have been removed. Therefore, only the `id` field in `AsyncResult` is used. The `id` field is the ID of a deployment or retrieval.

These asynchronous calls can return `AsyncResult`.

- [deploy\(\)](#)
- [retrieve\(\)](#)

`AsyncResult` has this field that's in use.

Name	Type	Description
<code>id</code>	ID	Required. The ID of the component that's being deployed or retrieved.

All fields in `AsyncResult` other than `id` are deprecated as of API version 31.0. These fields exist but are no longer in use.

- `done`
- `message`
- `state`
- `statusCode`

## API Versions 29.0 and 30.0

In API version 29.0, Salesforce moved several properties from the `AsyncResult` object to the [DeployResult](#) object and added several new ones, to improve the process for getting information about deployments. For more information about these changes, see [deploy\(\)](#).

In API versions 29.0 and 30.0, `AsyncResult` is returned by the same asynchronous calls as in API version 28.0 and earlier, but it has different fields.

Name	Type	Description
<code>done</code>	boolean	Required. Indicates whether the call has been completed ( <code>true</code> ) or not ( <code>false</code> ).
<code>id</code>	ID	Required. The ID of the component that's being created, updated, deleted, deployed, or retrieved.
<code>message</code>	string	The message that corresponds to the returned <a href="#">statusCode</a> field, if any.
<code>state</code>	<code>AsyncRequestState</code> ( <a href="#">enumeration</a> of type string)	Required. The <code>AsyncRequestState</code> object has one of four possible values. <ul style="list-style-type: none"> <li>• <code>Queued</code>: This call hasn't started. It's waiting in a queue.</li> <li>• <code>InProgress</code>: This call has started but hasn't been completed.</li> <li>• <code>Completed</code>: This call has been completed.</li> <li>• <code>Error</code>: An error occurred. See the <a href="#">statusCode</a> for more information.</li> </ul>

Name	Type	Description
statusCode	Status Code (enumeration of type string)	If an error occurred during the <code>create()</code> , <code>update()</code> , or <code>delete()</code> call, a status code is returned, and the message that corresponds to the status code is returned in the <code>message</code> field.  For a description of each Status Code value, see Status Code in the <a href="#">SOAP API Developer Guide</a> .

## API Version 28.0 and Earlier

In API version 28.0 and earlier, these asynchronous calls can return AsyncResult.

- [create\(\)](#)
- [delete\(\)](#)
- [deploy\(\)](#)
- [retrieve\(\)](#)
- [update\(\)](#)

Use the [checkStatus\(\)](#) call against each object to discover when the call is completed for that object. Salesforce updates each AsyncResult object as the call is completed or when errors occur.

Similarly, the [deploy\(\)](#) and [retrieve\(\)](#) calls use AsyncResult, though you must subsequently use [checkDeployStatus\(\)](#) or [checkRetrieveStatus\(\)](#) respectively to get more status information for the deployment or retrieval.

AsyncResult has the following fields.

Name	Type	Description
checkOnly	boolean	Indicates whether this deployment is used to check the validity of the deployed files without changing the organization ( <code>true</code> ) or not ( <code>false</code> ). A check-only deployment doesn't deploy any components or change the organization in any way. This field is available in API version 16.0 and later and is relevant only for the <a href="#">deploy()</a> call.
done	boolean	Required. Indicates whether the call has been completed ( <code>true</code> ) or not ( <code>false</code> ).
id	ID	Required. The ID of the component that's being created, updated, deleted, deployed, or retrieved.
message	string	The message that corresponds to the returned <code>statusCode</code> field, if any.
numberComponentErrors	int	The number of components that generated errors during this deployment. This field is available in API version 16.0 and later and is relevant only for the <a href="#">deploy()</a> call.
numberComponentsDeployed	int	The number of components that have been deployed for this deployment. This field in conjunction with the <code>numberComponentsTotal</code> field gives you an indication of the progress of the deployment. This field is available in API version 16.0 and later and is relevant only for the <a href="#">deploy()</a> call.

Name	Type	Description
<code>numberComponentsTotal</code>	int	The total number of components in the deployment. This field in conjunction with the <code>numberComponentsDeployed</code> field gives you an indication of the progress of the deployment. This field is available in API version 16.0 and later and is relevant only for the <code>deploy()</code> call.
<code>numberTestErrors</code>	int	The number of Apex tests that generated errors during this deployment. This field is available in API version 16.0 and later and is relevant only for the <code>deploy()</code> call.
<code>numberTestsCompleted</code>	int	The number of Apex tests that have been completed for this deployment. This field in conjunction with the <code>numberTestsTotal</code> field gives you an indication of the progress of tests for the deployment. This field is available in API version 16.0 and later and is relevant only for the <code>deploy()</code> call.
<code>numberTestsTotal</code>	int	The total number of Apex tests in the deployment. This field in conjunction with the <code>numberTestsCompleted</code> field gives you an indication of the progress of tests for the deployment. The value in this field isn't accurate until the deployment has started running tests for the components that are being deployed. This field is available in API version 16.0 and later and is relevant only for the <code>deploy()</code> call.
<code>secondsToWait</code>	int	This field is no longer supported for API version 13.0 and later and is provided only for backward compatibility. The field was removed in API version 17.0.  Indicates the number of seconds before the call is likely to be completed. This number is an estimate only. A reasonable approach is to wait one second before calling to see if the operation is complete. Double your wait time for each successive iteration of calls until the operation is complete.
<code>state</code>	AsyncRequestState (enumeration of type string)	Required. The <code>AsyncRequestState</code> object has one of four possible values. <ul style="list-style-type: none"> <li>• <code>Queued</code>: This call hasn't started. It's waiting in a queue.</li> <li>• <code>InProgress</code>: This call has started but hasn't been completed.</li> <li>• <code>Completed</code>: This call has been completed.</li> <li>• <code>Error</code>: An error occurred. See the <code>statusCode</code> for more information.</li> </ul>
<code>stateDetail</code>	string	Indicates which component is being deployed or which Apex test class is running. This field is available in API version 16.0 and later and is relevant only for the <code>deploy()</code> call.
<code>stateDetailLastModifiedDate</code>	dateTime	The date and time when the <code>stateDetail</code> field was last modified. This field is available in API version 16.0 and later and is relevant only for the <code>deploy()</code> call.
<code>statusCode</code>	StatusCode (enumeration of type string)	If an error occurred during the <code>create()</code> , <code>update()</code> , <code>delete()</code> , or <code>deploy()</code> call, a status code is returned, and the message that corresponds to the status code is returned in the <code>message</code> field.  For a description of each <code>StatusCode</code> value, see <code>StatusCode</code> in the <a href="#">SOAP API Developer Guide</a> .

## CancelDeployResult

---

Contains information about a deployment cancellation—whether the cancellation completed and the deployment ID.

The asynchronous metadata call [cancelDeploy\(\)](#) returns a `CancelDeployResult` object.

### Version

Available in API version 30.0 and later.

`CancelDeployResult` has the following properties.

Name	Type	Description
<code>done</code>	boolean	Indicates whether the deployment cancellation, which is started through <code>cancelDeploy()</code> , has completed ( <code>true</code> ) or not ( <code>false</code> ).  When a deployment hasn't started yet and is still in the queue, the deployment is canceled immediately with the <code>cancelDeploy()</code> call and this field returns <code>true</code> . Otherwise, this field returns <code>false</code> when the cancellation is in progress.
<code>id</code>	ID	ID of the deployment being canceled.

## DeployResult

---

Contains information about the success or failure of the associated `deploy()` call.

The asynchronous metadata call [checkDeployStatus\(\)](#) returns a `DeployResult` object.

In API version 29.0, Salesforce moved several properties from the [AsyncResult](#) on page 113 object to the `DeployResult` object to improve the process for getting information about deployments. For more information about these changes, see [deploy\(\)](#) on page 56.

For API version 29.0 and later, the `DeployResult` object has these properties.

Name	Type	Description
<code>id</code>	ID	ID of the component being deployed.
<code>canceledBy</code>	ID	The ID of the user who canceled the deployment.  This field is available in API version 30.0 and later.
<code>canceledByName</code>	string	The full name of the user who canceled the deployment.  This field is available in API version 30.0 and later.
<code>checkOnly</code>	boolean	Indicates whether this deployment is used to check the validity of the deployed files without changing the organization ( <code>true</code> ) or not ( <code>false</code> ). A check-only deployment doesn't deploy any components or change the organization in any way.
<code>completedDate</code>	dateTime	Timestamp for when the deployment process ended.

Name	Type	Description
createdBy	ID	The ID of the user who created the deployment. This field is available in API version 30.0 and later.
createdByName	string	The full name of the user who created the deployment. This field is available in API version 30.0 and later.
createdDate	dateTime	Timestamp for when the <code>deploy()</code> call was received.
details	<a href="#">DeployDetails[]</a>	Provides the details of a deployment that is in-progress or ended, if the <code>includeDetails</code> parameter is set to <code>true</code> in the <code>checkDeployStatus()</code> call.
done	boolean	Indicates whether the server finished processing the <code>deploy()</code> call for the specified <code>id</code> .
errorMessage	string	Message corresponding to the values in the <code>errorStatusCode</code> field, if any.
errorStatusCode	string	If an error occurred during the <code>deploy()</code> call, a status code is returned, and the message corresponding to the status code is returned in the <code>errorMessage</code> field.  For a description of each <code>StatusCode</code> value, see <code>StatusCode</code> in the <i>SOAP API Developer Guide</i> .
ignoreWarnings	boolean	Optional. Defaults to <code>false</code> . Specifies whether a deployment continues even if the deployment generates warnings. Don't set this argument to <code>true</code> for deployments to production organizations.
lastModifiedDate	dateTime	Timestamp of the last update for the deployment process.
numberComponentErrors	int	The number of components that generated errors during this deployment.
numberComponentsDeployed	int	The number of components deployed in the deployment process. Use this value with the <code>numberComponentsTotal</code> value to get an estimate of the deployment's progress.
numberComponentsTotal	int	The total number of components in the deployment. Use this value with the <code>numberComponentsDeployed</code> value to get an estimate of the deployment's progress.
numberTestErrors	int	The number of Apex tests that have generated errors during this deployment.
numberTestsCompleted	int	The number of completed Apex tests for this deployment. Use this value with the <code>numberTestsTotal</code> value to get an estimate of the deployment's test progress.
numberTestsTotal	int	The total number of Apex tests for this deployment. Use this value with the <code>numberTestsCompleted</code> value to get an estimate of the deployment's test progress. The value in this field isn't accurate until the deployment has started running tests for the components being deployed.
runTestsEnabled	boolean	Indicates whether Apex tests were run as part of this deployment ( <code>true</code> ) or not ( <code>false</code> ). Tests are either automatically run as part of a deployment or can be set

Name	Type	Description
		to run in <a href="#">DeployOptions</a> for the <code>deploy()</code> call. For information on when tests are automatically run, see <a href="#">Running Tests in a Deployment</a> .  This field is available in API version 30.0 and later.
<code>rollbackOnError</code>	boolean	Optional. Defaults to <code>true</code> . Indicates whether any failure causes a complete rollback ( <code>true</code> ) or not ( <code>false</code> ). If <code>false</code> , whatever set of actions can be performed without errors are performed, and errors are returned for the remaining actions. This parameter must be set to <code>true</code> if you're deploying to a production organization.
<code>startDate</code>	dateTime	Timestamp for when the deployment process began.
<code>stateDetail</code>	string	Indicates which component is being deployed or which Apex test class is running.
<code>status</code>	DeployStatus (enumeration of type string)	Indicates the current state of the deployment. The valid values are: <ul style="list-style-type: none"> <li>• Pending</li> <li>• InProgress</li> <li>• Succeeded</li> <li>• SucceededPartial</li> <li>• Failed</li> <li>• Canceling</li> <li>• Canceled</li> </ul>
<code>success</code>	boolean	Indicates whether the deployment was successful ( <code>true</code> ) or not ( <code>false</code> ).

## DeployDetails

These fields provide more information for the `details` field of the `DeployResult` object, if the `includeDetails` parameter is set to (`true` in the `deploy()` call).

 **Note:** While a deployment is still in-progress, the `DeployDetails` object only contains `componentFailures` data. After the deployment process finishes, the other fields populate with the data for the entire deployment.

Name	Type	Description
<code>componentFailures</code>	<a href="#">DeployMessage[]</a>	One or more <code>DeployMessage</code> objects containing deployment errors for each component.
<code>componentSuccesses</code>	<a href="#">DeployMessage[]</a>	One or more <code>DeployMessage</code> objects containing successful deployment details for each component.
<code>retrieveResult</code>	<a href="#">RetrieveResult</a>	If the <code>performRetrieve</code> parameter was specified for the <code>deploy()</code> call, a <code>retrieve()</code> call is performed immediately after the <code>deploy()</code> process completes. This field contains the results of that retrieval.
<code>runTestResult</code>	<a href="#">RunTestsResult</a>	If tests were run for the <code>deploy()</code> call, this field contains the test results. While a deployment is still in-progress, this field only contains error data. After the deployment process finishes, this field populates with the data for the entire deployment.

For API version 28.0 and earlier, the DeployResult object has the following properties.

Name	Type	Description
id	ID	ID of the component being deployed.
messages	<a href="#">DeployMessage[]</a>	Contains information about the success or failure of a <a href="#">deploy()</a> call.
retrieveResult	<a href="#">RetrieveResult</a>	If the <a href="#">performRetrieve</a> parameter was specified for the <a href="#">deploy()</a> call, a <a href="#">retrieve()</a> call is performed immediately after the <a href="#">deploy()</a> process completes. This field contains the results of that retrieval.
runTestResult	<a href="#">RunTestsResult</a>	If tests were run for the <a href="#">deploy()</a> call, this field contains the test results.
success	boolean	Indicates whether the deployment was successful ( <code>true</code> ) or not ( <code>false</code> ).

## DeployMessage

Each DeployResult object contains one or more DeployMessage objects. Each DeployMessage object contains information about the deployment success or failure of a component in the deployment `.zip` file:

As of the Spring '20 release, only authenticated users can access DeployMessage objects.

Name	Type	Description
changed	boolean	If <code>true</code> , the component was changed as a result of this deployment. If <code>false</code> , the deployed component was the same as the corresponding component already in the organization.
columnNumber	int	A text file represents each component. If an error occurred during deployment, this field represents the column of the text file where the error occurred.
componentType	string	The metadata type of the component in this deployment. This field is available in API version 30.0 and later.
created	boolean	If <code>true</code> , the component was created as a result of this deployment. If <code>false</code> , the component was either deleted or modified as a result of the deployment.
createdDate	dateTime	The date and time when the component was created as a result of this deployment. This field is available in API version 30.0 and later.
deleted	boolean	If <code>true</code> , the component was deleted as a result of this deployment. If <code>false</code> , the component was either new or modified as a result of the deployment.
fileName	string	The name of the file in the <code>.zip</code> file used to deploy this component.
fullName	string	The full name of the component. Inherited from <a href="#">Metadata</a> , this field is defined in the WSDL for this metadata type. It must be specified when creating, updating, or deleting. See <a href="#">createMetadata()</a> to see an example of this field specified for a call.
id	ID	ID of the component being deployed.

Name	Type	Description
lineNumber	int	A text file represents each component. If an error occurred during deployment, this field represents the line number of the text file where the error occurred.
problem	string	If an error or warning occurred, this field contains a description of the problem that caused the compile to fail.
problemType	DeployProblemType (enumeration of type string)	Indicates the problem type. The problem details are tracked in the <code>problem</code> field. The valid values are: <ul style="list-style-type: none"> <li>Warning</li> <li>Error</li> </ul> This field is available in API version 18.0 and later. Before version 18.0, there was no distinction between warnings and errors. All problems were treated as errors and prevented a successful deployment.
success	boolean	Indicates whether the component was successfully deployed ( <code>true</code> ) or not ( <code>false</code> ).

## RunTestsResult

Contains information about the execution of unit tests, including whether unit tests were completed successfully, code coverage results, and failures.

A RunTestsResult object has the following properties

Name	Type	Description
apexLogId	string	The ID of an ApexLog object that is created at the end of a test run. The ApexLog object is created if there is an active trace flag on the user running an Apex test, or on a class or trigger being executed.  This field is available in API version 35.0 and later.
codeCoverage	CodeCoverageResult[]	An array of one or more CodeCoverageResult objects that contains the details of the code coverage for the specified unit tests.
codeCoverageWarnings	CodeCoverageWarning[]	An array of one or more code coverage warnings for the test run. The results include both the total number of lines that could have been executed, as well as the number, line, and column positions of code that was not executed.
failures	RunTestFailure[]	An array of one or more RunTestFailure objects that contain information about the unit test failures, if there are any.
flowCoverage	FlowCoverageResult[]	An array of results from test runs that executed flows. This field is available in API version 44.0 and later.
flowCoverageWarnings	FlowCoverageWarning[]	An array of warnings generated by test runs that executed flows. This field is available in API version 44.0 and later.
numFailures	int	The number of failures for the unit tests.

Name	Type	Description
numTestsRun	int	The number of unit tests that were run.
successes	<a href="#">RunTestSuccess</a> []	An array of one or more <a href="#">RunTestSuccess</a> objects that contain information about successes, if there are any.
totalTime	double	The total cumulative time spent running tests, in milliseconds. This can be helpful for performance monitoring.

## CodeCoverageResult

The [RunTestsResult](#) object contains this object. It contains information about whether or not the compile of the specified Apex and run of the unit tests was successful.

Name	Type	Description
dmlInfo	<a href="#">CodeLocation</a> []	For each class or trigger tested, for each portion of code tested, this property contains the DML statement locations, the number of times the code was executed, and the total cumulative time spent in these calls. This can be helpful for performance monitoring.
id	ID	The ID of the <a href="#">CodeLocation</a> . The ID is unique within an organization.
locationsNotCovered	<a href="#">CodeLocation</a> []	For each class or trigger tested, if any code is not covered, the line and column of the code not tested, and the number of times the code was executed.
methodInfo	<a href="#">CodeLocation</a> []	For each class or trigger tested, the method invocation locations, the number of times the code was executed, and the total cumulative time spent in these calls. This can be helpful for performance monitoring.
name	string	The name of the class or trigger covered.
namespace	string	The namespace that contained the unit tests, if one is specified.
numLocations	int	The total number of code locations.
soqlInfo	<a href="#">CodeLocation</a> []	For each class or trigger tested, the location of SOQL statements in the code, the number of times this code was executed, and the total cumulative time spent in these calls. This can be helpful for performance monitoring.
type	string	Do not use. In early, unsupported releases, used to specify class or package.

## CodeCoverageWarning

The [RunTestsResult](#) object contains this object. It contains information about the Apex class which generated warnings.

This object has the following properties.

Name	Type	Description
id	ID	The ID of the <a href="#">CodeLocation</a> . The ID is unique within an organization.
message	string	The message of the warning generated.
name	string	The namespace that contained the unit tests, if one is specified.
namespace	string	The namespace that contained the unit tests, if one is specified.

## RunTestFailure

The [RunTestsResult](#) object returns information about failures during the unit test run.

This object has these properties.

Name	Type	Description
id	ID	The ID of the class which generated failures.
message	string	The failure message.
methodName	string	The name of the method that failed.
name	string	The name of the class that failed.
namespace	string	The namespace that contained the class, if one was specified.
seeAllData	boolean	Indicates whether the test method has access to organization data ( <b>true</b> ) or not ( <b>false</b> ). This field is available in API version 33.0 and later.
stackTrace	string	The stack trace for the failure.
time	double	The time spent running tests for this failed operation, in milliseconds. This can be helpful for performance monitoring.
type	string	Do not use. In early, unsupported releases, used to specify class or package.

## FlowCoverageResult

This object contains information about the flow version and the number of elements executed by the test run. This object is available in API version 44.0 and later.

Name	Type	Description
elementsNotCovered	string	List of elements in the flow version that weren't executed by the test run.
flowId	string	The ID of the flow version. The ID is unique within an org.
flowName	string	The name of the flow that was executed by the test run.
flowNamespace	string	The namespace that contains the flow, if one is specified.
numElements	int	The total number of elements in the flow version.
numElementsNotCovered	int	The number of elements in the flow version that weren't executed by the test run.
processType	FlowProcessType (enumeration of type string)	The process type of the flow version.

## FlowCoverageWarning

This object contains information about the flow version that generated warnings. This object is available in API version 44.0 and later.

Name	Type	Description
flowId	string	The ID of the flow version that generated the warning.
flowName	string	The name of the flow that generated the warning. If the warning applies to the overall test coverage of flows within your org, this value is null.
flowNamespace	string	The namespace that contains the flow, if one was specified.
message	string	The message of the warning that was generated.

## RunTestSuccess

The [RunTestsResult](#) object returns information about successes during the unit test run.

This object has these properties.

Name	Type	Description
id	ID	The ID of the class which generated the success.
methodName	string	The name of the method that succeeded.
name	string	The name of the class that succeeded.

Name	Type	Description
namespace	string	The namespace that contained the unit tests, if one is specified.
seeAllData	boolean	Indicates whether the test method has access to organization data ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 33.0 and later.
time	double	The time spent running tests for this operation. This can be helpful for performance monitoring.

## CodeLocation

The [RunTestsResult](#) object contains this object in a number of fields.

This object has these properties.

Name	Type	Description
column	int	The column location of the Apex tested.
line	int	The line location of the Apex tested.
numExecutions	int	The number of times the Apex was executed in the test run.
time	double	The total cumulative time spent at this location. This can be helpful for performance monitoring.

## DescribeMetadataResult

Contains information about the organization that is useful for developers working with declarative metadata.

The [describeMetadata\(\)](#) call returns a DescribeMetadataResult object.

Each DescribeMetadataResult object has the following properties:

Name	Type	Description
metadataObjects	<a href="#">DescribeMetadataObject</a> []	One or more metadata components and their attributes.
organizationNamespace	string	The namespace of the organization. Specify only for Developer Edition organizations that can contain a managed package. The managed package has a namespace specified when it is created.
partialSaveAllowed	boolean	Indicates whether <a href="#">rollbackOnError</a> is allowed ( <code>true</code> ) or not ( <code>false</code> ). This value is always : <ul style="list-style-type: none"> <li><code>false</code> in production organizations.</li> </ul>

Name	Type	Description
		<ul style="list-style-type: none"> <li>the opposite of <code>testRequired</code>.</li> </ul>
<code>testRequired</code>	boolean	Indicates whether tests are required ( <code>true</code> ) or not ( <code>false</code> ). This value is always the opposite of <code>partialSaveAllowed</code> .

## DescribeMetadataObject

This object is returned as part of the `DescribeMetadataResult`. Each `DescribeMetadataObject` has the following properties:

Name	Type	Description
<code>childXmlNames</code>	string[]	List of child sub-components for this component.
<code>directoryName</code>	string	The name of the directory in the <code>.zip</code> file that contains this component.
<code>inFolder</code>	boolean	Indicates whether the component is in a folder ( <code>true</code> ) or not ( <code>false</code> ). For example, documents, email templates and reports are stored in folders.
<code>metaFile</code>	boolean	Indicates whether the component requires an accompanying metadata file. For example, documents, classes, and s-controls are components that require an additional metadata file.
<code>suffix</code>	string	The file suffix for this component.
<code>xmlName</code>	string	The name of the root element in the metadata file for this component. This name also appears in the <code>Packages &gt; types &gt; name</code> field in the manifest file <code>package.xml</code> .

## DescribeValueTypeResult

Contains information about a value type that is useful for developers working with declarative metadata.

The `describeValueType()` call returns a `DescribeValueTypeResult` object.

Each `DescribeValueTypeResult` object has the following properties.

Name	Type	Description
<code>apiCreatable</code>	boolean	Indicates whether this value type can be created through the <code>createMetadata()</code> call ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 36.0 and later.
<code>apiDeletable</code>	boolean	Indicates whether this value type can be created through the <code>deleteMetadata()</code> call ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 36.0 and later.

Name	Type	Description
apiReadable	boolean	Indicates whether this value type can be created through the <a href="#">readMetadata()</a> call ( <code>true</code> ) or not ( <code>false</code> ).  This field is available in API version 36.0 and later.
apiUpdatable	boolean	Indicates whether this value type can be created through the <a href="#">updateMetadata()</a> call ( <code>true</code> ) or not ( <code>false</code> ).  This field is available in API version 36.0 and later.
parentField	<a href="#">ValueTypeField</a>	Information about the parent of this value type. Parent field information is useful for metadata types that are specified with the parent in their name, such as custom fields, email templates, workflow rules, and reports. For example, the full name of a custom field includes the sObject that contains it (for example, <code>Account.field1__c</code> ). Similarly, the full name of an email template includes the folder where the template is stored (for example, <code>MyFolder/EmailTemplate1</code> ).  If the value type has no parent, this field is null.  This field is available in API version 36.0 and later.
valueTypeFields	<a href="#">ValueTypeField[]</a>	One or more metadata components and their attributes.

## ValueTypeField

This object is returned as part of the [DescribeValueTypeResult](#) and represents the metadata for one field. Each [ValueTypeField](#) has the following properties.

Name	Type	Description
fields	<a href="#">ValueTypeField</a>	The <a href="#">ValueTypeField</a> object for the next field, if any.
foreignKeyDomain	string	If <code>isForeignKey</code> is <code>True</code> , <code>foreignKeyDomain</code> is the type of object, such as <code>Account</code> or <code>Opportunity</code> .
isForeignKey	boolean	<code>True</code> if the field is a foreign key. That means this field is the primary key in a different database table.
isNameField	boolean	<code>True</code> if this value type field is a <code>fullName</code> field, otherwise <code>False</code> .
minOccurs	int	1 if this field is required, 0 otherwise.
name	string	The name of this value type field. The name is null for parent fields.
picklistValues	<a href="#">PicklistEntry</a>	The individual picklist values if the field is a picklist.
soapType	string	The data type of the field, such as <code>boolean</code> or <code>double</code> .
valueRequired	boolean	Required. Indicates whether this value type field must have a value ( <code>true</code> ) or can be null ( <code>false</code> ).

## ReadResult

---

Contains result information for the `readMetadata` call.

### Version

Available in API version 30.0 and later.

### Properties

Name	Type	Description
<code>records</code>	<a href="#">Metadata[]</a>	An array of metadata components returned from <code>readMetadata()</code> .

## RetrieveResult

---

The `retrieve()` call returns an array of `RetrieveResult` objects.

A `RetrieveResult` object has these fields.

Name	Type	Description
<code>done</code>	boolean	Required. Indicates whether the <a href="#">retrieve()</a> on page 75 call is completed ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 31.0 and later.
<code>errorMessage</code>	string	If an error occurs during the <a href="#">retrieve()</a> on page 75 call, this field contains a descriptive message about this error. This field is available in API version 31.0 and later.
<code>errorStatusCode</code>	StatusCode	If an error occurs during the <a href="#">retrieve()</a> on page 75 call, this field contains the status code for this error. This field is available in API version 31.0 and later.  For a description of each <code>StatusCode</code> value, see <code>StatusCode</code> in the <a href="#">SOAP API Developer Guide</a> .
<code>fileProperties</code>	<a href="#">FileProperties[]</a>	Contains information about the properties of each component in the <code>.zip</code> file, and the manifest file <code>package.xml</code> . One object per component is returned.
<code>id</code>	ID	ID of the component being retrieved.
<code>messages</code>	<a href="#">RetrieveMessage[]</a>	Contains information about the success or failure of the <a href="#">retrieve()</a> on page 75 call.
<code>status</code>	RetrieveStatus (enumeration of type string)	The status of the <a href="#">retrieve()</a> on page 75 call. Valid values are: <ul style="list-style-type: none"> <li>• Pending</li> <li>• InProgress</li> <li>• Succeeded</li> <li>• Failed</li> </ul> This field is available in API version 31.0 and later.

Name	Type	Description
success	boolean	Indicates whether the <code>retrieve()</code> on page 75 call was successful ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 31.0 and later.
zipFile	base64Binary	The zip file returned by the retrieve request. Base 64-encoded binary data. Before making an API call, client applications must encode the binary attachment data as base64. Upon receiving a response, client applications must decode the base64 data to binary. This conversion is handled for you by a SOAP client.

## FileProperties

This component contains information about the properties of each component in the `.zip` file, and the manifest file `package.xml`. One object per component is returned. This component doesn't contain information about any associated metadata files in the `.zip` file, only the component files and manifest file. FileProperties contains the following properties:

Name	Type	Description
createdById	string	Required. ID of the user who created the file.
createdByName	string	Required. Name of the user who created the file.
createdDate	dateTime	Required. Date and time when the file was created.
fileName	string	Required. Name of the file.
fullName	string	Required. The file developer name used as a unique identifier for API access. The value is based on the <code>fileName</code> but the characters allowed are more restrictive. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
id	string	Required. ID of the file.
lastModifiedById	string	Required. ID of the user who last modified the file.
lastModifiedByName	string	Required. Name of the user who last modified the file.
lastModifiedDate	dateTime	Required. Date and time that the file was last modified.
manageableState	ManageableState (enumeration of type string)	Indicates the manageable state of the specified component if it's contained in a package: <ul style="list-style-type: none"> <li>• beta</li> <li>• deleted</li> <li>• deprecated</li> <li>• deprecatedEditable</li> <li>• installed</li> <li>• installedEditable</li> <li>• released</li> <li>• unmanaged</li> </ul>

Name	Type	Description
<code>namespacePrefix</code>	string	If any, the namespace prefix of the component.
<code>type</code>	string	Required. The metadata type, such as <code>CustomObject</code> , <code>CustomField</code> , or <code>ApexClass</code> .

## RetrieveMessage

[RetrieveResult](#) on page 128 returns this object, which contains information about the success or failure of the [retrieve\(\)](#) on page 75 call. One object per problem is returned:

Name	Type	Description
<code>fileName</code>	string	The name of the file in the retrieved <code>.zip</code> file where a problem occurred.
<code>problem</code>	string	A description of the problem that occurred.

SEE ALSO:

[retrieve\(\)](#)

## SaveResult

Contains result information for the `createMetadata`, `updateMetadata`, or `renameMetadata` call.

## Version

Available in API version 30.0 and later.

## Properties

Name	Type	Description
<code>errors</code>	<a href="#">Error[]</a>	An array of errors returned if the operation wasn't successful.
<code>fullName</code>	string	The full name of the component processed.
<code>success</code>	boolean	Indicates whether the operation was successful ( <code>true</code> ) or not ( <code>false</code> ).

## DeleteResult

Contains result information for the `deleteMetadata` call.

## Version

Available in API version 30.0 and later.

## Properties

Name	Type	Description
errors	Error[]	An array of errors returned if the operation wasn't successful.
fullName	string	The full name of the deleted component.
success	boolean	Indicates whether the deletion was successful ( <code>true</code> ) or not ( <code>false</code> ).

## UpsertResult

---

Contains information about the result of the associated `upsertMetadata()` call.

## Version

Available in API version 31.0 and later.

## Properties

Name	Type	Description
created	boolean	Indicates whether the upsert operation resulted in the creation of the component ( <code>true</code> ) or not ( <code>false</code> ). If <code>false</code> and the upsert operation was successful, the component was updated.
errors	Error[]	An array of errors that were returned if the operation wasn't successful.
fullName	string	The full name of the component that was created or updated if the operation was successful.
success	boolean	Indicates whether the operation was successful ( <code>true</code> ) or not ( <code>false</code> ).

## Error

---

Represents an error that occurred during a synchronous CRUD (`createMetadata()`, `updateMetadata()`, or `deleteMetadata()`) operation.

## Version

Available in API version 30.0 and later.

## Properties

Name	Type	Description
<code>extendedErrorDetails</code>	<code>ExtendedErrorDetails</code>	More details about the error, including an extended error code and extra error properties, when available. Reserved for future use.  For a description of the <code>ExtendedErrorDetails</code> element, see <code>ExtendedErrorDetails</code> in the <i>SOAP API Developer Guide</i> .
<code>fields</code>	<code>string[]</code>	An array containing names of fields that affected the error condition.
<code>message</code>	<code>string</code>	The error message text.
<code>statusCode</code>	<code>StatusCode</code>	A status code corresponding to the error.  For a description of each <code>StatusCode</code> value, see <code>StatusCode</code> in the <i>SOAP API Developer Guide</i> .

## CHAPTER 12 Metadata Types

Metadata API enables you to access some entities and feature settings that you can customize in the user interface.

### Note:

- Metadata type names are case-sensitive. Specifying a type name with an invalid case results in a deployment error.
- Metadata types don't always correspond directly to their related data types. In some cases, the information is accessible but not organized as expected. For example, dependent picklists are exposed as a type of picklist, not a separate metadata type.
- The wildcard character doesn't apply to metadata types for feature settings, like AccountSettings. The wildcard applies only when retrieving all settings and not an individual setting. See [Settings](#).

### [Metadata Coverage Report](#)

Launch the Metadata Coverage report to determine supported metadata components. The Metadata Coverage report is the ultimate source of truth for metadata coverage across several channels. These channels include Metadata API, scratch org source tracking, unlocked packages, second-generation managed packages, classic managed packages, and more.

### [Unsupported Metadata Types](#)

Some Salesforce features have metadata types that aren't available in Metadata API. These metadata types can't be retrieved or deployed with Metadata API. To make changes to these types, you must do it manually in each of your organizations.

### [Special Behavior in Metadata API Deployments](#)

Important considerations for specific types and contents of a deployment.

### [Data Cloud Metadata Types](#)

Check out the metadata types that are used for development in Data Cloud.

### [AccountRelationshipShareRule](#)

The rule that determines which object records are shared, how they're shared, the account relationship type that shares the records, and the level of access granted to the records.

### [AccountingFieldMapping](#)

Represents the accounting field mappings to organize your data and bring it to ledger entry records.

### [AccountingModelConfig](#)

Represents the mapping of the financial data model to a logical data model and configuration for the generation of Transaction Journal records.

### [ActionLinkGroupTemplate](#)

Represents the action link group template. Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking on an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. Every action link belongs to an action link group and action links within the group are mutually exclusive.

### [ActionPlanTemplate](#)

Represents the instance of an action plan template. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Metadata Types

### [ActionableListDefinition](#)

Represents the data source definition details associated with an actionable list.

### [AdvAccountForecastSet](#)

Represents the forecast sets that define the forecast configurations for each business unit or different groups of accounts. With separate forecast sets at account or business unit level, you can focus on account-specific data and manage configuration updates for one business unit without impacting any other business unit's data.

### [AffinityScoreDefinition](#)

Represents the affinity information used in calculations to analyze and categorize contacts for marketing purposes.

### [AIApplication](#)

Represents an instance of an AI application. For example, Einstein Prediction Builder. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [AIApplicationConfig](#)

Additional prediction information related to an AI application. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [AIScoringModelDefinition](#)

Represents information about a machine learning model that's used by the Scoring Framework for Industries Cloud Einstein. The machine learning model is used for scoring, including its configuration.

### [AIUsecaseDefinition](#)

Represents a collection of fields in your Salesforce org used to define a machine learning use case and get real-time predictions.

### [AnalyticSnapshot](#)

Represents a reporting snapshot. A reporting snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object's fields with the report's data. Reporting snapshots enable you to work with report data similarly to how you work with other records in Salesforce.

### [AnimationRule](#)

Represents criteria for determining when an animation is displayed to Path users. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ArticleType](#)

Represents the metadata associated with an article type.

### [ApexClass](#)

Represents an Apex class. An Apex class is a template or blueprint from which Apex objects are created. Classes consist of other classes, user-defined methods, variables, exception types, and static initialization code.

### [ApexComponent](#)

Represents a Visualforce component.

### [ApexEmailNotifications](#)

The `ApexEmailNotifications` type allows you to define users and email addresses that receive email for unhandled Apex errors. Flow errors can also use this metadata type.

### [ApexPage](#)

Represents a Visualforce page.

### [ApexTestSuite](#)

Represents a suite of Apex test classes to include in a test run.

## Metadata Types

### [ApexTrigger](#)

Represents an Apex trigger. A trigger is Apex code that executes before or after specific data manipulation language (DML) events occur, such as before object records are inserted into the database, or after records have been deleted.

### [AppMenu](#)

Represents the app menu or the Salesforce mobile navigation menu. Reserved for future use.

### [AppointmentAssignmentPolicy](#)

Represents the information about a resource assignment rule. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [AppointmentSchedulingPolicy](#)

Represents a set of rules for scheduling appointments using Lightning Scheduler. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ApprovalProcess](#)

Represents the metadata associated with an approval process. An approval process automates how records are approved in Salesforce. An approval process specifies each step of approval, including who to request approval from and what to do at each point of the process.

### [AssignmentRules](#)

Represents assignment rules that allow you to automatically route cases to the appropriate users or queues. You can access rules metadata for all applicable objects, for a specific object, or for a specific rule on a specific object.

### [AssessmentQuestion](#)

Represents the container object that stores the questions required for an assessment.

### [AssessmentQuestionSet](#)

Represents the container object for Assessment Questions.

### [Audience](#)

Represents the audience in an Experience Builder site. An audience consists of different types of criteria, where the audience can be assigned and used for targeting in a site. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [AuraDefinitionBundle](#)

Represents an Aura definition bundle. A bundle contains an Aura definition, such as an Aura component, and its related resources, such as a JavaScript controller. The definition can be a component, application, event, interface, or a tokens collection.

### [AuthProvider](#)

Represents an authentication provider (auth provider). An auth provider lets users log in to Salesforce from an external service provider such as Facebook, Google, or GitHub. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [AutoResponseRules](#)

Represents an auto-response rule that sets conditions for sending automatic email responses to lead or case submissions based on the attributes of the submitted record. You can access rules metadata for all applicable objects, for a specific object, or for a specific rule on a specific object.

### [BatchCalcJobDefinition](#)

Represents a Data Processing Engine definition.

### [BatchProcessJobDefinition](#)

Represents the details of a Batch Management job definition. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [BillingSettings](#)

Represents the settings for Salesforce Billing.

## Metadata Types

### [BlacklistedConsumer](#)

Represents a connected app that is inaccessible to your Salesforce org's users. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [Bot](#)

Represents a definition of an Einstein Bot configuration that can have one or more versions. Only one version can be active.

### [BotBlock](#)

Represents the configuration details for a specific Einstein Bot block, including dialogs and variables.

### [BotTemplate](#)

Represents the configuration details for a specific Einstein Bot template, including dialogs and variables.

### [BotVersion](#)

Represents the configuration details for a specific Einstein Bot version, including dialogs and variables.

### [BrandingSet](#)

Represents the definition of a set of branding properties for an Experience Builder site, as defined in the Theme panel in Experience Builder.

### [BriefcaseDefinition](#)

Represents a briefcase definition. A briefcase makes selected records available for specific users and groups to view when they're offline in the Salesforce Field Service mobile app for iOS and Android. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [BusinessProcessGroup](#)

Represents the surveys used to track customers' experiences across different stages in their lifecycle. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [CallCenter](#)

Represents the Call Center definition used to integrate Salesforce with a third-party computer-telephony integration (CTI) system, a partner telephony system, or partner Contact Center as a Service (CCaaS) system.

### [CallCoachingMediaProvider](#)

Represents the [CallCoachingMediaProvider](#) configuration. Use [CallCoachingMediaProvider](#) to configure which providers of voice recordings that Einstein Conversation Insights can use. For example, Sales Dialer can provide voice recordings. Einstein Conversation Insights then stores and analyzes call recordings to surface insights and trends in customer conversations. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [CampaignInfluenceModel](#)

Represents a campaign influence model used by Customizable Campaign Influence. You can't configure Customizable Campaign Influence via the [Metadata](#) API, but you can add a campaign influence model.

### [CaseSubjectParticle](#)

Represents the Social Business Rules custom format for the **Case Subject** field on cases created from inbound social posts.

### [CareBenefitVerifySettings](#)

Represents the configuration settings for benefit verification requests.

### [CareLimitType](#)

Defines the characteristics of limits on benefit provision.

### [CareSystemFieldMapping](#)

Represents a mapping from source system fields to Salesforce objects and fields. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Metadata Types

### [CareProviderSearchConfig](#)

Represents the information about the fields that appear in care provider search results. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [CareRequestConfiguration](#)

Represents the details for a record type such as service request, drug request, or admission request. One or more record types can be associated with a care request.

### [Certificate](#)

Represents a certificate used for digital signatures that verify that requests are coming from your org. Certificates are used for either authenticated single sign-on with an external website, or when using your org as an identity provider. This type extends the [Metadata With Content](#) metadata type and inherits its `content` and `fullName` fields.

### [ChatterExtension](#)

Represents the metadata used to describe a Rich Publisher App that's integrated with the Chatter publisher.

### [ChoiceList](#)

Represents the `ChoiceList` dropdown field that's used for pre-chat.

### [ClaimFinancialSettings](#)

Represents the configuration settings for Insurance Claim Financial Services.

### [ClauseCatgConfiguration](#)

Represents the configuration about the clause category that can be used to categorize your disclosure and compliance reports from standardized disclosure templates in a response document.

### [CleanDataService](#)

Represents a data service that adds and updates data in standard objects.

### [CMSConnectSource](#)

Represents the connection information for external content management systems that feed content to Experience Builder sites. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [Community \(Zone\)](#)

Represents a zone that contains Ideas or Chatter Answers objects. Zones are shared by the Ideas, Answers, and Chatter Answers features, allowing you to view and create zones from those locations. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [CommerceSettings](#)

Represents settings for various Commerce features.

### [CommunityTemplateDefinition](#)

Represents the definition of an Experience Builder site template. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [CommunityThemeDefinition](#)

Represents the definition of a theme for an Experience Builder site. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ConnectedApp](#)

Represents a connected app configuration. A connected app enables an external application to integrate with Salesforce using APIs and standard protocols, such as SAML, OAuth, and OpenID Connect. Connected apps use these protocols to authenticate, authorize, and provide single sign-on (SSO) for external apps. The external apps that are integrated with Salesforce can run on the customer success platform, other platforms, devices, or SaaS subscriptions.

## Metadata Types

### [ContentAsset](#)

Represents the metadata for creating an asset file. Asset files enable a Salesforce file to be used for org setup and configuration purposes. This type extends the `MetadataWithContent` metadata type and inherits its `content` and `fullName` fields.

### [ContextDefinition](#)

Represents the details of a context definition that describe the relationship between the node structures within a context.

### [ConversationMessageDefinition](#)

Represents a messaging component in an Enhanced Messaging channel or Messaging for In-App and Web session.

### [ConversationVendorInfo](#)

Represents the connection between the partner vendor system and the Service Cloud feature. For example, for Service Cloud Voice, this type contains information about the partner telephony system or Contact Center as a Service (CCaaS) system. For Bring Your Own Channel or Bring Your Own Channel for CCaaS, this type contains information about the partner messaging system or CCaaS system.

### [CorsWhitelistOrigin](#)

Represents an origin in the CORS allowlist.

### [CspTrustedSite](#)

Represents a trusted URL. For each `CspTrustedSite` component, you can specify Content Security Policy (CSP) directives and permissions policy directives. Each CSP directive allows Lightning components, third-party APIs, and WebSocket connections to access a resource type from the trusted URL. If the Permissions-Policy HTTP header is enabled, each permissions policy directive grants the trusted URL access to a browser feature. In API version 58.0 and earlier, `CspTrustedSite` components included only CSP directives and were referred to as CSP Trusted Sites.

### [CustomApplication](#)

`CustomApplication` represents a custom or standard application. In API version 29.0 and earlier, `CustomApplication` represents only a custom application. An application is a list of tab references, with a description and a logo. This type extends the `Metadata` metadata type and inherits its `fullName` field.

### [CustomApplicationComponent](#)

Represents a custom console component (Visualforce page) assigned to a `CustomApplication` that is marked as a Salesforce console. Custom console components extend the capabilities of Salesforce console apps. See [Customize a Console with Custom Components in Salesforce Classic](#) in Salesforce Help.

### [CustomFeedFilter](#)

Represents a custom feed filter that limits the feed view to feeds from the `Cases` object. The custom feed filter shows only feed items that satisfy the criteria specified in the `CustomFeedFilter` definition. This type extends the `Metadata` metadata type and inherits its `fullName` field.

### [CustomHelpMenuSection](#)

Represents the section of the Lightning Experience help menu that the admin added to display custom, org-specific help resources for the org. The custom section contains help resources added by the admin. This type extends the `Metadata` metadata type and inherits its `fullName` field.

### [CustomIndex](#)

Represents an index used to increase the speed of queries. This type extends the `Metadata` metadata type and inherits its `fullName` field.

### [CustomLabels](#)

The `CustomLabels` metadata type allows you to create custom labels that can be localized for use in different languages, countries, and currencies.

### [Custom Metadata Types \(CustomObject\)](#)

Represents the metadata associated with a custom metadata type.

## Metadata Types

### [CustomNotificationType](#)

Represents the metadata associated with a custom notification type.

### [CustomObject](#)

Represents a custom object that stores data unique to your org or an external object that maps to data stored outside your org.

### [CustomObjectTranslation](#)

This metadata type allows you to translate custom objects for a variety of languages.

### [CustomPageWebLink](#)

Represents a custom link defined in a home page component.

### [CustomPermission](#)

Represents a permission that grants access to a custom feature. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [CustomSite](#)

Represents a Salesforce site. Create public websites and applications that are directly integrated with your Salesforce organization, but don't require users to log in with a username and password.

### [CustomTab](#)

Represents a custom tab. Custom tabs let you display custom object data or other web content in Salesforce. When you add a custom tab to an app in Salesforce Classic, it appears as a tab. When you add a custom tab to an app in Lightning Experience, it appears as an item in the app's navigation bar and in the App Launcher. When a tab displays a custom object, the tab name is the same as the custom object name. For page, s-control, or URL tabs, the name is arbitrary.

### [CustomValue](#)

Represents the definition of a value used in a global value set or local custom picklist. Custom picklist fields can be local and unique, or can inherit their values from a global picklist (called a *global value set* in API version 38.0). This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [Dashboard](#)

Represents a dashboard. Dashboards are visual representations of data that allow you to see key metrics and performance at a glance.

### [DataCategoryGroup](#)

Represents a data category group.

### [DataWeaveResource](#)

Represents the `DataWeaveScriptResource` class that is generated for all DataWeave scripts. DataWeave scripts can be directly invoked from Apex.

### [DecisionTable](#)

Represents the information about a decision table.

### [DecisionTableDatasetLink](#)

Represents the information about a dataset link associated with a decision table. In a dataset link, select an object for whose records, the decision table must provide an outcome. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [DecisionMatrixDefinition](#)

Represents a definition of a decision matrix.

### [DelegateGroup](#)

Represents a group of users who have the same administrative privileges. These groups are different from public groups used for sharing.

## Metadata Types

### [DigitalExperienceBundle](#)

Represents a text-based code structure of your organization's workspaces, organized by workspace type, and each workspace's content items.

### [DigitalExperienceConfig](#)

Represents details for your organization's workspaces, such as the site label, site URL path prefix, and workspace type.

### [DisclosureDefinition](#)

Represents information that defines a disclosure type, such as details of the publisher or vendor who created or implemented the report.

### [DisclosureDefinitionVersion](#)

Represents the version information about the disclosure definition.

### [DisclosureType](#)

Represents the types of disclosures that are done by an individual or an organization and the associated metadata.

### [DiscoveryAIModel](#)

Represents the metadata associated with a model used in Einstein Discovery.

### [DiscoveryGoal](#)

Represents the metadata associated with an Einstein Discovery prediction definition.

### [DiscoveryStory](#)

Represents the metadata associated with a story used in Einstein Discovery.

### [Document](#)

Represents a Document. All documents must be in a document folder, such as `sampleFolder/TestDocument`.

### [DocumentCategory](#)

Represents a document category.

### [DocumentCategoryDocumentType](#)

Represents the junction between a DocumentCategory and a DocumentType. Puts a DocumentType in a DocumentCategory.

### [DocumentChecklistSettings](#)

Represents an org's DocumentChecklistItem settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [DocumentType](#)

Represents a document type.

### [DuplicateRule](#)

Represents a rule that specifies how duplicate records in an object are detected. This type extends the Metadata metadata type and inherits its `fullName` field.

### [EclairGeoData](#)

Represents an Analytics custom map chart. Custom maps are user-defined maps that are uploaded to Analytics and are used just as standard maps are. Custom maps are accessed in Analytics from the list of maps available with the map chart type.

### [EmailServicesFunction](#)

Represents an email service. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [EmailTemplate](#)

Represents a template for an email, mass email, list email, or Sales Engagement email. Supported in first-generation managed packages only.

## Metadata Types

### [EmbeddedServiceBranding](#)

Represents the branding for each Embedded Service deployment. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [EmbeddedServiceConfig](#)

Represents a setup node for creating an Embedded Service for Web deployment. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [EmbeddedServiceFieldService](#)

Represents a setup node for creating an embedded Appointment Management deployment. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [EmbeddedServiceFlowConfig](#)

Represents a setup node for creating an embedded flow. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [EmbeddedServiceLiveAgent](#)

Represents a setup node for creating an embedded chat deployment. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [EmbeddedServiceMenuSettings](#)

Represents a setup node for creating a channel menu deployment. Channel menus list the ways in which customers can contact your business. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [EnablementMeasureDefinition](#)

Represents an Enablement measure, which specifies the job-related activity that a user performs to complete a milestone or outcome in an Enablement program. A measure identifies a source object and optional related objects, with optional field filters and filter logic, for tracking the activity. To avoid deployment errors, deploy measures before you deploy programs.

### [EnablementProgramDefinition](#)

Represents an Enablement program, which includes exercises and measurable milestones to help users such as sales reps achieve specific outcomes related to your company's revenue goals.

### [EnblProgramTaskSubCategory](#)

Represents a custom exercise type that an Enablement admin adds to an Enablement program in Program Builder. A custom exercise type also requires a corresponding [EnblProgramTaskDefinition](#) record for Program Builder and corresponding [LearningItem](#) and [LearningItemType](#) records for when users take the exercise in the Guidance Center.

### [EntitlementProcess](#)

Represents the settings for an entitlement process.

### [EntitlementTemplate](#)

Represents an entitlement template. Entitlement templates are predefined terms of customer support that you can quickly add to products. For example, you can create entitlement templates for Web or phone support so that users can easily add entitlements to products offered to customers.

### [EscalationRules](#)

Represents case escalation rules to escalate cases automatically if they aren't resolved within a certain time. You can access rules metadata for all applicable objects, for a specific object, or for a specific rule on a specific object.

### [EventDelivery](#)

Represents how an event instance maps to a target payload. Removed in API version 46.0. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Metadata Types

### [EventRelayConfig](#)

Represents the configuration of an event relay, which relays platform events and change data capture events from Salesforce to Amazon EventBridge.

### [EventSubscription](#)

Represents a subscription to an event type. Removed in API version 46.0. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ExperienceBundle](#)

Represents a text-based code structure of the settings and site components, such as pages, branding sets, and themes that make up an Experience Builder site. Developers can quickly update and deploy Experience Builder sites *programmatically* using their preferred development tools. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ExperiencePropertyTypeBundle \(Beta\)](#)

Represents a property type. When you create a custom property type for a Lightning web component, deploy this bundle to your org.

### [ExplainabilityMsgTemplate](#)

Represents information about the template that contains the decision explanation message for a specified expression set step type.

### [ExpressionSetDefinition](#)

Represents an expression set definition.

### [ExpressionSetMessageToken](#)

Represents an interface to retrieve, deploy, create, update, or delete information on Expression Set Message Token.

### [ExpressionSetObjectAlias](#)

Represents information about the alias of the source object that's used in an expression set.

### [ExternalAuthIdentityProvider](#)

Represents an external authentication (auth) identity provider. Use an external auth identity provider to simplify the configuration process for the authentication providers used by your named credentials. An external auth identity provider links to an external credential and securely stores credentials in Salesforce for an external service provider, such as Facebook, Google, or GitHub.

### [ExternalClientApplication](#)

Represents the header file for an external client application configuration.

### [ExternalCredential](#)

Represents the details of how Salesforce authenticates to the external system.

### [ExternalAIModel](#)

Represents the state of a given model for an Einstein for Service feature, such as Einstein Reply Recommendations.

### [ExternalServiceRegistration](#)

Represents the External Service configuration for an org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ExtlClntAppConfigurablePolicies](#)

Represents the policies for an external client app to disable or enable plugins.

### [ExtlClntAppGlobalOAuthSettings](#)

Represents the global settings for the OAuth plugin in an external client app. These settings include private and sensitive OAuth consumer information that can't be packaged and must not be added to source control.

### [ExtlClntAppOAuthConfigurablePolicies](#)

Represents the policies configured by the admin for an OAuth-enabled external client app.

## Metadata Types

### [ExtlCintAppOauthSettings](#)

Represents the settings configuration for the external client app's OAuth plugin.

### [FeatureParameterBoolean](#)

Represents a boolean feature parameter in the Feature Management App (FMA). Feature parameters let you drive app behavior and track activation metrics in subscriber orgs that install your package. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [FeatureParameterDate](#)

Represents a date feature parameter in the Feature Management App (FMA). Feature parameters let you drive app behavior and track activation metrics in subscriber orgs that install your package. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [FeatureParameterInteger](#)

Represents an integer feature parameter in the Feature Management App (FMA). Feature parameters let you drive app behavior and track activation metrics in subscriber orgs that install your package. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [FieldRestrictionRule](#)

Represents a field visibility rule that controls whether a field is visible to a user, based on the field's inclusion in a field set. If Enhanced Personal Information Management setting was enabled before Spring '22, field visibility is based on the field's compliance categorization. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [FlexiPage](#)

Represents the metadata associated with a Lightning page. A Lightning page represents a customizable screen made up of regions containing Lightning components.

### [Flow](#)

Represents the metadata associated with a flow. Use Flow to create an application that takes users through a series of pages to query and update records in the database. You can also execute logic and provide branching capability based on user input to build dynamic applications.

### [FlowCategory](#)

Represents a list of flows that are grouped by category. Flows aren't added directly to a Lightning Bolt Solution. Instead, add the category the flows are in to the Lightning Bolt Solution. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [FlowDefinition](#)

Represents the flow definition's description and active flow version number.

### [FlowTest](#)

Represents the metadata associated with a flow test. Before you activate a record-triggered flow, you can test it to verify its expected results and identify flow run-time failures.

### [Folder](#)

Represents a folder. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ForecastingFilter](#)

Represents the custom filter for including or excluding data from opportunity forecasts.

### [ForecastingFilterCondition](#)

Represents the custom filter condition logic for including or excluding data from opportunity forecasts.

### [ForecastingSourceDefinition](#)

Represents the object, measure, date type, and hierarchy that a forecast uses to project sales.

## Metadata Types

### [ForecastingType](#)

Represents a forecast type.

### [ForecastingTypeSource](#)

Represents the mapping of a forecasting source definition to a forecast type.

### [FuelType](#)

Represents a custom fuel type in an org.

### [FuelTypeSustnUom](#)

Represents a mapping between the custom fuel types and their corresponding unit of measure (UOM) values defined by a customer in an org.

### [FunctionReference](#)

Represents information about a deployed Salesforce Function that can be invoked from the org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [FundraisingConfig](#)

Represents a collection of settings to configure the fundraising product.

### [GatewayProviderPaymentMethodType](#)

Represents an entity that allows integrators and payment providers to choose an active payment to receive an order's payment data rather than allowing the Salesforce Order Management platform to select a default payment method. This object is available in API version 51 and later.

### [GenAiFunction](#)

Represents an agent action that can be added to an AI agent.

### [GenAiPlanner](#)

Represents an agent planner service that uses a large language model (LLM) and a reasoning strategy to decompose a given task into smaller subtasks, identify the most suitable actions for each subtask, and invoke them.

### [GenAiPlugin](#)

Represents an agent topic, which is a category of actions related to a particular job to be done by AI agents.

### [GenAiPluginInstructionDef](#)

Represents a topic instruction.

### [GenAiPromptTemplate](#)

Represents the definition of a prompt template, including its related objects and fields.

### [GenAiPromptTemplateActv](#)

Represents the activation status of a Salesforce-provided prompt template.

### [GlobalPicklist](#)

Represents a global picklist, or the set of shared picklist values that custom picklist fields can use. In contrast, the custom picklist fields that are based on a global picklist are of type `CustomValue`. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [GlobalPicklistValue](#)

Represents the definition of a value used in a global picklist. Custom picklist fields can inherit the picklist value set from a global picklist.

### [GlobalValueSet](#)

Represents the metadata for a global picklist value set, which is the set of shared values that custom picklist fields can use. A global value set isn't a field itself. In contrast, the custom picklist fields that are based on a global picklist are of type `ValueSet`. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Metadata Types

### [GlobalValueSetTranslation](#)

Contains details for a global value set translation. Global value sets are lists of values that can be shared by multiple custom picklist fields, optionally across objects. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [Group](#)

Represents a set of public groups, which can have users, roles, and other groups.

### [HomePageComponent](#)

Represents the metadata associated with a home page component. You can customize the Home tab in Salesforce Classic to include components such as sidebar links, a company logo, a dashboard snapshot, or custom components that you create. Use to create, update, or delete home page component definitions.

### [HomePageLayout](#)

Represents the metadata associated with a home page layout. You can customize home page layouts and assign the layouts to users based on their user profile.

### [IdentityVerificationProcDef](#)

Represents the definition of the identity verification process.

### [IdentityVerificationProcDtl](#)

Represents the search functionality configuration and the minimum number of optional verifiers for identity verification. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [IdentityVerificationProcFld](#)

Represents the search and verification fields used in identity verification. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [InboundCertificate](#)

Represents a mutual authentication certificate that is imported to your Salesforce org.

### [InboundNetworkConnection](#)

Represents a private connection between a third-party data service and a Salesforce org. The connection is inbound because the callouts are coming *into* Salesforce. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [IndustriesPricingSettings](#)

Represents the settings for Salesforce Pricing.

### [IndustriesRatingSettings](#)

Represents the settings for Rate Management.

### [InstalledPackage](#)

Represents a first-generation managed package to be installed or uninstalled. Deploying a newer version of a currently installed package upgrades the package. To install an unlocked or second-generation managed package, use the `sf package install` Salesforce CLI command.

### [IntegrationProviderDef](#)

Represents an integration definition associated with a service process. Stores data for the Industries: Send Apex Async Request and Industries: Send External Async Request invocable actions.

### [IPAddressRange](#)

Represents a range of IP addresses to include in or exclude from the specified feature.

### [KeywordList](#)

Represents a list of keywords used in Experience Cloud site moderation. This keyword list is a type of moderation criteria that defines offensive language or inappropriate content that you don't want in your site.

## Metadata Types

### [Layout](#)

Represents the metadata associated with a page layout. For more information, see [Page Layouts in Salesforce Help](#).

### [LearningItemType](#)

Represents a custom exercise type that an Enablement user takes in an Enablement program in the Guidance Center. A custom exercise type also requires a corresponding LearningItem record for the Guidance Center and corresponding EnblProgramTaskDefinition and EnblProgramTaskSubCategory records for when admins create a program in Program Builder.

### [Letterhead](#)

Represents formatting options for the letterhead in an email template. A letterhead defines the logo, page color, and text settings for your HTML email templates. Use letterheads to ensure a consistent look and feel in your company's emails.

### [LightningBolt](#)

Represents the definition of a Lightning Bolt Solution, which can include custom apps, flow categories, and Experience Builder templates. This type extends the Metadata metadata type and inherits its `fullName` field.

### [LightningComponentBundle](#)

Represents a Lightning web component bundle. A bundle contains Lightning web component resources.

### [LightningExperienceTheme](#)

Represents the details of a custom theme, including the [BrandingSet](#). Themes enable admins to specify configurable attributes, such as three colors and five images. The colors and some of the images override SLDS token values and influence the generation of `app.css`.

### [LightningMessageChannel](#)

Represents the metadata associated with a Lightning Message Channel. A Lightning Message Channel represents a secure channel to communicate across UI technologies, such as Lightning Web Components, Aura Components, and Visualforce.

### [LightningOnboardingConfig](#)

Represents the feedback provided when users switch from Lightning Experience to Salesforce Classic. Admins can customize the question, how frequently the form appears, and where the feedback is stored in Chatter from the Adoption Assistance page in Lightning Experience Setup. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [LiveChatAgentConfig](#)

Represents the configuration of an organization's Chat deployment, such as how many chats can be assigned to an agent and whether chat sounds are enabled.

### [LiveChatButton](#)

Represents a Chat deployment's settings for the button that customers click to chat with an agent and the chat window, such as the label that appears on the button and the pre-chat form that appears before a chat begins. This type extends the Metadata metadata type and inherits its `fullName` field.

### [LiveChatDeployment](#)

Represents the configuration settings for a specific Chat deployment, such as the branding image for the deployment and whether or not chat transcripts are automatically saved.

### [LiveChatSensitiveDataRule](#)

Represents a rule for masking or deleting data of a specified pattern. Written as a regular expression (regex).

### [LoyaltyProgramSetup](#)

Represents the configuration of a loyalty program process including its parameters and rules. Program processes determine how new transaction journals are processed. When new transaction journals meet the criteria and conditions for a program process, actions that are set up in the process are triggered for the transaction journals.

## Metadata Types

### [ManagedContentType](#)

Represents the definition of custom content types for use with Salesforce CMS. Custom content types are displayed as forms with defined fields.

### [ManagedEventSubscription \(Beta\)](#)

Represents a managed event subscription in Pub/Sub API. Use a managed event subscription to track the events that a subscriber client consumed and resume a subscription where it left off. This type extends the metadata type and inherits its `fullName` field.

### [ManagedTopics](#)

Represents navigational and featured topics managed in an Experience Cloud site.

### [MarketingAppExtension](#)

Represents an integration with a third-party app or service that is used to work with prospects.

### [MatchingRule](#)

Represents a matching rule that is used to identify duplicate records.

### [MessagingChannel](#)

Represents the metadata associated with an Embedded Service Messaging channel.

### [Metadata](#)

The base class for all metadata types. You can't edit this object. A component is an instance of a metadata type.

### [MetadataWithContent](#)

MetadataWithContent is the base type for all metadata types that contain content, such as documents or email templates. It extends Metadata. You can't edit this object.

### [MfgProgramTemplate](#)

Represents a definition of a program to create a program-based business. A program-based business, also known as a Manufacturing Program, enables manufacturers to drive their business models with forecasting tools and manage the end-to-end sales process efficiently.

### [MilestoneType](#)

Represents the name and description of a milestone, which you can use in an entitlement process to track important steps in cases.

### [MIDomain](#)

Represents an Einstein Intent Set. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [MLDataDefinition](#)

Represents a modeling data definition, which specifies the data used to create a model. Such data can include filters, fields to include, fields to exclude, and so on. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [MLPredictionDefinition](#)

Represents a prediction definition that specifies details about the prediction. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [MobileApplicationDetail](#)

Represents the packaging attributes for a mobile connected app. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [MobileSecurityAssignment](#)

Represents the assignment of mobile app security policies to a profile. The policies apply to the Salesforce mobile app with Enhanced Mobile App Security enabled.

### [MobileSecurityPolicy](#)

Represents a mobile app security policy on the Salesforce mobile app with Enhanced Mobile App Security enabled. For a full description of each policy, see [Enable and Configure Mobile App Security Policies](#).

## Metadata Types

### [MobSecurityCertPinConfig](#)

Represents the authentication server certificate pin configuration on the Salesforce mobile app with Enhanced Mobile Security.

### [ModerationRule](#)

Represents a rule used in your Experience Cloud site to moderate member-generated content. Each rule specifies the member-generated content the rule applies to, the criteria to enforce the rule on, and the moderation action to take. Moderation rules help protect your site from spammers, bots, and offensive or inappropriate content. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [MutingPermissionSet](#)

Represents a set of disabled permissions and is used in conjunction with [PermissionSetGroup](#).

### [MyDomainDiscoverableLogin](#)

Represents the configuration settings when the My Domain login page type is Discovery. Login Discovery provides an identity-first login experience, where the login page contains the identifier field only. Based on the identifier entered, a handler determines how to authenticate the user. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [NamedCredential](#)

Represents a named credential, which specifies the URL of a callout endpoint and its required authentication parameters in one definition. A named credential can be specified as an endpoint to simplify the setup of authenticated callouts.

### [NavigationMenu](#)

Represents the navigation menu in an Experience Builder site. A navigation menu consists of items that users can click to go to other parts of the site. This type replaces the [NavigationLinkSet](#) subtype on [Network](#). [NavigationMenu](#) is available in API version 47.0 and later. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [Network](#)

Represents an Experience Cloud site. Salesforce Experience Cloud lets you create branded spaces for your employees, customers, and partners. You can customize and create experiences, whether they're communities, sites, or portals, to meet your business needs, then transition seamlessly between them. If you want to create zones that contain Chatter Answers and Ideas, use the [Community \(Zone\)](#) component.

### [NetworkBranding](#)

Represents the branding and color scheme applied to the login pages of an Experience Cloud site. (Experience Cloud sites are represented by the [Network](#) component.)

### [NotificationTypeConfig](#)

Represents the metadata associated with org-level notification settings for standard and custom notification types. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [OAuthCustomScope](#)

Represents a permission defining the protected data that a connected app can access from an external entity when Salesforce is the OAuth authorization provider. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [OAuthTokenExchangeHandler](#)

Represents a token exchange handler. The token exchange handler also consists of an Apex class. During the OAuth 2.0 token exchange flow, the token exchange handler is used to validate tokens from an external identity provider and to map users to Salesforce.

### [OcrSampleDocument](#)

Represents the details of a sample document or a document type that's used as a reference while extracting and mapping information from a customer form. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [OcrTemplate](#)

Represents the details of the mapping between a form and a Salesforce object using Intelligent Form Reader. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Metadata Types

### [OmniExtTrackingDef](#)

Represents a connection between an OmniTrackingGroup in OmniAnalytics and a third-party Analytics system such as Google Analytics.

### [OmniScript](#)

Represents an OmniScript for the Discovery Framework, which guides users through sales, service, and other business processes.

### [OmniSupervisorConfig](#)

Represents the Omni-Channel supervisor configuration for an assigned group of supervisors.

### [OmniTrackingGroup](#)

Represents a group of FlexCard and OmniScript components that have their user interactions tracked together in OmniAnalytics.

### [OutboundNetworkConnection](#)

Represents a private connection between a Salesforce org and a third-party data service. The connection is outbound because the callouts are going *out* of Salesforce. This type extends the Metadata metadata type and inherits its `fullName` field.

### [Package](#)

Specifies which metadata components to retrieve as part of a `retrieve()` call or defines a package of components.

### [ParticipantRole](#)

Represents details, such as the name and associated default access level, for a role that a participant can have in the context of a parent record.

### [PathAssistant](#)

Represents Path records. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [PaymentGatewayProvider](#)

Represents the metadata associated with a payment gateway provider. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [PermissionSet](#)

Represents a set of permissions that's used to grant more access to one or more users without changing their profile or reassigning profiles. You can use permission sets to grant access but not to deny access.

### [PermissionSetGroup](#)

Represents a group of permission *sets* and the permissions within them. Use permission set groups to organize permissions based on job functions or tasks. Then, you can package the groups as needed.

### [PermissionSetLicenseDefinition \(Developer Preview\)](#)

Represents the definition of a custom permission set license, which entitles specified features in a package.

### [PersonAccountOwnerPowerUser](#)

Represents a user who can own more than 50,000 customer or partner portal accounts. Person account owner power users can own a large number of either customer or partner users. They can't change their role, look up to a parent role, or reparent their role. Person account owner power user objects can't be created if deferred sharing is turned on for your org. This object is available in API version 57.0 and later.

### [PipelineInspMetricConfig](#)

Represents the settings of Pipeline Inspection forecast category metrics.

### [PlatformCachePartition](#)

Represents a partition in the Platform Cache. This type extends the Metadata metadata type and inherits its `fullName` field.

### [PlatformEventChannel](#)

Represents a channel that you can subscribe to in order to receive a stream of events. In API version 46.0 and earlier, it is the default standard channel for change data capture events. In API version 47.0 and later, it is a custom channel for change data capture events.

## Metadata Types

### [PlatformEventChannelMember](#)

Represents an entity selected for Change Data Capture notifications on a standard or custom channel, or a platform event selected on a custom channel.

### [PlatformEventSubscriberConfig](#)

Represents configuration settings for a platform event Apex trigger, including the batch size and the trigger's running user.

### [Portal](#)

The Portal metadata type represents a partner portal.

### [PortalDelegablePermissionSet](#)

Represents the org-level permission sets that can be assigned to a particular profile for external users or shoppers in a store after enabling the Delegable Administration perm.

### [PostTemplate](#)

Represents the metadata associated with an approval post template for Approvals in Chatter. With approval post templates, you can customize the information included in approval request posts that appear in Chatter feeds. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ProductAttributeSet](#)

Represents the ProductAttribute information being used as an attribute such as `color_c`, `size_c`.

### [PresenceDeclineReason](#)

Represents an Omni-Channel decline reason that agents can select when declining work requests. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [PresenceUserConfig](#)

Represents a configuration that determines a presence user's settings.

### [Profile](#)

Represents a user profile. A profile defines a user's permission to perform different functions within Salesforce. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ProfileActionOverride](#)

Represents an override of an [ActionOverride](#) by a user profile. You can use it to override an [ActionOverride](#) on a standard Home tab or object record page in Lightning Experience. When a user logs in with a profile, a matching [ProfileActionOverride](#) assignment takes precedence over existing overrides for the Home tab or record page specified in [ActionOverride](#). In API versions 39.0 to 44.0, you can access [ProfileActionOverride](#) by accessing its encompassing [CustomApplication](#) on page 560 or [Profile](#) on page 1477 metadata types. In API version 45.0 and later, you can access [ProfileActionOverride](#) only by accessing its encompassing [CustomApplication](#) on page 560.

### [ProfilePasswordPolicy](#)

Represents a profile's password policies. Profile password policies override org-wide password policies for that profile's users. Use [ProfilePasswordPolicy](#) to retrieve password policies for a given profile. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ProfileSessionSetting](#)

Represents a profile's session settings. Use [ProfileSessionSetting](#) to retrieve the session settings for a given profile. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [Prompt](#)

Represents the metadata related to in-app guidance, which includes prompts and walkthroughs. Help users discover your products and services, adopt your processes, or learn how to use a new feature. Write the content, select the target audience, and specify where and when the in-app guidance appears.

## Metadata Types

### [PublicKeyCertificate](#)

Represents the public key certificate. On this entity we store a public certificate or a JSON web key, which is used to validate the customer-provided JWT.

### [PublicKeyCertificateSet](#)

Represents a set of public certificate keys. On this entity we store a public certificates or JSON web keys.

### [Queue](#)

Represents a holding area for items before they are processed.

### [QueueRoutingConfig](#)

Represents the settings that determine how work items are routed to agents.

### [QuickAction](#)

Represents a specified create or update quick action for an object that then becomes available in the Chatter publisher. For example, you can create an action that, on the detail page of an account, allows a user to create a contact related to that account from the Chatter feed on that page. QuickAction can be created on objects that permit custom fields.

### [RedirectWhitelistUrl](#)

Represents a trusted URL that's excluded from redirection restrictions when the `redirectionWarning` or `redirectBlockModeEnabled` field on the SessionSettings Metadata type is set to `true`. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [RecommendationStrategy](#)

Represents a recommendation strategy. Recommendation strategies are applications, similar to data flows, that determine a set of recommendations to be delivered to the client through data retrieval, branching, and logic operations.

### [RecordActionDeployment](#)

Represents configuration settings for the Actions & Recommendations, Action Launcher, and Bulk Action Panel components. For example, you can have a deployment that specifies which types of actions to display, default actions for channels, and the actions that users can add at runtime. If the component shows Next Best Action recommendations, the deployment configures which strategies to use and how recommendations appear. This type extends the Metadata metadata type and inherits its `fullName` field.

### [RecordAggregationDefinition](#)

Represents a data aggregation from one object to another object to which it is connected by other objects in the data model.

### [RecordAlertCategory](#)

Represents a category to group and present record alerts.

### [RegisteredExternalService](#)

Represents a registered external service, which provides an extension or integration.

### [ReferencedDashboard](#)

Represents the ReferencedDashboard object in CRM Analytics. A referenced dashboard stores information about an externally referenced dashboard.

### [RelatedRecordAssocCriteria](#)

Represents criteria for automatically linking records like accounts, leads, opportunities, and cases with the branches that work with them.

### [RelationshipGraphDefinition](#)

Represents a definition of a graph that you can configure in your organization to traverse object hierarchies and record details, giving you a glimpse of how your business works.

## Metadata Types

### [RemoteSiteSetting](#)

Represents a remote site setting. Before any Visualforce page, Apex callout, or JavaScript code using XMLHttpRequest in an s-control or custom button can call an external site, that site must be registered in the Remote Site Settings page, or the call fails.

### [Report](#)

Represents a custom report. This metadata type only supports custom reports; standard reports aren't supported.

### [ReportType](#)

Represents the metadata associated with a custom report type. Custom report types allow you to build a framework from which users can create and customize reports.

### [RestrictionRule](#)

Represents a restriction rule or a scoping rule. A restriction rule has `enforcementType` set to `Restrict` and controls the access that specified users have to designated records. A scoping rule has `enforcementType` set to `Scoping` and controls the default records that your users see without restricting access. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [Role](#)

Represents a role in your organization.

### [RoleOrTerritory](#)

Represents the common base type and valid values for role or territory.

### [SalesWorkQueueSettings](#)

Represents settings used to customize work queue options for third-party scoring. In Sales Engagement, you can add a custom number field on person accounts, contacts, or leads. Then, use the custom number field to sort the work queue. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [SamlSsoConfig](#)

Represents a SAML Single Sign-On configuration. This type extends the [Metadata](#) metadata type and inherits its `fullName` field. Single sign-on (SSO) is an authentication method that enables users to access multiple applications with one login and one set of credentials. For example, after users log in to your org, they can automatically access all apps from the App Launcher. You can set up your Salesforce org to trust a third-party identity provider to authenticate users. Or you can configure a third-party app to rely on your org for authentication.

### [SchedulingObjective](#)

Represents a scheduling objective in Workforce Engagement. Scheduling objectives define business goals that the scheduling tools consider when identifying agents for shifts.

### [SchedulingRule](#)

Represents a scheduling rule in Workforce Engagement Management. Scheduling rules determine when agents are assigned to shifts.

### [Scontrol](#)

Deprecated. Represents an Scontrol component, corresponding to an s-control in the Salesforce user interface.

### [SearchCustomization](#)

Represents the configuration of search settings created in Search Manager. The configuration includes the search channel, searchable objects and fields, and rules to filter search results.

### [SearchOrgWideObjectConfig](#)

Represents an object in the search index. The search index contains org-wide search settings created in Search Manager. Each object in the search index includes searchable fields and fields protected by field-level security in search.

## Metadata Types

### [ServiceAISetupDefinition](#)

Represents settings for an Einstein for Service feature such as Einstein Article Recommendations. This type extends the Metadata metadata type and inherits its `fullName` field.

### [ServiceAISetupField](#)

Represents a field on cases or knowledge articles that Einstein uses to identify relevant articles in Einstein Article Recommendations. This type extends the Metadata metadata type and inherits its `fullName` field.

### [ServiceChannel](#)

Represents a channel of work items that are received from your organization—for example, cases, chats, or leads.

### [ServicePresenceStatus](#)

Represents a presence status that can be assigned to a service channel. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [ServiceProcess](#)

Represents a process created in Service Process Studio and its associated attributes.

### [Settings](#)

Represents the organization settings related to a feature. For example, your password policies, session settings and network access controls are all available in the SecuritySettings component type.

### [SharedTo](#)

SharedTo defines the sharing access for a list view or a folder. It can be used to specify the target and source for owner-based sharing rules.

### [SharingBaseRule](#)

Represents sharing rule settings such as access level and to whom access is granted.

### [SharingRules](#)

Represents the base container for sharing rules, which can be criteria-based, ownership-based, territory-based, or for guest user access. SharingRules enables you to share records with a set of users, using rules that specify the access level for the target user group.

### [SharingSet](#)

Represents a sharing set. A sharing set defines an access mapping that grants portal or community users access to objects that are associated with their accounts or contacts.

### [SiteDotCom](#)

Represents a site for deployment.

### [Skill](#)

Represents the settings for a skill used for field service or to route chats to agents in Chat, such as the name of the skill and which agents the skills are assigned to.

### [StandardValueSet](#)

Represents the set of values in a standard picklist field. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [StandardValueSetTranslation](#)

Contains details for a standard picklist translation. It returns a translated standard value set. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [StaticResource](#)

Represents a static resource file, often a code library in a ZIP file. Static resources allow you to upload content that you can reference in a Visualforce page, including archives (such as .zip and .jar files), images, style sheets, JavaScript, and other files. Static resources can be used only within your Salesforce org, so you can't host content here for other apps or websites.

## Metadata Types

### [SustainabilityUom](#)

Represents the unit of measure (UOM) values for custom fuel types in an org. Track fuel consumption and emission results with the flexibility to add custom fuel types and UOM values.

### [SustnUomConversion](#)

Represents information about the unit of measure (UOM) conversion for the custom fuel types defined by a customer in an org.

### [SvcCatalogCategory](#)

Represents the grouping of individual catalog items in Service Catalog.

### [SvcCatalogFulfillmentFlow](#)

Represents the flow associated with a specific catalog item in the Service Catalog.

### [SvcCatalogItemDef](#)

Represents the entity associated with a specific, individual service available in the Service Catalog.

### [SynonymDictionary](#)

Represents a set of synonym groups, which are groups of words or phrases that are treated as equivalent in users' searches. You can define synonym groups to optimize search results for acronyms, variations of product names, and other terminology unique to your organization.

### [Territory](#)

Represents a territory in your organization.

### [Territory2](#)

Represents the metadata associated with a sales territory in Territory Management 2.0. This type extends the [Metadata](#) metadata type and inherits its `fullName` field. Available only if Territory Management 2.0 has been enabled for your organization.

### [Territory2Model](#)

Represents the metadata associated with a territory model in Territory Management 2.0. This type extends the [Metadata](#) metadata type and inherits its `fullName` field. Available only if Territory Management 2.0 has been enabled for your Salesforce org.

### [Territory2Rule](#)

Represents the metadata associated with a territory assignment rule associated with an object, such as Account, in Territory Management 2.0. Available only if Territory Management 2.0 has been enabled for your Salesforce org.

### [Territory2Type](#)

Represents the metadata for a category of territories in Territory Management 2.0. Every Territory2 must have a Territory2Type. This type extends the [Metadata](#) metadata type and inherits its `fullName` field. Available only if Enterprise Territory Management has been enabled for your Salesforce org.

### [TimelineObjectDefinition](#)

Represents the container that stores the details of a timeline configuration. You can use this resource with Salesforce objects to see their records' related events in a linear time-sorted view.

### [TimeSheetTemplate](#)

Represents a template for creating time sheets in Field Service. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [TopicsForObjects](#)

Represents the ability to assign topics to objects or to remove topic assignments.

### [TransactionSecurityPolicy](#)

Represents a transaction security policy definition. Transaction security policies give you a way to look through events in your organization and specify actions to take when certain combinations occur.

## Metadata Types

### [Translations](#)

Metadata type that enables work with translations for various supported languages. The ability to translate component labels is part of the Translation Workbench.

### [UiFormatSpecificationSet](#)

Represents a set of rules that define the style and visibility of conditional field formatting on Dynamic Forms-enabled Lightning page field instances.

### [UIObjectRelationConfig](#)

Represents the admin-created configuration of the object relation UI component.

### [UserAccessPolicy](#)

Represents a user access policy.

### [UserAuthCertificate](#)

Represents a PEM-encoded user certificate. These certificates are associated with a user, and externally uploaded. The uploaded certificate is used to authenticate the user.

### [UserCriteria](#)

Represents the member criteria to use in Experience Cloud site moderation rules. This type extends the [Metadata](#) metadata type and inherits its `fullName` field..

### [UserProfileSearchScope](#)

Reserved for internal use.

### [UserProvisioningConfig](#)

Represents information to use during a user provisioning request flow, such as the attributes for an update. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [VirtualVisitConfig](#)

Represents an external video provider configuration, which relays events from Salesforce to the provider.

### [WaveAnalyticAssetCollection](#)

Represents a collection of Analytics assets. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [WaveApplication](#)

Represents the Analytics application. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [WaveComponent](#)

Represents the `WaveComponent` object in the Analytics application. This type extends the [MetadataWithContent](#) metadata type and inherits its `content` and `fullName` fields.

### [WaveDataflow](#)

Represents the `WaveDataflow` object in the Analytics application. This type extends the [MetadataWithContent](#) metadata type and inherits its `content` and `fullName` fields.

### [WaveDashboard](#)

Represents the `WaveDashboard` object in the Analytics application. This type extends the [MetadataWithContent](#) metadata type and inherits its `content` and `fullName` fields.

### [WaveDataset](#)

Represents the `WaveDataset` object in the Analytics application. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### [WaveLens](#)

Represents the `WaveLens` object in the Analytics application.

[WaveRecipe](#)

Represents the WaveRecipe type in an Analytics application. A recipe is a saved set of steps to perform on a specific source dataset or connected data. This type extends the MetadataWithContent metadata type and inherits its `content` and `fullName` fields.

[WaveTemplateBundle](#)

Represents an Analytics template bundle, which can be used to create Analytics apps. A bundle contains an Analytics template definition and all its related resources. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

[WaveXmd](#)

Represents the WaveXmd object in the Analytics application. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

[WebStoreBundle](#)

Represents the configuration of a webstore.

[WebStoreTemplate](#)

Represents a configuration for creating commerce stores.

[Workflow](#)

Represents the metadata associated with a workflow rule. A workflow rule sets workflow actions into motion when its designated conditions are met. You can configure workflow actions to execute immediately when a record meets the conditions in your workflow rule, or set time triggers that execute the workflow actions on a specific day. Use this metadata type to create, update, or delete workflow rule definitions.

[WorkSkillRouting](#)

Represents a setup object that stores a set of WorkSkillRoutingAttribute objects. These objects are used to route a work item to an agent who has the skills necessary to take the work. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Metadata Components and Types

---

Metadata components are not based on sObjects, like objects in the API. Instead, they are based on metadata types, such as ApexClass and CustomObject, which extend Metadata, the base class for all metadata types. A component is an instance of a metadata type.

For example, `CustomObject` is a metadata type for custom objects, and the `MyCustomObject__c` component is an instance of a custom object.

A metadata type can be identified in the metadata WSDL as any complexType that extends the [Metadata](#) complexType. A complexType that is a metadata type includes the following element in its WSDL definition:

```
<xsd:extension base="tns:Metadata">
```

`CustomObject` and `BusinessProcess` extend `Metadata` so they are metadata types; `ActionOverride` doesn't extend `Metadata` so it's not a metadata type.

You can individually deploy or retrieve a component for a metadata type. For example, you can retrieve an individual `BusinessProcess` component, but you can't retrieve an individual `ActionOverride` component. You can only retrieve an `ActionOverride` component by retrieving its encompassing `CustomObject` component.

Metadata components can be manipulated by [asynchronous Metadata API calls](#) or [declarative \(or file-based\) Metadata API calls](#).

Most of the components can be accessed using Salesforce Extensions for Visual Studio Code. Exceptions are noted in the description of the object.

## Field Data Types

Each component field has a specific field type. These field types can correspond to other components defined in the WSDL, or primitive data types, like `string`, that are commonly used in strongly typed programming languages.

These field data types are used in the messages that are exchanged between your client application and the API. When writing your client application, follow the data typing rules defined for your programming language and development environment. Your development tool handles the mapping of typed data in your programming language with these data types.

For more information, see [Primitive Data Types in the Salesforce Object Reference](#).

## Enumeration Fields

Some component fields have a data type that is an enumeration. An enumeration is the API equivalent of a picklist. The valid values of the field are restricted to a strict set of possible values, all having the same data type. These values are listed in the field description column for each enumeration field. See [sortBy](#) for an example of an enumeration field of type string. The XML below shows a sample definition of an enumeration of type string in the WSDL.

```
<xsd:simpleType name="DashboardComponentFilter">
  <xsd:restriction base="xsd:string">
    <xsd:enumeration value="RowLabelAscending"/>
    <xsd:enumeration value="RowLabelDescending"/>
    <xsd:enumeration value="RowValueAscending"/>
    <xsd:enumeration value="RowValueDescending"/>
  </xsd:restriction>
</xsd:simpleType>
```

## Supported Calls

All of the metadata types are supported by the main calls, unless it is stated otherwise in the individual component sections. The main Metadata API calls are:

- [CRUD calls](#), such as `createMetadata()` and `deleteMetadata()`
- [File-based calls](#), such as `deploy()` and `retrieve()`
- [Utility calls](#), such as `listMetadata()` and `describeMetadata()`

## Metadata Coverage Report

---

Launch the Metadata Coverage report to determine supported metadata components. The Metadata Coverage report is the ultimate source of truth for metadata coverage across several channels. These channels include Metadata API, scratch org source tracking, unlocked packages, second-generation managed packages, classic managed packages, and more.

To view the [Metadata Coverage report](#), you don't have to be logged into an org.

## Unsupported Metadata Types

---

Some Salesforce features have metadata types that aren't available in Metadata API. These metadata types can't be retrieved or deployed with Metadata API. To make changes to these types, you must do it manually in each of your organizations.

Some metadata types may also be unsupported in source tracking, packaging, and change sets.

For a complete list of metadata types and where they're supported, see [Metadata Coverage](#).

## Special Behavior in Metadata API Deployments

---

Important considerations for specific types and contents of a deployment.

Use the information here to determine what to include in your deployment and how the changes appear in the destination.

[Special Behavior in Deployments](#)

## Data Cloud Metadata Types

---

Check out the metadata types that are used for development in Data Cloud.

### [ActivationPlatform](#)

Represents the ActivationPlatform configuration, such as platform name, delivery schedule, output format, and destination folder.

### [ActivationPlatformField](#)

Represents the information about the fields used in ActivationPlatform.

### [ActvPfrmDataConnectorS3](#)

Represents the Amazon S3 bucket name and export directory.

### [ActvPlatformAdnclIdentifier](#)

Represents the information about the identifiers to be activated, such as Email, Phone, Mobile Advertiser (MAID) ID, and Over-the-top (OTT) ID.

### [ActvPlatformFieldValue](#)

Represents the field values for the ActivationPlatformFields.

### [DataConnectorIngestApi](#)

Represents the connection information specific to Ingestion API.

### [DataConnectorS3](#)

Represents the connection information specific to Amazon S3.

### [DataPackageKitDefinition](#)

Represents the top-level Data Kit container definition. Content objects can be added after the Data Kit is defined.

### [DataPackageKitObject](#)

Represents the object in Data Kit Content Object. These objects are added inside the data kit.

### [DataSource](#)

Used to represent the system where the data was sourced. This object is always needed when creating a Data Stream Definition.

[DataSourceBundleDefinition](#)

Represents the bundle of streams that a user adds to a data kit.

[DataSourceField](#)

Represents the details of a data source field.

[DataSourceObject](#)

Represents the object from where the data was sourced.

[DataSourceTenant](#)

For internal use only.

[DataSrcDataModelFieldMap](#)

Represents the entity that is used for storing the design time bundle level mappings for the data source fields and data model fields.

[DataStreamDefinition](#)

Contains data ingestion information such as connection, API, and file retrieval settings.

[DataStreamTemplate](#)

Represents the datastream that a user adds to a datakit.

[ExternalDataConnector](#)

Used to represent the object where the data was sourced.

[ExternalDataSource](#)

Represents the metadata associated with an external data source. Create external data sources to manage connection details for integration with data and content that are stored outside your Salesforce org.

[ExternalDataTranObject](#)

Represents a definition of a Data Cloud schema object. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

[FieldSrcTrgtRelationship](#)

Stores the relationships between a data model object (DMO) and its fields. For example, the `Individual.Id` field has a one-to-many relationship (1:M) with the `ContactPointEmail.PartyId` field.

[InternalDataConnector](#)

For internal use only.

[MarketSegmentDefinition](#)

Represents the field values for MarketSegmentDefinition. MarketSegmentDefinition is used to store the exportable metadata of a segment, such as segment criteria and other attributes. Developers can create segment definition packages, pass segment definition in the form of data build tool (DBT), and publish it on AppExchange for subscriber organizations to install and instantiate these segments.

[MktCalcInsightObjectDef](#)

Represents Calculated Insight definition such as expression.

[MktDataTranObject](#)

An entity that is used to deliver (aka transport) information from the source to a target (target will be called a landing entity). This can be the schema of a file, API, Event, or other means of transporting data, such as `SubscriberFile1.csv`, or `SubscriberCDCEvent`.

[ObjectSourceTargetMap](#)

Contains the object-level mappings between the source and the target objects. The source and target objects can be an `MktDataLakeObject` or an `MktDataModelObject`. For example, an Email source object can be mapped to the `ContactPointEmail` object.

[StreamingAppDataConnector](#)

Represents the connection information specific to Web and Mobile Connectors.

SEE ALSO:

[Developer Center: Data Cloud](#)

## ActivationPlatform

Represents the ActivationPlatform configuration, such as platform name, delivery schedule, output format, and destination folder.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

ActivationPlatform components have the suffix `.activationPlatform` and are stored in the `activationPlatforms` folder.

## Version

ActivationPlatform components are available in API version 54.0 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
<code>activationPlatformConnectorType</code>	<p><b>Field Type</b> ActivationPlatformConnectorType (enumeration of type string)</p> <p><b>Description</b> Reserved for future use.</p>
<code>dataConnector</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Reference to the <code>ActvPfrmDataConnectorS3</code> metadata type, which contains S3 bucket and export directory information into which Data Cloud writes data.</p>
<code>description</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>The description for ActivationPlatform.</p>
enabled	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Required.</p> <p>Indicates if ActivationPlatform is enabled (<code>true</code>) or not (<code>false</code>). The default is false.</p>
includeSegmentNames	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether to include the segment name in metadata (<code>true</code>) or not (<code>false</code>).</p>
logoUrl	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>URL of the logo for the activation channel destination.</p>
masterLabel	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The name for the activation channel destination.</p>
notes	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Notes for this ActivationPlatform.</p>
outputFormat	<p><b>Field Type</b></p> <p>ActivationPlatformFileOutputFormat (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>The output format of the file.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• CSV</li> <li>• JSON</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• PARQUET</li> </ul>
outputGrouping	<p><b>Field Type</b> ActivationPlatformFileOutputGrouping (enumeration of type string)</p> <p><b>Description</b> Required. The grouping of the output. Valid values are:</p> <ul style="list-style-type: none"> <li>• PER_ACCOUNT</li> <li>• PER_SEGMENT</li> </ul>
periodicRefreshFrequency	<p><b>Field Type</b> ActivationPlatformPeriodicFullRefresh (enumeration of type string)</p> <p><b>Description</b> Reserved for internal use.</p>
platformType	<p><b>Field Type</b> ActivationPlatformType (enumeration of type string)</p> <p><b>Description</b> Required. The type of the Activation Platform. Valid values are:</p> <ul style="list-style-type: none"> <li>• Advertising</li> <li>• Analytics</li> <li>• Marketing</li> <li>• Publishing</li> <li>• Technology</li> </ul>
refreshFrequency	<p><b>Field Type</b> ActivationPlatformRefreshFrequency (enumeration of type string)</p> <p><b>Description</b> Required. Indicates how often the activation platform accepts data delivery. Valid value is:</p> <ul style="list-style-type: none"> <li>• TWENTY_FOUR</li> </ul>
refreshMode	<p><b>Field Type</b> ActivationPlatformRefreshMode (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>Defines how the refresh method handles refreshing files.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• FULL</li> <li>• INCREMENTAL</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of an ActivationPlatform component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ActivationPlatform xmlns="http://soap.sforce.com/2006/04/metadata">
  <dataConnector>S3Connector</dataConnector>
  <description>Activation Platform Description</description>
  <enabled>>false</enabled>
  <includeSegmentNames>>false</includeSegmentNames>
  <logoUrl>link to logo</logoUrl>
  <masterLabel>MyExternalPlatform</masterLabel>
  <notes>Notes about this Platform</notes>
  <outputFormat>CSV</outputFormat>
  <outputGrouping>PER_ACCOUNT</outputGrouping>
  <refreshMode>FULL</refreshMode>
  <refreshFrequency>TWENTY_FOUR</refreshFrequency>
  <periodicRefreshFrequency>NEVER</periodicRefreshFrequency>
  <platformType>Advertising</platformType>
</ActivationPlatform>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>MyActivationPlatform</fullName>
  <types>
    <members>APlatform</members>
    <name>ActivationPlatform</name>
  </types>
  <types>
    <members>AccountIdField</members>
    <name>ActivationPlatformField</name>
  </types>
  <types>
    <members>S3Connector</members>
    <name>ActvPfrmDataConnectorS3</name>
  </types>
  <types>
    <members>EmailIdentifier</members>
    <name>ActvPlatformAdncIdentifier</name>
  </types>
```

```

<types>
  <members>AccountIdFieldValue</members>
  <name>ActvPlatformFieldValue</name>
</types>
<version>54.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ActivationPlatformField

Represents the information about the fields used in ActivationPlatform.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

ActivationPlatformField components have the suffix `.activationPlatformField` and are stored in the `activationPlatformFields` folder.

## Version

ActivationPlatformField components are available in API version 54.0 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
<code>activationPlatform</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Reference to the ActivationPlatform metadata type.</p>

Field Name	Description
helpText	<p><b>Field Type</b> string</p> <p><b>Description</b> Information about ActivationPlatformField.</p>
isHidden	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Indicates whether ActivationPlatformField can be overridden by marketer (<code>false</code>) or not (<code>true</code>). The default is <code>false</code>. Field can't be overridden by marketer when set to <code>true</code>.</p>
isProtected	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type.</p>
isRequired	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Indicates whether this ActivationPlatformField is required (<code>true</code>) or not (<code>false</code>). The default is <code>false</code>.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the ActivationPlatformField.</p>
type	<p><b>Field Type</b> ActivationPlatformFieldType (enumeration of type string)</p> <p><b>Description</b> Represents the datatype of the field. Valid value is:</p> <ul style="list-style-type: none"><li>• Text</li></ul>

## Declarative Metadata Sample Definition

The following is an example of an ActivationPlatformField component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ActivationPlatformField xmlns="http://soap.sforce.com/2006/04/metadata">
  <activationPlatform>APlatform</activationPlatform>
  <isHidden>>false</isHidden>
  <isRequired>>true</isRequired>
  <masterLabel>AccountId</masterLabel>
</ActivationPlatformField>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>MyActivationPlatform</fullName>
  <types>
    <members>APlatform</members>
    <name>ActivationPlatform</name>
  </types>
  <types>
    <members>AccountIdField</members>
    <name>ActivationPlatformField</name>
  </types>
  <version>54.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ActvPfrmDataConnectorS3

Represents the Amazon S3 bucket name and export directory.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its fullName field.

## File Suffix and Directory Location

ActvPfrmDataConnectorS3 components have the suffix .actvPfrmDataConnectorS3 and are stored in the actvPfrmDataConnectorS3s folder.

## Version

ActvPfrmDataConnectorS3 components are available in API version 54.0 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
bucketName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The Amazon S3 bucket name.</p>
exportDirectory	<p><b>Field Type</b> string</p> <p><b>Description</b> This is an optional field that is reserved for internal use.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The display name of ActvPfrmDataConnectorS3.</p>

## Declarative Metadata Sample Definition

The following is an example of an ActvPfrmDataConnectorS3 component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ActvPfrmDataConnectorS3 xmlns="http://soap.sforce.com/2006/04/metadata">
  <bucketName>MyS3Bucket</bucketName>
  <exportDirectory>Output</exportDirectory>
  <masterLabel>S3Connector</masterLabel>
</ActvPfrmDataConnectorS3>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>MyActivationPlatform</fullName>
  <types>
    <members>APlatform</members>
    <name>ActivationPlatform</name>
  </types>
  <types>
    <members>S3Connector</members>
```

```

    <name>ActvPfrmDataConnectorS3</name>
  </types>
  <version>54.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ActvPlatformAdncIdentifier

Represents the information about the identifiers to be activated, such as Email, Phone, Mobile Advertiser (MAID) ID, and Over-the-top (OTT) ID.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`ActvPlatformAdncIdentifier` components have the suffix `.actvPlatformAdncIdentifier` and are stored in the `actvPlatformAdncIdentifiers` folder.

## Version

`ActvPlatformAdncIdentifier` components are available in API version 54.0 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
<code>activationPlatform</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Reference to the ActivationPlatform metadata type.Reference to ActivationPlatform.</p>

Field Name	Description
identifierHashMethod	<p><b>Field Type</b> ActivationPlatformIdentifierHashMethod (enumeration of type string)</p> <p><b>Description</b> The hash method of the identifier type. The supported hash method for Email and Phone is <code>SHA256</code>. The supported hash method for MAID and OTT is <code>NONE</code>.</p>
identifierType	<p><b>Field Type</b> ActivationPlatformIdentifierType (enumeration of type string)</p> <p><b>Description</b> Required. The type of identifier to be activated. Valid values are:</p> <ul style="list-style-type: none"> <li>• EMAIL</li> <li>• MAID</li> <li>• OTT</li> <li>• PHONE</li> </ul>
isProtected	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the identifier.</p>

## Declarative Metadata Sample Definition

The following is an example of an ActvPlatformAdncIdentifier component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ActvPlatformAdncIdentifier xmlns="http://soap.sforce.com/2006/04/metadata">
  <activationPlatform>APlatform</activationPlatform>
  <identifierHashMethod>SHA256</identifierHashMethod>
  <identifierType>EMAIL</identifierType>
  <masterLabel>EmailIdentifier</masterLabel>
</ActvPlatformAdncIdentifier>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>MyActivationPlatform</fullName>
  <types>
    <members>APlatform</members>
    <name>ActivationPlatform</name>
  </types>
  <types>
    <members>EmailIdentifier</members>
    <name>ActvPlatformAdncIdentifier</name>
  </types>
  <version>54.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ActvPlatformFieldValue

Represents the field values for the ActivationPlatformFields.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

ActvPlatformFieldValue components have the suffix `.actvPlatformFieldValue` and are stored in the `actvPlatformFieldValues` folder.

## Version

ActvPlatformFieldValue components are available in API version 54.0 and later.

## Special Access Rules

## Fields

Field Name	Description
<code>activationPlatformField</code>	<b>Field Type</b> string

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>Reference to the ActivationPlatform metadata type.</p>
isDefault	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Required.</p> <p>Indicates whether the value is default (<code>true</code>) or not (<code>false</code>). The default is false. Picklist isn't supported in API version 54.0</p>
isProtected	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>An auto-generated value that doesn't impact the behavior of the metadata type.</p>
masterLabel	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The name of the field.</p>
value	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The value of <code>activationPlatformField</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of an ActvPlatformFieldValue component.

Field with no value:

```
<ActvPlatformFieldValue xmlns="http://soap.sforce.com/2006/04/metadata">
  <activationPlatformField>AccountIdField</activationPlatformField>
  <isDefault>true</isDefault>
  <masterLabel>AccountIdValue</masterLabel>
  <value>null</value>
</ActvPlatformFieldValue>
```

Field with value:

```
<ActvPlatformFieldValue xmlns="http://soap.sforce.com/2006/04/metadata">
  <activationPlatformField>AccountIdField</activationPlatformField>
```

```

    <isDefault>true</isDefault>
    <masterLabel>AccountIdValue</masterLabel>
    <value>1234</value>
  </ActvPlatformFieldValue>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>MyActivationPlatform</fullName>
  <types>
    <members>APlatform</members>
    <name>ActivationPlatform</name>
  </types>
  <types>
    <members>AccountIdField</members>
    <name>ActivationPlatformField</name>
  </types>
  <types>
    <members>AccountIdValue</members>
    <name>ActvPlatformFieldValue</name>
  </types>
  <version>54.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DataConnectorIngestApi

Represents the connection information specific to Ingestion API.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`DataConnectorIngestApi` components have the suffix `.dataConnectorIngestApi` and are stored in the `dataConnectorIngestApis` folder.

### Version

`DataConnectorIngestApi` components are available in API version 54.0 and later.

## Special Access Rules

You must have the CustomizeApplication user permissions to access the DataConnectorIngestApi type.

## Fields

Field Name	Description
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. UI label of the Ingestion API Connector.</p>
sourceName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the Ingestion API Connector.</p>

## Declarative Metadata Sample Definition

The following is an example of a DataConnectorIngestApi component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DataConnectorIngestApi xmlns="http://soap.sforce.com/2006/04/metadata">
  <sourceName>CONNECTOR NAME</sourceName>
  <masterLabel>CONNECTOR NAME</masterLabel>
</DataConnectorIngestApi>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<DataConnectorIngestApi xmlns="http://soap.sforce.com/2006/04/metadata">
  <sourceName>MyConnector</sourceName>
  <masterLabel>MyConnector</masterLabel>
</DataConnectorIngestApi>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DataConnectorS3

Represents the connection information specific to Amazon S3.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

DataConnectorS3 components have the suffix s3DataConnector and are stored in the s3DataConnectors folder.

## Version

DataConnectorS3 components are available in API version 50.0 and later.

## Special Access Rules

You need the Salesforce CustomizeApplication permission to access this object.

## Fields

Field Name	Field Type	Description
fileNameWildcard	string	Optional. File or Wildcard (*) to be used when finding files.
importFromDirectory	string	Required. Path from the directory to where files are located.
masterLabel	string	Required. The UI name for the S3 data connector.
s3BucketName	string	Optional. The Amazon S3 Name of the Bucket.

## Declarative Metadata Sample Definition

The following is an example of a DataConnectorS3 component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DataConnectorS3 xmlns="http://soap.sforce.com/2006/04/metadata">
  <fileNameWildcard>*.csv</fileNameWildcard>
  <importFromDirectory>c360-subset-lheader</importFromDirectory>
  <masterLabel>Person</masterLabel>
  <s3BucketName>bucketeer-aa32faea-8431-4635-8a1d-b323a2d66c7c</s3BucketName>
</DataConnectorS3>
```

## DataPackageKitDefinition

Represents the top-level Data Kit container definition. Content objects can be added after the Data Kit is defined.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this metadata type's name.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`DataPackageKitDefinition` components have the suffix `.dataPackageKitDefinition` and are stored in the `dataPackageKitDefinitions` folder.

## Version

`DataPackageKitDefinition` components are available in API version 53.0 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of the data kit.</p>
<code>developerName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Represents the name of the application. Can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
<code>isDeployed</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether Data Kit content is deployed.</p>
<code>isEnabled</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Data Kit is enabled.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. Label that identifies the AI application throughout the Salesforce user interface.</p>
versionNumber	<p><b>Field Type</b></p> <p>double</p> <p><b>Description</b></p> <p>Auto incremented version number.</p>

## Declarative Metadata Sample Definition

The following is an example of a DataPackageKitDefinition component.

```
<DataPackageKitDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <developerName>SalesforceCRM</developerName>
  <isDeployed>>false</isDeployed>
  <isEnabled>>false</isEnabled>
  <masterLabel>SalesforceCRM</masterLabel>
  <versionNumber>1.0</versionNumber>
</DataPackageKitDefinition>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>SalesforceDataKit</fullName>
  <types>
    <members>SalesforceCRM</members>
    <name>DataPackageKitDefinition</name>
  </types>
  <types>
    <members>Admin</members>
    <name>Profile</name>
  </types>
  <version>53.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DataPackageKitObject

Represents the object in Data Kit Content Object. These objects are added inside the data kit.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this metadata type's name.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`DataPackageKitObject` components have the suffix `.DataPackageKitObject` and are stored in the `DataPackageKitObjects` folder.

## Version

`DataPackageKitDefinition` components are available in API version 53.0 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Label that identifies the AI application throughout the Salesforce user interface.</p>
<code>parentDataPackageKitDefinitionName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the data kit definition</p>
<code>referenceObjectName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the data kit content.</p>
<code>referenceObjectType</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The type of the content object in the data kit.</p>

## Declarative Metadata Sample Definition

The following is an example of a `DataPackageKitDefinition` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DataPackageKitObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>CRM</masterLabel>
  <parentDataPackageKitDefinitionName>CRM</parentDataPackageKitDefinitionName>
  <referenceObjectName>CRM</referenceObjectName>
  <referenceObjectType>DLO</referenceObjectType>
</DataPackageKitObject>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>SalesforceDataKit</fullName>
  <types>
    <members>CRM</members>
    <name>DataPackageKitObject</name>
  </types>
  <types>
    <members>Admin</members>
    <name>Profile</name>
  </types>
  <version>53.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DataSource

Used to represent the system where the data was sourced. This object is always needed when creating a Data Stream Definition.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

`DataSource` components have the suffix `dataSource` and are stored in the `mktDataSources` folder.

## Version

`DataSource` components are available in API version 50.0 and later.

## Special Access Rules

You need the `Salesforce CustomizeApplication` permission to access this object.

## Fields

Field Name	Field Type	Description
<code>masterLabel</code>	string	Required. The UI name for the Data Source.
<code>prefix</code>	string	Required. Prefix for the Data Source to make Data Source Object records unique.

## DataSourceBundleDefinition

Represents the bundle of streams that a user adds to a data kit.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`DataSourceBundleDefinition` components have the suffix `.dataSourceBundleDefinition` and are stored in the `dataSourceBundleDefinitions` folder.

## Version

`DataSourceBundleDefinition` components are available in API version 52.0 and later.

## Special Access Rules

You need Data Cloud permission to access this object.

## Fields

Field Name	Description
<code>dataPlatform</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Indicates the connector type that the streams in the bundle belong to.</p>
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> A description of the associated data source bundle. This field is available in API version 53.0 and later.</p>

Field Name	Description
icon	<p><b>Field Type</b> string</p> <p><b>Description</b> The icon used in the deployment flow. This field is available in API version 53.0 and later.</p>
isMultiDeploymentSupported	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates if the bundle can be deployed multiple times or not. Default value is <code>false</code>.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Indicates the name of the bundle.</p>

## Declarative Metadata Sample Definition

The following is an example of a `DataSourceBundleDefinition` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DataSourceBundleDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <dataPlatform>Salesforce_Sales_and_Service_Cloud</dataPlatform>
  <isMultiDeploymentSupported>true</isMultiDeploymentSupported>
  <masterLabel>b2</masterLabel>
</DataSourceBundleDefinition>
```

The following is an example `package.xml` that references the previous definition.

```
<types>
  <members>b2</members>
  <name>DataSourceBundleDefinition</name>
</types>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DataSourceField

Represents the details of a data source field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`DataSourceField` components have the suffix `.dataSourceField` and are stored in the `dataSourceFields` folder.

## Version

`DataSourceField` components are available in API version 52.0 and later.

## Special Access Rules

You need the Salesforce Customize Application permission to access this metadata type.

## Fields

Field Name	Field Type	Description
<code>datatype</code>	string	Required. Indicates the data type of the field: text, number, or date.
<code>dateFormat</code>	string	The date format of date, time, date/time fields.
<code>externalName</code>	string	Required. Name of the object in the external system. This is different from the developer name.
<code>fieldFormula</code>	string	Used for formulas.
<code>isDataRequired</code>	boolean	If <code>true</code> , data is required. Default value is <code>false</code> .
<code>isFormula</code>	boolean	If <code>true</code> , a formula is required. Default value is <code>false</code> .
<code>keyQualifier</code>	string	Contains the developer name if <code>usageTag</code> is <code>KEY_QUALIFIER</code> . Available in API version 55.0 and later.
<code>length</code>	int	Length of a string column.
<code>masterLabel</code>	string	Required. Field label.
<code>precision</code>	int	The total number of digits in a number including decimal points. Used for currency and for numeric accuracy.
<code>primaryIndexOrder</code>	int	If supplied, indicates that this field is part of the primary key. The number value indicates the order of attributes if it's a compound primary key. A missing value means that this field isn't part of the primary key.
<code>scale</code>	int	The number of digits to the right of the decimal point. Used for currency and for numeric accuracy.
<code>sequence</code>	int	Required. The sequence of this source schema.

Field Name	Field Type	Description
srcKeyQualifier	string	Contains a reference to the source key qualifier record. The source key is the MktDataLakeSrcKeyQualifier metadata type. Available in API version 55.0 and later.
usageTag	usageTag (enumeration of type string)	Indicates if the field is a key qualifier field. Available in API version 55.0 and later. Values are: <ul style="list-style-type: none"> <li>KEY_QUALIFIER—The field is used as a key qualifier field.</li> <li>NONE—The field isn't used as a key qualifier field.</li> </ul>
versionNumber	double	Required. The version of the data source object.

## Declarative Metadata Sample Definition

The following is an example of a DataSourceObject component and its fields.

```
<DataSourceObject xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <dataSource>test1108</dataSource>
  <dataSourceFields>
    <fullName>DOB</fullName>
    <datatype>D</datatype>
    <externalName>DOB</externalName>
    <isDataRequired>>false</isDataRequired>
    <masterLabel>DOB</masterLabel>
    <sequence xsi:nil="true"/>
    <versionNumber xsi:nil="true"/>
  </dataSourceFields>
  <externalRecordIdentifier>individuals_20200125_000000_csv</externalRecordIdentifier>
  <masterLabel>test1108</masterLabel>
  <objectType>Object</objectType>
</DataSourceObject>
```

The following is an example package.xml that references the previous definition.

```
<types>
  <members>test1108</members>
  <name>DataSource</name>
</types>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DataSourceObject

Represents the object from where the data was sourced.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

DataSourceObject components have the suffix `dataSourceObject` and are stored in the `mktDataSourceObjects` folder.

## Version

DataSourceObject components are available in API version 50.0 and later.

## Special Access Rules

You need the Salesforce Customize Application permission to access this metadata type.

## Fields

Field Name	Field Type	Description
<code>additionalDLOInfoJson</code>	string	Additional information about the Directory Table data lake object (DLO), such as the directory path and file pattern.
<code>creationType</code>	string	Indicates whether this object was added by the user or as part of a standard taxonomy.
<code>dataConnection</code>	string	The source data connector for the Directory Table DLO.
<code>dataSource</code>	string	Required. The system where the data was sourced.
<code>dataSourceFields</code>	<a href="#">DataSourceField[]</a> on page 180	An array of data source fields.
<code>dmoDeveloperName</code>	string	The developer name of the Directory Table data model object (DMO).
<code>dmoLabel</code>	string	The UI name of the Directory Table DMO.
<code>externalRecordIdentifier</code>	string	The identifier for the data source.
<code>masterLabel</code>	string	Required. The UI name for the data source object.
<code>objectCategory</code>	string	The category of the data source object.
<code>objectType</code>	string	The object type.
<code>sourceObject</code>	string	The developer name of the source object for the data source object.
<code>templateVersion</code>	int	The version number of the data source object.

## DataSourceTenant

For internal use only.

## DataSrcDataModelFieldMap

Represents the entity that is used for storing the design time bundle level mappings for the data source fields and data model fields.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`DataSrcDataModelFieldMap` components have the suffix `.dataSrcDataModelFieldMap` and are stored in the `dataSrcDataModelFieldMaps` folder.

## Version

`DataSrcDataModelFieldMap` components are available in API version 53.0 and later.

## Special Access Rules

You need Data Cloud permission to access this object.

## Fields

Field Name	Description
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Indicates the name of the entity.</p>
<code>sourceField</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Indicates the developer name of data source fields.</p>
<code>targetField</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Indicates the developer name of data mapping object fields.</p>

Field Name	Description
versionNumber	<p><b>Field Type</b> double</p> <p><b>Description</b> Required. Indicates the version number of the entity.</p>

## Declarative Metadata Sample Definition

The following is an example of a DataSrcDataModelFieldMap component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DataSrcDataModelFieldMap xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>DataSrcDataModel26</masterLabel>
  <sourceField>Account1.LastModifiedDate__c</sourceField>
  <targetField>ssot__Account__dml.ssot__LastModifiedDate__c</targetField>
  <versionNumber>1.0</versionNumber>
</DataSrcDataModelFieldMap>
```

The following is an example package.xml that references the previous definition.

```
<types>
  <members>DataSrcDataModel26</members>
  <name>DataSrcDataModelFieldMap</name>
</types>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DataStreamDefinition

Contains data ingestion information such as connection, API, and file retrieval settings.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

DataStreamDefinition components have the suffix `dataStreamDefinition` and are stored in the `dataStreamDefinitions` folder.

## Version

DataStreamDefinition components are available in API version 50.0 and later.

## Special Access Rules

You need the Salesforce CustomizeApplication permission to access this object.

## Fields

Field Name	Field Type	Description
areHeadersIncludedInFile	boolean	If true, headers are included in the file if this is a single file stream.
bulkIngest	boolean	If true, files are aggregated before data is ingested if the file names contain a wildcard. For example, <code>profiles*.csv</code> .
definitionCreationType	string	Required. Enum tracks the source of an object or field creation. Valid values are: <ul style="list-style-type: none"> <li>• Custom</li> <li>• Standard</li> </ul>
dataConnector	string	Required. Describe whether this data stream definition was created by a customer or by an internal system.
dataConnectorType	DataConnectorType (enumeration of type string)	The ingestion data source. Valid values are: <ul style="list-style-type: none"> <li>• ACCOUNTENGAGEMENT</li> <li>• AmazonS3</li> <li>• AzureBlob</li> <li>• BIG_QUERY</li> <li>• CuratedEntity</li> <li>• DataCloud</li> <li>• ExternalPlatform</li> <li>• GoogleCloudStorage</li> <li>• IngestApi</li> <li>• REDSHIFT</li> <li>• SalesforceCommerceCloud</li> <li>• SalesforceDotCom</li> <li>• SalesforceInteractionStudio</li> <li>• SalesforceMarketingCloud</li> <li>• SFTP</li> <li>• Snowflake</li> <li>• StreamingApp</li> <li>• UPLOAD</li> </ul>
dataExtensionIdentifier	string	For a Marketing Cloud data extension, the unique identifier.
dataExtractField	string	Name of the transport field that's used when the extract method is CDC.

Field Name	Field Type	Description
<code>dataExtractMethods</code>	<code>DataExtractMethods</code> (enumeration of type string)	Describes how to identify the data to be extracted. Valid values include: <ul style="list-style-type: none"> <li>• <code>DATETIME_CDC</code></li> <li>• <code>FULL_REFRESH</code></li> <li>• <code>NUMERIC_CDC</code></li> </ul>
<code>dataPlatDataSetBundle</code>	string	Identifies which data set bundle this definition was created from. Useful in cases where the same item can be configured across data connections.
<code>dataPlatformDataSet</code>	string	The description is provided by the developer.
<code>dataPlatformDataSetItemName</code>	string	Name of the Data Platform Set Item.
<code>dataSource</code>	string	Required. Reference to the data source from which the data originated, such as the name of a CRM Org. Example: MC Enterprise.
<code>description</code>	string	Required. A description of the data stream definition.
<code>fileNameWildcard</code>	string	File or wildcard (*) used when finding files.
<code>internalOrganization</code>	string	The name of the internal organization.
<code>isLimitedToNewFiles</code>	boolean	If true, file retrieval is limited to new files.
<code>isMissingFileFailure</code>	boolean	If true, treat the case of missing files as a failure.
<code>masterLabel</code>	string	Required. UI label for this data stream definition.
<code>mktDataLakeObject</code>	string	Required. Reference to the landing entity (target) where data will be stored.
<code>mktDataTranObject</code>	string	Reference to the object that's used to transport information from the source to a landing entity (target).

## DataStreamTemplate

Represents the datastream that a user adds to a datakit.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`DataStreamTemplate` components have the suffix `.dataStreamTemplate` and are stored in the `dataStreamTemplates` folder.

## Version

DataStreamTemplate components are available in API version 53.0 and later.

## Special Access Rules

You need the Salesforce Customize Application permission to access this metadata type.

## Fields

Field Name	Description
<code>dataSourceBundleDefinition</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Reference to the bundle to which this template belongs.</p>
<code>dataSourceObject</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Reference to the Data Source Objects (DSOs). A DSO represents the object from where the data was sourced</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name assigned to the datastream template.</p>
<code>objectCategory</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Category of the Data Model Object (DMO).</p>
<code>refreshFrequency</code>	<p><b>Field Type</b> DataImportRefreshFrequency (enumeration of type string)</p> <p><b>Description</b> The frequency with which the datastream must be refreshed. Possible values are:</p> <ul style="list-style-type: none"> <li>• NONE</li> <li>• MINUTES_15</li> <li>• HOURLY</li> <li>• DAILY</li> <li>• WEEKLY</li> <li>• MONTHLY</li> </ul>

Field Name	Description
refreshHours	<p><b>Field Type</b> string</p> <p><b>Description</b> The duration after which the datastream must be refreshed.</p>
refreshMode	<p><b>Field Type</b> DataImportRefreshMode (enumeration of type string)</p> <p><b>Description</b> The mode of refresh. Possible values are:</p> <ul style="list-style-type: none"> <li>• FULL_REFRESH</li> <li>• UPSERT</li> <li>• INCREMENTAL</li> <li>• REPLACE</li> <li>• NEAR_REAL_TIME_INCREMENTAL</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a `DataStreamTemplate` component.

```
<DataStreamTemplate xmlns="http://soap.sforce.com/2006/04/metadata">
  <dataSourceBundleDefinition>b2</dataSourceBundleDefinition>
  <dataSourceObject>sd3ds</dataSourceObject>
  <masterLabel>b2</masterLabel>
  <objectCategory>Profile</objectCategory>
</DataStreamTemplate>
```

The following is an example `package.xml` that references the previous definition.

```
<types>
  <members>ssd3s</members>
  <name>DataStreamTemplate</name>
</types>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ExternalDataConnector

Used to represent the object where the data was sourced.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

ExternalDataConnector components have the suffix externalDataConnector and are stored in the externalDataConnectors folder.

## Version

ExternalDataConnector components are available in API version 50.0 and later.

## Special Access Rules

You need the Salesforce CustomizeApplication permission to access this object.

## Fields

Field Name	Field Type	Description
dataConnectionStatus	DataConnectionStatus (enumeration of type string)	Indicates whether you're connected to a data source. Valid values are: <ul style="list-style-type: none"> <li>• Connected</li> <li>• Disconnected</li> <li>• Failed</li> </ul>
dataConnectorConfiguration	string	Reference to the Data Connector Configuration that is used to retrieve or receive data such as DataConnectorS3.
dataConnectorType	DataConnectorType (enumeration of type string)	Type of connection such as AmazonS3. Valid values are: <ul style="list-style-type: none"> <li>• ACCOUNTENGAGEMENT</li> <li>• AmazonS3</li> <li>• CuratedEntity</li> <li>• DataCloud</li> <li>• ExternalPlatform</li> <li>• GoogleCloudStorage</li> <li>• IngestApi</li> <li>• SalesforceCommerceCloud</li> <li>• SalesforceDotCom</li> <li>• SalesforceInteractionStudio</li> <li>• SalesforceMarketingCloud</li> <li>• SFTP</li> <li>• StreamingApp</li> <li>• UPLOAD</li> </ul>
dataPlatform	string	Reference to the Data Platform that provides or uses this data, such as Amazon_S3.
masterLabel	string	Required. The UI name for the ExternalDataConnector.

## Declarative Metadata Sample Definition

The following is an example of a ExternalDataConnector component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExternalDataConnector xmlns="http://soap.sforce.com/2006/04/metadata">
<dataConnectionStatus>Connected</dataConnectionStatus>
<dataConnectorConfiguration>Person</dataConnectorConfiguration>
<dataConnectorType>AmazonS3</dataConnectorType>
<dataPlatform>Amazon_S3</dataPlatform>
<masterLabel>AmazonS3</masterLabel>
</ExternalDataConnector>
```

## ExternalDataSource

Represents the metadata associated with an external data source. Create external data sources to manage connection details for integration with data and content that are stored outside your Salesforce org.

 **Note:** All credentials stored within this entity are encrypted under a framework that is consistent with other encryption frameworks on the platform. Salesforce encrypts your credentials by auto-creating org-specific keys. Credentials encrypted using the previous encryption scheme have been migrated to the new framework.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

ExternalDataSource components are stored in the `dataSources` directory of the corresponding package directory. ExternalDataSource components have the suffix `.dataSource`, and the prefix is the name of the external data source.

## Version

ExternalDataSource components are available in API version 28.0 and later.

## Special Access Rules

As of Spring '20 and later, only authenticated internal and external users can access this type.

## Fields

Field Name	Field Type	Description
<code>authProvider</code>	string	The authentication provider represented by the AuthProvider component.
<code>certificate</code>	string	If you specify a certificate, your Salesforce org supplies it when establishing each two-way SSL connection with the external system. The certificate is used for digital signatures, which verify that requests are coming from your Salesforce org.

Field Name	Field Type	Description
		 <b>Tip:</b> For best performance, verify that your remote HTTPS encrypted sites have OSCP (Online Certificate Status Protocol) stapling turned on.
customConfiguration	string	<p>A string of configuration parameters that are specific to the external data source's <code>type</code>.</p> <ul style="list-style-type: none"> <li>• <a href="#">customConfiguration for Salesforce Connect—Cross-Org Adapter</a></li> <li>• <a href="#">customConfiguration for Salesforce Connect—OData 2.0 or 4.0 Adapter</a></li> <li>• <a href="#">customConfiguration for Salesforce Connect—Custom Adapter</a></li> </ul>
customHttpHeaders	<a href="#">CustomHttpHeaders[]</a>	Represents custom HTTP headers used with OData 2.0 or OData 4.0 connectors. Available in API version 43.0 or later.
endpoint	string	<p>The URL of the external system, or if that URL is defined in a named credential, the named credential URL. Corresponds to <code>URL</code> in the user interface.</p> <p>A named credential URL contains the scheme <code>callout:</code>, the name of the named credential, and an optional path. For example: <code>callout:My_Named_Credential/some_path</code>.</p> <p>You can append a query string to a named credential URL. Use a question mark (?) as the separator between the named credential URL and the query string. For example: <code>callout:My_Named_Credential/some_path?format=json</code>.</p>
externalDataSrcDescriptors	<a href="#">ExternalDataSrcDescriptors[]</a>	Represents schema descriptors for an external data source used with Salesforce Connect adapter for Amazon DynamoDB (available in API version 55.0 or later) or Amazon Athena (available in API version 56.0 or later).
isWritable	boolean	<p>Lets the Lightning Platform and users in this org create, update, and delete records for external objects associated with the external data source. The external object data is stored outside the org. By default, external objects are read only. Corresponds to <code>Writable External Objects</code> in the user interface.</p> <p>Available in API version 35.0 and later. However, with the cross-org adapter for Salesforce Connect, you can set this field to <code>true</code> only in API version 39.0 and later.</p>
label	string	<p>A user-friendly name for the external data source. The label is displayed in the Salesforce user interface, such as in list views.</p> <p>Examples include Acme Team Marketing Site, or Acme SharePoint.</p>

Field Name	Field Type	Description
namedCredential	string	Represents the definition of the referenced named credential for an external data source of the type Amazon DynamoDB or Amazon Athena.
oauthRefreshToken	string	The OAuth refresh token. Used to obtain a new access token for an end user when a token expires.
oauthScope	string	Specifies the scope of permissions to request for the access token. Corresponds to <code>Scope</code> in the user interface.
oauthToken	string	The access token issued by the external system.
password	string	The password to be used by your org to access the external system. Ensure that the credentials you use have adequate privileges to access the external system, perform searches, return data, and return information about the external system's metadata.
principalType	ExternalPrincipalType (enumeration of type string)	Determines whether you're using one set or multiple sets of credentials to access the external system. Corresponds to <code>Identity Type</code> in the user interface. The valid values are: <ul style="list-style-type: none"> <li>Anonymous</li> <li>PerUser</li> <li>NamedUser</li> </ul>
protocol	Authentication Protocol (enumeration of type string)	The authentication protocol that's required to access the external system. The valid values are: <ul style="list-style-type: none"> <li>NoAuthentication</li> <li>Oauth</li> <li>Password</li> </ul> For cloud-based Files Connect external systems, select <b>Oauth 2.0</b> . For on-premises systems, select <b>Password Authentication</b> . For Simple URL data sources, select <b>No Authentication</b> .
repository	string	Used for SharePoint Online. If metadata is not accessible, use this field to create tables and default table fields.
type	ExternalDataSourceType (enumeration of type string)	Required. For Salesforce Connect, specifies the adapter that connects to the external system. The valid values are: <ul style="list-style-type: none"> <li>AmazonAthena—Amazon Athena</li> <li>AmazonDynamoDB—Amazon DynamoDB</li> <li>OData—OData 2.0 adapter</li> <li>OData4—OData 4.0 adapter</li> <li>SfdcOrg—cross-org adapter</li> <li>ApexClassId—DataSource.Provider class that defines the custom adapter created via the Apex Connector Framework</li> </ul>

Field Name	Field Type	Description
		<p>For Files Connect, specifies the data source type. The valid values are:</p> <ul style="list-style-type: none"> <li>• <code>ContentHubSharepoint</code>—SharePoint 2010 or 2013</li> <li>• <code>ContentHubSharepointOffice365</code>—SharePoint Online</li> <li>• <code>ContentHubSharepointOneDrive</code>—OneDrive for Business</li> <li>• <code>ContentHubGDrive</code>—Google Drive</li> <li>• <code>ContentHubIsotope</code>—Isotope</li> </ul> <p>If Chatter is enabled, you can also specify <code>SimpleURL</code> to access data hosted on a web server that doesn't require authentication.</p> <ul style="list-style-type: none"> <li>• <code>outgoingemail</code>—A data source used for sending an email through a quick action.</li> </ul> <p>The <code>Identity</code> and <code>Wrapper</code> types are reserved for future use.</p> <p>For the federated search external data source type, the valid value is <code>OpenSearch</code>.</p>
<code>username</code>	string	The username to be used by your org to access the external system. Ensure that the credentials you use have adequate privileges to access the external system, perform searches, return data, and return information about the external system's metadata.
<code>version</code>	string	Reserved for future use.

## CustomHttpHeaders

Represents a custom HTTP header used with OData 2.0 or OData 4.0 connectors. Available in API version 43.0 or later.

Field Name	Field Type	Description
<code>description</code>	string	A text description of the header field's purpose.
<code>headerFieldName</code>	string	Required. Name of the header field. The name must contain at least one alphanumeric character or underscore. It can also include: <code>! # \$ % &amp; ' * + - . ^ _ `   ~</code>
<code>headerFieldValue</code>	string	Required. A formula that resolves to the value for the header. The values in the formula must evaluate to a string. If the formula resolves to null and an empty string, the header isn't sent.
<code>isActive</code>	boolean	Indicates whether the custom HTTP header is available to use ( <code>true</code> ) or unavailable ( <code>false</code> ).

## customConfiguration for Salesforce Connect—Cross-Org Adapter

The following sample JSON-encoded configuration string defines parameters that apply when the external data source's `type` is set to `SfdcOrg`.

```
{ "apiVersion": "32.0", "environment": "CUSTOM",
  "searchEnabled": "true", "timeout": "120" }
```

The parameters correspond to these fields in the user interface:

- `apiVersion`—API Version
- `environment`—Connect to
- `searchEnabled`—Enable Search
- `timeout`—Connection Timeout

## customConfiguration for Salesforce Connect—OData 2.0 or 4.0 Adapter

The following JSON-encoded configuration string defines parameters that apply when the external data source's `type` is set to `OData` or `OData4`.

```
{ "inlineCountEnabled": "true", "csrfTokenName": "X-CSRF-Token",
  "requestCompression": "false", "pagination": "CLIENT",
  "noIdMapping": "false", "format": "ATOM",
  "searchFunc": "", "compatibility": "DEFAULT",
  "csrfTokenEnabled": "true", "timeout": "120",
  "searchEnabled": "true" }
```

The parameters correspond to these fields in the user interface.

- `compatibility`—Special Compatibility
- `csrfTokenEnabled`—CSRF Protection
- `csrfTokenName`—Anti-CSRF Token Name
- `format`—Format
- `inlineCountEnabled`—Request Row Counts
- `noIdMapping`—High Data Volume
- `pagination`—Server Driven Pagination
- `requestCompression`—Compress Requests
- `searchEnabled`—Enable Search
- `searchFunc`—Custom Query Option for Salesforce Search
- `timeout`—Connection Timeout

### Declarative Metadata Sample Definition: OData 2.0 or 4.0

The following is the definition of an external data source for Salesforce Connect—OData 2.0 or 4.0 adapter.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExternalDataSource xmlns="http://soap.sforce.com/2006/04/metadata">
  <authProvider>FacebookAuth</authProvider>
  <customConfiguration>{"compatibility": "DEFAULT",
    "noIdMapping": "false", "inlineCountEnabled": "true",
    "searchEnabled": "true", "format": "ATOM",
    "requestCompression": "false", "pagination": "SERVER",
```

```

    "timeout": "120"}</customConfiguration>
  <customHttpHeaders>
    <headerFieldName>X-User</headerFieldName>
    <headerFieldValue>$User.Username</headerFieldValue>
  </customHttpHeaders>
  <endpoint>http://myappname.herokuapp.com/DataHub.svc</endpoint>
  <label>DataHub</label>
  <principalType>NamedUser</principalType>
  <protocol>Oauth</protocol>
  <type>OData</type>
</ExternalDataSource>

```

## customConfiguration for Salesforce Connect—Custom Adapter

The following sample JSON-encoded configuration string defines the parameter that applies when the external data source's `type` is set to the ID of a `DataSource.Provider` class.

```
{"noIdMapping": "false"}
```

The `noIdMapping` parameter corresponds to the `High Data Volume` field in the user interface.

## ExternalDataSourceDescriptors for Salesforce Connect Adapter for Amazon DynamoDB and for Amazon Athena

Represents schema descriptors for an external data source used with Salesforce Connect adapter for Amazon DynamoDB (available in API version 55.0 or later) or Amazon Athena (available in API version 56.0 or later).

Field Name	Field Type	Description
<code>customObject</code>	string	If set, the external object associated with the descriptor.
<code>descriptor</code>	string	Required. The descriptor document that contains the metadata information.
<code>descriptorVersion</code>	string	If the external system supports schema versioning for the data source, the optional descriptor document version tracks the external system's schema version. Several descriptors with different document versions may be active.
<code>developerName</code>	string	Required. The unique name of the child-level setup entity.
<code>externalDataSource</code>	string	Required. The name of the external data source associated with the descriptor.
<code>subtype</code>	ExternalDataSourceDescriptorSubtype (enumeration of type string)	Required. The subtype of the descriptor. Values are: <ul style="list-style-type: none"> <li><code>SchemaTableMetadata</code>— Used to cache information about the external system.</li> <li><code>SchemaTableQualifiers</code>— Used to customize the data retrieval query to the external system.</li> </ul>

Field Name	Field Type	Description
systemVersion	int	Required. The version that defines the descriptor format and allows compatibility with descriptor formats between Salesforce releases.
type	ExternalDataSrcDescType (enumeration of type string)	Required. The type of the descriptor.  Valid value: <ul style="list-style-type: none"> <li>• Schema</li> </ul>

### Declarative Metadata Sample Definition: Amazon DynamoDB

The following is an example of an external data source for the Salesforce Connect adapter for Amazon DynamoDB that uses ExternalDataSrcDescriptor component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExternalDataSource xmlns="http://soap.sforce.com/2006/04/metadata">
  <customConfiguration>{"timeout": "120"}</customConfiguration>
  <externalDataSrcDescriptors>
    <fullName>MyQualifierName</fullName>
    <customObject>MyExternalObject__x</customObject>
    <descriptor>
      {
        "tableName": "MyDynamoDBTable",
        "columns": {
          "MyField": {"presence": "exists"}
        }
      }
    </descriptor>
    <developerName>MyQualifierName</developerName>
    <externalDataSource>MyDataSource</externalDataSource>
    <subtype>SchemaTableQualifiers</subtype>
    <systemVersion>0</systemVersion>
    <type>Schema</type>
  </externalDataSrcDescriptors>
  <isWritable>true</isWritable>
  <label>MyDataSource</label>
  <namedCredential>MyNamedCredential</namedCredential>
  <principalType>Anonymous</principalType>
  <protocol>NoAuthentication</protocol>
  <type>AmazonDynamoDb</type>
</ExternalDataSource>
```

### Declarative Metadata Sample Definition: Amazon Athena

The following is an example of an external data source for the Salesforce Connect adapter for Amazon Athena that uses ExternalDataSrcDescriptor component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExternalDataSource xmlns="http://soap.sforce.com/2006/04/metadata">
  <customConfiguration>
    {
      "DataCatalog": "AwsDataCatalog",
      "timeout": "120"
    }
  </customConfiguration>
</ExternalDataSource>
```

```

}
</customConfiguration>
<externalDataSrcDescriptors>
  <fullName>MyAthenaQualifierName</fullName>
  <customObject>MyAthenaExternalObject__x</customObject>
  <descriptor>
    {
      "tableName": "myathenadatabase.myathenatable",
      "extendedQualifiers": {"workgroup": "primary"},
      "keyColumns": ["ExternalIdComponent", "OtherExternalIdComponent"]
    }
  </descriptor>
  <developerName>MyAthenaQualifierName</developerName>
  <externalDataSource>MyAthenaDataSource</externalDataSource>
  <subtype>SchemaTableQualifiers</subtype>
  <systemVersion>0</systemVersion>
  <type>Schema</type>
</externalDataSrcDescriptors>
<isWritable>>false</isWritable>
<label>MyAthenaDataSource</label>
<namedCredential>MyAthenaNamedCredential</namedCredential>
<principalType>Anonymous</principalType>
<protocol>NoAuthentication</protocol>
<type>AmazonAthena</type>
</ExternalDataSource>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ExternalDataTranObject

Represents a definition of a Data Cloud schema object. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

`ExternalDataTranObject` components have the suffix `.externalDataTranObject` and are stored in the `externalDataTranObjects` folder.

## Version

`ExternalDataTranObject` components are available in API version 55.0 and later.

## Special Access Rules

`ExternalDataTranObject` is available only if Data Cloud is provisioned.

## Fields

Field Name	Description
availabilityStatus	<p><b>Field Type</b> AvailabilityStatus (enumeration of type string)</p> <p><b>Description</b> Required. Represents the availability of the object. Valid values are:</p> <ul style="list-style-type: none"> <li>• Available</li> <li>• In_Use</li> </ul>
creationType	<p><b>Field Type</b> DefinitionCreationType (enumeration of type string)</p> <p><b>Description</b> Required. Describes whether this object was added by the Customer or as part of a Standard Taxonomy or by the System. Valid values are:</p> <ul style="list-style-type: none"> <li>• Segment_Membership</li> <li>• Custom</li> <li>• Standard</li> <li>• System</li> <li>• Derived</li> <li>• Bridge</li> <li>• Curated</li> </ul>
extDataTranObjectTemplate	<p><b>Field Type</b> string</p> <p><b>Description</b> Reserved for internal use and read-only. Reference to the associated ExtDataTranObjectTemplate data kit object. The system populates this field when a data kit that contains a data stream is deployed.</p>
externalDataTranFields	<p><b>Field Type</b> <a href="#">ExternalDataTranField</a></p> <p><b>Description</b> Optional. Stores the fields related to that schema object.</p>
masterLabel	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>The UI name for the object.</p>
mktDataTranObject	<p><b>Field Type</b></p> <p><a href="#">MktDataTranObject</a></p> <p><b>Description</b></p> <p>Optional.</p> <p>An entity that is used to transport information from the source to a target.</p>
objectCategory	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Reference to the Object Category. For Transport, they're Profile, Engagement, or Other.</p>

## ExternalDataTranField

Stores the fields related to ExternalDataTranObject schema.

Field Name	Description
creationType	<p><b>Field Type</b></p> <p>DefinitionCreationType (enumeration of type string).</p> <p><b>Description</b></p> <p>Required.</p> <p>Describes whether this object was added by the Customer or as part of a Standard Taxonomy or by the System. Valid values are:</p> <ul style="list-style-type: none"> <li>• Segment_Membership</li> <li>• Custom</li> <li>• Standard</li> <li>• System</li> <li>• Derived</li> <li>• Bridge</li> <li>• Curated</li> </ul>
datatype	<p><b>Field Type</b></p> <p>string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>Phone, currency, number, or other assigned type.</p>
dateFormat	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Optional.</p> <p>The Date format of date, time, date/time fields in this Transport field.</p>
extDataTranFieldTemplate	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Reserved for internal use and read-only. Reference to the associated ExtDataTranFieldTemplate data kit object. The system populates this field when a data kit that contains a data stream is deployed.</p>
externalName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Optional.</p> <p>Name of the object in the external system (different from Developer Name).</p>
isDataRequired	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Optional.</p> <p>If true, data is required for this field.</p>
length	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Optional.</p> <p>Length of a string column.</p>
masterLabel	Optional. Field label.
mktDataTranField	<p><b>Field Type</b></p> <p><a href="#">mktDataTranFieldType</a> on page 202</p>

Field Name	Description
	<p><b>Description</b></p> <p>Optional.</p>
precision	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Optional.</p> <p>Used for currency and numeric accuracy.</p>
primaryIndexOrder	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Optional.</p> <p>If supplied, indicates this field is part of the primary key where the number value (starting at 1) indicates the order of attributes if it's a compound primary key. Missing value means this field isn't part of the primary key.</p>
scale	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Optional.</p> <p>Used for currency and numbers.</p>
sequence	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Optional.</p> <p>The sequence of this source schema.</p>

## MktDataTranField

Stores fields related to [MktDataTranObject](#).

Field Name	Description
creationType	<p><b>Field Type</b></p> <p>DefinitionCreationType (enumeration of type string).</p> <p><b>Description</b></p> <p>Required.</p>

Field Name	Description
	<p>Describes whether this object was added by the Customer or as part of a Standard Taxonomy or by the System. Valid values are:</p> <ul style="list-style-type: none"> <li>• Segment_Membership</li> <li>• Custom</li> <li>• Standard</li> <li>• System</li> <li>• Derived</li> <li>• Bridge</li> <li>• Curated</li> </ul>
datatype	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Phone, currency, number, or other assigned type.</p>
dateFormat	<p><b>Field Type</b> string</p> <p><b>Description</b> Optional. The Date format of date, time, date/time fields in this Transport field.</p>
externalName	<p><b>Field Type</b> string</p> <p><b>Description</b> Optional. Name of the object in the external system (different from Developer Name).</p>
isDataRequired	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Optional. If true, data is required for this field.</p>
length	<p><b>Field Type</b> int</p> <p><b>Description</b> Optional. Length of a string column.</p>

Field Name	Description
masterLabel	Optional. Field label.
precision	<p><b>Field Type</b> int</p> <p><b>Description</b> Optional. Used for currency and numeric accuracy.</p>
primaryIndexOrder	<p><b>Field Type</b> int</p> <p><b>Description</b> Optional. If supplied, indicates this field is part of the primary key where the number value (starting at 1) indicates the order of attributes if it's a compound primary key. Missing value means this field isn't part of the primary key.</p>
scale	<p><b>Field Type</b> int</p> <p><b>Description</b> Optional. Used for currency and numbers.</p>
sequence	<p><b>Field Type</b> int</p> <p><b>Description</b> Optional. The sequence of this source schema.</p>

## Declarative Metadata Sample Definition

The following is an example of a ExternalDataTranObject component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExternalDataTranObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <CreationType>Custom</CreationType>
  <DataConnectorId>1WMxx00000000mPGAQ</DataConnectorId>
  <DeveloperName>Third_Identity_Create</DeveloperName>
  <Language>en_US</Language>
  <MasterLabel>Identity Create</MasterLabel>
  <ObjectCategoryId>0hqxx000000009hAAA</ObjectCategoryId>
  <Status>Available</Status>
</ExternalDataTranObject>
```

The following is an example `package.xml` that references the previous definition.

```
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ExternalDataTranObject</name>
  </types>
  <version>55.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## FieldSrcTrgtRelationship

Stores the relationships between a data model object (DMO) and its fields. For example, the `Individual.Id` field has a one-to-many relationship (1:M) with the `ContactPointEmail.PartyId` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`FieldSrcTrgtRelationship` components have the suffix `.fieldSrcTrgtRelationship` and are stored in the `fieldSrcTrgtRelationships` folder.

## Version

`FieldSrcTrgtRelationship` components are available in API version 51.0 and later.

## Special Access Rules

To access this metadata type, you must have the `Customize Application` user permission.

## Fields

Field Name	Field Type	Description
<code>definitionCreationType</code>	<code>DefinitionCreationType</code> (enumeration of type string)	Required. Describes whether this object was added by the user or as part of a standard taxonomy. Values are:

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• ADG</li> <li>• Activation_Audience</li> <li>• Bridge</li> <li>• Calculated_Insight</li> <li>• Chunk</li> <li>• Curated</li> <li>• Custom</li> <li>• Derived</li> <li>• Directory_Table</li> <li>• External</li> <li>• Ml_Prediction</li> <li>• Segment_Membership</li> <li>• Semantic</li> <li>• Standard</li> <li>• System</li> <li>• Transform</li> <li>• Vector_Embedding</li> </ul>
lookupFieldName	string	Reference to the DMO lookup field.
masterLabel	string	Required. The UI name for the field relationship.
relationshipCardinality	RelationshipCardinality (enumeration of type string)	<p>Required. Cardinality of the relationship between the source and target fields.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• ManyToOne</li> <li>• OneToOne</li> </ul>
sourceFieldName	string	Required. Name of the field that represents the source side of the relationship.
targetFieldName	string	Required. Name of the field that represents the target side of the relationship.

## InternalDataConnector

For internal use only.

## MarketSegmentDefinition

Represents the field values for MarketSegmentDefinition. MarketSegmentDefinition is used to store the exportable metadata of a segment, such as segment criteria and other attributes. Developers can create segment definition packages, pass segment definition in the form of data build tool (DBT), and publish it on AppExchange for subscriber organizations to install and instantiate these segments.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) type and inherits its `fullName` field.

## File Suffix and Directory Location

`MarketSegmentDefinition` components have the suffix `.marketSegmentDefinition` and are stored in the `marketSegmentDefinitions` folder.

## Version

`MarketSegmentDefinition` components are available in API version 55.0 and later.

## Fields

Field Name	Description
<code>additionalMetadata</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> An XML clob to hold name value pairs for storing additional metadata. Not applicable for DBT type segment.</p>
<code>excludeCriteria</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Holds the JSON exclude criteria for UI based segments. Not applicable for DBT or Lookalike segments.</p>
<code>includeCriteria</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> An XML wrapped in a CDATA section that captures DBT definition. Only single model DBT is supported.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Display name of the field value.</p>
<code>segmentOn</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required when <code>segmentType</code> is <code>UI</code>. Points to relevant <code>MktDataModelObject</code> entity instance. Must be a valid <code>developerName</code> for an <code>MktDataModelObject</code> instance of <code>Profile</code> type.</p>
<code>segmentType</code>	<p><b>Field Type</b></p> <p><code>MarketSegmentType</code> (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. Type of the segment to be created. Only <code>DBT</code> is supported via API.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• <code>DBT</code></li> <li>• <code>Lookalike</code></li> <li>• <code>UI</code></li> <li>• <code>EinsteinGPTSegmentsUI</code></li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a `MarketSegmentDefinition` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<MarketSegmentDefinition>
  <segmentType>DBT</segmentType>
  <includeCriteria>
    <![CDATA[
      <DbtPipeline>
        <models>
          <model>
            <name>m1</name>
            <sql>select sspot__Individual__dlm.sspot__Id__c from
sspot__Individual__dlm</sql>
          </model>
        </models>
      </DbtPipeline>
    ]]>
  </includeCriteria>
  <masterLabel>msd2_simple</masterLabel>
</MarketSegmentDefinition>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<ns2:Package xmlns:ns2="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>MarketSegmentDefinition</name>
```

```

</types>
<version>55.0</version>
</ns2:Package>

```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MktCalcInsightObjectDef

Represents Calculated Insight definition such as expression.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`MktCalcInsightObjectDef` components have the suffix `mktCalcInsightObjectDef` and are stored in the `mktCalcInsightObjectDefs` folder.

## Version

`MktCalcInsightObjectDef` components are available in API version 52.0 and later.

## Special Access Rules

You need the Salesforce `CustomizeApplication` permission to access this object.

## Fields

Field Name	Field Type	Description
<code>creationType</code>	Custom Type (enum of type string)	Required. Describes whether this Calculated Insight Object Definition was added was added by the customer. Valid values include: Custom.
<code>description</code>	string	The description for this Calculated Insight Object Definition.
<code>expression</code>	string	Required when the Calculated Insight Object Definition is for internal insight type. This is the SQL query to generate the calculated insight.
<code>masterLabel</code>	string	Required. App name for this Calculated Insight Object Definition.

## Declarative Metadata Sample Definition

The following is an example of a MktCalcInsightObjectDef component.

```
<?xml version="1.0" encoding="UTF-8"?>
<MktCalcInsightObjectDef xmlns="http://soap.sforce.com/2006/04/metadata">
  <creationType>Custom</creationType>
  <description>InsightName description</description>
  <expression>SELECT COUNT(ssot__Individual__dml.ssot__Id__c) as count__c FROM
ssot__Individual__dml</expression>
</MktCalcInsightObjectDef>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## MktDataTranObject

An entity that is used to deliver (aka transport) information from the source to a target (target will be called a landing entity). This can be the schema of a file, API, Event, or other means of transporting data, such as `SubscriberFile1.csv`, or `SubscriberCDCEvent`.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

MktDataTranObject components have the suffix `mktDataTranObject` and are stored in the `mktDataTranObjects` folder.

## Version

MktDataTranObject components are available in API version 50.0 and later.

## Special Access Rules

You need the Salesforce `CustomizeApplication` permission to access this object.

## Fields

Field Name	Field Type	Description
<code>creationType</code>	<code>DefinitionCreationType</code>	Optional. Describe whether this object was added as the result of the Customer or as part of a Standard Taxonomy.
<code>dataSource</code>	<code>string</code>	Optional. Your reference to the data source from which the data originated (source of that data such as the name of a CRM Org. Example: MC Enterprise).
<code>masterLabel</code>	<code>string</code>	Required. The UI name for the Data Transport Object.

Field Name	Field Type	Description
<code>objectCategory</code>	string	Required. Reference to the Object Category. For Transport, these are Profile, Engagement, or Other.

## MktDataTranField

This is a sub-type to MktDataTranObject.

Field Name	Field Type	Description
<code>creationType</code>	DefinitionCreationType	Optional: Was this object added as a result of the Customer, part of a Standard Taxonomy.
<code>datatype</code>	string	Required. Phone, currency, number, or other assigned type.
<code>dateFormat</code>	string	Optional: The Date format of date, time, date/time fields in this Transport field.
<code>externalName</code>	string	Optional. Name of the object in the external system (different from Developer Name).
<code>isDataRequired</code>	boolean	Optional. If true, data is required for this field.
<code>length</code>	int	Optional. Length of a string column
<code>masterLabel</code>	string	Optional? Field label.
<code>precision</code>	int	Optional. Used for currency and numeric accuracy.
<code>primaryIndexOrder</code>	int	Optional. If supplied, indicates this field is part of the primary key where the number value (starting at 1) indicates the order of attributes if this happens to be a compound primary key. Missing value means this field is not part of the primary key.
<code>scale</code>	int	Optional. Used for currency and numeric accuracy.
<code>sequence</code>	int	Optional. The sequence of this source schema.

## ObjectSourceTargetMap

Contains the object-level mappings between the source and the target objects. The source and target objects can be an MktDataLakeObject or an MktDataModelObject. For example, an Email source object can be mapped to the ContactPointEmail object.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

ObjectSourceTargetMap components have the suffix `.objectSourceTargetMap` and are stored in the `objectSourceTargetMaps` folder.

## Version

ObjectSourceTargetMap components are available in API version 51.0 and later.

## Special Access Rules

To access this metadata type, you must have the Customize Application user permission.

## Fields

Field Name	Field Type	Description
<code>creationType</code>	DefinitionCreationType (enumeration of type string)	Describes whether this object was added by the user or as part of a standard taxonomy. Values are: <ul style="list-style-type: none"> <li>• ADG</li> <li>• Activation_Audience</li> <li>• Bridge</li> <li>• Calculated_Insight</li> <li>• Chunk</li> <li>• Curated</li> <li>• Custom</li> <li>• Derived</li> <li>• Directory_Table</li> <li>• External</li> <li>• Ml_Prediction</li> <li>• Segment_Membership</li> <li>• Semantic</li> <li>• Standard</li> <li>• System</li> <li>• Transform</li> <li>• Vector_Embedding</li> </ul>
<code>fieldSourceTargetMaps</code>	FieldSourceTargetMap[]	Contains the field-level mappings associated with this object mapping.
<code>masterLabel</code>	string	Required. The UI name for the target map.
<code>sequenceNbr</code>	int	Use this field to display multiple mappings between the same two objects, for a consistent customer experience when presenting the mappings.

Field Name	Field Type	Description
sourceObjectName	string	Required. Name of the source object that's mapped, such as Email, or SfmEnt1_Subscriber.
targetObjectName	string	Required. Name of the target object that's mapped, such as ContactPointEmail or Individual.

## FieldSourceTargetMap

Contains the field-level mappings between the source and the target objects.

The source and target can be MktDataLakeField or MktDataModelField.

For example, you can map a Person source object's field called emailAddress to an Individual target object's field called emailAddress.

Field Name	Field Type	Description
creationType	DefinitionCreationType (enumeration of type string)	Describes whether this object was added by the user or as part of a standard taxonomy. Values are: <ul style="list-style-type: none"> <li>• ADG</li> <li>• Activation_Audience</li> <li>• Bridge</li> <li>• Calculated_Insight</li> <li>• Chunk</li> <li>• Curated</li> <li>• Custom</li> <li>• Derived</li> <li>• Directory_Table</li> <li>• External</li> <li>• Ml_Prediction</li> <li>• Segment_Membership</li> <li>• Semantic</li> <li>• Standard</li> <li>• System</li> <li>• Transform</li> <li>• Vector_Embedding</li> </ul>
filterApplied	boolean	Specifies whether the field-level mapping is an event type filter ( <code>true</code> ) or not ( <code>false</code> ).
filterOperationType	string	If the field-level mapping is an event type filter, specifies the filtering operator. Value is: <ul style="list-style-type: none"> <li>• Equal</li> </ul>

Field Name	Field Type	Description
<code>filterValue</code>	string	If the field-level mapping is an event type filter, specifies the object that contains the event type field.
<code>isSourceFormula</code>	boolean	Specifies whether the source field is a formula ( <code>true</code> ) or not ( <code>false</code> ). If <code>true</code> , you must include the <code>sourceFormula</code> value.
<code>sourceField</code>	string	Required. The source object field that's mapped, such as <code>EmailAddr</code> or <code>SfmcEnt1_Subscriber.FName</code> .
<code>sourceFormula</code>	string	A formula, such as concatenation, date function, or constant value.
<code>targetField</code>	string	Required. The target object field that's mapped, such as <code>SfmcEnt1_Email.EmailAddr</code> or <code>Individual.FirstName</code> .

## StreamingAppDataConnector

Represents the connection information specific to Web and Mobile Connectors.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`StreamingAppDataConnector` components have the suffix `.streamingAppDataConnector` and are stored in the `streamingAppDataConnectors` folder.

### Version

`StreamingAppDataConnector` components are available in API version 55.0 and later.

### Special Access Rules

There are no additional access requirements that are specific to this type.

### Fields

Field Name	Description
<code>appIdentifier</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p>

Field Name	Description
	The unique app identifier (UUID).
<code>dataConnectorType</code>	<p><b>Field Type</b> DataConnectorType (enumeration of type string)</p> <p><b>Description</b> Required. The value of the field is restricted to <code>StreamingApp</code>. Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>DataCloud</code></li> <li>• <code>StreamingApp</code></li> </ul>
<code>isProtected</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The display name of the connector.</p>
<code>streamingAppDataConnectorType</code>	<p><b>Field Type</b> StreamingAppDataConnectorType (enumeration of type string)</p> <p><b>Description</b> Required. The type of connector. Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>MobileApp</code></li> <li>• <code>WebApp</code></li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a `StreamingAppDataConnector` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<StreamingAppDataConnector xmlns="http://soap.sforce.com/2006/04/metadata">
  <appIdentifier>61826b62-6b90-49ff-8259</appIdentifier>
  <dataConnectorType>StreamingApp</dataConnectorType>
  <masterLabel>My Web Application</masterLabel>
</StreamingAppDataConnector>
```

```
<streamingAppDataConnectorType>WebApp</streamingAppDataConnectorType>
</StreamingAppDataConnector>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>MyPackage</fullName>
  <namespacePrefix>ns1</namespacePrefix>
  <types>
    <members>My_Web_Application_Behavioral_Events_F4DA8759</members>
    <name>DataStreamDefinition</name>
  </types>
  <types>
    <members>My_Web_Application_61826b62_6b90_49ff_8259</members>
    <name>ExternalDataConnector</name>
  </types>
  <types>
    <members>My_Web_Application_61826b62_6b90_49ff_8259</members>
    <name>StreamingAppDataConnector</name>
  </types>
  <version>55.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AccountRelationshipShareRule

The rule that determines which object records are shared, how they're shared, the account relationship type that shares the records, and the level of access granted to the records.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

This type extends the [MetadataWithContent](#) metadata type and inherits its `content` and `fullName` fields.

## File Suffix and Directory Location

AccountRelationshipShareRule components have the suffix `.accountRelationshipShareRule` and are stored in the `.accountRelationshipShareRules` folder.

## Version

AccountRelationshipShareRule components are available in API version 45.0 and later.

## Special Access Rules

Access to the AccountRelationshipShareRule type requires orgs to enable the Account Relationships permission. The Manage Experiences permission is required for user access.

## Fields

Field Name	Field Type	Description
accessLevel	string	Type of access granted by the share rule. Valid values are: <ul style="list-style-type: none"> <li>• Read</li> <li>• Edit</li> </ul>
accountToCriteriaField	string	Criteria that must be met for the data to be shared. Valid values include any custom or standard lookup to Account or User on top-level objects. To get the full list for your org, do a Describe on the ARSR entity.
description	string	A meaningful explanation of the sharing rule.
entityType	string	The type of data shared by this share rule. Valid values are: <ul style="list-style-type: none"> <li>• Account</li> <li>• Campaign</li> <li>• Case</li> <li>• Contact</li> <li>• Custom Object</li> <li>• Lead</li> <li>• Opportunity</li> <li>• Order</li> </ul> API names of top-level custom objects in the org can also be used, for example, CustomObject__c.
masterLabel	string	The label assigned to the sharing rule to identify it.
staticFormulaCriteria	string	A way to further filter what data gets shared. This string must be a deterministic formula, and spanning isn't allowed.
type	string	Match the type of an account relationship for data to be shared according to the accountToCriteriaField and the staticFormulaCriteria fields.

## Declarative Metadata Sample Definition

The following is an example of an AccountRelationshipShareRule component.

```
<?xml version="1.0" encoding="UTF-8"?>
<AccountRelationshipShareRule xmlns="http://soap.sforce.com/2006/04/metadata">
  <accessLevel>Edit</accessLevel>
  <accountToCriteriaField>Account.OwnerId</accountToCriteriaField>
```

```

<description>TestDescription</description>
<entityType>Account</entityType>
<masterLabel>TestName</masterLabel>
<staticFormulaCriteria>YearStarted = &quot;1980&quot;</staticFormulaCriteria>
<type>Dealer</type>
</AccountRelationshipShareRule>

```

The following is an example `package.xml` that references the previous definition.

```

<Package>
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>ArshrDevName</members>
    <name>AccountRelationshipShareRule</name>
  </types>
</version>45.0</version>
</Package>

```

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file.

## AccountingFieldMapping

Represents the accounting field mappings to organize your data and bring it to ledger entry records.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

AccountingFieldMapping components have the suffix `.accountingFieldMapping` and are stored in the `accountingFieldMappings` folder.

### Version

AccountingFieldMapping components are available in API version 58.0 and later.

### Fields

Field Name	Description
<code>accountingModelConfig</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p>

Field Name	Description
	Record ID of the AccountingModelConfig record that the Field Mapping is associated with.
<code>isForAllocationType</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Reserved for internal use.</p>
<code>isForPaymentType</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Reserved for internal use.</p>
<code>isForTransactionType</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Reserved for internal use.</p>
<code>isProtected</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether this component is protected (<code>true</code>) or not protected (<code>false</code>). Default value is <code>false</code>.</p>
<code>mappingBehavior</code>	<p><b>Field Type</b> MappingBehaviorType (enumeration of type string)</p> <p><b>Description</b> Required. Specifies how the target's field data is mapped from the source field only when the journal entry is created. When set to <code>CurrentValue</code>, Subledger reverses and replaces journal entries whose value differs from the value in <code>sourceField</code>. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>CurrentValue</code></li> <li>• <code>PointInTime</code></li> </ul>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for AccountingFieldMapping, which is defined when the AccountingFieldMapping is created.</p>

Field Name	Description
sourceField	<p><b>Field Type</b> string</p> <p><b>Description</b> The API name of the field on the source object that is mapped to the target field.</p>
targetField	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The API name of the field on the Transaction Journal record for this mapping.</p>

## Declarative Metadata Sample Definition

The following is an example of an AccountingFieldMapping component.

```
<?xml version="1.0" encoding="UTF-8"?>
<AccountingFieldMapping xmlns="http://soap.sforce.com/2006/04/metadata">
  <accountingModelConfig>ModelConfigOne</accountingModelConfig>
  <fullName>FieldMappingOne</fullName>
  <masterLabel>FieldMappingOne</masterLabel>
  <isForAllocationType>true</isForAllocationType>
  <isForPaymentType>true</isForPaymentType>
  <isForTransactionType>true</isForTransactionType>
  <mappingBehavior>PointInTime</mappingBehavior>
  <sourceField>TransactionJournal.MappingTargetOne__c</sourceField>
  <targetField>MappingTargetOne__c</targetField>
  <isProtected>false</isProtected>
</AccountingFieldMapping>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>FieldMappingOne</members>
    <name>AccountingFieldMapping</name>
  </types>
  <version>58.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AccountingModelConfig

---

Represents the mapping of the financial data model to a logical data model and configuration for the generation of Transaction Journal records.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

AccountingModelConfig components have the suffix `.accountingModelConfig` and are stored in the `accountingModelConfigs` folder.

### Version

AccountingModelConfig components are available in API version 57.0 and later.

### Fields

Field Name	Description
<code>accountingType</code>	<p><b>Field Type</b> AccountingType (enumeration of type string)</p> <p><b>Description</b> Required. Determines whether the accounting set generates revenue or expense type transaction journal records. Valid values are:</p> <ul style="list-style-type: none"> <li>• Expense</li> <li>• Revenue</li> </ul>
<code>defaultAccrualAccountCode</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The code for your accounting system's default accrual account.</p>
<code>defaultWriteOffAccountCode</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Represents the name of your account for written off payments.</p>

Field Name	Description
earliestCreatedDate	<p><b>Field Type</b> dateTime</p> <p><b>Description</b> Required. The date used to filter source records for processing. The Accounting Subledger only considers records created on or after this date.</p>
expectedCashFlowGrouping	<p><b>Field Type</b> ExpectedCashFlowGrouping (enumeration of type string)</p> <p><b>Description</b> Determines whether Accounting Subledger groups transaction journal records by fund account or by a combination of fund account and due date.</p> <p> <b>Note:</b> Changing this setting doesn't impact existing records; it only affects records created or reversed afterward.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• GroupByFundAccount</li> <li>• GroupByFundAndDueDate</li> </ul>
financeBook	<p><b>Field Type</b> string</p> <p><b>Description</b> Reserved for internal use.</p>
internalMappingDetails	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Represents the structure of your financial data in JSON format.</p>
isActive	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Indicates whether only records that are true are processed when the Subledger Job runs.</p>
isGroupedByFundAccount	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Reserved for internal use.</p>

Field Name	Description
isUsed	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Indicates whether the Accounting Model has been used or activated at least once (<code>true</code>) or not (<code>false</code>).</p> <p> <b>Note:</b> If the value is set to <code>true</code>, you can't select another object for the object model or change the number of objects associated with that Accounting Model.</p>
jobFilterCriteria	<p><b>Field Type</b> string</p> <p><b>Description</b> Reserved for internal use.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for AccountingModelConfig, which is defined when the AccountingModelConfig is created.</p>
paidCashFlowGrouping	<p><b>Field Type</b> PaidCashFlowGrouping (enumeration of type string)</p> <p><b>Description</b> Determines the level of detail for generated transaction journal records. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>GroupByFundAccount</code>—Accounting Subledger splits all transaction journal records into fund accounts. Secondary records are created for payment type records but not for transaction type records.</li> <li>• <code>GroupBySummary</code>—Accounting Subledger only splits credits for revenue and debits for expenses by fund accounts.</li> </ul>
recordTypeFilter	<p><b>Field Type</b> string</p> <p><b>Description</b> Specify the record type IDs from the primary object to be processed. This field is case-sensitive.</p> <p> <b>Note:</b> If no record type is specified in the filter, all records are processed.</p>

Field Name	Description
runOrder	<p><b>Field Type</b> int</p> <p><b>Description</b> Determines the load order sequence of the multiple Accounting Model. The lower number runs first. For example, load order 1 runs before load order 2.</p>

## Declarative Metadata Sample Definition

The following is an example of an AccountingModelConfig component.

```
<?xml version="1.0" encoding="UTF-8"?>
<AccountingModelConfig
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>ModelConfigOne</fullName>
  <masterLabel>ModelConfigOne</masterLabel>
  <defaultAccrualAccountCode>abc</defaultAccrualAccountCode>
  <defaultWriteOffAccountCode>abc</defaultWriteOffAccountCode>
  <isUsed>>false</isUsed>
  <isActive>>false</isActive>
  <runOrder>123</runOrder>
  <recordTypeFilter>abcabc</recordTypeFilter>
  <earliestCreatedDate>2021-12-01T00:00:00.000Z</earliestCreatedDate>
  <internalMappingDetails>abcabc</internalMappingDetails>
  <accountingType>Revenue</accountingType>
  <expectedCashFlowGrouping>GroupByFundAccount</expectedCashFlowGrouping>
  <paidCashFlowGrouping>GroupBySummary</paidCashFlowGrouping>
</AccountingModelConfig>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>ModelConfigOne</members>
    <name>AccountingModelConfig</name>
  </types>
  <version>57.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ActionLinkGroupTemplate

---

Represents the action link group template. Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking on an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. Every action link belongs to an action link group and action links within the group are mutually exclusive.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

ActionLinkGroupTemplate components have the suffix `.actionLinkGroupTemplate` and are stored in the `actionLinkGroupTemplates` folder.

### Version

ActionLinkGroupTemplate components are available in API version 33.0 and later.

### Fields

Field Name	Field Type	Description
<code>actionLinkTemplates</code>	<a href="#">ActionLinkTemplate</a> on page 226[]	Action link templates that are associated with the action link group template.
<code>category</code>	PlatformActionGroupCategory (enumeration of type string)	Required. The location of the action link group within the feed element. Values are: <ul style="list-style-type: none"> <li><code>Primary</code>—The action link group is displayed in the body of the feed element.</li> <li><code>Overflow</code>—The action link group is displayed in the overflow menu of the feed element.</li> </ul>
<code>executionsAllowed</code>	ActionLinkExecutionsAllowed (enumeration of type string)	Required. The number of times an action link can be executed. Values are: <ul style="list-style-type: none"> <li><code>Once</code>—An action link can be executed only once across all users.</li> <li><code>OncePerUser</code>—An action link can be executed only once for each user.</li> <li><code>Unlimited</code>—An action link can be executed an unlimited number of times by each user. If the action link's <code>actionType</code> is <code>Api</code> or <code>ApiAsync</code>, you can't use this value.</li> </ul>
<code>hoursUntilExpiration</code>	int	Required. The number of hours from when the action link group is created until it's removed from associated feed elements and can no longer be executed. The maximum value is 8,760.

Field Name	Field Type	Description
<code>isPublished</code>	boolean	Required. If <code>true</code> , the action link group template is published. Action link group templates shouldn't be published until at least one action link template is associated with it.
<code>name</code>	string	Required. The name of the action link group template to use in code.

## ActionLinkTemplate

ActionLinkTemplate components are used to create multiple action links that share properties.

Field Name	Field Type	Description
<code>actionUrl</code>	string	Required. The action link URL. For example, a <code>ui</code> action link URL is a Web page. A <code>Download</code> action link URL is a link to the file to download. <code>ui</code> and <code>Download</code> action link URLs are provided to clients. An <code>Api</code> or <code>ApiAsync</code> action link URL is a REST resource. <code>Api</code> and <code>ApiAsync</code> action link URLs aren't provided to clients. Links to Salesforce can be relative. All other links must be absolute and start with <code>https://</code> .
<code>headers</code>	string	Template for the HTTP headers sent when corresponding action links are invoked. This field can be used only for <code>Api</code> and <code>ApiAsync</code> action links. This field can contain context variables and binding variables in the form <code>{!Bindings.<b>key</b>}</code> .
<code>isConfirmationRequired</code>	boolean	Required. If <code>true</code> , a confirmation dialog appears before the action is executed.
<code>isGroupDefault</code>	boolean	Required. If <code>true</code> , action links derived from this template are the default or primary action in their action groups. There can be only one default action per action group.
<code>label</code>	string	A custom label to display on the action link button. If none of the <code>LabelKey</code> values make sense for an action link, use a custom label. Set the <code>LabelKey</code> field to <code>None</code> and enter a label name in the <code>Label</code> field.
<code>labelKey</code>	string	Required. Key for the set of labels to display for these action link states: new, pending, success, failed. For example, the Approve set contains these labels: Approve, Pending, Approved, Failed. For a complete list of keys and labels, see <a href="#">Action Link Labels</a> in the <i>Connect REST API Developer Guide</i> .
<code>linkType</code>	ActionLinkType (enumeration of type string)	Required. The type of action link. One of these values: <ul style="list-style-type: none"> <li><code>Api</code>—The action link calls a synchronous API at the action URL. Salesforce sets the status to <code>SuccessfulStatus</code> or <code>FailedStatus</code> based on the HTTP status code returned by your server.</li> <li><code>ApiAsync</code>—The action link calls an asynchronous API at the action URL. The action remains in a <code>PendingStatus</code> state until a third party makes a request to <code>/connect/action-links/<b>actionLinkId</b></code> to set the status to <code>SuccessfulStatus</code> or <code>FailedStatus</code> when the asynchronous operation is complete.</li> <li><code>Download</code>—The action link downloads a file from the action URL.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>Ui</code>—The action link takes the user to a web page at the action URL.</li> </ul>
<code>method</code>	ActionLink HttpMethod (enumeration of type string)	<p>Required. HTTP method for the action URL. One of these values:</p> <ul style="list-style-type: none"> <li>• <code>HttpDelete</code>—Returns HTTP 204 on success. Response body or output class is empty.</li> <li>• <code>HttpGet</code>—Returns HTTP 200 on success.</li> <li>• <code>HttpHead</code>—Returns HTTP 200 on success. Response body or output class is empty.</li> <li>• <code>HttpPatch</code>—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty.</li> <li>• <code>HttpPost</code>—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success.</li> <li>• <code>HttpPut</code>—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty.</li> </ul> <p><code>Ui</code> and <code>Download</code> action links must use <code>HttpGet</code>.</p>
<code>position</code>	int	Required. An integer specifying the position of the action link template relative to other action links in the group. 0 is the first position.
<code>requestBody</code>	string	Template for the HTTP request body sent when corresponding action links are invoked. This field can be used only for <code>Api</code> and <code>ApiAsync</code> action links. This field can contain context variables and binding variables in the form <code>{!Bindings.<b>key</b>}</code> .
<code>userAlias</code>	string	If you selected <code>CustomUser</code> or <code>CustomExcludedUser</code> for <code>UserVisibility</code> , this field is the alias for the custom user. Use the alias in a template binding to specify the custom user when an action link group is created using the template.
<code>userVisibility</code>	ActionLink UserVisibility (enumeration of type string)	<p>Required. Who can see the action link. This value is set per action link, not per action link group. Values are:</p> <ul style="list-style-type: none"> <li>• <code>Creator</code>—Only the creator of the action link can see the action link.</li> <li>• <code>Everyone</code>—Everyone can see the action link.</li> <li>• <code>EveryoneButCreator</code>—Everyone but the creator of the action link can see the action link.</li> <li>• <code>Manager</code>—Only the manager of the creator of the action link can see the action link.</li> <li>• <code>CustomUser</code>—Only the custom user can see the action link.</li> <li>• <code>CustomExcludedUser</code>—Everyone but the custom user can see the action link.</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of an ActionLinkGroupTemplate component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ActionLinkGroupTemplate xmlns="http://soap.sforce.com/2006/04/metadata">
  <actionLinkTemplates>
    <actionUrl>/services/data/{!Bindings.word}/chatter/feed-elements</actionUrl>
    <headers>Content-Type:{!Bindings.word3}</headers>
    <isConfirmationRequired>true</isConfirmationRequired>
    <isGroupDefault>true</isGroupDefault>
    <labelKey>Add</labelKey>
    <linkType>API</linkType>
    <method>httpPost</method>
    <position>0</position>
    <requestBody>{"body":{"messageSegments":[{"type": "Text",
"text": "{!Bindings.word1}"}]}, "subjectId": "{!Bindings.word2}",
"feedElementType": "feedItem"}</requestBody>
    <userAlias>customExcludedUser</userAlias>
    <userVisibility>CustomExcludedUser</userVisibility>
  </actionLinkTemplates>
  <category>Primary</category>
  <executionsAllowed>OncePerUser</executionsAllowed>
  <hoursUntilExpiration>10</hoursUntilExpiration>
  <isPublished>true</isPublished>
  <name>MyPackage</name>
</ActionLinkGroupTemplate>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ActionLinkGroupTemplate</name>
  </types>
  <version>33.0</version>
</Package>
```

## Usage

If you modify action link group templates, you overwrite the related action link templates.

If you delete a published action link group template, you delete all related action link information which includes deleting all action links that were instantiated using the template from feed items.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ActionPlanTemplate

Represents the instance of an action plan template. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

ActionPlanTemplate components have the suffix `.apt` and are stored in the `actionPlanTemplates` folder.

### Version

Action Plan Template components are available in API version 47.0 and later.

### Special Access Rules

To create or access action plan templates, you must have the `Customize Application` permission and the `IndustriesActionPlans` license.

### Fields

Field Name	Field Type	Description
<code>actionPlanTemplateItem</code>	<a href="#">ActionPlanTemplateItem</a> on page 229	The instance of an item on an action plan template version.
<code>description</code>	string	The description of the action plan template.
<code>name</code>	string	Required. The name of the action plan template.
<code>targetEntityType</code>	string	Required. The parent object this action plan template relates to. Supported parent objects are Account, BusinessMilestone, Campaign, Case, Claim, Contact, Contract, InsurancePolicy, InsurancePolicyCoverage, Lead, Opportunity, PersonLifeEvent, and Visit and custom objects with activities enabled.
<code>uniqueName</code>	string	Required. The unique identifier for this action plan template record.

### ActionPlanTemplateItem

Represents the instance of an item on an action plan template version.

Field Name	Field Type	Description
<code>actionPlanTemplateItemValue</code>	<a href="#">ActionPlanTemplateValue</a>	The value associated with the action plan template item.
<code>displayOrder</code>	int	The order in which this item is displayed within the action plan template version.
<code>isRequired</code>	boolean	Indicates whether the task created from this template item is required.
<code>itemEntityType</code>	string	Required. The name of the field on the action plan template item that this value is for. Available in API version 48.0 and later.

Field Name	Field Type	Description
name	string	Required. The name of the action plan template item.
uniqueName	string	Required. The unique identifier for this action plan template item record.

## ActionPlanTemplateItemValue

Represents the value associated with an action plan template item.

Field Name	Field Type	Description
itemEntityType	string	Required. The name of the field on the action plan template item that this value is for. Available in API version 48.0 and later.
name	string	Required. The name of the action plan template item value.
valueFormula	string	The formula for this action plan template item.
valueLiteral	string	The value for this action plan template item.

## Declarative Metadata Sample Definition

The following is an example of an ActionPlanTemplate component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ActionPlanTemplate xmlns="http://soap.sforce.com/2006/04/metadata">
  <actionPlanTemplateItem>
    <actionPlanTemplateItemValue>
      <itemEntityType>Task</itemEntityType>
      <name>Subject</name>
      <valueLiteral>Task 1</valueLiteral>
    </actionPlanTemplateItemValue>
    <actionPlanTemplateItemValue>
      <itemEntityType>Task</itemEntityType>
      <name>Priority</name>
      <valueLiteral>Normal</valueLiteral>
    </actionPlanTemplateItemValue>
    <actionPlanTemplateItemValue>
      <itemEntityType>Task</itemEntityType>
      <name>ActivityDate</name>
      <valueFormula>StartDate + 1</valueFormula>
    </actionPlanTemplateItemValue>
    <isRequired>true</isRequired>
    <itemEntityType>Task</itemEntityType>
    <name>Task 1</name>
    <uniqueName>Task_1_f1beaba5_1ae1_11ea_93ad_5bc214d4daaf</uniqueName>
  </actionPlanTemplateItem>
  <description>This is a sample template for packaging</description>
  <name>Action Plan Template 1</name>
  <targetEntityType>Account</targetEntityType>
  <uniqueName>Action_Plan_Template_1_da365953_1ae1_11ea_93ad_89a1c3d51bae</uniqueName>
</ActionPlanTemplate>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ActionableListDefinition

---

Represents the data source definition details associated with an actionable list.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`ActionableListDefinition` components have the suffix `.actionableListDefinition` and are stored in the `actionableListDefinitions` folder.

## Version

`ActionableListDefinition` components are available in API version 57.0 and later.

## Fields

Field Name	Description
<code>actionableListDatasetColumns</code>	<p><b>Field Type</b> <a href="#">ActionableListDatasetColumn[]</a></p> <p><b>Description</b> The object that stores columns in a dataset associated with an actionable list.</p>
<code>actionableListMemberStatuses</code>	<p><b>Field Type</b> <a href="#">ActionableListMemberStatus[]</a></p> <p><b>Description</b> The object that stores the status and the corresponding status icon details of an individual actionable list member.</p>
<code>batchCalcJobDefinition</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The batch calculation job definition that's associated with the creation of an actionable list. This field is a relationship field.</p>

Field Name	Description
datasetName	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the dataset that is associated with the actionable list.</p>
edgeMart	<p><b>Field Type</b> string</p> <p><b>Description</b> The edgemart dataset that's associated with the actionable list. Available in API version 58.0 and later.</p>
isActive	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the actionable list definition is active (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The master label of the actionable list definition.</p>
objectName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The object for which the actionable list is created. Possible values are organized by the API version in which they were introduced. Values are available in all versions after introduction unless noted otherwise. Possible values are: API version 60.0 and later: <code>PersonLifeEvent</code> API version 60.0 and later with Insurance Managed Package: <ul style="list-style-type: none"> <li>• <code>Claim</code></li> <li>• <code>InsurancePolicy</code></li> <li>• <code>Quote</code></li> </ul> API version 59.0 and later with Health Cloud: <ul style="list-style-type: none"> <li>• <code>CareFacilityBed</code></li> </ul> </p>

Field Name	Description
	<ul style="list-style-type: none"> <li>CareRequest</li> <li>CareRequestItem</li> <li>CareServiceVisit</li> <li>CareServiceVisitPlan</li> <li>ClinicalServiceRequest</li> </ul> <p>API version 59.0 and later with Loyalty Cloud:</p> <ul style="list-style-type: none"> <li>LoyaltyProgramMember</li> </ul> <p>API version 59.0 and later:</p> <ul style="list-style-type: none"> <li>Case</li> </ul> <p>API version 58.0 and later with Automotive Cloud:</p> <ul style="list-style-type: none"> <li>Vehicle</li> </ul> <p>API version 58.0 and later:</p> <ul style="list-style-type: none"> <li>Asset</li> <li>Lead</li> <li>Opportunity</li> </ul> <p>API version 57.0 and later:</p> <ul style="list-style-type: none"> <li>Account</li> <li>Contact</li> </ul>

## ActionableListDatasetColumn

Represents the information about the columns in a dataset associated with an actionable list.

**Table 1: Fields**

Field Name	Description
dataDomain	<p><b>Field Type</b> DatasetColumnType (enumeration of type string)</p> <p><b>Description</b> The data domain that is mapped to the data type of the dataset column.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>Dates</li> <li>Dimensions</li> <li>Measures</li> </ul>
dataType	<p><b>Field Type</b> DatatableDataType (enumeration of type string)</p> <p><b>Properties</b> Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p>

Field Name	Description
	<p><b>Description</b></p> <p>The data type of the dataset column in the actionable list. Available in API version 58.0 and later.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• Boolean</li> <li>• Currency</li> <li>• Date</li> <li>• DateTime</li> <li>• Email</li> <li>• Location</li> <li>• Number</li> <li>• Percent</li> <li>• Phone</li> <li>• Text</li> <li>• Url</li> </ul>
displayOrder	<p><b>Field Type</b></p> <p>int</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b></p> <p>The order in which the actionable list dataset columns are displayed. Available in API version 58.0 and later.</p>
isDefault	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the dataset column is added to the actionable list by default (<code>true</code>) or not (<code>false</code>).</p> <p>The default value is <code>false</code>.</p>
isGroupedByListDefObj	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the dataset column is grouped by the object defined in the actionable list definition (<code>true</code>) or not (<code>false</code>). Available in API version 59.0 and later.</p>
IsTypeAheadSearchEnabled	<p><b>Field Type</b></p> <p>boolean</p>

Field Name	Description
	<p><b>Description</b></p> <p>Indicates whether the type-ahead search for filters is enabled (<code>true</code>) or not (<code>false</code>). Available in API version 60.0 and later.</p>
<code>objectName</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The name of the object that's associated with the dataset column.</p> <p>Possible values are:</p> <p>API version 60.0 and later:</p> <ul style="list-style-type: none"> <li><code>PersonLifeEvent</code></li> </ul> <p>API version 60.0 and later with Insurance Managed Package:</p> <ul style="list-style-type: none"> <li>• <code>Claim</code></li> <li>• <code>InsurancePolicy</code></li> <li>• <code>Quote</code></li> </ul> <p>API version 59.0 and later with Health Cloud:</p> <ul style="list-style-type: none"> <li>• <code>CareFacilityBed</code></li> <li>• <code>CareRequest</code></li> <li>• <code>CareRequestItem</code></li> <li>• <code>CareServiceVisit</code></li> <li>• <code>CareServiceVisitPlan</code></li> <li>• <code>ClinicalServiceRequest</code></li> </ul> <p>API version 59.0 and later with Loyalty Cloud:</p> <ul style="list-style-type: none"> <li>• <code>LoyaltyProgramMember</code></li> </ul> <p>API version 59.0 and later:</p> <ul style="list-style-type: none"> <li>• <code>Case</code></li> </ul> <p>API version 58.0 and later with Automotive Cloud:</p> <ul style="list-style-type: none"> <li>• <code>Vehicle</code></li> </ul> <p>API version 58.0 and later:</p> <ul style="list-style-type: none"> <li>• <code>Asset</code></li> <li>• <code>Lead</code></li> <li>• <code>Opportunity</code></li> </ul> <p>API version 57.0 and later:</p> <ul style="list-style-type: none"> <li>• <code>Account</code></li> <li>• <code>Contact</code></li> </ul>
<code>sourceColumnApiName</code>	<p><b>Field Type</b></p> <p>string</p>

Field Name	Description
	<p><b>Description</b></p> <p>The API name of the column in the source dataset.</p>
sourceFieldName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The name of the field in the object for which the actionable list dataset is created.</p>

## ActionableListMemberStatus

Represents the status and the corresponding status icon details of an individual actionable list member.

**Table 2: Fields**

Field Name	Description
iconName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The name of the icon that's mapped to the status.</p>
status	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The status of the actionable list member.</p>

## Declarative Metadata Sample Definition

The following is an example of a ActionableListDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ActionableListDefinition
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <actionableListDatasetColumns>
    <isDefault>true</isDefault>
    <sourceFieldName>NewColumn1</sourceFieldName>
  </actionableListDatasetColumns>
  <actionableListDatasetColumns>
    <sourceColumnApiName>ApiName</sourceColumnApiName>
    <dataDomain>Dimensions</dataDomain>
    <isDefault>>false</isDefault>
    <sourceFieldName>NewColumn2</sourceFieldName>
    <objectName>Account</objectName>
    <displayOrder>1</displayOrder>
    <dataType>Text</dataType>
  </actionableListDatasetColumns>
</ActionableListDefinition>
```

```

</actionableListDatasetColumns>
<actionableListMemberStatuses>
  <iconName>NewMember1</iconName>
  <status>Active</status>
</actionableListMemberStatuses>
<isActive>true</isActive>
<masterLabel>NewMember2</masterLabel>
<objectName>Account</objectName>
<isProtected>true</isProtected>
<batchCalcJobDefinition>Test1</batchCalcJobDefinition>
<datasetName>AccountDef</datasetName>
</ActionableListDefinition>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ActionableListDefinition</name>
  </types>
  <version>62.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AdvAccountForecastSet

---

Represents the forecast sets that define the forecast configurations for each business unit or different groups of accounts. With separate forecast sets at account or business unit level, you can focus on account-specific data and manage configuration updates for one business unit without impacting any other business unit's data.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`AdvAccountForecastSet` components have the suffix `.advAccountForecastSet` and are stored in the `AdvAccountForecastSet` folder.

### Version

`AdvAccountForecastSet` components are available in API version 53.0 and later.

## Special Access Rules

The advanced account forecasting feature setting for Manufacturing Cloud is required to create an advanced account forecast set.

## Fields

Field Name	Description
accountFieldName	<p><b>Field Type</b> string</p> <p><b>Description</b> The field name for the account in the advanced account forecast fact record.</p>
calculationFrequency	<p><b>Field Type</b> AdvAcctFcstCalcFrequency (enumeration of type string)</p> <p><b>Description</b> The frequency at which the forecast set is recalculated automatically. Possible values are:</p> <ul style="list-style-type: none"> <li>• Monthly</li> <li>• Quarterly</li> <li>• Weekly</li> <li>• Yearly</li> </ul> <p>The default value is Monthly.</p>
description	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of the advanced account forecast set record.</p>
dimensions	<p><b>Field Type</b> <a href="#">AdvAcctForecastDimension[]</a></p> <p><b>Description</b> The dimensions selected for an advanced account forecast set to categorize the forecast data.</p>
displayGroups	<p><b>Field Type</b> <a href="#">AdvAcctFrcstDisplayGroup[]</a></p> <p><b>Description</b> The information about the groups for the advanced account forecast set measures or dimensions.</p>
forecastAdjPeriods	<p><b>Field Type</b> <a href="#">AdvAcctForecastAdjPeriod[]</a></p>

Field Name	Description
	<p><b>Description</b></p> <p>The details about the adjustment period of the advanced account forecast values.</p>
forecastFactObjectName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The API name of the object that contains the advanced forecast fact records.</p>
forecastFormulas	<p><b>Field Type</b></p> <p><a href="#">AdvAccountForecastFormula[]</a></p> <p><b>Description</b></p> <p>The formulas based on which forecast values are calculated.</p>
forecastPeriodGroupName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The name of the advanced account forecast period group record.</p>
forecastQuantityFieldName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The field name for the forecast quantity in the advanced account forecast fact record.</p>
forecastRevenueFieldName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The field name for the forecast revenue in the advanced account forecast record.</p>
forecastSetFieldName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The field name for the Forecast Set ID in the advanced account forecast fact record.</p>
forecastSetName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The name of the advanced account forecast set record.</p>

Field Name	Description
forecastStatusFieldName	<p><b>Field Type</b> string</p> <p><b>Description</b> The field name for the status in the advanced account forecast fact record.</p>
generationDpeDefName	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the data processing engine (DPE) definition that's used to generate advanced account forecast fact records.</p>
measureDefinitions	<p><b>Field Type</b> <a href="#">AdvAcctForecastMeasureDef[]</a></p> <p><b>Description</b> The measures to display in the advanced account forecasts grid for the forecast set.</p>
periodFieldName	<p><b>Field Type</b> string</p> <p><b>Description</b> The field name for the period in the advanced account forecast fact record.</p>
recalculateDpeDefName	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the data processing engine definition that's used to recalculate the advanced account forecast fact records.</p>
regenerationDpeDefName	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the data processing engine definition that's used to regenerate the advanced account forecast fact records.</p>
rolloverDpeDefName	<p><b>Field Type</b> string</p> <p><b>Description</b> The data processing engine definition that's used to generate the rollover advanced account forecast fact records.</p>
rolloverFrequency	<p><b>Field Type</b> AdvAcctFcstCalcFrequency (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>The frequency of rollover of the advanced account forecast records.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• Monthly</li> <li>• Quarterly</li> <li>• Weekly</li> <li>• Yearly</li> </ul> <p>The default value is Monthly.</p>
status	<p><b>Field Type</b></p> <p>AdvAccForecastSetStatus (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>The status of the advanced account forecast set.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Inactive</li> </ul>

## AdvAccountForecastFormula

Represents the formulas that are used to calculate forecast values in real time after applying the DPE calculations. For example, processing forecast rollover for all accounts at the start of a month.

Field Name	Description
endPeriod	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Required.</p> <p>The period until when the forecast formula is applicable.</p>
formulaExpression	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The formula based on which forecast values are calculated.</p>
formulaType	<p><b>Field Type</b></p> <p>AdvAcctFcstFormulaType (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>Specifies the calculation type for the formula.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• QUANTITY</li> <li>• REVENUE</li> </ul> <p>The default value is QUANTITY.</p>
startPeriod	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Required.</p> <p>The period from when the forecast formula is applicable.</p>

## AdvAcctForecastAdjPeriod

Represents details about the adjustment period of the advanced account forecast values.

Field Name	Description
adjustmentDayCount	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Required.</p> <p>The number of days during which you can make forecast adjustments.</p>
frequency	<p><b>Field Type</b></p> <p>PeriodTypes (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>The frequency that's applicable to make any forecast adjustments.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• Month</li> <li>• Quarter</li> <li>• Week</li> <li>• Year</li> </ul> <p>The default value is Month.</p>

Field Name	Description
profileName	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the profile with which you can adjust the forecast set.</p>
startDay	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. The start date for forecast adjustments.</p>

## AdvAcctForecastDimension

Represents the dimensions selected for an advanced account forecast set to categorize the data. For example, a business unit requires forecast data for each account aggregated by product and ship-from location.

Field Name	Description
advAcctForecastDimName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the advanced account forecast dimension.</p>
dimensionFieldName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The API name of the field for the dimension in the custom object that contains the generated advanced account forecast records.</p>
dimensionSourceName	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the dimension source associated with the advanced account forecast set dimension record.</p>
hierarchySequenceNumber	<p><b>Field Type</b> int</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>The sequence number of the dimension source associated with the forecast set.</p>

## AdvAcctForecastMeasureDef

Represents information about the measures to display in the advanced account forecasts grid for the forecast set.

Field Name	Description
advAcctForecastMeasureDefName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The name of the definition for the advanced account forecast measure.</p>
aggregationType	<p><b>Field Type</b></p> <p>AdvAcctFcstAggregationType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>The type of aggregation that's used for calculating the advanced account forecast values.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• AVERAGE</li> <li>• MAXIMUM</li> <li>• MINIMUM</li> <li>• SUM</li> </ul> <p>The default value is SUM.</p>
computationMethod	<p><b>Field Type</b></p> <p>AdvAcctFcstComputationMethod (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>The method that's used for calculating the advanced account forecast values.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• CUSTOM</li> <li>• DATA_PROCESSING_ENGINE_DEFINITION</li> <li>• FORMULA</li> </ul>

Field Name	Description
	The default value is <code>DATA_PROCESSING_ENGINE_DEFINITION</code> .
<code>forecastDataMeasureName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The field of the facts object used for the advanced account forecast measure.</p>
<code>forecastMeasureName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name for the advanced account forecast measure to show on UI.</p>
<code>forecastMeasureType</code>	<p><b>Field Type</b> <code>AdvAcctFcstMeasureType</code> (enumeration of type string)</p> <p><b>Description</b> Required. The measure type that's used for the generated advanced forecast values. Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>QUANTITY</code></li> <li>• <code>REVENUE</code></li> </ul> <p>The default value is <code>QUANTITY</code>.</p>
<code>isAdjustmentTracked</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the adjustments made to the advanced account forecast values for this metric are tracked (<code>true</code>) or not (<code>false</code>).</p>

## AdvAcctFrcstDisplayGroup

Represents information about the groups for the advanced account forecast set measures or dimensions.

Field Name	Description
<code>advAcctFrcstDisplayGroupName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p>

Field Name	Description
	The name of the advanced account forecast display group.
displayGroupItems	<p><b>Field Type</b> AdvAcctFrcstDplyGroupItem[]</p> <p><b>Description</b> The items associated with a display group for an advanced account forecast set.</p>
displayGroupType	<p><b>Field Type</b> AdvAcctFrcstDisplayGroupType (enumeration of type string)</p> <p><b>Description</b> The category of the display group. Possible value is:</p> <ul style="list-style-type: none"> <li>MEASURE</li> </ul>
isDefault	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the display group is the default group (<code>true</code>) or not (<code>false</code>).</p>
userProfileName	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the profile for which the display group is applicable.</p>

## AdvAcctFrcstDplyGroupItem

Represents information about the items associated with a display group for an advanced account forecast set.

Field Name	Description
advAcctFrcstDplyGroupName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the advanced account forecast display group that's associated with the group item.</p>
displayOrder	<p><b>Field Type</b> int</p> <p><b>Description</b> Required.</p>

Field Name	Description
	The display order of the display group item.
measureReferenceName	<p><b>Field Type</b> string</p> <p><b>Description</b> The ID of the measure associated with the display group item.</p>

## Declarative Metadata Sample Definition

The following is an example of an AdvAccountForecastSet component.

```
<?xml version="1.0" encoding="UTF-8"?>
<AdvAccountForecastSet xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">

  </displayGroups>
</AdvAccountForecastSet>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>AdvAccountForecastSet</name>
  </types>
  <version>62.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AffinityScoreDefinition

---

Represents the affinity information used in calculations to analyze and categorize contacts for marketing purposes.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

AffinityScoreDefinition components have the suffix `.affinityScoreDefinition` and are stored in the `affinityScoreDefinitions` folder.

## Version

AffinityScoreDefinition components are available in API version 62.0 and later.

## Special Access Rules

This metadata type is available only if the Fundraising Access license is enabled for the org and the Fundraising admin permission is assigned to users.

## Fields

Field Name	Description
<code>affinityScoreDefinitionDesc</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Description of the affinity score definition.</p>
<code>affinityScoreDefinitionName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the affinity score definition.</p>
<code>affinityScoreType</code>	<p><b>Field Type</b> AffinityScoreType (enumeration of type string)</p> <p><b>Description</b> Type of the affinity score that's defined. Valid values are:</p> <ul style="list-style-type: none"> <li>• CAP—Capacity, Ability, Propensity (CAP)</li> <li>• RFM—Recency, Frequency, Monetary (RFM)</li> </ul> <p>The default value is RFM.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Label for this affinity score definition value. This display value is the internal label that doesn't get translated.</p>

Field Name	Description
numberOfMonths	<p><b>Field Type</b> int</p> <p><b>Description</b> Number of months to analyze the records for calculating the affinity score.</p>
numberOfRanges	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. Number of ranges to use in the calculation, ranging from 0 to 9. Provide the corresponding range list values in the <code>scoreRangeList</code> field.</p>
scoreRangeList	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Ranges that are referenced in the affinity score calculation. This field is used with <code>scoreRangeList</code>. For example, to calculate RFM with <code>numberOfRanges</code> value as 3, provide the values for the <code>scoreRangeList</code> field in this format.</p> <pre> {   "R ranges": "0-30, 31-100, 100+",   "F ranges": "0-10, 11-100, 100+",   "M ranges": "0-1000, 1001-5000, 5000+" } </pre>
sourceFieldApiNameList	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. API names of the source fields that are referenced in the score calculation.</p>
sourceObjectApiNameList	<p><b>Field Type</b> string</p> <p><b>Description</b> API names of the source objects that are referenced in the score calculation.</p>
targetFieldApiNameList	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p>

Field Name	Description
	API names of the target fields where the calculated scores are added.
targetObjectApiName	<p><b>Field Type</b> string</p> <p>API name of the target object where the calculated scores are added.</p>

## Declarative Metadata Sample Definition

This example shows a sample of an AffinityScoreDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<AffinityScoreDefinition
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <affinityScoreDefinitionDesc>RFM Affinity Score</affinityScoreDefinitionDesc>
  <affinityScoreDefinitionName>AffinityScoreDefinition_RFM</affinityScoreDefinitionName>
  <affinityScoreType>RFM</affinityScoreType>
  <masterLabel>MasterLabel</masterLabel>
  <numberOfMonths>12</numberOfMonths>
  <numberOfRanges>3</numberOfRanges>
  <scoreRangeList>
    [
      {
        "name": "R Ranges",
        "direction": "ascending",
        "ranges": [30,90,180]
      },
      {
        "name": "F Ranges",
        "direction": "descending",
        "ranges": [10,15,100]
      },
      {
        "name": "M Ranges",
        "direction": "descending",
        "ranges": [500,1000,5000]
      }
    ]

            "fieldName": "DonorGiftSummary.MonetaryScore",
            "fieldWeight": 1
          }
        ]
    }
  ]
}

```

```

    ]
  </targetFieldApiNameList>
</AffinityScoreDefinition>

```

This example shows a sample of the `package.xml` file that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>AffinityScoreDefinition</name>
  </types>
  <version>62.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AIApplication

Represents an instance of an AI application. For example, Einstein Prediction Builder. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

AIApplication components have the suffix `.ai` and are stored in the `aiApplications` folder.

## Version

AIApplication is available in API version 50.0 and later.

## Fields

Field Name	Field Type	Description
<code>developerName</code>	string	Required. Represents the name of the application. Can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.   <b>Note:</b> Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.
<code>masterLabel</code>	string	Label that identifies the AI application throughout the Salesforce user interface.

Field Name	Field Type	Description
status	AIApplicationStatus (enumeration of type string)	Required. The status of the application. Valid values are: <ul style="list-style-type: none"> <li>• Disabled</li> <li>• Draft</li> <li>• Enabled</li> <li>• Migrated</li> </ul>
type	AIApplicationType (enumeration of type string)	The type of AI application. Valid values are: <ul style="list-style-type: none"> <li>• PredictionBuilder</li> </ul>

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AIApplicationConfig

Additional prediction information related to an AI application. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

AIApplicationConfig components have the suffix `.aiapplicationconfig` and are stored in the `aiApplicationConfigs` folder.

## Version

AIApplicationConfig is available in API version 50.0 and later.

## Fields

Field Name	Field Type	Description
<code>aiApplicationDeveloperName</code>	string	Required. Represents the AIApplication to which AIApplicationConfig belongs. Can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Available in API version 51.0 and later.
<code>applicationId</code>	string	Required. The ID of the parent AI application.
<code>developerName</code>	string	Represents the name of the application config. Can contain only underscores and alphanumeric characters and must be unique in your org. It must begin

Field Name	Field Type	Description
		with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
<code>insightReasonEnabled</code>	boolean	Required. When <code>true</code> , generates the predictors, or field values, that were used to generate the prediction value.
<code>masterLabel</code>	string	Required. Label that identifies the AI application configuration throughout the Salesforce user interface.
<code>rank</code>	int	Required. Reserved for future use.
<code>scoringMode</code>	AIScoringMode (enumeration of type string)	Required. Frequency with which the prediction scores are written back. Valid values are: <ul style="list-style-type: none"> <li>• Batch</li> <li>• OnDemand</li> <li>• Streaming</li> </ul>

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AIScoringModelDefinition

Represents information about a machine learning model that's used by the Scoring Framework for Industries Cloud Einstein. The machine learning model is used for scoring, including its configuration.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

AIScoringModelDefinition components have the suffix `.aiScoringModelDefinition` and are stored in the `aiScoringModelDefinitions` folder.

## Version

AIScoringModelDefinition components are available in API version 58.0 and later.

## Special Access Rules

To access this metadata type, you must have the AI Accelerator User permission set with Scoring Framework enabled for Industries Cloud Einstein from Salesforce Setup. The Salesforce org must have the CRM Plus license and the product's CRM license.

## Fields

Field Name	Description
aiModelConfig	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. ID of an AI model configuration related to the AI scoring model record.</p>
aiScoringModelDefVersions	<p><b>Field Type</b> <a href="#">AIScoringModelDefVersion[]</a></p> <p><b>Description</b> Represents information of various versions of a model.</p>
description	<p><b>Field Type</b> string</p> <p><b>Description</b> Description for an AIScoringModelDefinition record.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for the AIScoringModelDefinition metadata component, which is defined when the AIScoringModelDefinition metadata component is created.</p>

## AIScoringModelDefVersion

Represents information about a version of an AI scoring model.

Field Name	Description
aiScoringModelDefinition	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p>

Field Name	Description
	Parent AIScoringModelDefinition record that's related to an AIScoringModelDefVersion record.
aiScoringSteps	<p><b>Field Type</b> AIScoringStep[]</p> <p><b>Description</b> Represents information about a step associated with an AI scoring model version.</p>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is <b>Record Type Name</b>.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for the AIScoringModelDefVersion component name, which is defined when the AIScoringModelDefVersion component name is created.</p>
modelMode	<p><b>Field Type</b> AIScoringModelDefVersionMode (enumeration of type string)</p> <p><b>Description</b> Required. Mode of an AI scoring model. Values are:</p> <ul style="list-style-type: none"> <li>• DEPLOY</li> <li>• TRAIN</li> <li>• TRAIN_AND_DEPLOY</li> </ul>

## AIScoringStep

Represents information about a step associated with an AI scoring model version. For example, an AI scoring step can include steps, such as propensity to purchase products or prediction scores for accounts.

Field Name	Description
aiModelConfigStep	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. ID of the AI model config step that's related to the AIScoringStep record.</p>
stepDetail	<p><b>Field Type</b> string</p> <p><b>Description</b> Scoring step details in JSON format.</p>

## Declarative Metadata Sample Definition

Here's an example of an AIScoringModelDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<AIScoringModelDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <aiModelConfig>Prediction_Scores_for_Accounts</aiModelConfig>
  <aiScoringModelDefVersions>
    <fullName>V1</fullName>
    <aiScoringModelDefinition>Test</aiScoringModelDefinition>
    <aiScoringSteps>

<aiModelConfigStep>Prediction_Scores_for_Accounts.GrainSelector</aiModelConfigStep>
    <stepDetail>{label:Account,name:Account}</stepDetail>
  </aiScoringSteps>
<aiScoringSteps>

<aiModelConfigStep>Prediction_Scores_for_Accounts.AugmentedDataset</aiModelConfigStep>
  </aiScoringSteps>
<aiScoringSteps>

<aiModelConfigStep>Prediction_Scores_for_Accounts.TargetConditionBuilder</aiModelConfigStep>
    <stepDetail>{specificOutcomeDefined:Yes,label:Financial accounts are associated
with an account,name:FA_Target}</stepDetail>
  </aiScoringSteps>
<aiScoringSteps>

<aiModelConfigStep>Prediction_Scores_for_Accounts.InputVariableSelector</aiModelConfigStep>
```

```

        </aiScoringSteps>
        <aiScoringSteps>

<aiModelConfigStep>Prediction_Scores_for_Accounts.CustomFilter</aiModelConfigStep>
        </aiScoringSteps>
        <aiScoringSteps>

<aiModelConfigStep>Prediction_Scores_for_Accounts.WriteBackConnector</aiModelConfigStep>
        </aiScoringSteps>
        <developerName>V1</developerName>
        <masterLabel>V1</masterLabel>
        <modelMode>TRAIN_AND_DEPLOY</modelMode>
    </aiScoringModelDefVersions>
    <description>Test for metadata</description>
    <masterLabel>Test</masterLabel>
</AIScoringModelDefinition>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>*</members>
        <name>AIScoringModelDefVersion</name>
    </types>
    <types>
        <members>*</members>
        <name>AIScoringModelDefinition</name>
    </types>
    <version>62.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AIUsecaseDefinition

---

Represents a collection of fields in your Salesforce org used to define a machine learning use case and get real-time predictions.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

AIUsecaseDefinition components have the suffix `.aiUsecaseDefinitions` and are stored in the `aiUsecaseDefinitions` folder.

## Version

AIUsecaseDefinition components are available in API version 56.0 and later.

## Special Access Rules

The AIUsecaseDefinition object is available when the admin settings for AI Accelerator and for the product related to the use case are enabled. The Salesforce org must have the CRM Plus license and the product's CRM license.

## Fields

Field Name	Description
<code>aiUsecaseFieldMappings</code>	<p><b>Field Type</b> <a href="#">AIUsecaseFieldMapping[]</a></p> <p><b>Description</b> The field mappings for the use case definition. Each use case definition can have multiple field mappings.</p>
<code>aiUsecaseModels</code>	<p><b>Field Type</b> <a href="#">AIUsecaseModel[]</a></p> <p><b>Description</b> The models for the use case definition. Each use case definition can have multiple use case models.</p>
<code>creatorType</code>	<p><b>Field Type</b> CreatorType (enumeration of type string)</p> <p><b>Description</b> Required. The type of user who created the use case definition that's used by AI Accelerator. Valid values are:</p> <ul style="list-style-type: none"> <li>INTERNAL_USER</li> <li>SALESFORCE_ADMIN</li> </ul> <p>Available in API version 57.0 and later.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p>

Field Name	Description
	A user-friendly name for the use case definition, which is defined when the use case definition is created.
maximumInsightCount	<p><b>Field Type</b> int</p> <p><b>Description</b> The maximum number of insights returned by the scoring response.</p>
maximumRecommendationCount	<p><b>Field Type</b> int</p> <p><b>Description</b> The maximum number of recommendations returned by the Next Best Action Strategy.</p>
maximumSuggestionCount	<p><b>Field Type</b> int</p> <p><b>Description</b> The maximum number of suggestions returned by the scoring response.</p>
primaryResponseObject	<p><b>Field Type</b> string</p> <p><b>Description</b> The primary object in which the scoring response is stored based on the specified field mapping.</p>
recommendationResponseObject	<p><b>Field Type</b> string</p> <p><b>Description</b> The recommendation response object associated with the use case definition.</p>
recommendationSource	<p><b>Field Type</b> RcmdSourceType (enumeration of type string)</p> <p><b>Description</b> The tool or platform that generates recommendations. Valid values are:</p> <ul style="list-style-type: none"> <li>• Next_Best_Action_Flow</li> <li>• None</li> </ul> <p>Available in API version 57.0 and later.</p>
secondaryResponseObject	<p><b>Field Type</b> string</p> <p><b>Description</b> The object in which the scoring response is stored based on the specified field mapping.</p>

Field Name	Description
<code>shouldSaveFeatures</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to save the features extracted for the scoring request (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>shouldSaveInsights</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to save the prediction insights that are used to generate the score (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>shouldSaveRecommendation</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to save the recommendation (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>shouldSaveRequestResponse</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to save the request response (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>shouldSaveScore</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to save the prediction score (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>shouldSaveSuggestions</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to save the suggestions for improving the prediction score (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>suggestionImpactMinimumPct</code>	<p><b>Field Type</b> int</p>

Field Name	Description
	<p><b>Description</b></p> <p>The minimum eligible percentage for improving the existing prediction score based on the suggestions. Suggestions with an impact greater than the specified percentage on the score are displayed on the prediction scorecard.</p>
usecaseName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The name of the use case definition.</p>

## AIUsecaseFieldMapping

Represents information about the field mapping to store extracted features, prediction scores, prediction insights, and use case suggestions in the response object.

Field Name	Description
developerName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The unique name for the field mapping in the use case definition.</p> <p>Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is <b>Record Type Name</b>.</p>
mappedFieldName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The name of the field where the scoring response is stored.</p>
mappedFieldType	<p><b>Field Type</b></p> <p>MappedFieldType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>The type of the mapped field.</p>

Field Name	Description
	<p>Valid values are:</p> <ul style="list-style-type: none"> <li>• FEATURE</li> <li>• PREDICTION_SCORE</li> <li>• INSIGHT</li> <li>• SUGGESTION</li> <li>• SECONDARY_RESPONSE_RECORD_ID</li> <li>• RECOMMENDATION_RESPONSE_RECORD_ID</li> <li>• RECOMMENDATION</li> </ul> <p>The default value is <code>FEATURE</code>.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for the use case field mapping, which is defined when the field mapping is created.</p>
<code>responseFieldName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the response object's field that's mapped to the field storing the score.</p>
<code>responseObject</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The object whose field is mapped to the field storing the score. It's either the <code>PrimaryResponseObject</code> or the <code>SecondaryResponseObject</code> specified in the <code>AIUsecaseDefinition</code> object.</p>
<code>sequenceNumber</code>	<p><b>Field Type</b> int</p> <p><b>Description</b> The sequence number for the information stored in the field mapping.</p>

## AIUsecaseModel

Represents information about the machine learning models that generate predictions for your use case.

Field Name	Description
aiFeatureExtractors	<p><b>Field Type</b> AIFeatureExtractor[]</p> <p><b>Description</b> The AI feature extractors to retrieve the input data.</p>
defaultFeatureExtractor	<p><b>Field Type</b> AIFeatureExtractor</p> <p><b>Description</b> The default AI feature extractor to retrieve the input data.</p>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> The unique name for the use case model.  Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is <b>Record Type Name</b>.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  A user-friendly name for the use case model, which is defined when the use case model is created.</p>
predictionDefinition	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  The unique identifier of the prediction definition that's related to the use case model. This identifier can be an external ID. If you use Einstein Discovery to create models, the <code>predictionDefinition</code> field stores the developer name of the record.</p>
predictionPlatform	<p><b>Field Type</b> PredictionPlatform (enumeration of type string)</p> <p><b>Description</b> Required.</p>

Field Name	Description
	<p>The platform on which the machine learning model is created and deployed. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Einstein_Discovery</code></li> <li>• <code>Default</code>—For internal use only.</li> </ul> <p>The default value is <code>Einstein_Discovery</code>. Available in API version 57.0 and later.</p>

## AIFeatureExtractor

Represents information about the feature extractor that's used to retrieve the input data for the use case model that's used to generate predictions.

Field Name	Description
<code>batchInputSourceIdentifier</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The identifier of the input source of the features computed by batch jobs, which can be used by a model for generating predictions. Available in API version 57.0 and later.</p>
<code>className</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The ID of the Apex class created for the feature extractor.</p>
<code>developerName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The unique name for the feature extractor. Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is <b>Record Type Name</b>.</p>
<code>extractorType</code>	<p><b>Field Type</b> ExtractorType (enumeration of type string)</p> <p><b>Description</b> Required.</p>

Field Name	Description
	<p>The type of the feature extractor.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• APEX</li> <li>• JAVA</li> <li>• HYBRID</li> </ul> <p>The default value is APEX.</p>
featureInputType	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>The type of feature input that's used in generating predictions. Valid values are:</p> <ul style="list-style-type: none"> <li>• Realtime_Input</li> <li>• Sample_Input</li> <li>• Batch_Input</li> <li>• Batch_And_Realtime_Input</li> </ul> <p>Available in API version 57.0 and later.</p>
inputContext	<p><b>Field Type</b> string</p> <p><b>Description</b> The JSON file with features that act as context for the feature extractor. This data can also include the data in the uploaded CSV file. Available in API version 57.0 and later.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>A user-friendly name for the feature extractor, which is defined when the feature extractor is created.</p>

## Declarative Metadata Sample Definition

The following is an example of an AIUsecaseDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<AIUsecaseDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <aiUsecaseFieldMappings>
    <developerName>DevName1</developerName>
    <mappedFieldName>Name</mappedFieldName>
  </aiUsecaseFieldMappings>
</AIUsecaseDefinition>
```

```

    <mappedFieldType>INSIGHT</mappedFieldType>
    <masterLabel>DevName</masterLabel>
    <responseFieldName>AnnualRevenue</responseFieldName>
    <responseObject>Lead</responseObject>
    <sequenceNumber>2</sequenceNumber>
  </aiUsecaseFieldMappings>
  <aiUsecaseFieldMappings>

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>*AIUsecaseDefinition*</name>
  </types>

```

```
<version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AnalyticSnapshot

Represents a reporting snapshot. A reporting snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object's fields with the report's data. Reporting snapshots enable you to work with report data similarly to how you work with other records in Salesforce.

## Declarative Metadata File Suffix and Directory Location

Lightning Platform AnalyticSnapshot components are stored in the `analyticSnapshots` directory of the corresponding package directory. The file name matches the unique name of the reporting snapshot, and the extension is `.snapshot`.

## Version

Lightning Platform AnalyticSnapshot components are available in API version 16.0 and later.

## Fields

Field	Field Type	Description
<code>description</code>	string	A description of the reporting snapshot.
<code>fullName</code>	string	The reporting snapshot name used for API access. The name can only contain characters, letters, and the underscore ( <code>_</code> ) character. It must start with a letter and can't end with an underscore or contain two consecutive underscore characters. This field is inherited from the <a href="#">Metadata</a> component.
<code>groupColumn</code>	string	A column that specifies which level to extract data from the source report. It's only applicable for summary reports.
<code>mappings</code>	<a href="#">AnalyticSnapshotMapping[]</a>	A list of reporting snapshot mappings. For valid values, see <a href="#">AnalyticSnapshotMapping</a> .
<code>name</code>	string	Required. The display name of the reporting snapshot.
<code>runningUser</code>	string	The username of the user whose role and <i>sharing</i> settings are used to run the reporting snapshot.
<code>sourceReport</code>	string	Required. The report where data is extracted from.

Field	Field Type	Description
targetObject	string	Required. The custom object where data is inserted.

## AnalyticSnapshotMapping

AnalyticSnapshotMapping defines the mapping for the reporting snapshot. Valid values are:

Field	Field Type	Description
aggregateType	<a href="#">ReportSummaryType[]</a> (enumeration of type string)	List that defines if and how each report field is summarized. For valid values, see <a href="#">ReportSummaryType</a> .
sourceField	string	The sourceField can be one of the following: <ul style="list-style-type: none"> <li>The field on the sourceReport that you want to map to the targetField in the targetObject</li> <li>A summary of a field on the sourceReport (for Summary reports only)</li> <li>A field on the reporting snapshot, such as JobName, RunningUser, or ExecutionTime (set through the user interface)</li> </ul> <p><b>Note:</b> The sourceField must correspond to the sourceType you specify.</p>
sourceType	<a href="#">ReportJobSourceTypes[]</a> (enumeration of type string)	List that defines the report format for the reporting snapshot. For valid values, see <a href="#">ReportJobSourceTypes</a> .
targetField	string	A field on the targetObject into which this particular sourceField is inserted.

## ReportJobSourceTypes

An enumeration of type string that defines the report format for the reporting snapshot. Valid values are:

Enumeration Value	Description
snapshot	Use this option if the sourceField contains snapshot-specific information such as JobName, RunningUser, or ExecutionTime.
summary	Use this option if referencing a summary (Sum, Average, Minimum, Maximum) of a field from the sourceReport.
tabular	Use this option if referencing an available column from the sourceReport.

## Declarative Metadata Sample Definition

Here's a sample XML definition of a reporting snapshot.

```
<?xml version="1.0" encoding="UTF-8"?>
<AnalyticSnapshot xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>my description</description>
  <groupColumn>INDUSTRY</groupColumn>
  <mappings>
```

```

    <aggregateType>Average</aggregateType>
    <sourceField>SALES</sourceField>
    <sourceType>summary</sourceType>
    <targetField> myObject __c.Name</targetField>
</mappings>
<mappings>
    <sourceField>ExecutionTime</sourceField>
    <sourceType>snapshot</sourceType>
    <targetField> myObject __c.field3__c</targetField>
</mappings>
<mappings>
    <sourceField>INDUSTRY</sourceField>
    <sourceType>tabular</sourceType>
    <targetField>testObject__c.Name</targetField>
</mappings>
<name>my snapshot</name >
<runningUser>user@salesforce.com</runningUser>
<sourceReport>myFolder/mytSummaryReport</sourceReport>
<targetObject>myObject__c</targetObject>
</AnalyticSnapshot>

```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

[Report](#)

## AnimationRule

---

Represents criteria for determining when an animation is displayed to Path users. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

AnimationRule components have the suffix `animationRule` and are stored in the `animationRules` folder.

## Version

AnimationRule components are available in API version 46.0 and later.

## Fields

Field Name	Field Type	Description
animationFrequency	picklist	<p>Required. The frequency with which an animation is displayed when a user selects the designated picklist values in a path. Valid values are:</p> <ul style="list-style-type: none"> <li>• always</li> <li>• often</li> <li>• sometimes</li> <li>• rarely</li> </ul> <p>A value of <code>always</code> triggers an animation every time. The values <code>often</code>, <code>sometimes</code>, and <code>rarely</code> trigger an animation progressively less frequently.</p>
developerName	string	<p>Required. The developer name for the animation rule.</p> <p> <b>Note:</b> Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
isActive	boolean	Required. Indicates whether the animation rule is active ( <code>true</code> ) or not ( <code>false</code> ).
masterLabel	string	Required. The label for the animation rule.
recordTypeContext	picklist	Required. An enum to track whether this AnimationRule applies to all record types for the associated sObject, or only to a single or main record type. Valid values are <code>All</code> , <code>Master</code> , or <code>Custom</code> .
recordTypeName	reference	The record type selected for the sObject in which the animation is displayed.
objectType	string	The object on which the animation rule is run.
targetField	string	Required. Name of the field used to determine when to display an animation.
targetFieldChangeToValues	string	Required. Values used to determine when to display an animation. When a user selects a value in <code>targetField</code> that matches a value stored in <code>targetFieldChangeToValues</code> , the animation is displayed.

## Declarative Metadata Sample Definition

The following is an example of an AnimationRule component.

```
<?xml version="1.0" encoding="UTF-8"?>
<AnimationRule xmlns="http://soap.sforce.com/2006/04/metadata">
  <animationFrequency>Always</animationFrequency>
  <developerName>AnimationRule_DeveloperName</developerName>
  <isActive>true</isActive>
  <masterLabel>AnimationRule Label</masterLabel>
</AnimationRule>
```

```

<recordTypeContext>All</recordTypeContext>
<recordTypeName>__MASTER__</recordTypeName>
<subjectType>Opportunity</subjectType>
<targetField>StageName</targetField>
<targetFieldChangeToValues>Delivered, Negotiating, Closed Won</targetFieldChangeToValues>
</AnimationRule>

```

The following is an example `package.xml` that references the `AnimationRule` component.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>PathAssistant</members>
    <name>Settings</name>
  </types>
  <types>
    <members>AnimationRule_Developer_Name</members>
    <name>AnimationRule</name>
  </types>
  <version>46.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ArticleType

Represents the metadata associated with an article type.

All articles in Salesforce Knowledge are assigned to an *article type*. An article's type determines the type of content it contains, its appearance, and which users can access it. For example, a simple FAQ article type can have two custom fields, `Question` and `Answer`, where article managers enter data when creating or updating FAQ articles. A more complex article type can have dozens of fields organized into several sections. Using layouts and templates, administrators can structure the article type in the most effective way for its particular content. User access to article types is controlled by permissions. For each article type, an administrator can grant "Create," "Read," "Edit," or "Delete" permissions to users. For example, the article manager can allow internal users to read, create, and edit FAQ article types, but let partner users only read FAQs. See "[Knowledge Article Types](#)" in the Salesforce online help and [Knowledge](#) in the *SOAP API Developer Guide*.

## Declarative Metadata File Suffix and Directory Location

An `ArticleType` is defined as a custom object and is stored in the `objects` folder. `ArticleTypes` have a suffix `__kav` (instead of `__c` for custom objects). `ArticleType` field names have a suffix of `__c` like other custom objects, and must be dot-qualified with the name of the article type to which they belong. This is shown in the following sample `package.xml` file:

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>articlefilemetadata</fullName>
  <apiAccessLevel>Unrestricted</apiAccessLevel>
  <types>

```

```

    <members>newarticle__kav.description__c</members>
    <name>CustomField</name>
  </types>
<types>
  <members>newarticle__kav</members>
  <name>CustomObject</name>
</types>
</Package>

```

## Version

ArticleTypes are available in API version 19.0 and later.

## Fields

Field Name	Field Type	Description
articleTypeChannelDisplay	<a href="#">articleTypeChannelDisplay</a>	Represents the article-type templates used to display an article in the various channels. See “ <a href="#">Article Type Templates</a> ” in the Salesforce online help.
deploymentStatus	DeploymentStatus ( <a href="#">enumeration</a> of type string)	A string which represents the deployment status of a custom object or field. Valid values are: <ul style="list-style-type: none"> <li>• InDevelopment</li> <li>• Deployed</li> </ul>
description	string	A description of the article type. Maximum of 1000 characters.
fields	<a href="#">CustomField[]</a>	Represents one or more fields in the article type.
gender	Gender	Indicates the gender of the noun that represents the object. This is used for languages where words need different treatment depending on their gender.
label	string	Label that represents the object throughout the Salesforce user interface.
pluralLabel	string	Plural version of the <a href="#">label</a> value.
startsWith	StartsWith ( <a href="#">enumeration</a> of type string)	Indicates whether the noun starts with a vowel, consonant, or is a special character. This is used for languages where words need different treatment depending on the first character. Valid values are listed in <a href="#">StartsWith</a> .

## ArticleTypeChannelDisplay

Determines the article-type templates that are used to display an article in its channels. Unless otherwise noted, all fields are createable, filterable, and nillable.

Field Name	Field Type	Description
articleTypeTemplates	ArticleTypeTemplate on page 276[]	Indicates which article-type template applies in the specified channel.

## ArticleTypeTemplate

Sets the article-type template for a specific channel. If not specified, the default article-type template applies.

Field Name	Field Type	Description
channel	string	Specifies the channel where the article-type template applies: <ul style="list-style-type: none"> <li>• AllChannels: all the available channels.</li> <li>• App: the Articles tab in Salesforce Knowledge.</li> <li>• Pkb: the public knowledge base.</li> <li>• Csp: the Customer Portal.</li> <li>• Prm: the partner portal.</li> </ul>
page	string	Represents the name of the custom Visualforce page used as a custom article-type template. Use this field when you select Page in the template field.
template	string	Indicates the article-type template used for the specified channel: <ul style="list-style-type: none"> <li>• Page: custom Visualforce page. When specifying this value, you must also set the page field with the Visualforce page name.</li> <li>• Tab: display the sections you defined in the layout as tabs.</li> <li>• Toc: display the sections you defined in the layout as table of content.</li> </ul>

## Declarative Metadata Sample Definitions

A sample article type definition follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <articleTypeChannelDisplay>
    <articleTypeTemplates>
      <channel>App</channel>
      <template>Tab</template>
    </articleTypeTemplates>
    <articleTypeTemplates>
      <channel>Prm</channel>
      <template>Tab</template>
    </articleTypeTemplates>
    <articleTypeTemplates>
      <channel>Csp</channel>
      <template>Tab</template>
    </articleTypeTemplates>
  </articleTypeChannelDisplay>
</CustomObject>
```

```

        <channel>Pkb</channel>
        <template>Toc</template>
    </articleTypeTemplates>
</articleTypeChannelDisplay>
<deploymentStatus>Deployed</deploymentStatus>
<description>Article type with custom fields</description>
<fields>
    <fullName>description__c</fullName>
    <label>Description</label>
    <length>48</length>
    <type>Text</type>
</fields>
<label>newarticle</label>
<pluralLabel>newarticles</pluralLabel>
</CustomObject>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

### ArticleType Layout

Represents the metadata associated with an article type page layout. Article type layouts determine which fields users can view and edit when entering data for an article. Article type layouts also determine which sections appear when users view articles.

### Channellayout

Represents the metadata associated with a communication channel layout. Communication channel layouts let admins share article content inline into communication channels (for example, in email publishers, Experience Builder sites, or social media publishers). Admins can create a list of fields for an article type or record type that they want to share for each communication channel. You can customize the order of the fields.

### ArticleType CustomField

Represents the metadata associated with an article type custom field. Use this metadata type to create, update, or delete article type custom field definitions.

[ArticleType CustomField](#)

## ArticleType Layout

Represents the metadata associated with an article type page layout. Article type layouts determine which fields users can view and edit when entering data for an article. Article type layouts also determine which sections appear when users view articles.

The format of the article, for example whether layout sections display as subtabs or as a single page with links, is defined by the [article-type template](#). Each article type has only one layout, but you can choose a different template for each of the article type's four channels. See [Knowledge](#) in *SOAP API Developer Guide*.

## File Suffix and Directory Location

ArticleType layouts are stored in the `layouts` directory of the corresponding package directory. The prefix must match with the article type API name. The extension is `.layout`.

## Version

ArticleType layouts are available in API version 19.0 and later.

## Fields

Field Name	Field Type	Description
<code>layoutSections</code>	<a href="#">LayoutSection[]</a>	The main sections of the layout containing the article fields. The order here determines the layout order.

## LayoutSection

LayoutSection represents a section of an ArticleType layout.

Field Name	Field Type	Description
<code>customLabel</code>	boolean	Indicates if this section's label is custom or standard (built-in). Custom labels can be any text, but must be translated. Standard labels have a predefined set of valid values, for example 'System Information', which are automatically translated.
<code>label</code>	string	The label; either standard or custom, based on the <code>customLabel</code> flag.
<code>layoutColumns</code>	<a href="#">LayoutColumn[]</a>	The columns of the layout, depending on the style. Salesforce Knowledge only supports one column in article type layouts.
<code>style</code>	LayoutSectionStyle (enumeration of type string)	The style of the layout. Salesforce Knowledge only supports the value <code>OneColumn</code> , which displays a one-column page.

## LayoutColumn

LayoutColumn represents the items in a column within a layout section.

Field Name	Field Type	Description
<code>layoutItems</code>	<a href="#">LayoutItem[]</a>	The individual items within a column (ordered from top to bottom).

## LayoutItem

LayoutItem represents the valid values that define a layout item.

Field Name	Field Type	Description
field	string	The field name reference, for example MyField__c.

## Declarative Metadata Sample Definition

The following is the definition of an ArticleType page layout:

```
<?xml version="1.0" encoding="UTF-8"?>
<Layout xmlns="http://soap.sforce.com/2006/04/metadata">
  <layoutSections>
    <customLabel>true</customLabel>
    <label>Description</label>
    <layoutColumns>
      <layoutItems>
        <field>description__c</field>
      </layoutItems>
      <layoutItems>
        <field>dateTime__c</field>
      </layoutItems>
    </layoutColumns>
    <style>OneColumn</style>
  </layoutSections>
  <layoutSections>
    <label>Data Sheet</label>
    <layoutColumns>
      <layoutItems>
        <field>file__c</field>
      </layoutItems>
    </layoutColumns>
    <style>OneColumn</style>
  </layoutSections>
</Layout>
```

SEE ALSO:

[ArticleType](#)

[ArticleType CustomField](#)

## ChannelLayout

Represents the metadata associated with a communication channel layout. Communication channel layouts let admins share article content inline into communication channels (for example, in email publishers, Experience Builder sites, or social media publishers). Admins can create a list of fields for an article type or record type that they want to share for each communication channel. You can customize the order of the fields.

## File Suffix and Directory Location

Channel layout components have the suffix `.channelLayout` and are stored in the `channelLayouts` folder of the corresponding package directory. The prefix must match with the article type API name. In Lightning Knowledge, the prefix must match the API name for the knowledge object.

## Version

Channel layout components are available in API version 32.0 and later.

## Fields

Field Name	Field Type	Description
<code>doesExcludeFieldLabels</code>	boolean	Indicates whether field labels are excluded from the field contents in the communication channels where this layout applies ( <code>true</code> ) or not ( <code>false</code> ). The default is <code>false</code> , meaning field labels are inserted. Available when Lightning Knowledge is enabled in API version 48.0 and later.
<code>doesExcludeFiles</code>	boolean	Indicates whether related files are left off emails ( <code>true</code> ) or attached to emails ( <code>false</code> ). The default is <code>false</code> , meaning related files are attached. Available when Lightning Knowledge is enabled in API version 48.0 and later.
<code>enabledChannels</code>	string[]	The communication channels where this layout applies. In API version 32.0 to 46.0, the only valid value is <code>Email</code> . When Lightning Knowledge is enabled in API version 47.0 and later, <code>Chat</code> , <code>Messaging</code> , and <code>Social</code> are added valid values.
<code>label</code>	string	Required. The label for this configuration.
<code>layoutItems</code>	<a href="#">ChannelLayoutItem</a> on page 280[]	The article fields contained in the layout. The order here determines the field order.
<code>recordType</code>	string	The name of the record type that the channel layout applies to. The default is the primary record type. Available in API version 41.0 and later.

## ChannelLayoutItem

Field Name	Field Type	Description
<code>field</code>	string	Required. Name of the field. The format is <code>ArticleTypeName.FieldName</code> or, in Lightning Knowledge, <code>KnowledgeBaseName.FieldName</code> .

## Declarative Metadata Sample Definition

The following is an example of a ChannelLayout component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ChannelLayout xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>Layout for Email</label>
  <layoutItems>
    <field>Knowledge.Question</field>
  </layoutItems>
</layoutItems>
```

```

    <field>Knowledge.Answer</field>
</layoutItems>
<enabledChannels>Email</enabledChannels>
<enabledChannels>Social</enabledChannels>
<enabledChannels>Chat</enabledChannels>
<doesExcludeFiles>>false</doesExcludeFiles>
<doesExcludeFieldLabels>>true</doesExcludeFieldLabels>
</ChannelLayout>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ChannelLayout</name>
  </types>
  <version>41.0</version>
</Package>

```

## ArticleType CustomField

Represents the metadata associated with an article type custom field. Use this metadata type to create, update, or delete article type custom field definitions.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

Always specify the full name whenever you create or update a custom field. For example, a custom field on a custom object:

```
MyArticleType__kav.MyCustomField__c
```

## Declarative Metadata File Suffix and Directory Location

Custom fields are defined as part of the article type. `ArticleType` field names have a suffix of `__c` like other custom objects, and must be dot-qualified with the name of the article type to which they belong. See [ArticleType](#) for more information.

## Retrieving Custom Fields on Custom or Standard Objects

When you retrieve a custom or standard object, you return everything associated with the object. However, you can also retrieve only the custom fields for an object by explicitly naming the object and fields in `package.xml`. The following definition in `package.xml` retrieves the files `objects/MyCustomObject__c.object`, `objects/Account.object__c.object`, and `objects/MyArticleType__kav.object`, each containing one custom field definition.

```

<types>
  <members>MyCustomObject__c.MyCustomField__c</members>
  <members>Account.MyCustomAccountField__c</members>
  <members>MyArticleType__kav.MyOtherCustomField__c</members>
  <name>CustomField</name>
</types>

```

## Version

ArticleTypes custom fields are available in API version 19.0 and later.

## Fields for ArticleType

Unless otherwise noted, all fields are createable, filterable, and nillable.

 **Note:** If you create a knowledge validation rule, the errors always display at the top of the page, even if you add it beside the field. Therefore, write the errors descriptively so authors know how to satisfy the validation rule. For example, identify which field is causing the error. The Salesforce Classic user interface does not support field level error messages for articles.

Field Name	Field Type	Description
defaultValue	string	If specified, represents the default value of the field. This field was deprecated in API version 48.0.
deleteConstraint	<a href="#">Metadata Field Types</a> (enumeration of type string)	Provides deletion options for lookup relationships. Valid values are: <ul style="list-style-type: none"> <li>• <code>Cascade</code>—Deletes the lookup record as well as associated lookup fields.</li> <li>• <code>Restrict</code>—Prevents the record from being deleted if it's in a lookup relationship.</li> <li>• <code>SetNull</code>—This is the default. If the lookup record is deleted, the lookup field is cleared.</li> </ul> For more information on lookup relationships, see "Object Relationships" in Salesforce Help.
description	string	Description of the field.
formula	string	If specified, represents a formula on the field.
formulaTreatBlankAs	<a href="#">Metadata Field Types</a> (enumeration of type string)	Indicates how to treat blanks in a formula. Valid values are: <code>BlankAsBlank</code> and <code>BlankAsZero</code> .
fullName	string	Inherited from <a href="#">Metadata</a> , this field is defined in the WSDL for this metadata type. It must be specified when creating, updating, or deleting. See <a href="#">createMetadata()</a> to see an example of this field specified for a call.  This value cannot be <code>null</code> .
inlineHelpText	string	Represents the content of field-level help. For more information, see "Define Field-Level Help" in Salesforce Help.
label	string	Label for the field. You cannot update the label for standard fields in Article Type such as Title, UrlName, Summary, etc.
length	int	Length of the field.
picklist	<a href="#">Picklist (Including Dependent Picklist)</a>	<b>(Deprecated.)</b> Use this field in API version 37.0 and earlier only. In later versions, use <code>valueSet</code> instead.) If specified, the field

Field Name	Field Type	Description
		is a picklist, and this field enumerates the picklist values and labels.
referenceTo	string	If specified, indicates a reference this field has to another object.
relationshipLabel	string	Label for the relationship.
relationshipName	string	If specified, indicates the value for one-to-many relationships. For example, in the object MyObject that had a relationship to YourObject, the relationship name might be YourObjects.
required	boolean	Indicates whether the field requires a value on creation ( <code>true</code> ) or not ( <code>false</code> ).
type	FieldType	Required. Indicates the field type for the field. Valid values are: <ul style="list-style-type: none"> <li>• <code>Checkbox</code> available in version 30.0 and later</li> <li>• <code>Currency</code></li> <li>• <code>ArticleCurrency</code></li> <li>• <code>Date</code></li> <li>• <code>DateTime</code></li> <li>• <code>Email</code></li> <li>• <code>File</code></li> <li>• <code>Formula</code></li> <li>• <code>Html</code></li> <li>• <code>Lookup</code></li> <li>• <code>Number</code></li> <li>• <code>Percent</code></li> <li>• <code>Phone</code></li> <li>• <code>Picklist</code></li> <li>• <code>DependentPicklist</code></li> <li>• <code>MultiselectPicklist</code></li> <li>• <code>Text</code></li> <li>• <code>TextArea</code></li> <li>• <code>LongTextArea</code></li> <li>• <code>URL</code></li> </ul>
visibleLines	int	Indicates the number of lines displayed for the field.

## Declarative Metadata Sample Definition

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <fields>
    <fullName>Comments__c</fullName>
  </fields>
</CustomObject>
```

```

    <description>add your comments about this object here</description>
    <label>Comments</label>
    <length>32000</length>
    <type>LongTextArea</type>
    <visibleLines>30</visibleLines>
  </fields>
</CustomObject>

```

[ArticleType](#)

[ArticleType Layout](#)

## ApexClass

---

Represents an Apex class. An Apex class is a template or blueprint from which Apex objects are created. Classes consist of other classes, user-defined methods, variables, exception types, and static initialization code.

For more information, see the [Lightning Platform Apex Code Developer's Guide](#). This type extends the [MetadataWithContent](#) metadata type and inherits its `content` and `fullName` fields.

 **Note:** By default, you can't deploy updates to an Apex class if there are one or more active jobs for that class. To deploy updates in this case, do one of the following.

- Cancel Apex jobs before deploying changes to Apex code. Reschedule the jobs after the deployment.
- Enable deployments with Apex jobs in the Salesforce user interface in the Deployment Settings page.

## Supported Calls

All Metadata API calls except [CRUD-Based Calls](#), which prevents deployment outside of proper deployment lifecycle and test-execution constraints.

## Declarative Metadata File Suffix and Directory Location

The file suffix is `.cls` for the class file. The accompanying metadata file is named `ClassName-meta.xml`.

Apex classes are stored in the `classes` folder in the corresponding package directory.

## Version

Apex classes are available in API version 10.0 and later.

## Fields

This metadata type contains the following fields:

Field Name	Field Type	Description
<code>apiVersion</code>	double	The API version for this class. Every class has an API version specified at creation.

Field Name	Field Type	Description
content	base64	The Apex class definition. Base 64-encoded binary data. Before making an API call, client applications must encode the binary attachment data as base64. Upon receiving a response, client applications must decode the base64 data to binary. This conversion is handled for you by a SOAP client. This field is inherited from the <a href="#">MetadataWithContent</a> component.
fullName	string	The Apex class name. The name can only contain characters, letters, and the underscore ( <code>_</code> ) character, must start with a letter, and can't end with an underscore or contain two consecutive underscore characters. This field is inherited from the <a href="#">Metadata</a> component.
packageVersions	<a href="#">PackageVersion</a> []	The list of installed managed package versions that are referenced by this Apex class.  For more information about managed packages, see <a href="#">Second-Generation Managed Packages</a> in the <i>Salesforce DX Developer Guide</i> . This field is available in API version 16.0 and later.
status	ApexCodeUnitStatus ( <a href="#">enumeration</a> of type string)	The status of the Apex class. The following string values are valid: <ul style="list-style-type: none"> <li>• <code>Active</code> - The class is active.</li> <li>• <code>Deleted</code> - The class is marked for deletion. This value is useful for managed packages, because it allows a class to be deleted when a managed package is updated.</li> </ul> <p>ApexCodeUnitStatus includes an <code>Inactive</code> option, but it's only supported for <a href="#">ApexTrigger</a>; it isn't supported for ApexClass.</p>

## PackageVersion

PackageVersion identifies a version of a managed package. A package version is a number that identifies the set of components included in a package. The version number has the format `majorNumber.minorNumber.patchNumber` (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The `patchNumber` is generated and updated only for a patch release. It's available in API version 16.0 and later.

Field Name	Field Type	Description
namespace	string	Required. In a packaging context, a namespace prefix is a one to 15-character alphanumeric identifier that distinguishes your package and its contents from packages of other developers on AppExchange. Namespace prefixes are case-insensitive. For example, ABC and abc aren't recognized as unique. Your namespace prefix must be globally unique across all Salesforce orgs.  Salesforce automatically prepends your namespace prefix, followed by two underscores ( <code>__</code> ), to all unique component names in your Salesforce organization. A unique package component is one that requires a name that no other component has within Salesforce, such as custom objects, custom fields, custom links, s-controls, and validation rules. For more information about

Field Name	Field Type	Description
		namespaces, see <a href="#">Create and Register Your Namespace</a> in the <i>Second-Generation Managed Packaging Developer Guide</i> .
majorNumber	int	Required. The major number of the package version. A package version number has a <i>majorNumber.minorNumber</i> format.
minorNumber	int	Required. The minor number of the package version. A package version number has a <i>majorNumber.minorNumber</i> format.

## Declarative Metadata Sample Definition

The following sample creates the `MyHelloWorld.cls` class, and the corresponding `MyHelloWorld.cls-meta.xml` metadata file.

`MyHelloWorld.cls` file:

```
public class MyHelloWorld {
// This method updates the Hello field on a list
// of accounts.
public static void addHelloWorld(Account[] accs){
    for (Account a:accs){
        if (a.Hello__c != 'World')
            a.Hello__c = 'World';
        }
    }
}
```

`MyHelloWorld.cls-meta.xml`:

```
<?xml version="1.0" encoding="UTF-8"?>
<ApexClass xmlns="http://soap.sforce.com/2006/04/metadata">
    <apiVersion>62.0</apiVersion>
</ApexClass>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[ApexTrigger](#)

## ApexComponent

Represents a Visualforce component.

For more information, see Visualforce in Salesforce Help and [StaticResource: MetadataWithContent](#) on page 2037

## Declarative Metadata File Suffix and Directory Location

The file suffix is `.component` for the page file. The accompanying metadata file is named `ComponentName-meta.xml`.

Visualforce components are stored in the `components` folder in the corresponding package directory.

## Version

Visualforce components are available in API version 12.0 and later.

## Fields

This metadata type contains the following fields:

Field Name	Field Type	Description
<code>apiVersion</code>	double	The API version for this Visualforce component. Every component has an API version specified at creation. This field is available in API version 16.0 and later.
<code>content</code>	base64Binary	The component content. Base 64-encoded binary data. Before making an API call, client applications must encode the binary attachment data as base64. Upon receiving a response, client applications must decode the base64 data to binary. This conversion is handled for you by a SOAP client. This field is inherited from the <a href="#">MetadataWithContent</a> component.
<code>description</code>	string	A description of what the component does.
<code>fullName</code>	string	The component developer name used as a unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component.
<code>label</code>	string	Required. The label for this component.
<code>packageVersions</code>	<a href="#">PackageVersion</a> []	<p>The list of installed managed package versions that are referenced by this Visualforce component.</p> <p>Package components and Visualforce custom component are distinct concepts. A package is comprised of many elements, such as custom objects, Apex classes and triggers, and custom pages and components.</p> <p>For more information about managed packages, see <a href="#">Second-Generation Managed Packages</a> in the <i>Salesforce DX Developer Guide</i>. This field is available in API version 16.0 and later.</p>

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[ApexPage](#)

## ApexEmailNotifications

---

The `ApexEmailNotifications` type allows you to define users and email addresses that receive email for unhandled Apex errors. Flow errors can also use this metadata type.

### Declarative Metadata File Suffix and Directory Location

The component filename is `apexEmailNotifications.notifications`. The Apex email notification file is stored in the `apexEmailNotifications` folder in the corresponding package directory.

### Version

`ApexEmailNotifications` components are available in API version 49.0 and later.

### Fields

Field Name	Field Type	Description
<code>apexEmailNotification</code>	<a href="#">ApexEmailNotification</a>	A specific Apex email notification. You can specify multiple notifications.

### ApexEmailNotification

Represents an Apex email notification.

 **Note:** Each `ApexEmailNotification` can contain an email or a user but not both.

Field Name	Field Type	Description
<code>email</code>	string	The external email address to which the notification is sent. Mutually exclusive with the <code>user</code> field.
<code>user</code>	string	The username of the Salesforce user to be notified. Mutually exclusive with the <code>email</code> field.

## Usage

Deploying ApexEmailNotifications deletes all previous notifications in the org. For example, consider two notifications, test1@example.com and test2@example.com, that are deployed in an org. When the following apexEmailNotifications.notifications is deployed, test1@example.com is deleted, because it's not in the deployed list.

```
<?xml version="1.0" encoding="UTF-8"?>
<ApexEmailNotifications xmlns="http://soap.sforce.com/2006/04/metadata">
  <apexEmailNotification>
    <email>test2@example.com</email>
  </apexEmailNotification>
</ApexEmailNotifications>
```

 **Note:** The ApexEmailNotifications metadata type isn't supported in destructiveChanges.xml. To delete specific ApexEmailNotification items, deploy a new ApexEmailNotifications without those items. To delete all Apex email notifications in an org, deploy an empty list of ApexEmailNotifications.

## Declarative Metadata Sample Definition

To deploy Apex email notifications, you can specify either the exact file name or use a wildcard in package.xml.

This example specifies the exact file name in package.xml.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>apexEmailNotifications</members>
    <name>ApexEmailNotifications</name>
  </types>
  <version>49.0</version>
</Package>
```

This example uses a wildcard in package.xml.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ApexEmailNotifications</name>
  </types>
  <version>49.0</version>
</Package>
```

This sample deploys an Apex email notification that notifies a Salesforce user in the org.

```
<?xml version="1.0" encoding="UTF-8"?>
<ApexEmailNotifications xmlns="http://soap.sforce.com/2006/04/metadata">
  <apexEmailNotification>
    <user>user1@example.com</user>
  </apexEmailNotification>
</ApexEmailNotifications>
```

This sample deploys an Apex email notification that notifies an external email address.

```
<?xml version="1.0" encoding="UTF-8"?>
<ApexEmailNotifications xmlns="http://soap.sforce.com/2006/04/metadata">
```

```
<apexEmailNotification>
  <email>test@example.com</email>
</apexEmailNotification>
</ApexEmailNotifications>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ApexPage

---

Represents a Visualforce page.

For more information, see *Visualforce* in Salesforce Help. This type extends the [MetadataWithContent](#) metadata type and inherits its `content` and `fullName` fields.

## Declarative Metadata File Suffix and Directory Location

The file suffix is `.page` for the page file. The accompanying metadata file is named `PageName-meta.xml`.

Visualforce pages are stored in the `pages` folder in the corresponding package directory.

## Version

Visualforce pages are available in API version 11.0 and later.

## Fields

This metadata type contains the following fields:

Field Name	Field Type	Description
<code>apiVersion</code>	double	Required. The API version for this page. Every page has an API version specified at creation. This field is available in API version 15.0 and later. If you set this field to a number lower than 15.0, it's changed to 15.0.
<code>content</code>	base64Binary	The page content. Base 64-encoded binary data. Before making an API call, client applications must encode the binary attachment data as base64. Upon receiving a response, client applications must decode the base64 data to binary. This conversion is handled for you by a SOAP client. This field is inherited from the <a href="#">MetadataWithContent</a> component.
<code>description</code>	string	A description of what the page does.
<code>fullName</code>	string	The page developer name used as a unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces,

Field Name	Field Type	Description
		not end with an underscore, and not contain two consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component.
availableInTouch	boolean	Indicates if Visualforce tabs associated with the Visualforce page can be used in the Salesforce mobile app. (Use of this field for Salesforce Touch is deprecated.). This field is available in API version 27.0 and later.  Standard object tabs that are overridden with a Visualforce page aren't supported in the Salesforce mobile app, even if you set this field for the page. The default page for the object is displayed instead of the Visualforce page.
confirmationTokenRequired	boolean	Indicates whether <code>GET</code> requests for the page require a CSRF confirmation token. This field is available in API version 28.0 and later.  If you change this field's value from <code>false</code> to <code>true</code> , links to the page require a CSRF token to be added to them, or the page is inaccessible.
label	string	Required. The label for this page.
packageVersions	<a href="#">PackageVersion</a> []	The list of installed managed package versions that are referenced by this Visualforce page.  For more information about managed packages, see <a href="#">Second-Generation Managed Packages</a> in the <i>Salesforce DX Developer Guide</i> . This field is available in API version 16.0 and later.

## Declarative Metadata Sample Definition

The following sample creates the `MyPage.page` page, and the corresponding `MyPage.page-meta.xml` metadata file.

SampleApexPage.page file:

```
<apex:page>
<h1>Congratulations</h1>
This is your new Page.
</apex:page>
```

SampleApexPage.page-meta.xml:

```
<?xml version="1.0" encoding="UTF-8"?>
<ApexPage xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>This is a sample Visualforce page.</description>
  <label>SampleApexPage</label>
</ApexPage>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[ApexComponent](#)

## ApexTestSuite

---

Represents a suite of Apex test classes to include in a test run.

### File Suffix and Directory Location

ApexTestSuite components have the suffix `.testSuite` and are stored in the `testSuites` folder.

### Version

ApexTestSuite components are available in API version 38.0 and later.

### Fields

Field Name	Field Type	Description
<code>testClassName</code>	<code>string[]</code>	A list of Apex test classes, specified by name, to include in this test suite.

## Declarative Metadata Sample Definition

To include namespaced tests in an Apex test suite, specify each namespace individually. Local Apex tests consist of all tests in the org that don't originate from managed packages.

```
<?xml version="1.0" encoding="UTF-8"?>
<ApexTestSuite xmlns="http://soap.sforce.com/2006/04/metadata">
  <testClassName>LocalTestClass</testClassName>
  <!-- LocalTestClass adds the test class named LocalTestClass. -->
  <testClassName>A*Class</testClassName>
  <!-- A*Class adds AClass, AnotherClass, AwesomeClass, and so on. -->
  <testClassName>Namespace1.NamespaceedTestClass</testClassName>
  <testClassName>*</testClassName> <!-- Adds all local tests. -->
  <testClassName>Namespace1.*</testClassName> <!-- Adds all tests in Namespace1. -->
  <testClassName>Namespace2.*</testClassName> <!-- Adds all tests in Namespace2. -->
</ApexTestSuite>
```

These syntaxes are supported in `package.xml`. If the test classes in your suites are already present in the target org, you can omit the `ApexClass` type in `package.xml`.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ApexClass</name>
  </types>
  <types>
    <members>*</members>
    <name>ApexTestSuite</name>
  </types>
  <version>38.0</version>
</Package>
```

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ApexClass</name>
  </types>
  <types>
    <members>Suite1</members>
    <members>Suite2</members>
    <name>ApexTestSuite</name>
  </types>
  <version>38.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ApexTrigger

Represents an Apex trigger. A trigger is Apex code that executes before or after specific data manipulation language (DML) events occur, such as before object records are inserted into the database, or after records have been deleted.

For more information, see “Manage Apex Triggers” in Salesforce Help. This type extends the [MetadataWithContent](#) metadata type and inherits its `content` and `fullName` fields.

## Supported Calls

All Metadata API calls except [CRUD-Based Calls](#), which prevents deployment outside of proper deployment lifecycle and test-execution constraints.

## Declarative Metadata File Suffix and Directory Location

The file suffix is `.trigger` for the trigger file. The accompanying metadata file is named `TriggerName-meta.xml`.

Apex triggers are stored in the `triggers` folder in the corresponding package directory.

## Version

Triggers are available in API version 10.0 and later.

## Fields

This metadata type contains the following fields:

Field Name	Field Type	Description
<code>apiVersion</code>	double	Required. The API version for this trigger. Every trigger has an API version specified at creation.
<code>content</code>	base64	The Apex trigger definition. This field is inherited from the <a href="#">MetadataWithContent</a> component.
<code>fullName</code>	string	The Apex trigger name. The name can only contain characters, letters, and the underscore ( <code>_</code> ) character, must start with a letter, and can't end with an underscore or contain two consecutive underscore characters. This field is inherited from the <a href="#">Metadata</a> component.
<code>packageVersions</code>	<a href="#">PackageVersion</a> []	The list of installed managed package versions that are referenced by this Apex trigger.  For more information about managed packages, see the <a href="#">Second-Generation Managed Packaging Developer Guide</a> . This field is available in API version 16.0 and later.
<code>status</code>	ApexCodeUnitStatus ( <a href="#">enumeration</a> of type string)	Required. The status of the Apex trigger. The following string values are valid: <ul style="list-style-type: none"> <li><code>Active</code> - The trigger is active.</li> <li><code>Inactive</code> - The trigger is inactive, but not deleted.</li> <li><code>Deleted</code> - The trigger is marked for deletion. Useful for managed packages, because it allows a trigger to be deleted when a managed package is updated.</li> </ul>

## Declarative Metadata Sample Definition

The following sample creates the `MyHelloWorld.trigger` trigger, and the corresponding `MyHelloWorld.trigger-meta.xml` metadata file.

`MyHelloWorld.trigger` file:

```
trigger HelloWorldAccountTrigger on Account (before insert) {

    Account[] accs = Trigger.new;

    MyHelloWorld.addHelloWorld(accs);
}
```

MyHelloWorld.trigger-meta.xml:

```
<?xml version="1.0" encoding="UTF-8"?>
<ApexTrigger xmlns="http://soap.sforce.com/2006/04/metadata">
  <apiVersion>62.0</apiVersion>
</ApexTrigger>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[ApexClass](#)

## AppMenu

---

Represents the app menu or the Salesforce mobile navigation menu. Reserved for future use.

## AppointmentAssignmentPolicy

---

Represents the information about a resource assignment rule. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

AppointmentAssignmentPolicy components have the suffix `.policy` and are stored in the `appointmentSchedulingPolicies` folder.

## Version

AppointmentSchedulingPolicy components are available in API version 53.0 and later.

## Fields

Field Name	Field Type	Description
<code>masterLabel</code>	string	Required. The label for the appointment assignment policy.
<code>policyApplicableDuration</code>	string	Required. The frequency at which the utilization of service resources is calculated. Valid values are: <ul style="list-style-type: none"> <li>Monthly</li> <li>ParameterBased</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>Weekly</li> </ul>
policyType	string	Required. The type of appointment assignment policy. Valid value is: <ul style="list-style-type: none"> <li>loadBalancing</li> </ul>
utilizationFactor	string	Required. Specifies the count type for the resource utilization. Valid values are: <ul style="list-style-type: none"> <li>NumberOfAppointments</li> <li>TotalAppointmentDuration</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of an appointmentAssignmentPolicy component.

```
<?xml version="1.0" encoding="UTF-8"?>
<AppointmentAssignmentPolicy xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>loadBalancing Assignment Policy</masterLabel>
  <policyType>loadBalancing</policyType>
  <policyApplicableDuration>Weekly</policyApplicableDuration>
  <utilizationFactor>TotalAppointmentDuration</utilizationFactor>
</AppointmentAssignmentPolicy>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>sample</members>
    <name>AppointmentAssignmentPolicy</name>
  </types>
  <version>53.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AppointmentSchedulingPolicy

Represents a set of rules for scheduling appointments using Lightning Scheduler. This type extends the [Metadata](#) metadata type and inherits its fullName field.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

AppointmentSchedulingPolicy components have the suffix `.policy` and are stored in the `appointmentSchedulingPolicies` folder.

## Version

AppointmentSchedulingPolicy components are available in API version 47.0 and later.

## Special Access Rules

You must have the ViewSetup and CustomizeApplication user permissions to access the AppointmentSchedulingPolicy type.

## Fields

Field Name	Field Type	Description
<code>appointmentAssignmentPolicy</code>	string	The name of the appointment assignment policy. This field is available in API version 53.0 and later.
<code>appointmentStartTimeInterval</code>	picklist	<p>Required. The proposed time interval in minutes between appointment start times. For example, if you set the interval to 15, appointments can then begin at the top of the hour and at 15-minute intervals thereafter (10:00 AM, 10:15 AM, 10:30 AM, and so on). Valid values are:</p> <ul style="list-style-type: none"> <li>• 5</li> <li>• 10</li> <li>• 15</li> <li>• 20</li> <li>• 30</li> <li>• 45</li> <li>• 60</li> <li>• 90</li> <li>• 120</li> <li>• 150</li> <li>• 180</li> <li>• 240</li> <li>• 300</li> <li>• 360</li> <li>• 420</li> <li>• 480</li> </ul>
<code>extCalEventHandler</code>	lookup	Required. The API name of the custom Apex class that checks service resources' external calendar events and returns the time slots where

Field Name	Field Type	Description
		service resources are already booked. Available in API version 50.0 and later.
isSvcTerritoryMemberShiftUsed	boolean	Required. Indicates whether to consider shifts of service territory members when determining the availability of service resources for appointments ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 54.0 and later.
isSvcTerrOpHoursWithShiftsUsed	boolean	Required. Indicates whether to consider the intersection of shifts and service territory operating hours when determining the availability of service resources for appointments ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 54.0 and later.
masterLabel	string	Required. The label for the appointment scheduling policy.
shouldCheckExternalCalendar	boolean	Required. Indicates whether to check the external calendar for resource availability ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 53.0 and later.
shouldConsiderCalendarEvents	boolean	Required. Indicates whether to consider events on the Salesforce calendar to determine the availability of service resources to be assigned to appointments ( <code>true</code> ) or not ( <code>false</code> ).
shouldEnforceExcludedResource	boolean	Required. Indicates whether this appointment scheduling policy prevents excluded service resources from being assigned to appointments ( <code>true</code> ) or not ( <code>false</code> ).
shouldEnforceRequiredResource	boolean	Required. Indicates whether this appointment scheduling policy allows only required service resources to be assigned to appointments ( <code>true</code> ) or not ( <code>false</code> ).
shouldMatchSkill	boolean	Required. Indicates whether this appointment scheduling policy allows only required service resources who have certain skills to be assigned to appointments ( <code>true</code> ) or not ( <code>false</code> ).
shouldMatchSkillLevel	boolean	Required. Indicates whether this appointment scheduling policy allows only required service resources who have certain skills and skill levels to be assigned to appointments ( <code>true</code> ) or not ( <code>false</code> ).
shouldRespectVisitingHours	boolean	Required. Indicates whether this appointment scheduling policy prevents users from scheduling appointments outside of an account's visiting hours ( <code>true</code> ) or not ( <code>false</code> ).
shouldUsePrimaryMembers	boolean	Required. Indicates whether this appointment scheduling policy allows only service resources who are primary members of a service territory to be assigned to appointments ( <code>true</code> ) or not ( <code>false</code> ).
shouldUseSecondaryMembers	boolean	Required. Indicates whether this appointment scheduling policy allows service resources who are secondary members of a service territory to be assigned to appointments ( <code>true</code> ) or not ( <code>false</code> ).

## Declarative Metadata Sample Definition

The following is an example of an appointmentSchedulingPolicy component.

```
<?xml version="1.0" encoding="UTF-8"?>
<AppointmentSchedulingPolicy xmlns="http://soap.sforce.com/2006/04/metadata">
  <appointmentAssignmentPolicy>ResourceAssignmentRule1</appointmentAssignmentPolicy>
  <appointmentStartTimeInterval>15</appointmentStartTimeInterval>
  <masterLabel>Default Appointment Scheduling Policy</masterLabel>
  <shouldCheckExternalCalendar>true</shouldCheckExternalCalendar>
  <shouldConsiderCalendarEvents>true</shouldConsiderCalendarEvents>
  <shouldEnforceExcludedResource>true</shouldEnforceExcludedResource>
  <shouldEnforceRequiredResource>true</shouldEnforceRequiredResource>
  <shouldMatchSkill>true</shouldMatchSkill>
  <shouldMatchSkillLevel>false</shouldMatchSkillLevel>
  <shouldRespectVisitingHours>true</shouldRespectVisitingHours>
  <shouldUsePrimaryMembers>true</shouldUsePrimaryMembers>
  <shouldUseSecondaryMembers>true</shouldUseSecondaryMembers>
</AppointmentSchedulingPolicy>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>sample</members>
    <name>AppointmentSchedulingPolicy</name>
  </types>
  <version>47.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ApprovalProcess

---

Represents the metadata associated with an approval process. An approval process automates how records are approved in Salesforce. An approval process specifies each step of approval, including who to request approval from and what to do at each point of the process.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### Note:

- To use approval processes on Salesforce Knowledge articles with the Metadata API, the article type must be deployed. For article version (`_kav`) in approval processes, the supported action types are: Knowledge Action, Email Alert, Field Update, and Outbound Message.
- Send actions and approval processes for email drafts aren't supported in the Metadata API.
- The metadata doesn't include the order of active approval processes. Sometimes you have to reorder the approval processes in the destination org after deployment.

- Before you implement an approval process for your organization, see [Limits and Considerations for Approvals](#) in Salesforce Help.

## File Suffix and Directory Location

ApprovalProcess components have the suffix `.approvalProcess` and are stored in the `approvalProcesses` folder.

## Version

ApprovalProcess components are available in API version 28.0 and later.

## Fields

Field Name	Field Type	Description
<code>active</code>	boolean	Required. Whether the approval process is active.  After an approval process is activated, you can't add, delete, or change the order of the steps or change its reject or skip behavior, even if the process is inactive.
<code>allowRecall</code>	boolean	Whether to allow submitters to recall approval requests.  If set to <code>false</code> , only administrators can recall approval requests.
<code>allowedSubmitters</code>	<a href="#">ApprovalSubmitter[]</a>	Required. An array of users who are allowed to submit records for approval.
<code>approvalPageFields</code>	<a href="#">ApprovalPageField</a>	Specifies which fields to display on the approval page, where the approver goes to approve or reject the record. By default, the approval page displays the following: <ul style="list-style-type: none"> <li>• <code>Name</code> field</li> <li>• <code>Owner</code> field (except for child objects)</li> </ul> If you enable notifications in the Salesforce mobile app, keep in mind that approvers can view this list of fields on a mobile device. Select only the fields necessary for users to decide whether to approve or reject records.
<code>approvalStep</code>	<a href="#">ApprovalStep[]</a>	An array of approval step definitions.
<code>description</code>	string	Describes the approval process.
<code>emailTemplate</code>	string	Specifies which Classic email template to use for approval requests. If not specified, the default email template is used.  Lightning email templates aren't packageable. We recommend using a Classic email template.  When an approval process assigns an approval request to a user, Salesforce sends the user an approval request email.

Field Name	Field Type	Description
<code>enableMobileDeviceAccess</code>	boolean	<p>Whether users can access an external version of the approval page from any browser, including browsers on mobile devices, without logging in to Salesforce. Corresponds to <code>Security Settings</code> in the user interface.</p> <p>If set to <code>true</code>, approval steps can't have approvers of type <code>adhoc</code>.</p> <p>If set to <code>false</code>, approvers must log in to Salesforce to access the approval page.</p>
<code>entryCriteria</code>	<a href="#">ApprovalEntryCriteria</a>	<p>Determines which records can enter the approval process. Exclude this field to allow all records to enter the approval process.</p> <p>When you deploy an approval process with no entry criteria to overwrite an existing approval process with entry criteria, then the entry criteria from the existing process are applied to the deployed process.</p>
<code>finalApprovalActions</code>	<a href="#">ApprovalAction</a>	Specifies which workflow actions to execute when all required approvals have been given for a record.
<code>finalApprovalRecordLock</code>	boolean	Whether to keep the record locked after it receives all necessary approvals. Default: <code>false</code> .
<code>finalRejectionActions</code>	<a href="#">ApprovalAction</a>	Specifies which workflow actions to execute after a record enters the final rejection state.
<code>finalRejectionRecordLock</code>	boolean	Whether to keep the record locked after it's finally rejected. Default: <code>false</code> .
<code>initialSubmissionActions</code>	<a href="#">ApprovalAction</a>	Specifies which workflow actions to execute when a record is initially submitted for approval.
<code>label</code>	string	Required. Name of the approval process.
<code>nextAutomatedApprover</code>	<a href="#">NextAutomatedApprover</a>	<p>Specifies a standard or custom user hierarchy field that can be used to automatically assign the approver for an approval step.</p> <p>If you exclude this field, then no approval step can use a user hierarchy field to automatically assign the approver.</p>
<code>postTemplate</code>	string	<p>Post template to use for Approvals in Chatter.</p> <p>Chatter post approval notifications are only available for approval processes associated with an object that has been enabled for feed tracking.</p>
<code>recallActions</code>	<a href="#">ApprovalAction</a>	Specifies which workflow actions to execute when a pending approval request is withdrawn.
<code>recordEditability</code>	RecordEditabilityType (enumeration of type string)	Specifies which users can edit records that are pending approval. When a record is submitted for approval, it's

Field Name	Field Type	Description
		<p>automatically locked to prevent other users from editing it during the approval process. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>AdminOnly</code>—Records pending approval can be edited by: <ul style="list-style-type: none"> <li>– Users with the “Modify All Data” permission</li> <li>– Users with the “Modify All” object-level permission for the given object</li> </ul> </li> <li>• <code>AdminOrCurrentApprover</code>—Records pending approval can be edited by: <ul style="list-style-type: none"> <li>– Users with the “Modify All Data” permission</li> <li>– Users with the “Modify All” object-level permission for the given object</li> <li>– The assigned approver, who must have edit access to the record through user permissions and the organization-wide sharing defaults for the given object</li> </ul> </li> </ul>
<code>showApprovalHistory</code>	boolean	<p>Whether to add the Approval History related list to the approval page, which is where the approver can view the approval request details and approve or reject the record. The Approval History related list tracks a record through the approval process.</p> <p>If you also want to add the Approval History related list to record detail and edit pages, use the Salesforce user interface to customize the page layouts for the given object.</p>

## ApprovalSubmitter

Represents a user or set of users who can submit records for approval.

Field Name	Field Type	Description
<code>submitter</code>	string	<p>Identifies a specific user or set of users who can submit records for approval. This field is required, except when the following types are specified and the <code>submitter</code> field is ignored:</p> <ul style="list-style-type: none"> <li>• <code>owner</code></li> <li>• <code>creator</code></li> <li>• <code>allInternalUsers</code></li> </ul> <p>Example:</p> <pre>&lt;allowedSubmitters&gt;   &lt;type&gt;allInternalUsers&lt;/type&gt; &lt;/allowedSubmitters&gt; &lt;allowedSubmitters&gt;</pre>

Field Name	Field Type	Description
		<pre>&lt;submitter&gt;myGroup&lt;/submitter&gt; &lt;type&gt;group&lt;/type&gt; &lt;/allowedSubmitters&gt;</pre>
type	ProcessSubmitterType (enumeration of type string)	<p>Required. Type of user or set of users who can submit records for approval. Valid values are:</p> <ul style="list-style-type: none"> <li>• group</li> <li>• role</li> <li>• user</li> <li>• roleSubordinates</li> <li>• roleSubordinatesInternal</li> <li>• owner</li> <li>• creator</li> <li>• partnerUser</li> <li>• customerPortalUser</li> <li>• portalRole</li> <li>• portalRoleSubordinates</li> <li>• allInternalUsers—all Salesforce users in the organization</li> </ul>

## ApprovalPageField

Represents the selection of fields to display on the approval page, where an approver can view the approval request details and approve or reject the record.

Field Name	Field Type	Description
field	string[]	An array of fields that are displayed on the page for the approver to approve or reject the record.

## ApprovalStep

Represents a step in the approval process. Approval steps define the chain of approval for a particular approval process. Each step determines which records can advance to that step, who to assign approval requests to, and whether to let each approver's delegate respond to the requests. The first step specifies what to do if a record doesn't advance to that step. Later steps specify what happens if an approver rejects the request.

### Note:

- The order of the `ApprovalStep` entries in the approval process definition determines the order in which the approval steps are executed.
- After an approval process is activated, you can't add, delete, or change the order of the steps or change its reject or skip behavior, even if the process is inactive.
- Each approval process supports up to 30 steps.

Field Name	Field Type	Description
allowDelegate	boolean	Whether to allow delegated approvers in this step of the approval process. A delegated approver is a user appointed by an assigned approver as an alternate for approval requests.
approvalActions	<a href="#">ApprovalAction</a>	Specifies which workflow actions to execute when a record is approved in this step of the approval process.
assignedApprover	<a href="#">ApprovalStepApprover</a>	Specifies the assigned approvers for this step of the approval process.
description	string	Describes the approval step.
entryCriteria	<a href="#">ApprovalEntryCriteria</a>	Determines which records can enter this step of the approval process.
ifCriteriaNotMet	StepCriteriaNotMetType (enumeration of type string)	Specifies what to do for records that don't meet the entry criteria. Valid values are: <ul style="list-style-type: none"> <li>• <code>ApproveRecord</code>—Approve the request and execute all final approval actions.</li> <li>• <code>RejectRecord</code>—Reject the request and execute all final rejection actions. This option is available only for the first step in the approval process.</li> <li>• <code>GoToNextStep</code>—Skip to the next approval step. If you select this option for the first approval step, and a record doesn't meet the entry criteria for any other step, the record is rejected.</li> </ul>
label	string	Required. Name of the approval step.
name	string	Required. Unique name of the approval step. It must contain only underscores and alphanumeric characters, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. The requirement for uniqueness is only within the specific approval process.
rejectBehavior	<a href="#">ApprovalStepRejectBehavior</a>	Required, except for the first step in the approval process. Specifies what happens if the approver rejects the request during this approval step, unless it's the first step in the approval process.  If the approver rejects the request in the first step in the approval process, the reject behavior is determined by the <code>finalRejectionActions</code> .
rejectionActions	<a href="#">ApprovalAction</a>	Specifies which workflow actions to execute when a record is rejected in this step of the approval process.

## ApprovalAction

Represents the actions that occur as a result of an approval process.

Field Name	Field Type	Description
<code>action</code>	<a href="#">WorkflowActionReference</a> []	An array of workflow actions to execute.

## ApprovalStepApprover

Represents the assigned approvers for an approval step. Each step supports up to 25 approvers.

Field Name	Field Type	Description
<code>approver</code>	<a href="#">Approver</a> []	An array of assigned approvers for this step of the approval process.
<code>whenMultipleApprovers</code>	RoutingType (enumeration of type string)	Specifies how to handle approval or rejection when multiple approvers are assigned to the step. Valid values are: <ul style="list-style-type: none"> <li><code>Unanimous</code>—(Default) Require unanimous approval from all approvers for this step. If any of the approvers reject the request, the approval request for this step is rejected.</li> <li><code>FirstResponse</code>—Approve or reject based on the first response.</li> </ul>

## Approver

Represents an assigned approver for an approval step. Check out [Considerations for Setting Approvers](#) in Salesforce Help.

Field Name	Field Type	Description
<code>name</code>	string	Identifies an assigned approver. This field is required, except when the <code>type</code> is one of the following and the <code>name</code> is ignored: <ul style="list-style-type: none"> <li><code>adhoc</code></li> <li><code>userHierarchyField</code></li> </ul>
<code>type</code>	NextOwnerType (enumeration of type string)	Combined with the specified <code>name</code> , <code>type</code> identifies an assigned approver. Valid values are: <ul style="list-style-type: none"> <li><code>adhoc</code>—The approver for the step must be selected manually. For the first step, the submitter selects the approver. For the second and later steps, the approver for the previous step selects the approver. For this value, exclude the <code>name</code> field.</li> <li><code>user</code>—A user in your organization. For this value, enter a username for the <code>name</code> field.</li> <li><code>userHierarchyField</code>—A user specified in a standard or custom user hierarchy field, such as the standard <code>Manager</code> field. For this value, exclude the <code>name</code> field. The user hierarchy field must be defined in the <a href="#">nextAutomatedApprovers</a> for the approval process.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li><code>relatedUserField</code>—A user specified in a user lookup field on the submitted record, such as the <code>Last Modified By</code> field. For this value, enter the name of the user lookup field for the <code>name</code> field.</li> <li><code>queue</code>—Automatically assign to a queue. For this value, enter the name of the queue for the <code>name</code> field.</li> </ul>

## ApprovalEntryCriteria

Represents the criteria that records must meet to enter the approval process or an approval step. Specify either filter criteria or a formula, but not both.

Field Name	Field Type	Description
<code>booleanFilter</code>	string	Filter logic for <code>criteriaItems</code> . Exclude this field if you enter a <code>formula</code> .
<code>criteriaItems</code>	<a href="#">FilterItem</a> []	<p>Filter criteria that a record must meet to enter the approval process or approval step.</p> <p>Approval processes don't support <code>valueField</code> entries in filter criteria.</p>
<code>formula</code>	string	Formula that must evaluate to true for a record to enter the approval process or approval step.

## ApprovalStepRejectBehavior

Represents what happens if the approver rejects the request during this approval step, unless it's the first step in the approval process. For the first step in the approval process, the reject behavior is determined by the approval process's final rejection actions.

Field Name	Field Type	Description
<code>type</code>	StepRejectBehaviorType (enumeration of type string)	<p>Not allowed in the first step of the approval process. Valid values are:</p> <ul style="list-style-type: none"> <li><code>RejectRequest</code>—Rejects the request even if previous steps were approved. Salesforce performs all rejection actions specified for this step and all final rejection actions.</li> <li><code>BackToPrevious</code>—Rejects the request, and returns the approval request to the previous approver. Salesforce performs all rejection actions specified for this step.</li> </ul>

## NextAutomatedApprover

Represents the user hierarchy field to use as the next automated approver for the approval process. If defined, the user specified in the hierarchy field can be automatically assigned as the approver in one or more approval steps.

Field Name	Field Type	Description
useApproverFieldOfRecordOwner	boolean	Required. Whether the first executed approval step uses the specified <code>userHierarchyField</code> in the record owner's user record—instead of the submitter's user record—as the approver. All remaining steps use the specified <code>userHierarchyField</code> in the user record of the preceding step's approver.
userHierarchyField	string	Required. Standard or custom user hierarchy field whose value specifies which user to assign as the approver. For example, the standard <code>Manager</code> hierarchy field can be used to assign approvers for employee PTO (paid time off) requests.

## Declarative Metadata Sample Definition

The following is an example of an `ApprovalProcess` component:

```
<?xml version="1.0" encoding="UTF-8"?>
<ApprovalProcess xmlns="http://soap.sforce.com/2006/04/metadata">
  <active>false</active>
  <allowRecall>false</allowRecall>
  <allowedSubmitters>
    <type>owner</type>
  </allowedSubmitters>
  <allowedSubmitters>
    <submitter>USSalesRep</submitter>
    <type>role</type>
  </allowedSubmitters>
  <allowedSubmitters>
    <submitter>MarketingGroup</submitter>
    <type>group</type>
  </allowedSubmitters>
  <allowedSubmitters>
    <submitter>kcooper@example.com</submitter>
    <type>user</type>
  </allowedSubmitters>
  <approvalPageFields>
    <field>Name</field>
    <field>Owner</field>
    <field>MyLeadCustomField__c</field>
    <field>Address</field>
  </approvalPageFields>
  <approvalStep>
    <allowDelegate>false</allowDelegate>
    <approvalActions>
      <action>
        <name>LeadApprovedTask1</name>
        <type>Task</type>
      </action>
      <action>
        <name>LeadApprovedTask2</name>
        <type>Task</type>
      </action>
    </approvalActions>
  </approvalStep>
</ApprovalProcess>
```

```

    </action>
  </approvalActions>
  <assignedApprover>
    <approver>
      <type>adhoc</type>
    </approver>
  </assignedApprover>
  <label>Step1</label>
  <name>Step1</name>
  <rejectionActions>
    <action>
      <name>LeadRejectedTask</name>
      <type>Task</type>
    </action>
  </rejectionActions>
</approvalStep>
<approvalStep>
  <allowDelegate>>false</allowDelegate>
  <assignedApprover>
    <approver>
      <type>userHierarchyField</type>
    </approver>
  </assignedApprover>

```

## Wildcard Support in the Manifest File

Use the wildcard character \* (asterisk) in the `package.xml` manifest file to retrieve all approval processes for all objects. You can't use it to retrieve a subset of approval processes. Syntax such as `Lead.*` isn't supported. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AssignmentRules

Represents assignment rules that allow you to automatically route cases to the appropriate users or queues. You can access rules metadata for all applicable objects, for a specific object, or for a specific rule on a specific object.

The `package.xml` syntax for accessing all assignment rules for all objects is:

```

<types>
  <members>*</members>
  <name>AssignmentRules</name>
</types>

```

All rules for a specific object use a similar syntax without the wildcard. For example, all assignment rules for the Case object would use this syntax:

```

<types>
  <members>Case</members>
  <name>AssignmentRules</name>
</types>

```

You can also access specific assignment rules for an object. The following example only accesses the "samplerule" and "newrule" assignment rules on the Case object. Notice that for this example the type name syntax is `AssignmentRule` and not `AssignmentRules`.

```

<types>
  <members>Case.samplerule</members>
  <members>Case.newrule</members>
  <name>AssignmentRule</name>
</types>

```

## File Suffix and Directory Location

Assignment rules for an object have the suffix `.assignmentRules` and are stored in the `assignmentRules` folder. For example, all Case assignment rules are stored in the `Case.assignmentRules` file.

## Version

AssignmentRules components are available in API version 27.0 and later.

## Fields

Field Name	Field Type	Description
<code>assignmentRule</code>	<a href="#">AssignmentRule[]</a>	Represents the definitions of the named assignment rules.

## AssignmentRule

Specifies whether the rule is active or not and its definition. Rules are processed in the order they appear within the AssignmentRules container.

Field Name	Field Type	Description
<code>active</code>	boolean	Indicates whether the assignment rule is active ( <code>true</code> ) or not ( <code>false</code> ).
<code>fullname</code>	string	Inherited from <a href="#">Metadata</a> , this field is defined in the WSDL for this metadata type. It must be specified when creating, updating, or deleting. See <a href="#">createMetadata()</a> to see an example of this field specified for a call.  This value can't be <code>null</code> .
<code>ruleEntry</code>	<a href="#">RuleEntry[]</a>	Represents the type and description for the assignment rule.

## RuleEntry

Represents the fields used by the rule.

Field Name	Field Type	Description
<code>assignedTo</code>	string	The name of the user or queue the item is assigned to.
<code>assignedToType</code>	<a href="#">AssignToLookupValueType</a> (enumeration of type string)	Valid values are: <ul style="list-style-type: none"> <li>• User</li> <li>• Queue</li> </ul>
<code>booleanFilter</code>	string	Advanced filter conditions that were specified for the rule.

Field Name	Field Type	Description
criteriaItems	FilterItem[]	The items in the list that define the assignment criteria.
formula	string	The validation formula. Specify either <code>formula</code> or <code>criteriaItems</code> , but not both fields.
notifyCcRecipients	boolean	Specifies whether email addresses included on the Cc line of an incoming Email-to-Case or Web-to-Lead message are included on the Cc line of the auto-response to that message ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 32.0 and later.
overrideExistingTeams	boolean	Specifies whether the case team resets when the assignment is done ( <code>true</code> ) or if the current team is added to the case instead of replacing the previous team ( <code>false</code> ).
team	string[]	The name of the case team. It can occur 0 or more times.
template	string	Specifies the template to use for the email that is automatically sent to the designated recipient. Lightning email templates aren't packageable. We recommend using a Classic email template.

## Declarative Metadata Sample Definition

The following is an example file showing two assignment rules on the Case object:

```
<AssignmentRules xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <assignmentRule>
    <fullName>samplerule</fullName>
    <active>>false</active>
    <ruleEntry>
      <assignedTo>testUser@org.com</assignedTo>
      <assignedToType>User</assignedToType>
      <criteriaItems>
        <field>Case.IsEscalated</field>
        <operation>equals</operation>
        <value>True</value>
      </criteriaItems>
      <template>emailtemplate</template>
    </ruleEntry>
  </assignmentRule>
  <assignmentRule>
    <fullName>Another samplerule</fullName>
    <active>>false</active>
    <ruleEntry>
      <assignedTo>otherUser@org.com</assignedTo>
      <assignedToType>User</assignedToType>
      <criteriaItems>
```

```

        <field>Case.IsEscalated</field>
        <operation>equals</operation>
        <value>False</value>
    </criteriaItems>
    <template>emailtemplate</template>
</ruleEntry>
</assignmentRule>
</AssignmentRules>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AssessmentQuestion

---

Represents the container object that stores the questions required for an assessment.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

AssessmentQuestion components have the suffix `.AssessmentQuestion` and are stored in the `AssessmentQuestions` folder.

### Version

AssessmentQuestion components are available in API version 55.0 and later.

## Fields

Field Name	Description
<code>assessmentQuestionVersion</code>	<p><b>Field Type</b> <a href="#">AssessmentQuestionVersion</a></p> <p><b>Description</b> The object that stores the question versions for the assessment questions.</p>
<code>dataType</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The data type of the assessment question.</p>

Field Name	Description
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The developer name of the assessment question. Can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
formulaResponseDataType	<p><b>Field Type</b> string</p> <p><b>Description</b> Specifies the data type of the question response calculated by a formula.</p>
name	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the record.</p>
questionCategory	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Stores the question category.</p>
relatedQuestion	<p><b>Field Type</b> string</p> <p><b>Description</b> Specifies the related question. Used to define a question hierarchy.</p>

## AssessmentQuestionVersion

Stores the question versions for the assessment questions.

Field Name	Description
additionalInformation	<p><b>Field Type</b> string</p> <p><b>Description</b> The additional details for a UI element, such as the disclosure text.</p>

Field Name	Description
description	<p><b>Field Type</b> string</p> <p><b>Description</b> The description for the assessment question. This text isn't rendered on the assessment.</p>
guidanceInformation	<p><b>Field Type</b> string</p> <p><b>Description</b> The guidance for the assessment question.</p>
helpText	<p><b>Field Type</b> string</p> <p><b>Description</b> The text that's added as an info bubble in the UI element related to the assessment question.</p>
isActive	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Indicates whether the current version of the assessment question is set to active (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
name	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the assessment question version record.</p>
optionSourceResponseValue	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the response value source for an assessment question is configured as custom (<code>true</code>) or sObject in the OmniStudio designer (<code>false</code>). The default value is <code>false</code>.</p>
questionText	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p>

Field Name	Description
	The assessment question text. Contains the label for the assessment question that appears on the assessment.
responseValues	<p><b>Field Type</b> string</p> <p><b>Description</b> Holds the values to be defined in the picklist, multiselect picklist, or radio buttons.</p>
status	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  Status of the assessment question version. Possible values are Draft, Active, or Archived.</p>
versionNumber	<p><b>Field Type</b> int</p> <p><b>Description</b> Required.  The assessment question version number.</p>

## Declarative Metadata Sample Definition

The following is an example of an AssessmentQuestion component.

```
<?xml version="1.0" encoding="UTF-8"?>
<AssessmentQuestion
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <assessmentQuestionVersion>
    <additionalInformation>ParentQuestionDevName AI</additionalInformation>
    <description>ParentQuestionDevName Desc</description>
    <helpText>ParentQuestionDevName HT</helpText>
    <isActive>true</isActive>
    <name>ParentQuestionDevName</name>
    <optionSourceResponseValue>true</optionSourceResponseValue>
    <questionText>ParentQuestionDevName Text</questionText>
    <status>Active</status>
    <versionNumber>1</versionNumber>
  </assessmentQuestionVersion>
  <dataType>DateTime</dataType>
  <developerName>ParentQuestionDevName</developerName>
  <name>ParentQuestionDevName</name>
  <questionCategory>Demographic</questionCategory>
</AssessmentQuestion>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>AssessmentQuestion</name>
  </types>
  <version>55.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Usage

Before you retrieve assessment questions, we recommend that you review these considerations.

- When you retrieve an assessment question, you also get the related assessment question version with the status Active.
  -  **Note:** If an active assessment question version doesn't exist for the assessment question, then the latest assessment question version with Status as Draft is retrieved.
- The value for the `<status>` tag in the XML definition must match the status of the related assessment question version.
- If an assessment question has a related assessment question (parent question), the XML definition must include the developer name of the related assessment question.
- If the fields of an assessment question contain values, the XML definition must contain tags with those values when retrieving it.

Before you deploy assessment questions, we recommend that you review these considerations.

- If the Related Question isn't available in the target org, deploying the assessment question fails.
- If an assessment question with the same developer name exists in the target org, deploying the assessment question updates the values of the other fields in the target org.
- If the `<versionNumber>` tag is present in the XML definition of an assessment question, deploying creates a version for that question in the target org.
- If the Related Questions aren't available in target org but available in the package, then deploying the questions inserts the Related Questions in the correct order.

## AssessmentQuestionSet

---

Represents the container object for Assessment Questions.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

AssessmentQuestionSet components have the suffix `.AssessmentQuestionSet` and are stored in the `AssessmentQuestionSets` folder.

## Version

AssessmentQuestionSet components are available in API version 55.0 and later.

## Fields

Field Name	Description
<code>assessmentQuestionDeveloperNames</code>	<p><b>Field Type</b> string[]</p> <p><b>Description</b> The developer names for the assessment question. Can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
<code>developerName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  The developer name for the assessment question set. Can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
<code>name</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  The question set name.</p>

## Declarative Metadata Sample Definition

The following is an example of an AssessmentQuestionSet component.

```
<?xml version="1.0" encoding="UTF-8"?>
<AssessmentQuestionSet
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <developerName>QuestionSetDevName</developerName>
```

```
<name>QuestionSetName</name>
<assessmentQuestionDeveloperNames>QuestionDevName</assessmentQuestionDeveloperNames>
</AssessmentQuestionSet>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>AssessmentQuestion</name>
  </types>
  <types>
    <members>*</members>
    <name>AssessmentQuestionSet</name>
  </types>
  <version>55.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Usage

Before you retrieve assessment question sets, we recommend that you review these considerations.

- When retrieving an assessment question set, if its fields contain values, then the XML definition must contain tags with those values.
- When retrieving an assessment question set, if that set is associated with multiple questions, then the XML definition must contain developer names of all the associated questions.

Before you deploy assessment question sets, we recommend that you review these considerations.

- When deploying an assessment question set, if an assessment question set with the same developer name doesn't exist in the target org, deploying creates one with that name.
- If an assessment question set with the same developer name exists in the target org, then deploying the question set updates the values of the other fields in the target org.
- If the questions associated with the assessment question set don't exist in the target org, deploying the assessment question set fails.
- If the questions associated with the assessment question set don't exist in the target org but are available in the package, then deploying the assessment question sets inserts the questions in the correct order.

## Audience

---

Represents the audience in an Experience Builder site. An audience consists of different types of criteria, where the audience can be assigned and used for targeting in a site. This type extends the Metadata metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

Audience components have the suffix `.audience` and are stored in the `audience` folder.

## Version

Audience components are available in API version 44.0 and later.

## Special Access Rules

Access to the Audience type requires the AudienceMetadata permission. This permission is on by default for orgs that have Networks enabled.

Access to permission criteria for the Audience type requires the AudiencePermissionCriteria permission. This permission is available in API version 45.0 and later and is on by default for orgs that have Networks enabled.

## Fields

Field Name	Field Type	Description
<code>audienceName</code>	string	Required. The name of the audience.
<code>container</code>	string	Required. The name of the site or org that contains the audience.
<code>criteria</code>	<a href="#">AudienceCriteria</a>	Required. Criteria in an audience. This field is available in API version 47.0 and later.
<code>criterion</code>	<a href="#">AudienceCriterion</a> []	Removed. List of criteria in an audience.  This field is available in API version 44.0–46.0. In API version 47.0 and later, use <code>criteria</code> instead.
<code>description</code>	string	The description of the audience.
<code>formula</code>	string	Formula used to determine the audience. This field is available in API version 45.0 and later.
<code>formulaFilterType</code>	FormulaFilterType (enumeration of type string)	Indicates the audience's formula type. Valid values are <ul style="list-style-type: none"> <li>• <code>AllCriteriaMatch</code></li> <li>• <code>AnyCriterionMatches</code></li> <li>• <code>CustomLogicMatches</code> (available in API version 45.0 and later)</li> </ul>
<code>isDefaultAudience</code>	boolean	Indicates whether the audience is the default audience ( <code>true</code> ) or not ( <code>false</code> ). This field is available and required in API version 48.0. In API version 49.0 and later, this field is optional.  The default audience file name is of format <code>Default_<b>Network Name</b>.audience</code> .
<code>targets</code>	<a href="#">PersonalizationTargetInfos</a>	Targets for the audience. This field is available in API version 47.0 and later.

## AudienceCriteria

Represents criteria for an audience. This subtype is available in API version 47.0 and later.

Field Name	Field Type	Description
<code>criterion</code>	<a href="#">AudienceCriterion</a> []	List of criteria for an audience. An audience can have up to 100 criteria.

## AudienceCriterion

Represents a criterion for an audience.

Field Name	Field Type	Description
<code>criterionNumber</code>	int	The number associated with the criterion in a formula, for example (1 AND 2) OR 3. This field is available in API version 45.0 and later.
<code>criterionValue</code>	<a href="#">AudienceCriteriaValue</a>	The value of the criterion.
<code>operator</code>	<a href="#">AudienceCriterionOperator</a> ( <a href="#">enumeration</a> of type string)	The operator associated with this criterion. Valid values are: <ul style="list-style-type: none"> <li>• Equal</li> <li>• NotEqual</li> <li>• GreaterThan</li> <li>• GreaterThanOrEqual</li> <li>• LessThan</li> <li>• LessThanOrEqual</li> <li>• Contains</li> <li>• StartsWith</li> <li>• Includes (available in API version 45.0 and later)</li> <li>• NotIncludes (available in API version 45.0 and later)</li> </ul>
<code>type</code>	<a href="#">AudienceCriterionType</a> ( <a href="#">enumeration</a> of type string)	Required. Valid values are: <ul style="list-style-type: none"> <li>• GeoLocation</li> <li>• Domain</li> <li>• Profile</li> <li>• FieldBased</li> <li>• Permission (available in API version 45.0 and later)</li> <li>• Default (available in API version 47.0 and later)</li> <li>• Audience (available in API version 53.0 and later)</li> </ul> <p>For a list of <a href="#">AudienceCriteriaValue</a> fields that you can use with each <a href="#">AudienceCriterion</a> <code>type</code> field value, see <a href="#">this table</a>.</p>

## AudienceCriteriaValue

Represents the value of a criterion in an audience. For a list of AudienceCriteriaValue fields that you can use with each AudienceCriterion `type` field value, see [this table](#).

Field Name	Field Type	Description
<code>audienceDeveloperName</code>	string	Developer name of the audience. This field is available in API version 53.0 and later. You can use this field only when the value of the AudienceCriterion <code>type</code> field is <code>Audience</code> .
<code>city</code>	string	City of a user. You can use this field only when the value of the AudienceCriterion <code>type</code> field is <code>GeoLocation</code> .
<code>country</code>	string	Country of a user. You can use this field only when the value of the AudienceCriterion <code>type</code> field is <code>GeoLocation</code> .
<code>domain</code>	string	Domain of a user. You can use this field only when the value of the AudienceCriterion <code>type</code> field is <code>Domain</code> .
<code>entityField</code>	string	Field of an object. You can use this field only when the value of the AudienceCriterion <code>type</code> field is <code>FieldBased</code> .
<code>entityType</code>	string	Type of object. You can use this field only when the value of the AudienceCriterion <code>type</code> field is <code>FieldBased</code> .
<code>fieldValue</code>	string	Value of a field. You can use this field only when the value of the AudienceCriterion <code>type</code> field is <code>FieldBased</code> .
<code>isEnabled</code>	string	Indicates whether the permission is enabled ( <code>true</code> ) or not ( <code>false</code> ) for a user. This field is available in API version 45.0 and later. You can use this field used only when the value of the AudienceCriterion <code>type</code> field is <code>Permission</code> .
<code>permissionName</code>	string	Valid API name of a standard user or custom permission. This field is available in API version 45.0 and later. You can use this field only when the value of the AudienceCriterion <code>type</code> field is <code>Permission</code> .
<code>permissionType</code>	string	Type of permission. Valid values are <code>Standard</code> and <code>Custom</code> . This field is available in API version 45.0 and later. You can use this field only when the value of the AudienceCriterion <code>type</code> field is <code>Permission</code> .
<code>profile</code>	string	Profile of a user. You can use this field only when the value of the AudienceCriterion <code>type</code> field is <code>Profile</code> .
<code>subdivision</code>	string	Subdivision of a user. You can use this field only when the value of the AudienceCriterion <code>type</code> field is <code>GeoLocation</code> .

This table summarizes which AudienceCriteriaValue fields you can use with the different AudienceCriterion `type` field values.

AudienceCriterion Type	AudienceCriteriaValue Fields
<code>GeoLocation</code>	<code>city</code> <code>country</code>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>Report (API version 49.0 and later)</li> <li>Dashboard (API version 49.0 and later)</li> </ul> <p>You can have up to 2,500 <code>ExperienceVariation</code> targets and 25,000 record targets.</p> <p>For more information on the <code>ExperienceVariation</code> target type, see <a href="#">ExperienceBundle</a>.</p>
targetValue	string	<p>Required. Value of the target, which is the developer name of the experience variation, such as <code>ContactSupport_ContactSupportForCalifornia_Page</code> for a page variation.</p> <p>To determine the target developer name, see <a href="http://developer.salesforce.com/docs/api/commerce-dev/commerce-dev-variation-targets.html">http://developer.salesforce.com/docs/api/commerce-dev/commerce-dev-variation-targets.html</a> in the <i>Experience Cloud Developer Guide</i>.</p>

## Declarative Metadata Sample Definition

The following is an example of an Audience component.

```
<?xml version="1.0" encoding="UTF-8"?>
<Audience xmlns="http://soap.sforce.com/2006/04/metadata">

```

    <target>
      <groupName>c194d79c-5c6b-4c6a-8d14-0e7042564355$#$Branding</groupName>
      <priority>1</priority>
      <targetType>ExperienceVariation</targetType>
      <targetValue>Customer_Service_testBrandingSet_Branding</targetValue>
    </target>
  </targets>
</Audience>

```

## Usage

You can't use Metadata API to delete an audience.

In API version 47.0 and later, you can't create an audience without criteria.

The list of targets provided in the input for an audience is considered the state of target assignments that you want. For example, see the following information for deleting, creating, and updating targets.

If you don't have a default audience, updating targets can result in the UI erroneously showing a target assigned to the default audience. The target assignment data in the API is correct. To work around the UI issue, temporarily assign another target to the default audience and then delete it.

Personalization using audience targeting varies what the user can see in the browser but doesn't secure data in any way. To prevent users accessing sensitive data, use standard Salesforce security features, such as sharing rules and permission sets.

### Delete targets

To delete a single target from an audience, deploy the entire list of targets for the audience minus the one that you want to delete.

To delete all the targets from an audience, deploy the audience with empty targets tags. For example:

```

<?xml version="1.0" encoding="UTF-8"?>
<Audience
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <audienceName>testAudience</audienceName>
  <container>testContainer</container>
  <criteria>
    <criterion>
      <criteriaNumber>1</criteriaNumber>
      <criterionValue>
        <country>United States</country>
        <subdivision>Nevada</subdivision>
      </criterionValue>
      <operator>Equal</operator>
      <type>GeoLocation</type>
    </criterion>
  </criteria>
  <formulaFilterType>AllCriteriaMatch</formulaFilterType>
  <isDefaultAudience>>false</isDefaultAudience>
  <targets>
  </targets>
</Audience>

```

### Update an audience without updating targets

To update an audience without updating targets, deploy the audience without targets tags. For example:

```
<?xml version="1.0" encoding="UTF-8"?>
<Audience
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <audienceName>testAudience</audienceName>
  <container>testContainer</container>
  <criteria>
    <criterion>
      <criteriaNumber>1</criteriaNumber>
      <criterionValue>
        <country>United States</country>
        <subdivision>Nevada</subdivision>
      </criterionValue>
      <operator>Equal</operator>
      <type>GeoLocation</type>
    </criterion>
  </criteria>
  <formulaFilterType>AllCriteriaMatch</formulaFilterType>
  <isDefaultAudience>>false</isDefaultAudience>
</Audience>
```

### Create targets

To create a target, deploy the entire list of targets for the audience plus the one that you want to create.

### Update the priority of a target

To change the priority of a target within an audience, deploy the entire list of targets for the audience with the new priority values for the targets.

To change the priority of a target that affects priority in another audience, deploy both audiences with their entire list of targets with the new priority values for the targets.

### Update the target assignment for an audience

To reassign a target to a new audience, deploy both audiences with their entire list of targets. Deploy one list with the target removed, and the other list with the target added.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AuraDefinitionBundle

---

Represents an Aura definition bundle. A bundle contains an Aura definition, such as an Aura component, and its related resources, such as a JavaScript controller. The definition can be a component, application, event, interface, or a tokens collection.

## File Suffix and Directory Location

An `AuraDefinitionBundle` component is a folder that contains definition files. Unlike most other metadata components, an `AuraDefinitionBundle` component isn't a single file, it's a collection of files. Each file represents a resource in a bundle, such as markup,

applications, code files (including controllers and helpers), events, documentation, and interfaces. For example, this directory structure shows the hierarchy of the folders and files for two bundles: `bundle1` and `bundle2`.

```
aura
  bundle1
    bundle1.cmp
    bundle1Controller.js
  bundle2
    bundle2.app
    bundle2Controller.js
    bundle2.auradoc
```

Aura definition bundles must be under a top-level folder named `aura`. Each bundle must have its own subfolder under the `aura` folder. The name of each definition file must start with the bundle name.

A bundle doesn't have a suffix. Definition files can have one of these suffixes:

Suffix	Component Type
<code>.app</code>	Application
<code>.cmp</code>	Component
<code>.design</code>	Design
<code>.evt</code>	Event
<code>.intf</code>	Interface
<code>.js</code>	Controller, Helper, or Renderer
<code>.svg</code>	SVG image
<code>.css</code>	Style
<code>.auradoc</code>	Documentation
<code>.tokens</code>	Tokens collection

Each bundle can have only one file each with a suffix of `.app`, `.cmp`, `.design`, `.evt`, `.intf`, or `.tokens`.

## Version

AuraDefinitionBundle components are available in API version 32.0 and later.

Design and SVG components are available in API version 33.0 and later.

In API version 45.0 and later, there are two types of Lightning component: Aura components and Lightning web components. This metadata type describes an Aura component.

## Special Access Rules

Definitions can be created only in organizations with defined namespaces.

## Fields

Field Name	Field Type	Description
apiVersion	double	The API version for this definition bundle. When you create an Aura bundle, you can specify the API version to save it with. Available in API version 35.0 and later.
auraDefinitions	AuraDefinitions	Reserved for internal use.
controllerContent	base64Binary	The content of a JavaScript client-side controller.
description	string	The specification of the Aura bundle. Available in API version 35.0 and later.
designContent	base64Binary	The content of a design definition. Only valid inside a component bundle.
documentationContent	base64Binary	The content of a documentation definition.
helperContent	base64Binary	The content of a JavaScript helper.
markup	base64Binary	The content of the markup for a definition.
modelContent	base64Binary	Deprecated. Do not use.
packageVersions	<a href="#">PackageVersion</a> []	The list of installed managed package versions that this Aura definition bundle references. Available in API version 35.0 and later.
rendererContent	base64Binary	The content of a JavaScript client-side renderer.
styleContent	base64Binary	The CSS for the definition.
SVGContent	base64Binary	The SVG image for the definition.
testsuiteContent	base64Binary	Reserved for internal use.
type	AuraBundleType (enumeration of type string)	The definition type. Valid values are: <ul style="list-style-type: none"> <li>• Application</li> <li>• Component</li> <li>• Event</li> <li>• Interface</li> <li>• Tokens</li> </ul>

## Declarative Metadata Sample Definition

This example shows the directory structure of an AuraDefinitionBundle component.

```
aura
  sampleCmp
    sampleCmp.cmp
    sampleCmpController.js
```

The following samples show the contents of the metadata definition files that correspond to the sample `aura` directory.

Content of `sampleCmp.cmp`:

```
<aura:component>
  <aura:attribute name="val1" type="String" default="Value"/>
  <aura:attribute name="val2" type="String" />
  <aura:handler name="init" value="{!this}" action="{!c.myAction}"/>
    <ui:outputText value='Hello world!'/>
    <ui:outputText value='{!v.val1}'/>
    <ui:outputText value='{!v.val2}'/>
</aura:component>
```

Content of `sampleCmpController.js`:

```
({
  myAction : function(component) {
    component.set('v.val1', 'Value1');
    component.set('v.val2', 'Value2');
  }
})
```

This `package.xml` references the definitions of all Lightning components that are present in the `sampleCmp` bundle.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>sampleCmp</members>
    <name>AuraDefinitionBundle</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AuthProvider

---

Represents an authentication provider (auth provider). An auth provider lets users log in to Salesforce from an external service provider such as Facebook, Google, or GitHub. This type extends the Metadata metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

Authentication providers are stored in the `authproviders` directory. The file name matches the URL suffix, and the extension is `.authprovider`. For example, an auth provider with URL suffix `FacebookProvider` is stored in `authproviders/FacebookProvider.authprovider`.

## Version

Authentication providers are available in API version 27.0 and later.

## Special Access Rules

Only users with the Customize Application and Manage AuthProviders permissions can access this object.

## Fields

Field Name	Field Type	Description
<code>appleTeam</code>	string	Required when using Apple as a third-party authentication provider. A 10-character team ID, obtained from an Apple developer account. Available in API version 48.0 and later.
<code>authorizeUrl</code>	string	Required when creating an OpenID Connect authentication provider. The OAuth authorization endpoint URL. Available in API version 29.0 and later.  In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value. For details, see "Usage."
<code>consumerKey</code>	string	The app's key that is registered at the third-party (external) authentication provider.  In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value. For details, see "Usage."
<code>consumerSecret</code>	string	The consumer secret of the app that is registered at the third-party provider. After it's set, you can't change the value. When using <code>create()</code> , this field must be encrypted. To create an encrypted form of the consumer secret from plaintext: <ol style="list-style-type: none"> <li>1. Create an authentication provider with the <code>consumerSecret</code> plaintext value.</li> <li>2. Save the authentication provider.</li> <li>3. Create an outbound change set that includes the authentication provider component.</li> </ol> The new change set .xml file has an entry in the form <code>&lt;consumerSecret&gt;++XYZ++&lt;/consumerSecret&gt;</code> where <code>++XYZ++</code> is the encrypted secret.  In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value. For details, see Usage.  If a consumer secret is defined on an authentication provider, the consumer secret is always exported as a placeholder value, not as an encrypted secret.
<code>controlPlane</code>	<code>MuleSoftControlPlane</code> (enumeration of type string)	Required when using MuleSoft as a third-party authentication provider. Environment where the MuleSoft Anypoint Platform control plane is hosted. The control plane is the part of the Anypoint Platform architecture that includes Anypoint Exchange and determines the login URL. If you select User-Specified, you must enter the Consumer Key and Consumer Secret.

Field Name	Field Type	Description
		<p>Obtain the values from the MuleSoft connected app that you created to store the authentication details for your Salesforce org. Available in API version 57.0 and later. Valid values include:</p> <ul style="list-style-type: none"> <li>• <code>None</code>—User-specified control plane. If you select <code>None</code>, you must enter the Consumer Key and Consumer Secret. Obtain the values from the MuleSoft connected app that you created to store the authentication details for your Salesforce org.</li> <li>• <code>US</code>—US control plane</li> <li>• <code>EU</code>—EU control plane</li> </ul>
<code>customMetadataTypeRecord</code>	string	Required when creating a custom authentication provider plug-in. The API name of the custom authentication provider. Available in API version 36.0 and later.
<code>defaultScopes</code>	string	<p>For OpenID Connect authentication providers, the scopes to send with the authorization request, if not specified when a flow starts. Available in API version 29.0 and later.</p> <p>In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value. See “Usage.”</p>
<code>ecKey</code>	string	Required when using Apple as a third-party authentication provider. A private key generated by Apple. Available in API version 48.0 and later.
<code>errorUrl</code>	string	A custom error URL for the authentication provider to use to report errors.
<code>executionUser</code>	string	Required when specifying a registration handler class. The username of the Salesforce admin or system user who runs the Apex handler, which provides the context in which the Apex handler runs. For example, if the Apex handler creates a contact, the creation can be easily traced back to the registration process. In production, use a system user. The user must have the Manage Users permission. Available in API version 27.0 and later.
<code>friendlyName</code>	string	Required. A user-friendly name for the authentication provider.
<code>iconUrl</code>	string	The path to an icon to use as a button on the login page. Users click the button to log in with the associated authentication provider, such as Twitter or Facebook. Available in API version 32.0 and later.
<code>idTokenIssuer</code>	string	The source of the authentication token in <code>https:</code> URI format. This field is available when configuring an OpenID Connect or Microsoft authentication provider. If provided, Salesforce validates the returned <code>id_token</code> value. OpenID Connect requires returning an <code>id_token</code> value with the <code>access_token</code> value. Available in API version 30.0 and later.
<code>includeOrgIdInIdentifier</code>	boolean	Used to differentiate between users with the same user ID from two sources (such as two sandboxes). If enabled ( <code>true</code> ), Salesforce stores the org ID of the third-party identity in addition to the user ID. After you enable this

Field Name	Field Type	Description
		setting, you can't disable it. Applies only to a Salesforce-managed auth provider. Available in API version 32.0 and later.
<code>isPkceEnabled</code>	boolean	Indicates whether the OAuth 2.0 Proof Key for Code Exchange (PKCE) security extension is enabled ( <code>true</code> ) or not ( <code>false</code> ). You can enable PKCE for these <code>providerType</code> values. <ul style="list-style-type: none"> <li>• Custom</li> <li>• Facebook</li> <li>• Google</li> <li>• Microsoft</li> <li>• OpenIdConnect</li> <li>• Salesforce.</li> </ul> This field is available in API version 59.0 and later.
<code>linkKickoffUrl</code>	string	The URL for linking existing Salesforce users to a third-party account. This field is read-only. Available in API version 43.0 and later.
<code>logoutUrl</code>	string	The destination for users after they log out if they authenticated using single sign-on. The URL must be fully qualified with an <code>http</code> or <code>https</code> prefix, such as <code>https://acme.my.salesforce.com</code> . Available in API version 33.0 and later.
<code>oauthKickoffUrl</code>	string	The URL for obtaining OAuth access tokens for a third party. This field is read-only. Available in API version 43.0 and later.
<code>paramForwardAllowlist</code>	<code>AuthProviderAllowlist</code>	An allowlisted URL parameter that can be forwarded from the authentication provider's client configuration URLs to the authorization URL. Available in API version 62.0 and later.
<code>plugin</code>	string	An existing Apex class that extends the <code>Auth.AuthProviderPluginClass</code> abstract class. Available in API version 36.0 and later.
<code>portal</code>	string	This field is used only with portals, which are deprecated. Salesforce doesn't support creating portals, but existing portals are supported.
<code>providerType</code>	<code>AuthProviderType</code> (enumeration of type string)	Required. The third-party authentication provider to use. Valid values include: <ul style="list-style-type: none"> <li>• Apple</li> <li>• Bitbucket—Provides authentication for a <code>Bitbucket</code> provider. Enables you to connect to Bitbucket from a Lightning Platform application. When logged in to Bitbucket, the app can make calls to Bitbucket APIs. The <code>Bitbucket</code> provider isn't available as an SSO provider, so users can't log in to a Salesforce org using their Bitbucket login credentials. Available in API version 61.0 and higher.</li> <li>• Custom—A provider configured with a custom authentication provider plug-in. Available in API version 36.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• Facebook.</li> <li>• GitHub—Provides authentication for a GitHub provider. Used to log in users of your Lightning Platform app to GitHub using OAuth. When logged in to GitHub, your app can make calls to GitHub APIs. The GitHub provider isn't available as an SSO provider, so users can't log in to your Salesforce org using their GitHub login credentials. Available in API version 35.0 and later.</li> <li>• Google.</li> <li>• Janrain.</li> <li>• LinkedIn. Available in API version 32.0 and later.</li> <li>• Microsoft—Provides authentication for all services that can be accessed via Microsoft Azure Active Directory. Available in API version 55.0 and later.</li> <li>• MicrosoftACS—Microsoft Access Control Service typically provides authentication for a Microsoft Office 365 service, like SharePoint Online. The MicrosoftACS provider doesn't support SSO. Available in API version 31.0 and later.</li> <li>• MuleSoft. Available in API version 57.0 and later.</li> <li>• OpenIdConnect. Available in API version 29.0 and later.</li> <li>• Salesforce.</li> <li>• Slack. Available in API version 54.0 and later.</li> <li>• Twitter. Available in API version 32.0 and later.</li> </ul>
registrationHandler	string	An existing Apex class that implements the <code>Auth.RegistrationHandler</code> interface.
requireMfa	boolean	Requires multi-factor authentication (MFA) for single sign-on with this auth provider based on the MFA status of each user. For this setting to trigger MFA, you must apply MFA directly to users via one of two methods. 1) Enable the org setting Require multi-factor authentication (MFA) for all direct UI logins to your Salesforce org. 2) Assign the user permission multi-factor authentication for User Interface Logins.
sendAccessTokenInHeader	boolean	If enabled ( <code>true</code> ), the access token is sent to the <code>UserInfoUrl</code> in a header instead of a query string. Available in API version 30.0 and later.
sendClientCredentialsInHeader	boolean	Required when creating an OpenID Connect authentication provider. If enabled ( <code>true</code> ), the client credentials are sent in a header to the <code>tokenUrl</code> instead of a query string. The credentials are in the standard OpenID Connect Basic Credentials header format, which is <code>Basic &lt;token&gt;</code> , where <code>&lt;token&gt;</code> is the base64-encoded string <code>"clientkey:clientsecret"</code> . Available in API version 30.0 and later.
sendSecretInApis	boolean	Determines whether the encrypted consumer secret appears in API responses. If enabled (default), the secret appears in the response. If

Field Name	Field Type	Description
		<p>disabled (<code>false</code>), responses don't include the consumer secret. For security, you can disable the setting. However, keep in mind that:</p> <ul style="list-style-type: none"> <li>By disabling this setting, the consumer secret is excluded from API responses in all API versions.</li> <li>Change sets and other metadata deployments break because both the consumer key and secret are expected. To fix this problem, insert the consumer key manually during deployment.</li> </ul> <p>Available in API version 47.0 and later.</p> <p>The consumer secret is always included in the response as a placeholder value, regardless of the value provided for <code>sendSecretInApis</code>.</p>
<code>ssoKickoffUrl</code>	string	The URL for performing single sign-on into Salesforce from a third party by using its third-party credentials. This field is read-only. Available in API version 43 and later.
<code>tokenUrl</code>	string	<p>The OAuth token endpoint URL of an OpenID Connect authentication provider. Available in API version 29.0 and later.</p> <p>In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value. For details, see "Usage."</p>
<code>userInfoUrl</code>	string	<p>The OpenID Connect endpoint URL of the OpenID Connect authentication provider. Available in API version 29.0 and later.</p> <p>In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value. For details, see "Usage."</p>

## AuthProvParamFwdAllowlist

Represents an allowlisted URL parameter that can be forwarded from authentication provider client configuration URLs to the authorization URL. Use this type to add custom functionality to authentication providers. For example, allowlist a `ui_locales` parameter and use it to send a user's language preference from Salesforce to the third-party provider's login page.

Field Name	Field type	Description
<code>description</code>	string	A description for the allowlisted URL parameter.
<code>param</code>	string	The name of the parameter, such as <code>ui_locales</code> or <code>login_hint</code> .

## Declarative Metadata Sample Definition

-  **Note:** Starting in November 2022, enter the `consumerSecret` value as plaintext, for example, `<consumerSecret>yourplaintextconsumersecret</consumerSecret>`. Existing consumer secrets that were entered as encrypted values can be deployed throughout the Winter '23 release.

```
<?xml version="1.0" encoding="UTF-8"?>
<AuthProvider xmlns="http://soap.sforce.com/2006/04/metadata">
  <consumerKey>yourappkey</consumerKey>
  <consumerSecret>PwdVxXjzu3NCZ3MD4He+wA==</consumerSecret>
  <executionUser>admin@your.org</executionUser>
  <friendlyName>FacebookAuthProvider</friendlyName>
  <providerType>Facebook</providerType>
  <registrationHandler>RegistrationHandler</registrationHandler>
  <sendSecretInApis>true</sendSecretInApis>
</AuthProvider>
```

This example package manifest references the previous AuthProvider definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>FacebookAuthProvider</members>
    <name>AuthProvider</name>
  </types>
  <version>28.0</version>
</Package>
```

## Usage

Salesforce provides default authentication providers, called Salesforce-managed auth providers, to simplify setting up these service providers for authentication.

- Apple
- Bitbucket
- Facebook
- GitHub
- Google
- Janrain
- LinkedIn
- Microsoft
- Microsoft Access Control Service
- MuleSoft
- Salesforce
- Slack

To use a Salesforce-managed auth provider, leave these fields blank when creating your auth provider from the Auth. Provider Setup page.

- `authorizeUrl`
- `consumerKey`

- consumerSecret
- defaultScopes
- tokenURL
- userInfoUrl

 **Note:** If you provide a value for one of these fields, you must also provide a value for `consumerKey` and `consumerSecret`.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## AutoResponseRules

Represents an auto-response rule that sets conditions for sending automatic email responses to lead or case submissions based on the attributes of the submitted record. You can access rules metadata for all applicable objects, for a specific object, or for a specific rule on a specific object.

The `package.xml` syntax for accessing all auto-response rules for all objects is:

```
<types>
  <members>*/members>
  <name>AutoResponseRules</name>
</types>
```

All rules for a specific object use a similar syntax without the wildcard. For example, all auto-response rules for the Case object would use this syntax:

```
<types>
  <members>Case</members>
  <name>AutoResponseRules</name>
</types>
```

You can also access specific auto-response rules for an object. The following example only accesses the “samplerule” and “newrule” auto-response rules on the Case object. Notice that for this example the type name syntax is `AutoResponseRule` and not `AutoResponseRules`.

```
<types>
  <members>Case.samplerule</members>
  <members>Case.newrule</members>
  <name>AutoResponseRule</name>
</types>
```

## File Suffix and Directory Location

`AutoResponseRules` for an object have the suffix `.autoResponseRules` and are stored in the `autoResponseRules` folder. For example, all Case auto-response rules are stored in the `Case.autoResponseRules` file.

## Version

AutoResponseRules components are available in API version 27.0 and later.

## Fields

Field Name	Field Type	Description
<code>autoresponseRule</code>	<a href="#">AutoResponseRule[]</a>	Represents the definitions of the named auto-response rules.

## AutoResponseRule

Represents whether a rule is active or not and the order in which the entry is processed in the rule.

Field Name	Field Type	Description
<code>active</code>	boolean	Indicates whether the autoresponse rule is active ( <code>true</code> ) or not ( <code>false</code> ).
<code>fullname</code>	string	Inherited from <a href="#">Metadata</a> , this field is defined in the WSDL for this metadata type. It must be specified when creating, updating, or deleting. See <a href="#">createMetadata()</a> to see an example of this field specified for a call.  This value can't be <code>null</code> .
<code>ruleEntry</code>	<a href="#">RuleEntry[]</a>	Represents the type and description for the auto-response rule.

## RuleEntry

Represents the fields used by the rule.

Field Name	Field Type	Description
<code>booleanFilter</code>	string	Advanced filter conditions that were specified for the rule.
<code>criteriaItems</code>	<a href="#">FilterItem[]</a>	The items in the list that define the assignment criteria.
<code>formula</code>	string	The validation formula.  Specify either <code>formula</code> or <code>criteriaItems</code> , but not both fields.
<code>replyToEmail</code>	string	The email address that appears in the reply-to header.
<code>senderEmail</code>	string	The email address of the person or queue sending the email notification.
<code>senderName</code>	string	The name of the person or queue sending the email notification.

Field Name	Field Type	Description
template	string	Specifies the template to use for the email that is automatically sent to the designated recipient.  Lightning email templates aren't packageable. We recommend using a Classic email template.

## Declarative Metadata Sample Definition

The following is an example AutoResponseRules component:

```
<AutoResponseRules xmlns="http://soap.sforce.com/2006/04/metadata">
  <autoResponseRule>
    <fullName>ajbdeploytest2</fullName>
    <active>false</active>
    <ruleEntry>
      <criteriaItems>
        <field>Case.Description</field>
        <operation>contains</operation>
        <value>testing</value>
      </criteriaItems>
      <senderEmail>test@test.org</senderEmail>
      <senderName>tester name j</senderName>
      <replyToEmail>test@@test.org</replyToEmail>
      <template>emailtemplate</template>
    </ruleEntry>
  </autoResponseRule>
</AutoResponseRules>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## BatchCalcJobDefinition

Represents a Data Processing Engine definition.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

BatchCalcJobDefinition components have the suffix `.batchCalcJobDefinition` and are stored in the `batchCalcJobDefinitions` folder.

## Version

BatchCalcJobDefinition components are available in API version 51.0 and later.

## Special Access Rules

To use this metadata type, one of these licenses is required:

- Loyalty Management
- Financial Services Cloud
- Rebate Management
- Manufacturing Cloud
- Net Zero Cloud

## Fields

Field Name	Field Type	Description
aggregates	<a href="#">BatchCalcJobAggregate[]</a>	Collection of aggregate nodes in a data processing engine.
appends	<a href="#">BatchCalcJobUnion[]</a>	Collection of append nodes in a data processing engine.
customNodes	<a href="#">BatchCalcJobCustomNode[]</a>	Collection of custom nodes in a data processing engine. Available in API version 57.0 and later.
dataSpaceApiName	string	Stores the Data Space API Name from Data Cloud. Available in API version 60.0 and later.
datasources	<a href="#">BatchCalcJobDatasource[]</a>	Collection of data source nodes in a data processing engine.
description	string	Description of a data processing engine definition.
executionPlatformType	<a href="#">ExecutionPlatformEnum</a> (of type string)	The platform that's used to run the Data Processing Engine definition. Valid values are: <ul style="list-style-type: none"> <li>• CRMA</li> <li>• CDP</li> <li>• CORE</li> </ul> Available in API version 59.0 and later.
filters	<a href="#">BatchCalcJobFilter[]</a>	Collection of filter nodes in a data processing engine. definition.
forecasts	<a href="#">BatchCalcJobForecast[]</a>	Collection of forecast nodes in a data processing engine. definition. Available in API version 58.0 and later.
hierarchyPaths	<a href="#">BatchCalcJobHierarchyPath[]</a>	Collection of hierarchy path nodes in a data processing engine definition.
isTemplate	boolean	Indicates whether it's a template data processing engine definition.

Field Name	Field Type	Description
joins	<a href="#">BatchCalcJobSourceJoin[]</a>	Collection of join nodes in a data processing engine.
label	string	The label of a data processing engine definition.
parameters	<a href="#">BatchCalcJobParameter[]</a>	Collection of input variables in a data processing engine.
processType	BatchCalcProcessType (enumeration of type string)	The process type of a data processing engine. Valid values are: <ul style="list-style-type: none"> <li>AccountingSubledger—This value is reserved for internal use.</li> <li>ActionableList</li> <li>AdvancedAccountForecast</li> <li>BenefitManagement</li> <li>CDPEnrichment</li> <li>CriteriaBsdSearchAndFilter</li> <li>DataProcessingEngine</li> <li>DecisionMatrixDataUpload</li> <li>Education</li> <li>FSCHierarchyRollUp</li> <li>Loyalty</li> <li>LoyaltyPartnerManagement</li> <li>LoyaltyPointsAggregation</li> <li>NetZero</li> <li>ProgramBasedBusiness</li> <li>ProviderSearch—This value is reserved for internal use.</li> <li>Rebates</li> </ul>
status	BatchJobDefinitionStatus (enumeration of type string)	Status of a data processing engine definition. Valid values are: <ul style="list-style-type: none"> <li>Active</li> <li>Inactive</li> </ul>
transforms	<a href="#">BatchCalcJobTransform[]</a>	Collection of data transformation nodes in a data processing engine.
writebacks	<a href="#">BatchCalcJobWritebackObject[]</a>	Collection of writeback objects in which the results of the data processing engine are written back.

## BatchCalcJobAggregate

Represents a collection of fields relating to an aggregate node in a data processing engine.

## Fields

Field Name	Field Type	Description
description	string	Description of an aggregate node.
fields	<a href="#">BatchCalcJobAggregateField[]</a>	Required. Collection of aggregation fields.
groupBy	string[]	Required. Collections of fields used to group data in an aggregate node.
label	string	Required. Label of an aggregate node.
name	string	Required. Name of an aggregate node.
sourceName	string	Required. Name of the source node.

## BatchCalcJobAggregateField

Represents a collection of fields relating to an aggregation field in an aggregate node of a data processing engine.

## Fields

Field Name	Field Type	Description
aggregateFunction	<a href="#">BatchCalcJobAggregateFunction</a> (enumeration of type string)	Required. Function used for aggregation. Valid values are: <ul style="list-style-type: none"> <li>• <code>Unique</code>—A count of unique values.</li> <li>• <code>Sum</code>—The sum of all values.</li> <li>• <code>Max</code>—The largest value.</li> <li>• <code>Min</code>—The smallest value.</li> <li>• <code>Avg</code>—The average value, calculated as the mean.</li> <li>• <code>Std</code>—The standard deviation.</li> <li>• <code>Stdp</code>—A standard deviation with population variance.</li> <li>• <code>Var</code>—The variance.</li> <li>• <code>Varp</code>—The variance with population.</li> <li>• <code>Count</code>—The total count of values.</li> </ul>
alias	string	Required. Name that subsequent nodes within the data processing engine use to refer to the aggregate field.
sourceFieldName	string	Required. Source node field on which the aggregate is calculated.

## BatchCalcJobCustomNode

Represents a collection of custom nodes in a data processing engine. Use a custom node to add a custom action.

## Fields

Field Name	Field Type	Description
description	string	Description of a custom node.
extensionName	string	Required. Name of an extension node.
extensionNamespace	string	Required. Namespace of an extension node.
label	string	Required. Label of a custom node.
name	string	Required. Name of a custom node.
parameters	<a href="#">BatchCalcJobCustomNodeParameter[]</a>	The field mappings of an extension node.
sources	string[]	Sources of an extension node.

## BatchCalcJobCustomNodeParameter

Represents the field mappings of an extension node.

## Fields

Field Name	Field Type	Description
name	string	Required. Name of a parameter.
value	string	Required. Value of a parameter.

## BatchCalcJobDatasource

Represents a collection of fields relating to a data source node in a data processing engine.

## Fields

Field Name	Field Type	Description
CSVDelimiter	BatchCalcJobCSVDelimiter (enumeration of type string)	Specifies the field separator to read fields from a CSV file record. Possible values are: <ul style="list-style-type: none"> <li>• COMMA</li> <li>• BACKQUOTE</li> <li>• CARET</li> <li>• PIPE</li> <li>• SEMICOLON</li> <li>• TAB</li> </ul>

Field Name	Field Type	Description
		The default value is <code>COMMA</code> .  The same delimiter value used for the CSV file can't be used within any of the column values in the file. If you mistakenly use the same delimiter value in column values, it can cause data parsing issues.
<code>description</code>	string	Description of a data source node.
<code>fields</code>	<a href="#">BatchCalcJobDataSourceField[]</a>	Required. Collection of data source fields.
<code>fileIdentifier</code>	string	Specifies the source of the file or file storage system.
<code>filePath</code>	string	The file path for the specified file.
<code>fileSource</code>	<a href="#">BatchCalcJobFileSource</a> (enumeration of type string)	Specifies the source of the file or file storage system. Possible value is: <ul style="list-style-type: none"> <li>• <code>ContentManagement</code></li> </ul>
<code>label</code>	string	Required. Label of a data source node.
<code>name</code>	string	Required. Name of a data source node.
<code>sourceName</code>	string	Required. Name of a standard or custom object from which the data source node extracts data.
<code>type</code>	<a href="#">BatchCalcJobDataSourceType</a> (enumeration of type string)	Required. Type of object for the source object field. Supported values are: <ul style="list-style-type: none"> <li>• <code>Analytics</code></li> <li>• <code>CalculatedInsightsObject</code></li> <li>• <code>CRMObject</code></li> <li>• <code>CSV</code></li> <li>• <code>DataModelObject</code></li> <li>• <code>StandardObject</code></li> </ul>

## BatchCalcJobDataSourceField

Represents a collection of fields relating to a source object field that are selected in the data source node of a data processing engine.

### Fields

Field Name	Field Type	Description
<code>alias</code>	string	Name that subsequent nodes within the data processing engine use to refer to the data source field. Required when the field name is lookup.

Field Name	Field Type	Description
<code>dataType</code>	<code>BatchCalcJobDataType</code> (enumeration of type string)	Specifies the data type of the input field when using a CSV file as a data source. Possible values are: <ul style="list-style-type: none"> <li>• <code>Text</code></li> <li>• <code>Numeric</code></li> <li>• <code>Date</code></li> <li>• <code>DateTime</code></li> </ul>
<code>isPrimaryKey</code>	boolean	Indicates whether a column name is the primary key ( <code>true</code> ) or not ( <code>false</code> ) for the Data Cloud CSV file.
<code>name</code>	string	Required. Name of the field. Can be either of the following: <ul style="list-style-type: none"> <li>• Name of the source field selected in the associated data source object.</li> <li>• Name from a nested lookup object with three child levels.</li> </ul>

## BatchCalcJobFilter

Represents a collection of fields relating to a filter node in a data processing engine.

### Fields

Field Name	Field Type	Description
<code>criteria</code>	<a href="#">BatchCalcJobFilterCriteria</a> []	Collection of filter criteria in a filter node. The field is required when <code>isDynamicFilter</code> is set to <code>False</code> .
<code>description</code>	string	Description of the batch calculation job filter.
<code>filterCondition</code>	string	Logic that is specified to apply the filter conditions. The field is required when <code>isDynamicFilter</code> is set to <code>False</code> .
<code>filterParameterName</code>	string	Name of the parameter of type filter.
<code>isDynamicFilter</code>	boolean	Indicates whether the filter criteria is dynamic. If value is set to <code>True</code> , filter criteria is passed in runtime with <code>filterParameterName</code> .
<code>label</code>	string	Required. Label of the filter node.
<code>name</code>	string	Required. Name of the filter node.
<code>sourceName</code>	string	Required. Name of the source node.

## BatchCalcJobForecast

Represents a collection of fields relating to a forecast node in a data processing engine. Available in API version 58.0 and later.

## Fields

Field Name	Field Type	Description
<del>accuracy</del> BatchCalcJobFrcstAccuracy	(enumeration of type string)	<p>The interval percentage to account for errors in forecasts.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• Eighty</li> <li>• NinetyFive</li> <li>• None</li> </ul> <p>The default value is None.</p>
<del>aggrFields</del> BtchCalcJobFrcstAggrFld[]		The list of fields to forecast.
<del>dateField</del> string		<p>Required.</p> <p>The date field from the source node used to forecast values for the specified forecast length.</p>
<del>description</del> string		The description of the forecast node.
<del>forecastModel</del> BatchCalcJobFrcstModel	(enumeration of type string)	<p>The model used to forecast data.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• Additive</li> <li>• Auto</li> <li>• Multiplicative</li> </ul> <p>The default value is Auto.</p>
<del>forecastPeriodCount</del> int		<p>The number of time periods to generate forecast data. For example, if you select Year-Month as the forecast period type, and 4 as the forecast period count, the forecast results are generated for the next 4 months.</p> <p>The minimum and the default count is 1, and the maximum is 100.</p>

Field Name	Field Type	Description
<del>forecastPeriod</del>	BatchCalcJobFrcstPeriodType (enumeration of type string)	<p>Required.</p> <p>The type of forecast period to group date field values in the forecast results.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• FiscalYear</li> <li>• FiscalYearMonth</li> <li>• FiscalYearQuarter</li> <li>• FiscalYearWeek</li> <li>• Year</li> <li>• YearMonth</li> <li>• YearMonthDay</li> <li>• YearQuarter</li> <li>• YearWeek</li> </ul>
<del>groupFields</del>	BatchCalcJobFrcstGrpFld[]	The source fields for grouping the data to be processed by the forecast node.
label	string	<p>Required.</p> <p>The name of the forecast node in the UI.</p>
name	string	<p>Required.</p> <p>A unique name for the forecast node.</p>
<del>startDate</del>	string	<p>Required.</p> <p>The start date of the forecast period.</p>
<del>seasonality</del>	BatchCalcJobFrcstSeasonality (enumeration of type string)	<p>Represents the periodic fluctuations that occur around the same time every year.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• Two</li> <li>• Three</li> <li>• Four</li> <li>• Five</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• Six</li> <li>• Seven</li> <li>• Eight</li> <li>• Nine</li> <li>• Ten</li> <li>• Eleven</li> <li>• Twelve</li> <li>• Thirteen</li> <li>• Fourteen</li> <li>• Fifteen</li> <li>• Sixteen</li> <li>• Seventeen</li> <li>• Eighteen</li> <li>• Nineteen</li> <li>• Twenty</li> <li>• TwentyOne</li> <li>• TwentyTwo</li> <li>• TwentyThree</li> <li>• TwentyFour</li> <li>• Auto</li> <li>• None</li> </ul> <p>The default value is None.</p>
<del>ignoreLastPeriod</del>	boolean	<p>Indicates whether to ignore the last period in the source node when it has incomplete data (<code>true</code>) or not (<code>false</code>).</p> <p>The default value is <code>false</code>.</p>
<del>sourceName</del>	string	<p>Required.</p> <p>The name of the source node.</p> <p>A source can be any node other than the datasink and register node.</p>

## BtchCalcJobFrcstAggrFld

Represents a list of fields to forecast in a forecast node.

Field Name	Field Type	Description
aggregateFunction	BatchCalcJobAggregateFunction (enumeration of type string)	Required. The function of the aggregate field. Possible values are: <ul style="list-style-type: none"> <li>• Avg</li> <li>• Count</li> <li>• Max</li> <li>• Min</li> <li>• Std</li> <li>• StdP</li> <li>• Sum</li> <li>• Unique</li> <li>• Var</li> <li>• VarP</li> </ul>
aggregationResultLabel	string	Required. The name of the aggregation result generated from the aggregation function that's applied to the source node field.
fieldName	string	Required. The name of the source field.

## BatchCalcJobFrcstGrpFld

Represents source fields for grouping the data to be processed by the forecast node.

Field Name	Field Type	Description
fieldName	string	Required. The name of the source field to group the data to be processed by the forecast node.
groupBy	string	A comma-separated list of values to group data by. Required when the source field type is Date or DateTime. Possible values are: <ul style="list-style-type: none"> <li>• Second</li> <li>• Second Epoch</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• Minute</li> <li>• Hour</li> <li>• Day</li> <li>• Day Epoch</li> <li>• Week</li> <li>•</li> <li>• Month</li> <li>• Quarter</li> <li>•</li> <li>•</li> <li>•</li> <li>• Year</li> </ul>

## BatchCalcJobHierarchyPath

Represents a collection of hierarchy path nodes in a data processing engine definition.

### Fields

Field Name	Field Type	Description
description	string	Description of the hierarchy path node.
hierarchyFieldName	string	Required. Field name that contains the hierarchy path.
isSelfFieldValueIncluded	boolean	Indicates whether the self value is included in the calculated hierarchy path ( <code>True</code> ) or not ( <code>False</code> ).
label	string	Required. Label of the hierarchy path node.
name	string	Required. Name of the hierarchy path node.
parentFieldName	string	Required. Parent field name to calculate hierarchy path.
selfFieldName	string	Required. Self field name to calculate hierarchy path.
sourceName	string	Required. Name of the source node.

## BatchCalcJobFilterCriteria

Represents a collection of fields relating to a filter condition in a filter node in a data processing engine.

## Fields

Field Name	Field Type	Description
inputVariable	string	Name of the input variable used as a filter.
operator	BatchCalcJobFilter Operator (enumeration of type string)	Required. Operator that is specified in the filter condition. Valid values are: <ul style="list-style-type: none"> <li>• Equals</li> <li>• NotEquals</li> <li>• GreaterThan</li> <li>• GreaterThanOrEqual</li> <li>• LessThan</li> <li>• LessThanOrEqual</li> <li>• StartsWith</li> <li>• EndsWith</li> <li>• Contains</li> <li>• DoesNotContain</li> <li>• IsNull</li> <li>• IsNotNull</li> <li>• In</li> <li>• NotIn</li> </ul>
sequence	integer	Required. Sequence number used to refer the criteria in a filter node.
sourceFieldName	string	Required. Name of the field from the source node to apply the filter.
value	string	Value used to filter data from the source node.

## BatchCalcJobParameter

Represents a collection of fields relating to an input variable in a data processing engine.

## Fields

Field Name	Field Type	Description
dataType	BatchCalcJobParameter DataType (enumeration of type string)	Required. Data type of the parameter. Valid values are: <ul style="list-style-type: none"> <li>• Date</li> <li>• DateTime</li> <li>• Expression</li> <li>• FileIdentifier</li> <li>• Filter</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>Numeric</li> <li>Text</li> </ul>
defaultValue	string	Default value of the parameter.
description	string	Description of the batch calculation job parameter.
isMultiValue	boolean	Indicates whether the parameter has different values ( <code>True</code> ) or not ( <code>False</code> ). This field is supported only for the <code>Text</code> data type.
label	string	Required. Label of the batch calculation job parameter.
name	string	Required. Name of the batch calculation job parameter.

## BatchCalcJobSourceJoin

Represents a collection of fields relating to a join node in a data processing engine.

### Fields

Field Name	Field Type	Description
description	string	Description of the join node.
fields	<a href="#">BatchCalcJobJoinResultField[]</a>	Collection of fields in a join node.
joinKeys	<a href="#">BatchCalcJobJoinKey[]</a>	Collection of mapping of fields from the primary source node and the second source node in a join node.
label	string	Required. Label of the join node.
name	string	Required. Name of the join node.
primarySourceName	string	Required. Name associated with the node as the primary source node.
secondarySourceName	string	Required. Name associated with the node as the secondary source node.
type	<a href="#">BatchCalcJobSourceJoinType</a> (enumeration of type string)	Required. Type of join specified between the primary source node and secondary source node. Valid values are: <ul style="list-style-type: none"> <li>LeftOuter</li> <li>RightOuter</li> <li>Inner</li> <li>Outer</li> <li>Lookup</li> </ul>

## BatchCalcJobJoinKey

Represents a collection of fields relating to a mapping of fields from the first source node and second source node in a join node of a data processing engine.

### Fields

Field Name	Field Type	Description
primarySourceFieldName	string	Required. Mapped field name of the primary source node.
secondarySourceFieldName	string	Required. Mapped field name of the secondary source node.

## BatchCalcJobJoinResultField

Represents a collection of fields relating to a set of resultant fields in a join node of a data processing engine.

### Fields

Field Name	Field Type	Description
alias	string	Required. Name that subsequent nodes within the data processing engine definition use to refer to the resultant field.
sourceFieldName	string	Required. Name of field from the primary or secondary data source.
sourceName	string	Required. Source node of the primary or secondary data source.

## BatchCalcJobTransform

Represents a collection of fields relating to a data transformation in a data processing engine.

### Fields

Field Name	Field Type	Description
description	string	The description of the batch calculation job transform.
droppedFields	<a href="#">BatchCalcJobTransform DroppedField[]</a>	The collection of dropped fields in a data transformation. Available when the transformation type is <code>SLICE</code> .
expressionFields	<a href="#">BatchCalcJobTransform AddedField[]</a>	The collection of formula fields in a data transformation. Available when the transformation type is <code>EXPRESSION</code> .
label	string	Required. The label of the batch calculation job transform.
name	string	Required. The name of the batch calculation job transform.

Field Name	Field Type	Description
orderBy	<a href="#">BatchCalcJobOrderByField</a> on page 355[]	A collection of fields that's used to sort the records within each partition group.
partitionBy	string[]	A group of fields that's used to partition the source data into partition groups.
sourceName	string	Required. Name of the source node.
transformType	BatchCalcJobTransform Type (enumeration of type string)	Required. The type of transformation. Valid values are: <ul style="list-style-type: none"> <li>• <code>ComputeRelative</code>—This transformation calculates values based on values of the same partition group.</li> <li>• <code>Expression</code>—This transformation calculates values based on existing values of fields in the same record.</li> <li>• <code>Slice</code>—This transformation removes fields from the source node.</li> </ul>

## BatchCalcJobTransformDroppedField

Represents a collection of fields relating to a dropped field in a data transformation of a data processing engine.

### Fields

Field Name	Field Type	Description
sourceFieldName	string	Required. Name of the field that is dropped.

## BatchCalcJobTransformAddedField

Represents a collection of fields relating to a formula in a data transformation of a data processing engine.

### Fields

Field Name	Field Type	Description
alias	string	Required. Name that subsequent nodes within the data processing engine use to the transform node.
dataType	BatchCalcJobDataType (enumeration of type string)	Required. Data type of the formula. Valid values are: <ul style="list-style-type: none"> <li>• <code>Text</code></li> <li>• <code>Numeric</code></li> <li>• <code>Date</code></li> <li>• <code>DateTime</code></li> </ul>

Field Name	Field Type	Description
<code>decimalPlaces</code>	integer	Number of digits to the right of a decimal point in the value. Required for the <code>Numeric</code> data type.
<code>expression</code>	string	Required. Formula defined by the user.
<code>length</code>	integer	Total length of the value including the decimal places. Required for data types: <code>Text</code> and <code>Numeric</code> .

## BatchCalcJobOrderByField

Represents a collection of fields that are used to sort the partitioned data.

### Fields

Field Name	Field Type	Description
<code>name</code>	string	Required. Name of the field that is used to sort data.
<code>orderType</code>	<code>BatchCalcJobOrderByField</code> (enum of type string)	Order in which the data is sorted. Valid values are: <ul style="list-style-type: none"> <li>• Ascending</li> <li>• Descending</li> </ul>

## BatchCalcJobUnion

Represents a collection of fields relating to the union of data from two nodes in a data processing engine.

### Fields

Field Name	Field Type	Description
<code>description</code>	string	Description of the batch calculation job union.
<code>isDisjointedSchema</code>	boolean	Indicates whether the union is of two disjointed datasets ( <code>true</code> ) or not ( <code>false</code> ). Set to <code>True</code> to allow joining of two datasets having no common fields.
<code>label</code>	string	Required. Label of the batch calculation job union.
<code>name</code>	string	Required. Name of the batch calculation job union.
<code>sources</code>	string[]	Names of the source nodes.

## BatchCalcJobWritebackObject

Represents a collection of fields relating to the object in which the results of the data processing engine are written back.

### Fields

Field Name	Field Type	Description
description	string	Descriptions of the batch calculation job writeback object.
externalIdFieldName	string	Unique external field ID for the target object name. Available in API version 60.0 and later.
fields	<a href="#">BatchCalcJobWritebackMapping[]</a>	Collection of the writeback fields.
filterCondition	string	The condition that filters the records from a writeback dataset for a user. Examples of a filter condition include a user ID, stage name, and a security policy that returns only the records that a user owns. Available in API version 57.0 and later.
folderName	string	The folder where the writeback dataset is saved. Available in API version 57.0 and later.
isChangedRow	boolean	Indicates whether a row in the write back object is changed. Set to <code>True</code> to write back the changed rows.
label	string	Required. Name of the write back object.
name	string	Required. Name of the batch calculation job write back object.
operationType	<a href="#">BatchCalcJobWritebackOpn</a> (enumeration of type string)	Type of operation specified. Valid values are: <ul style="list-style-type: none"> <li>• <code>Delete</code>—This value is available in API version 56.0 and later.</li> <li>• <code>Insert</code></li> <li>• <code>Overwrite</code>—Available only when <code>storageType</code> is <code>DataLakeObject</code>. This value is available in API version 60.0 and later.</li> <li>• <code>Update</code></li> <li>• <code>Upsert</code></li> </ul>
sharingInheritanceObjectName	string	The name of the source object from which the row-level sharing inheritance settings are applied. Available in API version 57.0 and later.
sourceName	string	Required. Name of the source node associated with the write back object.
storageType	<a href="#">BatchCalcJobWritebackType</a> (enumeration of type string)	Specifies where you want to use the data stored in the source node. Available in API version 57.0 and later. Valid values are: <ul style="list-style-type: none"> <li>• <code>Analytics</code></li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>DataLakeObject</li> <li>sObject</li> </ul> <p>The default value is sObject.</p>
targetObjectName	string	Required. Object that is inserted or upserted by the data processing engine.
writebackSequence	integer	Sequence in which the target object is updated by the data processing engine.
writebackUser	string	ID of the user whose permissions decide which objects and fields of the target object can be updated.

## BatchCalcJobWritebackMapping

Represents a collection of fields relating to the mapping between results and the fields in the target object.

### Fields

Field Name	Field Type	Description
parentName	string	Name of the lookup object. Required only when the relationshipName field is defined.
relationshipName	string	Name of the lookup relationship.
runtimeParameter	boolean	Indicates whether the source field from runtime parameter is true or false. The default value is false. Available in API version 59.0 and later.
sourceFieldName	string	Required. Name of the field in the source node that is written back.
targetFieldName	string	Name of the sObject field to which the results are written back.

## Declarative Metadata Sample Definition

The following is an example of a BatchCalcJobDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<BatchCalcJobDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <aggregates>

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## BatchProcessJobDefinition

---

Represents the details of a Batch Management job definition. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

`BatchProcessJobDefinition` components have the suffix `.batchProcessJobDefinition` and are stored in the `batchProcessJobDefinitions` folder.

## Version

`BatchProcessJobDefinition` components are available in API version 51.0 and later.

## Special Access Rules

To use this metadata type, your Salesforce org must have the Loyalty Management or the Rebate Management license. The Loyalty Program Process type is only available in orgs that have Loyalty Management enabled.

## Fields

Field Name	Field Type	Description
<code>batchSize</code>	integer	Required. Number of records that each Batch Management job can process. Flow type Batch Management jobs can process up to 2000 records and Loyalty Program Process type Batch Management jobs can process up to 250 records.
<code>dataSource</code>	<a href="#">BatchDataSource</a> on page 365[]	Required. Source of information whose records must be processed by the Batch Management job.
<code>description</code>	string	Description of the Batch Management job, up to 255 characters.
<code>executionProcessApiName</code>	string	<p>API name of process that must be executed by the Batch Management job. This field is available in API version 55.0 and later.</p> <ul style="list-style-type: none"> <li>• If the batch job's type is Flow, enter the API name of an active flow that the batch job must execute.</li> <li>• If the batch job's type is Loyalty Program Process, enter: <ul style="list-style-type: none"> <li>– <code>Transaction_Journals</code> if you want the batch job to process Transaction Journal records by applying the applicable active loyalty program process of the type <code>TransactionJournal</code>.</li> <li>– API name of an active loyalty process of the type <code>TierProcessing</code> if you want the batch job to run the loyalty program process to assess the tier of eligible members. The API name consists of the name of the process, the process type, and the name of the loyalty program separated by two consecutive underscores. For example, the process API name is <code>Update Member Tier_TierProcessing__Inner Circle</code> if the process name is Update Member Tier, the process type is <code>TierProcessing</code>, and the loyalty program name is Inner Circle.</li> </ul> </li> </ul> <p>You can use database-based APEX classes that let you use flex queues in the Batch Management job, allowing to place more than 5 jobs in a queue. This functionality is applicable to all Industry Clouds that use managed packages. See <a href="#">Apex Flex Queue</a>.</p>
<code>flowApiName</code>	string	<p>API name of an active flow process that must be executed by the Batch Management job.</p> <p> <b>Note:</b> You can either specify the flow API name in the <code>executionProcessApiName</code> field or in the <code>flowApiName</code> field.</p>

Field Name	Field Type	Description
flowInputVariable	string	Input variable of associated flow that is used by the batch job to uniquely identify records.
masterLabel	string	Required. Name of the Batch Management job, up to 80 characters.
processGroup	string	Required. Name of the group for which the Batch Management job processes records.
retryCount	integer	Required. Number of times this Batch Management job must be rerun in case it fails. The maximum retry count is 3. Valid values are 1–3.
retryInterval	integer	Required. Number of milliseconds after which the Batch Management job must be rerun in case it fails. Valid values are 1,000–10,000.
status	string	Indicates the status of the Batch Management job. Valid values are <code>Active</code> and <code>Inactive</code> .
type	string (enumeration of type string)	The type of process that the Batch Management job must execute. This field is available in API version 55.0 and later. Valid values are: <ul style="list-style-type: none"> <li>• <code>Flow</code></li> <li>• <code>Loyalty Program Process</code></li> </ul>

## BatchDataSource

Represents the source of information whose records must be processed by the Batch Management job.

## Fields

Field Name	Field Type	Description
condition	string	Required. Criteria defined to filter the records.
criteria	string	Type of filter criteria that's used to filter records for processing.
filters	<a href="#">BatchDataSrcFilterCriteria</a> on page 366[]	Filter criterion that decides which records must be processed by the Batch Management job.
sourceObject	string	Required. API name of an object whose records must be processed by the batch job.  If the batch job type is <code>Loyalty Program Process</code> , the source object must be: <ul style="list-style-type: none"> <li>• <code>TransactionJournal</code> if the batch job is used to process transaction journals by applying the applicable loyalty program process.</li> <li>• An object that stores the details of loyalty program members whose tier must be assessed by the loyalty program process specified in the <code>executionProcessApiName</code> field.</li> </ul>

Field Name	Field Type	Description
sourceObjectField	string	<p>API name of the source object field that uniquely identifies records for which the batch job is executed. This field is available in API version 57.0 and later.</p> <p>This field is only applicable when the batch job's type is Loyalty Program Process and a TierProcess type active loyalty program process is specified in the <code>executionProcessApiName</code> field. Specify the API name of a field that is a lookup to the LoyaltyProgramMember object and uniquely identifies the members whose tier must be assessed.</p>

## BatchDataSrcFilterCriteria

Represents the filter conditions that decide which records must be processed by the Batch Management job.

### Fields

Field Name	Field Type	Description
dynamicValueType	string	Data type of the input variable used as a filter.
fieldName	string	Required. Name of the field that must be used to filter records.
fieldValue	string	Required. Value of the field that must be filtered. Specify the field if <code>isDynamicValue</code> is set to <code>False</code> .
isDynamicValue	boolean	Required. Indicates whether the filter criteria is dynamic.
operator	string (enumeration of type string)	<p>Required. Operator that is specified in the filter criteria. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>equals</code></li> <li>• <code>excludes</code></li> <li>• <code>greaterThan</code></li> <li>• <code>greaterThanOrEqualTo</code></li> <li>• <code>in</code></li> <li>• <code>includes</code></li> <li>• <code>lessThan</code></li> <li>• <code>LessThanOrEqualTo</code></li> <li>• <code>GreaterOrEqual</code></li> <li>• <code>like</code></li> <li>• <code>notEquals</code></li> <li>• <code>notIn</code></li> </ul>
sequenceNo	integer	Required. Sequence number used to refer the criteria in a filter.

## Declarative Metadata Sample Definition

The following is an example of a BatchProcessJobDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<BatchProcessJobDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <batchSize>10</batchSize>
  <dataSource>
    <condition>1</condition>
    <criteria>all</criteria>
    <filters>
      <dynamicValue>>false</dynamicValue>
      <dynamicValueType>string</dynamicValueType>
      <fieldName>Name</fieldName>
      <fieldValue>abcd</fieldValue>
      <operator>equals</operator>
      <sequenceNo>1</sequenceNo>
    </filters>
    <sourceObject>Account</sourceObject>
  </dataSource>
  <flowApiName>Flow1</flowApiName>
  <flowInputVariable>recordId</flowInputVariable>
  <masterLabel>BatchJob1</masterLabel>
  <processGroup>Loyalty</processGroup>
  <retryCount>2</retryCount>
  <retryInterval>1000</retryInterval>
  <status>Inactive</status>
  <description>test</description>
  <type>Flow</type>
  <executionProcessApiName>testFlow</executionProcessApiName>
</BatchProcessJobDefinition>
```

The following is an example of a Flow object used in Metadata API.

```
<?xml version="1.0" encoding="UTF-8"?>
<!--
  ~ Copyright 2020 Salesforce, Inc.
  ~ All Rights Reserved
  ~ Company Confidential
-->
<Flow xmlns="http://soap.sforce.com/2006/04/metadata">

    <filters>
        <field>Id</field>
        <operator>EqualTo</operator>
        <value>
            <elementReference>recordId</elementReference>
        </value>
    </filters>
    <getFirstRecordOnly>>true</getFirstRecordOnly>
    <object>Account</object>
    <storeOutputAutomatically>>true</storeOutputAutomatically>
</recordLookups>
<start>
    <locationX>73</locationX>
    <locationY>213</locationY>
    <connector>
        <targetReference>getAcc</targetReference>
    </connector>
</start>
<status>Draft</status>
<variables>
    <name>recordId</name>
    <dataType>String</dataType>
    <isCollection>>false</isCollection>
    <isInput>>true</isInput>
    <isOutput>>false</isOutput>
</variables>
</Flow>

```

The following is an example package.xml that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>*</members>
        <name>BatchProcessJobDefinition</name>
    </types>
    <types>
        <members>Flow1</members>
        <name>Flow</name>
    </types>
    <version>51.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## BillingSettings

---

Represents the settings for Salesforce Billing.

### Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the “Settings” name. See [Settings](#) for more details.

### File Suffix and Directory Location

The `BillingSettings` values are stored in the `BillingSettings.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there is only one settings file for each settings component.

### Version

`BillingSettings` components are available in API version 62.0 and later.

### Special Access Rules

These settings are available when Billing is enabled.

### Fields

Field Name	Description
<code>enableBillingSetup</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to enable Billing setting (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>enableCrMemoApplicationToPostedInvoices</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to enable Apply Credits to Posted Invoices setting (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>

Field Name	Description
enableInvoiceEmailDelivery	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to enable Configure Email Delivery Settings (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
enableInvoicePdfGeneration	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to enable Document Generation setting (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
enableNegInvoiceLn ConversionToCrMemoLn	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to enable Convert Negative Invoice Lines to Credit Memo Lines setting (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
enableTransactions ApplicationToInvoices	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether to enable Credit Application Level setting (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of a BillingSettings component.

```
<BillingSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <enableBillingSetup>true</enableBillingSetup>
  <enableInvoicePdfGeneration>true</enableInvoicePdfGeneration>
  <enableTransactionsApplicationToInvoices>true</enableTransactionsApplicationToInvoices>

  <enableCrMemoApplicationToPostedInvoices>true</enableCrMemoApplicationToPostedInvoices>

  <enableInvoiceEmailDelivery>true</enableInvoiceEmailDelivery>
</BillingSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Billing</members>
    <name>Settings</name>
  </types>
```

```
<version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## BlacklistedConsumer

Represents a connected app that is inaccessible to your Salesforce org's users. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

BlacklistedConsumer components have the suffix `.blacklistedConsumer` and are stored in the `blacklistedConsumers` folder.

## Version

BlacklistedConsumer components are available in API version 49.0 and later.

## Fields

This metadata type contains the following fields:

Field Name	Field Type	Description
<code>blockedByApiWhitelisting</code>	boolean	Set to <code>true</code> to apply the Permitted Users policy, <code>Admin approved users are pre-authorized</code> to all connected apps in the org. This policy limits access to only users with the associated profile or permission set assigned to the app. Set to <code>false</code> to allow access to the connected app. False is the default value.
<code>consumerKey</code>	string	Required. A value used by the consumer for identification of the connected app to Salesforce. Referred to as <code>client_id</code> in OAuth 2.0. After you define and save the value, it can't be edited. The value must be alphanumeric, can't contain special characters or spaces, and must be between 8–256 characters. Consumer keys must be globally unique.
<code>consumerName</code>	string	Required. The name of the connected app being blocked.
<code>masterLabel</code>	string	Required. The primary label for the connected app record.

## Declarative Metadata Sample Definition

The following is an example of a component.

```
<BlacklistedConsumer xmlns="http://soap.sforce.com/2006/04/metadata">
  <consumerKey>testConsumerKey</consumerKey>
  <consumerName>testName</consumerName>
  <blockedByApiWhitelisting>false</blockedByApiWhitelisting>
  <masterLabel>myTest</masterLabel>
</BlacklistedConsumer>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>BlacklistedConsumer</name>
  </types>
  <version>49.0</version>
</Package>
```

## Usage

Use this type judiciously for connected apps that you want to make inaccessible to your org's users. Blocking an app ends all current user sessions and prevents future sessions. To block malicious attempts to access your org's data, we recommend using API Access Control instead. This feature restricts users from accessing your Salesforce APIs unless they are pre-authorized through an approved connected app.

## Bot

---

Represents a definition of an Einstein Bot configuration that can have one or more versions. Only one version can be active.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

Bot components have the suffix `.bot` and are stored in the `bots` folder.

## Version

Bot components are available in API version 43.0 and later.

## Special Access Rules

Bot is available only if Chat and Einstein Bots are enabled in your org.

## Fields

Field Name	Field Type	Description
botMlDomain	<a href="#">LocalMlDomain</a> on page 373	Represents the Einstein intent set that groups intents, entities, and variables associated with a bot. All Einstein Bot versions under the same bot now share an intent set. Available in API version 44.0 and later.
botUser	string	Represents a user profile associated with the bot. Available in API version 46.0 and later.
botVersions	<a href="#">BotVersion</a> on page 391	Represents the configuration details for a specific Einstein Bots version, including dialogs, intents, entities, and variables.
contextVariables	<a href="#">ConversationContextVariable</a> on page 373	Represents the context variables that enable your bot to gather customer information regardless of channel. Available in API 45.0 and later.
conversationChannelProviders	<a href="#">ConversationChannelProvider</a> on page 375	Represents a list of the conversation channels linked to the bot. Available in API version 51.0 and later.
description	string	A description of the bot.
label	string	Label that identifies the bot throughout the Salesforce user interface.
logPrivateConversationData	boolean	Specifies whether to log customer inputs as part of conversation data ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 48.0 and later.
sessionTimeout	int	Represents the maximum amount of minutes that a bot session can be idle. Available in API version 58.0 and later.

## LocalMlDomain

An Einstein Intent Set local to the current bot version.

Field Name	Field Type	Description
label	string	Label that represents an Einstein Intent Set local to the current bot version throughout the Salesforce user interface.
mlIntents	<a href="#">MlIntent</a> []	List of intents associated with this local intent set.
mlSlotClasses	<a href="#">MlSlotClass</a> []	List of entities associated with this local intent set.
name	string	Required. This unique name prevents conflicts with other local Einstein Intent Sets. This name can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

## ConversationContextVariable

A context variable local to the current bot version. Available in API version 45.0 and later.

Field Name	Field Type	Description
contextVariableMappings	<a href="#">ConversationContextVariableMapping</a> on page 374	Represents the mapping between a context variable, channel type, and sObject field.
dataType	ConversationDataType (enumeration of type string)	Required. Represents the data type of the context variable. Valid values are: <ul style="list-style-type: none"> <li>• Text</li> <li>• Number</li> <li>• Boolean</li> <li>• Object</li> <li>• Date</li> <li>• DateTime</li> <li>• Currency</li> <li>• Id</li> </ul>
developerName	string	Required. Represents the name of the context variable. Can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
label	string	Required. A label that identifies the context variable throughout the Salesforce user interface.
sObjectType	string	Valid values are: <ul style="list-style-type: none"> <li>• BotDefinition</li> <li>• Queue</li> </ul>

## ConversationContextVariableMapping

Represents the mapping between a context variable, channel type, and sObject field.

Field Name	Field Type	Description
fieldName	string	Required. The API name of an sObject field to be used as part of the mapping.
messageType	MessageType (enumeration of type string)	Required. Represents the message channel. Valid values are: <ul style="list-style-type: none"> <li>• Alexa</li> <li>• AppleBusinessChat—Messages sent in enhanced Apple Messages for Business channels.</li> <li>• EmbeddedMessaging—Messages sent in Messaging for In-App and Web channels. Available in API version 50.0 and later.</li> <li>• Facebook</li> <li>• GoogleHome</li> <li>• Line</li> <li>• Omega</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• Phone</li> <li>• Text</li> <li>• WeChat</li> <li>• WebChat</li> <li>• WhatsApp</li> </ul>
SObjectType	string	Required. SObject type for the field property defined as part of the mapping. Valid values are: <ul style="list-style-type: none"> <li>• LiveChatTranscript</li> <li>• MessagingEndUser</li> <li>• MessagingSession</li> </ul>

## ConversationDefinitionChannelProvider

The developer name of a conversation channel linked to the bot. Available in API version 51.0 and later.

 **Note:** To add, edit, or remove a messaging channel, you must use the UI. If you deploy a bot with messaging channel providers, those providers aren't visible in Metadata API.

Field Name	Field Type	Description
agentRequired	boolean	Specifies whether an agent must be online for the bot to be active ( <code>true</code> ) or not ( <code>false</code> ) The default is <code>false</code> .
chatButtonName	string	Required. The developer name of a LiveChatButton metadata component.

## Declarative Metadata Sample Definition

The following is an example of a Bot. This example has been trimmed to make it easier to read.

```
<?xml version="1.0" encoding="UTF-8"?>

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>Pizza_Bot</members>
        <name>Bot</name>
    </types>
    <version>45.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## BotBlock

---

Represents the configuration details for a specific Einstein Bot block, including dialogs and variables.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

BotBlock components have the suffix `.botBlock` and are stored in the `botBlocks` folder.

## Version

BotBlock components are available in API version 58.0 and later.

## Special Access Rules

BotBlock is available only if Chat and Einstein Bots are enabled in your org.

### Fields

Field Name	Description
botBlockVersions	<p><b>Field Type</b> <a href="#">BotBlockVersion[]</a></p> <p><b>Description</b> The configuration details for specific Einstein Bot block versions, including dialogs and variables.</p>
description	<p><b>Field Type</b> string</p> <p><b>Description</b> A description of the bot block.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly label for BotBlock, which is defined when the block is created.</p>
richContentEnabled	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the block is available for enhanced bots (<code>true</code>) or for only standard bots (<code>false</code>). The default is <code>false</code>.</p>

### BotBlockVersion

Represents the configuration details for an Einstein Bot block version, including dialogs and variables.

Field Name	Description
botDialogs	<p><b>Field Type</b> <a href="#">BotDialog[]</a> on page 394</p> <p><b>Description</b> The list of dialogs in this bot block.</p>
conversationGoals	<p><b>Field Type</b> <a href="#">ConversationDefinitionGoal[]</a> on page 413</p>

Field Name	Description
	<p><b>Description</b></p> <p>The list of goals in this bot block. Available in API version 57.0 and later.</p>
conversationLanguages	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Specifies the language of the bot block.</p>
conversationVariables	<p><b>Field Type</b></p> <p><a href="#">ConversationVariable[]</a> on page 415</p> <p><b>Description</b></p> <p>A container that stores a specific piece of data collected from the customer. You can use variables within dialog actions as both inputs and outputs. Available in API version 44.0 and later.</p>
description	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>A description of the bot block.</p>
mlDomain	<p><b>Field Type</b></p> <p><a href="#">LocalMLDomain</a> on page 373</p> <p><b>Description</b></p> <p>Required.</p> <p>The Einstein Intent Set that groups intents, entities, and variables associated with a block.</p>
permissionSet	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The permission set associated with the bot block. Available in API version 59.0 and later.</p>
status	<p><b>Field Type</b></p> <p>ConvDefBlockVersionStatus (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>Indicates whether a block is published or is a draft.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• Published</li> </ul>

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## BotTemplate

---

Represents the configuration details for a specific Einstein Bot template, including dialogs and variables.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

BotTemplate components have the suffix `.botTemplate` and are stored in the `botTemplates` folder.

### Version

BotTemplate components are available in API version 55.0 and later.

### Special Access Rules

BotTemplate is available only if Chat and Einstein Bots are enabled in your org.

## Fields

Field Name	Description
botDialogGroups	<p><b>Field Type</b>  <a href="#">BotDialogGroup[]</a> on page 394</p> <p><b>Description</b>            The list of dialog groups in this bot template.</p>
botDialogs	<p><b>Field Type</b>  <a href="#">BotDialog[]</a> on page 394</p> <p><b>Description</b>            The list of dialogs in this bot template.</p>

richTextEnabled	<p><b>Field Type</b></p> <p>boolean</p>

Field Name	Description
	<p><b>Description</b></p> <p>Indicates whether the template is available for enhanced bots (<code>true</code>) or for standard bots (<code>false</code>). The default is <code>false</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of a BotTemplate component.

```
<?xml version="1.0" encoding="UTF-8"?>
<BotTemplate xmlns="http://soap.sforce.com/2006/04/metadata">
  <botDialogGroups>
    <developerName>dialog_group1</developerName>
    <label>dialog_group1</label>
  </botDialogGroups>
  <botDialogs>
    <developerName>Test_Dialog_1</developerName>
    <label>Test_Dialog_1</label>
    <showInFooterMenu>false</showInFooterMenu>
  </botDialogs>
  <botDialogs>
    <developerName>Test_Dialog_2</developerName>
    <label>Test_Dialog_2</label>
    <showInFooterMenu>false</showInFooterMenu>
  </botDialogs>
  <botDialogs>
    <botSteps>
      <botMessages>
        <message>Hi! I&apos;m your helpful bot.</message>
        <messageIdentifier>m1</messageIdentifier>
      </botMessages>
      <stepIdentifier>s1</stepIdentifier>
      <type>Message</type>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>BotTemplate</name>
  </types>
  <version>55.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## BotVersion

---

Represents the configuration details for a specific Einstein Bot version, including dialogs and variables.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

BotVersion components have the suffix `.bot` and are stored in the `bot` folder. BotVersion is a top-level child of Bot and shares its suffix and file directory.

## Version

BotVersion components are available in API version 43.0 and later.

## Special Access Rules

BotVersion is available only if Chat and Einstein Bots are enabled in your org.

## Fields

Field Name	Description
<code>botDialogGroups</code>	<p><b>Field Type</b>  <a href="#">BotDialogGroup[]</a> on page 394</p> <p><b>Description</b>            The list of dialog groups in this bot version.</p>
<code>botDialogs</code>	<p><b>Field Type</b>  <a href="#">BotDialog[]</a> on page 394</p> <p><b>Description</b>            The list of dialogs in this bot version.</p>
<code>conversationGoals</code>	<p><b>Field Type</b>  <a href="#">ConversationDefinitionGoal[]</a> on page 413</p> <p><b>Description</b>            The list of goals in this bot version. Available in API version 57.0 and later.</p>
<code>conversationSystemDialogs</code>	<p><b>Field Type</b>  <a href="#">ConversationSystemDialog[]</a> on page 414</p> <p><b>Description</b>            A system function assigned to a dialog. Available in API version 48.0 and later.</p>
<code>conversationVariables</code>	<p><b>Field Type</b>  <a href="#">ConversationVariable[]</a> on page 415</p> <p><b>Description</b>            A container that stores a specific piece of data collected from the customer. You can use variables within dialog actions as both inputs and outputs. Available in API version 44.0 and later.</p>

Field Name	Description
entryDialog	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A reference to the first dialog that the bot presents to your customer. For example, Welcome.</p>
intentDisambiguationEnabled	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Reserved for internal use.</p>
intentV3Enabled	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Reserved for internal use.</p>
knowledgeFallbackEnabled	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Reserved for internal use.</p>
mainMenuDialog	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A reference to the dialog identified as the main menu dialog. For example, Main Menu.</p>
nlpProviders	<p><b>Field Type</b> <a href="#">ConversationDefinitionNlpProvider[]</a> on page 416</p> <p><b>Description</b> Defines the language provider which is used for a particular language. Available in API version 49.0 and later.</p>
responseDelayMilliseconds	<p><b>Field Type</b> int</p> <p><b>Description</b> An optional default or custom delay after every bot response to simulate typing.</p>

## BotDialogGroup

The list of dialog groups in this bot version.

Field Name	Description
description	<p><b>Field Type</b> string</p> <p><b>Description</b> A description of the bot dialog group.</p>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  This unique name prevents conflicts with other dialog groups associated with the same bot version. This name can contain only underscores and alphanumeric characters. The name must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p> <p> <b>Note:</b> Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
label	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  A label that identifies the dialog group throughout the Salesforce user interface.</p>

## BotDialog

The list of dialogs in this bot version.

Field Name	Description
botDialogGroup	<p><b>Field Type</b> string</p> <p><b>Description</b> The bot dialog group that contains this bot dialog.</p>
botSteps	<p><b>Field Type</b> <a href="#">BotStep[]</a> on page 396</p> <p><b>Description</b> A list of steps that are executed as part of the dialog.</p>

Field Name	Description
description	<p><b>Field Type</b> string</p> <p><b>Description</b> A description of the bot dialog.</p>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  This unique name prevents conflicts with other dialogs associated with the same bot version. This name can contain only underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p> <p> <b>Note:</b> Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
isPlaceholderDialog	<p><b>Field Type</b> boolean</p> <p><b>Description</b> In a bot block, indicates whether a dialog is a placeholder (<code>true</code>) or not (<code>false</code>). In a bot template or bot version not associated with a bot block, this field is read-only and the value is <code>false</code>. Available in API version 58.0 and later.</p>
label	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  A label that identifies the dialog throughout the Salesforce user interface.</p>
mlIntent	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  A label that identifies the dialog throughout the Salesforce user interface. The name of the intent associated with a dialog.</p>
mlIntentTrainingEnabled	<p><b>Field Type</b> boolean</p>

Field Name	Description
	<p><b>Description</b></p> <p>Indicates whether Einstein is turned on to train an intent model for the dialog intent (<code>true</code>) or turned off for the exact match option (<code>false</code>). The default value is <code>false</code>. Available in API version 46.0 and later.</p>
<code>showInFooterMenu</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether to show this dialog in the Bot Options menu. The default value is <code>false</code>.</p>

## BotStep

A step that is executed as part of the dialog.

Field Name	Description
<code>booleanFilter</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>This field is reserved for future use.</p>
<code>botInvocation</code>	<p><b>Field Type</b></p> <p><a href="#">BotInvocation</a> on page 398</p> <p><b>Description</b></p> <p>Bot Invocation used by a BotStep of type <code>Invocation</code>.</p>
<code>botMessages</code>	<p><b>Field Type</b></p> <p><a href="#">BotMessage[]</a> on page 400</p> <p><b>Description</b></p> <p>List of bot messages used by a BotStep of type <code>Message</code>.</p>
<code>botNavigation</code>	<p><b>Field Type</b></p> <p><a href="#">BotNavigation</a> on page 401</p> <p><b>Description</b></p> <p>Bot Navigation used by a BotStep of type <code>Navigation</code>.</p>
<code>botStepConditions</code>	<p><b>Field Type</b></p> <p><a href="#">BotStepCondition[]</a> on page 402</p> <p><b>Description</b></p> <p>List of BotStep conditions associated with a BotStep of type <code>Group</code>.</p>

Field Name	Description
botSteps	<p><b>Field Type</b>  <a href="#">BotStep[]</a> on page 396</p> <p><b>Description</b>            List of BotSteps associated to a Bot Step of type Group.</p>
botVariableOperation	<p><b>Field Type</b>  <a href="#">BotVariableOperation[]</a> on page 403</p> <p><b>Description</b>            Bot Variable Operation used by a BotStep of type VariableOperation.</p>
conditionLogicType	<p><b>Field Type</b>            ConversationDefinitionLogicalOperatorType (enumeration of type string)</p> <p><b>Description</b>            Represents the type of conditional logic used by a BotStep. Values are:</p> <ul style="list-style-type: none"> <li>• And</li> <li>• Or</li> </ul> <p>Available in API version 58.0 and later.</p>
conversationRecordLookup	<p><b>Field Type</b>  <a href="#">ConversationRecordLookup[]</a> on page 408</p> <p><b>Description</b>            A lookup action to the Conversation record. Available in API version 46.0 and later.</p>
conversationStepGoalMappings	<p><b>Field Type</b>  <a href="#">ConversationDefinitionStepGoalMapping[]</a> on page 411</p> <p><b>Description</b>            The API name of a goal used by a BotStep of type GoalStep. Available in API version 57.0 and later.</p>
conversationSystemMessage	<p><b>Field Type</b>  <a href="#">ConversationSystemMessage[]</a> on page 412</p> <p><b>Description</b>            System messages that represent an action for a BotStep, such as transferring to an agent or ending a chat. Available in API version 46.0 and later.</p>
messageDefinition	<p><b>Field Type</b>  <a href="#">ConversationDefinitionRichMessage[]</a> on page 413</p> <p><b>Description</b>            List of configuration details used by a BotStep that references a messaging component. Available in API version 54.0 and later.</p>

Field Name	Description
<code>stepIdentifier</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> A unique key that identifies a step within a dialog. It is used to link translated labels to labels within the step. This field is recommended for all step records and is required for translated step labels. Available in API version 53.0 and later.</p> <p>If a step is created via the UI, the <code>stepIdentifier</code> is automatically generated. If a step is created via API, the <code>stepIdentifier</code> must be provided. The <code>stepIdentifier</code> can contain letters, numbers, dashes, and underscores, up to 255 characters.</p>
<code>type</code>	<p><b>Field Type</b> BotStepType (enumeration of type string)</p> <p><b>Description</b> Required. Values are:</p> <ul style="list-style-type: none"> <li>• GoalStep (Available in API version 57.0 and later.)</li> <li>• Group</li> <li>• Invocation</li> <li>• Message</li> <li>• Navigation</li> <li>• RecordLookup (Available in API version 48.0 and later.)</li> <li>• RichMessage (Available in API version 54.0 and later.)</li> <li>• SystemMessage</li> <li>• VariableOperation</li> <li>• Wait</li> </ul>

## BotInvocation

Bot Invocation used by a BotStep of type `Invocation`.

Field Name	Description
<code>invocationActionName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the invocable action used by a Bot Invocation.</p>
<code>invocationActionType</code>	<p><b>Field Type</b> ConversationInvocableTargetType (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>Available dialog action types are:</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• apex</li> <li>• externalService (Available in API version 53.0 and later.)</li> <li>• flow</li> <li>• logFeedback (Available in API version 51.0 and later.)</li> <li>• logGoalAchieved (Deprecated in API version 57.0 and later.)</li> <li>• standardInvocableAction</li> </ul>
invocationMappings	<p><b>Field Type</b></p> <p><a href="#">BotInvocationMapping[]</a> on page 399</p> <p><b>Description</b></p> <p>List of Bot Invocation Mappings for a Bot Invocation.</p>

## BotInvocationMapping

List of Bot Invocation Mappings for a Bot Invocation.

Field Name	Description
parameterName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Name of an Input/Output parameter of the parent Bot Invocation target.</p>
recordName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Name of the record that is used as part of an Invocation mapping. Available in API version 54.0 and later.</p>
type	<p><b>Field Type</b></p> <p>BotInvocationMappingType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• Input</li> <li>• Output</li> </ul>

Field Name	Description
value	<p><b>Field Type</b> string</p> <p><b>Description</b> Literal value to be assigned to the specified parameter.</p>
variableName	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the Bot Variable that is used as part of an Invocation mapping.</p>
variableType	<p><b>Field Type</b> ConversationVariableType (enumeration of type string)</p> <p><b>Description</b> This field relates to the type of variable used in this invocation mapping. Values are:</p> <ul style="list-style-type: none"> <li>• ContextVariable</li> <li>• ConversationVariable</li> </ul>

## BotMessage

A bot message used by a BotStep of type Message.

Field Name	Description
message	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Message to display as part of an outgoing message from the bot to the customer.</p>
messageIdentifier	<p><b>Field Type</b> string</p> <p><b>Description</b> A unique key that identifies a message within a dialog. It is used to link translated labels to labels within the message. This field is recommended for all message records and is required for translated message labels. Available in API version 53.0 and later.  If a message is created via the UI, the <code>messageIdentifier</code> is automatically generated. If a message is created via API, the <code>messageIdentifier</code> must be provided. <code>messageIdentifier</code> can contain letters, numbers, dashes, and underscores, up to 255 characters.</p>

## BotNavigation

Bot navigation used by a BotStep of type `Navigation`.

Field Name	Description
<code>botNavigationLinks</code>	<p><b>Field Type</b> <code>BotNavigationLink[]</code> on page 401</p> <p><b>Description</b> List of Bot Navigation links associated with a Bot Navigation of type <code>Call</code> or <code>Redirect</code>.</p>
<code>type</code>	<p><b>Field Type</b> <code>BotNavigationType</code> (enumeration of type string)</p> <p><b>Description</b> Required. Values are:</p> <ul style="list-style-type: none"> <li>• <code>Call</code></li> <li>• <code>Redirect</code></li> <li>• <code>TransferToAgent</code></li> </ul>

## BotNavigationLink

List of Bot Navigation links associated with a Bot Navigation of type `Call` or `Redirect`.

Field Name	Description
<code>label</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Label displayed when more than one Bot Navigation Link is available under a Bot Navigation of type <code>Redirect</code>. The target dialog label is used when no label is provided.</p>
<code>targetBotDialog</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the target dialog to be called as part of this Bot Navigation Link.</p>
<code>targetVariable</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> In the Redirect to Dialog Rule Action, the ID of the target object variable to be called as part of this Bot Navigation link. Available in API version 57.0 and later.</p>

Field Name	Description
targetVariableType	<p><b>Field Type</b> ConversationVariableType (enumeration of type string)</p> <p><b>Description</b> In the Redirect to Dialog Rule Action, the type of variable referred to in targetVariable. Available in API version 57.0 and later.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• ContextVariable</li> <li>• ConversationVariable</li> </ul>

## BotStepCondition

List of BotStep conditions associated with a BotStep of type Group.

Field Name	Description
leftOperandName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the variable used as the left side of the condition operation.</p>
leftOperandType	<p><b>Field Type</b> ConversationVariableType (enumeration of type string)</p> <p><b>Description</b> Required. Type of the variable used as the left side of the condition operation.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• ContextVariable</li> <li>• ConversationVariable</li> </ul>
operatorType	<p><b>Field Type</b> BotStepConditionOperatorType (enumeration of type string)</p> <p><b>Description</b> Required. Values are:</p> <ul style="list-style-type: none"> <li>• Equals</li> <li>• GreaterThan (Available in API version 47.0 and later.)</li> <li>• GreaterThanOrEqualTo (Available in API version 47.0 and later.)</li> <li>• IsNotSet</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• <code>IsSet</code></li> <li>• <code>LessThan</code> (Available in API version 47.0 and later.)</li> <li>• <code>LessThanOrEqualTo</code> (Available in API version 47.0 and later.)</li> <li>• <code>NotEquals</code></li> </ul>
<code>rightOperandValue</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Value that is used as the right side of the condition operation. This value is ignored when using <code>IsSet</code> and <code>IsNotSet</code> operators.</p>

## BotVariableOperation

Bot variable operation used by a BotStep of type `VariableOperation`.

Field Name	Description
<code>askCollectIfSet</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If <code>true</code>, the bot runs a Bot Variable Operation of type <code>Collect</code> regardless of whether the variable already has a value. When a value exists for a variable, the bot asks the user for the relevant information, and the bot overwrites the existing value with the user-provided value. If <code>false</code>, the bot skips variables with an existing value and maintains the existing value. The default is <code>false</code>. Available in API version 51.0 and later.</p>
<code>autoSelectIfSingleChoice</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If <code>true</code>, the bot automatically selects the answer in the conversation flow when only one button choice is available in a Bot Variable Operation of type <code>Collect</code> and a <code>quickReplyType</code> value of <code>Dynamic</code>. If <code>false</code>, the bot presents the single button choice and waits for the user's response. The default is <code>false</code>. Available in API version 51.0 and later.</p>
<code>botInvocation</code>	<p><b>Field Type</b> <a href="#">BotInvocation</a> on page 398</p> <p><b>Description</b> Bot Invocation used to provide Dynamic choices by a Bot Variable Operation of type <code>Collect</code> and <code>quickReplyType</code> of <code>Dynamic</code>.</p>

Field Name	Description
botMessages	<p><b>Field Type</b>  <a href="#">BotMessage[]</a> on page 400</p> <p><b>Description</b>  List of Bot Messages used as prompt messages by a Bot Variable Operation of type <code>Collect</code>.</p>
botQuickReplyOptions	<p><b>Field Type</b>  <a href="#">BotQuickReplyOption[]</a> on page 406</p> <p><b>Description</b>  List of static choice options used by a Bot Variable Operation of type <code>Collect</code> and <code>quickReplyType</code> of <code>Static</code>.</p>
botVariableOperands	<p><b>Field Type</b>  <a href="#">BotVariableOperand[]</a> on page 407</p> <p><b>Description</b>  List of Bot Variable Operands associated with a Bot Variable of type <code>Set</code> or <code>Unset</code>.</p>
invalidInputBotNavigation	<p><b>Field Type</b>  <a href="#">BotNavigation</a> on page 401</p> <p><b>Description</b>  Bot Navigation used by a Bot Variable Operation of type <code>Collect</code>. This navigation is executed when the associated Bot Invocation doesn't return any options.</p>
messageDefinition	<p><b>Field Type</b>  <a href="#">ConversationDefinitionRichMessage</a> on page 413</p> <p><b>Description</b>  Configuration details that reference a messaging component. Outputs are used by a Bot Variable Operation of type <code>Set</code>. Available in API version 58.0 and later.</p>
optionalCollect	<p><b>Field Type</b>  boolean</p> <p><b>Description</b>  If <code>true</code>, the bot asks the repair attempts once and then moves on to the next dialog step. The default value is <code>false</code>. Available in API version 48.0 and later.</p>
quickReplyOptionTemplate	<p><b>Field Type</b>  string</p> <p><b>Description</b>  Formula template used to resolve a label for Dynamic choice options of type <code>Object</code>.</p>
quickReplyType	<p><b>Field Type</b>  BotQuickReplyType (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• <code>Dynamic</code></li> <li>• <code>Static</code></li> </ul>
<code>quickReplyWidgetType</code>	<p><b>Field Type</b></p> <p><code>BotWidgetType</code> (enumeration of type string)</p> <p><b>Description</b></p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• <code>Buttons</code></li> <li>• <code>Menu</code></li> </ul>
<code>retryMessages</code>	<p><b>Field Type</b></p> <p><a href="#">BotMessage[]</a> on page 400</p> <p><b>Description</b></p> <p>In <a href="#">Conversation Repair</a>, the messages assigned to repair attempts. Available in API version 48.0 and later.</p>
<code>sourceVariableName</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Name of the source <code>variableName</code> used in the variable operation. Available in API version 47.0 and later.</p>
<code>sourceVariableType</code>	<p><b>Field Type</b></p> <p><code>ConversationVariableType</code> (enumeration of type string)</p> <p><b>Description</b></p> <p>This name defines the data type of <code>variableName</code> used in the variable operation.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• <code>ContextVariable</code></li> <li>• <code>ConversationVariable</code></li> </ul>
<code>successMessages</code>	<p><b>Field Type</b></p> <p><a href="#">BotMessage[]</a> on page 400</p> <p><b>Description</b></p> <p>In a File dialog step, the message displayed to the customer as part of type <code>CollectAttachment</code> to confirm a successful file upload. Available in API version 57.0 and later.</p>
<code>type</code>	<p><b>Field Type</b></p> <p><code>BotVariableOperationType</code> (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• <code>Collect</code></li> <li>• <code>CollectAttachment</code> (Available in API version 57.0 and later.)</li> <li>• <code>Set</code></li> <li>• <code>SetConversationLanguage</code> (Available in API version 53.0 and later.)</li> <li>• <code>Unset</code></li> </ul>
<code>variableOperationIdentifier</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>A unique key that identifies a variable operation within a dialog. It is used to link translated labels to labels within the variable operation. This field is recommended for all variable operation records and is required for translated variable operation labels. Available in API version 53.0 and later.</p> <p>If a variable operation is created via the UI, the <code>variableOperationIdentifier</code> is automatically generated. If a variable operation is created via API, the <code>variableOperationIdentifier</code> must be provided. <code>variableOperationIdentifier</code> can contain letters, numbers, dashes, and underscores, up to 255 characters.</p>

## BotQuickReplyOption

List of static choice options used by a bot variable operation of type `Collect` and `quickReplyType` of `Static`.

Field Name	Description
<code>literalValue</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Value to be displayed as a menu or button choice to your customer.</p>
<code>quickReplyOptionIdentifier</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>A unique key that identifies a quick reply option within a dialog. It is used to link translated labels to labels within the quick reply option. This field is recommended for all quick reply option records and is required for translated quick reply option labels. Available in API version 53.0 and later.</p>

Field Name	Description
	<p>If a quick reply option is created via the UI, the <code>quickReplyOptionIdentifier</code> is automatically generated. If a message is created via API, the <code>quickReplyOptionIdentifier</code> must be provided.</p> <p><code>quickReplyOptionIdentifier</code> can contain letters, numbers, dashes, and underscores, up to 255 characters.</p>

## BotVariableOperand

List of bot variable operands associated with a bot variable of type `Set` or `Unset`.

Field Name	Description
<code>disableAutoFill</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Disables auto-fill behavior for a bot variable under a bot variable operation of type <code>Collect</code>.</p>
<code>sourceName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the source <code>CustomField</code> or <code>MISlotClass</code> used in the variable operation.</p>
<code>sourceType</code>	<p><b>Field Type</b> <code>ConversationVariableOperandSourceType</code> (enumeration of type string)</p> <p><b>Description</b> Values are:</p> <ul style="list-style-type: none"> <li>• <code>BotDefinition</code> (Available in API version 46.0 and later.)</li> <li>• <code>ContextVariable</code> (Available in API version 45.0 and later.)</li> <li>• <code>ConversationVariable</code></li> <li>• <code>FlowDefinition</code> (Available in API version 52.0 and later.)</li> <li>• <code>MISlotClass</code></li> <li>• <code>Queue</code> (Available in API version 46.0 and later.)</li> <li>• <code>StandardConversationVariable</code></li> <li>• <code>StandardMISlotClass</code></li> <li>• <code>Value</code></li> </ul>
<code>sourceValue</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Literal value used as the source for this variable operation.</p>

Field Name	Description
targetName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the target variable used in the variable operation.</p>
targetType	<p><b>Field Type</b> ConversationVariableType (enumeration of type string)</p> <p><b>Description</b> Required. Type of the target used in the variable operation. Values are:</p> <ul style="list-style-type: none"> <li>• ContextVariable</li> <li>• ConversationVariable</li> </ul>

## ConversationRecordLookup

Information related to the linked conversation. Currently only works on Lightning Knowledge. Available in API version 46.0 and later.

Field Name	Description
SObjectType	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Specifies the SObjectType of the ID stored in a bot variable.</p>
conditions	<p><b>Field Type</b> <a href="#">ConversationRecordLookupCondition[]</a> on page 410</p> <p><b>Description</b> The conditions associated with this lookup. Available in API version 51.0 and later.</p>
filterLogic	<p><b>Field Type</b> string</p> <p><b>Description</b> The logical operator that connects the conditions. Values are:</p> <ul style="list-style-type: none"> <li>• And</li> <li>• Or</li> </ul>

Field Name	Description
	Available in API version 51.0 and later.
lookupFields	<p><b>Field Type</b>  <a href="#">ConversationRecordLookupField[]</a> on page 411</p> <p><b>Description</b>            Definition of the fields that are used for this lookup.</p>
maxLookupResults	<p><b>Field Type</b>            int</p> <p><b>Description</b>            Required.            The maximum number of records to return (1-3).</p>
sortFieldName	<p><b>Field Type</b>            string</p> <p><b>Description</b>            The name of the field used to sort the lookup results. Available in API version 51.0 and later.</p>
sortOrder	<p><b>Field Type</b>            SortOrder (enumeration of type string)</p> <p><b>Description</b>            The display order of the lookup results.            Values are:</p> <ul style="list-style-type: none"> <li>• Asc</li> <li>• Desc</li> </ul> <p>Available in API version 51.0 and later.</p>
sourceVariableName	<p><b>Field Type</b>            string</p> <p><b>Description</b>            The input for this lookup operation.</p>
sourceVariableType	<p><b>Field Type</b>            ConversationVariableType (enumeration of type string)</p> <p><b>Description</b>            Type of the target used in the variable operation.            Values are:</p> <ul style="list-style-type: none"> <li>• ContextVariable</li> <li>• ConversationVariable</li> </ul>

Field Name	Description
targetVariableName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The variable that holds the results of this lookup.</p>

## ConversationRecordLookupCondition

List of conditions associated with a ConversationRecordLookup. Available in API version 51.0 and later.

Field Name	Description
leftOperand	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Field on which the condition operation takes place.</p>
operatorType	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The operator applied to the leftOperand. Values are:</p> <ul style="list-style-type: none"> <li>• Equals</li> <li>• NotEquals</li> <li>• IsSet</li> <li>• IsNotSet</li> <li>• GreaterThan</li> <li>• LessThan</li> <li>• GreaterThanOrEqualTo</li> <li>• LessThanOrEqualTo</li> </ul>
rightOperandName	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the variable to compare against.</p>

Field Name	Description
rightOperandType	<p><b>Field Type</b> ConversationVariableType (enumeration of type string)</p> <p><b>Description</b> The type of the variable to compare against.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• ContextVariable</li> <li>• ConversationVariable</li> </ul>
rightOperandValue	<p><b>Field Type</b> string</p> <p><b>Description</b> The custom value to compare against. This value is ignored when using <code>IsSet</code> and <code>IsNotSet</code> operators.</p>
sortOrder	<p><b>Field Type</b> int</p> <p><b>Description</b> Required.</p> <p>Order in which the conditions are applied.</p>

## ConversationRecordLookupField

The fields used in a conversation record lookup. Available in API version 46.0 and later.

Field Name	Description
fieldName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>Defines the field names used in the Conversation Lookup function.</p>

## ConversationDefinitionStepGoalMapping

Represents the association between a goal and a BotStep. A goal can be associated with only one BotStep and one dialog at a time. Available in API version 57.0 and later.

Field Name	Description
goalName	<p><b>Field Type</b> string</p> <p><b>Description</b> The API name of the goal.</p>

## ConversationSystemMessage

System messages that represent an action for a Bot Step, such as transferring to an agent or ending a chat. Available in API version 46.0 and later.

Field Name	Description
systemMessageMappings	<p><b>Field Type</b> <a href="#">ConversationSystemMessageMapping</a> on page 412</p> <p><b>Description</b> Defines the type of system message to be sent.</p>
type	<p><b>Field Type</b> ConversationSystemMessageType (enumeration of type string)</p> <p><b>Description</b> Required. This field defines the values available for a system message. Values are:</p> <ul style="list-style-type: none"> <li>• EndChat</li> <li>• Transfer</li> </ul>

## ConversationSystemMessageMapping

List of mappings that indicate additional information provided for the system message. Available in API version 46.0 and later.

Field Name	Description
mappingType	<p><b>Field Type</b> ConversationMappingType (enumeration of type string)</p> <p><b>Description</b> Required. Defines the type of mapping used in the record. Values are:</p> <ul style="list-style-type: none"> <li>• Input</li> <li>• Output</li> </ul>

Field Name	Description
parameterType	<p><b>Field Type</b> ConversationSystemMessageParamType (enumeration of type string)</p> <p><b>Description</b> Required. Defines the type of parameter the value is mapped to. Values are:</p> <ul style="list-style-type: none"> <li>• Transfer</li> </ul>
variableName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the variable that contains the value passed to the system message.</p>

## ConversationDefinitionRichMessage

Represents the configuration details for referencing a messaging component, such as an enhanced link. Available in API version 54.0 and later.

Field Name	Description
messageDefinitionMappings	<p><b>Field Type</b> <a href="#">BotInvocationMapping[]</a> on page 399</p> <p><b>Description</b> List of mappings for referencing a messaging component. Includes any input parameters and their values. Optionally, specifies the conversation variable for storing any outputs.  Input parameter values can be either static values or references to conversation or context variables.</p>
messageDefinitionName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The API name of the messaging component referenced by the bot.</p>

## ConversationDefinitionGoal

A goal included in the bot version. Available in API version 57.0 and later.

Field Name	Description
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>A unique name that prevents conflicts with other goals associated with the same bot version. This name can contain only underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
label	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>A label that identifies the goal throughout the Salesforce user interface. This label can contain only underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>

## ConversationSystemDialog

A system function assigned to a dialog. Available in API version 48.0 and later.

Field Name	Description
dialog	<p><b>Field Type</b> string</p> <p><b>Description</b> The dialog name triggered when this system event fires.</p>
type	<p><b>Field Type</b> ConversationSystemDialogType (enumeration of type string)</p> <p><b>Description</b> The type of system event. Required. Valid values are:</p> <ul style="list-style-type: none"> <li>• Disambiguation (Reserved for Future Use)</li> <li>• DisambiguationFailed (Reserved for Future Use)</li> <li>• ErrorHandling</li> <li>• KnowledgeFallback (Available in API version 51.0.)</li> <li>• TransferFailed</li> </ul>

## ConversationVariable

A container that stores a specific piece of data collected from the customer. You can use variables within dialog actions as both inputs and outputs. Available in API version 44.0 and later.

Field Name	Description
collectionType	<p><b>Field Type</b> ConversationVariableCollectionType (enumeration of type string)</p> <p><b>Description</b> This field defines whether a variable is designated as a List Variable. Valid value is List.</p>
dataType	<p><b>Field Type</b> ConversationVariableCollectionType (enumeration of type string)</p> <p><b>Description</b> Required. Valid values are:</p> <ul style="list-style-type: none"> <li>• Boolean</li> <li>• Currency</li> <li>• Date</li> <li>• DateTime</li> <li>• Id (available in API 45.0 and later.)</li> <li>• Object</li> <li>• Number</li> <li>• Text</li> </ul>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. This name can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</p>
label	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Label that identifies a variable throughout the Salesforce user interface.</p>
SObjectType	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Specifies the SObjectType of the ID stored in a bot variable. Valid values are:</p> <ul style="list-style-type: none"> <li>• BotDefinition</li> <li>• Queue</li> </ul>

## ConversationDefinitionNlpProvider

Defines the natural language service that is used for the language assigned to a bot version. Available in API version 49.0 and later.

Field Name	Description
language	<p><b>Field Type</b></p> <p>Language</p> <p><b>Description</b></p> <p>Required.</p> <p>The language assigned to a bot version.</p>
nlpProviderName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>If nlpProviderType is EinsteinAI, this field is blank. If Apex, this field holds the Apex class name of the service.</p>
nlpProviderType	<p><b>Field Type</b></p> <p>ConversationDefinitionNlpProviderType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>Default value is EinsteinAi. Valid values are:</p> <ul style="list-style-type: none"> <li>• EinsteinAi</li> <li>• Apex</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a BotVersion.

```
<?xml version="1.0" encoding="UTF-8"?>
<Bot xmlns="http://soap.sforce.com/2006/04/metadata">
  <botMlDomain>
    <label>Astros Pizza</label>

```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Astros Pizza_Bot.v1</members>
    <name>BotVersion</name>
  </types>
  <version>45.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## BrandingSet

Represents the definition of a set of branding properties for an Experience Builder site, as defined in the Theme panel in Experience Builder.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

`BrandingSet` components have the suffix `brandingSet` and are stored in the `brandingSets` folder.

## Version

`BrandingSet` components are available in API version 40.0 and later.

## Special Access Rules

The `BrandingSet` type is available when at least one of the following is enabled in your org: Digital Experiences, Surveys, or Lightning Experience. All users, including unauthenticated guest users, can access this type.

## Fields

Field Name	Field Type	Description
<code>brandingSetProperty</code>	<a href="#">BrandingSetProperty</a> []	An array containing the name and value of each branding property, such as <code>TextColor:#333</code> .
<code>description</code>	string	A description of the set of branding properties.
<code>masterLabel</code>	string	Required. The user interface name of the set of branding properties.

Field Name	Field Type	Description
type	string	The assigned branding set definition for this BrandingSet.

## BrandingSetProperty

Represents the definition of a branding property in the Theme panel in Experience Builder.

Field Name	Field Type	Description
propertyName	string	Required. The name of the branding property, such as <code>TextColor</code> .
propertyValue	string	The value of the branding property, such as <code>#333</code> .

## Declarative Metadata Sample Definition

The following is an example of a BrandingSet component.

```
<?xml version="1.0" encoding="UTF-8"?>
<BrandingSet xmlns="http://soap.sforce.com/2006/04/metadata">
  <brandingSetProperty>
    <propertyName>TextTransformStyle</propertyName>
    <propertyValue>uppercase</propertyValue>
  </brandingSetProperty>
  <brandingSetProperty>
    <propertyName>DetailTextColor</propertyName>
    <propertyValue>#696969</propertyValue>
  </brandingSetProperty>
  <brandingSetProperty>
    <propertyName>BorderColor</propertyName>
    <propertyValue>#D4D4D4</propertyValue>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## BriefcaseDefinition

Represents a briefcase definition. A briefcase makes selected records available for specific users and groups to view when they're offline in the Salesforce Field Service mobile app for iOS and Android. This type extends the Metadata metadata type and inherits its `fullName` field.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

BriefcaseDefinition components have the suffix `.briefcaseDefinition` and are stored in the `briefcaseDefinitions` folder.

## Version

BriefcaseDefinition components are available in API version 50.0 and later.

## Fields

Field Name	Field Type	Description
<code>briefcaseRules</code>	<code>BriefcaseRule[]</code>	A list of rules that specify which records are included in the briefcase.
<code>description</code>	<code>string</code>	Description of the briefcase.
<code>isActive</code>	<code>boolean</code>	Required. Indicates whether the briefcase is active by default ( <code>true</code> ) or inactive ( <code>false</code> ). Activate a briefcase to make the selected records available to assignees.
<code>masterLabel</code>	<code>string</code>	Required. Label for the briefcase name that appears in the Salesforce user interface.
<code>type</code>	<code>BriefcaseType[]</code>	Reserved for future use.

## BriefcaseRule

Represents a rule that specifies records to be included in the BriefcaseDefinition.

Field Name	Field Type	Description
<code>briefcaseRuleFilters</code>	<code>BriefcaseRuleFilter[]</code>	A list of filters on a rule.
<code>filterLogic</code>	string	The filter logic for record selection, for example, <code>1 AND 2</code> where 1 and 2 correspond to filter 1 and filter 2. Filter logic operators include <code>AND</code> and <code>OR</code> .
<code>isAscendingOrder</code>	boolean	Indicates whether the records should be sorted in ascending order ( <code>true</code> ) or descending order ( <code>false</code> ).
<code>isRelatedFilesRule</code>	boolean	<p>Indicates whether the briefcase rule is part of a hierarchical set of rules that configure the offline priming of file attachments. Available only for the Offline App (Salesforce Mobile App Plus).</p> <p>Files Priming is a beta service that is subject to the Beta Services Terms at <a href="#">Agreements - Salesforce.com</a> or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the <a href="#">Product Terms Directory</a>. Use of this beta service is at the Customer's sole discretion.</p> <p>To configure the offline priming of file attachments, create a set of four hierarchical briefcase rules:</p> <ul style="list-style-type: none"> <li>• A rule with <code>targetEntity</code> set to the object with the file attachments at the first level</li> <li>• A rule with <code>targetEntity</code> set to <code>ContentDocumentLink</code> at the second level</li> <li>• A rule with <code>targetEntity</code> set to <code>ContentDocument</code> at the third level</li> <li>• A rule with <code>targetEntity</code> set to <code>ContentVersion</code> at the fourth level</li> </ul> <p>See the Declarative Metadata Sample Definition section for an example briefcase definition that configures the offline priming of file attachments.</p> <p>The <code>ContentDocumentLink</code>, <code>ContentDocument</code>, and <code>ContentVersion</code> rules must all have <code>isRelatedFilesRule</code> set to <code>true</code>. To delete a briefcase configuration for file attachments, you must delete the <code>ContentDocumentLink</code> rule and all of its nested rules. You can't delete a single rule within the hierarchy of <code>ContentDocumentLink</code>, <code>ContentDocument</code>, and <code>ContentVersion</code> rules.</p> <p>When <code>isRelatedFilesRule</code> is set to <code>true</code>, you must use the <code>recordLimit</code> field to limit the number of file attachments returned by a briefcase rule. Apply the same <code>recordLimit</code> value across the <code>ContentDocumentLink</code>, <code>ContentDocument</code>, and <code>ContentVersion</code> rules. You can optionally filter file attachments by file size and file type through Briefcase Builder in Setup.</p> <p>After you set a value for <code>isRelatedFilesRule</code>, you can no longer modify the field. The value that you set persists for the life of the rule.</p>
<code>orderBy</code>	string	The field to order the records by, which determines how the records can be sorted. For example, Account Name or Created By.

Field Name	Field Type	Description
queryScope	FilterScope (enumeration of type string)	<p>A group of records to restrict the scope of this rule. Valid values include:</p> <ul style="list-style-type: none"> <li>Everything</li> <li>AssignedToMe</li> <li>Mine</li> </ul> <p>The AssignedToMe scope is supported for the ServiceAppointment object only.</p>
recordLimit	int	The maximum number of records for an object on the briefcase rule. The maximum is 50,000 records that meet the criteria. However, the records returned by one briefcase rule must fit within the maximum limit of 50,000 records across active briefcases. If there are more records that match the criteria than the record limit allows, the orderBy field determines which records are returned.
relatedRules	BriefcaseRule[]	A list of rules that are related to the current rule.
relationshipField	string	Required for relatedRules. Defines the Salesforce object field that relates the relatedRules field to another relatedRules field or the briefcaseRules field on the BriefcaseDefinition metadata type that it's nested in. For example, an Account object rule can be related to a Contact object rule using the Account ID object field. In this example, the value for the related rule's relationshipField is AccountID.
relationshipType	BriefcaseRelationship (enumeration of type string)	<p>Required for relatedRules. Defines the relationship between the relatedRules field and another relatedRules field or the briefcaseRules field on the BriefcaseDefinition metadata type that it's nested in. Valid values include:</p> <ul style="list-style-type: none"> <li>ParentToChild</li> <li>ChildToParent</li> </ul>
targetEntity	string	<p>Required. The API name of the standard object, custom object, or custom metadata type that the briefcase rule selects records from.</p> <p>If the targetEntity is a custom metadata type, the briefcase rule can't include any other fields. You can add only one briefcase rule for the same custom metadata type in a briefcase. Custom metadata types are supported as the targetEntity for top-level rules only—you can't create a related rule with targetEntity as a custom metadata type.</p>

## BriefcaseRuleFilter

Specifies filter criteria for a BriefcaseRule.

Field Name	Field Type	Description
filterOperator	BriefcaseFilterOperator (enumeration of type string)	<p>Required. The comparison operator for this rule filter. Capitalization matters with date filter operators. Be sure to specify date literals in uppercase. Some valid date literals include TODAY, YESTERDAY and TOMORROW.</p> <p>Valid values include:</p> <ul style="list-style-type: none"> <li>• d—Ends with</li> <li>• e—Equals</li> <li>• g—Greater than</li> <li>• h—Greater than or equal</li> <li>• l—Less than</li> <li>• m—Less than or equal</li> <li>• n—Not equals. This value is applicable only when <code>filterValue</code> is empty.</li> <li>• s—Starts with</li> </ul>
filterSeqNumber	int	<p>Required. The filter number. When you apply multiple filters, the filters are numbered sequentially, 1, 2, 3, and so on.</p>
filterValue	string	<p>The value that the field and criteria evaluate. For example, <code>true</code> or <code>false</code> for a boolean field whose criteria or filter operator is Equals.</p> <p>Be sure to specify date literals in uppercase. Some valid date literals include TODAY, YESTERDAY and TOMORROW.</p> <p>For <code>targetEntityField</code> values that accept a user ID, such as <code>OwnerId</code> or <code>CreatedById</code>, enter <code>\$User.Id</code> to pass the ID of the user making the request.</p> <p>To evaluate <code>targetEntityField</code> by whether the field is empty or not empty, leave <code>filterValue</code> blank and set <code>filterOperator</code> to <code>e</code> (equals) or <code>n</code> (not equals).</p>
targetEntityField	string	<p>Required. The API name of the field to filter by. This field is from the <code>targetEntity</code> on <code>BriefcaseRule</code>. Compound fields aren't supported. Fields encrypted with deterministic encryption can be used in filters with equals and not equals operators.</p>

## Declarative Metadata Sample Definition

The following is an example of a `BriefcaseDefinition` component for account records.

The following is an example definition of a briefcase definition. If you include a rule filter, you must include a filter logic.

```
<?xml version="1.0" encoding="UTF-8"?>
<BriefcaseDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <briefcaseRules>
    <briefcaseRuleFilters>
      <filterOperator>g</filterOperator>
      <filterSeqNumber>1</filterSeqNumber>
    </briefcaseRuleFilters>
  </briefcaseRules>
</BriefcaseDefinition>
```

```

        <filterValue>50000.00</filterValue>
        <targetEntityField>AnnualRevenue</targetEntityField>
    </briefcaseRuleFilters>
    <briefcaseRuleFilters>
        <filterOperator>1</filterOperator>
        <filterSeqNumber>2</filterSeqNumber>
        <filterValue>50</filterValue>
        <targetEntityField>NumberOfEmployees</targetEntityField>
    </briefcaseRuleFilters>
    <filterLogic>1 AND 2</filterLogic>
    <isAscendingOrder>>false</isAscendingOrder>
    <orderBy>NumberOfEmployees</orderBy>
    <queryScope>Everything</queryScope>
    <recordLimit>1000</recordLimit>
    <targetEntity>Account</targetEntity>
</briefcaseRules>
<description>Account Briefcase</description>
<isActive>>true</isActive>
<masterLabel>Account With Standard Fields</masterLabel>
</BriefcaseDefinition>

```

The following is an example package.xml that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>AccountWithCustomFields</members>
        <name>BriefcaseDefinition</name>
    </types>
    <version>49.0</version>
</Package>

```

This example briefcase definition configures the offline priming of file attachments for the WorkOrder object. Files Priming (beta) is available only for the Offline App (Salesforce Mobile App Plus).

 **Note:** Files Priming is a beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](https://www.salesforce.com/agreements) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this beta service is at the Customer's sole discretion.

```

<?xml version="1.0" encoding="UTF-8"?>
<BriefcaseDefinition xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
    <briefcaseRules>
        <isAscendingOrder>>false</isAscendingOrder>
        <orderBy>SystemModstamp</orderBy>
        <queryScope>Everything</queryScope>
        <recordLimit>25</recordLimit>
        <targetEntity>WorkOrder</targetEntity>
        <relatedRules>
            <targetEntity>ContentDocumentLink</targetEntity>
            <relationshipField>LinkedEntityId</relationshipField>
            <relationshipType>ParentToChild</relationshipType>
            <isAscendingOrder>>false</isAscendingOrder>
            <isRelatedFilesRule>>true</isRelatedFilesRule>
            <queryScope>Everything</queryScope>
        </relatedRules>
    </briefcaseRules>
</BriefcaseDefinition>

```

```

<recordLimit>2</recordLimit>
<relatedRules>
  <targetEntity>ContentDocument</targetEntity>
  <relationshipField>ContentDocumentId</relationshipField>
  <relationshipType>ChildToParent</relationshipType>
  <isAscendingOrder>>false</isAscendingOrder>
  <isRelatedFilesRule>>true</isRelatedFilesRule>
  <queryScope>Everything</queryScope>
  <recordLimit>2</recordLimit>
  <relatedRules>
    <targetEntity>ContentVersion</targetEntity>
    <relationshipField>ContentDocumentId</relationshipField>
    <relationshipType>ParentToChild</relationshipType>
    <isAscendingOrder>>false</isAscendingOrder>
    <isRelatedFilesRule>>true</isRelatedFilesRule>
    <queryScope>Everything</queryScope>
    <recordLimit>2</recordLimit>
  </relatedRules>
</relatedRules>
</briefcaseRules>
<description xsi:nil="true"/>
<isActive>>true</isActive>
<masterLabel>WorkOrder with Related Files</masterLabel>
</BriefcaseDefinition>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Usage

Briefcase objects are available in orgs that have Briefcase Builder and Field Service enabled.

## BusinessProcessGroup

Represents the surveys used to track customers' experiences across different stages in their lifecycle. This type extends the Metadata metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

BusinessProcessGroup components have the suffix `.businessProcessGroup` and are stored in the `businessProcessGroups` folder.

## Version

BusinessProcessGroup components are available in API version 49.0 and later.

## Special Access Rules

This metadata type is available in orgs with Surveys enabled with the Customer Lifecycle Designer license.

## Fields

Field Name	Field Type	Description
businessProcessDefinitions	<a href="#">BusinessProcessDefinition</a> on page 430[]	A list that defines stages in a customer lifecycle map.
customerSatisfactionMetric	SurveyType (enum of type string)	<p>Required. Types of questions that can be associated with stages in a customer lifecycle map.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• Attachment</li> <li>• Boolean</li> <li>• CSAT</li> <li>• Currency</li> <li>• Date</li> <li>• DateTime</li> <li>• FreeText</li> <li>• Image</li> <li>• NPS</li> <li>• Matrix</li> <li>• MultiChoice</li> <li>• MultiSelectPicklist</li> <li>• NPS</li> <li>• Number</li> <li>• Picklist</li> <li>• Rating</li> <li>• ShortText</li> <li>• Slider</li> <li>• StackRank</li> <li>• Toggle</li> </ul>
description	string	A description of the customer lifecycle map.
masterLabel	string	Required. The name of the customer lifecycle map.

## BusinessProcessDefinition

Field Name	Field Type	Description
businessProcessFeedbacks	<a href="#">BusinessProcessFeedback</a> on page 430[]	A list of stages in a customer lifecycle map.
description	string	A description of a stage in the customer lifecycle map.
developerName	string	Required. The API name of a stage in the customer lifecycle map. Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.
masterLabel	string	Required. The name of a stage in the customer lifecycle map.
sequenceNumber	int	Required. The position of a stage in the customer lifecycle map.

## BusinessProcessFeedback

Field Name	Field Type	Description
actionName	string	Required. The name of the survey used to collect feedback
actionParam	string	Required. The name of the survey question used to collect feedback.
actionType	Enum (Type: <a href="#">FeedbackType</a> of type string)	Required. The mode of feedback collection. Valid values are: <ul style="list-style-type: none"> <li>PHONE_CALL</li> <li>SURVEY</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a BusinessProcessGroup component.

```
<?xml version="1.0" encoding="UTF-8"?>
<BusinessProcessGroup xmlns="http://soap.sforce.com/2006/04/metadata">
  <businessProcessDefinitions>
    <developerName>Customer_Onboarding</developerName>
    <masterLabel>Customer Onboarding</masterLabel>
    <description>A stage in a customer's lifecycle.</description>
    <sequenceNumber>0</sequenceNumber>
    <businessProcessFeedbacks>
      <actionType>Survey</actionType>
      <actionName>New Customer CSAT</actionName>
      <actionParam>How would you rate our service?</actionParam>
    </businessProcessFeedbacks>
  </businessProcessDefinitions>
  <customerSatisfactionMetric>NPS</customerSatisfactionMetric>
  <masterLabel>Customer Lifecycle</masterLabel>
  <description>This map tracks the feedback provided by customers' at different stages
```

```
during their lifecycle.</description>
</BusinessProcessGroup>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>policyholder</members>
    <name>BusinessProcessGroup</name>
  </types>
  <version>49.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CallCenter

---

Represents the Call Center definition used to integrate Salesforce with a third-party computer-telephony integration (CTI) system, a partner telephony system, or partner Contact Center as a Service (CCaaS) system.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

CallCenter components have the suffix `.callCenter` and are stored in the `callCenters` folder.

### Version

CallCenter components are available in API version 27.0 and later.

### Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
<code>adapterUrl</code>	<b>Field Type</b> string

Field Name	Description
	<p><b>Description</b></p> <p>Optional field. A URL that points to an adapter.</p>
contactCenterChannels	<p><b>Field Type</b></p> <p><a href="#">ContactCenterChannel[]</a></p> <p><b>Description</b></p> <p>Relates Bring Your Own Channel for Contact Center as a Service (CCaaS) messaging channels to a CallCenter and represents the routing details for a voicemail configuration.</p>
displayName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The display name of this call center.</p>
displayNameLabel	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The label of the <code>displayName</code> field in Call Center setup page.</p>
internalNameLabel	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The label of the <code>internalName</code> field in Call Center setup page.</p>
sections	<p><b>Field Type</b></p> <p><a href="#">CallCenterSection[]</a></p> <p><b>Description</b></p> <p>Custom setup items defined for this call center.</p>
version	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The version of this call center.</p>

## CallCenterSection

Field Name	Description
items	<b>Field Type</b> <a href="#">CallCenterItem[]</a> <b>Description</b> Contains the label, name, and value that describe the sections.
label	<b>Field Type</b> string <b>Description</b> Required. The label of the section.
name	<b>Field Type</b> string <b>Description</b> Required. The name of the section.

## CallCenterItem

Field Name	Description
label	<b>Field Type</b> string <b>Description</b> Required. The label of the custom setup item.
name	<b>Field Type</b> string <b>Description</b> Required. The name of the custom setup item.
value	<b>Field Type</b> string <b>Description</b> Required.

Field Name	Description
	The value of the custom setup item.

## ContactCenterChannel

Represents a junction subtype that relates a Bring Your Own Channel for Contact Center as a Service (CCaaS) messaging channel to a CallCenter type for Bring Your Own Channel for CCaaS. This subtype also represents the routing details for a voicemail configuration. This subtype is available in API version 56.0 and later.

Field Name	Description
channel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. For Bring Your Own Channel for CCaaS, this field represents the unique ID of the Bring Your Own Channel messaging channel (MessagingChannel) that's associated with the contact center (CallCenterId). Available in API version 60.0 and later.</p>
contactCenter	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. For Bring Your Own Channel for CCaaS, this field represents the unique ID of the contact center (CallCenterId) that's associated with the Bring Your Own Channel messaging channel (MessagingChannel). Available in API version 60.0 and later.</p>
voiceMailFallbackQueue	<p><b>Field Type</b> string</p> <p><b>Description</b> If voicemail routing is configured for the contact center, this field represents the unique ID of the fallback queue to use if voicemail routing fails. Don't change the value in this field. Instead, configure voicemail routing in Lightning Experience.</p>
voiceMailHandler	<p><b>Field Type</b> string</p> <p><b>Description</b> If voicemail routing is configured for the contact center, this field represents the unique ID of the flow used to route voicemails. Don't change the value in this field. Instead, configure voicemail routing in Lightning Experience.</p>

## Declarative Metadata Sample Definition

The following is an example of a CallCenter component:

```
<?xml version="1.0" encoding="UTF-8"?>
<CallCenter xmlns="http://soap.sforce.com/2006/04/metadata">
  <adapterUrl>http://localhost:11000</adapterUrl>
  <displayName>Demo Call Center Adapter</displayName>
  <displayNameLabel>Display Name</displayNameLabel>
  <internalNameLabel>Internal Name</internalNameLabel>
  <sections>
    <items>
      <label>Description</label>
      <name>reqDescription</name>
      <value>Demo Call Center Adapter</value>
    </items>
    <items>
      <label>CTI Connector ProgId</label>
      <name>reqProgId</name>
      <value>DemoAdapter.DemoAdapter.1</value>
    </items>
    <items>
      <label>Version</label>
      <name>reqVersion</name>
      <value>3.0</value>
    </items>
    <items>
      <label>CTI Adapter URL</label>
      <name>reqAdapterUrl</name>
      <value>http://localhost:11000</value>
    </items>
    <label>General Information</label>
    <name>reqGeneralInfo</name>
  </sections>
  <sections>
    <items>
      <label>Outside Prefix</label>
      <name>reqOutsidePrefix</name>
      <value>1</value>
    </items>
    <items>
      <label>Long Distance Prefix</label>
      <name>reqLongDistPrefix</name>
      <value>1</value>
    </items>
    <items>
      <label>International Prefix</label>
      <name>reqInternationalPrefix</name>
      <value>01</value>
    </items>
    <label>Dialing Options</label>
    <name>reqDialingOptions</name>
  </sections>
  <version>4</version>
</CallCenter>
```

For information about the CallCenter definition file, see [Call Center Definition Files](#).

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CallCoachingMediaProvider

---

Represents the CallCoachingMediaProvider configuration. Use CallCoachingMediaProvider to configure which providers of voice recordings that Einstein Conversation Insights can use. For example, Sales Dialer can provide voice recordings. Einstein Conversation Insights then stores and analyzes call recordings to surface insights and trends in customer conversations. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

CallCoachingMediaProvider components have the suffix `.callCoachingMediaProvider` and are stored in the `CallCoachingMediaProvider` folder.

## Version

CallCoachingMediaProvider components are available in API version 49.0 and later.

## Special Access Rules

You must be a Sales Engagement customer to access this metadata type.

## Fields

Field Name	Field Type	Description
<code>isActive</code>	boolean	Indicates whether the media provider can upload voice recordings ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> .
<code>providerDescription</code>	string	Description of the media provider.
<code>providerName</code>	string	Name of the media provider.

## Declarative Metadata Sample Definition

The following is an example of a CallCoachingMediaProvider component.

```
<?xml version="1.0" encoding="UTF-8"?>
<CallCoachingMediaProvider xmlns="http://soap.sforce.com/2006/04/metadata">
  <isActive>true</isActive>
```

```
<providerDescription>Salesforce telephony provider</providerDescription>
<providerName>Dialer</providerName>
</CallCoachingMediaProvider>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>CallCoachingMediaProvider</name>
  </types>
  <version>49.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CampaignInfluenceModel

Represents a campaign influence model used by Customizable Campaign Influence. You can't configure Customizable Campaign Influence via the Metadata API, but you can add a campaign influence model.

 **Note:** This information applies only to Customizable Campaign Influence and not to [Campaign Influence 1.0](#).

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`CampaignInfluenceModel` values are stored in the `campaignInfluenceModels` directory of the corresponding package directory. The file name matches the model name, and the extension is `.campaignInfluenceModel`.

## Version

`CampaignInfluenceModel` components are available in API version 38.0 and later.

## Fields

Field Name	Field Type	Description
<code>isActive</code>	boolean	Indicates whether the model is active. Active models can generate campaign influence records. Deactivating a model deletes its campaign influence records. Custom models are always active and this field is ignored. This field is available beginning with API version 40.0.
<code>isDefaultModel</code>	boolean	Required. Indicates if the model is the default model or not. Only campaign influence records associated with the default model appear

Field Name	Field Type	Description
		<p>on campaigns and opportunities. You can only have one default model at a time. A model must be active to become the default model.</p> <p>Activating or deactivating custom models does not automatically generate or delete campaign influence records.</p>
isModelLocked	boolean	Required. Indicates if the model is locked or not. Campaign Influence records for locked models can be manipulated only via the API.
modelDescription	string	A description of the influence model.
name	string	Required. A unique name for the model.
recordPreference	picklist	<p>The value of this field determines when to create campaign influence records.</p> <ul style="list-style-type: none"> <li>AllRecords: Creates records regardless of the revenue attribution percentage.</li> <li>RecordsWithAttribution: Creates records only when the revenue attribution is greater than 0%.</li> </ul> <p>This field is available in API version 41.0 and later.</p>

## Declarative Metadata Sample Definition

The following is an example of a CampaignInfluenceModel component that represents the default Salesforce campaign influence attribution model. The default `isDefaultModel` value of `true` can be changed if another model is created and set as the default model. The `isModelLocked` value of `true` means that Campaign Influence records for this model can be seen in the UI, but not created, updated, or deleted.

```
<?xml version="1.0" encoding="UTF-8"?>
<CampaignInfluenceModel xmlns="http://soap.sforce.com/2006/04/metadata">
  <isActive>true</isActive>
  <isDefaultModel>true</isDefaultModel>
  <isModelLocked>true</isModelLocked>   <recordPreference>AllRecords</recordPreference>

  <modelDescription>Primary Campaign gets 100% of the revenue share</modelDescription>
  <name>Salesforce Model</name>
</CampaignInfluenceModel>
```

The following is an example of a CampaignInfluenceModel component that creates an influence model called Last Touch, which will not be the default model.

```
<?xml version="1.0" encoding="UTF-8"?>
<CampaignInfluenceModel xmlns="http://soap.sforce.com/2006/04/metadata">
  <isActive>true</isActive>
  <isDefaultModel>false</isDefaultModel>
  <isModelLocked>true</isModelLocked>
  <modelDescription>This model gives 100% influence attribution to the last campaign
that touched the contact.</modelDescription>
```

```
<name>Last Touch</name>
<recordPreference>RecordsWithAttribution</recordPreference>
</CampaignInfluenceModel>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CaseSubjectParticle

Represents the Social Business Rules custom format for the **Case Subject** field on cases created from inbound social posts.

### File Suffix and Directory Location

CaseSubjectParticle components have the suffix `.CaseSubjectParticle` and are stored in the `CaseSubjectParticles` folder.

### Version

CaseSubjectParticle is available in API version 41.0 and later.

### Fields

Field Name	Field Type	Description
<code>index</code>	<code>int</code>	Required. The order in which the custom <b>Case Subject</b> is generated, meaning if the social network is 0 and the social message is 1, then the subject generates as <code>Twitter   Tweet</code> .
<code>textField</code>	<code>string</code>	Specifies inbound social content added to <b>Case Subject</b> in case records.
<code>type</code>	CaseSubjectParticleType (enumeration of type string)	Required. Specifies the custom <b>Case Subject</b> format from which inbound social content appears in case records. Valid values are: <ul style="list-style-type: none"> <li>• <code>ProvidedString</code></li> <li>• <code>Source</code></li> <li>• <code>MessageType</code></li> <li>• <code>SocialHandle</code></li> <li>• <code>SocialNetwork</code></li> <li>• <code>Sentiment</code></li> <li>• <code>RealName</code></li> <li>• <code>Content</code></li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• PipeSeparator</li> <li>• ColonSeparator</li> <li>• HyphenSeparator</li> </ul>

## Declarative Metadata Sample Definition

This is a sample of a `.CaseSubjectParticle` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns=http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>CaseSubjectParticle</name>
  </types>
  <version>41.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CareBenefitVerifySettings

Represents the configuration settings for benefit verification requests.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

CareBenefitVerifySettings components have the suffix `.careBenefitVerifySettings` and are stored in the `careBenefitVerifySettings` folder.

## Version

CareBenefitVerifySettings components are available in API version 52.0 and later.

## Fields

Field Name	Description
codeSetType	<p><b>Field Type</b> string</p> <p><b>Description</b> Specifies the code set type for the benefits verification service type codes.</p>
defaultNpi	<p><b>Field Type</b> string</p> <p><b>Description</b> Default National Provider Identifier to be used in the benefits verification request.</p>
generalPlanServiceTypeCode	<p><b>Field Type</b> string</p> <p><b>Description</b> Service type code for the plan benefits as a whole.</p>
isDefault	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether this record is the default verification service (<code>true</code>) or not (<code>false</code>).</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the benefits verification service.</p>
organizationName	<p><b>Field Type</b> string</p> <p><b>Description</b> Specifies the organization name for the benefits verification request service.</p>
serviceApexClass	<p><b>Field Type</b> string</p> <p><b>Description</b> Apex class used to access the benefits verification service.</p>
serviceNameCredential	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Credential used to access the benefits verification service.</p>
serviceTypeSourceSystem	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Service type code for the plan benefits as a whole.</p>
uriPath	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Link to payer endpoint.</p>

## Declarative Metadata Sample Definition

This is an example of a CareBenefitVerifySettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<CareBenefitVerifySettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <generalPlanServiceTypeCode>abc</generalPlanServiceTypeCode>
  <isDefault>>true</isDefault>
  <masterLabel>test</masterLabel>
  <serviceApexClass>TestApexClass</serviceApexClass>
  <serviceNamedCredential>test</serviceNamedCredential>
  <uriPath>efgh</uriPath>
  <serviceTypeSourceSystem>Lorem ipsum dolor</serviceTypeSourceSystem>
  <codeSetType>Code set</codeSetType>
  <defaultNpi>Npi info</defaultNpi>
  <organizationName>Organization name</organizationName>
</CareBenefitVerifySettings>
```

This is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>CareBenefitVerifySettings</name>
  </types>
  <types>
    <members>*</members>
    <name>ApexClass</name>
  </types>
  <types>
    <members>*</members>
    <name>NamedCredential</name>
  </types>
```

```
<version>52.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CareLimitType

Defines the characteristics of limits on benefit provision.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

CareLimitType components have the suffix `.careLimitType` and are stored in the `careLimitTypes` folder.

## Version

CareLimitType components are available in API version 52.0 and later.

## Fields

Field Name	Description
<code>isProtected</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type.</p>
<code>limitType</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Source of limit on benefit provision, such as a co-insurance requirement.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>Name of the limit type.</p>
metricType	<p><b>Field Type</b></p> <p>CareLimitTypeMetricType (enumeration of type string)</p> <p><b>Description</b></p> <p>Metric to be used for calculating and displaying the benefit limit, such as number of visits, amount spent, or percentage of allowed expenditure.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• Amount</li> <li>• Money</li> <li>• Percentage</li> <li>• Text</li> </ul>

## Declarative Metadata Sample Definition

This is an example of a CareLimitType component.

```
<?xml version="1.0" encoding="UTF-8"?>
<CareLimitType xmlns="http://soap.sforce.com/2006/04/metadata">
  <limitType>test</limitType>
  <masterLabel>test</masterLabel>
  <metricType>Money</metricType>
  <isProtected>>false</isProtected>
</CareLimitType>
```

This is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>CareLimitType</name>
  </types>
  <version>52.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CareSystemFieldMapping

---

Represents a mapping from source system fields to Salesforce objects and fields. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

**[other]:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### File Suffix and Directory Location

CareSystemFieldMapping components have the suffix `.careSystemFieldMapping` and are stored in the `careSystemFieldMappings` folder.

### Version

CareSystemFieldMapping components are available in API version 49.0 and later.

### Special Access Rules

To use this metadata type, your Salesforce org must have the Health Cloud or Life Sciences Cloud license and the user must have the Health Cloud Foundation (for Health Cloud) or Health Cloud Starter (for Life Sciences Cloud) permission set.

### Fields

Field Name	Field Type	Description
<code>externalIdField</code>	string	The ID of the field in the external system.
<code>isActive</code>	boolean	Indicates whether this field mapping is active ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>False</code> .
<code>isProtected</code>	boolean	An auto-generated value that doesn't currently impact the behavior of the metadata type.
<code>masterLabel</code>	string	Required. The name of the care system field mapping.
<code>role</code>	SourceSystemFieldRole (enumeration of type string)	Required. The role the field represents. Valid values are: <ul style="list-style-type: none"> <li><code>Patient</code>—When the <code>role</code> field is set to <code>Patient</code>, the Enrollment API uses the value of <code>externalIdField</code> as the patient ID. This role can be used when <code>targetObject</code> is set to <code>Account</code>.</li> <li><code>RemoteMonitoringDevice</code>—Indicates which <code>externalIdField</code> on the Asset object maps to the <code>Device</code> field in the CareObservation object. This role can be used when <code>targetObject</code> is set to <code>Asset</code>.</li> <li><code>RemoteMonitoringPatient</code>—Indicates which <code>externalIdField</code> on the Account object maps to the</li> </ul>

Field Name	Field Type	Description
		<p>ObservedSubject field in the Care Observation object. This role is used when targetObject is set to Account.</p> <ul style="list-style-type: none"> <li>ServiceProvider—The Enrollment API uses the value of externalIdField as the provider ID. This role is used when targetObject is set to Account.</li> <li>NotApplicable—This role is used when targetObject is set to CareProgram or Product, which means that there is no applicable role.</li> </ul>
sourceSystem	string	The system where the record originated.
targetObject	string	The name of the Salesforce object to which the external system field is mapped.

## Declarative Metadata Sample Definition

The following is an example of a CareSystemFieldMapping component.

```
<?xml version="1.0" encoding="UTF-8"?>
<CareSystemFieldMapping xmlns="http://soap.sforce.com/2006/04/metadata">
  <externalIdField>AccountNumber</externalIdField>
  <isActive>true</isActive>
  <isProtected>false</isProtected>
  <masterLabel>Map1</masterLabel>
  <role>Patient</role>
  <sourceSystem>Epic</sourceSystem>
  <targetObject>Account</targetObject>
</CareSystemFieldMapping>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>patient</members>
    <name>CareSystemFieldMapping</name>
  </types>
  <version>49.0</version>
</Package>
```

## CareProviderSearchConfig

Represents the information about the fields that appear in care provider search results. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

CareProviderSearchConfig components have the suffix `.careProviderSearchConfig` and are stored in the `careProviderSearchConfigs` folder.

## Version

CareProviderSearchConfig components are available in API version 48.0 and later.

## Fields

Field Name	Field Type	Description
<code>isActive</code>	boolean	Indicates whether this configuration is active ( <code>true</code> ) or not ( <code>false</code> ).
<code>isProtected</code>	boolean	An auto-generated value that doesn't currently impact the behavior of the metadata type.
<code>mappedObject</code>	ProviderSearch ObjectMapping (enumeration of type string)	Required. Indicates mapped objects. Possible values are; <ul style="list-style-type: none"> <li>HealthCarePractitionerFacility</li> <li>HealthCareProvider</li> </ul>
<code>masterLabel</code>	string	Required. Name of the care provider.
<code>sourceField</code>	string	API name of the field that is copied to the target object.
<code>targetField</code>	string	API name of the field to copy the data to.

## Declarative Metadata Sample Definition

The following is an example of a CareProviderSearchConfig component.

```
<?xml version="1.0" encoding="UTF-8"?>
<CareProviderSearchConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <sourceField>Test1__c</sourceField>
  <targetField>Test1__c</targetField>
  <mappedObject>HealthcareProvider</mappedObject>
  <isProtected>>false</isProtected>
  <isActive>>true</isActive>
  <masterLabel>testlabel</masterLabel>
</CareProviderSearchConfig>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>HealthcareProvider.Test1__c</members>
```

```

    <name>CustomField</name>
  </types>
  <types>
    <members>CareProviderSearchableField.Test1__c</members>
    <name>CustomField</name>
  </types>
  <types>
    <members>Test</members>
    <name>CareProviderSearchConfig</name>
  </types>
  <version>48.0</version>
</Package>

```

## CareRequestConfiguration

---

Represents the details for a record type such as service request, drug request, or admission request. One or more record types can be associated with a care request.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

CareRequestConfiguration components have the suffix `.careRequestConfiguration` and are stored in the `careRequestConfigurations` folder.

### Version

CareRequestConfiguration components are available in API version 44.0 and later.

### Fields

Field Name	Description
<code>careRequestRecordType</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The record type for the care request.</p>
<code>careRequestRecords</code>	<p><b>Field Type</b> <a href="#">CareRequestRecords[]</a></p>

Field Name	Description
	<p><b>Description</b></p> <p>The list of objects you can select to configure the care request.</p>
careRequestType	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The type of care request. For example, an appeal, a service request, or an admission.</p>
isActive	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the care request is active (<code>true</code>) or not (<code>false</code>).</p>
	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the record type of the care request is default (<code>true</code>) or not (<code>false</code>).</p>
	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>A user-friendly name for CareRequestConfiguration, which is defined when the CareRequestConfiguration is created.</p>

## CareRequestRecords

Displays a list of objects to customize the care request.

Field Name	Description
careRequestRecord	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The object selected to configure the care request.</p>

## Declarative Metadata Sample Definition

This is an example of a CareRequestConfiguration component.

```
<?xml version="1.0" encoding="UTF-8"?>
<CareRequestConfiguration xmlns="http://soap.sforce.com/2006/04/metadata">
  <careRequestRecordType>DrugRequest</careRequestRecordType>
  <careRequestRecords>
    <careRequestRecord>CareRequestItem</careRequestRecord>
  </careRequestRecords>
  <careRequestRecords>
    <careRequestRecord>CareRequestDrug</careRequestRecord>
  </careRequestRecords>
  <careRequestType>Drug Request</careRequestType>
  <isActive>>false</isActive>
  <isDefaultRecordType>>false</isDefaultRecordType>
  <masterLabel>DrugRequest</masterLabel>
</CareRequestConfiguration>
```

This is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Case.DrugRequest</members>
    <name>BusinessProcess</name>
  </types>
  <types>
    <members>*</members>
    <name>CareRequestConfiguration</name>
  </types>
  <types>
    <members>CareRequest.DrugRequest</members>
    <members>CareRequestDrug.DrugRequest</members>
    <members>CareRequestItem.DrugRequest</members>
    <members>Case.DrugRequest</members>
    <name>RecordType</name>
  </types>
  <version>44.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Certificate

Represents a certificate used for digital signatures that verify that requests are coming from your org. Certificates are used for either authenticated single sign-on with an external website, or when using your org as an identity provider. This type extends the Metadata With Content metadata type and inherits its content and fullName fields.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

Certificate components have the suffix `.cert` and are stored in the `certs` folder.

## Version

Certificate components are available in API version 36.0 and later.

## Fields

Field Name	Field Type	Description
<code>caSigned</code>	boolean	Required. Indicates whether this certificate is signed by the issuer (true) or not (false).
<code>encryptedWithPlatformEncryption</code>	boolean	Indicates whether this certificate is encrypted with Platform Encryption.
<code>expirationDate</code>	dateTime	The date that this certificate expires and is no longer usable. For self-signed certificates, if <code>keySize</code> is 2048 bits, the expiration date is automatically 1 year after you create the certificate. If <code>keySize</code> is 4096 bits, the expiration date is automatically 2 years after you create the certificate. For CA-signed certificates, <code>expirationDate</code> is automatically updated to the signed certificate's expiration date when a signed certificate chain is uploaded. The date format is YYYY-MM-DD.
<code>keySize</code>	int	Certificate keys can be either 2048 bits or 4096 bits. A certificate with 4096-bit keys lasts 2 years, and a certificate with 2048-bit keys lasts 1 year. Certificates with 2048-bit keys are faster than certificates with 4096-bit keys. If <code>keySize</code> isn't specified when you create a certificate, the key size defaults to 2048 bits.
<code>masterLabel</code>	string	Required. A user-friendly name for the certificate that appears in the Salesforce user interface, such as in Certificate and Key Management. Limit: 64 characters.
<code>privateKeyExportable</code>	boolean	Indicates whether this certificate's private key is exportable. If <code>privateKeyExportable</code> isn't specified when you create a certificate, its default value is <code>true</code> .

## Usage

The Metadata API can be used to create a self-signed or a CA-signed certificate. The `.cert` file's contents are the certificate chain, which can be updated when you renew or update the intermediate certificate chain of a CA-signed certificate. After creating a CA-signed certificate, the `.cert` file contains a certificate signing request (CSR). For details, see [About Salesforce Certificates and Keys](#) in Salesforce Help.

To copy an existing certificate's X.509 parameter data to a new certificate, upload the existing certificate. You can also use this procedure to renew a certificate. A new private+public key pair is created with a new certificate. Salesforce doesn't allow the import or export of the private key via the API.

Using the Metadata API, you can download a CSR. After it's CA-signed, you can upload it back to Salesforce.

After the signed certificate chain is uploaded via the Metadata API, the CSR of that certificate can't be downloaded via the API anymore. The content of the `.crt` file is the signed certificate chain. However, the CSR can still be downloaded via the UI.

- Downloading a CSR—The CSR is downloadable after a CA-signed cert is created. If a signed certificate hasn't been uploaded to that certificate, the content of the downloaded `.crt` file is the CSR.
- Uploading a CA-Signed Certificate—To upload the signed certificate chain back to Salesforce, save the signed certificate chain as the content of the `.crt` file and update it via the Metadata API.

## Declarative Metadata Sample Definition

The following is an example of a Certificate component.

```
<?xml version="1.0" encoding="UTF-8"?>
<Certificate xmlns="http://soap.sforce.com/2006/04/metadata">
  <caSigned>true</caSigned>
  <encryptedWithPlatformEncryption>true</encryptedWithPlatformEncryption>
  <expirationDate>2017-03-19</expirationDate>
  <keySize>4096</keySize>
  <masterLabel>My Certificate Name</masterLabel>
  <privateKeyExportable>true</privateKeyExportable>
</Certificate>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ChatterExtension

Represents the metadata used to describe a Rich Publisher App that's integrated with the Chatter publisher.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Retrieving ChatterExtension

Using an API tool, you can get extension information from `package.xml` using this code.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>xw1</members>
    <name>ChatterExtension</name>
  </types>
```

```
<version>41.0</version>
</Package>
```

Use the `<members>` tag to name a specific extension (in this example, `xw1`), or use the wildcard (\*) symbol to retrieve all your extensions.

Here's an example of retrieved information.

```
<?xml version="1.0" encoding="UTF-8"?>
<ChatterExtension xmlns="http://soap.sforce.com/2006/04/metadata">
  <compositionComponent>xwComp</compositionComponent>
  <description>des</description>
  <extensionName>xw1</extensionName>
  <headerText>h1</headerText>
  <hoverText>h2</hoverText>
  <icon>tiger</icon>
  <masterLabel>primary</masterLabel>
  <renderComponent>xwRend</renderComponent>
  <type>Lightning</type>
</ChatterExtension>
```

## Version

ChatterExtension is a new feature in API version 41.0.

## Fields

Field	Field Type	Description
compositionComponent	string	Required. The composition component of the Rich Publisher App that you provide. It's comprised of the <code>lightning:availableForChatterExtensionComposer</code> interface.
description	string	Required. The description of your custom Rich Publisher App.
extensionName	string	Required. The name of your extension. That is, your Rich Publisher App.
headerText	string	The text to show in the header of your app composer. Header text is required for Lightning type extensions. This text can be localized.
hoverText	string	The text to show when a user mouses over your extension's icon. Mouse-over text is required for Lightning type extensions. This text can be localized.
icon	string	Required. The icon to show in the Chatter publisher. Use an existing file asset id from your org.
isProtected	boolean	An auto-generated value. It currently has no impact.
masterLabel	string	Required. Label for the ChatterExtension object.

Field	Field Type	Description
<code>renderComponent</code>	string	Required. The rendering component of the Rich Publisher App that you provide. It's comprised of the <code>lightning:availableForChatterExtensionRenderer</code> interface.
<code>type</code>	ChatterExtensionType (enumeration of type string)	Required. Describes the type of the extension. Currently, the only value supported is <code>Lightning</code> . Included to allow for other possible types in the future.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

[Integrate Your Custom Apps into the Chatter Publisher](#)

## ChoiceList

Represents the `ChoiceList` dropdown field that's used for pre-chat.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`ChoiceList` components have the suffix `.ChoiceList` and are stored in the `ChoiceList` folder.

## Version

`ChoiceList` components are available in API version 62 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
choiceListValue	<p><b>Field Type</b>  <a href="#">ChoiceListValue[]</a></p> <p><b>Description</b>            A list of choices to display in the choice list.</p>
description	<p><b>Field Type</b>            string</p> <p><b>Description</b>            A description of the choice list.</p>
masterLabel	<p><b>Field Type</b>            string</p> <p><b>Description</b>            Required. The label for the choice list.</p>

## ChoiceListValue

Represents a choice list value in the pre-chat dropdown. ChoiceListValue is available in API version 62 or later.

Field Name	Description
embeddedServiceCustomLabels	<p><b>Field Type</b>  <a href="#">EmbeddedServiceCustomLabel[]</a> on page 843</p> <p><b>Description</b>            Custom labels for the choicelist value.</p>
isDefaultValue	<p><b>Field Type</b>            boolean</p> <p><b>Description</b>            Required. Indicates whether the choicelist value should be selected by default.</p>
order	<p><b>Field Type</b>            int</p> <p><b>Description</b>            Required. The order of the choicelist value in the choicelist dropdown field.</p>
valueName	<p><b>Field Type</b>            string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. The value of the choicelist.</p>

## Declarative Metadata Sample Definition

The following is an example of a ChoiceList component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ChoiceList xmlns="http://soap.sforce.com/2006/04/metadata">
  <choiceListValue>
    <embeddedServiceCustomLabels>

<customLabel>EM_PreChat_ChoiceList_PrechatCustomFieldLabel_133xx0000004GG1_7741637</customLabel>

      <labelKey>EM_PreChat_ChoiceList_PrechatCustomFieldLabel</labelKey>
      <feature>EmbeddedMessaging</feature>
    </embeddedServiceCustomLabels>
    <isDefaultValue>true</isDefaultValue>
    <order>0</order>
    <valueName>Pizza</valueName>
  </choiceListValue>
  <choiceListValue>
    <embeddedServiceCustomLabels>

<customLabel>EM_PreChat_ChoiceList_PrechatCustomFieldLabel_133xx0000004GG2_5523047</customLabel>

      <labelKey>EM_PreChat_ChoiceList_PrechatCustomFieldLabel</labelKey>
      <feature>EmbeddedMessaging</feature>
    </embeddedServiceCustomLabels>
    <isDefaultValue>>false</isDefaultValue>
    <order>1</order>
    <valueName>Burger</valueName>
  </choiceListValue>
  <masterLabel>Food</masterLabel>
  <description>Food Choice List</description>
</ChoiceList>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ChoiceList</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ClaimFinancialSettings

---

Represents the configuration settings for Insurance Claim Financial Services.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

ClaimFinancialSettings components have the suffix `claimFinancialSettings` and are stored in the `ClaimFinancialSettings` folder.

### Version

ClaimFinancialSettings components are available in API version 57.0 and later.

### Special Access Rules

To access this metadata type, you require access to either `InsurancePolicyAdminAccess` or `InsuranceClaimMgmtAccess` add-on license.

### Fields

Field Name	Description
<code>claimCovPendingAuthStatus</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The status of pending financial authority for claim coverage.</p>
<code>claimPendingAuthorityStatus</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The status of pending financial authority for claim.</p>

Field Name	Description
clmCovPymtDtlPendAuthSts	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The status of pending financial authority for claim coverage payment detail.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The unique label that identifies the claim financial settings throughout the Salesforce user interface.</p>

## Declarative Metadata Sample Definition

The following is an example of a ClaimFinancialSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ClaimFinancialSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <claimCovPendingAuthStatus>Pending Authority</claimCovPendingAuthStatus>
  <claimPendingAuthorityStatus>Pending Authority</claimPendingAuthorityStatus>
  <clmCovPymtDtlPendAuthSts>Pending Authority</clmCovPymtDtlPendAuthSts>
  <masterLabel>Claim Financial Settings</masterLabel>
</ClaimFinancialSettings>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?><!--
~ Copyright 2022 salesforce.com, inc.
~ All Rights Reserved
~ Company Confidential
-->
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ClaimFinancialSettings</name>
  </types>
  <version>57.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ClauseCatgConfiguration

---

Represents the configuration about the clause category that can be used to categorize your disclosure and compliance reports from standardized disclosure templates in a response document.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

ClauseCatgConfiguration components have the suffix `.clauseCatgConfiguration` and are stored in the `clauseCatgConfigurations` folder.

### Version

ClauseCatgConfiguration components are available in API version 57.0 and later.

### Special Access Rules

The ClauseManagementAddOn license is required to access this object along with user access for the Clause Designer User permission set license.

### Fields

Field Name	Description
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The description about the clause category configuration.</p>
<code>isProtected</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type. The default is <code>false</code>.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p>

Field Name	Description
	A user-friendly name for ClauseCatgConfiguration, which is defined when the ClauseCatgConfiguration is created.
usageType	<p><b>Field Type</b> CImCategoryUsageType</p> <p><b>Description</b> Required. The usage type of the clause category configuration. Possible values are:</p> <ul style="list-style-type: none"> <li>• ContractClauseCategory</li> <li>• DisclosureCategory</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a ClauseCatgConfiguration component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ClauseCatgConfiguration
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>This is to add description for Contract Clause Category.</description>
  <usageType>ContractClauseCategory</usageType>
  <isProtected>>false</isProtected>
  <masterLabel>Contract Clause Cat</masterLabel>
</ClauseCatgConfiguration>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>Pkg</fullName>
  <types>
    <name>ClauseCatgConfiguration</name>
  </types>
  <version>57.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CleanDataService

---

Represents a data service that adds and updates data in standard objects.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

CleanDataService components have the `.cleanDataService` suffix and are stored in the `cleanDataServices` directory. The name of the component file is based on the name of the object associated with the data service. For example, the component file name `cleanDataServices/DataCloudCompanyMatch.cleanDataService` describes a data service component called `DataCloudCompanyMatch` that's associated with the company name in account objects.

### Version

CleanDataService components are available in API version 62.0 and later.

### Fields

Field Name	Field Type	Description
<code>cleanRules</code>	<a href="#">CleanRule[]</a>	Required. A list of data integration rules
<code>description</code>	string	Required. A description of the data service
<code>masterLabel</code>	string	Required. Label for this data service. Although this value is displayed, it's an internal label for the data service and isn't translated.
<code>matchEngine</code>	string	Required. A key that maps to the internal data service identifier.

### CleanRule

Represents information that controls how the data service adds and updates data in an org.

Field Name	Field Type	Description
<code>bulkEnabled</code>	boolean	Required. If this field is set to <code>true</code> , Salesforce applies the data integration rule to existing records whenever the rule is updated or saved.
<code>bypassTriggers</code>	boolean	Required. If this field is set to <code>true</code> , Salesforce bypasses triggers when it applies the rule; otherwise, it applies triggers after it applies the rule.
<code>bypassWorkflow</code>	boolean	Required. If this field is set to <code>true</code> , Salesforce bypasses workflow rules when it applies the data integration rule; otherwise, it applies workflow rules after it applies the rule.
<code>description</code>	string	Required. User-friendly text that describes the data integration rule.

Field Name	Field Type	Description
developerName	string	Required. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This unique name prevents conflicts with rules from other packages that have the same <code>masterLabel</code> .   <b>Note:</b> Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.
fieldMappings	<a href="#">FieldMapping</a> []	Required. A list of FieldMapping entries for the rule.
masterLabel	string	Required. Label for this object. This display value is the internal label that is not translated.
matchRule	string	Required. An internal label for a matching rule in the data service that's associated with the CleanRule.
sourceObjectType	string	Required. A virtual object in the data service that is associated with the CleanRule. Specifying a non-existent object causes an error.
status	string	Required. Status of the data integration rule. Valid values are <code>Active</code> and <code>Inactive</code> .
targetObjectType	string	Required. A standard object that's the target of additions and updates specified by this CleanRule. Specifying an object that the data service does not support causes an error.

## FieldMapping

Represents a mapping between fields in the data service and fields in an object in the org.

Field Name	Field Type	Description
developerName	string	Required. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This unique name prevents conflicts with field mappings from other packages that have the same <code>masterLabel</code> .   <b>Note:</b> Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.
fieldMappingRows	<a href="#">FieldMappingRow</a> []	Required. A list of FieldMappingRow entries. Each entry represents a field in a standard object that maps to a field in the data service.
masterLabel	string	Required. Label for this object. This display value is the internal label that is not translated.
SObjectType	string	Required. The standard object associated with this FieldMapping. Specifying an object that the data service does not support causes an error.

## FieldMappingRow

Represents the status of a CleanRule.

Field Name	Field Type	Description
fieldName	string	The display name for the field represented by the FieldMappingRow.
fieldMappingFields	FieldMappingField[]	Required. A list of FieldMappingField entries. Each entry is a field in a standard object that maps to a field in the data service.
mappingOperation	string	The comparison operation the data service applies when it compares the value of this FieldMappingRow to the mapped field in the object specified in SObjectType. The value of this field is <code>AutoFill</code> , which indicates that the data service only adds data if the object field is blank.
SObjectType	string	The standard object for the field mapped to the FieldMappingRow. Specifying an object that the data service does not support causes an error.

## FieldMappingField

Represents a field in a standard object. A FieldMappingField maps to a FieldMappingRow entry in a data service.

Field Name	Field Type	Description
dataServiceField	string	Required. A field in the data service that is mapped to this field.
dataServiceObjectName	string	Required. An object in the data service that contains the FieldMappingRow associated with this FieldMappingField. Specifying a non-existent object causes an error.
priority	int	Required. Represents the priority that the data service uses when it updates the field, relative to other update rules for the same field. Valid values are 1-100.

## Declarative Metadata Sample Definition

The following is an example of a CleanDataService component for the lead standard object.

```
<?xml version="1.0" encoding="UTF-8"?>
<CleanDataService xmlns="http://soap.sforce.com/2006/04/metadata">
  <cleanRules>
    <bulkEnabled>>false</bulkEnabled>
    <bypassTriggers>>false</bypassTriggers>
    <bypassWorkflow>>false</bypassWorkflow>
    <description>Adds data info to leads</description>
    <developerName>DataService_Leads_Enrichment</developerName>
    <fieldMappings>
      <SObjectType>DataServiceCompanyObject</SObjectType>
      <developerName>DataService_Leads_Enrichment_InputMapping</developerName>
      <fieldMappingRows>
        <SObjectType>DataServiceCompanyObject</SObjectType>
        <fieldMappingFields>
```

```

        <dataServiceField>Email</dataServiceField>
        <dataServiceObjectName>Lead</dataServiceObjectName>
        <priority>1</priority>
    </fieldMappingFields>
    <fieldName>Email</fieldName>
    <mappingOperation>Autofill</mappingOperation>
</fieldMappingRows>
<fieldMappingRows>
    <SObjectType>DataServiceCompanyObject</SObjectType>
    <fieldMappingFields>
        <dataServiceField>Company</dataServiceField>
        <dataServiceObjectName>Lead</dataServiceObjectName>
        <priority>1</priority>
    </fieldMappingFields>
    <fieldName>Name</fieldName>
    <mappingOperation>Autofill</mappingOperation>
</fieldMappingRows>
<masterLabel>DataServiceInputMapping</masterLabel>
</fieldMappings>
<fieldMappings>
    <SObjectType>Lead</SObjectType>
    <developerName>DataService_Leads_Enrichment_OutputMapping</developerName>
    <fieldMappingRows>
        <SObjectType>Lead</SObjectType>
        <fieldMappingFields>
            <dataServiceField>EmployeesTotal</dataServiceField>
            <dataServiceObjectName>DataServiceCompanyObject</dataServiceObjectName>

            <priority>1</priority>
        </fieldMappingFields>
        <fieldName>NumberOfEmployees</fieldName>
        <mappingOperation>Autofill</mappingOperation>
    </fieldMappingRows>
    <fieldMappingRows>
        <SObjectType>Lead</SObjectType>
        <fieldMappingFields>
            <dataServiceField>Revenue</dataServiceField>
            <dataServiceObjectName>DataServiceCompanyObject</dataServiceObjectName>

            <priority>1</priority>
        </fieldMappingFields>
        <fieldName>AnnualRevenue</fieldName>
        <mappingOperation>Autofill</mappingOperation>
    </fieldMappingRows>
    <fieldMappingRows>
        <SObjectType>Lead</SObjectType>
        <fieldMappingFields>
            <dataServiceField>Industry</dataServiceField>
            <dataServiceObjectName>DataServiceCompanyObject</dataServiceObjectName>

            <priority>1</priority>
        </fieldMappingFields>
        <fieldName>Industry</fieldName>
        <mappingOperation>Autofill</mappingOperation>
    </fieldMappingRows>

```

```

        </fieldMappingRows>
        <masterLabel>DataServiceOutputMapping</masterLabel>
    </fieldMappings>
    <masterLabel>Data Service Company Info for Leads</masterLabel>
    <matchRule>DataServiceLeadAppendMatchRule</matchRule>
    <sourceSubjectType>DataServiceCompanyObject</sourceSubjectType>
    <status>Active</status>
    <targetSubjectType>Lead</targetSubjectType>
</cleanRules>
<description>Data Service Companies for Leads</description>
<masterLabel>Data Service Companies for Leads</masterLabel>
<matchEngine>LeadEnrichmentMatchEngine</matchEngine>
</CleanDataService>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>DataService_Leads_Enrichment</members>
        <name>CleanDataService</name>
    </types>
    <version>38.0</version>
</Package>

```

## Usage

Use `CleanDataService` to retrieve all the metadata that describes a data enrichment service. To configure the service in a new org, deploy the metadata you retrieved. Avoid using CRUD-Based Calls with `CleanDataService`.

To make small modifications to the `CleanDataService` component, use the Tooling API.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CMSConnectSource

---

Represents the connection information for external content management systems that feed content to Experience Builder sites. This type extends the Metadata metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

 **Note:** For use with Change Sets, `CMSConnectSource` is a dependent of **Network** and **Community**.

## File Suffix and Directory Location

CMSConnectSource components have the suffix `.cmsConnectSource` and are stored in the `cmsConnectSource` folder. In that folder, separate files exist for each network (for example, `networkname.sourcedevelopername.cmsConnectSource`). Each file represents a CMS connection.

## Version

CMSConnectSource components are available in API version 43.0 and later.

## Special Access Rules

The **CMS Connect org** permission must be enabled.

## Fields

Field Name	Field Type	Description
<code>cmsConnectAsset</code>	<a href="#">CMSConnectAsset</a> on page 467[]	Represents CSS or JavaScript defined for the connection. <ul style="list-style-type: none"> <li>• 0–10 for CSS</li> <li>• 0–10 for JavaScript</li> </ul>
<code>cmsConnectLanguage</code>	<a href="#">CMSConnectLanguage</a> on page 468[]	0 to more. Represents language mappings defined for the connection.
<code>cmsConnectPersonalization</code>	<a href="#">CMSConnectPersonalization</a> on page 468	0 or 1. Represents personalization defined for the connection. Only for use when <code>type</code> is <code>AEM</code> .
<code>cmsConnectResourceType</code>	<a href="#">CMSConnectResourceType</a> on page 468[]	0–5. Represents JSON definitions defined for the connection.
<code>connectionType</code>	<a href="#">CMSConnectType</a> (enum of type string)	Required. Type of authentication being used with outside system. Valid values are: <ul style="list-style-type: none"> <li>• <code>Public</code></li> <li>• <code>Authenticated</code></li> </ul>
<code>cssScope</code>	string	The class name used to prefix and scope the CSS rules.
<code>developerName</code>	string	Required. API name of the CMSConnectSource entity.
<code>languageEnabled</code>	string	Required. Valid values are: <ul style="list-style-type: none"> <li>• <code>Y</code> to enable language mapping for connection.</li> <li>• <code>N</code> if no language mapping is needed.</li> </ul>
<code>masterLabel</code>	string	Required. Connection name
<code>namedCredential</code>	string	Required when the <code>connectionType</code> is <code>Authenticated</code> . API name of <code>namedCredential</code> . Before deploying <code>namedCredential</code> , it must exist on the destination org.

Field Name	Field Type	Description
<code>personalizationEnabled</code>	string	Required. Valid values are: <ul style="list-style-type: none"> <li>• Y to enable personalization mapping for connection.</li> <li>• Otherwise N.</li> </ul>
<code>rootPath</code>	string	Required. Root path.
<code>sortOrder</code>	int	Required. Defines the load order of the connection when multiple connections defined on page. The load order begins with 1.
<code>status</code>	CMSConnectSource (enum of type string)	Required. Status of connection. Valid values are: <ul style="list-style-type: none"> <li>• ACTIVE</li> <li>• INACTIVE</li> </ul>
<code>type</code>	CMSConnectSource (enum of type string)	Required. The identification of the source connection system. Valid values are: <ul style="list-style-type: none"> <li>• AEM</li> <li>• Drupal</li> <li>• WordPress</li> <li>• SDL</li> <li>• Sitecore</li> <li>• Other</li> </ul>
<code>websiteUrl</code>	string	Required if <code>connectionType</code> is Public

 **Note:** Because there can be existing connections when a package comes in, there's some INSERT or UPDATE logic to consider:

- If you find `developerName` in the destination, then update the existing collection with all details from source.
- `namedCredential` is handled through `developerName`. If you don't find `namedCredential` with `developerName`, then an error is generated.
- If the destination isn't `sortOrder` from the source, then insert or update with the source `sortOrder`.
- If `sortOrder` from the source is already in the destination, then increase the source `sortOrder` by 1 for connections such that the destination `sortOrder` > source `sortOrder`.

## CMSConnectAsset

CMSConnectAsset defines the location, types, and order of assets necessary to support the incoming content, such as JavaScript and CSS files.

 **Note:** Because there can be existing connections when a package comes in, there's some INSERT or UPDATE logic to consider:

- If `assetPath` exists in the destination, then update the existing record, else the new `assetPath` is inserted.
- Always keep the `sortOrder` from the source and adjust the destination accordingly.

Field Name	Field Type	Description
assetPath	string	Relative path of the asset.
assetType	string	When used in Apex, this value can be sent as an enum, otherwise, this field has a type of string. Allowed values as string <ul style="list-style-type: none"> <li>• CSS</li> <li>• Javascript</li> </ul> Allowed values as enum <ul style="list-style-type: none"> <li>• CSS</li> <li>• Javascript</li> </ul>
sortOrder	int	Loading sequence on the page.

## CMSConnectLanguage

CMSConnectLanguage components determine the presented language of the content.

Field Name	Field Type	Description
cmsLanguage	string	When a language placeholder is in the URL path, this value is used to replace it.
language	string	Salesforce supported language. For information see <a href="https://developer.salesforce.com/docs/atlas.en-us/api_metameta/api_meta/meta_translations.htm">https://developer.salesforce.com/docs/atlas.en-us/api_metameta/api_meta/meta_translations.htm</a>

## CMSConnectPersonalization

CMSConnectPersonalization is used only with Adobe Experience Manager (AEM).

 **Note:** Because there can be existing connections when a package comes in, there's some INSERT or UPDATE logic to consider. If personalization isn't enabled in the source system, but is enabled in the destination, the destination is disabled. The record for the connection is deleted from the table.

Field Name	Field Type	Description
connectorPage	string	The path to the JSP file that you created and installed in AEM.
connectorPageAsset	string	The path to your Javascript file. Providing this path allows you to run scripts dynamically.

## CMSConnectResourceType

CMSConnectResourceType is for use only to define JSON connections.

 **Note:** Because there can be existing connections when a package comes in, there's some INSERT or UPDATE logic to consider. If you find the developer name in the destination, then update the existing record with all details from the source.

Field Name	Field Type	Description
<code>cmsConnectResourceDefinition</code>	<code>cmsConnectResourceDefinition</code>	0–10 allowed per CMSConnectResourceType. on page 469[]
<code>developerName</code>	string	API name of CMSConnectResourceType.
<code>masterLabel</code>	string	Content type name.
<code>resourceType</code>	string	The only allowed value is JSON.

## CMSConnectResourceDefinition

`cmsConnectResourceDefinition` is used to define JSON connections.

-  **Note:** Because there can be existing connections when a package comes in, there's some INSERT or UPDATE logic to consider:
- If you find `developerName` in the destination, then the existing record is updated with all details from the new source, else the new value is inserted.
  - If the current source is `DETAIL` and the destination has `DETAIL` with a different name, then the destination is updated to `LIST` and the source is inserted as `DETAIL`.

Field Name	Field Type	Description
<code>developerName</code>	string	Required. API name of CMSConnectResourceDefinition.
<code>masterLabel</code>	string	Required. <code>developerName</code> of Content Item or Content List.
<code>options</code>	int	Required. Identifies whether the content from the external source is a single item or a list. 0 for Content List 1 for Content Item
<code>payloadType</code>	string	Required. The only valid value is JSON.
<code>resourceIdPath</code>	string	Relative path to ID. Required for Content Item.
<code>resourceNamePath</code>	string	Relative path to resource name. Required for Content Item.
<code>resourcePath</code>	string	Required. JSON resource path.
<code>rootNodePath</code>	string	Only for Content List and collection. Defines the initial starting path for a collection or list.

## Declarative Metadata Sample Definition

The following is an example of a CMSConnectSource definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<CMSConnectSource xmlns="http://soap.sforce.com/2006/04/metadata">
  <cmsConnectAsset>
    <assetPath>etc/designs/capricorn/app-prefixed.min.css</assetPath>
    <assetType>CSS</assetType>
    <sortOrder>1</sortOrder>
  </cmsConnectAsset>
  <cmsConnectAsset>
    <assetPath>etc/designs/capricorn/w3data.js</assetPath>
    <assetType>Javascript</assetType>
    <sortOrder>1</sortOrder>
  </cmsConnectAsset>
  <cmsConnectLanguage>
    <cmsLanguage>en</cmsLanguage>
    <language>en_US</language>
  </cmsConnectLanguage>
  <cmsConnectLanguage>
    <cmsLanguage>fr</cmsLanguage>
    <language>fr</language>
  </cmsConnectLanguage>
  <cmsConnectPersonalization>
    <connectorPage>content/salesforceConnector.js</connectorPage>
    <connectorPageAsset>content/js/capricorn/assets.js</connectorPageAsset>
  </cmsConnectPersonalization>
  <cmsConnectResourceType>
    <cmsConnectResourceDefinition>
      <developerName>Details</developerName>
      <masterLabel>Details</masterLabel>
      <options>0</options>
      <payloadType>JSON</payloadType>
      <resourceIdPath>ID</resourceIdPath>
      <resourceNamePath>title</resourceNamePath>
    </cmsConnectResourceDefinition>
    <resourcePath>rest/v1.1/sites/cmstry.wordpress.com/posts/{component}</resourcePath>
  </cmsConnectResourceDefinition>
  <cmsConnectResourceDefinition>
    <developerName>List</developerName>
    <masterLabel>List</masterLabel>
    <options>1</options>
    <payloadType>JSON</payloadType>
  </cmsConnectResourceDefinition>
  <resourcePath>rest/v1.1/sites/cmstry.blog.wordpress.com/posts?number={itemsPerPage}&page={pageNumber}</resourcePath>
  </cmsConnectResourceDefinition>
  <developerName>Posts</developerName>
  <masterLabel>Posts</masterLabel>
  <resourceType>JSON</resourceType>
</cmsConnectResourceType>
<connectionType>Public</connectionType>
<cssScope>capricorn</cssScope>
<developerName>Capricorn</developerName>
```

```

<languageEnabled>Y</languageEnabled>
<masterLabel>Capricorn</masterLabel>
<personalizationEnabled>Y</personalizationEnabled>
<rootPath>content/capricorn/{language}</rootPath>
<sortOrder>11</sortOrder>
<status>ACTIVE</status>
<type>AEM</type>
<websiteUrl>https://public-api.wordpress.com</websiteUrl>
</CMSConnectSource>

```

The following is an example `package.xml`.

```

<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>NetworkA.*</members>
    <name>CMSConnectSource</name>
  </types>
  <version>43.0</version>
</Package>

```

To retrieve a specific connection:

```

<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>NetworkA.DeveloperName</members>
    <name>CMSConnectSource</name>
  </types>
  <version>43.0</version>
</Package>

```

## Usage

The INSERT or UPDATE logic for the incoming information is always UPSERT. If data isn't in the entity, then it's inserted, otherwise the current data is updated.

Before doing upsert, the content from the package is validated against the maximum limits for the following:

- CSS assets  $\leq 10$
- JavaScript assets  $\leq 10$
- Resource types  $\leq 5$
- Resource definitions for each type  $\leq 10$

For example

1. The validation on a new connection totals only the elements in the incoming package.
2. Validation of existing connections totals the existing assets and new elements to assess validity. For example, if a connection on the destination org already has six CSS definitions, and the incoming package has defined seven CSS definitions (four new + three existing), the new total is the six current from the database. The total ignores the three repeated in the package and adds four new definitions from the incoming package. This totals 10 definitions, which number is at or below the 10 asset threshold, and it passes validation.

Refer to the following content for more details for how each entity how is handled while saving the details from package to destination org:

Type	Description
<p><code>CMSConnectSource</code></p>	<ul style="list-style-type: none"> <li>If you find <code>developerName</code> in the destination, then update the existing collection with all details from source.</li> <li><code>namedCredential</code> is handled through <code>developerName</code>. If you don't find <code>namedCredential</code> with <code>developerName</code>, then an error is generated.</li> <li>If the destination isn't <code>sortOrder</code> from the source, then insert or update with the source <code>sortOrder</code>.</li> <li>If <code>sortOrder</code> from the source is already in the destination, then increase the source <code>sortOrder</code> by 1 for connections such that the destination <code>sortOrder</code> &gt; <code>sortOrder</code> from the source.</li> </ul>
<p><code>CMSConnectAsset</code></p>	<ul style="list-style-type: none"> <li>If <code>assetPath</code> exists in the destination, then update the existing record, else the new <code>assetPath</code> is inserted.</li> <li>Always keep the <code>sortOrder</code> from the source and adjust the destination accordingly.</li> </ul>
<p><code>CMSConnectPersonalization</code></p>	<p>If personalization isn't enabled in the source system, but is enabled in the destination, the destination is disabled. The record for the connection is deleted from the table.</p>
<p><code>CMSConnectResourceType</code></p>	<p>If you find the developer name in the destination, then update the existing record with all details from the source.</p>
<p><code>CMSConnectResourceDefinition</code></p>	<ul style="list-style-type: none"> <li>If you find <code>developerName</code> in the destination, then the existing record is updated with all details from the new source, else the new value is inserted.</li> <li>If the current source is <code>DETAIL</code> and the destination has <code>DETAIL</code> with a different name, then the destination is updated to <code>LIST</code> and the source is inserted as <code>DETAIL</code>.</li> </ul>

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Community (Zone)

---

Represents a zone that contains Ideas or Chatter Answers objects. Zones are shared by the Ideas, Answers, and Chatter Answers features, allowing you to view and create zones from those locations. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Note:** Starting with the Summer '13 release, Chatter Answers and Ideas “communities” have been renamed to “zones.” In API version 28, the API object label has changed to `zone`, but the API type is still `Community`.

## File Suffix and Directory Location

Zones have the suffix `community` and are stored in the `communities` folder.

## Version

Community (Zone) components are available in API version 27.0 and later.

## Fields

 **Note:** When `enableChatterAnswers` is set to `false`, values specified for the following fields are ignored and not saved: `communityFeedPage`, `emailFooterDocument`, `emailHeaderDocument`, `enablePrivateQuestions`, `emailNotificationUrl`, and `site`.

Field Name	Field Type	Description
<code>active</code>	boolean	Indicates whether the zone is active ( <code>true</code> ) or not ( <code>false</code> ).
<code>chatterAnswersFacebookSsoUrl</code>	string	(Read only) The Facebook sign-on URL, which is based on the Facebook authentication provider selected in your Chatter Answers settings. This field is available only if Chatter Answers and Facebook Single Sign-On for Chatter Answers are enabled.
<code>communityFeedPage</code>	string	The Visualforce page that hosts the zone’s feeds. This field is available when Chatter Answers is enabled in the organization.
<code>description</code>	string	The description of the zone.
<code>emailFooterDocument</code>	string	The text or HTML file that incorporates your organization’s branding into the footer of email notifications. This field is available when Chatter Answers is enabled in the organization.
<code>emailHeaderDocument</code>	string	The text or HTML file that incorporates your organization’s branding into the header of email notifications. This field is available when Chatter Answers is enabled in the organization.
<code>emailNotificationUrl</code>	string	The URL that’s included in email notifications. This field is available when Chatter Answers is enabled in the organization. This field replaces <code>portalEmailNotificationUrl</code> in API version 28.0 and later.

Field Name	Field Type	Description
<code>enableChatterAnswers</code>	boolean	Indicates whether the zone has Chatter Answers enabled ( <code>true</code> ) or not ( <code>false</code> ). This field is available when Chatter Answers is enabled in the organization.
<code>enablePrivateQuestions</code>	boolean	Indicates whether Chatter Answers questions can be escalated to cases ( <code>true</code> ) or not ( <code>false</code> ). This field is available when Chatter Answers is enabled in the organization.
<code>expertsGroup</code>	string	The name of the public group that act as experts in the zone. This field is available when either Ideas or Answers are enabled in the organization.
<code>portal</code>	string	The name of the portal in which to display the zone.
<code>portalEmailNotificationUrl</code>	string	The portal URL that's included in email notifications. This field is available when Chatter Answers is enabled in the organization. This field has been replaced by <code>emailNotificationUrl</code> in API version 28.0 and later.
<code>reputationLevels</code>	<a href="#">ReputationLevels</a>	The fields that define the points and name of each reputation level you define. You can create up to 25 reputation levels per zone.
<code>showInPortal</code>	boolean	Indicates whether the zone is available to all portals ( <code>true</code> ) or not available to any portals ( <code>false</code> ).
<code>site</code>	string	The name of the site for the zone. This field is available when Chatter Answers is enabled in the organization.

## ReputationLevels

Represents the points and reputation label that displays on hover over a user's photo in the feed.

Field Name	Field Type	Description
<code>chatterAnswersReputationLevels</code>	<a href="#">ChatterAnswersReputationLevel</a> []	Contains the name and value pair that describes the reputation level for Chatter Answers. Available in API version 28.0 and later.
<code>ideaReputationLevels</code>	<a href="#">IdeaReputationLevel</a>	Contains the name and value pair that describes the reputation for Ideas. Available in API version 28.0 and later.

## ChatterAnswersReputationLevel

Represents the reputation name and the number of points for that level for Chatter Answers.

Field Name	Field Type	Description
<code>name</code>	string	The name of the reputation level, for example, "Expert."
<code>value</code>	int	The minimum number of points for the reputation level.

## IdeaReputationLevel

Represents the reputation name and the number of points for that level for Ideas. Available in API version 28.0 and later.

Field Name	Field Type	Description
name	string	The name of the reputation level, for example, "Expert."
value	int	The minimum number of points for the reputation level.

## Declarative Metadata Sample Definition

The following is the definition of a community (zone) component:

```
<?xml version="1.0" encoding="UTF-8"?>
<Community xmlns="http://soap.sforce.com/2006/04/metadata">
  <active>true</active>
  <communityFeedPage>communityWithHeaderAndFooter_main</communityFeedPage>
  <description>Metadata Test</description>
  <emailFooterDocument>sampleFolder/emailFooter.html</emailFooterDocument>
  <emailHeaderDocument>sampleFolder/emailHeader.html</emailHeaderDocument>
  <enableChatterAnswers>true</enableChatterAnswers>
  <enablePrivateQuestions>true</enablePrivateQuestions>
  <expertsGroup>CommunityExperts</expertsGroup>
  <portal>Customer Portal</portal>
  <emailNotificationUrl>http://yourURL</emailNotificationUrl>
  <reputationLevels>
    <chatterAnswersReputationLevels>
      <name>Newbie</name>
      <value>0</value>
    </chatterAnswersReputationLevels>
    <chatterAnswersReputationLevels>
      <name>Smartie</name>
      <value>500</value>
    </chatterAnswersReputationLevels>
    <chatterAnswersReputationLevels>
      <name>Pro</name>
      <value>2000</value>
    </chatterAnswersReputationLevels>
    <chatterAnswersReputationLevels>
      <name>All Star</name>
      <value>5000</value>
    </chatterAnswersReputationLevels>
    <ideaReputationLevels>
      <name>Observer</name>
      <value>0</value>
    </ideaReputationLevels>
    <ideaReputationLevels>
      <name>Contributor</name>
      <value>100</value>
    </ideaReputationLevels>
    <ideaReputationLevels>
      <name>Influencer</name>
    </ideaReputationLevels>
  </reputationLevels>
</Community>
```

```

    <value>400</value>
  </ideaReputationLevels>
  <ideaReputationLevels>
    <name>Thought Leader</name>
    <value>1500</value>
  </ideaReputationLevels>
</reputationLevels>
<showInPortal>true</showInPortal>
<site>ChatterAnswersSite</site>
</Community>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CommerceSettings

---

Represents settings for various Commerce features.

### Parent Type and Manifest Access

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the “Settings” name. See [Settings](#) for more details.

### File Suffix and Directory Location

CommerceSettings values are stored in the `Commerce.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there’s only one settings file for each settings component.

### Version

Commerce Settings are available in API version 50.0 and later.

### Special Access Rules

### Fields

Field Name	Description
<code>commerceAnalyticsEnabled</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether Commerce Analytics is enabled (<code>true</code>) or not (<code>false</code>).</p>

Field Name	Description
commerceConciergeEnabled	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether Commerce Concierge bots are enabled (<code>true</code>) or not (<code>false</code>).</p>
commerceDiscoveryExpansion	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Commerce Discovery Expansion service is enabled (<code>true</code>) or not (<code>false</code>).</p>
commerceEnabled	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether Commerce is enabled (<code>true</code>) or not (<code>false</code>).</p>
lowestUnitPriceTracking	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether lowest unit price tracking (for EU customers) is enabled (<code>true</code>) or not (<code>false</code>).</p>

## Declarative Metadata Sample Definition

The following is an example of a CommerceSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<CommerceSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <commerceEnabled>false</commerceEnabled>
</CommerceSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Commerce</members>
    <name>Settings</name>
  </types>
  <version>60.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CommunityTemplateDefinition

---

Represents the definition of an Experience Builder site template. This type extends the Metadata metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

CommunityTemplateDefinition components have the suffix `.communityTemplateDefinition` and are stored in the `communityTemplateDefinitions` folder.

## Version

CommunityTemplateDefinition components are available in API version 38.0 and later.

## Special Access Rules

This type is available only if Salesforce Digital Experiences is enabled in your org.

## Fields

Field Name	Field Type	Description
<code>baseTemplate</code>	CommunityBaseTemplate (enumeration of type string)	Denotes that this CommunityTemplateDefinition was created in API version 41.0 or later. The only valid value is <code>c</code> . This field is available in API 41.0 and later.
<code>bundlesInfo</code>	<a href="#">CommunityBundle</a>	The list of preview images and feature highlights of this CommunityTemplateDefinition.
<code>category</code>	CommunityTemplateCategory (enumeration of type string)	Required. The optimized use case of this CommunityTemplateDefinition. Valid values are: <ul style="list-style-type: none"> <li>• Commerce</li> <li>• IT</li> <li>• Marketing</li> <li>• Sales</li> <li>• Service</li> </ul>

Field Name	Field Type	Description
defaultBrandingSet	string	The set of branding properties associated with this CommunityTemplateDefinition, as defined in the Theme panel in Experience Builder. Available in API version 40.0 and later.  In API version 44.0 and later, this field is read-only and can be implemented in <a href="#">CommunityThemeDefinition</a> on page 484.
defaultThemeDefinition	string	Required. The assigned theme definition for this CommunityTemplateDefinition.
description	string	The optional description text of this CommunityTemplateDefinition.
enableExtendedCleanUpOnDelete	boolean	False by default. Determines if deleting this CommunityTemplateDefinition attempts to delete other directly or indirectly referenced objects automatically, for example, <a href="#">CommunityThemeDefinition</a> on page 484, <a href="#">Flexipage</a> on page 1001, or <a href="#">StaticResource</a> on page 2037. Values are true or false.
masterLabel	string	Required. The label for this CommunityTemplateDefinition, which displays in Setup.
navigationLinkSet	<a href="#">NavigationLinkSet</a>	The navigation menu associated with this CommunityTemplateDefinition. A navigation menu consists of items that users can click to go to other parts of the site. Available in API versions 37.0 to 46.0. In API versions 47.0 and later, use <a href="#">NavigationMenu</a> .
pageSetting	<a href="#">CommunityPageSet</a>	The list of FlexiPage of this CommunityTemplateDefinition.
publisher	string	Defines the name of the publisher as seen in the Change Theme wizard. If no name is provided, the name of the org from which the package was originally exported is used.  This field is available in API version 45.0 and later.

## CommunityTemplateBundleInfo

Field Name	Field Type	Description
description	string	The optional description text of its CommunityTemplateBundleInfo.
image	string	Required only when the <code>type</code> is <code>PreviewImage</code> , otherwise this field is optional. A preview image for this CommunityTemplateDefinition.
order	int	Required. An integer specifying the position of this CommunityTemplateBundleInfo relative to others of the same <code>type</code> within its CommunityTemplateDefinition. 1 is the first position, 3 is the maximum position for <code>PreviewImage</code> type, and 4 is the maximum position for the <code>Highlight</code> type.
title	string	Required. The title of this CommunityTemplateBundleInfo to use in code.

Field Name	Field Type	Description
type	CommunityTemplateBundleInfoType (enumeration of type string)	Required. Stores descriptive information about the template that's included in the export. The template powers the interface of the Experience Creation Wizard. Valid values are: <ul style="list-style-type: none"> <li><code>Highlight</code>—This CommunityTemplateBundleInfo is used as a highlighted feature. Up to 4 are supported.</li> <li><code>PreviewImage</code>—This CommunityTemplateBundleInfo is used as a preview image. Up to 3 are supported.</li> </ul>

## CommunityTemplatePageSetting

Field Name	Field Type	Description
page	string	Required. The list of FlexiPage of this CommunityTemplateDefinition.
themeLayout	string	Required. The name of the FlexiPage for the theme layout.  This field is available in API version 39.0 and later.

## Declarative Metadata Sample Definition

The following is an example of a CommunityTemplateDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<CommunityTemplateDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <baseTemplate>c</baseTemplate>
  <bundlesInfo>
    <description>Feature Description</description>
    <order>1</order>
    <title>Feature Heading</title>
    <type>Highlight</type>
  </bundlesInfo>
  <bundlesInfo>
    <image>siteAsset_2dbe594eb6794173af78da264cd6a4a7</image>
    <order>1</order>
    <title>Preview Image</title>
    <type>PreviewImage</type>
  </bundlesInfo>
  <category>Sales</category>
  <defaultThemeDefinition>communityTemplate</defaultThemeDefinition>
  <description>This is an Experience Builder template</description>
  <enableExtendedCleanUpOnDelete>true</enableExtendedCleanUpOnDelete>
  <masterLabel>communityTemplate</masterLabel>
  <navigationLinkSet>
    <navigationMenuItem>
      <label>Topics</label>
      <position>0</position>
      <publiclyAvailable>true</publiclyAvailable>
      <target>ShowMoreTopics</target>
    </navigationMenuItem>
  </navigationLinkSet>
</CommunityTemplateDefinition>
```

```

        <type>NavigationalTopic</type>
    </navigationMenuItem>

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>MyTemplate</members>
    <name>CommunityTemplateDefinition</name>
  </types>
  <version>62.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CommunityThemeDefinition

---

Represents the definition of a theme for an Experience Builder site. This type extends the Metadata metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

CommunityThemeDefinition components have the suffix `.communityThemeDefinition` and are stored in the `communityThemeDefinitions` folder.

## Version

CommunityThemeDefinition components are available in API version 38.0 and later.

## Special Access Rules

This type is available only if Salesforce Digital Experiences is enabled in your org.

## Fields

Field Name	Field Type	Description
<code>bundlesInfo</code>	<a href="#">CommunityThemeBundleInfo []</a>	If specified, at least one preview image and one highlight are required. Up to 3 preview images and 4 highlights are supported. Available in API version 44.0 and later
<code>customThemeLayoutType</code>	<a href="#">CommunityThemeLayoutType []</a>	The list of custom theme layout types available to the theme layout.
<code>defaultBrandingSet</code>	string	The set of branding properties associated with this CommunityThemeDefinition, as defined in the Theme panel in Experience Builder. Available in API version 44.0 and later.
<code>description</code>	string	The optional description text of this CommunityThemeDefinition.
<code>enableExtendedCleanUpOnDelete</code>	boolean	False by default. Determines if deleting this CommunityThemeDefinition attempts to delete other directly or indirectly referenced objects automatically, for example, FlexiPage. Values are true or false.
<code>masterLabel</code>	string	Required. The label for this CommunityThemeDefinition, which displays in Setup.
<code>publisher</code>	string	Defines the name of the publisher as seen in the wizard for creating Experience Builder sites. If no name is provided, the name of the org from which the package was originally exported is used.  This field is available in API version 45.0 and later.
<code>themeRouteOverride</code>	<a href="#">CommunityThemeRouteOverride []</a>	List of theme layout type overrides for flexipages (currently only for home). Available in API version 44.0 and later.
<code>themeSetting</code>	<a href="#">CommunityThemeSetting []</a>	Required. The list of settings for this CommunityThemeDefinition.

## CommunityThemeBundleInfo

Field Name	Field Type	Description
<code>description</code>	string	The optional description text of its CommunityThemeBundleInfo.
<code>image</code>	string	Required only when the <code>type</code> is <code>PreviewImage</code> , otherwise this field is optional. A preview image for this CommunityThemeDefinition.
<code>order</code>	int	Required. An integer specifying the position of this CommunityThemeBundleInfo relative to others of the same <code>type</code> within its CommunityThemeDefinition. 1 is the first position, 3 is the maximum position

Field Name	Field Type	Description
		for <code>PreviewImage</code> type, and 4 is the maximum position for the <code>Highlight</code> type.
<code>title</code>	string	Required. The title of this <code>CommunityThemeBundleInfo</code> to use in code.
<code>type</code>	<code>CommunityTemplateBundleInfoType</code> (enumeration of type string)	Required. Stores descriptive information about the theme that is included in the export. Valid values are: <ul style="list-style-type: none"> <li><code>Highlight</code>—This <code>CommunityThemeBundleInfo</code> is used as a highlighted feature. Up to 4 are supported.</li> <li><code>PreviewImage</code>—This <code>CommunityThemeBundleInfo</code> is used as a preview image. Up to 3 are supported.</li> </ul>

## CommunityCustomThemeLayoutType

Field Name	Field Type	Description
<code>description</code>	string	The description of the custom theme layout type.
<code>label</code>	string	Required. The name of the custom theme layout type. The values <code>Inner</code> , <code>Home</code> , and <code>Login</code> are reserved.

## CommunityThemeRouteOverride

Field Name	Field Type	Description
<code>customThemeLayoutType</code>	string	Required when <code>themeLayoutType</code> isn't specified. Provides the custom theme layout type associated with the theme layout. This field and <code>themeLayoutType</code> are mutually exclusive; you can't specify both.
<code>pageAttributes</code>	string	Required. Specifies the attributes of the site page for which the default theme layout type is overridden. The only valid value is <code>{ "PageName": "Home" }</code> .
<code>pageType</code>	string	Required. Specifies the type of the site page for which the default theme layout type is overridden. The only valid value is <code>comm__standardPage</code> .
<code>themeLayoutType</code>	<code>CommunityThemeLayoutType</code> (enumeration of type string)	Required if <code>customThemeLayoutType</code> isn't specified. Provides the default theme layout type associated with the theme layout. Valid values are <code>Inner</code> , <code>Home</code> , or <code>Login</code> . This field and <code>customThemeLayoutType</code> are mutually exclusive; you can't specify both.

## CommunityTheme Setting

Field Name	Field Type	Description
customThemeLayoutType	string	Required when <code>themeLayoutType</code> isn't specified. The custom theme layout type associated with the theme layout. This field and <code>themeLayoutType</code> are mutually exclusive; you can't specify both.
themeLayout	string	Required. The configuration and layout for this theme.
themeLayoutType	CommunityThemeLayoutType (enumeration of type string)	Required when <code>customThemeLayoutType</code> isn't specified. The default theme layout type associated with the theme layout. Valid values are <code>Inner</code> , <code>Home</code> , or <code>Login</code> . This field and <code>customThemeLayoutType</code> are mutually exclusive; you can't specify both.

## Declarative Metadata Sample Definition

The following is an example of a `CommunityThemeDefinition` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<CommunityThemeDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <bundlesInfo>
    <description>Batman Feature1 description</description>
    <order>1</order>
    <title>Batman Feature1</title>
    <type>Highlight</type>
  </bundlesInfo>
  <bundlesInfo>
    <image>siteAsset_d90e2d5ce4cf4d8899e233c051091246</image>
    <order>1</order>
    <title>siteAsset_d90e2d5ce4cf4d8899e233c051091246</title>
    <type>PreviewImage</type>
  </bundlesInfo>
  <defaultBrandingSet>Batman</defaultBrandingSet>
  <description>Batman theme</description>
  <enableExtendedCleanupOnDelete>true</enableExtendedCleanupOnDelete>
  <masterLabel>Batman</masterLabel>
  <themeRouteOverride>
    <pageAttributes>{ &quot;PageName&quot; : &quot;Home&quot; }</pageAttributes>
    <pageType>comm__standardPage</pageType>
    <themeLayoutType>Home</themeLayoutType>
  </themeRouteOverride>
  <themeSetting>
    <themeLayout>Batman_themeLayout_Login</themeLayout>
    <themeLayoutType>Login</themeLayoutType>
  </themeSetting>
  <themeSetting>
    <themeLayout>Batman_themeLayout_Home</themeLayout>
    <themeLayoutType>Home</themeLayoutType>
  </themeSetting>
  <themeSetting>
    <themeLayout>Batman_themeLayout_Default</themeLayout>
    <themeLayoutType>Inner</themeLayoutType>
  </themeSetting>
</CommunityThemeDefinition>
```

```

    </themeSetting>
  </CommunityThemeDefinition>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Batman</members>
    <name>BrandingSet</name>
  </types>
  <types>
    <members>Batman</members>
    <name>CommunityThemeDefinition</name>
  </types>
  <types>
    <members>Batman_themeLayout_Default</members>
    <members>Batman_themeLayout_Home</members>
    <members>Batman_themeLayout_Login</members>
    <name>FlexiPage</name>
  </types>
  <types>
    <members>siteAsset_d90e2d5ce4cf4d8899e233c051091246</members>
    <name>StaticResource</name>
  </types>
  <version>62.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ConnectedApp

---

Represents a connected app configuration. A connected app enables an external application to integrate with Salesforce using APIs and standard protocols, such as SAML, OAuth, and OpenID Connect. Connected apps use these protocols to authenticate, authorize, and provide single sign-on (SSO) for external apps. The external apps that are integrated with Salesforce can run on the customer success platform, other platforms, devices, or SaaS subscriptions.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

ConnectedApp components have the suffix `.connectedApp` and are stored in the `connectedApps` folder.

## Version

ConnectedApp components are available in API version 29.0 and later.

## Fields

Field Name	Field Type	Description
attributes	canvasConfig	A custom attribute of the connected app.
	<a href="#">AppCanvasConfig</a>	The configuration options of the connected app if it's exposed as a canvas app.
contactEmail	string	Required. The email address that Salesforce uses to contact you or your support team.
contactPhone	string	The phone number for Salesforce to use to contact you.
description	string	An optional description for your app.
iconUrl	string	Reserved for future use.
infoUrl	string	An optional URL for a web page with more information about your app.
ipRanges	<a href="#">ConnectedAppIpRange[]</a>	Specifies the ranges of IP addresses that can access the app without requiring the user to authenticate with the connected app.
label	string	Required. The name of the app.
logoUrl	string	An optional logo for the app. The logo appears with the app's entry in the list of apps and on the consent page the user sees when authenticating. The URL must use HTTPS, and the logo can't be larger than 125 pixels high or 200 pixels wide. The default logo is a cloud.
mobileStartUrl	string	Users are directed to this URL after they've authenticated when the app is accessed from a mobile device. If you don't give a URL, the user is sent to the app's default start page after authentication completes. If the connected app that you're creating is a canvas app, then you can leave this field blank. The Canvas App URL field contains the URL that gets called for the connected app.
oauthConfig	<a href="#">connectedAppOAuthConfig</a>	Specifies how your app communicates with Salesforce.
oauthPolicy	<a href="#">ConnectedAppOAuthPolicy</a>	Specifies OAuth access policies associated with your connected app. Available in API version 49.0 and later.
permissionSetName	string[]	<p>Specifies the permissions required to perform different functions with the connected app. Available in API version 46.0 and later.</p> <p>You can assign multiple permission sets to the connected app, but you must enter each permission set name on a separate line. You can't enter the same permission set name more than one time for each connected app.</p> <p>You can also change a permission set by replacing the current permission set with a new permission set. Make sure that each permission set name assigned to the connected app is unique.</p> <p>You can delete individual permission sets or remove all permission sets from a connected app by entering an empty</p>

Field Name	Field Type	Description
		<p><code>permissionSetName</code> string on deployment of the connected app: (<code>&lt;permissionSetName&gt;&lt;/permissionSetName&gt;</code>).</p> <p>To use this field, the <code>isAdminApproved</code> field on the <code>ConnectedAppOAuthConfig</code> subtype must be set to <code>true</code>.</p>
<code>plugin</code>	string	The name of a custom Apex class that extends <code>Auth.ConnectedAppPlugin</code> to customize the behavior of the app.
<code>pluginExecutionUser</code>	string	<p>Specifies the user to run the plugin as. If the user isn't authorized to use the connected app, use the <code>authorize</code> method. See the <code>ConnectedAppPlugin</code> class in the <a href="#">Apex Developer Guide</a>. Available in API version 46.0 and later.</p> <p>Enter a user that is part of your org. Otherwise, the user is removed from this field when you deploy the connected app. If you don't want to specify a user, you can leave this field empty.</p> <p>To use this field in an org, the <code>ConAppPluginExecuteAsUser</code> setting must be enabled.</p>
<code>profileName</code>	string[]	<p>Specifies the profile (base-level user permissions) required to perform different functions with the connected app. Available in API version 46.0 and later.</p> <p>You can assign multiple profiles to the connected app, but you must enter each profile name on a separate line. You can't enter the same profile name more than one time for each connected app.</p> <p>You can also change profiles by replacing the current profiles with new profiles. Make sure that each profile name assigned to the connected app is unique.</p> <p>You can also delete individual profiles or remove all profiles from a connected app by entering an empty <code>profileName</code> string on deployment of the connected app: (<code>&lt;profileName&gt;&lt;/profileName&gt;</code>).</p> <p>To use this field, the <code>isAdminApproved</code> field on the <code>ConnectedAppOAuthConfig</code> subtype must be set to <code>true</code>.</p>
<code>samlConfig</code>	<a href="#">ConnectedAppSamlConfig</a>	Controls how the app uses single sign-on.
<code>sessionPolicy</code>	<a href="#">ConnectedAppSessionPolicy</a>	Specifies a connected app's session policies. Available in API version 49.0 and later.
<code>startUrl</code>	string	If the app isn't accessed from a mobile device, users are directed to this URL after they've authenticated. If you don't give a URL, the user is sent to the app's default start page after authentication completes. Whether you give a URL or not, the start URL can be updated later by managing the connected app. If the app is accessed from a mobile device, see <code>mobileStartUrl</code> . If the connected app that you're

Field Name	Field Type	Description
		creating is a canvas app, then you can leave this field empty. The Canvas App URL field contains the URL that gets called for the connected app.

## ConnectedAppAttribute

Represents the field names that make up a custom attribute when using SAML with a ConnectedApp. Tailor these values to a specific service provider.

Field Name	Field Type	Description
formula	string	Required. The value of the attribute.
key	string	Required. The attribute's identifier.

## ConnectedAppCanvasConfig

Represents the configuration options of the connected app if it's exposed as a canvas app.

Field Name	Field Type	Description
accessMethod	AccessMethod (enumeration of type string)	Required. Indicates how the canvas app initiates the OAuth authentication flow. The valid values are: <ul style="list-style-type: none"> <li><code>GET</code>—OAuth authentication is used, and the user is prompted to allow the third-party application to access their information. When you use this access method, the canvas app must initiate the OAuth authentication flow.</li> <li><code>POST</code>—OAuth authentication is used, but when the administrator installs the canvas app, they implicitly allow access for users. Therefore, the user isn't prompted to allow the third party to access their user information. When you use this access method, the authentication is posted directly to the canvas app URL.</li> </ul>
canvasUrl	string	Required. The URL of the third-party app that's exposed as a canvas app.
lifecycleClass	string	The name of the <code>Canvas.CanvasLifecycleHandler</code> Apex class, if you've implemented this class for custom parameters. Available in API version 31.0 and later.
locations	CanvasLocationOptions (enumeration of type string)[]	Indicates where the canvas app can appear to the user. The valid values are: <ul style="list-style-type: none"> <li><code>Aura</code>—Reserved for future use.</li> <li><code>AppLauncher</code>—Reserved for future use.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li><code>Chatter</code>—The canvas app can appear in the app navigation list on the Chatter tab.</li> <li><code>ChatterFeed</code>—The canvas app can appear as a Chatter feed item.</li> <li><code>MobileNav</code>—The canvas app can appear in a mobile card in the Salesforce mobile app. Available in API version 31.0 and later.</li> <li><code>None</code>—The canvas app can appear only in the Canvas App Previewer.</li> <li><code>OpenCTI</code>—The canvas app can appear in the call control tool.</li> <li><code>PageLayout</code>—The canvas app can appear on a page layout. When viewed in the Salesforce mobile app, the canvas app appears in the record detail page. Available in API version 31.0 and later.</li> <li><code>Publisher</code>—The canvas app can appear as a global action.</li> <li><code>ServiceDesk</code>—The canvas app can appear in the footer or sidebars of a Salesforce console.</li> <li><code>UserProfile</code>—Reserved for future use.</li> <li><code>Visualforce</code>—The canvas app can appear on a Visualforce page.</li> </ul>
<code>options</code>	CanvasOptions (enumeration of type string)[]	<p>Indicates whether to hide the <b>Share</b> button and header in the publisher for your canvas app and whether the app is a canvas personal app. Valid values are:</p> <ul style="list-style-type: none"> <li><code>HideShare</code>—The <b>Share</b> button is hidden in the publisher for the related canvas app. Available in API version 30.0 and later.</li> <li><code>HideHeader</code>—The header is hidden in the publisher for the related canvas app. Available in API version 30.0 and later.</li> <li><code>PersonalEnabled</code>—End users can install the app as a canvas personal app. Available in API version 32.0 and later.</li> </ul>
<code>samlInitiationMethod</code>	SamlInitiationMethod (enumeration of type string)	<p>If you're using SAML single sign-on (SSO), indicates which provider initiates the SSO flow.</p> <ul style="list-style-type: none"> <li><code>IdpInitiated</code>—Identity provider initiated. Salesforce makes the initial request to start the SSO flow.</li> <li><code>SpInitiated</code>—Service provider initiated. The canvas app starts the SSO flow after it's invoked.</li> <li><code>None</code>—The canvas app isn't using SAML SSO. Available in API version 31.0 and later.</li> </ul>

## ConnectedAppIpRange

Represents the list of IP addresses that can access the app without requiring the user to authenticate.

Field Name	Field Type	Description
<code>description</code>	string	Identifies the purpose of the range, such as which part of a network corresponds to this range. Available in API version 31.0 and later.
<code>end</code>	string	Required. The last address in the IP range, inclusive.
<code>start</code>	string	Required. The first address in the IP range, inclusive.

## ConnectedAppOAuthConfig

Represents the field names that configure how your connected app communicates with Salesforce.

Field Name	Field Type	Description
<code>assetTokenConfig</code>	<a href="#">connectedAppOAuthAssetToken</a>	The OAuth asset token configuration for the connected app OAuth settings. Available in API version 49.0 and later.
<code>callbackUrl</code>	string	Required. The endpoint that Salesforce calls back to your connected app during OAuth. It's the OAuth <code>redirect_uri</code> .
<code>certificate</code>	string	The PEM-encoded certificate string, if the app uses a certificate.
<code>consumerKey</code>	string	A value used by the consumer for identification to Salesforce. Referred to as <code>client_id</code> in OAuth 2.0.  In API version 32.0 and later, you can set this field's value only during creation. After you define and save the value, it can't be edited. The value must be alphanumeric, can't contain special characters or spaces, and must be between 8–256 characters. Consumer keys must be globally unique.
<code>consumerSecret</code>	string	A value that is combined with the <code>consumerKey</code> and used by the consumer for identification to Salesforce. Referred to as <code>client_secret</code> in OAuth 2.0. Typically, Salesforce generates this value when you create the connected app. However, you can customize the shared secret value during creation. After you save the value, it can't be edited. When set, the value isn't returned in Metadata API requests.  The value must be alphanumeric (no special characters and no spaces) and a minimum of 8 characters (maximum of 256 characters). If you specify a secret already in use for another connected app in the organization, an error occurs.  Available in API version 32.0 and later.
<code>idTokenConfig</code>	<a href="#">ConnectedAppOAuthIdToken</a>	Specifies the ID token configuration for the connected app OAuth settings. Available in API version 43.0 and later.

Field Name	Field Type	Description
<code>isAdminApproved</code>	boolean	<p>If set to <code>false</code> (default), anyone in the org can authorize the app. Users must approve the app the first time they access it.</p> <p>If set to <code>true</code>, only users with the appropriate profile or permission set can access the app. These users don't have to approve the app before they can access it. Manage profiles for the app by editing each profile's Connected App Access list. Manage permission sets for the app by editing each permission set's Assigned Connected App list. This setting isn't available in Group Edition. Available in API version 46.0 and later.</p> <p>Connected app consumers can edit this setting when deploying a connected app in their org.</p>
<code>isClientCredentialEnabled</code>	boolean	<p>If set to <code>true</code>, the connected app can use the OAuth 2.0 client credentials flow. To use the client credentials flow, you must also specify a user for <code>oauthClientCredentialUser</code>.</p> <p>If set to <code>false</code> (default), the connected app can't use the client credentials flow.</p> <p>Available in API version 56.0 and later.</p>
<code>isCodeCredentialEnabled</code>	boolean	<p>Determines whether the app can use the Authorization Code and Credentials Flow to provide identity services to headless, off-platform apps. The Authorization Code and Credentials Flow is the foundation of headless login, headless registration, headless passwordless login, and headless guest identity.</p> <p>If set to <code>true</code>, the connected app can use the Authorization Code and Credentials Flow and all associated Headless Identity features. The default value is <code>false</code>.</p> <p>This field is available in API version 57.0 and later.</p>
<code>isCodeCredentialPostOnly</code>	boolean	<p>For the Authorization Code and Credentials Flow, determines whether the user's credentials must be sent in the body of the initial HTTPS POST request to the Salesforce authorization endpoint. Requiring the credentials in the POST body instead of in the header improves security.</p> <p>If set to <code>true</code>, the user's credentials must be included in the POST body. The default value is <code>false</code>.</p> <p>This field is available in API version 57.0 and later.</p>
<code>isConsumerSecretOptional</code>	boolean	<p>If set to <code>false</code> (default), the connected app's client secret is required in exchange for an access token in the OAuth 2.0 web server flow.</p> <p>If the client app can't keep the client secret confidential and it must use the web server flow, set to <code>true</code>. A client secret is still generated for the connected app, but this setting instructs the web server flow not to require the <code>client_secret</code> parameter in the access token request. We recommend the user agent flow as a more secure option</p>

Field Name	Field Type	Description
		than web server flow without the secret. Available in API version 49.0 and later.
<code>isIntrospectAllTokens</code>	boolean	<p>If set to <code>true</code>, authorizes the connected app to introspect all access and refresh tokens within the entire org.</p> <p>If set to <code>false</code> (default), the connected app can introspect its own tokens. In addition, an OAuth client that directly registers OAuth 2.0 connected apps through the dynamic client registration endpoint can check the tokens for itself and its registered apps. Available in API version 49.0 and later.</p>
<code>isNamedUserJwtEnabled</code>	boolean	<p>If set to <code>true</code>, the connected app is enabled to issue JSON Web Token (JWT)-based access tokens. For installed apps, JWT-based access tokens must also be enabled in your connected app policies.</p> <p>This field is generally available in API version 59.0 and later.</p>
<code>isPkceRequired</code>	boolean	<p>Determines whether the Proof Key for Code Exchange (PKCE) extension is required for variations of the OAuth 2.0 authorization code flow configured for the connected app, including the web server flow and Authorization Code and Credentials Flow. For public client apps that can't keep the consumer secret confidential, such as mobile apps, the PKCE extension helps ensure that the client that initiates an authorization flow is the same client that completes it. For this reason, we always recommend implementing PKCE for public clients. We also strongly recommend that you implement PKCE for private clients.</p> <p>If set to <code>true</code>, the PKCE extension is required and any authorization code flow variations that don't implement it fail. If set to <code>false</code>, you can still implement PKCE but it isn't required. The default value is <code>false</code>.</p> <p>This field is available in API version 59.0 and later.</p>
<code>isRefreshTokenRotatable</code>	boolean	<p>If set to <code>true</code>, the connected app issues a new refresh token each time the OAuth refresh token flow is invoked. The old refresh token is automatically invalidated. If a user tries to use a previous refresh token that's been invalidated, the current refresh token and its associated access tokens get deleted. If set to <code>false</code>, the refresh token can be used to obtain multiple access tokens.</p> <p>This field is available in API version 60.0 and later.</p>
<code>isSecretRequiredForRefreshToken</code>	boolean	<p>If set to <code>true</code> (default), the app's client secret is required in the authorization request of a refresh token and hybrid refresh token flow. If set to <code>false</code> and an app sends the client secret in the authorization request, Salesforce still validates it.</p> <p>Select this option for web-server based apps that can protect client secrets. For apps that can't protect client secrets, such as mobile apps</p>

Field Name	Field Type	Description
		or apps installed on a user's computer, we recommend against selecting this option. Available in API version 51.0 and later.
<code>isSecretRequiredForTokenExchange</code>	boolean	<p>If set to <code>true</code>, the connected app must include its consumer secret (<code>client_secret</code>) in the token request during the OAuth 2.0 token exchange flow. For security, set this field to <code>true</code> only if your app has a private client backend where it can keep the secret safe. For public client apps, such as single-page apps and mobile apps, set this field to <code>false</code> and don't include the consumer secret.</p> <p>This field is available in API version 60.0 and later.</p>
<code>isTokenExchangeEnabled</code>	boolean	<p>If set to <code>true</code>, the connected app can use the OAuth 2.0 token exchange flow to exchange tokens from an external identity provider for Salesforce tokens.</p> <p>This field is available in API version 60.0 and later.</p>
<code>oauthClientCredentialUser</code>	string	<p>The execution user for the OAuth 2.0 client credentials flow. Salesforce returns access tokens on behalf of this user. This user must have the API Only permission.</p> <p>To use this field, set <code>isClientCredentialEnabled</code> to <code>true</code> and specify a <code>consumerKey</code>.</p> <p>Available in API version 56.0 and later.</p>
<code>scopes</code>	ConnectedAppOauthAccessScope (enumeration of type string)[]	<p>The permissions given by the user running the connected app. When deploying metadata, valid values are:</p> <ul style="list-style-type: none"> <li><code>Basic</code>—Allows access to your identity URL service (the same behavior as deploying <code>Address</code>, <code>Email</code>, <code>Phone</code>, and <code>Profile</code>).</li> <li><code>Api</code>—Allows access to the logged-in user's account over the APIs.</li> <li><code>Web</code>—Allows use of the <code>access_token</code> on the web. This usage also includes <code>visualforce</code>, allowing access to Visualforce pages.</li> <li><code>Full</code>—Allows access to all data accessible by the logged-in user.</li> <li><code>Chatter</code>—Allows access to only the Connect REST API resources.</li> <li><code>CustomApplications</code>—Provides access to custom applications, such as those using Visualforce.</li> <li><code>RefreshToken</code>—Allows a refresh token to be returned if you're eligible to receive one (the same behavior as deploying <code>OfflineAccess</code>).</li> <li><code>OpenID</code>—Allows access to the logged-in user's unique identifier for OpenID Connect apps.</li> <li><code>Profile</code>—Allows access to the logged-in user's profile (the same behavior as deploying <code>Basic</code>).</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <b>Email</b>—Allows access to the logged-in user's email address (the same behavior as deploying <code>Basic</code>).</li> <li>• <b>Address</b>—Allows access to the logged-in user's street address (the same behavior as deploying <code>Basic</code>).</li> <li>• <b>Phone</b>—Allows access to the logged-in user's phone number value (the same behavior as deploying <code>Basic</code>).</li> <li>• <b>OfflineAccess</b>—Allows the app to interact with the user's data while the user is offline and get a refresh token (the same behavior as deploying <code>RefreshToken</code>).</li> <li>• <b>CustomPermissions</b>—Allows access to the custom permissions in an organization associated with the connected app and shows whether the current user has each permission enabled.</li> <li>• <b>Wave</b>—Allows access to the Analytics REST API resources. Available in API version 35.0 and later.</li> <li>• <b>Eclair</b>—Allows access to the Analytics REST API Charts Geodata resource. Available in API version 35.0 and later.</li> <li>• <b>Pardot</b>—Allows access to Pardot API services on behalf of the user. The full extent of accessible services is managed by the Pardot account. Available in API version 49.0 and later.</li> <li>• <b>Lightning</b>—Allows hybrid apps to directly obtain Lightning child sessions through the OAuth 2.0 hybrid app token flow and hybrid app refresh token flow. Available in API version 51.0 and later.</li> <li>• <b>Content</b>—Allows hybrid apps to directly obtain content child sessions through the OAuth 2.0 hybrid app token flow and hybrid app refresh token flow. Available in API version 51.0 and later.</li> <li>• <b>CDPIngest</b>—Allows access to Data Cloud ingest API services. Customers use these API services to upload and maintain external datasets in the Data Cloud. Available in API version 52.0 and later.</li> <li>• <b>Chatbot</b>—Allows access to Einstein Bot API services. Available in API version 54.0 and later.</li> <li>• <b>ForgotPassword</b>—Allows access to Headless Forgot Password API. Assign to an internal integration user to get an access token for authenticated requests to this API. Available in API version 57.0 and later.</li> <li>• <b>UserRegistration</b>—Allows access to Headless Registration API. Assign to an internal integration user to get an access token for authenticated requests to this API. Available in API version 58.0 and later.</li> <li>• <b>PwdlessLogin</b>—Allows access to Headless Passwordless Login API. Assign to an internal integration user to get an access token for authenticated requests to this API. Available in API version 59.0 and later.</li> </ul>

Field Name	Field Type	Description
		<p>When retrieving metadata, valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Api</code>—Allows access to the logged-in user's account over the APIs.</li> <li>• <code>Basic</code>—Allows access to the user's identity URL service, and includes <code>Address</code>, <code>Email</code>, <code>Phone</code>, and <code>Profile</code>.</li> <li>• <code>Chatter</code>—Allows access to only the Connect REST API resources.</li> <li>• <code>CustomApplications</code>—Allows access to custom applications, such as those using Visualforce.</li> <li>• <code>Full</code>—Allows access to all data accessible by the logged-in user.</li> <li>• <code>OpenID</code>—Allows access to the logged-in user's unique identifier for OpenID Connect apps.</li> <li>• <code>CDPIngest</code>—Allows access to Data Cloud ingest API services. Customers use these API services to upload and maintain external datasets in the Data Cloud. Available in API version 52.0 and later.</li> <li>• <code>Pardot</code>—Allows access to Pardot API services on behalf of the user. The full extent of accessible services is managed by the Pardot account. Available in API version 49.0 and later.</li> <li>• <code>Lightning</code>—Allows hybrid apps to directly obtain Lightning child sessions through the OAuth 2.0 hybrid app token flow and hybrid app refresh token flow. Available in API version 51.0 and later.</li> <li>• <code>Content</code>—Allows hybrid apps to directly obtain content child sessions through the OAuth 2.0 hybrid app token flow and hybrid app refresh token flow. Available in API version 51.0 and later.</li> <li>• <code>RefreshToken</code>—Allows a refresh token to be returned if you're eligible to receive one and is synonymous with allowing <code>OfflineAccess</code>.</li> <li>• <code>Wave</code>—Allows access to the Analytics REST API resources. Available in API version 35.0 and later.</li> <li>• <code>Eclair</code>—Allows access to the Analytics REST API Charts Geodata resource. Available in API version 35.0 and later.</li> <li>• <code>Web</code>—Allows usage of the <code>access_token</code> on the web. This usage also includes <code>visualforce</code>, allowing access to Visualforce pages.</li> <li>• <code>Chatbot</code>—Allows access to Einstein Bot API services. Available in API version 54.0 and later.</li> <li>• <code>ForgotPassword</code>—Allows access to Headless Forgot Password API. Assign to an internal integration user to get an access token for authenticated requests to this API. Available in API version 57.0 and later.</li> <li>• <code>UserRegistration</code>—Allows access to Headless Registration API. Assign to an internal integration user to get an access token for authenticated requests to this API. Available in API version 58.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li><code>PwdlessLogin</code>—Allows access to Headless Passwordless Login API. Assign to an internal integration user to get an access token for authenticated requests to this API. Available in API version 59.0 and later.</li> </ul>
<code>singleLogoutUrl</code>	string	The single logout endpoint. This URL is the endpoint where Salesforce sends a logout request when users log out of Salesforce.

## ConnectedAppOAuthAssetToken

Specifies an OAuth asset token configuration for the connected app OAuth settings. Available in API version 49.0 and later.

Field Name	Field Type	Description
<code>assetAudiences</code>	string	Required. The audience claim associated with the asset token payload. This claim identifies who the JWT is intended for. Value is an array of case-sensitive strings, each containing a <code>StringOrURI</code> value. An audience is specified for each intended consumer of the asset token.
<code>assetIncludeAttributes</code>	boolean	Required. If set to <code>true</code> (default), custom attributes associated with the connected app are included in the asset token payload. If set to <code>false</code> , these attributes aren't included.
<code>assetIncludeCustomPerms</code>	boolean	Required. If set to <code>true</code> (default), custom permissions associated with the connected app are included in the asset token payload. If set to <code>false</code> , these permissions aren't included.
<code>assetSigningCertId</code>	string	Required. The ID of the JWT certificate's signing secret. The certificate size can't exceed 4 KB. If it does, try using a DER encoded file to reduce the size.
<code>assetValidityPeriod</code>	int	Required. The asset token's validity period. The validity must be the expiration time of the assertion within 3 minutes, expressed as the number of seconds from 1970-01-01T0:0:0Z measured in UTC.

## ConnectedAppOAuthIdToken

Specifies the ID token configuration for the connected app OAuth settings. Available in API version 43.0 and later.

Field Name	Field Type	Description
<code>idTokenAudience</code>	string	The audiences that this ID token is intended for. The value is an array of case-sensitive strings. If no audiences are specified, the OAuth 2.0 <code>client_id</code> of the relying party is returned as the default audience. Otherwise, the other audiences are returned with the <code>client_id</code> in the <code>aud</code> value.
<code>idTokenIncludeAttributes</code>	boolean	Indicates whether attributes are included in the ID token.

Field Name	Field Type	Description
<code>idTokenIncludeCustomPerms</code>	boolean	Indicates whether custom permissions are included in the ID token.
<code>idTokenIncludeStandardClaims</code>	boolean	Indicates whether standard claims about the authentication event are included in the ID token.
<code>idTokenValidity</code>	int	The length of time that the ID token is valid for after it's issued. The value can be from 1 to 720 minutes. The default is 2 minutes.

## ConnectedAppOAuthPolicy

Specifies OAuth access policies for the connected app. Available in API version 49.0 and later.

Field Name	Field Type	Description
<code>ipRelaxation</code>	string	<p>Required. Specifies whether a user's access to the connected app is restricted by IP ranges. Valid options are:</p> <ul style="list-style-type: none"> <li>• <code>ENFORCE</code> (default)—Enforces the IP restrictions configured for the org, such as the IP ranges assigned to a user profile.</li> <li>• <code>BYPASS_2FACTOR</code>—Allows a user running the app to bypass the org's IP restrictions when either of these conditions is true. <ul style="list-style-type: none"> <li>– The app has a list of allowed IP ranges and is using the web server OAuth authorization flow. Requests coming from only these IPs are allowed.</li> <li>– The app doesn't have a list of allowed IP ranges, but it uses the web server authentication flow. And the user successfully completes identity verification if accessing Salesforce from a new browser or device.</li> </ul> </li> <li>• <code>BYPASS</code>—Allows a user to run this app without org IP restrictions.</li> <li>• <code>ENFORCE_RELAXREFRESH</code>—Enforces the IP restrictions configured for the org, such as the IP ranges assigned to a user profile. However, this option bypasses these restrictions when the connected app uses refresh tokens to get access tokens.</li> </ul>
<code>refreshTokenPolicy</code>	string	<p>Required. Specifies how long a refresh token is valid for.</p> <p>If refresh tokens are provided, users can continue to access the OAuth-enabled connected app without having to reauthorize when the access token expires, as defined by the session timeout value. The connected app exchanges the refresh token with an access token to start a new session. The Refresh Token policy is evaluated only during usage of the issued refresh token and doesn't affect a user's current session. Refresh tokens are required only when a user's session has expired or isn't available. For example, you set a refresh token policy to expire the token after 1 hour. If a user uses the app for 2 hours, the user isn't forced to reauthenticate after 1 hour. However, the user is</p>

Field Name	Field Type	Description
		<p>required to authenticate again when the session expires and the client attempts to exchange its refresh token for a new session.</p> <p>Valid options are:</p> <ul style="list-style-type: none"> <li><code>zero</code>—The refresh token is invalid immediately. The user can use the current session (access token) already issued, but can't obtain a new session when the access token expires.</li> <li><code>infinite</code>—The refresh token is used indefinitely, unless revoked by the user or Salesforce admin. Default setting.</li> <li><code>specific_lifetime: <b>number: HOURS, DAYS, MONTHS</b></code>—The refresh token is valid for a fixed amount of time. For example, if the policy states <code>specific_lifetime: 1: DAYS</code>, the user can obtain new sessions for only 24 hours.</li> <li><code>specific_inactivity: <b>number: HOURS, DAYS, MONTHS</b></code>—The refresh token is valid as long as it's been used within the specified amount of time. For example, if set to <code>specific_inactivity: 7: DAYS</code>, and the refresh token isn't exchanged for a new session within seven days, the next attempt to use the token fails. The expired token can't generate new sessions. If the refresh token is exchanged within seven days, the token is valid for another seven days. The monitoring period of inactivity also resets.</li> </ul>
<code>singleLogoutUrl</code>	string	If single logout is enabled, specify the single logout URL. Salesforce sends logout requests to this URL when users log out of Salesforce. The single logout URL must be an absolute URL starting with <code>https://</code> .

## ConnectedAppSamlConfig

Specifies how an app uses single sign-on.

Field Name	Field Type	Description
<code>acsUrl</code>	string	Required. The assertion consumer service URL from the service provider.
<code>certificate</code>	string	The PEM-encoded certificate string, if the app uses a certificate.
<code>encryptionCertificate</code>	string	The name of the certificate to use for encrypting SAML assertions to the service provider. This certificate is saved in the organization's Certificate and Key Management list. Available in API version 30.0 and later.
<code>encryptionType</code>	SamLEncryptionType (enumeration of type string)	When Salesforce is the identity provider, the SAML configuration can specify the encryption method used for encrypting SAML assertions to the service provider. The service provider detects the encryption method in the SAML assertion for decryption. Valid values are:

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li><code>AES_128</code>—128-bit key</li> <li><code>AES_256</code>—256-bit key</li> <li><code>Triple_Des</code>—Triple Data Encryption Algorithm</li> </ul> Available in API version 30.0 and later.
<code>entityUrl</code>	string	Required. The entity ID from your service provider.
<code>issuer</code>	string	A URI that sends the SAML response. A service provider can use this URI to determine which identity provider sent the response. Available in API version 29.0 and later.
<code>samlIdpSLOBindingEnum</code>	SamldpSLOBinding (enumeration of type string)	The SAML HTTP binding type from the service provider used for single logout. Available in API version 40.0 and later. Valid values are: <ul style="list-style-type: none"> <li><code>PostBinding</code></li> <li><code>RedirectBinding</code></li> </ul>
<code>samlNameIdFormat</code>	SamlnameldFormatType (enumeration of type string)	Indicates the format the service provider (SP) requires for the user's single sign-on identifier. Available in API version 29.0 and later. Valid values are: <ul style="list-style-type: none"> <li><code>Unspecified</code> (default)—No format given.</li> <li><code>EmailAddress</code>—Used if the subject type is the user's name or a federation ID (an ID internal to the SP).</li> <li><code>Persistent</code>—Used with the user ID and persistent ID subject types.</li> <li><code>Transient</code>—Used when the subject type is a custom attribute and can change every time the user logs in.</li> </ul>
<code>samlSigningAlgoType</code>	SamlsigningAlgoType (enumeration of type string)	Indicates the signing algorithm applied to SAML requests and responses when Salesforce is the identity provider. The selected signing algorithm is applied to both single sign-on and single logout responses from your org. Available in API version 50.0 and later. Valid values are: <ul style="list-style-type: none"> <li><code>SHA1</code></li> <li><code>SHA256</code></li> </ul>
<code>samlSloUrl</code>	string	The SAML single-logout endpoint of the connected app service provider (SP). This endpoint is where SAML LogoutRequests and LogoutResponses are sent when users log out of Salesforce. The SP provides this endpoint. Available in API version 40.0 and later.
<code>samlSubjectCustomAttr</code>	string	If the <code>samlSubjectType</code> is <code>CustomAttr</code> , include that custom value here; otherwise, leave empty. Available in API version 29.0 and later.
<code>samlSubjectType</code>	SamlsubjectType (enumeration of type string)	Required. The single sign-on identifier for the user. Valid values are: <ul style="list-style-type: none"> <li><code>Username</code>—The user's Salesforce name.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li><code>FederationId</code>—The user's identifier at the service provider. Get this value from the service provider.</li> <li><code>UserId</code>—The user's 15-character Salesforce identifier.</li> <li><code>PersistentID</code>—A persistent opaque identifier that is specific to the identity provider and a service provider.</li> <li><code>CustomAttr</code>—The identifier is taken from a custom field value in <code>samlSubjectCustomAttr</code>.</li> </ul>

## ConnectedAppSessionPolicy

Specifies the configuration options for a connected app's session policies. Use these policies to define how long a user's session can last before reauthenticating, to block user access to the connected app, or to require multi-factor authentication (MFA) to access the app. Available in API version 49.0 and later.

Field Name	Field Type	Description
<code>policyAction</code>	string	<p>If the High Assurance session security level is applied to the connected app, specify associated high assurance action. Valid values are:</p> <ul style="list-style-type: none"> <li><code>Block</code>—Makes the connected app inaccessible to your org's users. Blocking an app ends all current user sessions with the connected app and prevents all new sessions.</li> <li><code>RaiseSessionLevel</code>—Requires users to verify their identity with multi-factor authentication when they log in to the connected app. This setting applies to authorization flows that include a user approval step for API logins. These flows are the OAuth 2.0 refresh token flow, web server flow, and user-agent flow. All other flows, such as the JSON Web Token (JWT) bearer token flow, don't include a user approval step. For flows without a user approval step, API logins with the High Assurance session security level are blocked.</li> </ul>
<code>sessionLevel</code>	string	Applies the High Assurance session security level to the connected app. This session level requires users to verify their identity with multi-factor authentication when they log in to the connected app.
<code>sessionTimeout</code>	int	The length of time the connected app's session lasts. If you don't set a value, Salesforce uses the timeout value in the connected app user's profile. If the user's profile doesn't specify a timeout value, Salesforce uses the timeout value in the org's Session Settings.

## Declarative Metadata Sample Definition

The following is an example of a ConnectedApp component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ConnectedApp xmlns="http://soap.sforce.com/2006/04/metadata">
```

```

<attributes>
  <formula>$Api.Enterprise_Server_URL_100</formula>
  <key>test</key>
</attributes>
<attributes>

</ConnectedApp>

```

You can enter multiple callback URL values. At run time, Salesforce validates the callback URL specified by the app by matching it with one of the values. You must separate each callback URL with line breaks. To enter a new line programmatically, use the `\r` line break character.

Here's an example of a ConnectedApp component with multiple callback URLs.

```

<?xml version="1.0" encoding="UTF-8"?>
<ConnectedApp xmlns="http://soap.sforce.com/2006/04/metadata">
  <contactEmail>example@salesforce.com</contactEmail>
  <label>MyConnectedApp</label>
  <oauthConfig>
    <callbackUrl>https://example.com/callback1
https://example.com/callback2
https://example.com/callback3</callbackUrl>
    <consumerKey>3MVG9AOp4kbriZOcnmoLmTrguy9ryzcLbBjoNY...</consumerKey>
    <isAdminApproved>>false</isAdminApproved>
    <isConsumerSecretOptional>>false</isConsumerSecretOptional>
    <isIntrospectAllTokens>>false</isIntrospectAllTokens>
    <isSecretRequiredForRefreshToken>>true</isSecretRequiredForRefreshToken>
    <scopes>Full</scopes>
    <scopes>RefreshToken</scopes>
  </oauthConfig>
  <oauthPolicy>
    <ipRelaxation>ENFORCE</ipRelaxation>
    <refreshTokenPolicy>infinite</refreshTokenPolicy>
  </oauthPolicy>
</ConnectedApp>

```

The following is an example package manifest used to deploy or retrieve the ConnectedApp metadata for an organization.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>PortalTestApp</members>
    <name>ConnectedApp</name>
  </types>
  <version>29.0</version>
</Package>
```

## Usage

If you're constructing a SAML-enabled connected app using Metadata API, and must set the `IdP-Initiated Login URL` for your service provider, you have two options:

You can use the service provider app ID with the `app` parameter in the following format. This value is displayed in the Salesforce user interface. From Setup, enter *Connected Apps* in the Quick Find box, then select **Connected Apps**, then click the name of the connected app to see its detail page.

```
https://<Salesforce_base_URL>/idp/login?app=<app_id>
```

Or, if you're configuring the connected app using Metadata API only, you can use the `apiName` parameter of the service provider app in the following format. The `apiName` parameter is the `fullName` inherited from the Metadata type.

```
https://<Salesforce_base_URL>/idp/login?apiName=<fullName>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ContentAsset

---

Represents the metadata for creating an asset file. Asset files enable a Salesforce file to be used for org setup and configuration purposes. This type extends the `MetadataWithContent` metadata type and inherits its `content` and `fullName` fields.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

ContentAsset components have the suffix `.asset` and are stored in the `contentassets` folder.

## Version

ContentAsset components are available in API version 38.0 and later.

## Special Access Rules

The system prevents metadata retrieval if the total size of the asset's file content exceeds 30 MB. All pre-existing limits for packaging apply to asset files.

## Fields

Field Name	Field Type	Description
<code>format</code>	ContentAssetFormat (enumeration of type string)	Describes the format of the asset file. Valid values are: <ul style="list-style-type: none"> <li><code>original</code>—A single asset file version.</li> <li><code>zippedVersions</code>—Contains multiple versions of the asset file.</li> </ul>
<code>isVisibleByExternalUsers</code>	boolean	Indicates whether unauthenticated users can see the asset file ( <code>true</code> ) or not ( <code>false</code> ). If not specified, the default value is <code>false</code> . This field is available in API version 44.0 and later.
<code>language</code>	string	Required. The language of the asset file label.
<code>masterLabel</code>	string	Required. The label for the asset file record, which displays in Setup.
<code>originNetwork</code>	string	For deploys, the name of the Experience Cloud site the file is assigned upon creation. For retrievals, the name of the Experience Cloud site the file is assigned to appears in the field value. If <code>null</code> , the file wasn't assigned to an Experience Cloud site.
<code>relationships</code>	<a href="#">ContentAssetRelationships</a>	The list of ContentAssetLinks that describe whether the asset file can be shared with the org.
<code>versions</code>	<a href="#">ContentAssetVersions</a>	Required. Captures basic information about the file version included the asset metadata. Typically the file has only one version.

## ContentAssetRelationships

Represents the relationships between an asset file and the locations it's linked with.

Field Name	Field Type	Description
<code>emailTemplate</code>	ContentAsset[]	An array of email templates the content asset is related to. This field is available in API version 51.0 and later.
<code>insightsApplication</code>	ContentAsset[]	An array of the insights applications that use the content asset. This field is available in API version 39.0 and later.
<code>network</code>	ContentAsset[]	An array of networks that use the content asset. This field is available in API version 39.0 and later.
<code>organization</code>	ContentAsset[]	Stores information about sharing the asset file with the org. Maps to ContentDocumentLink. This field is available in API version 39.0 and later.

Field Name	Field Type	Description
<code>workspace</code>	<code>ContentAsset[]</code>	An array of workspaces and libraries that own or share the content asset. This field is available in API version 39.0 and later.

## ContentAssetLink

Represents a relationship link for an asset file, and includes details about the level of access for the link.

Field Name	Field Type	Description
<code>access</code>	<code>ContentAssetAccess</code> (enumeration of type string)	Required. The permission granted to the user of the shared file, determined by the permission the user already has. Valid values are: <ul style="list-style-type: none"> <li>VIEWER</li> <li>COLLABORATOR</li> <li>INFERRED</li> </ul>
<code>isManagingWorkspace</code>	boolean	Indicates whether the content asset resides in the workspace or not. When <code>true</code> , the content asset resides in the workspace. If not specified, the default value is <code>false</code> . This field is available in API version 39.0 and later.
<code>name</code>	string	Reserved for future use.

## ContentAssetVersions

Represents information about all file versions included in the asset metadata.

Field Name	Field Type	Description
<code>version</code>	<code>ContentAssetVersion[]</code>	A list of file versions for the asset.

## ContentAssetVersion

Represents information about one file version included in the asset metadata.

Field Name	Field Type	Description
<code>number</code>	string	Required. The version number. This field is based on, or sets, the <code>ContentVersion</code> .
<code>pathOnClient</code>	string	Required. Describes the original filename of the file. This field maps to <code>ContentVersion.PathOnClient</code> . It provides the data for the <code>ContentVersion</code> Title field.
<code>zipEntry</code>	string	If the asset file has more than one version, <code>format</code> is <code>ZipperedVersions</code> . In this case, <code>zipEntry</code> is the name of the file within the zip. If the asset file has only one version, this field is empty.

## Declarative Metadata Sample Definition

The following is an example of a ContentAsset component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ContentAsset xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>some asset</masterLabel>
  <relationships>
    <organization>
      <access>VIEWER</access>
    </organization>
  </relationships>
  <versions>
    <version>
      <number>1</number>
      <pathOnClient>some asset.txt</pathOnClient>
    </version>
  </versions>
</ContentAsset>
```

For assets that include just one version, the format field can be omitted or specified with the value as `Original`. File assets with more than one version have versions wrapped in a zip file.

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>MyAsset</members>
    <name>ContentAsset</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ContextDefinition

---

Represents the details of a context definition that describe the relationship between the node structures within a context.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

ContextDefinition components have the suffix `.contextDefinition` and are stored in the `contextDefinitions` folder.

## Version

ContextDefinition components are available in API version 59.0 and later.

## Special Access Rules

Enable Context Service to access the ContextDefinition metadata type.

## Fields

Field Name	Description
<code>clonedFrom</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the context definition that's used to clone the current context definition.</p>
<code>contextDefinitionVersions</code>	<p><b>Field Type</b> <a href="#">ContextDefinitionVersion[]</a></p> <p><b>Description</b> Version of the context definition.</p>
<code>contextTtl</code>	<p><b>Field Type</b> int</p> <p><b>Description</b> Duration to persist the data, which is loaded in the run-time context instances created by this context definition, in the cache.  The default value is 10 minutes.</p>
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Description of the context definition.</p>
<code>inheritedFrom</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the parent context definition that's used to derive the current context definition.</p>

Field Name	Description
<code>inheritedFromVersion</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Version number of the parent definition that's used to derive the current context definition.</p>
<code>isProtected</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Auto-generated value that doesn't impact the behavior of the metadata type.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. User-friendly name for the context definition, which is defined when the context definition is created.</p>
<code>title</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the context definition.</p>

## ContextDefinitionVersion

Represents details about the context definition version. Only one version can be active at a time.

Field Name	Description
<code>contextMappings</code>	<p><b>Field Type</b> <a href="#">ContextMapping[]</a></p> <p><b>Description</b> Mapping of attributes and nodes to related objects.</p>
<code>contextNodes</code>	<p><b>Field Type</b> <a href="#">ContextNode[]</a></p> <p><b>Description</b> Details of the structure of the nodes within the context.</p>

Field Name	Description
<code>endDate</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Date and time when the context definition version becomes inactive.</p>
<code>isActive</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the context definition version is active (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>startDate</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Date and time when the context definition version becomes active.</p>
<code>versionNumber</code>	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. Version number of the context definition.</p>

## ContextMapping

Represents the mapping of attributes and nodes to related objects.

Field Name	Description
<code>contextMappingIntents</code>	<p><b>Field Type</b> <a href="#">ContextMappingIntent[]</a></p> <p><b>Description</b> Purpose associated to a context mapping.</p>
<code>contextNodeMappings</code>	<p><b>Field Type</b> <a href="#">ContextNodeMapping[]</a></p> <p><b>Description</b> Mapping of the node in the context and values in the input schema.</p>
<code>default</code>	<p><b>Field Type</b> boolean</p>

Field Name	Description
	<p><b>Description</b></p> <p>Indicates whether the mapping for a context definition version is default (<code>true</code>) or not (<code>false</code>).</p> <p>The default value is <code>false</code>.</p>
<code>description</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Description of the context mapping.</p>
<code>inheritedFrom</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Name of the parent mapping that's used to derive the current mapping.</p>
<code>title</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Name of the context mapping.</p>

## ContextMappingIntent

Represents the purpose associated to a context mapping.

Field Name	Description
<code>mappingIntent</code>	<p><b>Field Type</b></p> <p>ContextMappingIntentType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>Specifies the purpose that's used to identify the type of context mapping required.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• Hydration</li> <li>• Association</li> <li>• Persistence</li> <li>• Translation</li> </ul>

## ContextNodeMapping

Represents the relationship between the node in the context and values in the input schema.

Field Name	Description
<code>contextAttributeMappings</code>	<p><b>Field Type</b> <a href="#">ContextAttributeMapping[]</a></p> <p><b>Description</b> Mapping of the attribute defined in the context and the values in the related objects.</p>
<code>contextNode</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Context node record associated with the context node mapping.</p>
<code>inheritedFrom</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the parent context node mapping that's used to derive the current context node mapping.</p>
<code>mappedContextDefinition</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> API name of the context definition for existing context-to-context mappings.</p>
<code>object</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the object used for the mapping.</p>

## ContextAttributeMapping

Represents the relationship between the attributes defined in the context and the values in the related objects.

Field Name	Description
<code>contextAttrHydrationDetails</code>	<p><b>Field Type</b> <a href="#">ContextAttrHydrationDetail[]</a></p> <p><b>Description</b> Details of the SOQL (database) queries that fetch data for a chosen attribute from the input schema.</p>

Field Name	Description
contextAttribute	<p><b>Field Type</b> string</p> <p><b>Description</b> Context attribute record associated with the context attribute mapping.</p>
contextInputAttributeName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the input attribute.</p>
ctxAttrHydrationCtxs	<p><b>Field Type</b> <a href="#">CtxAttrHydrationCtx[]</a></p> <p><b>Description</b> Query that fetches data for a chosen attribute from the input schema for context-to-context mapping.</p>
inheritedFrom	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the parent context attribute mapping that's used to derive the current context attribute mapping.</p>

## ContextAttrHydrationDetail

Represents the SOQL (database) queries that fetch data for a chosen attribute from the input schema.

Field Name	Description
contextAttrHydrationDetails	<p><b>Field Type</b> <a href="#">ContextAttrHydrationDetail[]</a></p> <p><b>Description</b> Details of the query that fetches the data for the specific query attribute.</p>
inheritedFrom	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the parent context attribute hydration detail that's used to derive the current context attribute hydration detail.</p>
objectName	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>Name of the object used for the attribute hydration detail.</p>
queryAttribute	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The SOQL query that is the source of the hydration.</p>

## CtxAttrHydrationCtx

Represents the queries that fetch data for a chosen attribute from the input schema for context-to-context mapping.

Field Name	Description
contextQueryAttribute	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Attribute in context definition that's the source of context hydration.</p>
inheritedFrom	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Name of the parent context attribute hydration detail that's used to derive the current context attribute.</p>

## ContextNodeAttrDictionary

Represents the relationship between a context node and the context attribute dictionary.

Field Name	Description
contextAttrDictIdentifier	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Developer name of the context attribute dictionary.</p>

Field Name	Description
<code>contextNodeTagPrefix</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Tag prefix of the context node that's used to create the unique identifier of the parent context node.</p>

## ContextNode

Represents details of the structure of the nodes within the context. Each node can have other nodes related to them and attributes to describe the object. You can also define a hierarchy for the nodes.

Field Name	Description
<code>canonicalNode</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Canonical node that's associated with the context node.</p>
<code>contextAttributes</code>	<p><b>Field Type</b> <a href="#">ContextAttribute[]</a></p> <p><b>Description</b> Details of the attribute used to describe the context node.</p>
<code>contextNodeAttrDictionaries</code>	<p><b>Field Type</b> <a href="#">ContextNodeAttrDictionary[]</a></p> <p><b>Description</b> Facilitates relationships between context node mapping and context dictionary. Additionally, it records the relationship between context node and context dictionary.</p>
<code>contextTags</code>	<p><b>Field Type</b> <a href="#">ContextTag[]</a></p> <p><b>Description</b> Unique identifier of the attribute or node.</p>
<code>displayName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Display name of the context node.</p>
<code>inheritedFrom</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b> Name of the parent context node that's used to derive the current context node.</p>
title	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the context node.</p>
transposable	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the data in the Context Node record can be converted to field names (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>

## ContextAttribute

Represents details of an attribute used to describe a context node. Each node can have one or many associated attributes.

Field Name	Description
contextTags	<p><b>Field Type</b> <a href="#">ContextTag[]</a></p> <p><b>Description</b> Shortened name of the attribute or node.</p>
dataType	<p><b>Field Type</b> ContextAttributeDataType (enumeration of type string)</p> <p><b>Description</b> Required. Type of data that's stored in the context attribute. Valid values are:</p> <ul style="list-style-type: none"> <li>• boolean</li> <li>• currency</li> <li>• date</li> <li>• datetime</li> <li>• number</li> <li>• percent</li> <li>• picklist</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• reference</li> <li>• string</li> </ul>
domainSet	<p><b>Field Type</b> string</p> <p><b>Description</b> List of node references to show the parent-child relationship between the nodes in a definition.</p>
fieldType	<p><b>Field Type</b> ContextAttributeFieldType (enumeration of type string)</p> <p><b>Description</b> Required. List of node references to depict the parent-child relation between the nodes in a definition. Valid values are:</p> <ul style="list-style-type: none"> <li>• aggregate</li> <li>• input</li> <li>• inputoutput</li> <li>• output</li> </ul>
inheritedFrom	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the parent attribute that's used to derive the current attribute.</p>
key	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the attribute is a key attribute in the node (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
title	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the context attribute.</p>
value	<p><b>Field Type</b> boolean</p>

Field Name	Description
	<p><b>Description</b></p> <p>Indicates whether the attribute identifies as a value in a node (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>

## ContextTag

Represents a unique identifier of an attribute or node instead of a fully qualified tag structure name.

Field Name	Description
<code>title</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Name of the context tag.</p>
<code>inheritedFrom</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Name of the parent context tag that's used to derive the current context tag.</p>

## Declarative Metadata Sample Definition

The following is an example of a ContextDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ContextDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>Test</fullName>
  <contextDefinitionVersions>
    <contextMappings>
      <contextNodeMappings>
        <contextNodeAttrDictionaries>
          <contextAttrDictIdentifier>Context Attribute Dictionary
Name</contextAttrDictIdentifier>
          <contextNodeTagPrefix>Context Node Tag Prefix</contextNodeTagPrefix>
        </contextNodeAttrDictionaries>
        <contextAttributeMappings>
          <contextAttrHydrationDetails>
            <objectName>CustomAccount__c</objectName>
            <queryAttribute>Name</queryAttribute>
          </contextAttrHydrationDetails>
        </contextAttributeMappings>
      </contextNodeMappings>
    </contextMappings>
  </contextDefinitionVersions>
  <inheritedFrom>StandardDefinition/version/CustomAccountMapping/Praneeth/AccountName/hydrationInfo-1</inheritedFrom>
</ContextDefinition>
```

```

```

The following is an example `package.xml` that references the previous definition.

```

<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Test</members>
    <name>ContextDefinition</name>
  </types>
  <types>
    <members>Account.CustomAccountName__c</members>
    <name>CustomField</name>
  </types>
  <types>
    <members>CustomAccount__c</members>
    <name>CustomObject</name>
  </types>
  <version>60.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ConversationMessageDefinition

---

Represents a messaging component in an Enhanced Messaging channel or Messaging for In-App and Web session.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`ConversationMessageDefinition` components have the suffix `.conversationMessageDefinition` and are stored in the `conversationMessageDefinitions` folder.

## Version

`ConversationMessageDefinition` is supported for use in enhanced Messaging channels and Messaging for In-App and Web, and is available in API version 59.0 and later.

## Fields

Field Name	Description
<code>constants</code>	<p><b>Field Type</b> <a href="#">ConversationMessageConstant[]</a></p> <p><b>Description</b> An array of constants that defines the messaging components. Constants support multiple data types, including text, URL, and image.</p>
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of the conversation message definition.</p>
<code>label</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> A user-friendly name for <code>ConversationMessageDefinition</code>, which is defined when <code>ConversationMessageDefinition</code> is created.</p>
<code>language</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The language of the conversation message definition.</p>
<code>messageHandlers</code>	<p><b>Field Type</b> <a href="#">ConversationMessageHandler[]</a></p> <p><b>Description</b> An array of message handlers.</p>
<code>messageLayouts</code>	<p><b>Field Type</b> <a href="#">ConversationMessageLayout[]</a></p> <p><b>Description</b> An array of message layouts.</p>
<code>optionsParameter</code>	<p><b>Field Type</b> <a href="#">ConversationMessageOptionsParameter[]</a></p>

Field Name	Description
	<p><b>Description</b></p> <p>An array of options parameter of the <code>ConversationMessageDefinition</code>.</p>
parameters	<p><b>Field Type</b></p> <p><code>ConversationMessageParameter[]</code></p> <p><b>Description</b></p> <p>An array of parameters.</p>
type	<p><b>Field Type</b></p> <p><code>ConversationMessageDefinitionType</code> (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. The type of the conversation message definition. Valid values are:</p> <ul style="list-style-type: none"> <li>• Action</li> <li>• AuthenticationRequest</li> <li>• AutoResponse</li> <li>• Link</li> <li>• Notification</li> <li>• PaymentRequest</li> <li>• Picklist</li> <li>• RecordPicker</li> <li>• RecordView</li> <li>• TimePicker</li> </ul>

## ConversationMessageConstant

Represents a constant value on the messaging component. When a messaging component is created in the UI, the text and images entered during creation are saved as standard constants. Custom constants can also be added.

Field Name	Description
compositeValues	<p><b>Field Type</b></p> <p><code>ConversationMessageConstantCompositeValue[]</code></p> <p><b>Description</b></p> <p>An array of composite values of <code>ConversationMessageConstant</code>.</p>
constantType	<p><b>Field Type</b></p> <p><code>ConversationMessageConstantType</code> (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. The conversation message constant type. Valid values are:</p> <ul style="list-style-type: none"> <li>• Custom</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• Image</li> <li>• Options</li> <li>• SubTitle</li> <li>• Title</li> <li>• Url</li> </ul>
label	<p><b>Field Type</b> string</p> <p><b>Description</b> The UI label of the conversation message constant.</p>
name	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the conversation message constant.</p>
primitiveValues	<p><b>Field Type</b> <a href="#">ConversationMessageConstantPrimitiveValue</a> (enumeration of type string)</p> <p><b>Description</b> An array of primitive values of <a href="#">ConversationMessageConstant</a>.</p>
valueType	<p><b>Field Type</b> <a href="#">ConversationMessageValueType</a> (enumeration of type string)</p> <p><b>Description</b> The type of the conversation message constant value. Valid values are:</p> <ul style="list-style-type: none"> <li>• Boolean</li> <li>• Date</li> <li>• DateTime</li> <li>• Double</li> <li>• ImageId</li> <li>• Integer</li> <li>• RecordId</li> <li>• Text</li> <li>• Url</li> </ul>

## ConversationMessageConstantCompositeValue

Represents the composite values of the [ConversationMessageConstant](#).

Field Name	Description
<code>constantItems</code>	<p><b>Field Type</b> <a href="#">ConversationMessageConstant</a>[]</p> <p><b>Description</b> An array of constant items.</p>
<code>identifier</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The client identifier.</p>

## ConversationMessageConstantPrimitiveValue

Represents the primitive values of the [ConversationMessageConstant](#).

Field Name	Description
<code>contentAssetName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Represents the value for type = ImageAsset</p>
<code>textValue</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Represents the value for type = Text</p>
<code>type</code>	<p><b>Field Type</b> ConversationMessageConstantValueType (enumeration of type string)</p> <p><b>Description</b> Required. The type of the conversation message constant primitive value. Valid values are:</p> <ul style="list-style-type: none"> <li>• ImageAsset</li> <li>• Text</li> <li>• Url</li> </ul>
<code>urlValue</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Represents the value for type = Url</p>

## ConversationMessageHandler

Represents the conversation message handler.

Field Name	Description
activeRequestDurationMinutes	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. The duration of an active request in minutes.</p>
handlerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the message handler.</p>
handlerType	<p><b>Field Type</b> ConversationMessageHandlerType (enumeration of type string)</p> <p><b>Description</b> Required. The type of message handler. Valid values are:</p> <ul style="list-style-type: none"> <li>• AuthProvider</li> <li>• PaymentProvider</li> <li>• QuickAction</li> </ul>

## ConversationMessageLayout

Represents the conversation message layout.

Field Name	Description
externalTemplates	<p><b>Field Type</b> <a href="#">ConvMsgExternalTemplateVersion</a>[]</p> <p><b>Description</b> The external template version of the ConversationMessageLayout.</p>
formatType	<p><b>Field Type</b> ConversationMessageFormatType (enumeration of type string)</p> <p><b>Description</b> Required. The format type of the conversation message layout. Valid values are:</p> <ul style="list-style-type: none"> <li>• Application</li> <li>• Buttons</li> <li>• Carousel</li> <li>• EncryptedOAuthToken</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• ExternalTemplate</li> <li>• Inputs</li> <li>• ListPicker</li> <li>• Media</li> <li>• Payment</li> <li>• QuickReplies</li> <li>• RichLink</li> <li>• Text</li> <li>• TimePicker</li> <li>• WebView</li> </ul>
layoutItems	<p><b>Field Type</b> ConversationMessageLayoutItem[]</p> <p><b>Description</b> An array of layout items.</p>
messageType	<p><b>Field Type</b> ConversationMessageType (enumeration of type string)</p> <p><b>Description</b> Required. The conversation message type. Valid values are:</p> <ul style="list-style-type: none"> <li>• AuthenticationRequest</li> <li>• Choices</li> <li>• Form</li> <li>• PaymentRequest</li> <li>• StaticContent</li> </ul>

## ConvMsgExternalTemplateVersion

Represents the external template version of the conversation message layout.

Field Name	Description
accountIdentifier	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The account identifier. For WhatsApp channels, this is the WABA ID.</p>
accountName	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b> Required. The account name.</p>
language	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The language of the conversation message external template.</p>
status	<p><b>Field Type</b> ConvMsgExternalTemplateVersionStatus (enumeration of type string)</p> <p><b>Description</b> Required. The status of the conversation message external template. Valid values are:</p> <ul style="list-style-type: none"> <li>• Approved</li> <li>• Disabled</li> <li>• InAppeal</li> <li>• Paused</li> <li>• Pending</li> <li>• Rejected</li> </ul>
templateName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the conversation message external template.</p>
templateVersionIdentifier	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The template version identifier.</p>

## ConversationMessageLayoutItem

Represents the conversation message layout item.

Field Name	Description
collectionType	<p><b>Field Type</b> ConversationMessageCollectionType (enumeration of type string)</p> <p><b>Description</b> Required. The type of conversation message collection. Valid values are:</p> <ul style="list-style-type: none"> <li>• DynamicList</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• None</li> <li>• StaticList</li> </ul>
compositeValues	<p><b>Field Type</b>  <a href="#">ConversationMessageLayoutCompositeValue[]</a></p> <p><b>Description</b>            An array of composite values of the <a href="#">ConversationMessageLayoutItem</a>.</p>
name	<p><b>Field Type</b>            string</p> <p><b>Description</b>            The name of the conversation message layout item.</p>
primitiveValues	<p><b>Field Type</b>  <a href="#">ConversationMessageLayoutPrimitiveValue[]</a></p> <p><b>Description</b>            An array of primitive values of the <a href="#">ConversationMessageLayoutItem</a>.</p>

## ConversationMessageLayoutCompositeValue

Represents the composite value of the [ConversationMessageLayoutItem](#).

Field Name	Description
compositeTypeName	<p><b>Field Type</b>            string</p> <p><b>Description</b>            Required. The name of the conversation message layout composite value type.</p>
layoutItems	<p><b>Field Type</b>  <a href="#">ConversationMessageLayoutItem[]</a></p> <p><b>Description</b>            An array of layout items.</p>
valueSourceReference	<p><b>Field Type</b>            string</p> <p><b>Description</b>            The source of the conversation message layout composite value.</p>

## ConversationMessageLayoutPrimitiveValue

Represents the primitive value of the [ConversationMessageLayoutItem](#).

Field Name	Description
contentAssetName	<p><b>Field Type</b> string</p> <p><b>Description</b> The content asset name.</p>
fieldName	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the conversation message layout primitive value field.</p>
formulaTemplate	<p><b>Field Type</b> string</p> <p><b>Description</b> The formula template defines the content for each entry in the list.</p>
literalValue	<p><b>Field Type</b> string</p> <p><b>Description</b> The literal primitive value of the conversation message layout.</p>
mergeFields	<p><b>Field Type</b> <a href="#">ConversationMessageMergeField[]</a></p> <p><b>Description</b> Inserts multiple values to a list.</p>
type	<p><b>Field Type</b> ConversationMessageLayoutValueType (enumeration of type string)</p> <p><b>Description</b> Required. The type of the conversation message layout primitive value. Valid values are:</p> <ul style="list-style-type: none"> <li>• FormulaTemplate</li> <li>• Literal</li> <li>• MediaAsset</li> <li>• SourcePrimitiveValue</li> <li>• SourceSubjectField</li> <li>• SourceSubjectFieldValue</li> <li>• SourceSubjectFormula</li> </ul>

Field Name	Description
valueFormula	<p><b>Field Type</b> string</p> <p><b>Description</b> The formula of the conversation message layout primitive value.</p>
valueSourceReference	<p><b>Field Type</b> string</p> <p><b>Description</b> The source of the conversation message layout primitive value.</p>

## ConversationMessageMergeField

Merge field is used to insert multiple values to a list.

Field Name	Description
formulaTemplate	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The formula template of the conversation message merge field.</p>
mergeFieldType	<p><b>Field Type</b> ConversationMessageMergeFieldType (enumeration of type string)</p> <p><b>Description</b> Required. The type of the conversation message merge field. Valid value is ListTemplate.</p>
name	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the conversation message merge field.</p>
valueSourceReference	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The source of the conversation message merge field value.</p>

## ConversationMessageOptionsParameter

Represents a conversation message options parameter.

Field Name	Description
<code>compositeTypeDetails</code>	<p><b>Field Type</b>  <a href="#">ConversationMessageParameterCompositeDetails[]</a></p> <p><b>Description</b>            An array of composite details of <code>ConversationMessageOptionsParameter</code>.</p>
<code>optionsParameterType</code>	<p><b>Field Type</b>  <code>ConversationMessageOptionsParameterType</code> (enumeration of type string)</p> <p><b>Description</b>            Required. The type of conversation message options parameter. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>CustomCompositeOptions</code></li> <li>• <code>CustomPrimitiveOptions</code></li> <li>• <code>RecordIdOptions</code></li> <li>• <code>TimeSlotOptions</code></li> </ul>
<code>primitiveTypeDetails</code>	<p><b>Field Type</b>  <code>ConversationMessageParameterPrimitiveDetails</code></p> <p><b>Description</b>            The primitive type details of conversation message options parameter.</p>

## ConversationMessageParameterCompositeDetails

Represents the composite details of a conversation message parameter.

Field Name	Description
<code>compositeChildItems</code>	<p><b>Field Type</b>  <code>ConversationMessageParameterCompositeDetails[]</code></p> <p><b>Description</b>            The composite child items of the conversation message parameter.</p>
<code>isList</code>	<p><b>Field Type</b>  <code>boolean</code></p> <p><b>Description</b>            Indicates whether the conversation message parameter composite details field is a list item (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>isRequired</code>	<p><b>Field Type</b>  <code>boolean</code></p> <p><b>Description</b>            Indicates whether the conversation message parameter is required (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>

Field Name	Description
label	<p><b>Field Type</b> string</p> <p><b>Description</b> The UI label of the conversation message parameter composite details field.</p>
maxListItems	<p><b>Field Type</b> int</p> <p><b>Description</b> The maximum number of list items in the conversation message parameter composite details field.</p>
name	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the conversation message parameter composite details field.</p>
primitiveChildItems	<p><b>Field Type</b> <a href="#">ConversationMessageParameterPrimitiveDetails[]</a></p> <p><b>Description</b> An array of primitive child items.</p>

## ConversationMessageParameterPrimitiveDetails

Represents the primitive details of the conversation message parameter.

Field Name	Description
isList	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the conversation message parameter primitive details field is a list item (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
isRequired	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the conversation message parameter primitive details field is required (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
label	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>The UI label of the conversation message parameter primitive details field.</p>
maxListItems	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>The maximum number of list items that are allowed in the conversation message parameter primitive details field.</p>
name	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The name of the conversation message parameter primitive details field.</p>
subjectType	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The sObject type.</p>
valueType	<p><b>Field Type</b></p> <p>ConversationMessageValueType (enumeration of type string)</p> <p><b>Description</b></p> <p>The type of the conversation message parameter value. Valid values are:</p> <ul style="list-style-type: none"> <li>• Boolean</li> <li>• Date</li> <li>• DateTime</li> <li>• Double</li> <li>• ImageId</li> <li>• Integer</li> <li>• RecordId</li> <li>• Text</li> <li>• Url</li> </ul>

## ConversationMessageParameter

Represents a conversation message parameter.

Field Name	Description
compositeTypeDetails	<p><b>Field Type</b></p> <p><a href="#">ConversationMessageParameterCompositeDetails</a></p>

Field Name	Description
	<p><b>Description</b></p> <p>An array of composite type details.</p>
parameterType	<p><b>Field Type</b></p> <p>ConversationMessageParameterType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. The type of conversation message parameter. Valid values are:</p> <ul style="list-style-type: none"> <li>• CustomComposite</li> <li>• CustomPrimitive</li> <li>• RecordIds</li> </ul>
primitiveTypeDetails	<p><b>Field Type</b></p> <p><a href="#">ConversationMessageParameterPrimitiveDetails</a></p> <p><b>Description</b></p> <p>An array of primitive type details.</p>

## Declarative Metadata Sample Definition

The following is an example of a ConversationMessageDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ConversationMessageDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <constants>

The following is an example package.xml that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>Favourite_Month</members>
        <name>ConversationMessageDefinition</name>
    </types>
    <version>61.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ConversationVendorInfo

---

Represents the connection between the partner vendor system and the Service Cloud feature. For example, for Service Cloud Voice, this type contains information about the partner telephony system or Contact Center as a Service (CCaaS) system. For Bring Your Own Channel or Bring Your Own Channel for CCaaS, this type contains information about the partner messaging system or CCaaS system.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

ConversationVendorInfo components have the suffix `.ConversationVendorInformation` and are stored in the `ConversationVendorInformation` folder.

### Version

ConversationVendorInfo components are available in API version 52.0 and later.

### Special Access Rules

This type requires an add-on license for Service Cloud Voice for Partner Telephony or Digital Engagement.

### Fields

The fields in the ConversationVendorInfo type apply to all Service Cloud features unless otherwise stated in the field description. For example, if a field applies to just one Service Cloud Voice telephony model setup or is applied differently by different partner systems, this is stated in the field description.

Field Name	Description
<code>agentSSOSupported</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If set to <code>true</code>, agents can single sign-on (SSO) into their contact center using Salesforce as the identity provider (IdP). Behind the scenes, Salesforce is used as the SAML IdP in the Single Sign-On connected app for the contact center. If set to <code>false</code>, an IdP other than Salesforce is used or an IdP isn't used at all. The default value is <code>false</code>.</p>

Field Name	Description
	<p>If this value is set to <code>false</code> and you want to use Salesforce as the IdP for your contact center, set this value and the <code>namedCredentialSupported</code> value to <code>true</code> and configure the <code>service_cloud_voice.PartnerSSO</code> interface in your Apex integration class.</p> <p>Available in API version 53.0 and later.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> <li>• Bring Your Own Channel for CCaaS</li> </ul>
<code>awsAccountKey</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The 12-digit AWS subaccount ID that's automatically provisioned for you when Service Cloud Voice was turned on. Available in API version 55.0 and later.</p> <p>Applies to the following implementation:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Amazon Connect</li> </ul>
<code>awsRootEmail</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The email address used by Salesforce to create the root user for the provisioned AWS subaccount when Service Cloud Voice was turned on. Available in API version 55.0 and later.</p> <p>Applies to the following implementation:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Amazon Connect</li> </ul>
<code>awsTenantVersion</code>	<p><b>Field Type</b> double</p> <p><b>Description</b> The version number of the <code>SVCTenantStack</code> AWS CloudFormation stack that's deployed. The stack is deployed in AWS region "us-east-1". Available in API version 55.0 and later.</p> <p>Applies to the following implementation:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Amazon Connect</li> </ul>
<code>bridgeComponent</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The Lightning component used to communicate between the telephony or messaging system and other Lightning components.</p> <p>Applies to the following implementations:</p>

Field Name	Description
	<ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> <li>• Bring Your Own Channel for CCaaS</li> </ul>
clientAuthMode	<p><b>Field Type</b> ClientAuthMode (enumeration of type string)</p> <p><b>Description</b> The client authentication mode.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• Custom</li> <li>• Mixed</li> <li>• SSO</li> </ul> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> </ul>
connectorUrl	<p><b>Field Type</b> string</p> <p><b>Description</b> The URL that hosts your Service Cloud Voice or Bring Your Own Channel for CCaaS connector. This value could be a Visualforce page or a public URL.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> <li>• Bring Your Own Channel for CCaaS</li> </ul>
customConfig	<p><b>Field Type</b> string</p> <p><b>Description</b> The foreign key to the CustomEntityDefinition, which contains partner-specific custom settings. Available in API version 53.0 and later.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> <li>• Bring Your Own Channel for CCaaS</li> </ul>
customIcon	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>ID of the static resource used to identify the contact center integration, such as a Contact Center as a Service (CCaaS) provider logo. The static resource must be in SVG format. This field is optional. Available in API version 62.0 and later.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Bring Your Own Channel for CCaaS</li> </ul>
customLoginUrl	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The URL that hosts your telephony system or CCaaS system login page.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> <li>• Bring Your Own Channel for CCaaS</li> </ul>
developerName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The unique name of the type in the API.</p>
einsteinConversationInsightsSupported	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>If set to <code>true</code>, Einstein Conversation Insights is turned on. The default value is <code>false</code>. Available in API version 53.0 and later.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> </ul>
integrationClass	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The foreign key to the partner Apex class implementing supported interfaces. Available in API version 53.0 and later.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> <li>• Bring Your Own Channel for CCaaS</li> </ul>

Field Name	Description
<code>integrationClassName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Deprecated in API version 53.0. Don't set this field. Instead, use <code>integrationClass</code>.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> </ul>
<code>intelligenceSupported</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If set to <code>true</code>, Salesforce ingests real-time signals sent from a partner telephony system. If set to <code>false</code>, Salesforce won't ingest real-time intelligence signals from a partner telephony system. The default value is <code>false</code>. Available in API version 59.0 and later.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> </ul>
<code>isTaxCompliant</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Amazon tax settings for the AWS subaccount provisioned for Service Cloud Voice have been confirmed (<code>true</code>). The default value is <code>false</code>. Available in API version 55.0 and later.</p> <p>Applies to the following implementation:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Amazon Connect</li> </ul>
<code>keyProvisioningSupported</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If set to <code>true</code>, key provisioning and renewal are automated. The default value is <code>false</code>. Available in API version 54.0 and later.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> </ul>
<code>masterLabel</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>The partner vendor's display name as it appears in the UI. This name appears in several places in the UI, so include the partner vendor name for easy identification. For Service Cloud Voice, this label also represents the telephony provider name in the contact center record.</p> <p>For Service Cloud Voice with Amazon Connect, this field is always set to <code>Service Cloud Voice</code>.</p>
<code>namedCredential</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>A sample-named credential that can be used for Apex callouts to the partner system. Available in API version 53.0 and later.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> <li>• Bring Your Own Channel for CCaaS</li> </ul>
<code>namedCredentialSupported</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>A sample-named credential that can be used for Apex callouts to the partner system. Available in API version 53.0 and later.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> <li>• Bring Your Own Channel for CCaaS</li> </ul>
<code>partnerContactCenterListSupported</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>If set to <code>true</code>, enables the customer to select one contact center from a list of multiple contact centers to connect with Salesforce. The default value is <code>false</code>. Available in API version 53.0 and later.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> <li>• Bring Your Own Channel for CCaaS</li> </ul>
<code>partnerPhoneNumbersSupported</code>	<p><b>Field Type</b></p> <p>boolean</p>

Field Name	Description
	<p><b>Description</b></p> <p>If set to <code>true</code>, displays a list of phone numbers used to create contact center channels. The default value is <code>false</code>. Available in API version 54.0 and later.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> </ul>
<code>partnerTransferDestinationsSupported</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>If set to <code>true</code>, allows Salesforce to fetch contact center queues so that Salesforce and contact center queues can be mapped. The default value is <code>false</code>. Available in API version 53.0 and later.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> <li>• Bring Your Own Channel for CCaaS</li> </ul>
<code>queueManagementSupported</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>If set to <code>true</code>, support queue management. The default value is <code>false</code>. Available in API version 56.0 and later.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> <li>• Bring Your Own Channel for CCaaS</li> </ul>
<code>serverAuthMode</code>	<p><b>Field Type</b></p> <p>ServerAuthMode (enumeration of type string)</p> <p><b>Description</b></p> <p>Deprecated in API 53.0. Server authentication mode. Set this value to <code>None</code>.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• <code>None</code></li> <li>• <code>OAuth</code></li> </ul> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> </ul>

Field Name	Description
telephonySettingsComponent	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the Lightning Web Component (LWC) that is used to display additional agent settings in the Omni-Channel widget. This value is in the format <code>mynamespace:componentName</code>, where <code>mynamespace</code> is the namespace associated with the Service Cloud Voice package that was created, and <code>componentName</code> is the FQDN of the Lightning component.</p> <p>Available in API version 54.0 and later.</p> <p>Applies to the following implementation:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> </ul>
universalCallRecordingAccessSupported	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If set to <code>true</code>, Universal Call Recording Access is turned on. The default value is <code>false</code>.</p> <p>If this value is set to <code>false</code> and you want to turn on Universal Call Recording, set this value to <code>true</code> and configure the <code>service_cloud_voice.RecordingMediaProvider</code> interface in your Apex integration class.</p> <p>Available in API version 54.0 and later.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> </ul>
userSyncingSupported	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If set to <code>true</code>, supports automated user syncing whenever a user is added to or removed from a contact center. The default value is <code>false</code>. Available in API version 53.0 and later.</p> <p>Applies to the following implementations:</p> <ul style="list-style-type: none"> <li>• Service Cloud Voice with Partner Telephony</li> <li>• Service Cloud Voice with Partner Telephony from Amazon Connect</li> <li>• Bring Your Own Channel for CCaaS</li> </ul>
vendorType	<p><b>Field Type</b> ConversationVendorType (enumeration of type string)</p> <p><b>Description</b> The Service Cloud feature the partner vendor supports.</p> <p>Possible values are:</p>

Field Name	Description
	<ul style="list-style-type: none"> <li>• <code>Amazon_Connect</code> — For Service Cloud Voice with Amazon Connect.</li> <li>• <code>BringYourOwnChannelPartner</code> — For Bring Your Own Channel. Available in API version 60.0 and later.</li> <li>• <code>BringYourOwnContactCenter</code> — For Bring Your Own Channel for Contact Center as a Service (CCaaS). Available in API version 60.0 and later.</li> <li>• <code>ServiceCloudVoicePartner</code> — For Service Cloud Voice with Partner Telephony or Service Cloud Voice with Partner Telephony from Amazon Connect. Available in API version 53.0 and later.</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a `ConversationVendorInfo` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ConversationVendorInfo xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <einsteinConversationInsightsSupported>true</einsteinConversationInsightsSupported>
  <partnerContactCenterListSupported>true</partnerContactCenterListSupported>
  <namedCredentialSupported>true</namedCredentialSupported>
  <partnerTransferDestinationsSupported>true</partnerTransferDestinationsSupported>
  <agentSSOSupported>true</agentSSOSupported>
  <keyProvisioningSupported>true</keyProvisioningSupported>
  <universalCallRecordingAccessSupported>true</universalCallRecordingAccessSupported>
  <partnerPhoneNumbersSupported>true</partnerPhoneNumbersSupported>
  <queueManagementSupported>true</queueManagementSupported>
  <clientAuthMode>SSO</clientAuthMode>
  <connectorUrl>https://exampleconnectorurl.com</connectorUrl>
  <customConfig>exampleCustomConfig__c</customConfig>
  <customLoginUrl>testurl</customLoginUrl>
  <integrationClass>ExampleIntegrationImpl</integrationClass>
  <masterLabel>Example Partner Name</masterLabel>
  <developerName>exampledevname</developerName>
  <namedCredential>exampleNamedCredential</namedCredential>
  <userSyncingSupported>true</userSyncingSupported>
  <vendorType>BringYourOwnContactCenter</vendorType>
</ConversationVendorInfo>
```

The following is an example `package.xml` that references the previous definition.

```
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ConversationVendorInfo</name>
  </types>
  <version>59.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CorsWhitelistOrigin

---

Represents an origin in the CORS allowlist.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this metadata type's name.

## File Suffix and Directory Location

`CorsWhitelistOrigin` components have the suffix `.corswhitelistorigin` and are stored in the `corswhitelistorigins` folder.

## Version

`CorsWhitelistOrigin` components are available in API version 32.0 and later.

## Fields

Field Name	Field Type	Description
<code>urlPattern</code>	String	<p>A URL pattern for the origin.</p> <p>The origin URL pattern must include the HTTPS protocol and a domain name, and can include a port. The wildcard character (*) is supported and must be in front of a second-level domain name. For example, <code>https://*.example.com</code> adds all subdomains of <code>example.com</code> to the allowlist.</p> <p>Google Chrome™ and Mozilla® Firefox® browser extensions are also allowed as resources in API version 53 and later. Chrome extensions must use the prefix <code>chrome-extension://</code> and 32 characters without digits or capital letters, for example <code>chrome-extension://abdkkegmbiomi.jcbdaodaf1gehfffed</code>. Firefox extensions must use the prefix <code>moz-extension://</code> and an 8-4-4-4-12 format of small alphanumeric characters, for example <code>moz-extension://1234ab56-78c9-1df2-3efg-4567891hi1j2</code>.</p> <p>The origin URL pattern can be an IP address. But an IP address and a domain that resolve to the same address aren't the same origin, and you must add them to the CORS allowlist as separate entries.</p>

## Declarative Metadata Sample Definition

Here's an example package manifest used to deploy or retrieve the CorsWhitelistOrigin metadata for an organization.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>CorsWhitelistOrigin</name>
  </types>
  <version>32.0</version>
</Package>
```

Here's an example of a CorsWhitelistOrigin component.

```
<?xml version="1.0" encoding="UTF-8"?>
<CorsWhitelistOrigin xmlns="http://soap.sforce.com/2006/04/metadata">
  <developerName>CorsWhitelistEntry1</developerName>
  <urlPattern>https://*.example.com</urlPattern>
</CorsWhitelistOrigin>
```

## Usage

[CORS](#) (cross-origin resource sharing) is a W3C recommendation that enables Web browsers to request resources from origins other than their own. For example, using CORS, a JavaScript script at `https://www.example.com` could request a resource from `https://www.salesforce.com`.

If a browser that supports CORS makes a request to an origin in your allowlist, Salesforce returns the origin in the `Access-Control-Allow-Origin` HTTP header, along with any additional CORS HTTP headers. If the origin isn't allow listed, Salesforce returns HTTP status code 404.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CspTrustedSite

Represents a trusted URL. For each CspTrustedSite component, you can specify Content Security Policy (CSP) directives and permissions policy directives. Each CSP directive allows Lightning components, third-party APIs, and WebSocket connections to access a resource type from the trusted URL. If the Permissions-Policy HTTP header is enabled, each permissions policy directive grants the trusted URL access to a browser feature. In API version 58.0 and earlier, CspTrustedSite components included only CSP directives and were referred to as CSP Trusted Sites.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Declarative Metadata File Suffix and Directory Location

CspTrustedSite components are stored in the `cspTrustedSites` directory of the corresponding package directory. The file name matches the unique name of the trusted site, and the extension is `.cspTrustedSite`.

## Version

CspTrustedSite components are available in API version 39.0 and later.

## Fields

Field	Field Type	Description
<code>canAccessCamera</code>	boolean	<p>Indicates whether this CspTrustedSite can access the user's camera (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p> <p>This field takes effect only when the <code>enablePermissionsPolicy</code> field equals <code>true</code> and the <code>grantCameraAccess</code> field equals <code>TrustedUrls</code> in the <a href="#">SecuritySettings</a> metadata API type.</p> <p>This field is available in API version 59.0 and later.</p>
<code>canAccessMicrophone</code>	boolean	<p>Indicates whether this CspTrustedSite can access the user's microphone (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p> <p>This field takes effect only when the <code>enablePermissionsPolicy</code> field equals <code>true</code> and the <code>grantMicrophoneAccess</code> field equals <code>TrustedUrls</code> in the <a href="#">SecuritySettings</a> metadata API type.</p> <p>This field is available in API version 59.0 and later.</p>
<code>context</code>	CspTrustedSiteContext (enumeration of type string)	<p>Declares the scope of the CSP directives for this trusted URL.</p> <ul style="list-style-type: none"> <li><code>All</code>—Apply the CSP directives to all supported context types.</li> <li><code>Communities</code>—Apply the CSP directives to Experience Builder sites only.</li> <li><code>FieldServiceMobileExtension</code>—Apply the CSP directives to the Field Service Mobile Extensions only. This value is available in API version 47.0 and later.</li> <li><code>LEx</code>—Apply the CSP directives to Lightning Experience pages only.</li> <li><code>VisualForce</code>—Apply the CSP directives to custom Visualforce pages only. This value is available in API version 55.0 and later.</li> </ul> <p>For custom Visualforce pages, content is restricted to trusted URLs only if the page's <code>cspHeader</code> attribute is set to <code>true</code>.</p> <p>This field is available in API version 44.0 and later.</p>
<code>description</code>	string	The description of this trusted URL.

Field	Field Type	Description
<code>endpointUrl</code>	string	<p>Required. The URL for this CspTrustedSite.</p> <p>This field must include a domain name and can include a port. For example, <code>https://example.com</code> or <code>https://example.com:8080</code>.</p> <p>To reduce repetition, you can use the wildcard character <code>*</code> (asterisk). For example, <code>*.example.com</code>. For a third-party API, the URL must begin with <code>https://</code>. For example, <code>https://example.com</code>. For a WebSocket connection, the URL must begin with <code>wss://</code>. For example, <code>wss://example.com</code>.</p>
<code>isActive</code>	boolean	<p>Required. Indicates whether this CspTrustedSite is active (<code>true</code>) or not (<code>false</code>). The default value is <code>true</code>.</p>
<code>isApplicableToConnectSrc</code>	boolean	<p>Indicates whether Lightning components, third-party APIs, and WebSocket connections can load URLs using script interfaces from this trusted URL (<code>true</code>) or not (<code>false</code>). This field has a default value of <code>false</code>.</p> <p>This field is available in API version 48.0 and later.</p>
<code>isApplicableToFontSrc</code>	boolean	<p>Indicates whether Lightning components, third-party APIs, and WebSocket connections can load fonts from this trusted URL (<code>true</code>) or not (<code>false</code>). This field has a default value of <code>false</code>.</p> <p>This field is available in API version 48.0 and later.</p>
<code>isApplicableToFrameSrc</code>	boolean	<p>Indicates whether Lightning components, third-party APIs, and WebSocket connections can load resources contained in <code>&lt;iframe&gt;</code> elements from this trusted URL (<code>true</code>) or not (<code>false</code>). This field has a default value of <code>false</code>. This field is available in API version 48.0 and later.</p>
<code>isApplicableToImgSrc</code>	boolean	<p>Indicates whether Lightning components, third-party APIs, and WebSocket connections can load images from this trusted URL (<code>true</code>) or not (<code>false</code>). This field has a default value of <code>false</code>.</p> <p>This field is available in API version 48.0 and later.</p>
<code>isApplicableToMediaSrc</code>	boolean	<p>Indicates whether Lightning components, third-party APIs, and WebSocket connections can load audio and video from this trusted URL (<code>true</code>) or not (<code>false</code>). This field has a default value of <code>false</code>.</p> <p>In API version 59.0 and later, for each trusted URL, at least one CspTrustedSite starting with <code>isApplicable</code> or <code>canAccess</code> must be set to <code>true</code>.</p> <p>In API version 50.0 to 58.0, if all <code>isApplicable</code> fields are <code>false</code>, the <code>isApplicableToImgSrc</code> field is set to</p>

Field	Field Type	Description
		<p><code>true</code>. In API version 49.0 and earlier, if all <code>isApplicable</code> fields are <code>false</code>, these fields all default to <code>true</code>.</p> <p>This field is available in API version 48.0 and later.</p>
<code>isApplicableToStyleSrc</code>	<code>boolean</code>	Indicates whether Lightning components, third-party APIs, and WebSocket connections can load style sheets from this trusted URL ( <code>true</code> ) or not ( <code>false</code> ). This field has a default value of <code>false</code> . This field is available in API version 48.0 and later.
<code>mobileExtension</code>	<code>string</code>	Reserved for future use.

## Declarative Metadata Sample Definition

A sample XML definition of a trusted site is shown below.

```
<?xml version="1.0" encoding="UTF-8"?>
<CspTrustedSite xmlns="http://soap.sforce.com/2006/04/metadata">
  <canAccessCamera>false</canAccessCamera>
  <canAccessMicrophone>true</canAccessMicrophone>
  <description>Used for Lightning component callout to mapping web service</description>

  <context>LEX</context>
  <endpointUrl>https://www.maptestsite.net/</endpointUrl>
  <isActive>true</isActive>
  <isApplicableToConnectSrc>true</isApplicableToConnectSrc>
  <isApplicableToFontSrc>true</isApplicableToFontSrc>
  <isApplicableToFrameSrc>false</isApplicableToFrameSrc>
  <isApplicableToImgSrc>true</isApplicableToImgSrc>
  <isApplicableToMediaSrc>false</isApplicableToMediaSrc>
  <isApplicableToStyleSrc>true</isApplicableToStyleSrc>
</CspTrustedSite>
```

## Usage

For each `CSPTrustedSite` component, at least one field starting with `grantAccess` or `isApplicableTo` must be set to `true`.

In API versions 50.0 to 58.0, if all `isApplicable` fields are `false`, the `isApplicableToImgSrc` field is set to `true`. In API version 49.0 and earlier, if all `isApplicable` fields are `false`, those fields all default to `true`.

To ensure smooth integration across Salesforce products, Salesforce includes URLs in each of the CSP directives that correspond to the `isApplicable` fields, even though those URLs aren't defined as `CspTrustedSite` components. Salesforce regularly updates those URLs based on the latest requirements.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CustomApplication

---

CustomApplication represents a custom or standard application. In API version 29.0 and earlier, CustomApplication represents only a custom application. An application is a list of tab references, with a description and a logo. This type extends the Metadata metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

Custom and standard applications have the suffix `.app` and are stored in the `applications` folder.

 **Note:** Retrieving a component of this metadata type in a project makes the component appear in any Profile and PermissionSet components that are retrieved in the same package.

### Version

Custom applications are available in API version 10.0 and later. Standard applications are available in API version 30.0 and later.

### Fields

Field Name	Field Type	Description
<code>actionOverrides</code>	<a href="#">AppActionOverride[]</a>	Represents an action override for an application. Use it to create, update, edit, or delete action overrides.  This field is available for Lightning Experience in API version 38.0 and later.
<code>brand</code>	<a href="#">AppBrand</a>	The color scheme and logo used for the app.  This field is available for Lightning Experience in API version 38.0 and later.
<code>consoleConfig</code>	<a href="#">ServiceCloudConsoleConfig</a>	Represents configuration settings for a Salesforce console app.  This field is available in API version 42.0 and later.
<code>defaultLandingTab</code>	string	The <a href="#">fullName</a> of a standard tab or custom tab that opens when this application is selected.
<code>description</code>	string	The optional description text of the application.
<code>formFactors</code>	FormFactor (enumeration of type string)	Indicates the form factors for which the app is visible for Lightning Experience. Valid values are: <ul style="list-style-type: none"> <li><code>Null</code> (no value)—For a desktop using Salesforce Classic</li> <li><code>Small</code>—For a mobile device using the Salesforce mobile app</li> <li><code>Medium</code>—Reserved for future use</li> <li><code>Large</code>—For a desktop using Lightning Experience</li> </ul>

Field Name	Field Type	Description
		<p>This field is available in API version 38.0 and later.</p> <p>As of API version 38.0, <code>formFactors</code> is set to <code>Large</code> for existing Salesforce Classic apps, except for Salesforce Classic consoles. Salesforce Classic apps installed from packages created before API version 38.0 also have <code>formFactors</code> set to <code>Large</code>. For Salesforce Classic apps in packages created with API 38.0 or later, you must set <code>formFactors</code> to <code>Large</code> for Salesforce Classic apps to appear in the Lightning Experience desktop.</p> <p>As of API version 47.0, the <code>Small</code> value is supported for Lightning apps. The <code>formFactors</code> field can be set to <code>Small</code> or <code>Large</code> for Lightning apps, and it can be set to <code>Null</code> or <code>Large</code> for Salesforce Classic apps.</p>
<code>isNavAutoTempTabsDisabled</code>	boolean	Indicates whether the navigation automatically creates temporary tabs settings. Applies only to Lightning apps with standard navigation. Available in API version 43.0 and later.
<code>isNavPersonalizationDisabled</code>	boolean	Indicates whether navigation personalization is disabled. Applies only to Lightning apps. Available in API version 43.0 and later.
<code>isNavTabPersistenceDisabled</code>	boolean	Indicates whether workspace tabs are cleared for each new console session ( <code>true</code> ) or not ( <code>false</code> ). Applies only to Lightning apps with console navigation. Available in API version 54.0 and later.
<code>isServiceCloudConsole</code>	boolean	Indicates if the application is a Salesforce Classic console app. For Lightning Experience console apps, this field is <code>null</code> and the <code>navType</code> field is set to <code>Console</code> .
<code>label</code>	string	The name of the application.
<code>logo</code>	string	The optional reference to the image document for a Salesforce app or Salesforce console app.
<code>navType</code>	NavType (enumeration of type string)	<p>Not updateable. Indicates the type of navigation the app uses. The value <code>Standard</code> is for a Lightning app with standard navigation. The value <code>Console</code> is for a Lightning app with console navigation.</p> <p>This field is available in API version 38.0 and later.</p>
<code>preferences</code>	<a href="#">AppPreferences</a>	<p>Represents the preferences for a Salesforce Classic console app. All of the <code>AppPreferences</code> fields are required.</p> <p>This field is available in API version 42.0 and later.</p>
<code>profileActionOverrides</code>	<a href="#">AppProfileActionOverride[]</a>	A list of the Lightning Experience record page <code>ProfileActionOverrides</code> that are assigned to this custom

Field Name	Field Type	Description
		<p>app. When a user invokes the custom app, a matching ProfileActionOverride assignment takes precedence over existing overrides for the record page specified in <a href="#">ActionOverride</a>. You can override a record page for the custom app by record type and profile.</p> <p>In API version 45.0 and later, you can override a home page for the custom app by profile.</p>
setupExperience	string	<p>The type of Setup experience associated with the app. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>all</code>—Represents the full Setup tree.</li> <li>• <code>essentials</code>—Represents the Essentials Setup tree, which contains a subset of Setup items configured for Essentials edition.</li> <li>• <code>service</code>—Represents the Service Setup tree, which contains a subset of Setup items configured for Service Console.</li> </ul> <p>A <code>null</code> value is equivalent to <code>all</code>.</p> <p>Previous valid values <code>AllSetup</code>, <code>ServiceSetup</code>, and <code>EssentialsSetup</code> have been deprecated.</p> <p>This field is available in API version 39.0 and later.</p>
subscriberTabs	string[]	<p>Represents the list of tabs appended by a subscriber to a Lightning app installed from a managed package. Records in a subscriber tab always open as primary tabs.</p> <p>This field is available in API version 41.0 and later.</p>
tabs	string[]	<p>The list of tabs included in this application. In API version 12.0, the <code>fullName</code> for built-in tabs like Home, Account, and Reports, is the name of the tab (Home, for example). In API version 13.0 and later, built-in tabs are prefixed with <code>standard-</code>. For example, to reference the Account tab you would use <code>standard-Account</code>.</p> <p>In API version 42.0, this field was renamed from <code>tab</code> to <code>tabs</code>.</p>
uiType	UiType (enumeration of type string)	<p>Not updateable. Identifies the type of custom app. The value is:</p> <ul style="list-style-type: none"> <li>• <code>Aloha</code> for Salesforce Classic</li> <li>• <code>Lightning</code> for Lightning Experience</li> </ul> <p>This field is available in API version 38.0 and later.</p>

Field Name	Field Type	Description
utilityBar	string	<p>The developer name of the utility bar associated with this app.</p> <p>We recommend assigning a utility bar to only one Lightning App, because utility bars are shared. Sharing means that if you change the utility bar in one app, it automatically changes in all apps associated with it.</p> <p>This field is available in API version 38.0 and later.</p>
workspaceConfig	<a href="#">AppWorkspaceConfig</a>	<p>Represents how records open in a Salesforce console app. Required if <code>isServiceCloudConsole</code> is <code>true</code>. In API version 42.0, this field was renamed to <code>workspaceConfig</code> from <code>workspaceMappings</code>.</p>

## AppActionBarOverride

Represents an action override for an application. Use it to create, update, edit, or delete action overrides. `AppActionBarOverride` inherits from [ActionOverride](#) and extends it by one field, `pageOrSubjectType`. Available for Lightning Experience in API version 38.0 and later.

Field Name	Field Type	Description
actionName	string	The only valid value is <code>view</code> for API version 43.0 and earlier. The value <code>tab</code> is supported for API version 44.0 and later.
comment	string	Any comments you want associated with the override.
content	string	Set this field if <code>type</code> is set to <code>flexipage</code> . It refers to the name of the page to use as the override. To reference installed components, use the format of <b><code>Component_namespace__Component_name</code></b> .
formFactor	FormFactor(enumeration of type string)	<p>The size of the page being overridden.</p> <p>If the <code>type</code> field is set to <code>flexipage</code>, set this field to <code>Large</code> to override the View action with a Lightning page in Lightning Experience.</p> <p>The <code>Large</code> value represents the Lightning Experience desktop environment and is valid only for the <code>flexipage</code> and <code>lightningcomponent</code> types. The <code>Small</code> value represents the Salesforce mobile app on a phone or tablet. The <code>Medium</code> value is reserved for future use. The <code>null</code> value (which is the same as specifying no value) represents Salesforce Classic.</p> <p>This field is available in API version 37.0 and later and is part of the feature for creating and editing record pages in Lightning Experience.</p> <p>Lightning component overrides return different <code>FormFactor</code> values depending on the API version used.</p>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>In API version 41.0 and earlier, Lightning component overrides return only the <code>null</code> value (no value), representing the Salesforce Classic environment.</li> <li>In API version 42.0, if you specify different Lightning component overrides for Lightning Experience and mobile, one component is selected randomly for both overrides and its <code>FormFactor</code> value is returned. If there's a conflict between Lightning components, and a Visualforce page override is also specified for Salesforce Classic, the Visualforce page takes precedence.</li> <li>In API version 43.0 and later, a Lightning component override for Lightning Experience returns the <code>Large</code> value and a Lightning component override for mobile returns the <code>Small</code> value, as expected.</li> </ul>
<code>pageOrObjectType</code>	string	<p>The name of the sObject type being overridden. Valid values are <code>standard</code> and <code>custom</code>.</p> <p>This value must be <code>standard-home</code> when <code>actionName</code> is <code>tab</code>.</p>
<code>skipRecordTypeSelect</code>	boolean	Set this field to <code>true</code> if you prefer that any new records created by this action override aren't forwarded to the record type selection page. This field is only valid if the <code>actionName</code> is a "create" type (like <code>new</code> ), and <code>type</code> is set to <code>visualforce</code> .
<code>type</code>	<a href="#">ActionOverrideType</a> (enumeration of type string)	<p>Required. Represents the type of action override. The valid values are <code>Flexipage</code> and <code>Default</code>.</p> <p>A <code>Flexipage</code> <code>AppActionOverride</code> set to <code>App Default</code> can't be deleted via Metadata API. Instead, remove the override using the page assignment wizard in the Lightning App Builder UI.</p>

## AppBrand

The color scheme and logo used for the app. Available for Lightning apps in API version 38.0 and later.

Field Name	Field Type	Description
<code>footerColor</code>	string	Optional. Determines the footer color in the app. Specify the color with a hexadecimal code, such as <code>#0000FF</code> for blue.
<code>headerColor</code>	string	Optional. Determines the header color in the app. Specify the color with a hexadecimal code, such as <code>#0000FF</code> for blue.
<code>logo</code>	string	The optional reference to the image document for the application.
<code>logoVersion</code>	int	An optional version number for the logo.
<code>shouldOverrideOrgTheme</code>	boolean	Indicates whether to override the global theme for the org. When <code>true</code> , the color scheme and logo that the user has set are used. When <code>false</code> ,

Field Name	Field Type	Description
		the global theme for the org is used, even if the user has set a color scheme and logo.

## AppComponentList

Represents custom console components (Visualforce pages) assigned to a Salesforce console app. In API version 42.0, this type was renamed from CustomApplicationComponents to AppComponentList.

Field Name	Field Type	Description
alignment	string	Required. Determines how custom console components are aligned in the footer of a Salesforce console app.
components	string[]	The name of a custom console component assigned to a Salesforce console app. In API version 42.0, this field was renamed from customApplicationComponent to components.

## AppPreferences

Represents the preferences for a Salesforce Classic console app. All of the AppPreferences fields are required. Available in API version 42.0 and later.

Field Name	Field Type	Description
enableCustomizeMyTabs	boolean	Indicates if a Salesforce Classic console app has Customize My Tabs enabled. If enabled, users can hide, display, and organize items in the navigation tab.
enableKeyboardShortcuts	boolean	Indicates if a Salesforce Classic console app has keyboard shortcuts enabled. Shortcuts let users perform actions by pressing a combination of keys instead of having to use a mouse. After keyboard shortcuts are enabled, several default shortcuts are available for customization. Before you can create custom shortcuts, a developer must define the shortcut's action with the <code>addEventListener()</code> method in the Salesforce Console Integration Toolkit. You can't create keyboard shortcuts for actions performed outside of the console. This field is required if <code>isServiceCloudConsole</code> is <code>true</code> .
enableListViewHover	boolean	Indicates if a Salesforce Classic console app has list view hovers enabled. If set to <code>true</code> , summary information is displayed about a record in a responsive list when the user hovers over a record name. For cases, hover over the subject field.
enableListViewReskin	boolean	Indicates if Salesforce Classic console apps use responsive list views instead of Salesforce Classic lists views.
enableMultiMonitorComponents	boolean	Indicates if a Salesforce Classic console app has multi-monitor components enabled, which lets users move portions of a console from

Field Name	Field Type	Description
		their browsers to locations on their screens. This field is required if <code>isServiceCloudConsole</code> is <code>true</code> .
<code>enablePinTabs</code>	boolean	Indicates if a Salesforce Classic console app has pinned tabs enabled, which lets users pin primary tabs to the tab bar for quick access.
<code>enableTabHover</code>	boolean	Indicates if a Salesforce Classic console app has tab hover enabled. If enabled, summary information is displayed about a record in an overlay when the user hovers over a tab.
<code>enableTabLimits</code>	boolean	Indicates whether limits are enabled on the number of primary tabs and subtabs that can be opened in a Salesforce Classic console session. When <code>true</code> , values for <code>tabLimitConfig</code> are required
<code>saveUserSessions</code>	boolean	Indicates if a Salesforce Classic console app saves user sessions automatically. If enabled, when console users close their browsers or log out of Salesforce, any previously open tabs display when users log in again. Required if <code>isServiceCloudConsole</code> is <code>true</code> .

## AppProfileActionOverride

Represents a ProfileActionOverride for a custom app. This type inherits from [ProfileActionOverride](#) on page 1494 and extends it by one field, `profile`. Available for Lightning Experience in API version 39.0 and later. In API version 45.0 and later, you can override a home page for the custom app by profile.

Field Name	Field Type	Description
<code>actionName</code>	string	Required. The name of the action. The only valid values are <code>Tab</code> and <code>View</code> .  If <code>pageOrSubjectType</code> is <code>record-home</code> , this field must be <code>View</code> . The <code>View</code> action is supported only when ProfileActionOverride is being specified as part of a CustomApplication.  In API version 45.0 and later, this action is supported only when ProfileActionOverride is being specified as part of a CustomApplication, <code>pageOrSubjectType</code> is <code>standard-home</code> , and this field is <code>Tab</code> .
<code>content</code>	string	Read-only. Represents the name of the Lightning page being used as the override.
<code>formFactor</code>	FormFactor (enumeration of type string)	Required. The size of the page being overridden. The <code>Large</code> value represents the Lightning Experience desktop environment.
<code>pageOrSubjectType</code>	string	Required. The name of the page being overridden. The only valid values are <code>record-home</code> and <code>standard-home</code> . If the <code>actionName</code> is <code>Tab</code> , this field must be <code>standard-home</code>
<code>profile</code>	string	The profile associated with the ProfileActionOverride.

Field Name	Field Type	Description
recordType	string	The record type associated with the override. If <code>pageOrSubjectType</code> is <code>standard-home</code> , this field must be <code>null</code> . This field is required when <code>actionName</code> is set to <code>View</code> .
type	ActionOverrideType (enumeration of type string)	Required. Read-only. The type of action override. The only valid value is <code>flexipage</code> .

## AppWorkspaceConfig

Represents how records open in a Salesforce console app. Required if `isServiceCloudConsole` is `true`. Available for Salesforce Classic console apps in API version 25.0 and later. Available for Lightning console apps in API version 41.0 and later. In API version 42.0, this type was renamed from `WorkspaceMappings` to `AppWorkspaceConfig`.

Field Name	Field Type	Description
mappings	<a href="#">WorkspaceMappingSingle</a> ]	Represents how records for a specific tab open in a Salesforce console app. Required for each tab specified in the <code>CustomApplication</code> . In API version 42.0, this field was renamed from <code>workspaceMapping</code> to <code>mappings</code> .

## WorkspaceMapping

Represents how records for a specific tab open in a Salesforce console app. Required for each tab specified in the `CustomApplication`. Available in API version 25.0 and later for Salesforce Classic console apps. Available in API version 41.0 and later for Lightning console apps.

Field Name	Field Type	Description
fieldName	string	The name of the field that specifies the primary tab in which to display <code>tab</code> as a subtab. If not specified, <code>tab</code> opens as a primary tab.
tab	string	Required. Name of the tab.

## CustomShortcut

Represents custom keyboard shortcuts assigned to a Salesforce console app in Salesforce Classic. Before you can create custom shortcuts, a developer must define the shortcut's action with the `addEventListener()` method in the Salesforce Console Integration Toolkit. You can't create keyboard shortcuts for actions performed outside of the console. Available in API version 28.0 and later.

Field Name	Field Type	Description
action	string	Required. The action performed in the console when a user presses the keyboard shortcut.
active	boolean	Required. Indicates whether the keyboard shortcut is active ( <code>true</code> ) or not ( <code>false</code> ).

Field Name	Field Type	Description
keyCommand	string	<p>Required. The combination of keys a user presses to trigger the keyboard shortcut. Keyboard shortcuts aren't case-sensitive, but they display as uppercase on setup pages in the Salesforce user interface so that they're easier to read.</p> <p>Each key command can include up to four modifier keys followed by one non-modifier key. Modifier and non-modifier keys are separated by the + key. Modifier keys can occur in any order, but you must place non-modifier keys at the end of the key command sequence. For example, SHIFT+CTRL+ALT+META +A.</p> <p>Valid modifier keys are:</p> <ul style="list-style-type: none"> <li>• SHIFT</li> <li>• CTRL</li> <li>• ALT</li> <li>• META (represents the COMMAND key on Macs)</li> </ul> <p>Valid non-modifier keys are letters A through Z and numbers 0 through 9. Other valid keys are:</p> <ul style="list-style-type: none"> <li>• TAB</li> <li>• ENTER</li> <li>• PAUSE/BREAK</li> <li>• CAPS LOCK</li> <li>• ESC</li> <li>• SPACE</li> <li>• PAGE UP</li> <li>• PAGE DOWN</li> <li>• END</li> <li>• HOME</li> <li>• LEFT ARROW</li> <li>• UP ARROW</li> <li>• RIGHT ARROW</li> <li>• DOWN ARROW</li> <li>• PRINT SCREEN</li> <li>• INSERT</li> <li>• DELETE</li> <li>• RIGHT WINDOW</li> <li>• NUMPAD 0</li> <li>• NUMPAD 1</li> <li>• NUMPAD 2</li> <li>• NUMPAD 3</li> <li>• NUMPAD 4</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• NUMPAD 5</li> <li>• NUMPAD 6</li> <li>• NUMPAD 7</li> <li>• NUMPAD 8</li> <li>• NUMPAD 9</li> <li>• MULTIPLY</li> <li>• ADD</li> <li>• SUBTRACT</li> <li>• DECIMAL POINT</li> <li>• DIVIDE</li> <li>• F1</li> <li>• F2</li> <li>• F3</li> <li>• F4</li> <li>• F5</li> <li>• F6</li> <li>• F7</li> <li>• F8</li> <li>• F9</li> <li>• F10</li> <li>• F11</li> <li>• F12</li> <li>• NUM LOCK</li> <li>• SCROLL LOCK</li> <li>• ;</li> <li>• =</li> <li>• ,</li> <li>• -</li> <li>• .</li> <li>• /</li> <li>• \</li> <li>• [</li> <li>• ]</li> <li>• \</li> <li>• ' </li></ul>
description	string	The optional description text for the keyboard shortcut.

Field Name	Field Type	Description
eventName	string	Required. Code available to developers who want to add custom shortcut functions to the console via the Salesforce Console Integration Toolkit.

## DefaultShortcut

Represents default keyboard shortcuts assigned to a Salesforce console app. After you enable keyboard shortcuts for a console, several default shortcuts are available for customization. These include opening and closing tabs, moving between tabs, and saving records. Available in API version 28.0 and later.

Field Name	Field Type	Description
action	string	<p>Required. The action performed in the console when a user presses the keyboard shortcut. Valid values are:</p> <ul style="list-style-type: none"> <li>• FOCUS_CONSOLE</li> <li>• FOCUS_NAVIGATOR_TAB</li> <li>• FOCUS_DETAIL_VIEW</li> <li>• FOCUS_PRIMARY_TAB_PANEL</li> <li>• FOCUS_SUBTAB_PANEL</li> <li>• FOCUS_LIST_VIEW</li> <li>• FOCUS_FIRST_LIST_VIEW</li> <li>• FOCUS_SEARCH_INPUT</li> <li>• MOVE_LEFT</li> <li>• MOVE_RIGHT</li> <li>• UP_ARROW</li> <li>• DOWN_ARROW</li> <li>• OPEN_TAB_SCROLLER_MENU</li> <li>• OPEN_TAB</li> <li>• CLOSE_TAB</li> <li>• ENTER</li> <li>• EDIT</li> <li>• SAVE</li> </ul>
active	boolean	Required. Indicates whether the keyboard shortcut is active ( <code>true</code> ) or not ( <code>false</code> ).
keyCommand	string	<p>Required. The combination of keys a user presses to trigger the keyboard shortcut. Keyboard shortcuts aren't case-sensitive, but they display as uppercase on setup pages in the Salesforce user interface so that they're easier to read.</p> <p>Each key command can include up to four modifier keys followed by one non-modifier key. Modifier and non-modifier keys are separated by the + key. Modifier keys can occur in any order, but you must place</p>

Field Name	Field Type	Description
		<p>non-modifier keys at the end of the key command sequence. For example, <code>SHIFT+CTRL+ALT+META +A</code>.</p> <p>Valid modifier keys are:</p> <p>Valid non-modifier keys are letters A through Z and numbers 0 through 9. Other valid keys are:</p>

## KeyboardShortcuts

Represents keyboard shortcuts assigned to a Salesforce console app. Required if `isServiceCloudConsole` is `true`. Available in API version 28.0 and later.

Field Name	Field Type	Description
<code>customShortcuts</code>	<a href="#">CustomShortcut[]</a>	<p>Represents custom keyboard shortcuts assigned to a Salesforce console app in Salesforce Classic. Before you can create custom shortcuts, a developer must define the shortcut's action with the <code>addEventListener()</code> method in the Salesforce Console Integration Toolkit. You can't create keyboard shortcuts for actions performed outside of the console.</p> <p>In API version 42.0, this field was renamed from <code>customShortcut</code> to <code>customShortcuts</code>.</p>
<code>defaultShortcuts</code>	<a href="#">DefaultShortcut[]</a>	<p>Represents default keyboard shortcuts assigned to a Salesforce console app. After you enable keyboard shortcuts for a console, several default shortcuts are available for customization. These include opening and closing tabs, moving between tabs, and saving records.</p> <p>In API version 42.0, this field was renamed from <code>defaultShortcut</code> to <code>defaultShortcuts</code>.</p>

## ListPlacement

Represents how lists display in a Salesforce console app. Required if `isServiceCloudConsole` is `true`. Available in API version 25.0 and later.

Field Name	Field Type	Description
<code>height</code>	<code>int</code>	Height of the list in pixels or percentage. Required if <code>location</code> is <code>top</code> .
<code>location</code>	<code>string</code>	<p>Required. Location of the list on the screen. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>full</code></li> <li>• <code>top</code></li> <li>• <code>left</code></li> </ul>
<code>units</code>	<code>string</code>	Required. Represents if <code>height</code> or <code>width</code> is in pixels or percentage.

Field Name	Field Type	Description
width	int	Width of the list in pixels or percentage. Required if location is left.

## LiveAgentConfig

Represents your organization's settings for using Chat in the Salesforce Console.

Field Name	Field Type	Description
enableLiveChat	boolean	Specifies whether Chat is enabled in your organization ( <code>true</code> ) or not ( <code>false</code> ).
openNewAccountSubtab	boolean	Specifies whether to open a new Account subtab in a Salesforce console app automatically ( <code>true</code> ) or not ( <code>false</code> ) when an agent accepts a chat.
openNewCaseSubtab	boolean	Specifies whether to open a new Case subtab in a Salesforce console app automatically ( <code>true</code> ) or not ( <code>false</code> ) when an agent accepts a chat.
openNewContactSubtab	boolean	Specifies whether to open a new Contact subtab in a Salesforce console app automatically ( <code>true</code> ) or not ( <code>false</code> ) when an agent accepts a chat.
openNewLeadSubtab	boolean	Specifies whether to open a new Lead subtab in a Salesforce console app automatically ( <code>true</code> ) or not ( <code>false</code> ) when an agent accepts a chat.
openNewVFPagesSubtab	boolean	Specifies whether to open a new Visualforce page as a subtab in a Salesforce console app automatically ( <code>true</code> ) or not ( <code>false</code> ) when an agent accepts a chat.
pageNamesToOpen	string [array of strings]	Specifies the Visualforce pages to open in subtabs when an agent accepts a chat in a Salesforce console app.  This field is available in API version 42.0 and later.
showKnowledgeArticles	boolean	Specifies whether to display the Knowledge component while using Chat in a Salesforce console app ( <code>true</code> ) or not ( <code>false</code> ).

## PushNotification

Represents a set of push notifications, which are visual indicators on lists and detail pages that show when a record or field has changed during a user's session. Available for use if `isServiceCloudConsole` is `true`. Available in API version 28.0 and later.

Field Name	Field Type	Description
fieldNames	string]	The name of the field or fields that trigger push notifications for the selected object.
objectName	string	Required. Name of the object that triggers push notifications.

## ServiceCloudConsoleConfig

Represents configuration settings for a Salesforce console app. Available in API version 42.0 and later.

Field Name	Field Type	Description
<code>componentList</code>	<a href="#">AppComponentList</a>	Represents custom console components (Visualforce pages) assigned to a Salesforce console app.
<code>detailPageRefreshMethod</code>	string	Determines how detail pages refresh in a Salesforce console app. Required if <code>isServiceCloudConsole</code> is <code>true</code> . The valid values are: <ul style="list-style-type: none"> <li>• <code>none</code></li> <li>• <code>autoRefresh</code></li> <li>• <code>flag</code></li> </ul>
<code>footerColor</code>	string	Determines the footer color in a Salesforce console app. Specify the color with a hexadecimal code, such as <code>#0000FF</code> for blue.
<code>headerColor</code>	string	Determines the header color in a Salesforce console app. Specify the color with a hexadecimal code, such as <code>#0000FF</code> for blue.
<code>keyboardShortcuts</code>	<a href="#">KeyboardShortcuts</a>	Represents the keyboard shortcuts for a Salesforce console app. Keyboard shortcuts let users perform actions by pressing a combination of keys instead of having to use a mouse.
<code>listPlacement</code>	<a href="#">ListPlacement</a>	Represents how lists display in a Salesforce console app. Required if <code>isServiceCloudConsole</code> is <code>true</code> .
<code>listRefreshMethod</code>	string	Determines how lists refresh in a Salesforce console app. Required if <code>isServiceCloudConsole</code> is <code>true</code> . The valid values are: <ul style="list-style-type: none"> <li>• <code>none</code></li> <li>• <code>refreshList</code></li> <li>• <code>refreshListRows</code></li> </ul>
<code>liveAgentConfig</code>	<a href="#">LiveAgentConfig</a>	Represents the configurations for using Chat in the Salesforce Console.
<code>primaryTabColor</code>	string	Determines the primary tab color in a Salesforce console app. Specify the color with a hexadecimal code, such as <code>#0000FF</code> for blue.
<code>pushNotifications</code>	<a href="#">PushNotification[]</a>	Represents push notifications for a Salesforce console app. Push notifications are visual indicators on lists and detail pages that show when a record or field has changed during a user's session. For example, assume that two support agents are working on the same case. If one agent changes the <code>Priority</code> , a push notification displays to the other agent so the agent notices the change and doesn't duplicate the effort.
<code>tabLimitConfig</code>	<a href="#">TabLimitConfig</a>	Represents the maximum number of primary tabs and subtabs allowed in one Salesforce console session. Required if <code>enableTabLimits</code> is <code>true</code> .
<code>whiteListedDomains</code>	string[]	Any external domains that users can access from within a Salesforce console app. For example, <code>www.yourdomain.com</code> .

## TabLimitConfig

Represents the maximum number of primary tabs and subtabs allowed in one Salesforce console session. Required if `enableTabLimits` is `true`. Available in API version 36.0 and later.

Field Name	Field Type	Description
<code>maxNumberOfPrimaryTabs</code>	string	The maximum number of primary tabs allowed in one console session. Valid values are: <ul style="list-style-type: none"> <li>• 5</li> <li>• 10</li> <li>• 20</li> <li>• 30</li> </ul>
<code>maxNumberOfSubTabs</code>	string	The maximum number of subtabs allowed in one console session. Valid values are: <ul style="list-style-type: none"> <li>• 5</li> <li>• 10</li> <li>• 15</li> </ul>

## Usage

You can't delete custom app `ProfileActionOverrides` by deploying with `destructiveChange.xml`. To delete a `ProfileActionOverride`, retrieve the app. In the app definition file, find the `<profileActionOverrides>` section, and remove the `<content>` row. Then, change the `<type>` value in that same section to `default` instead of `flexipage`. Do this for every override you want to reset. After making the changes, rezip the folder and deploy.

You can remove one override at a time each with its own deploy, or you can remove multiple overrides in a single deploy. However, we recommend that you do a fresh retrieve every time you want to delete a new override. Don't use a previously retrieved file.

## Retrieving Apps

To retrieve apps in your organization, use the `CustomApplication` type name in the `package.xml` manifest file. You can either retrieve all apps or specify which apps to retrieve in the `types` section of `package.xml`.

To retrieve all apps in your organization—custom and standard apps, specify the wildcard character (`*`), as follows.

```
<types>
  <members>*</members>
  <name>CustomApplication</name>
</types>
```

 **Note:** In API version 29.0 and earlier, use of the wildcard returns only all custom applications but not standard applications.

To retrieve a custom app, specify the app name.

```
<types>
  <members>MyCustomApp</members>
```

```
<name>CustomApplication</name>
</types>
```

To retrieve a standard app, add the `standard__` prefix to the app name. For example, to retrieve the Chatter standard app, specify `standard__Chatter`.

```
<types>
  <members>standard__Chatter</members>
  <name>CustomApplication</name>
</types>
```

To retrieve an app that is part of an installed package, add the package namespace prefix followed by two underscores and the app name. For example, if the package namespace is `myInstalledPackageNS` and the app name is `PackageApp`, specify `myInstalledPackageNS__PackageApp`, as follows.

```
<types>
  <members>myInstalledPackageNS__PackageApp</members>
  <name>CustomApplication</name>
</types>
```

## Declarative Metadata Sample Definition

Here's the definition of a custom Lightning Experience app:

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomApplication xmlns="http://soap.sforce.com/2006/04/metadata">
  <actionOverrides>
    <actionName>View</actionName>
    <comment>Action override created by Lightning App Builder during
activation.</comment>
    <content>Custom_Mobile_Oppty_Page</content>
    <formFactor>Small</formFactor>
    <skipRecordTypeSelect>>false</skipRecordTypeSelect>
    <type>Flexipage</type>
    <pageOrSubjectType>Opportunity</pageOrSubjectType>
  </actionOverrides>
  <actionOverrides>
    <actionName>View</actionName>
    <comment>Action override created by Lightning App Builder during
activation.</comment>
    <content>Custom_Mobile_Oppty_Page</content>
    <formFactor>Large</formFactor>
    <skipRecordTypeSelect>>false</skipRecordTypeSelect>
    <type>Flexipage</type>
    <pageOrSubjectType>Opportunity</pageOrSubjectType>
  </actionOverrides>
  <brand>
    <headerColor>#EE1518</headerColor>
    <shouldOverrideOrgTheme>>true</shouldOverrideOrgTheme>
  </brand>
  <description>Manage inventory and deliveries for our warehouses.</description>
  <formFactors>Small</formFactors>
  <formFactors>Large</formFactors>
  <isNavAutoTempTabsDisabled>>false</isNavAutoTempTabsDisabled>
```

```

<isNavPersonalizationDisabled>>false</isNavPersonalizationDisabled>
<label>Warehouse Lightning</label>
<navType>Standard</navType>
<profileActionOverrides>
  <actionName>View</actionName>
  <content>Warehouse_test_page</content>
  <formFactor>Large</formFactor>
  <pageOrSubjectType>Warehouse__c</pageOrSubjectType>
  <type>Flexipage</type>
  <profile>Admin</profile>
</profileActionOverrides>
<profileActionOverrides>
  <actionName>View</actionName>
  <content>Warehouse_test_page</content>
  <formFactor>Small</formFactor>
  <pageOrSubjectType>Warehouse__c</pageOrSubjectType>
  <type>Flexipage</type>
  <profile>Admin</profile>
</profileActionOverrides>
<setupExperience>all</setupExperience>
<tabs>standard-Feed</tabs>
<tabs>standard-File</tabs>
<tabs>standard-Account</tabs>
<tabs>standard-Case</tabs>
<tabs>Merchandise__c</tabs>
<tabs>Invoice__c</tabs>
<tabs>Warehouse__c</tabs>
<tabs>Delivery__c</tabs>
<tabs>standard-report</tabs>
<tabs>standard-Dashboard</tabs>
<uiType>Lightning</uiType>
</CustomApplication>

```

The following is a definition of a standard app (Chatter):

```

<?xml version="1.0" encoding="UTF-8"?>
<CustomApplication xmlns="http://soap.sforce.com/2006/04/metadata">
  <defaultLandingTab>standard-home</defaultLandingTab>
  <label>Collaboration</label>
  <tabs>standard-Chatter</tabs>
  <tabs>standard-UserProfile</tabs>
  <tabs>standard-OtherUserProfile</tabs>
  <tabs>standard-CollaborationGroup</tabs>
  <tabs>standard-File</tabs>
</CustomApplication>

```

## Declarative Metadata Sample Definition—Salesforce Console

The following is the definition of a custom app where `isServiceCloudConsole` is true:

```

<?xml version="1.0" encoding="UTF-8"?>
<CustomApplication xmlns="http://soap.sforce.com/2006/04/metadata">
  <consoleConfig>
    <componentList>

```

```

    <alignment>left</alignment>
    <components>MyComponent</components>
</componentList>

</CustomApplication>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[CustomTab](#)

## CustomApplicationComponent

---

Represents a custom console component (Visualforce page) assigned to a CustomApplication that is marked as a Salesforce console. Custom console components extend the capabilities of Salesforce console apps. See [Customize a Console with Custom Components in Salesforce Classic in Salesforce Help](#).

### File Suffix and Directory Location

Custom application components have the suffix `.customApplicationComponent` and are stored in the `customApplicationComponents` folder.

### Version

Custom applications are available in API version 25.0 and later.

### Fields

Field Name	Field Type	Description
<code>buttonIconUrl</code>	string	The address of a page that hosts an icon for the button.
<code>buttonStyle</code>	string	The inline style used to define how the button looks.
<code>buttonText</code>	string	The label on the button used to launch the custom console component.
<code>buttonWidth</code>	int	The pixel width of the button displayed in the Salesforce console.
<code>height</code>	int	The pixel height of the window used to display the custom console component.
<code>isHeightFixed</code>	boolean	Required. Indicates whether users can change the custom console component height ( <code>false</code> ) or not ( <code>true</code> ).
<code>isHidden</code>	boolean	Required. Indicates whether the custom console component is hidden from users ( <code>true</code> ) or not ( <code>false</code> ).
<code>isWidthFixed</code>	boolean	Required. Indicates whether users can change the component width ( <code>false</code> ) or not ( <code>true</code> ).
<code>visualforcePage</code>	string	Required. Name of the Visualforce page that represents the custom console component.

Field Name	Field Type	Description
width	int	The pixel width of the window used to display the custom console component.

## Declarative Metadata Sample Definition

The following is the definition of a custom application component:

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomApplicationComponent xmlns="http://soap.sforce.com/2006/04/metadata">
  <buttonIconUrl>https://salesforce.com</buttonIconUrl>
  <buttonStyle>buttonStyleCSS</buttonStyle>
  <buttonText>buttonText</buttonText>
  <buttonWidth>200</buttonWidth>
  <height>200</height>
  <isHeightFixed>>false</isHeightFixed>
  <isHidden>>false</isHidden>
  <isWidthFixed>>false</isWidthFixed>
  <visualforcePage>MyVisualforcePage</visualforcePage>
  <width>50</width>
</CustomApplicationComponent>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CustomFeedFilter

Represents a custom feed filter that limits the feed view to feeds from the Cases object. The custom feed filter shows only feed items that satisfy the criteria specified in the CustomFeedFilter definition. This type extends the Metadata metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

CustomFeedFilter components have the suffix `.feedFilter` and are stored in the `feedFilters` folder.

## Version

CustomFeedFilter components are available in API version 35.0 and later.

## Fields

Field Name	Field Type	Description
criteria	<a href="#">FeedFilterCriterion</a> on page 582 []	The criterion that defines which feed items are shown when the filter is applied. The feed filter displays all feed items that satisfy the criteria.
description	string	The description of the custom feed filter. For example, specify what feed items that filter shows.
label	string	Required. The API label of the custom feed filter.
isProtected	boolean	An auto-generated value. It currently has no impact.

## FeedFilterCriterion

Represents the conditions that a feed item must satisfy to be displayed when a feed filter is applied.

Field Name	Field Type	Description
feedItemType	FeedItemType (enumeration of type string)	<p>Required. The type of feed items that the filter shows.</p> <p>The feed item type can be one of the following values:</p> <ul style="list-style-type: none"> <li>• AttachArticleEvent</li> <li>• CallLogPost</li> <li>• CanvasPost</li> <li>• CaseCommentPost</li> <li>• ChangeStatusPost</li> <li>• ChatTranscriptPost</li> <li>• ContentPost</li> <li>• CreateRecordEvent</li> <li>• EmailMessageEvent</li> <li>• LinkPost</li> <li>• MilestoneEvent</li> <li>• QuestionPost</li> <li>• PollPost</li> <li>• ReplyPost</li> <li>• SocialPost</li> <li>• TextPost</li> </ul>
feedItemVisibility	FeedItemVisibility (enumeration of type string)	<p>The visibility of feed items that the filter shows. For example, you can show only poll posts that are visible internally.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• AllUsers</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>InternalUsers</li> </ul>
relatedSObjectType	string	<p>The API name of the object that the feed item refers to. This field is typically used with the CreateRecordEvent feed item type.</p> <p>For example, a feed filter can show CreateRecordEvent feed items for the Cases object.</p>

## Declarative Metadata Sample Definition

The following is an example of a [CustomFeedFilter](#) on page 581 component.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomFeedFilter xmlns="http://soap.sforce.com/2006/04/metadata">
  <criteria>
    <feedItemType>CreateRecordEvent</feedItemType>
    <relatedSObjectType>MyCO01__c</relatedSObjectType>
  </criteria>
  <criteria>
    <feedItemType>CreateRecordEvent</feedItemType>
    <relatedSObjectType>Case</relatedSObjectType>
  </criteria>
  <criteria>
    <feedItemType>PollPost</feedItemType>
    <feedItemVisibility>InternalUsers</feedItemVisibility>
  </criteria>
  <label>Sample Custom Feed Filter</label>
</CustomFeedFilter>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>myCaseFeedFilter</members>
    <name>CustomFeedFilter</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CustomHelpMenuSection

Represents the section of the Lightning Experience help menu that the admin added to display custom, org-specific help resources for the org. The custom section contains help resources added by the admin. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

CustomHelpMenuSection components have the suffix `.customHelpMenuSection` and are stored in the `customHelpMenuSections` folder.

## Version

CustomHelpMenuSection components are available in API version 45.0 and later.

## Fields

Field Name	Field Type	Description
<code>customHelpMenuItems</code>	<code>CustomHelpMenuItems[]</code>	Items included in the custom section. Specify up to 15 items.
<code>masterLabel</code>	<code>string</code>	Required. Name of the custom section. Only one custom section can be added to the Lightning Experience help menu. Specify up to 80 characters.

## CustomHelpMenuItems

Items included in the custom section. Specify up to 15 items.

Field Name	Field Type	Description
<code>linkURL</code>	<code>string</code>	Required. The URL for the resource.
<code>masterLabel</code>	<code>string</code>	Required. The name of the resource. Specify up to 100 characters.
<code>sortOrder</code>	<code>int</code>	Required. The order of the item within the custom section. Valid values are 1 through 15.

## Declarative Metadata Sample Definition

The following is an example of a CustomHelpMenuSection component.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomHelpMenuSection xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>MyOrgCustomHelp</masterLabel>
```

```

<customHelpMenuItems>
  <linkUrl>https://www.yourcompanyhelp.com/gettingstarted</linkUrl>
  <masterLabel>Getting Started</masterLabel>
  <sortOrder>1</sortOrder>
</customHelpMenuItems>
<customHelpMenuItems>
  <linkUrl>https://www.yourcompanyhelp.com/features</linkUrl>
  <masterLabel>Feature to Start Using Right Away</masterLabel>
  <sortOrder>2</sortOrder>
</customHelpMenuItems>
<customHelpMenuItems>
  <linkUrl>https://www.yourcompanyhelp.com/salestips</linkUrl>
  <masterLabel>Tips for Sales Team Members</masterLabel>
  <sortOrder>3</sortOrder>
</customHelpMenuItems>
</CustomHelpMenuSection>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>MyOrgCustomHelp</members>
    <name>CustomHelpMenuSection</name>
  </types>
  <version>45.0</version>
</Package>

```

## CustomIndex

---

Represents an index used to increase the speed of queries. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

CustomIndex components have the suffix `.indx-meta` and are stored in the `customindex` folder.

### Version

CustomIndex is available in API versions 50.0 and later.

### Special Access Rules

To use this metadata and create a custom index, review [Indexes](#) in *Best Practices for Deployments with Large Data Volumes*, and then contact Salesforce Customer Support.

## Fields

Field Name	Field Type	Description
<code>allowNullValues</code>	boolean	Indicates whether null values are allowed in the index ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of a CustomIndex component.

```
<?xml version="1.0" encoding="UTF-8" ?>
<CustomIndex xmlns="http://soap.sforce.com/2006/04/metadata">
  <allowNullValues>false</allowNullValues>
</CustomIndex>
```

## Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CustomLabels

The CustomLabels metadata type allows you to create custom labels that can be localized for use in different languages, countries, and currencies.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field. Custom labels are custom text values, up to 1,000 characters in length that can be accessed from Apex classes or Visualforce pages. For more information, see "Custom Labels" in Salesforce Help.

## Declarative Metadata File Suffix and Directory Location

Master custom label values are stored in the `CustomLabels.labels` file. Translations for custom labels can be retrieved through [Translations](#) in Metadata API. Translations are stored in files under the `translations` folder with the name format of `localeCode.translation`, where `localeCode` is the locale code of the translation language. The supported locale codes are listed in [Language](#) on page 2085.

## Version

CustomLabels components are available in API version 14.0 and later.

## Fields

Field	Field Type	Description
fullName	string	Required. The name of the custom label bundle.  Inherited from <a href="#">Metadata</a> , this field is defined in the WSDL for this metadata type. It must be specified when creating, updating, or deleting. See <a href="#">createMetadata()</a> to see an example of this field specified for a call.
labels	CustomLabel[]	A list of custom labels.

## CustomLabel

This metadata type represents a custom label. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

Field	Field Type	Description
categories	string	A comma-separated list of categories for the label. This field can be used in filter criteria when creating custom label list views. Maximum of 255 characters.
fullName	string	Required. The name of the custom label.  Inherited from <a href="#">Metadata</a> , this field is defined in the WSDL for this metadata type. It must be specified when creating, updating, or deleting. See <a href="#">createMetadata()</a> to see an example of this field specified for a call.
language	string	Required. The language of the translated custom label.
protected	boolean	Required. Indicates whether this component is protected ( <code>true</code> ) or not ( <code>false</code> ). Protected components can't be linked to or referenced by components created in the installing organization.
shortDescription	string	Required. An easily recognizable term to identify this custom label. This description is used in merge fields.
value	string	Required. The translated custom label. Maximum of 1000 characters.

## Usage

Use CustomLabels with the wildcard character (\*) for members in the `package.xml` manifest file to retrieve all custom labels that are defined in your organization. CustomLabels doesn't support retrieving one or more custom labels by name. To retrieve specific labels by name, use CustomLabel and specify the label names as members.

## Declarative Metadata Sample Definition

This is a sample XML definition of a custom label component.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomLabels xmlns="http://soap.sforce.com/2006/04/metadata">
  <labels>
    <fullName>quoteManual</fullName>
    <value>This is a manual quote.</value>
    <language>en_US</language>
    <protected>>false</protected>
    <shortDescription>Manual Quote</shortDescription>
  </labels>
  <labels>
    <fullName>quoteAuto</fullName>
    <value>This is an automatically generated quote.</value>
    <language>en_US</language>
    <protected>>false</protected>
    <shortDescription>Automatic Quote</shortDescription>
  </labels>
</CustomLabels>
```

This is a sample manifest file for retrieving all custom labels in the organization by using the CustomLabels type.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>MyPkg</fullName>
  <types>
    <members>*</members>
    <name>CustomLabels</name>
  </types>
  <version>62.0</version>
</Package>
```

This is a sample manifest file for retrieving two custom labels by name. Notice it uses the CustomLabel singular type.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>MyPkg</fullName>
  <types>
    <members>quoteManual</members>
    <members>quoteAuto</members>
    <name>CustomLabel</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CustomLabels Limitation

Before you use the CustomLabels metadata type, understand the limitations of this feature. You can't retrieve the CustomLabels metadata type with a namespace.

SEE ALSO:

[Translations](#)

## Custom Metadata Types (CustomObject)

---

Represents the metadata associated with a custom metadata type.

For more information, see the [Custom Metadata Types Implementation Guide](#).

## File Suffix and Directory Location

A custom metadata type is defined as a custom object and is stored in the objects folder. Custom metadata types have a suffix of `__mdt` (instead of `__c` for custom objects). Custom metadata type field names have a suffix of `__c`, like other custom fields. Custom metadata type field names must be dot-qualified with the name of the custom metadata type to which they belong.

Names of custom metadata types must be unique within their namespace. All custom metadata types belong to the `CustomMetadata` namespace and can optionally belong to a second namespace. In your organization, you can use custom metadata types with your namespace and also other organizations' namespaces.

## Version

Custom metadata type components are available in API version 31.0 and later.

## Special Access Rules

To create custom metadata types, you must have the "Author Apex" permission. Apex code can create, read, and update (but not delete) custom metadata records, as long as the metadata is subscriber-controlled and visible from within the code's namespace. You can edit records in memory but not upsert or delete them. Apex code can deploy custom metadata records, but not via a DML operation. Moreover, DML operations aren't allowed on custom metadata in the Partner or Enterprise APIs. Customers who install a managed custom metadata type can't add new custom fields to it. With unpackaged metadata, both developer-controlled and subscriber-controlled access behave the same: like subscriber-controlled access. Refer to [Trust, but Verify: Apex Metadata API and Security](#) to learn more.

 **Note:** Audit fields (`CreatedDate`, `CreatedBy`, `LastModifiedDate`, `LastModifiedBy`, `SystemModStamp`) remain uneditable.

## Fields

Custom metadata types can contain the following CustomObject fields.

To make the fields on your custom metadata types unique and indexable, mark your fields as `Unique` and `ExternalId`.

Field Name	Field Type	Description
description	string	A description of the custom metadata type. This field can contain a maximum of 1,000 characters.
fields	<a href="#">CustomField[]</a>	Represents one or more custom fields in the custom metadata type.
gender	Gender	Indicates the gender of the noun that represents the object. This field is used for languages where words need different treatment depending on their gender.
label	string	A label that represents the object throughout the Salesforce Setup user interface. Custom metadata types are visible only through the recently used objects list on the Lightning Platform Home Page and in the packaging user interface.
pluralLabel	string	The plural version of the label value.
startsWith	StartsWith (enumeration of type string)	Indicates whether the noun starts with a vowel, a consonant, or a special character. This field is used for languages where words need different treatment depending on their first character.
visibility	SetupObjectVisibility (enumeration of type string)	<p>This field returns the visibility of a custom metadata type. The following values are valid:</p> <ul style="list-style-type: none"> <li>• <code>Public</code>—If the custom setting or custom metadata type is packaged, it's accessible to all subscribing organizations.</li> <li>• <code>Protected</code>—If the custom object, custom setting, or custom metadata type is in a managed package, it's accessible only to the developer org. Subscribing orgs can't access it.</li> <li>• <code>PackageProtected</code>—If the custom metadata type is <code>PackageProtected</code>, it's only accessible by the custom Apex code in the package. Use this value to secure secrets such as API access keys and security tokens. Available in API version 47.0 and later.</li> </ul> <p>The default value is <code>Public</code>.</p>

## Declarative Metadata Sample Definition

In this example, Picklists R Us creates its Reusable Picklist custom metadata type by deploying a file in the objects folder, named `ReusablePicklistOption__mdt.object`, with these contents.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <fields>
    <fullName>AlphaSort__c</fullName>
    <defaultValue>>false</defaultValue>
```

```

        <externalId>false</externalId>
        <label>Sorted Alphabetically</label>
        <type>Checkbox</type>
    </fields>
    <label>Reusable Picklist</label>
    <pluralLabel>Reusable Picklist</pluralLabel>
    <visibility>Public</visibility>
</CustomObject>

```

This excerpt from a `package.xml` file shows the use of dot notation and the `__mdt` suffix. If you're using a namespace, for example `picklist1234`, the full name of `ReusablePicklistOption__mdt` would be `picklist1234__ReusablePicklistOption__mdt`.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
...
  <types>
    <members>PicklistTest__c.PicklistTestField__c</members>
    <members>ReusablePicklistOption__mdt.Picklist__c</members>
    <members>ReusablePicklistOption__mdt.SortOrder__c</members>
    <members>PicklistUsage__mdt.Field__c</members>
    <members>PicklistUsage__mdt.Picklist__c</members>
    <members>PicklistUsage__mdt.SObjectType__c</members>
    <members>ReusablePicklist__mdt.AlphaSort__c</members>
    <name>CustomField</name>
  </types>
...
  <types>
    <members>PicklistTest__c</members>
    <members>ReusablePicklistOption__mdt</members>
    <members>PicklistUsage__mdt</members>
    <members>ReusablePicklist__mdt</members>
    <name>CustomObject</name>
  </types>
...
  <version>62.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

### 1. CustomMetadata

Represents a record of a custom metadata type.

## CustomMetadata

Represents a record of a custom metadata type.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

CustomMetadata components have the suffix `.md` and are stored in the `customMetadata` folder. Unlike custom metadata types, custom metadata records don't have a double-underscore suffix. Custom metadata record names are prepended with their custom metadata type name, excluding the `__mdt` suffix but including the namespace of any types in an installed managed package.

## Version

CustomMetadata components are available in API version 31.0 and later.

## Special Access Rules

To create custom metadata records, you must have the "Customize Application" permission.

## Fields

Field Name	Field Type	Description
<code>description</code>	string	A description of the custom metadata record. This field can contain a maximum of 1,000 characters.
<code>label</code>	string	A label that represents the object throughout the Salesforce Setup user interface. Custom metadata records are currently visible only through the packaging user interface.
<code>protected</code>	boolean	<p>Boolean. Indicates whether the record is protected (true) or not (false). When a custom metadata type is released in a managed package, access is limited in specific ways.</p> <ul style="list-style-type: none"> <li>• Code that's in the same managed package as custom metadata records can read the records.</li> <li>• Code that's in the same managed package as custom metadata types can read the records that belong to that type.</li> <li>• Code that's in a managed package that doesn't contain either the type or the protected record can't read the protected records.</li> <li>• Code that the subscriber creates and code that's in an unmanaged package can't read the protected records.</li> <li>• The developer can modify protected records with a package upgrade or by using the Metadata Apex classes (if the Apex code is in the same namespace as either the records or their type). The subscriber can't read or modify protected records. The developer name of a protected record can't be changed after release.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>The subscriber can't create records of a protected type.</li> </ul> <p>Records that are hidden by these access rules are also unavailable to REST, SOAP, SOQL, and Setup.</p>
values	CustomMetadataValue[]	Represents one or more values for custom fields on the custom metadata record.

## CustomMetadataValue

Represents a value for a custom field on the custom metadata record.

Field Name	Field Type	Description
field	string	Required. The non-object-qualified name of a custom field in the custom metadata type. This value corresponds to the name of a field on the custom metadata record's custom metadata type. Include the namespace (if the type is from a managed package) and the __c suffix. The name of the custom metadata type isn't required. For example, picklist1234__AlphaSort__c.
value	Any type	The value on a custom metadata record. Where fields are EntityDefinition and FieldDefinition, the qualified API names of the entity and the field it points to. This value can be null.

## Declarative Metadata Sample Definitions

The following is an example of a CustomMetadata component. In this example, the sample app TravelApp deploys a Planets picklist, specifies its sort order, and adds picklist items to it.

Assuming Picklists R Us's namespace is picklist1234, to define the Planets picklist, TravelApp deploys a file in the customMetadata folder, named picklist1234\_\_ReusablePicklist.Planets.md, with these contents. The xsi:type attribute specifies the type for the value of the AlphaSort\_\_c checkbox field.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomMetadata xmlns="http://soap.sforce.com/2006/04/metadata"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema">
  <description>All the planets in the solar system. Does not
    include asteroids.</description>
  <label>Planets</label>
  <values>
    <field>picklist1234__AlphaSort__c</field>
    <value xsi:type="xsd:boolean">>false</value>
  </values>
</CustomMetadata>
```

Picklists R Us creates its Reusable Picklist Option custom metadata type by deploying a file in the objects folder, named `ReusablePicklist__mdt.object`, with these contents.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <fields>
    <fullName>Picklist__c</fullName>
    <externalId>>false</externalId>
    <label>Picklist</label>
    <length>40</length>
    <required>>true</required>
    <type>Text</type>
    <unique>>false</unique>
  </fields>
  <fields>
    <fullName>SortOrder__c</fullName>
    <externalId>>false</externalId>
    <label>Non-Alphabetical Sort Order</label>
    <precision>3</precision>
    <scale>0</scale>
    <required>>false</required>
    <type>Number</type>
    <unique>>false</unique>
  </fields>
  <label>Reusable Picklist Option</label>
  <pluralLabel>Reusable Picklist Options</pluralLabel>
</CustomObject>
```

To define the Mars picklist item, TravelApp deploys a file, named `picklist1234__ReusablePicklistOption.Mars.md`, with these contents. This component file specifies types that apply to the `ReusablePicklistOption__mdt` custom fields.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomMetadata xmlns="http://soap.sforce.com/2006/04/metadata"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema">
  <label>Mars</label>
  <values>
    <field>picklist1234__Picklist__c</field>
    <value xsi:type="xsd:string">Planets</value>
  </values>
  <values>
    <field>picklist1234__SortOrder__c</field>
    <value xsi:type="xsd:int">4</value>
  </values>
</CustomMetadata>
```

To define the Motel6 picklist item, TravelApp deploys a file, named `picklist1234__ReusablePicklistOption.Motel6.md`, with these contents.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomMetadata xmlns="http://soap.sforce.com/2006/04/metadata"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema">
  <label>Motel 6</label>
  <values>
```

```

    <field>picklist1234__Picklist__c</field>
    <value xsi:type="xsd:string">Hotels</value>
  </values>
</CustomMetadata>

```

Because the `SortOrder__c` field isn't required, this file doesn't require a value for `SortOrder__c`. Alternatively, the file could have explicitly specified a value with `xsi:nil` to ensure that `SortOrder__c` was cleared of any previous value.

```

<?xml version="1.0" encoding="UTF-8"?>
<CustomMetadata xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:xsd="http://www.w3.org/2001/XMLSchema">
  <label>Motel 6</label>
  <values>
    <field>picklist1234__Picklist__c</field>
    <value xsi:type="xsd:string">Hotels</value>
  </values>
  <values>
    <field>picklist1234__SortOrder__c</field>
    <value xsi:nil="true" />
  </values>
</CustomMetadata>

```

This excerpt from a `package.xml` file illustrates the inclusion of custom metadata types and their namespaces in custom metadata records' names. Assume that Picklists R Us's namespace is `picklist1234`.

```

<?xml version="1.0" encoding="UTF-8"?>
<package xmlns="http://soap.sforce.com/2006/04/metadata">
...
  <types>
    <members>picklist1234__ReusablePicklist.Hotels</members>
    <members>picklist1234__ReusablePicklist.Planets</members>
    <members>picklist1234__ReusablePicklistOption.Bellagio</members>
    <members>picklist1234__ReusablePicklistOption.Motel6</members>
    <members>picklist1234__ReusablePicklistOption.Mercury</members>
    <members>picklist1234__ReusablePicklistOption.Venus</members>
    <members>picklist1234__ReusablePicklistOption.Earth</members>
    <members>picklist1234__PicklistUsage.BookingHotel</members>
    <members>
      picklist1234__PicklistUsage.DestinationPlanetPL
    </members>
    <members>picklist1234__PicklistUsage.PlanetVisitedPl</members>
    <name>CustomMetadata</name>
  </types>
...
</package>

```

TravelApp, Inc.'s `package.xml` file uses a wildcard to install custom metadata, as is shown in this excerpt from their `package.xml` file. Unless you want to deploy or retrieve specific records, using a wildcard is easier than listing all of your custom metadata records in your `package.xml` file.

```

<types>
  <members>*</members>
  <name>CustomMetadata</name>
</types>

```

If the custom metadata is from a managed package, the name after the dot in the `package.xml` file—between the two dots in the file name—is qualified by the managed package’s namespace. For example, assuming TravelApp uses the namespace `travelApp1234`, the first member element in the TravelApp `package.xml` file appears to Galactic Tours as:

```
<members>picklist1234__ReusablePicklist.travelApp1234__Hotels</members>
```

Here’s another example. In this case, we have an instance of custom metadata record, whose `EntityDefinition` field points to a custom object named `SalesAgreement__c`. The `FieldDefinition` field points to the custom field `CustomerReference__c` on `SalesAgreement__c`. You can deploy new custom metadata records and retrieve existing ones with `EntityDefinition` and `FieldDefinition` fields using qualified API names of custom and standard entities and their fields.

```
<?xml version="1.0" encoding="UTF-8"?><values>
<field>EntityDefintionField__c</field>
<value xsi:type="xsd:string">v1__SalesAgreement__c</value>
</values>
<values>
<field>FieldDefinitionField__c</field>
<value xsi:type="xsd:string">v1__CustomerReference__c</value>
</values>
```

## Usage

When specifying the `value` field in the `CustomMetadataValue` subtype, specify an appropriately typed object that’s based on your field type definition. In declarative metadata definitions for `CustomMetadataValue`, use the `xsi:type` attribute of the value element. For example, to specify a boolean value: `<value xsi:type="xsd:boolean">true</value>`. Valid `xsi:type` attributes are:

Custom metadata value	Custom field definition
<code>xsi:type="xsd:boolean"</code>	Checkbox
<code>xsi:type="xsd:date"</code>	Date
<code>xsi:type="xsd:dateTime"</code>	Date/Time
<code>xsi:type="xsd:picklist"</code>	Picklist
<code>xsi:type="xsd:string"</code>	Text
<code>xsi:type="xsd:string"</code>	Phone
<code>xsi:type="xsd:string"</code>	TextArea
<code>xsi:type="xsd:string"</code>	URL
<code>xsi:type="xsd:string"</code>	Email
<code>xsi:type="xsd:int"</code>	Number/Percent, with scale equal to 0
<code>xsi:type="xsd:double"</code>	Number/Percent, with scale not equal to 0

You can also omit the `xsi:type` attribute. For example, `<value>true</value>`.

Although this attribute must be specified for any `CustomMetadataValue`, you can use an element with the `xsi:nil` attribute set to `true` to explicitly set the field’s value to `null`. For example, `<value xsi:nil="true"/>`.

Using `null` field values differs from leaving out the `CustomMetadataValue` for a particular field entirely. If you leave out the `CustomMetadataValue`, the value of the field doesn't change. The field's value is `null` for newly deployed custom metadata records and left at its previous value for updated custom metadata records.

When you retrieve `CustomMetadataValue` objects, the `value` field of the returned object holds a value of the correct type, specified by `xs:type` in the case of declarative metadata definitions.

Custom number fields are stored as double values. When you retrieve a value from a Number type field with a scale 0, you will see a decimal number. For example, if the value in UI is 1234567, a query through the API returns 1234567.0.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CustomNotificationType

---

Represents the metadata associated with a custom notification type.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

For more information about custom notifications, see Custom Notification Actions. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Declarative Metadata File Suffix and Directory Location

The file suffix is `.notiftype` for the notification type definition. Notification types are stored in the `notificationtypes` directory of the corresponding package directory.

## Version

`CustomNotificationType` components are available in API version 46.0 and later.

## Fields

Field Name	Field Type	Description
<code>customNotifTypeName</code>	string	Required. Specifies a notification type name. Maximum number of characters: 80.
<code>description</code>	string	Specifies a general description of the notification type, which is displayed with the notification type name. Maximum number of characters: 255.
<code>desktop</code>	boolean	Required. Indicates whether the desktop delivery channel is enabled ( <code>true</code> ) or not ( <code>false</code> ).
<code>masterLabel</code>	string	Required. Specifies the label for the notification type.
<code>mobile</code>	boolean	Required. Indicates whether the mobile delivery channel is enabled ( <code>true</code> ) or not ( <code>false</code> ).

Field Name	Field Type	Description
slack	boolean	Reserved for future use.

## Declarative Metadata Sample Definition

The following is a definition of a custom notification type that is enabled for desktop and mobile.

```
<CustomNotificationType xmlns="http://soap.sforce.com/2006/04/metadata">
  <customNotifTypeName>Custom Notification</customNotifTypeName>
  <desktop>true</desktop>
  <masterLabel>Custom Notification</masterLabel>
  <mobile>true</mobile>
</CustomNotificationType>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CustomObject

Represents a custom object that stores data unique to your org or an external object that maps to data stored outside your org.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

Specify all relevant fields when you create or update a custom object. You can't update a single field on the object. For more information about custom objects, see [Store Information That's Unique to Your Organization](#) in Salesforce Help.

You can also use this metadata type to work with customizations of standard objects, such as accounts. For an example, see the section on Standard Objects in [Sample package.xml Manifest Files](#) in the *Metadata API Developer Guide*

All metadata components have a `fullName` field, which must be fully specified for any custom object.

For example, the following are fully specified names for a standard object and a custom object respectively:

```
Account
MyCustomObject__c
```

And the following is a fully specified name for an external object:

```
MyExternalObject__x
```

For sample Java code that creates a custom object, see [Step 3: Walk Through the Java Sample Code](#) on page 16.

## Declarative Metadata File Suffix and Directory Location

Custom object names are automatically appended with `__c`. The file suffix is `.object` for the custom object or standard object file.

External object names are automatically appended with `__x`. The file suffix is `.object` for the external object file.

Custom, standard, and external objects are stored in the `objects` folder in the corresponding package directory.

 **Note:** Retrieving a component of this metadata type in a project makes the component appear in any Profile and PermissionSet components that are retrieved in the same package.

## Version

Custom objects are available in API version 10.0 and later. External objects are available in API version 32.0 and later.

## Fields

Unless otherwise noted, all fields are creatable, filterable, and nillable.

Field Name	Field Type	Description
<code>actionOverrides</code>	<a href="#">ActionOverride</a> []	A list of action overrides on the object. This field is available in API version 18.0 and later.
<code>allowInChatterGroups</code>	boolean	Indicates whether records of this custom object type can be added to Chatter groups. This field is available in API version 34.0 and later.
<code>businessProcesses</code>	<a href="#">BusinessProcess</a> []	A list of business processes associated with the object. This field is available in API version 17.0 and later.
<code>compactLayoutAssignment</code>	string	The compact layout assigned to the object. This field is available in API version 29.0 and later. This field is available for external objects in API version 42.0 and later.
<code>compactLayouts</code>	<a href="#">CompactLayout</a> []	A list of compact layouts associated with the object. This field is available in API version 29.0 and later. This field is available for external objects in API version 42.0 and later.
<code>customHelp</code>	string	The s-control that contains the help content if the object has customized help content. This field is available in API version 14.0 and later.
<code>customHelpPage</code>	string	The Visualforce page that contains the help content if the object has customized help content. This field is available in API version 16.0 and later.
<code>customSettingsType</code>	CustomSettingsType (enumeration of type string)	When this field is present, this component isn't a custom object, but a custom setting. This field returns the type of custom setting. The following string values are valid: <ul style="list-style-type: none"> <li><code>List</code>—static data stored in cache, accessed as part of your application, and available org-wide.</li> <li><code>Hierarchy</code>—static data stored in cache, accessed as part of your application, and available based on a hierarchy of user, profile, or org. This value is the default.</li> </ul>

Field Name	Field Type	Description
		This field is available in API version 17.0 and later.
<code>customSettingsVisibility</code>	CustomSettingsVisibility (enumeration of type string)	<p>When this field is present, this component isn't a custom object, but a custom setting. This field returns the visibility of the custom setting. The following string values are valid:</p> <ul style="list-style-type: none"> <li><code>Public</code>—if the custom setting is packaged, it's accessible to all subscribing orgs.</li> <li><code>Protected</code>—if the custom setting is in a managed package, it's accessible only to the developer org. Subscribing orgs can't access it. This value is the default.</li> </ul> <p>This field is available in API versions 17.0 through 33.0. In versions 34.0 and later, use the <code>visibility</code> field instead of this field.</p>
<code>dataStewardGroup</code>	string	Removed in API version 47.0.
<code>dataStewardUser</code>	string	Removed in API version 47.0.
<code>deploymentStatus</code>	DeploymentStatus (enumeration of type string)	Indicates the deployment status of the object.
<code>deprecated</code>	boolean	Reserved for future use.
<code>description</code>	string	A description of the object. Maximum of 1000 characters.
<code>enableActivities</code>	boolean	<p>Indicates whether the object is enabled for activities (<code>true</code>) or not (<code>false</code>).</p> <p>Not available for external objects.</p>
<code>enableBulkApi</code>	boolean	<p>When enabled, the object is classified as an Enterprise Application object for usage tracking.</p> <p>When enabled, <code>enableSharing</code> and <code>enableStreamingApi</code> must also be enabled.</p> <p>This field is available in API version 31.0 and later.</p>
<code>enableDivisions</code>	boolean	<p>Indicates whether the object is enabled for divisions (<code>true</code>) or not (<code>false</code>). See <a href="#">Division</a> in the <i>Salesforce Object Reference</i>.</p> <p>.</p>
<code>enableEnhancedLookup</code>	boolean	<p>Indicates whether the object is enabled for enhanced lookups (<code>true</code>) or not (<code>false</code>). In API version 28.0 and later, this field can also be used for the Account, Contact, and User objects. Enhanced lookups provide an updated lookup dialog interface that lets users filter, sort, and page through search results and customize search result columns. For more information about enhanced lookups, see "Enable Enhanced Lookups" in Salesforce Help.</p>

Field Name	Field Type	Description
<code>enableFeeds</code>	boolean	Indicates whether the object is enabled for feed tracking ( <code>true</code> ) or not ( <code>false</code> ). For more information, see “Customize Chatter Feed Tracking” in Salesforce Help.  This field is available in API version 18.0 and later.
<code>enableHistory</code>	boolean	Indicates whether the object is enabled for history tracking ( <code>true</code> ) or not ( <code>false</code> ). Also available for standard objects in API version 29.0 and later. History tracking on the Account object includes person account history tracking.
<code>enableLicensing</code>	boolean	Indicates whether this object is licensed by Salesforce and users require a permission set license for it ( <code>true</code> ) or not ( <code>false</code> ). This field is available in API version 45.0 and later.
<code>enableReports</code>	boolean	Indicates whether the object is enabled for reports ( <code>true</code> ) or not ( <code>false</code> ). Support for external objects is available in API version 38.0 and later.
<code>enableSearch</code>	boolean	Indicates whether the object’s records can be found via SOSL and Salesforce searches. Corresponds to <code>Allow Search</code> in the user interface.  By default, search is disabled for new custom objects. This field is available for custom objects in API version 35.0 and later.  By default, search is disabled for new external objects. However, you can validate and sync an external data source to automatically create external objects. Syncing always enables search on the external object when search is enabled on the external data source, and vice versa. This field is available for external objects in API version 37.0 and later.
<code>enableSharing</code>	boolean	When enabled, the object is classified as an Enterprise Application object for usage tracking.  When enabled, <code>enableBulkApi</code> and <code>enableStreamingApi</code> must also be enabled.  This field is available in API version 31.0 and later.
<code>enableStreamingApi</code>	boolean	When enabled, the object is classified as an Enterprise Application object for usage tracking.  When enabled, <code>enableBulkApi</code> and <code>enableSharing</code> must also be enabled.  This field is available in API version 31.0 and later.
<code>eventType</code>	PlatformEventType (enumeration of type string)	This field applies only to platform events. Indicates the event type. The values are: <ul style="list-style-type: none"> <li><code>HighVolume</code>—For a high-volume platform event.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li><code>StandardVolume</code>—Deprecated. Creating a platform event with this event type is supported and returns an error.</li> </ul> <p>This field is available in API version 41.0 and later.</p>
<code>externalDataSource</code>	string	<p>Required and available for external objects only. The name of the external data source that stores the data for the external object. The data source is represented by the <code>ExternalDataSource</code> component.</p> <p>This field is available in API version 32.0 and later.</p>
<code>externalName</code>	string	<p>Required and available for external objects only. The name of the table in the external data source that contains the data for the external object.</p> <p>This field is available in API version 32.0 and later.</p>
<code>externalRepository</code>	string	<p>Available for Salesforce Connect external objects only. Corresponds to <code>Display URL Reference Field</code> in the user interface.</p> <p>The external object's <code>Display URL</code> standard field values are automatically generated from the external system. For example, with the OData 2.0 adapter for Salesforce Connect, the value is based on the <code>link href</code> that's defined on the OData producer. You can override the default values with the values of a custom field on the same external object. Select the field name, and make sure that the custom field's values are valid URLs.</p> <p>This field is available in API version 32.0 and later.</p>
<code>externalSharingModel</code>	SharingModel (enumeration of type string)	<p>Indicates the external org-wide defaults for the object, which determines the access level for external users.</p> <p>This field is available in API version 31.0 and later.</p>
<code>fields</code>	CustomField[]	Represents one or more fields in the object.
<code>fieldSets</code>	FieldSet	Defines the field set that exists on this object.
<code>fullName</code>	string	<p>Inherited from <code>Metadata</code>, this field is defined in the WSDL for this metadata type. It must be specified when creating, updating, or deleting. See <code>createMetadata()</code> to see an example of this field specified for a call.</p> <p>This value can't be <code>null</code>.</p>
<code>gender</code>	Gender	<p>Indicates the gender of the noun that represents the object. This is used for languages where words need different treatment depending on their gender.</p>

Field Name	Field Type	Description
household	boolean	This field supports relationship groups, a feature available only with Salesforce for Wealth Management. For more information, see “Salesforce for Wealth Management” in Salesforce Help.
historyRetentionPolicy	<a href="#">HistoryRetentionPolicy</a>	Reserved for future use.
indexes	<a href="#">Index[]</a>	Defines the index for a custom big object.
label	string	Label that represents the object throughout the Salesforce user interface.  We recommend that you make object labels unique across all standard, custom, and external objects in the org.
listViews	<a href="#">ListView[]</a>	Represents one or more <i>list views</i> associated with the object.
namedFilter	<a href="#">NamedFilter[]</a>	Represents the metadata associated with a lookup filter. This metadata type is used to create, update, or delete lookup filter definitions. This component has been removed as of API version 30.0 and is only available in previous API versions. The metadata associated with a lookup filter is now represented by the lookupFilter field in the CustomField component.  This field is available in API version 17.0 and later.  This field has been removed as of API version 30.0 and is only available in prior versions. The metadata associated with a lookup filter is now represented by the lookupFilter field in the CustomField component.
nameField	<a href="#">CustomField</a>	Required for custom objects. On external objects, the name field can instead be specified by setting <code>isNameField</code> to <code>true</code> in the CustomField component.  The field that this object's name is stored in. Every custom object must have a name, usually a string or autonumber.  Identifier for the custom object record. This name appears in page layouts, related lists, lookup dialogs, search results, and key lists on tab home pages. By default, this field is added to the custom object page layout as a required field.
pluralLabel	string	Plural version of the <a href="#">label</a> value.  Custom objects require a plural version of the label to ensure that object names are localizable.
profileSearchLayouts	<a href="#">ProfileSearchLayouts</a>	Represents a user profile’s search results layouts for an object. With profile-specific layouts, each user profile can have a different search results layout for an object. Available in API version 47.0 and later.

Field Name	Field Type	Description
<code>publishBehavior</code>	PlatformEventPublishBehavior (enumeration of type string)	<p>This field applies only to platform events. Indicates when platform event messages are published in a Lightning Platform transaction. This field applies to event messages published through the Lightning Platform, such as Apex, Process Builder, and Flow Builder, but not through Salesforce APIs. Valid values are:</p> <ul style="list-style-type: none"> <li><code>PublishAfterCommit</code>—The event message is published only after a transaction commits successfully. If the transaction fails, the event message isn't published.</li> <li><code>PublishImmediately</code>—The event message is published when the publish call executes, regardless of whether the transaction succeeds.</li> </ul> <p>If you don't specify this field, the default value used is <code>PublishImmediately</code>.</p> <p>This field is available in API version 46.0 and later.</p>
<code>recordTypes</code>	<a href="#">RecordType[]</a>	An array of one or more record types defined for this object.
<code>recordTypeTrackFeedHistory</code>	boolean	<p>Indicates whether the record type is enabled for feed tracking (<code>true</code>) or not (<code>false</code>). To set this field to <code>true</code>, the <a href="#">enableFeeds</a> field on the associated <a href="#">CustomObject</a> must also be <code>true</code>. For more information, see “Customize Chatter Feed Tracking” in Salesforce Help.</p> <p>This field is available in API version 19.0 and later.</p>
<code>recordTypeTrackHistory</code>	boolean	<p>Indicates whether history tracking is enabled for this record type (<code>true</code>) or not (<code>false</code>). To set <code>recordTypeTrackHistory</code> to <code>true</code>, the <code>enableHistory</code> field on the associated custom object must also be <code>true</code>.</p> <p>This field is available in API version 19.0 and later.</p>
<code>searchLayouts</code>	<a href="#">SearchLayouts</a>	The <i>Search Layouts</i> related list information for the object.
<code>sharingModel</code>	SharingModel(enumeration of type string)	<p>Indicates the org-wide defaults for the object.</p> <p> <b>Note:</b> Using API version 29.0 and earlier, this field is read-only and can't be set using the Metadata API; you must use the Salesforce user interface. Using API version 30.0 and later, you can set this field for internal users using the API and the Salesforce user interface.</p>
<code>sharingReasons</code>	<a href="#">SharingReason[]</a>	The reasons why the object is being shared.
<code>sharingRecalculations</code>	<a href="#">SharingRecalculation[]</a>	A list of custom sharing recalculations associated with the object.

Field Name	Field Type	Description
<code>startsWith</code>	StartsWith (enumeration of type string)	Indicates whether the noun starts with a vowel, consonant, or is a special character. This is used for languages where words need different treatment depending on the first character. Valid values are listed in <a href="#">StartsWith</a> .
<code>validationRules</code>	<a href="#">ValidationRule</a> []	An array of one or more validation rules on the object.
<code>visibility</code>	SetupObjectVisibility (enumeration of type string)	<p>This field returns the visibility of the custom object, custom setting, or custom metadata type. The following values are valid.</p> <ul style="list-style-type: none"> <li><code>Public</code>—If the custom object, custom setting, or custom metadata type is packaged, it's accessible to all subscribing orgs.</li> <li><code>Protected</code>—If the custom object, custom setting, or custom metadata type is in a managed package, it's accessible only to the developer org. Subscribing orgs can't access it.</li> <li><code>PackageProtected</code>—(Custom metadata type only) If the custom metadata type is <code>PackageProtected</code>, it's only accessible by the custom Apex code in the package. Use this value to secure secrets such as API access keys and security tokens. Available in API version 47.0 and later.</li> </ul> <p>The default value is <code>Public</code>.</p> <p>This field is available in API version 34.0 and later. For custom settings, this field replaces the <code>customSettingsVisibility</code> field.</p>
<code>webLinks</code>	<a href="#">WebLink</a> []	An array of one or more weblinks defined for the object.

## MktDataModelAttributes

This type is a Data Cloud subtype of CustomObject.

Field Name	Field Type	Description
<code>creationType</code>	DefinitionCreationType	Was this object added as a result of the Customer or as part of a Standard Taxonomy.
<code>dataModelTaxonomy</code>	string	When the model is a Standard Data Cloud model, a Reference to the Data Model from which this Object was started. Currently only supports the following strings: if the <code>creationType</code> is Standard, it must be Reference, if <code>creationType</code> is Custom, it must be View.
<code>description</code>	string	A description of the object. This field can contain a maximum of 521 characters. This field is available in API version 55.0 and later.

Field Name	Field Type	Description
<code>isEnabled</code>	boolean	True indicates that the Data Model Object is enabled.
<code>isSegmentable</code>	boolean	True indicates that the Data Model Object can be used as a target for segmentation.
<code>isUsedForMetrics</code>	boolean	Indicates whether the Data Model Object is used for metrics ( <code>true</code> ) or not ( <code>false</code> ). This field is used to include additional attributes on the objects that are not present in the Data Model Object POJO. This field is available in API version 55.0 and later.
<code>objectCategory</code>	string	Reference to the Object Category. For modeling, the value is Profile, Engagement, or Other.
<code>referenceEntityGroup</code>	string	When this is a Standard Object, the Entity Group of the Object from the Reference Model.
<code>referenceEntityName</code>	string	When this is a Standard Object, the Name of the Object from the Reference Model.
<code>referenceEntitySubjectArea</code>	string	When this is a Standard Object, the Subject Area of the Object from the Reference Model.

## MktDataLakeAttributes

Represents how Data Cloud receives the data. MktDataLakeAttributes is a Data Cloud subtype of CustomObject. Its components are available in API version 50.0 and later.

## Special Access Rules

You need an org with Data Cloud license to access this object.

Field Name	Description
<code>creationType</code>	<p><b>Field Type</b> DefinitionCreationType <a href="#">enumeration of type string</a></p> <p><b>Description</b> Indicates how this object is added. Values are:</p> <ul style="list-style-type: none"> <li>• <code>Activation_Audience</code></li> <li>• <code>Bridge</code></li> <li>• <code>Curated</code></li> <li>• <code>Custom</code></li> <li>• <code>Derived</code></li> <li>• <code>Ml_Prediction</code></li> <li>• <code>Segment_Membership</code></li> <li>• <code>Standard</code></li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>System</li> </ul>
isEnabled	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the Landing Object is enabled.</p>
objectCategory	<p><b>Field Type</b> string</p> <p><b>Description</b> Reference to the Object Category. For landing object, these would be Profile, Behavioral, Other.</p>

## Declarative Metadata Additional Components

CustomObject definitions can include additional components defined in the custom object for declarative metadata. The following components are defined in the CustomObject:

- [ActionOverride](#)
- [BusinessProcess](#)
- [CompactLayout](#)
- [CustomField](#)
- [FieldSet](#)
- [HistoryRetentionPolicy](#)
- [ListView](#)
- [RecordType](#)
- [SearchLayouts](#)
- [SharingReason](#)
- [SharingRecalculation](#)
- [ValidationRule](#)
- [WebLink](#)

## Declarative Metadata Sample Definition

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <deploymentStatus>Deployed</deploymentStatus>
  <description>test object with one field for eclipse ide testing</description>
  <fields>
    <fullName>Comments__c</fullName>
    <description>add your comments about this object here</description>
    <inlineHelpText>This field contains comments made about this object</inlineHelpText>
  </fields>
</CustomObject>
```

```

        <label>Comments</label>
        <length>32000</length>
        <type>LongTextArea</type>
        <visibleLines>30</visibleLines>
    </fields>
    <label>MyFirstObject</label>
    <nameField>
        <label>MyFirstObject Name</label>
        <type>Text</type>
    </nameField>
    <pluralLabel>MyFirstObjects</pluralLabel>
    <sharingModel>ReadWrite</sharingModel>
</CustomObject>

```

The following is the metadata definition of an external object for Salesforce Connect.

```

<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <actionOverrides>
    <actionName>CancelEdit</actionName>
    <type>Default</type>
  </actionOverrides>
  <actionOverrides>
    <actionName>Delete</actionName>
    <type>Default</type>
  </actionOverrides>
  <actionOverrides>
    <actionName>Edit</actionName>
    <type>Default</type>
  </actionOverrides>
  <actionOverrides>
    <actionName>Follow</actionName>
    <type>Default</type>
  </actionOverrides>
  <actionOverrides>
    <actionName>List</actionName>
    <type>Default</type>
  </actionOverrides>
  <actionOverrides>
    <actionName>New</actionName>
    <type>Default</type>
  </actionOverrides>
  <actionOverrides>
    <actionName>SaveEdit</actionName>
    <type>Default</type>
  </actionOverrides>
  <actionOverrides>
    <actionName>Tab</actionName>
    <type>Default</type>
  </actionOverrides>
  <actionOverrides>
    <actionName>View</actionName>
    <type>Default</type>
  </actionOverrides>
  <deploymentStatus>InDevelopment</deploymentStatus>

```

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file for Field Sets and Record Types but not for other components. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

1. [ActionOverride](#)  
Represents an action override on a standard or custom object. Use it to create, update, edit, or delete action overrides. You can access ActionOverride only by accessing its encompassing CustomObject.
2. [BusinessProcess](#)  
The BusinessProcess metadata type enables you to display different picklist values for users based on their profile.
3. [CompactLayout](#)  
Represents the metadata associated with a compact layout. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.
4. [CustomField](#)  
Represents the metadata associated with a field. Use this metadata type to create, update, or delete custom field definitions on standard, custom, and external objects or standard field definitions on standard objects.
5. [FieldSet](#)  
Represents a field set. A field set is a grouping of fields. For example, you could have a field set that contains fields describing a user's first name, middle name, last name, and business title.
6. [HistoryRetentionPolicy](#)  
Represents the policy for archiving field history data. When you set a policy, you specify the number of months that you want to keep field history in Salesforce before archiving it. By default, when Field Audit Trail is enabled, all field history is retained.
7. [Index](#)  
Represents an index defined within a custom big object. Use this metadata type to define the composite primary key (index) for a custom big object. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.
8. [ListView](#)  
ListView allows you to see a filtered list of records, such as contacts, accounts, or custom objects.
9. [NamedFilter](#)  
Represents the metadata associated with a lookup filter. This metadata type is used to create, update, or delete lookup filter definitions. This component has been removed as of API version 30.0 and is only available in previous API versions. The metadata associated with a lookup filter is now represented by the `lookupFilter` field in the CustomField component.
10. [Picklist \(Including Dependent Picklist\)](#)  
Deprecated. Represents a picklist (or dependent picklist) definition for a custom field in a custom object or a custom or standard field in a standard object, such as an account.
11. [ProfileSearchLayouts](#)  
Represents a user profile's search results layouts for an object. `ProfileSearchLayouts` are similar to `SearchLayouts`. However, with profile-specific layouts, each user profile can have a different search results layout for an object.

#### 12. [RecordType](#)

Represents the metadata associated with a record type. Record types let you offer different business processes, picklist values, and page layouts to different users. Use this metadata type to create, update, or delete record type definitions for a custom object.

#### 13. [SearchLayouts](#)

Represents the metadata associated with the search layouts for an object. You can customize which fields to display for users in search results, search filter fields, lookup dialogs, and recent record lists on tab home pages. You can access SearchLayouts only by accessing its encompassing CustomObject.

#### 14. [SharingReason](#)

Represents an Apex sharing reason, which is used to indicate why sharing was implemented for a custom object. Apex managed sharing allows developers to use Apex to programmatically share custom objects. When you use Apex managed sharing to share a custom object, only users with the "Modify All Data" permission can add or change the sharing on the custom object's record, and the sharing access is maintained across record owner changes.

#### 15. [SharingRecalculation](#)

Represents Apex classes that recalculate the Apex managed sharing for a specific custom object.

#### 16. [ValidationRule](#)

Represents a validation rule, which is used to verify that the data a user enters in a record is valid and can be saved. A validation rule contains a formula or expression that evaluates the data in one or more fields and returns a value of `true` or `false`. Validation rules also include an error message that your client application can display to the user when the rule returns a value of `true` due to invalid data.

#### 17. [WebLink](#)

Represents a custom button or link defined in a custom object.

#### 18. [Metadata Field Types](#)

These field types extend the field types described in the *Salesforce Object Reference*.

## ActionOverride

Represents an action override on a standard or custom object. Use it to create, update, edit, or delete action overrides. You can access ActionOverride only by accessing its encompassing CustomObject.

## Declarative Metadata File Suffix and Directory Location

Action overrides are defined as part of a standard or custom object.

## Version

Action overrides are available in API version 18.0 and later. As of Summer '13, action overrides can be applied to both standard and custom objects. Previously, action overrides only applied to custom objects.

## Fields

Unless otherwise noted, all fields are creatable, filterable, and nillable.

Field Name	Field Type	Description
<code>actionName</code>	string	<p>Required. The possible values are the same as the actions you can override:</p> <ul style="list-style-type: none"> <li>• <code>accept</code></li> <li>• <code>clone</code></li> <li>• <code>delete</code></li> <li>• <code>edit</code></li> <li>• <code>list</code></li> <li>• <code>new</code></li> <li>• <code>tab</code></li> <li>• <code>view</code></li> </ul>
<code>comment</code>	string	Any comments you want associated with the override.
<code>content</code>	string	<p>Set this field if <code>type</code> is set to <code>flexipage</code>, <code>lightningcomponent</code>, <code>scontrol</code>, or <code>visualforce</code>. It refers to the name of the Lightning page, Lightning component, s-control, or Visualforce page to use as the override. To reference installed components, use this format:</p> <p><b><code>Component_namespace__Component_name</code></b>.</p>
<code>formFactor</code>	FormFactor (enumeration of type string)	<p>The size of the page being overridden.</p> <p>If the <code>type</code> field is set to <code>flexipage</code>, set this field to <code>Large</code> to override the View action with a Lightning page in Lightning Experience.</p> <p>The <code>Large</code> value represents the Lightning Experience desktop environment and is valid only for the <code>flexipage</code> and <code>lightningcomponent</code> types. The <code>Small</code> value represents the Salesforce mobile app on a phone or tablet. The <code>Medium</code> value is reserved for future use. The <code>null</code> value (which is the same as specifying no value) represents Salesforce Classic.</p> <p>This field is available in API version 37.0 and later and is part of the feature for creating and editing record pages in Lightning Experience.</p> <p>Lightning component overrides return different <code>FormFactor</code> values depending on the API version used.</p> <ul style="list-style-type: none"> <li>• In API version 41.0 and earlier, Lightning component overrides return only the <code>null</code> value (no value), representing the Salesforce Classic environment.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>In API version 42.0, if you specify different Lightning component overrides for Lightning Experience and mobile, one component is selected randomly for both overrides and its <code>FormFactor</code> value is returned. If there's a conflict between Lightning components, and a Visualforce page override is also specified for Salesforce Classic, the Visualforce page takes precedence.</li> <li>In API version 43.0 and later, a Lightning component override for Lightning Experience returns the <code>Large</code> value and a Lightning component override for mobile returns the <code>Small</code> value, as expected.</li> </ul>
<code>skipRecordTypeSelect</code>	boolean	Set this field to <code>true</code> if you prefer that any new records created by this action override aren't forwarded to the record type selection page. This field is only valid if the <code>actionName</code> is a "create" type (like <code>new</code> ), and <code>type</code> is set to <code>visualforce</code> . This field is available in API version 21.0 and later.
<code>type</code>	ActionOverrideType (enumeration of type string)	Required. Represents the type of action override. Valid values are described in <a href="#">ActionOverrideType</a> .

## ActionOverrideType

[ActionOverrideType](#) on page 614 is an enumeration of type string that defines which kind of action override to use. The valid values are:

- `default`—The override uses a custom override provided by an installed package. If there isn't one available, the standard Salesforce behavior is used.
- `flexipage`—The override uses behavior from a Lightning page, and is only valid for the View action in Lightning Experience.
- `lightningcomponent`—The override uses behavior from a Lightning component.
- `scontrol`—The override uses behavior from an s-control.
- `standard`—The override uses regular Salesforce behavior.
- `visualforce`—The override uses behavior from a Visualforce page.

**Note:** Existing s-controls can be used as overrides for Salesforce Classic under certain conditions. However, s-controls have been deprecated since the Spring '09 release. We recommend using Visualforce pages instead.

## Usage

You can't delete ActionOverrides by deploying with `destructiveChange.xml`. To delete an ActionOverride, retrieve the CustomObject. In the definition file, find the `<ActionOverrides>` section, and remove the `<content>` row. Then, change the `<type>` value in that same section to `Default`. Do this for every override you want to reset. After making the changes, rezip the folder and deploy.

You can remove one override at a time each with its own deploy, or you can remove multiple overrides in a single deploy. However, we recommend that you do a fresh retrieve every time you want to delete a new override. Don't use a previously retrieved file.

Org default flexipage override assignment metadata can't be retrieved from a managed package.

## Declarative Metadata Sample Definitions

You can define action overrides, as in these examples for the Edit action.

A Visualforce page override for Salesforce Classic:

```
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <actionOverrides>
    <actionName>edit</actionName>
    <type>visualforce</type>
    <content>myEditVFPage</content>
    <comment>This edit action is a lot safer.</comment>
  </actionOverrides>
</CustomObject>
```

This example includes no value for FormFactor. Using no value is the same as using the null value, which represents Salesforce Classic.

A Lightning component override for Lightning Experience:

```
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <actionOverrides>
    <actionName>edit</actionName>
    <type>lightningcomponent</type>
    <content>myEditLightningComponent</content>
    <formFactor>Large</formFactor>
    <comment>This edit action is a lot safer.</comment>
  </actionOverrides>
</CustomObject>
```

A Lightning component override for the Salesforce mobile app:

```
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <actionOverrides>
    <actionName>edit</actionName>
    <type>lightningcomponent</type>
    <content>myEditLightningComponent</content>
    <formFactor>Small</formFactor>
    <comment>This edit action is a lot safer.</comment>
  </actionOverrides>
</CustomObject>
```

When overrides are included in a managed package, the overrides are represented as default type in the metadata. Calling `retrieve()` presents the following:

```
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <actionOverrides>
    <actionName>edit</actionName>
    <type>default</type>
  </actionOverrides>
</CustomObject>
```

If you subscribe to a managed package with default overrides, you can replace the default override behavior by editing the XML. For example, to replace the Visualforce page override with the Salesforce standard page for Salesforce Classic, use:

```
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <actionOverrides>
    <actionName>edit</actionName>
    <type>standard</type>
  </actionOverrides>
</CustomObject>
```

```

    </actionOverrides>
</CustomObject>

```

To set a Lightning page action override on the View standard button in Lightning Experience, use:

```

<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <actionOverrides>
    <actionName>View</actionName>
    <content>myLightningPage</content>
    <formFactor>Large</formFactor>
    <type>flexipage</type>
  </actionOverrides>
</CustomObject>

```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[CustomObject](#)

## BusinessProcess

The BusinessProcess metadata type enables you to display different picklist values for users based on their profile.

Multiple business processes allow you to track separate sales, support, and lead lifecycles. A sales, support, lead, or solution process is assigned to a record type. The record type determines the user profiles that are associated with the business process.

 **Important:** Don't use business processes as an access control mechanism. Profile assignment governs create and edit access for business process but doesn't govern read access. For example, a user assigned to a profile that isn't enabled for a particular business process can't create or edit it, but they can read the business process record.

Users with access to a business process can read all information it stores. Don't store sensitive information in the business process description, name, or picklist values. Instead, store sensitive information in a separate object or fields to which you've applied appropriate access controls.

## Declarative Metadata File Suffix and Directory Location

Business processes are defined as part of the custom object or standard object definition. See [CustomObject](#) for more information.

## Version

[BusinessProcess](#) on page 616 components are available in API version 17.0 and later.

## Special Access Rules

Access to this object requires the View Setup and Configuration permission.

## Fields

Field	Field Type	Description
description	string	Description for the business process.
fullName	string	Required. The name used as a unique identifier for API access. This field is inherited from the <a href="#">Metadata</a> component, but the string it contains is created differently than the <code>fullName</code> strings for other types. For a <code>fullName</code> string <a href="#">BusinessProcess</a> on page 616, the <code>fullName</code> is created combining the Entity Name and Business Process Name. For example, for a business process called "Bulk Orders" for opportunities, the <code>fullName</code> would be <code>Opportunity.Bulk Orders</code> .
isActive	boolean	Indicates if the business process is active ( <code>true</code> ) or not ( <code>false</code> ).
namespacePrefix	string	The namespace of the developer organization where the package was created.
values	<a href="#">PicklistValue[]</a>	A list of picklist values associated with this business process.

## Declarative Metadata Sample Definition

The following is a sample XML definition of a lead business process.

```

<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
....
  <businessProcesses>
    <fullName>HardwareLeadProcess</fullName>
    <description>Lead Process for hardware division</description>
    <isActive>true</isActive>
    <values>
      <fullName>Closed - Converted</fullName>
      <default>>false</default>
    </values>
    <values>
      <fullName>CustomLeadStep1</fullName>
      <default>>false</default>
    </values>
    <values>
      <fullName>CustomLeadStep2</fullName>
      <default>>false</default>
    </values>
    <values>
      <fullName>Open - Not Contacted</fullName>
      <default>>false</default>
    </values>
    <values>
      <fullName>Working - Contacted</fullName>
      <default>>true</default>
    </values>
  </businessProcesses>
</CustomObject>

```

```

    </values>
  </businessProcesses>
  ....
</CustomObject>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file only when a [RecordType](#) on page 651 is specified. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Salesforce DX Developer Guide: BusinessProcessGroup](#)  
[CustomObject](#)

## CompactLayout

Represents the metadata associated with a compact layout. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

A compact layout displays a record's key fields at a glance in the Salesforce mobile app, Lightning Experience, and in the Outlook and Gmail integrations.

Compact layouts support all field types except:

- text area
- long text area
- rich text area
- multi-select picklist

For more information on compact layouts, see [Compact Layouts](#) in the Salesforce Help.

## File Suffix and Directory Location

Compact layouts are defined as part of the custom object, standard object, or external object definition. See [CustomObject](#) for more information.

## Version

CompactLayout components are available in API version 29.0 and later. CompactLayout components are available for external objects in API version 42.0 and later.

## Fields

Field Name	Field Type	Description
<code>fields</code>	string	The fields assigned to the compact layout. Their order represents the prioritization given to them when defining the compact layout.
<code>label</code>	string	Label that represents the object throughout the Salesforce user interface.

## Declarative Metadata Sample Definition

The following is an example of a CompactLayout component:

```
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <actionOverrides>
    <actionName>Accept</actionName>
    <type>Default</type>
  </actionOverrides>
  <actionOverrides>
    <actionName>Clone</actionName>
    <type>Default</type>
  </actionOverrides>
  <actionOverrides>
    <actionName>Delete</actionName>
    <type>Default</type>
  </actionOverrides>
  <actionOverrides>
    <actionName>Edit</actionName>
    <type>Default</type>
  </actionOverrides>
  <actionOverrides>
    <actionName>List</actionName>
    <type>Default</type>
  </actionOverrides>
  <actionOverrides>
    <actionName>New</actionName>
    <type>Default</type>
  </actionOverrides>
  <actionOverrides>
    <actionName>Tab</actionName>
    <type>Default</type>
  </actionOverrides>
  <actionOverrides>
    <actionName>View</actionName>
    <type>Default</type>
  </actionOverrides>
  <compactLayouts>
    <fullName>testCompactLayout</fullName>
    <fields>textfield__c</fields>
    <label>testCompactLayoutLabel</label>
  </compactLayouts>
  <compactLayoutAssignment>SYSTEM</compactLayoutAssignment>
  <deploymentStatus>Deployed</deploymentStatus>
  <enableActivities>false</enableActivities>
  <enableFeeds>false</enableFeeds>
  <enableHistory>false</enableHistory>
  <enableReports>false</enableReports>
  <fields>
    <fullName>textfield__c</fullName>
    <externalId>>false</externalId>
    <label>textfield</label>
    <length>255</length>
    <required>false</required>
    <type>Text</type>
  </fields>
</CustomObject>
```

```

    <unique>false</unique>
</fields>
<label>customObj</label>
<nameField>
  <label>customObj Name</label>
  <type>Text</type>
</nameField>
<pluralLabel>customObjs</pluralLabel>
<recordTypes>
  <fullName>RT1</fullName>
  <active>true</active>
  <label>RT1</label>
  <compactLayoutAssignment>testCompactLayout</compactLayoutAssignment>
</recordTypes>
<recordTypes>
  <fullName>RT2</fullName>
  <active>true</active>
  <label>RT2</label>
</recordTypes>
<searchLayouts/>
<sharingModel>ReadWrite</sharingModel>
</CustomObject>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CustomField

Represents the metadata associated with a field. Use this metadata type to create, update, or delete custom field definitions on standard, custom, and external objects or standard field definitions on standard objects.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Only standard fields that you can customize are supported, that is, standard fields to which you can add help text or enable history tracking or Chatter feed tracking. Other standard fields aren't supported, including system fields (such as `CreatedById` or `LastModifiedDate`) and autonumber fields. Some standard picklist fields aren't supported. See [Unsupported Metadata Types](#). By default, a custom object doesn't have any standard fields that are customizable.

Specify the full name whenever you create or update a field. For example, a custom field on a custom object:

```
MyCustomObject__c.MyCustomField__c
```

An example of a custom field on a standard object:

```
Account.MyAcctCustomField__c
```

An example of a standard field on a standard object:

```
Account.Phone
```

An example of a custom field on an external object:

```
MyExternalObject__x.MyCustomField__c
```

 **Note:** In Metadata API, external objects are represented by the CustomObject metadata type.

These custom field types aren't available for external objects.

- Auto-number (available only with the cross-org adapter for Salesforce Connect)
- Currency (available only with the cross-org adapter for Salesforce Connect)
- Formula
- Location
- Master-detail relationship
- Picklist and multi-select picklist (available only with the cross-org adapter for Salesforce Connect)
- Roll-up summary
- Text (encrypted)
- Text Area (rich)

## Declarative Metadata File Suffix and Directory Location

Custom fields are user-defined fields and are part of the custom object or standard object definition. See [CustomObject](#) for more information. Standard fields are predefined on standard objects.

 **Note:** Retrieving a component of this metadata type in a project makes the component appear in any Profile and PermissionSet components that are retrieved in the same package.

## Retrieving Fields on Custom or Standard Objects

When you retrieve a custom or standard object, you return everything associated with the object, except for standard fields that aren't customizable. You can also retrieve only specific fields for an object by explicitly naming the object and fields in `package.xml`. The following definition in `package.xml` creates the files `objects/MyCustomObject__c.object` and `objects/Account.object`, each containing the requested field definitions.

```
<types>
  <members>MyCustomObject__c.MyCustomField__c</members>
  <members>Account.MyCustomAccountField__c</members>
  <members>Account.Phone</members>
  <name>CustomField</name>
</types>
```

## Retrieving or Deploying Fields on Data Cloud Objects

When you retrieve a Data Cloud object, such as a DLO or DMO, not all of the custom field properties are returned. The properties returned depend on the data type of the custom field.

When you deploy a Data Cloud object via Metadata API, in API version 60.0 or later, the call succeeds only if the properties are supported by the custom field's data type. If you include a property that isn't supported by the field's data type, the API returns an error.

Data Cloud objects support these data types.

- Boolean/Checkbox

- Date
- DateTime
- Email
- Lookup (DMOs only)
- Number
- Percent
- Phone
- Text
- Url

## Version

Custom and standard fields are available in API version 10.0 and later.

## Fields

Unless otherwise noted, all fields are creatable, filterable, and nillable.

Field Name	Field Type	Description
<code>businessOwnerGroup</code>	reference	Indicates the group associated with this field. The business owner group understands the importance of the field's data to your company, and can be responsible for determining the minimum security classification. This field is available in API version 45.0 and later.
<code>businessOwnerUser</code>	reference	Indicates the person associated with this field. The business owner understands the importance of the field's data to your company, and can be responsible for determining the minimum security classification. This field is available in API version 45.0 and later.
<code>businessStatus</code>	picklist	Indicates whether the field is in use. Valid values include: <ul style="list-style-type: none"> <li>• Active</li> <li>• DeprecateCandidate</li> <li>• Hidden</li> </ul> This field is available in API version 45.0 and later
<code>caseSensitive</code>	boolean	Indicates whether the field is case-sensitive ( <code>true</code> ) or not ( <code>false</code> ).  For indirect lookup relationship fields on external objects, this attribute affects how this custom field's values are matched against the values of the <code>referenceTargetField</code> .
<code>complianceGroup</code>	multipicklist	Indicates the compliance acts, definitions, or regulations related to the field's data. Valid values include: <ul style="list-style-type: none"> <li>• CCPA</li> <li>• COPPA</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>GDPR</li> <li>HIPAA</li> <li>PCI</li> <li>PII</li> </ul> <p>This field is available in API version 47.0 and later.</p>
customDataType	string	Deprecated in the Spring '19 (API version 45.0) release.
defaultValue	string	If specified, represents the default value of the field.
deleteConstraint	DeleteConstraint (enumeration of type string)	<p>Provides deletion options for lookup relationships. Valid values are:</p> <ul style="list-style-type: none"> <li><code>Cascade</code>—Deletes the lookup record as well as associated lookup fields.</li> <li><code>Restrict</code>—Prevents the record from being deleted if it's in a lookup relationship.</li> <li><code>SetNull</code>—This value is the default. If the lookup record is deleted, the lookup field is cleared.</li> </ul> <p>For more information on lookup relationships, see "Object Relationships" in Salesforce Help.</p>
deprecated	boolean	Reserved for future use.
description	string	Description of the field.
displayFormat	string	The display format.
displayLocationInDecimal	boolean	Indicates how the geolocation values of a custom Location field appear in the user interface. If <code>true</code> , the geolocation values appear in decimal notation. If <code>false</code> , the geolocation values appear as degrees, minutes, and seconds.
elementType	ElementType (enumeration of type string)	Reserved for future use.
encrypted	boolean	<p>This entry is about Shield Platform Encryption, not Classic Encryption.</p> <p>Indicates whether this field is encrypted (<code>true</code>) or not (<code>false</code>). This field is available in API version 34.0 through 43.0.</p>
encryptionScheme	EncryptionScheme (enumeration of type string)	<p>This entry is about Shield Platform Encryption, not Classic Encryption.</p> <p>For encrypted fields, determines which encryption scheme a field takes. Valid values are</p> <ul style="list-style-type: none"> <li><code>CaseInsensitiveDeterministicEncryption</code></li> <li><code>CaseSensitiveDeterministicEncryption</code></li> <li><code>None</code></li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>ProbabilisticEncryption</code></li> </ul> <p>This field is available in API version 44.0 and later.</p>
<code>externalDeveloperName</code>	string	Available only for external objects. Name of the table column on the external data source that maps to this custom field in Salesforce. Corresponds to <code>External Column Name</code> in the user interface. This field is available in API version 32.0 and later.
<code>externalId</code>	boolean	Indicates whether the field is an external ID field ( <code>true</code> ) or not ( <code>false</code> ). This property is returned only if the custom field data type is <code>AutoNumber</code> , <code>Email</code> , <code>Number</code> , or <code>Text</code> .
<code>fieldManageability</code>	<code>FieldManageability</code> (enumeration of type string)	<p>Determines who can update the field after it's released in a managed package. Valid values:</p> <ul style="list-style-type: none"> <li>• <code>Locked</code>—The field can't be updated.</li> <li>• <code>DeveloperControlled</code>—The creator of the record can update the field with a package upgrade.</li> <li>• <code>SubscriberControlled</code>—Anyone with proper permissions can update the field. The field can't be updated with a package upgrade.</li> </ul> <p>Available only for fields on custom metadata types. If the field type is <code>MetadataRelationship</code>, and the manageability of the entity definition field is:</p> <ul style="list-style-type: none"> <li>• <code>Subscriber-controlled</code>, then the Field Definition field must be <code>subscriber-controlled</code>.</li> <li>• <code>Upgradeable</code>, then the Field Definition field must be either <code>upgradeable</code> or <code>subscriber-controlled</code>.</li> </ul>
<code>formula</code>	string	If specified, represents a formula on the field.
<code>formulaTreatBlanksAs</code>	<code>TreatBlanksAs</code> (enumeration of type string)	Indicates how to treat blanks in a formula. Valid values are: <code>BlankAsBlank</code> and <code>BlankAsZero</code> .
<code>fullName</code>	string	<p>Inherited from <code>Metadata</code>, this field is defined in the WSDL for this metadata type. It must be specified when creating, updating, or deleting. See <code>createMetadata()</code> to see an example of this field specified for a call.</p> <p>This value can't be <code>null</code>.</p>
<code>globalPicklist</code>	string.	(This field is available in API version 37.0 only and removed from later versions.) If this custom field is a picklist that's based on a global picklist, <code>globalPicklist</code> is the name of the global picklist whose value set this picklist inherits. A custom picklist that's based on a global picklist is restricted. You can only add or remove values by editing the global picklist.

Field Name	Field Type	Description
<code>indexed</code>	boolean	Indicates if the field is indexed. If this field is unique or the <code>externalId</code> is set true, the <code>isIndexed</code> value is set to true. This field has been deprecated as of API version 14.0 and is only provided for backward compatibility.
<code>inlineHelpText</code>	string	Represents the content of field-level help. For more information, see "Define Field-Level Help" in Salesforce Help.
<code>isAIPredictionField</code>	boolean	Available for Number type custom fields when you use Einstein Prediction Builder. Denotes whether the field can store and display Einstein prediction data on an object. Use Einstein Prediction Builder to determine the data for the target field. This field is available in API version 43.0 and later.
<code>isFilteringDisabled</code>	boolean	Available only for external objects. Indicates whether the custom field is available in filters. This field is available in API version 32.0 and later.
<code>isNameField</code>	boolean	Available only for external object fields of type text. For each external object, you can specify one field as the name field. If you set this value to <code>true</code> , make sure that the external table column identified by the <code>externalDeveloperName</code> attribute contains name values. This field is available in API version 32.0 and later.
<code>isSortingDisabled</code>	boolean	Available only for external objects. Indicates whether the custom field is sortable. This field is available in API version 32.0 and later.
<code>label</code>	string	Label for the field. You can't update the label for standard picklist fields, such as the <code>Industry</code> field for accounts.
<code>length</code>	int	Length of the field.
<code>lookupFilter</code>	LookupFilter	Represents the metadata associated with a lookup filter. This metadata type is used to create, update, or delete lookup filter definitions. This component has been removed as of API version 30.0 and is only available in previous API versions. The metadata associated with a lookup filter is now represented by the <code>lookupFilter</code> field in the CustomField component. This field is available in API version 30.0 and later. LookupFilter isn't supported on the article type object.
<code>maskChar</code>	EncryptedFieldMaskChar (enumeration of type string)	This page is about Classic Encryption, not Shield Platform Encryption. <a href="#">What's the difference?</a>  For encrypted fields, specifies the character to be used as a mask. Valid values are: <ul style="list-style-type: none"> <li>• asterisk</li> <li>• x</li> </ul>

Field Name	Field Type	Description
		For more information on encrypted fields, see <a href="#">Classic Encryption for Custom Fields in Salesforce Help</a> .
maskType	EncryptedFieldMaskType (enumeration of type string)	<p>This page is about Classic Encryption, not Shield Platform Encryption. <a href="#">What's the difference?</a></p> <p>For encrypted text fields, specifies the format of the masked and unmasked characters in the field. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>all</code>—All characters in the field are hidden. This option is equivalent to the <code>Mask All Characters</code> option in Salesforce.</li> <li>• <code>creditCard</code>—The first 12 characters are hidden and the last four display. This option is equivalent to the <code>Credit Card Number</code> option in Salesforce.</li> <li>• <code>lastFour</code>—All characters are hidden but the last four display. This option is equivalent to the <code>Last Four Characters Clear</code> option in Salesforce.</li> <li>• <code>nino</code>—All characters are hidden. Salesforce automatically inserts spaces after each pair of characters if the field contains nine characters. This option is equivalent to the <code>National Insurance Number</code> option in Salesforce.</li> <li>• <code>sin</code>—All characters are hidden but the last four display. This option is equivalent to the <code>Social Insurance Number</code> option in Salesforce.</li> <li>• <code>ssn</code>—The first five characters are hidden and the last four display. This option is equivalent to the <code>Social Security Number</code> option in Salesforce.</li> </ul> <p>For more information on encrypted fields, see "Classic Encryption for Custom Fields" in Salesforce Help.</p>
metadataRelationshipControllingField	string	In custom metadata relationships, represents the controlling field that specifies the standard or custom object in an entity definition metadata relationship. Required when creating a field definition or entity particle metadata relationship on a custom metadata type. The object specified in the controlling field determines the values available in its dependent field definition or entity particle. For example, specifying the <code>Account</code> object filters the available fields in the field definition to <code>Account</code> fields only. This field is available in API version 39.0 and later.
picklist	Picklist	<b>(Deprecated.)</b> Use this field in API version 37.0 and earlier only. In later versions, use <code>valueSet</code> instead.) If specified, the field is a picklist, and this field enumerates the picklist values and labels.
populateExistingRows	boolean	Indicates whether existing rows are going to be populated ( <code>true</code> ) or not ( <code>false</code> ).

Field Name	Field Type	Description
<code>precision</code>	<code>int</code>	The precision for number values. Precision is the number of digits in a number. For example, the number 256.99 has a precision value of 5.
<code>referenceTargetField</code>	<code>string</code>	Available only for indirect lookup relationship fields on external objects. Specifies the custom field on the parent object to match against this indirect lookup relationship field, whose values come from an external data source. The specified custom field on the parent object must have both <code>externalId</code> and <code>unique</code> set to <code>true</code> . This field is available in API version 32.0 and later.
<code>referenceTo</code>	<code>string</code>	If specified, indicates a reference this field has to another object.
<code>relationshipLabel</code>	<code>string</code>	Label for the relationship.
<code>relationshipName</code>	<code>string</code>	If specified, indicates the value for one-to-many relationships. For example, in the object <code>MyObject</code> that had a relationship to <code>YourObject</code> , the relationship name can be <code>YourObjects</code> .
<code>relationshipOrder</code>	<code>int</code>	This field is valid for all master-detail relationships, but the value is only non-zero for junction objects. A junction object has two master-detail relationships, and is analogous to an association table in a many-to-many relationship. Junction objects must define one parent object as primary (0), the other as secondary (1). The definition of primary or secondary affects delete behavior and inheritance of look and feel, and record ownership for junction objects. For more information, see <a href="#">Salesforce Help</a> .  0 or 1 are the only valid values, and 0 is always the value for objects that aren't junction objects.
<code>reparentableMasterDetail</code>	<code>boolean</code>	Indicates whether the child records in a master-detail relationship on a custom object can be reparented to different parent records. The default value is <code>false</code> .  This field is available in API version 25.0 and later.
<code>required</code>	<code>boolean</code>	Indicates whether the field requires a value on creation ( <code>true</code> ) or not ( <code>false</code> ).
<code>scale</code>	<code>int</code>	The scale for the field. Scale is the number of digits to the right of the decimal point in a number. For example, the number 256.99 has a scale of 2.
<code>securityClassification</code>	<code>picklist</code>	Indicates the sensitivity of the data contained in the field. Valid values include: <ul style="list-style-type: none"> <li>• <code>Public</code></li> <li>• <code>Internal</code></li> <li>• <code>Confidential</code></li> <li>• <code>Restricted</code></li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>MissionCritical</code></li> </ul> <p>This field is available in API version 45.0 and later.</p>
<code>startingNumber</code>	<code>int</code>	<p>If specified, indicates the starting number for the field. When you create records, <code>Starting Number</code>'s value increments to store the number that will be assigned to the next auto-number field created.</p> <ul style="list-style-type: none"> <li>• You can't retrieve the starting number of an auto-number field through Metadata API. To specify a <code>Starting Number</code> while deploying, add a <code>startingNumber</code> tag for your field to your <code>package.xml</code> file. For example:  <code>&lt;startingNumber&gt;42&lt;/startingNumber&gt;</code></li> <li>• If you deploy without specifying a <code>Starting Number</code> value in your <code>package.xml</code> file, the default starting number for standard fields is 0. The default starting number for custom fields is 1.</li> </ul>
<code>stripMarkup</code>	<code>boolean</code>	Set to <code>true</code> to remove markup, or <code>false</code> to preserve markup. Used when converting a rich text area to a long text area.
<code>summarizedField</code>	<code>string</code>	Represents the field on the detail row that's being summarized. This field can't be null unless the <code>summaryOperation</code> value is <code>count</code> .
<code>summaryFilterItems</code>	<code>FilterItem[]</code>	Represents the set of filter conditions for this field if it's a summary field. This field is summed on the child if the filter conditions are met.
<code>summaryForeignKey</code>	<code>string</code>	Represents the master-detail field on the child that defines the relationship between the parent and the child.
<code>summaryOperation</code>	<code>SummaryOperations</code> (enumeration of type string)	<p>Represents the type of sum operation to be performed. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Count</code></li> <li>• <code>Min</code></li> <li>• <code>Max</code></li> <li>• <code>Sum</code></li> </ul>
<code>trackFeedHistory</code>	<code>boolean</code>	<p>Indicates whether the field is enabled for feed tracking (<code>true</code>) or not (<code>false</code>). To set this field to <code>true</code>, the <code>enableFeeds</code> field on the associated <code>CustomObject</code> must also be <code>true</code>. For more information, see "Customize Chatter Feed Tracking" in Salesforce Help.</p> <p>This field is available in API version 18.0 and later.</p>

Field Name	Field Type	Description
<code>trackHistory</code>	boolean	<p>Indicates whether history tracking is enabled for the field (<code>true</code>) or not (<code>false</code>). Also available for standard object fields (picklist and lookup fields only) in API version 30.0 and later.</p> <p>To set <code>trackHistory</code> to <code>true</code>, the <code>enableHistory</code> field on the associated standard or custom object must also be <code>true</code>.</p> <p>For more information, see "Field History Tracking" in Salesforce Help.</p> <p>Field history tracking isn't available for external objects.</p>
<code>trackTrending</code>	boolean	<p>Indicates whether historical trending data is captured for the field (<code>true</code>) or not (<code>false</code>). An object is enabled for historical trending if this attribute is <code>true</code> for at least one field. Available in API version 29.0 and later.</p> <p>For more information, see "Report on Historical Changes" in Salesforce Help.</p>
<code>trueValueIndexed</code>	boolean	<p>Only relevant for a checkbox field. If set, <code>true</code> values are built into the index. This field has been deprecated as of API version 14.0 and is only provided for backward compatibility.</p>
<code>type</code>	FieldType (enumeration of type string)	<p>Indicates the field type for the field. Valid values are enumerated in <a href="#">FieldType</a>.</p> <p>For standard fields on standard objects, the <code>type</code> field is optional. This field is included for some standard field types, such as Picklist or Lookup, but not for others. The <code>type</code> field is included for custom fields.</p>
<code>unique</code>	boolean	<p>Indicates whether the field is unique (<code>true</code>) or not (<code>false</code>).</p>
<code>valueSet</code>	ValueSet	<p>Represents the set of values that make up a picklist on a custom field. Each value is defined as a <a href="#">CustomValue</a> on page 695. If this custom field is a picklist that uses a global value set, <code>valueSet</code> is the name of the global value set whose values this picklist inherits. A custom picklist that uses a global value set is restricted. You can only add or remove values by editing the global value set.</p> <p>A ValueSet component has either a <code>valueSetDefinition</code> or a <code>valueName</code> specified, but never both.</p> <p>This field is available in API version 38.0 and later.</p>
<code>visibleLines</code>	int	<p>Indicates the number of lines displayed for the field.</p>

Field Name	Field Type	Description
<code>writeRequiresMasterRead</code>	boolean	<p>Sets the minimum sharing access level required on the primary record to create, edit, or delete child records. This field applies only to master-detail or junction object custom field types.</p> <ul style="list-style-type: none"> <li><code>true</code>—Allows users with Read access to the primary record permission to create, edit, or delete child records. This setting makes sharing less restrictive.</li> <li><code>false</code>—Allows users with Read/Write access to the primary record permission to create, edit, or delete child records. This setting is more restrictive than <code>true</code>, and is the default value.</li> </ul> <p>For junction objects, the most restrictive access from the two parents is enforced. For example, if you set to <code>true</code> on both master-detail fields, but users have Read access to one primary record and Read/Write access to the other primary record, users aren't able to create, edit, or delete child records.</p>

Fields use additional data types. For more information, see [Metadata Field Types](#) on page 664.

## MktDataModelFieldAttributes

This is a subtype of CustomField.

Field Name	Field Type	Description
<code>definitionCreationType</code>	DefinitionCreationType <a href="#">enumeration</a>	<p>Indicates how this object was added.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>Bridge</li> <li>Custom</li> <li>Derived</li> <li>Standard</li> <li>System</li> </ul>
<code>invalidMergeActionType</code>	InvalidMergeActionType ( <a href="#">enumeration</a> of type string)	<p>If this field is used for merging data, indicates what the system should do when an invalid merge occurs.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>Drop</li> <li>Keep</li> <li>Override</li> </ul>
<code>isDynamicLookup</code>	boolean	When true, the existing data is queried for a unique set of values for this field.
<code>primaryIndexOrder</code>	int	If supplied, indicates that this field is part of the primary key. The number value (starting at 1) indicates the order of attributes if it's a compound primary key.

Field Name	Field Type	Description
refAttrDeveloperName	string	When this is a Standard Field, it's the Name of the field from the Reference Model.
mktDataLakeSrcKeyQualifier	string	String storing the developer name of MktDataLakeSrcKeyQualifier configured on the field

## MktDataLakeFieldAttributes

This is a subtype of CustomField. MktDataLakeFieldAttributes is available in API version 50.0 or later.

Field Name	Field Type	Description
definitionCreationType	DefinitionCreationType (enumeration of type string)	Indicates how this object is added. Valid values are: <ul style="list-style-type: none"> <li>• Bridge</li> <li>• Custom</li> <li>• Derived</li> <li>• Standard</li> <li>• System</li> </ul>
dateFormat	string	Optional: The Date format of date, time, date/time fields in this Lake field. <b>This field is deprecated in API version 55.0 and later.</b>
externalName	string	The external name of this field.
isEventDate	boolean	When true, this field contains the event date for behavioral model area objects that are used to partition data.
primaryIndexOrder	int	If supplied, indicates that this field is part of the primary key. The number value (starting at 1) indicates the order of attributes if it's a compound primary key.
isInternalOrganization	boolean	When true, this field contains the value for internal organization. In this case, the value of the field is the name of the internal organization. Landing Objects don't have access to the Salesforce ID and thus are using the developer name.
isRecordModified	boolean	Indicates the record modified field used to calibrate latest record version.
mktDataLakeSrcKeyQualifier	string	String storing the developer name of MktDataLakeSrcKeyQualifier configured on the field. Available in API version 55.0 and later.
keyQualifierName	string	Contains the developer name of key qualifier field. Available in API version 55.0 and later.

## LookupFilter

Represents the metadata associated with a lookup filter. Replaces the NamedFilter component, which was removed as of API version 30.0. LookupFilter is available in API version 30.0 and later.

Field	Field Type	Description
<code>active</code>	boolean	Required. Indicates whether the lookup filter is active ( <code>true</code> ) or not ( <code>false</code> ).
<code>booleanFilter</code>	string	Specifies advanced filter conditions.
<code>description</code>	string	A description of what this filter does.
<code>errorMessage</code>	string	The error message that appears if the lookup filter fails.
<code>filterItems</code>	<a href="#">FilterItem[]</a>	Required. The set of filter conditions. You can have up to 10 FilterItems per lookup filter.
<code>infoMessage</code>	string	The information message displayed on the page. Use to describe things the user possibly doesn't understand, such as why certain items are excluded in the lookup filter.
<code>isOptional</code>	boolean	Required. Indicates whether the lookup filter is optional ( <code>true</code> ) or not ( <code>false</code> ).

Lookup filters use additional data types. For more information, see [Metadata Field Types](#).

## FilterItem

Represents one entry in a set of filter criteria.

Field	Field Type	Description
<code>field</code>	string	Represents the field specified in the filter.
<code>operation</code>	FilterOperation ( <a href="#">enumeration</a> of type string)	Represents the filter operation for this filter item. Valid values are: <ul style="list-style-type: none"> <li><code>equals</code></li> <li><code>notEqual</code></li> <li><code>lessThan</code></li> <li><code>greaterThan</code></li> <li><code>lessOrEqual</code></li> <li><code>greaterOrEqual</code></li> <li><code>contains</code></li> <li><code>notContain</code></li> <li><code>startsWith</code></li> <li><code>includes</code></li> <li><code>excludes</code></li> <li><code>within</code> (DISTANCE criteria only)</li> </ul>
<code>value</code>	string	Represents the value of the filter item being operated upon, for example, if the filter is <code>my_number_field__c &gt; 1</code> , the value of <code>value</code> is 1.

Field	Field Type	Description
valueField	string	Specifies if the final column in the filter contains a field or a field value.  Approval processes don't support valueField entries in filter criteria.

## Declarative Metadata Sample Definition

The following example shows a field definition for a custom field that's named `Comments__c`.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  ....
  <fields>
    <fullName>Comments__c</fullName>
    <description>Add your comments about this object here</description>
    <inlineHelpText>This field contains help text for this object</inlineHelpText>
    <label>Comments</label>
    <length>32000</length>
    <type>LongTextArea</type>
    <visibleLines>30</visibleLines>
  </fields>
  ....
</CustomObject>
```

This XML is the definition for two fields on the Account standard object—a custom field (`MyCustomAccountField__c`), and a standard field (`Phone`) that has history tracking enabled.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <fields>
    <fullName>MyCustomAccountField__c</fullName>
    <description>A custom field on the Account standard object.</description>
    <externalId>false</externalId>
    <inlineHelpText>Some help text.</inlineHelpText>
    <label>MyCustomAccountField</label>
    <length>100</length>
    <required>false</required>
    <trackFeedHistory>false</trackFeedHistory>
    <trackHistory>false</trackHistory>
    <type>Text</type>
    <unique>false</unique>
  </fields>
  <fields>
    <fullName>Phone</fullName>
    <trackFeedHistory>false</trackFeedHistory>
    <trackHistory>true</trackHistory>
  </fields>
</CustomObject>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[CustomObject](#)

[Picklist \(Including Dependent Picklist\)](#)

[Metadata](#)

[NamedFilter](#)

## FieldSet

Represents a field set. A field set is a grouping of fields. For example, you could have a field set that contains fields describing a user's first name, middle name, last name, and business title.

Field sets can be referenced on Visualforce pages dynamically. If the page is added to a managed package, administrators can add, remove, or reorder fields in a field set to modify the fields presented on the Visualforce page without modifying any code.

## Version

FieldSet components are available in API version 21.0 and later.

## Fields

Field	Field Type	Description
<code>availableFields</code>	<a href="#">FieldSetItem</a> []	An array containing all the possible fields in the field set.
<code>description</code>	string	Required. A description provided by the developer that describes the field set. This is required.
<code>displayedFields</code>	<a href="#">FieldSetItem</a> []	An array containing all the fields that are presented on the Visualforce page. The order in which a field is listed determines the order of appearance on the page.
<code>label</code>	string	Required. The label used to reference the field set.

## FieldSetItem

FieldSetItem represents an individual field in a field set.

Field	Field Type	Description
<code>field</code>	string	Required. The name of a field in a standard or custom object.
<code>isFieldManaged</code>	boolean	Read-only. Denotes whether the field was added to the field set via a managed or unmanaged package.

Field	Field Type	Description
isRequired	boolean	Read-only. Indicates whether the field is universally required ( <code>true</code> ) or not ( <code>false</code> ).

## Declarative Metadata Sample Definition

A sample XML definition of a FieldSet component is shown below.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <fieldSets>
    <fullName>FieldSetNames</fullName>
    <availableFields>
      <field>MiddleName__c</field>
    </availableFields>
    <availableFields>
      <field>Title__c</field>
    </availableFields>
    <description>FieldSet containing how to properly address someone</description>
    <displayedFields>
      <field>FirstName__c</field>
    </displayedFields>
    <displayedFields>
      <field>LastName__c</field>
    </displayedFields>
    <label>FieldSet Names</label>
  </fieldSets>
</CustomObject>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## HistoryRetentionPolicy

Represents the policy for archiving field history data. When you set a policy, you specify the number of months that you want to keep field history in Salesforce before archiving it. By default, when Field Audit Trail is enabled, all field history is retained.

This component is only available to users with the `RetainFieldHistory` permission.

## Declarative Metadata File Suffix and Directory Location

Field history retention policies are defined as part of a standard or custom object. You can set field history retention policies for objects individually. See [CustomObject](#) for more information.

## Version

Available in API version 31.0 and later.

## Fields

Field Name	Field Type	Description
archiveAfterMonths	int	Required. The number of months that you want to keep field history data in Salesforce before archiving. You can set a minimum of 1 month and a maximum of 18 months. If you don't set a number, the default is 18 months. (That is, Salesforce maintains data for 18 months before archiving.)
archiveRetentionYears	int	The number of years until you manually delete data from the archive. Use this field as a reminder for manually deleting data. By default, field history data isn't automatically deleted when Field Audit Trail is enabled.
description	string	A text description for the history retention.
gracePeriodDays	int	The number of days of extra time after the <code>archiveAfterMonths</code> period before the data is archived. The <code>gracePeriodDays</code> interval applies only to the first time that the data is archived; because all the data is copied the first time, the operation can take longer than subsequent times when only the data that changed since the last archival operation is copied. The <code>gracePeriodDays</code> provides extra time for the administrator to prepare the organization before the initial archive operation. You can set a minimum of zero days and a maximum of 10 days. If no number is set, the default is 1 day.

## Declarative Metadata Sample Definition

This sample shows the definition of a history retention policy for a custom object.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <historyRetentionPolicy>
    <archiveAfterMonths>6</archiveAfterMonths>
    <archiveRetentionYears>5</archiveRetentionYears>
    <description>My field history retention</description>
  </historyRetentionPolicy>
  ...
</CustomObject>
```

## Index

Represents an index defined within a custom big object. Use this metadata type to define the composite primary key (index) for a custom big object. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

Indexes are user-defined and are part of the custom object definition for big objects. See [CustomObject](#) for more information.

## Version

The Index type is available in API version 41.0 and later.

## Fields

Field Name	Field Type	Description
fields	IndexField[]	The definition of the fields in the index.
label	string	Required. This name is used to refer to the big object in the user interface. Available in API version 41.0 and later.

## IndexField

Defines which fields make up the index, their order, and sort direction. The order in which the fields are defined determines the order fields are listed in the index.

Field Name	Field Type	Description
name	string	Required. The API name for the field that's part of the index. This value must match the <code>fullName</code> value for the corresponding field in the fields section and be marked as required.   <b>Warning:</b> When querying a big object record via SOQL and passing the results as arguments to the delete API, if any index field name has a leading or trailing white space, you can't delete the big object record.
sortDirection	string	Required. The sort direction of the field in the index. Valid values are <code>ASC</code> for ascending order and <code>DESC</code> for descending order.

## Declarative Metadata Sample Definition

The following is an example of an index contained within the definition of a custom big object, `Customer_Interactions__b.object`.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">

  <deploymentStatus>Deployed</deploymentStatus>

  // Define the fields within the big object
  <fields>
    <fullName>Purchase__c</fullName>
    <label>Purchase</label>
    <length>16</length>
    <required>>false</required>
    <type>Text</type>
    <unique>>false</unique>
  </fields>
```

```

<fields>
  <fullName>Order_Number__c</fullName>
  <label>Order Number</label>
  <length>16</length>
  <required>false</required>
  <type>Text</type>
  <unique>true</unique>
</fields>

<fields>
  <fullName>Platform__c</fullName>
  <label>Platform</label>
  <length>16</length>
  <required>true</required>
  <type>Text</type>
  <unique>false</unique>
</fields>

<fields>
  <fullName>Account__c</fullName>
  <label>User Account</label>
  <referenceTo>Account</referenceTo>
  <relationshipName>User_Account</relationshipName>
  <required>true</required>
  <type>Lookup</type>
</fields>

<fields>
  <fullName>Order_Date__c</fullName>
  <label>Order Date</label>
  <required>true</required>
  <type>DateTime</type>
</fields>

// Define the index
<indexes>
  <fullName>CustomerInteractionsIndex</fullName>
  <label>Customer Interactions Index</label>
  <fields>
    <name>Account__c</name>
    <sortDirection>DESC</sortDirection>
  </fields>
  <fields>
    <name>Platform__c</name>
    <sortDirection>ASC</sortDirection>
  </fields>
  <fields>
    <name>Order_Date__c</name>
    <sortDirection>DESC</sortDirection>
  </fields>
</indexes>

<label>Customer Interaction</label>

```

```
<pluralLabel>Customer Interactions</pluralLabel>
</CustomObject>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[CustomObject](#)

[Metadata](#)

## ListView

ListView allows you to see a filtered list of records, such as contacts, accounts, or custom objects.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field. See "Create a Custom List View in Salesforce Classic" in Salesforce Help.

 **Note:** List views with the Visible only to me `Restrict Visibility` option aren't accessible in Metadata API. Each of these list views is associated with a particular user.

## Declarative Metadata File Suffix and Directory Location

List views are stored within a CustomObject component. The component can represent a custom object or a standard object, such as an account.

## Version

ListView components for custom objects are available in API version 14.0 and later. ListView components for standard objects, such as accounts, are available in API version 17.0 and later.

## Fields

Field	Field Type	Description
<code>booleanFilter</code>	string	This field represents an Advanced Option for a filter. Advanced Options in filters allow you to build up filtering conditions that use a mixture of AND and OR boolean operators across multiple filter line items. For example, <code>(1 AND 2) OR 3</code> finds records that match both the first two filter line items or the third.
<code>columns</code>	string[]	The list of fields in the list view. The field name relative to the object name, for example <code>MyCustomField__c</code> , is specified for each custom field.  Field names in the ListView columns don't always match their API name counterparts. If person accounts are enabled in your organization, standard fields merged from a contact into an

Field	Field Type	Description
		account start with the <code>PC_</code> prefix, while the corresponding API name starts with the <code>Person</code> prefix. For example, the ListView column name is <code>PC_Email</code> for a corresponding API field name of <code>PersonEmail</code> .
<code>division</code>	string	If your organization uses divisions to segment data and you've got the "Affected by Divisions" permission, records in the list view must match this division. This field is only available if you're searching all records.  This field is available in API version 17.0 and later.
<code>filterScope</code>	<a href="#">FilterScope</a> (enumeration of type string)	Required. This field indicates whether you're filtering by owner or viewing all records.
<code>filters</code>	<a href="#">ListViewFilter</a> []	The list of filter line items.
<code>fullName</code>	string	Required. Inherited from <a href="#">Metadata</a> , this field is defined in the WSDL for this metadata type. It must be specified when creating, updating, or deleting. See <a href="#">createMetadata()</a> to see an example of this field specified for a call.
<code>label</code>	string	Required. The list view name.
<code>language</code>	<a href="#">Language</a>	The language used for filtering if your organization uses the Translation Workbench and you're using the <code>startsWith</code> or <code>contains</code> operator. The values entered as search terms must be in the same language as the filter language.  For a list of valid language values, see <a href="#">Language</a> .  This field is available in API version 17.0 and later.
<code>queue</code>	string	The name of a queue. Objects are sometimes assigned to a queue so that the users who have access to the queue can monitor and manage them. When you create a queue, a corresponding list view is automatically created. See "Create Queues" in Salesforce Help.
<code>sharedTo</code>	<a href="#">SharedTo</a>	Sharing access for the list view.  This field is available in API version 17.0 and later.

## ListViewFilter

ListViewFilter represents a filter line item.

Field	Field Type	Description
<code>filter</code>	string	Required. Represents the field specified in the filter.

Field	Field Type	Description
operation	FilterOperation (enumeration of type string)	Required. The operation used by the filter, such as <code>equals</code> . The valid values are: <ul style="list-style-type: none"> <li><code>equals</code></li> <li><code>notEqual</code></li> <li><code>lessThan</code></li> <li><code>greaterThan</code></li> <li><code>lessOrEqual</code></li> <li><code>greaterOrEqual</code></li> <li><code>contains</code></li> <li><code>notContain</code></li> <li><code>startsWith</code></li> <li><code>includes</code></li> <li><code>excludes</code></li> <li><code>within</code> (DISTANCE criteria only)</li> </ul>
value	string	Represents the value of the filter item being operated upon, for example, if the filter is <code>my_number_field__c &gt; 1</code> , the value of <code>value</code> is 1.

## FilterScope

The FilterScope is an enumeration of type string that represents the filtering criteria for the records. The valid values are listed in the table:

Enumeration Value	Description
Everything	All records, for example All Opportunities.
Mine	Records owned by the user running the list view, for example My Opportunities.
MineAndMyGroups	Records owned by the user running the list view, and records assigned to the user's queues.
AssignedToMe	Records assigned to the user running the list view. The <code>AssignedToMe</code> scope is supported for the ServiceAppointment object only.
Queue	Records assigned to a queue.
Delegated	Records delegated to another user for action: for example, a delegated task. This option is available in API version 17.0 and later.
MyTerritory	Records in the territory of the user seeing the list view. This option is available if territory management is enabled for your organization. Opportunities can't be filtered by <code>MyTerritory</code> . This option is available in API version 17.0 and later.

Enumeration Value	Description
MyTeamTerritory	Records in the territory of the team of the user seeing the list view. This option is available if territory management is enabled for your organization. Opportunities can't be filtered by MyTeamTerritory. This option is available in API version 17.0 and later.
Team	Records assigned to a team. In the Lightning Experience UI, the corresponding list view filter is <b>My team's opportunities</b> . This option is available in API version 17.0 and later.
SalesTeam	Opportunities assigned to an opportunity team. In the Lightning Experience UI, the corresponding list view filter is <b>My opportunity teams</b> . This option is available in API version 49.0 and later.
ScopingRule	Records that meet a scoping rule's record criteria. In Lightning Experience, scoping rules are applied to list views only if the user selects <b>Filter by scope</b> .

## Declarative Metadata Sample Definition

A sample XML definition of a list view in a custom object is shown.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  . . .
  <listViews>
    <fullName>All_Mileages</fullName>
    <filterScope>everything</filterScope>
    <label>All Mileages</label>
  </listViews>
  <listViews>
    <fullName>My_Mileages</fullName>
    <booleanFilter>1 AND 2</booleanFilter>
    <columns>NAME</columns>
    <columns>CREATED_DATE</columns>
    <filterScope>mine</filterScope>
    <filters>
      <field>NAME</field>
      <operation>equals</operation>
      <value>Eric Bristow</value>
    </filters>
    <filters>
      <field>City__c</field>
      <operation>equals</operation>
      <value>Paris</value>
    </filters>
    <label>My Mileages</label>
  </listViews>
  . . .
</CustomObject>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[CustomObject](#)

[Sample package.xml Manifest Files](#)

## NamedFilter

Represents the metadata associated with a lookup filter. This metadata type is used to create, update, or delete lookup filter definitions. This component has been removed as of API version 30.0 and is only available in previous API versions. The metadata associated with a lookup filter is now represented by the `lookupFilter` field in the `CustomField` component.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field. You can also use this metadata type to work with customizations of lookup filters on standard fields.

**Note:** The `namedFilter` appears as a child of the target object of the associated lookup field.

## Declarative Metadata File Suffix and Directory Location

Lookup filters are defined as part of the custom object or standard object definition. See [CustomObject](#) for more information.

**Note:** Retrieving a component of this metadata type in a project makes the component appear in any Profile and PermissionSet components that are retrieved in the same package.

## Version

Lookup filters are available in API version 17.0 and later. However, the `NamedFilter` type was removed in API version 30.0. The metadata associated with a lookup filter is now represented by the `lookupFilter` field in the `CustomField` type.

## Fields

Unless otherwise noted, all fields are creatable, filterable, and nillable.

Field Name	Field Type	Description
<code>active</code>	boolean	Required. Indicates whether the lookup filter is active.
<code>booleanFilter</code>	string	Specifies advanced filter conditions.
<code>description</code>	string	A description of what this filter does.
<code>errorMessage</code>	string	The error message that appears if the lookup filter fails.

Field Name	Field Type	Description
field	string	Required. The <code>fullName</code> of the custom or standard field associated with the lookup filter. You can associate one relationship field with each lookup filter, and vice versa.   <b>Note:</b> You can't update a field associated with a lookup filter.
filterItems	<a href="#">FilterItems[]</a>	Required. The set of filter conditions.
infoMessage	string	The information message displayed on the page. Use to describe things the user might not understand, such as why certain items are excluded in the lookup filter.
fullName	string	Inherited from <a href="#">Metadata</a> , this field is defined in the WSDL for this metadata type. It must be specified when creating, updating, or deleting. See <a href="#">createMetadata()</a> to see an example of this field specified for a call.  This value can't be <code>null</code> .
isOptional	boolean	Required. Indicates whether the lookup filter is optional.
name	string	Required. The name of the lookup filter. If you create this field in the user interface, a name is automatically assigned. If you create this field through Metadata API, you must include the <code>name</code> field.
sourceObject	string	The object that contains the lookup field that uses this lookup filter. Set this field if the lookup filter references fields on the source object.

Lookup filters use additional data types. For more information, see [Metadata Field Types](#).

## FilterItems

FilterItems contains the following properties:

Field	Field Type	Description
field	string	Represents the field specified in the filter.
operation	FilterOperation (enumeration of type string)	Represents the filter operation for this filter item. Valid values are enumerated in <a href="#">FilterOperation</a> .
value	string	Represents the value of the filter item being operated upon, for example, if the filter is <code>my_number_field__c &gt; 1</code> , the value of <code>value</code> is 1.

## FilterOperation

Here's an enumeration of type string that lists different filter operations. Valid values are:

- equals
- notEqual
- lessThan
- greaterThan
- lessOrEqual
- greaterOrEqual
- contains
- notContain
- startsWith
- includes
- excludes

## Declarative Metadata Sample Definition

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  ....
  <namedfilters>
    <fullName>nf_Acc</fullName>
    <active>true</active>
    <booleanFilter>1 OR 2</booleanFilter>
    <field>Account.lk__c</field>
    <filterItems>
      <field>Account.Phone</field>
      <operation>notEqual</operation>
      <value>x</value>
    </filterItems>
    <filterItems>
      <field>Account.Fax</field>
      <operation>notEqual</operation>
      <value>y</value>
    </filterItems>
    <name>Acc</name>
    <sourceObject>Account</sourceObject>
  </namedfilters>
  ....
</CustomObject>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[CustomObject](#)

[Picklist \(Including Dependent Picklist\)](#)

[Metadata](#)

[CustomField](#)

## Picklist (Including Dependent Picklist)

Deprecated. Represents a picklist (or dependent picklist) definition for a custom field in a custom object or a custom or standard field in a standard object, such as an account.

### Version

Use this type in API version 37.0 and earlier only. Picklists for custom fields in custom objects are available in API version 12.0 and later. Picklists for custom or standard fields in standard objects, such as accounts, are available in API version 16.0 and later.

In API version 38.0 and later, Picklist is replaced by [ValueSet](#) on page 666 on the CustomField type.

## Declarative Metadata File Suffix and Directory Location

Picklist definitions are included in the custom object and field with which they're associated.

### Fields

Picklist contains the following fields:

Field Name	Field Type	Description
<code>controllingField</code>	string	The <code>fullName</code> of the controlling field if <code>controllingField</code> is a dependent picklist. A dependent picklist works in conjunction with a controlling picklist or checkbox to filter the available options. The value chosen in the controlling field affects the values available in the dependent field. This field is available in API version 14.0 and later.
<code>picklistValues</code>	PicklistValue[]	Required. Represents a set of values for a picklist.
<code>restrictedPicklist</code>	boolean	Indicates whether the picklist's value list is restricted. With a restricted picklist, only an admin can add or change values; users can't load or remove values through the API. By default this value is <code>false</code> .  This field is available in API version 37.0 and later.
<code>sorted</code>	boolean	Indicates whether values are sorted ( <code>true</code> ), or not ( <code>false</code> ). By default this value is <code>false</code> .

## Java Sample

The following sample uses a picklist. For a complete sample of using a picklist with record types and profiles, see [Profile](#) on page 1477.

```
public void setPicklistValues() {
    // Create a picklist
    Picklist expenseStatus = new Picklist();
    PicklistValue unsubmitted = new PicklistValue();
    unsubmitted.setFullName("Unsubmitted");
    PicklistValue submitted = new PicklistValue();
    submitted.setFullName("Submitted");
    PicklistValue approved = new PicklistValue();
    approved.setFullName("Approved");
    PicklistValue rejected = new PicklistValue();
    rejected.setFullName("Rejected");
    expenseStatus.setPicklistValues(new PicklistValue[]
        {unsubmitted, submitted, approved, rejected});

    CustomField expenseStatusField = new CustomField();
    expenseStatusField.setFullName(
        "ExpenseReport__c.ExpenseStatus__c");
    expenseStatusField.setLabel("Expense Report Status");
    expenseStatusField.setType(FieldType.Picklist);
    expenseStatusField.setPicklist(expenseStatus);
    try {
        AsyncResult[] ars =
            metadataConnection.create(new Metadata[] {expenseStatusField});
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

## Declarative Metadata Sample Definition

The following sample shows usage for picklists, including dependent picklists, in a custom object. The `isAmerican__c` checkbox controls the list of manufacturers shown in the `manufacturer__c` picklist. The `manufacturer__c` checkbox in turn controls the list of models shown in the `model__c` picklist.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <deploymentStatus>Deployed</deploymentStatus>

        <probability>10</probability>
      </picklistValues>
      <picklistValues>
        <fullName>Needs Analysis</fullName>
        <default>>false</default>
        <forecastCategory>Pipeline</forecastCategory>
        <probability>20</probability>
      </picklistValues>
      ...
    </picklist>
  </fields>
</CustomObject>

```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ProfileSearchLayouts

Represents a user profile's search results layouts for an object. `ProfileSearchLayouts` are similar to `SearchLayouts`. However, with profile-specific layouts, each user profile can have a different search results layout for an object.

## File Suffix and Directory Location

Profile search layouts are defined as part of a standard or custom object. `SearchLayout` is the default search results layout used when no layout is specified for a user profile. For more information, see [CustomObject](#).

## Version

Profile search layouts for custom objects are available in API version 48.0 and later.

## Fields

Field	Field Type	Description
<code>profileName</code>	<code>string[]</code>	The name of the profile associated with a customized search results layout. The profile name can be a standard Salesforce profile or custom profile defined in your org.
<code>fields</code>	<code>string[]</code>	The list of fields displayed in search results for the object and for the users that have the profile <i>Profile Name</i> . The <code>name</code> field is required and is always displayed as the first column header, so it isn't included in this list. All additional fields are included. The field name relative to the object name, for <i>exampleMyCustomField__c</i> , is specified for each custom field.

## Declarative Metadata Sample Definition

The following shows a sample definition of profile-specific search layouts in an object.

 **Note:** To deploy a profile-specific search results layout, the profile must be defined in the destination org and if it's for a custom object, you must enable search for that custom object. If the profile-specific search results layout is for a custom object, the custom object's tab must exist in the destination org or must be included with the deployment.

```
<?xml version="1.0" encoding="UTF-8"?>
  <CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
    . . .
    <profileSearchLayouts>
      <fields>ACCOUNT.NAME</fields>
      <fields>ACCOUNT.SITE</fields>
```

```

<fields>ACCOUNT.PHONE1</fields>
<fields>CORE.USERS.ALIAS</fields>
<fields>ACCOUNT.ADDRESS2_CITY</fields>
<profileName>System Administrator</profileName>
</profileSearchLayouts>
<profileSearchLayouts>
<fields>ACCOUNT.NAME</fields>
<fields>ACCOUNT.SITE</fields>
<profileName>WDC Only User</profileName>
</profileSearchLayouts>
. . .
</CustomObject>

```

[SearchLayouts](#)

## RecordType

Represents the metadata associated with a record type. Record types let you offer different business processes, picklist values, and page layouts to different users. Use this metadata type to create, update, or delete record type definitions for a custom object.

For more information, see *Tailor Business Processes to Different Record Types Users* in Salesforce Help. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

**Important:** Don't use record types as an access control mechanism. Profile assignment governs create and edit access for an object but doesn't govern read access. For example, a user assigned to a profile that isn't enabled for a particular record type can't create records with that record type, but can access records associated with that record type.

Users with access to an object can read all record type information for that object. We strongly recommend against storing sensitive information in the record type description, name, or label. Instead, store sensitive information in a separate object or fields to which you've applied appropriate access controls.

**Note:** Retrieving a component of this metadata type in a project makes the component appear in any Profile and PermissionSet components that are retrieved in the same package.

**Note:** Metadata API doesn't retrieve custom picklist values on person account record types, if the picklist exists on a contact. In this case, Metadata API retrieves standard picklist values only.

## Version

Record types are available in API version 12.0 and later.

## Fields

Field	Field Type	Description
<code>active</code>	boolean	Required. Indicates whether the record type is active.
<code>businessProcess</code>	string	The <code>fullName</code> of the business process associated with the record type. This field is required in record types for lead,

Field	Field Type	Description
		<p>opportunity, solution, and case, and not allowed otherwise. See <a href="#">BusinessProcess</a> on page 616.</p> <p>This field is available in API version 17.0 and later.</p>
compactLayoutAssignment	string	<p>Represents the compact layout that is assigned to the record type.</p> <p>This field is available in API version 29.0 and later.</p>
description	string	Record type description. Maximum of 255 characters.
fullName	string	<p>Record type name. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. If this field contained characters before version 14.0 that are no longer allowed, the characters were stripped out of this field, and the previous value of the field was saved in the <a href="#">label</a> field.</p> <p>Inherited from the <a href="#">Metadata</a> component, this field isn't defined in the WSDL for this component. It must be specified when creating, updating, or deleting. See <a href="#">create()</a> to see an example of this field specified for a call.</p> <p>This value can't be <code>null</code>.</p>
label	string	<p>Required. Descriptive label for the record type. The list of characters allowed in the <code>fullName</code> field has been reduced for versions 14.0 and later. This field contains the value contained in the <code>fullName</code> field before version 14.0.</p>
picklistValues	<a href="#">RecordTypePicklistValue[]</a>	Represents a set of values for a picklist.

## RecordTypePicklistValue

RecordTypePicklistValue represents the combination of picklists and valid values that define a record type:

Field Name	Field Type	Description
picklist	string	Required. The name of the picklist.
values	<a href="#">PicklistValue</a>	One or more of the picklist values in the picklist. Each value defined is available in the record type that contains this component.

## Java Sample

The following sample uses two record types. For the complete sample that includes profiles and picklists, see [Profile](#) on page 1477.

```
public void recordTypeSample() {
    try {
        // Employees and managers have different access
        // to the state of the expense sheet
        RecordType edit = new RecordType();
        edit.setFullName("ExpenseReport__c.Edit");
        edit.setLabel("ExpenseReport__c.Label");
        PicklistValue unsubmitted = new PicklistValue();
        unsubmitted.setFullName("Unsubmitted");
        PicklistValue submitted = new PicklistValue();
        submitted.setFullName("Submitted");
        RecordTypePicklistValue editStatuses =
            new RecordTypePicklistValue();
        editStatuses.setPicklist("ExpenseStatus__c");
        editStatuses.setValues(
            new PicklistValue[] {unsubmitted, submitted});
        edit.setPicklistValues(
            new RecordTypePicklistValue[] {editStatuses});
        AsyncResult[] arsEdit =
            metadataConnection.create(new Metadata[] {edit});

        RecordType approve = new RecordType();
        approve.setFullName("ExpenseReport__c.Approve");
        PicklistValue approved = new PicklistValue();
        approved.setFullName("Approved");
        PicklistValue rejected = new PicklistValue();
        rejected.setFullName("Rejected");
        RecordTypePicklistValue approveStatuses =
            new RecordTypePicklistValue();
        approveStatuses.setPicklist("ExpenseStatus__c");
        approveStatuses.setValues(
            new PicklistValue[] {approved, rejected});
        approve.setPicklistValues(
            new RecordTypePicklistValue[] {approveStatuses});
        AsyncResult[] arsApprove =
            metadataConnection.create(new Metadata[] {approve});
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

## Declarative Metadata Sample Definition

The definition of a record type in a custom object is shown in this code block.

```
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
    . . .
    <recordTypes>
        <fullName>My First Recordtype</fullName>
```

```

    </recordTypes>
    . . .
</CustomObject>

```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SearchLayouts

Represents the metadata associated with the search layouts for an object. You can customize which fields to display for users in search results, search filter fields, lookup dialogs, and recent record lists on tab home pages. You can access SearchLayouts only by accessing its encompassing CustomObject.

For more information, see [Customize Layouts for Search Results](#) and [Customize Search Layouts for Custom Objects](#) in Salesforce Help.

## Version

Search layouts for custom objects are available in API version 14.0 and later. The ability to modify search layouts for standard objects (except events and tasks) is available in API version 27.0 and later.

## Fields

When defining metadata for search layouts:

- Any Name field defined as a text type is mandatory; it's always displayed as the first column in the search results page. When you query for a list of fields; the name field isn't returned but all other fields are. If you define the Name field as an autonumber type, it's not mandatory and you can remove it from the list. These rules apply to `customTabListAdditionalFields`, `lookupDialogsAdditionalFields`, `lookupPhoneDialogsAdditionalFields`, and `searchResultsAdditionalFields`
- For custom objects, the search layout uses the API name, for example, `MyCustomField__c` instead of the field name My Custom Field.

Field	Field Type	Description
<code>customTabListAdditionalFields</code>	<code>string[]</code>	The list of fields displayed in the Recent <i>Object Name</i> list view for an object.
<code>excludedStandardButtons</code>	<code>string[]</code>	The list of standard buttons excluded from the search layout.
<code>listViewButtons</code>	<code>string[]</code>	The list of buttons available in list views for an object.  This field is equivalent to the Buttons Displayed value in the <i>Object Name List View</i> in the related list of the object detail page in the UI.
<code>lookupDialogsAdditionalFields</code>	<code>string[]</code>	The list of fields displayed in a lookup dialog for the object.  Salesforce objects often include one or more <i>lookup fields</i> that allow users to associate two records together in a relationship. For example, a contact record includes an

Field	Field Type	Description
		<p><code>Account</code> lookup field that represents the relationship between the contact and the organization with which the contact is associated. A lookup search dialog helps you search for the record associated with the one being edited. Lookup filter fields allow you to filter your lookup search by a customized list of fields in the object.</p> <p>This field is equivalent to the <code>Lookup Dialogs</code> related list on the object detail page in the UI.</p>
<code>lookupFilterFields</code>	<code>string[]</code>	<p>The list of fields that can be used to filter enhanced lookups for an object. Enhanced lookups are optionally enabled by your administrator.</p> <p>This field is equivalent to the <code>Lookup Filter Fields</code> related list on the object detail page in the application user interface.</p>
<code>lookupPhoneDialogsAdditionalFields</code>	<code>string[]</code>	<p>The list of phone-related fields displayed in a lookup dialog for the object.</p> <p>This list enables integration of the fields with a softphone dial pad.</p> <p>This field is equivalent to the <code>Lookup Phone Dialogs</code> related list on the object detail page in the application user interface.</p>
<code>massQuickActions</code>	<code>string[]</code>	<p>The list of actions that you can use to perform mass quick action on records. Use this field to add an existing create or update action.</p> <p>You can perform mass quick actions on custom objects and all standard objects that support quick actions and have a search layout in Lightning Experience. This includes but isn't limited to cases, leads, accounts, campaigns, contacts, opportunities, and work orders.</p>
<code>searchFilterFields</code>	<code>string[]</code>	<p>The list of fields that can be used to filter a search for the object.</p> <p>This field is equivalent to the <code>Search Filter Fields</code> related list on the object detail page in the application user interface.</p>
<code>searchResultsAdditionalFields</code>	<code>string[]</code>	<p>The list of fields displayed in a search result for the object.</p> <p>This field is equivalent to the <code>Search Results</code> related list on the object detail page in the application user interface.</p>

Field	Field Type	Description
searchResultsCustomButtons	string[]	The list of custom buttons available in a search result for the object. The actions associated with the buttons can be applied to any of the records returned in the search result.

## Declarative Metadata Sample Definition

A sample definition of object's search layout is shown..

```
<?xml version="1.0" encoding="UTF-8"?>
  <CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
    . . .
    <searchLayouts>
      <listViewButtons>New</listViewButtons>
      <listViewButtons>Accept</listViewButtons>
      <listViewButtons>ChangeOwner</listViewButtons>
      <lookupDialogsAdditionalFields>firstQuote__c</lookupDialogsAdditionalFields>

      <lookupDialogsAdditionalFields>finalQuote__c</lookupDialogsAdditionalFields>

      <massQuickActions>Create_MQA_Contact</massQuickActions>
      <searchResultsAdditionalFields>CREATEDBY_USER</searchResultsAdditionalFields>

    </searchLayouts>
    . . .
  </CustomObject>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[CustomObject](#)  
[ProfileSearchLayouts](#)

## SharingReason

Represents an Apex sharing reason, which is used to indicate why sharing was implemented for a custom object. Apex managed sharing allows developers to use Apex to programmatically share custom objects. When you use Apex managed sharing to share a custom object, only users with the "Modify All Data" permission can add or change the sharing on the custom object's record, and the sharing access is maintained across record owner changes.

Use SharingReason to create, update, or delete sharing reason definitions for a custom object. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Version

Sharing reasons are available in API version 14.0 and later.

## Fields

Field	Field Type	Description
<code>fullName</code>	string	Required. Sharing reason name. The <code>__c</code> suffix is appended to custom sharing reasons.  Inherited from <a href="#">Metadata</a> , this field is defined in the WSDL for this metadata type. It must be specified when creating, updating, or deleting. See <a href="#">createMetadata ()</a> to see an example of this field specified for a call.
<code>label</code>	string	Required. Descriptive label for the sharing reason. Maximum of 40 characters.

## Declarative Metadata Sample Definition

The definition of a sharing reason in a custom object:

```
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  . . .
  <sharingReasons>
    <fullName>recruiter__c</fullName>
    <label>Recruiter</label>
  </sharingReasons>
  . . .
</CustomObject>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## SharingRecalculation

Represents Apex classes that recalculate the Apex managed sharing for a specific custom object.

## Version

Sharing recalculations are available in API version 14.0 and later.

## Fields

Field	Field Type	Description
<code>className</code>	string	Required. The Apex class that recalculates the Apex sharing for a custom object. This class must implement the <code>Database.Batchable</code> interface.

## Declarative Metadata Sample Definition

The definition of a sharing recalculation in a custom object:

```
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  . . .
  <sharingRecalculations>
    <className>RecruiterRecalculation</className>
  </sharingRecalculations>
  . . .
</CustomObject>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ValidationRule

Represents a validation rule, which is used to verify that the data a user enters in a record is valid and can be saved. A validation rule contains a formula or expression that evaluates the data in one or more fields and returns a value of `true` or `false`. Validation rules also include an error message that your client application can display to the user when the rule returns a value of `true` due to invalid data.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

As of API version 20.0, validation rules can't have compound fields. Examples of compound fields include addresses, first and last names, dependent picklists, and dependent lookups.

As of API version 40.0, you can use validation rules with custom metadata types.

## Version

Validation rules are available in API version 12.0 and later.

## Fields

Field Name	Field Type	Description
<code>active</code>	boolean	Required. Indicates whether this validation rule is active, ( <code>true</code> ), or not active ( <code>false</code> ).
<code>description</code>	string	A description of the validation rule.
<code>errorConditionFormula</code>	string	Required. The formula defined in the validation rule. If the formula returns a value of <code>true</code> , an error message is displayed.
<code>errorDisplayField</code>	string	The fully specified name of a field in the application. If a value is supplied, the error message appears next to the specified field. If you do not specify a value or the field isn't visible on the page layout, the value changes automatically to <code>Top of Page</code> .

Field Name	Field Type	Description
errorMessage	string	Required. The message that appears if the validation rule fails. The message must be 255 characters or less.
fullName	string	<p>The internal name of the object. White spaces and special characters are escaped for validity. The name must:</p> <ul style="list-style-type: none"> <li>• Contain characters, letters, or the underscore ( _ ) character</li> <li>• Must start with a letter</li> <li>• Can't end with an underscore</li> <li>• Can't contain two consecutive underscore characters.</li> </ul> <p>Inherited from the <a href="#">Metadata</a> component, this field isn't defined in the WSDL for this component. It must be specified when creating, updating, or deleting. See <a href="#">create()</a> to see an example of this field specified for a call.</p>

## Declarative Metadata Sample Definition

A sample XML definition of a validation rule in a custom object is shown in this code block.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <deploymentStatus>Deployed</deploymentStatus>
  <fields>
    <fullName>Mommy_Cat__c</fullName>
    <label>Mommy Cat</label>
    <referenceTo>Cat__c</referenceTo>
    <relationshipName>Cats</relationshipName>
    <type>Lookup</type>
  </fields>
  <label>Cat</label>
  <nameField>
    <label>Cat Name</label>
    <type>Text</type>
  </nameField>
  <pluralLabel>Cats</pluralLabel>
  <sharingModel>ReadWrite</sharingModel>
  <validationRules>
    <fullName>CatsRule</fullName>
    <active>true</active>
    <errorConditionFormula>OR(Name = &apos;Milo&apos;;,Name =
&apos;Moop&apos;)</errorConditionFormula>
    <validationMessage>Name must be that of one of my cats</validationMessage>
  </validationRules>
</CustomObject>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## WebLink

Represents a custom button or link defined in a custom object.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Version

WebLinks are available in API version 12.0 and later.

## Fields

Field Name	Field Type	Description
<code>availability</code>	WebLinkAvailability (enumeration of type string)	Required. Indicates whether the button or link is only available online ( <code>online</code> ), or if it is also available offline ( <code>offline</code> ).
<code>description</code>	string	A description of the button or link.
<code>displayType</code>	WebLinkDisplayType (enumeration of type string)	Represents how the button or link is rendered. Valid values are: <ul style="list-style-type: none"> <li><code>link</code> for a hyperlink</li> <li><code>button</code> for a button</li> <li><code>massActionButton</code> for a button attached to a related list</li> </ul>
<code>encodingKey</code>	Encoding	Required. The default encoding setting is Unicode: <code>UTF-8</code> . Change it if your template requires data in a different format. This is available if your content source is URL.  Valid values include: <ul style="list-style-type: none"> <li><code>UTF-8</code>—Unicode (UTF-8)</li> <li><code>ISO-8859-1</code>—General US &amp; Western Europe (ISO-8859-1, ISO-LATIN-1)</li> <li><code>Shift_JIS</code>—Japanese (Shift-JIS)</li> <li><code>ISO-2022-JP</code>—Japanese (JIS)</li> <li><code>EUC-JP</code>—Japanese (EUC-JP)</li> <li><code>x-SJIS_0213</code>—Japanese (Shift-JIS_2004)</li> <li><code>ks_c_5601-1987</code>—Korean (ks_c_5601-1987)</li> <li><code>Big5</code>—Traditional Chinese (Big5)</li> <li><code>GB2312</code>—Simplified Chinese (GB2312)</li> <li><code>Big5-HKSCS</code>—Traditional Chinese Hong Kong (Big5-HKSCS)</li> </ul>
<code>fullName</code>	string	The name of the custom button or link with white spaces and special characters escaped for validity. The name can only contain characters, letters, and the underscore ( <code>_</code> ) character. The name must start with a

Field Name	Field Type	Description
		letter, and can't end with an underscore or contain two consecutive underscore characters.  Inherited from the <a href="#">Metadata</a> component, this field isn't defined in the WSDL for this component. It must be specified when creating, updating, or deleting. See <a href="#">create()</a> to see an example of this field specified for a call.
hasMenubar	boolean	If the <a href="#">openType</a> is <code>newWindow</code> , this field indicates whether to show the browser menu bar for the window ( <code>true</code> ) or not ( <code>false</code> ). Otherwise, leave this field empty.
hasScrollbars	boolean	If the <a href="#">openType</a> is <code>newWindow</code> , this field indicates whether to show the scroll bars for the window ( <code>true</code> ) or not ( <code>false</code> ). Otherwise, leave this field empty.
hasToolBar	boolean	If the <a href="#">openType</a> is <code>newWindow</code> , this field indicates whether to show the browser toolbar for the window ( <code>true</code> ) or not ( <code>false</code> ). Otherwise, leave this field empty.
height	int	Height in pixels of the window opened by the custom button or link. Required if the <a href="#">openType</a> is <code>newWindow</code> . Otherwise, leave this field empty.
isResizable	boolean	If the <a href="#">openType</a> is <code>newWindow</code> , this field indicates whether to allow resizing of the window ( <code>true</code> ) or not ( <code>false</code> ). Otherwise, leave this field empty.
linkType	WebLinkType (enumeration of type string)	Required. Represents whether the content of the button or link is specified by a URL, an sControl, a JavaScript code block, or a Visualforce page. <ul style="list-style-type: none"> <li>• <code>url</code></li> <li>• <code>sControl</code></li> <li>• <code>javascript</code></li> <li>• <code>page</code></li> <li>• <code>flow</code>—Reserved for future use.</li> </ul>
masterLabel	string	Master label for this object. This display value is the internal label that is not translated.
openType	WebLinkWindowType (enumeration of type string)	Required. When the button or link is clicked, specifies the window style that will be used to display the content. Valid values: <ul style="list-style-type: none"> <li>• <code>newWindow</code></li> <li>• <code>sidebar</code></li> <li>• <code>noSidebar</code></li> <li>• <code>replace</code></li> <li>• <code>onClickJavaScript</code></li> </ul>

Field Name	Field Type	Description
page	string	If the value of <code>linkType</code> is <code>page</code> , this field represents the Visualforce page. Otherwise, leave this field empty.
position	WebLinkPosition (enumeration of type string)	If the value of <code>OpenType</code> is <code>newWindow</code> , this field indicates how the new window should be displayed. Otherwise, don't specify a value. Valid values are: <ul style="list-style-type: none"> <li>• <code>fullScreen</code></li> <li>• <code>none</code></li> <li>• <code>topLeft</code></li> </ul>
protected	boolean	Required. Indicates whether this subcomponent is protected ( <code>true</code> ) or not ( <code>false</code> ). Protected subcomponents can't be linked to or referenced by components or subcomponents created in the installing organization.
requireRowSelection	boolean	If the <code>displayType</code> is <code>massActionButton</code> , this field indicates whether to require individual row selection to execute the action for this button ( <code>true</code> ) or not ( <code>false</code> ). Otherwise, leave this field empty.
scontrol	string	If the value of <code>linkType</code> is <code>sControl</code> , this field represents the name of the sControl. Otherwise, leave this field empty.
showsLocation	boolean	If the <code>openType</code> is <code>newWindow</code> , this field indicates whether to show the browser location bar for the window ( <code>true</code> ) or not ( <code>false</code> ). Otherwise, leave this field empty.
showsStatus	boolean	If the <code>openType</code> is <code>newWindow</code> , this field indicates whether to show the browser status bar for the window. Otherwise, leave this field empty.
url	string	If the value of <code>linkType</code> is <code>url</code> , this is the URL value. If the value of <code>linkType</code> is <code>javascript</code> , this is the JavaScript content. If the value is neither of these options, leave this field empty.  Content must be escaped in a manner consistent with XML parsing rules.
width	int	Width in pixels of the window opened by the button or link.  Required if the <code>openType</code> is <code>newWindow</code> . Otherwise, leave this field empty.

## Java Sample

The following Java sample shows sample values for WebLink fields:

```
public void WebLinkSample(String name) throws Exception {
    WebLink webLink = new WebLink();
    // name variable represents the full name of the object
    // on which to create the WebLink, for example, customObject__c
    webLink.setFullName(name + ".googleButton");
}
```

```

WebLink.setUrl ("http://www.google.com");
WebLink.setAvailability(WebLinkAvailability.online);
WebLink.setLinkType(WebLinkType.url);
WebLink.setEncodingKey(Encoding.fromString("UTF-8"));
WebLink.setOpenType(WebLinkWindowType.newWindow);
WebLink.setHeight(600);
WebLink.setWidth(600);
WebLink.setShowsLocation(false);
WebLink.setHasScrollbars(true);
WebLink.setHasToolbar(false);
WebLink.setHasMenubar(false);
WebLink.setShowsStatus(false);
WebLink.setIsResizable(true);
WebLink.setPosition(WebLinkPosition.none);
WebLink.setMasterLabel("google");
WebLink.setDisplayType(WebLinkDisplayType.link);

AsyncResult[] asyncResults = metadataConnection.create(new WebLink[]{WebLink});
// After the create() call completes, we must poll the results of checkStatus()
//
}

```

## Declarative Metadata Sample Definition

The following is the definition of a WebLink in a custom object. For related samples, see [Declarative Metadata Sample Definition](#) and [Declarative Metadata Sample Definition](#).

```

<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
....
  <WebLinks>
    <fullName>googleButton</fullName>
    <availability>online</availability>
    <displayType>link</displayType>
    <encodingKey>UTF-8</encodingKey>
    <hasMenubar>false</hasMenubar>
    <hasScrollbars>true</hasScrollbars>
    <hasToolbar>false</hasToolbar>
    <height>600</height>
    <isResizable>true</isResizable>
    <linkType>url</linkType>
    <masterLabel>google</masterLabel>
    <openType>newWindow</openType>
    <position>none</position>
    <protected>false</protected>
    <showsLocation>false</showsLocation>
    <showsStatus>false</showsStatus>
    <url>http://www.google.com</url>
    <width>600</width>
  </WebLinks>
....
</CustomObject>

```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Metadata Field Types

These field types extend the field types described in the *Salesforce Object Reference*.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Field Type	Objects	What the Field Contains
CustomField	Custom object Custom field	Represents a custom field.
DeleteConstraint	Custom field	A string that represents deletion options for lookup relationships. Valid values are: <ul style="list-style-type: none"> <li>• SetNull</li> <li>• Restrict</li> <li>• Cascade</li> </ul>
DeploymentStatus	Custom object Custom field	A string which represents the deployment status of a custom object or field. Valid values are: <ul style="list-style-type: none"> <li>• InDevelopment</li> <li>• Deployed</li> </ul>
FieldType	Custom field	Indicates the type of a custom field. Valid values are: <ul style="list-style-type: none"> <li>• Address (beta)</li> <li>• AutoNumber</li> <li>• Lookup</li> <li>• MasterDetail</li> <li>• MetadataRelationship</li> <li>• Checkbox</li> <li>• Currency</li> <li>• Date</li> <li>• DateTime</li> <li>• Email</li> </ul>

Field Type	Objects	What the Field Contains
		<ul style="list-style-type: none"> <li>• EncryptedText</li> <li>•  <b>Note:</b> This page is about Classic Encryption, not Shield Platform Encryption. <a href="#">What's the difference?</a></li> <li>• ExternalLookup</li> <li>• IndirectLookup</li> <li>• Number<sup>1</sup></li> <li>• Percent</li> <li>• Phone</li> <li>• Picklist</li> <li>• MultiselectPicklist</li> <li>• Summary</li> <li>• Text</li> <li>• TextArea</li> <li>• LongTextArea</li> <li>• Url</li> <li>• Hierarchy</li> <li>• File</li> <li>• Html</li> <li>• Location (use for geolocation fields)</li> <li>• Time</li> </ul> <p><sup>1</sup> A Number custom field is internally represented as a field of type double. Setting the scale of the Number field to 0 gives you a double that behaves like an int.</p>
Gender	Custom object	<p>Indicates the gender of the noun that represents the object. This is used for languages where words need different treatment depending on their gender. Valid values are:</p> <ul style="list-style-type: none"> <li>• Masculine</li> <li>• Feminine</li> <li>• Neuter</li> <li>• AnimateMasculine (Slavic languages—currently Czech, Polish, Russian, Slovak, Slovenian, and Ukrainian)</li> <li>• ClassI, ClassIII, ClassV, ClassVII, ClassIX, ClassXI, ClassXIV, ClassXV, ClassXVI, ClassXVII, ClassXVIII (African languages—currently Afrikaans, Xhosa, and Zulu)</li> </ul> <p> <b>Note:</b> The following genders are displayed on the Rename Tabs and Labels page in Setup but are stored internally as “Feminine”. When setting them through the Metadata API, use “Feminine”.</p> <ul style="list-style-type: none"> <li>• Euter (Swedish)</li> <li>• Common (Dutch)</li> </ul>

Field Type	Objects	What the Field Contains
<a href="#">Picklist (Including Dependent Picklist)</a>	Custom field	(This field type isn't used in Metadata API. CustomField includes this field type for Tooling API support). Represents a picklist, a set of labels and values that can be selected from a picklist.
SharingModel	Custom object	<p>Represents the sharing model for the custom object. Depending on the object, valid values are:</p> <ul style="list-style-type: none"> <li>• Private</li> <li>• Read</li> <li>• ReadWrite</li> <li>• ReadWriteTransfer</li> <li>• FullAccess</li> <li>• ControlledByParent</li> <li>• ControlledByCampaign</li> <li>• ControlledByLeadOrContact</li> </ul> <p>For example, the User object supports <code>Private</code> and <code>Read</code> values. Accounts, opportunities, and custom objects support <code>Private</code>, <code>Read</code> and <code>ReadWrite</code> values. Campaign members support <code>ControlledByCampaign</code> and <code>ControlledByLeadOrContact</code>.</p>
StartsWith	Custom object Custom field	<p>Indicates whether the noun starts with a vowel, consonant, or is a special character. This is used for languages where words need different treatment depending on the first character. Valid values are:</p> <ul style="list-style-type: none"> <li>• Consonant</li> <li>• Vowel</li> <li>• Special (for nouns starting with <code>z</code>, or <code>s</code> plus consonants)</li> </ul>
TreatBlanksAs	Custom field	<p>Indicates how blanks should be treated. Valid values are:</p> <ul style="list-style-type: none"> <li>• BlankAsBlank</li> <li>• BlankAsZero</li> </ul>
ValueSet	Custom field	Represents a set of values that can be selected from a custom picklist field. Defines the <code>valueSet</code> of a custom picklist field.

## ValueSet

Represents a set of values that can be selected from a custom picklist field. Defines the `valueSet` of a custom picklist field.

Field Type	Field Type	Description
<code>controllingField</code>	string	The <code>fullname</code> of the controlling field if this is a dependent picklist. A controlling field can be a checkbox or picklist field, but in this case it's a picklist. The controlling picklist filters the available values in the dependent picklist.

Field Type	Field Type	Description
<code>restricted</code>	boolean	Whether the picklist's values are limited to only the values defined by a Salesforce admin. Values are <code>true</code> or <code>false</code> .
<code>valueSetDefinition</code>	ValueSetValuesDefinition	Defines value-specific settings for a custom dependent picklist. Indicates whether the value set of the custom picklist field is sorted alphabetically.
<code>valueSetName</code>	string	The <code>masterLabel</code> of the global value set to be used for this picklist field.
<code>valueSettings</code>	ValueSettings	Used for the settings that describe a value in a custom picklist field. The picklist can have its own unique value set, or inherit the values from a global value set. You can add field dependency values via Metadata API but not remove them.

## ValueSetValuesDefinition

Field Name	Field Type	Description
<code>sorted</code>	boolean	Whether the picklist's value set is displayed in alphabetical order in the user interface.
<code>value</code>	CustomValue	Required. The list of values for this local, custom picklist.

## ValueSettings

Field Name	Field Type	Description
<code>controllingFieldValue</code>	stringstring[]	Applies only to dependent custom picklists. A list of values in the controlling or parent picklist (that the custom picklist values depend on). You can add field dependency values via Metadata API but not remove them.
<code>valueName</code>	string	Defines the values in the custom dependent picklist.

## CustomObjectTranslation

This metadata type allows you to translate custom objects for a variety of languages.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field. The ability to translate component labels is part of the Translation Workbench.

## Declarative Metadata File Suffix and Directory Location

Local translations are stored in a file with a format of `customObjectName__c-lang.objectTranslation`, where `customObjectName__c` is the custom object name, and `lang` is the translation language. A sample file name for German translations is `myCustomObject__c-de.objectTranslation`.

Similarly, packaged translations are stored in a file with a format of `customObjectName-pkgNamespace__c-lang.objectTranslation`, where `customObjectName-pkgNamespace__c` is the custom object and package namespace, and `lang` is the translation language. A sample file name for German translations in a package with the namespace of Acme is `myCustomObject-Acme__c-de.objectTranslation`. Custom object translations are stored in the `objectTranslations` folder in the corresponding package directory.

Custom object translations are stored in the `objectTranslations` folder in the corresponding package directory.

## Version

CustomObjectTranslation components are available in API version 14.0 and later.

## Fields

Field	Field Type	Description
<code>caseValues</code>	<a href="#">ObjectNameCaseValue[]</a>	Different combinations of the custom object with regard to article, plural, possessive, and case.
<code>fields</code>	<a href="#">CustomFieldTranslation[]</a>	A list of translations for the custom fields associated with the custom object.
<code>fieldSets</code>	<a href="#">FieldSetTranslation[]</a>	A list of field set translations. Available in API version 41.0 and later.
<code>fullName</code>	string	The name of the custom object and the translation language with a format of <code>customObjectName-lang</code> , where <code>customObjectName</code> is the custom object name, and <code>lang</code> is the translation language.  Inherited from <a href="#">Metadata</a> , this field is defined in the WSDL for this metadata type. It must be specified when creating, updating, or deleting. See <a href="#">createMetadata()</a> to see an example of this field specified for a call.
<code>gender</code>	Gender	Indicates the gender of the noun that represents the object. This is used for languages where words need different treatment depending on their gender.
<code>layouts</code>	<a href="#">LayoutTranslation[]</a>	A list of page layout translations.
<code>nameFieldLabel</code>	string	The label for the name field. Maximum of 765 characters.
<code>namedFilters</code>	<a href="#">NamedFilterTranslation[]</a>	A list of translations for lookup filter error messages associated with the custom object.  This field has been removed as of API version 30.0 and is only available in prior versions. The translation metadata associated with a lookup filter is now represented by the <code>lookupFilter</code> field in the <a href="#">CustomFieldTranslation</a> on page 669 subtype.
<code>quickActions</code>	<a href="#">QuickActionTranslation[]</a>	A list of translations for actions.

Field	Field Type	Description
recordTypes	<a href="#">RecordTypeTranslation</a> []	A list of record type translations.
sharingReasons	<a href="#">SharingReasonTranslation</a> []	A list of sharing reason translations.
startsWith	StartsWith (enumeration of type string)	Indicates whether the noun starts with a vowel, consonant, or is a special character. This is used for languages where words need different treatment depending on the first character.
validationRules	<a href="#">ValidationRuleTranslation</a> []	A list of validation rule translations.
webLinks	<a href="#">WebLinkTranslation</a> []	A list of web link translations.
workflowTasks	<a href="#">WorkflowTaskTranslation</a> []	A list of workflow task translations.

 **Note:** When you retrieve or deploy translations from a package, the translations from the package might override existing translations. The overridden translations appear in the Rename Tabs and Labels UI until you click **Reset** to restore the translations installed by the latest package.

## CustomFieldTranslation

CustomFieldTranslation contains details for a custom field translation. In API versions 37.0 and earlier standard picklist values could be translated with CustomFieldTranslation. In API version 38.0, use StandardValueSetTranslation instead. For more details, see [CustomField](#).

 **Note:** Not every language supports all the possible values for the fields in CustomFieldTranslation. For language-specific supported values, see the [fully supported languages](#) and [end-user languages](#) appendices.

Field	Field Type	Description
caseValues	<a href="#">ObjectNameCaseValue</a> []	Different combinations of the custom object with regard to article, plural, possessive, and case. Available in API version 29.0 and later.
description	string	Translation for the custom field description.
gender	Gender	Available in API version 29.0 and later.
help	string	Translation for the text that displays in the field-level help hover text for this field.
label	string	Translation for the label. Maximum of 765 characters.
lookupFilter	<a href="#">LookupFilterTranslation</a>	Represents the translation metadata associated with a lookup filter.  This field is available in API version 30.0 and later.  LookupFilter isn't supported on the article type object.
name	string	Required. The name of the field relative to the custom object; for example, MyField__c.

Field	Field Type	Description
<code>picklistValues</code>	<a href="#">PicklistValueTranslation</a> []	List of translations for picklist values. See <a href="#">PicklistValue</a> .  Note: "Subject" on the Task object is a text field, not a picklist value. It can't be retrieved via Metadata API. Translations can be provided via the Translation Workbench.
<code>relationshipLabel</code>	string	Translation for a lookup relationship label. A lookup relationship allows a field to be associated with another field. The relationship field allows users to select an option from a list of values defined by the other field. Maximum of 765 characters.
<code>startsWith</code>	StartsWith (enumeration of type string)	Indicates whether the noun starts with a vowel, consonant, or is a special character. Used for languages where words need different treatment depending on the first character. Available in API version 29.0 and later.

## FieldSetTranslation

FieldSetTranslation contains details for a field set translation. For more details, see [FieldSet](#). Available in API 41.0 and later.

Field	Field Type	Description
<code>label</code>	string	Required. Translation for the field set label. Maximum of 765 characters.
<code>name</code>	string	Required. The field set name.

## LayoutTranslation

LayoutTranslation contains details for a page layout translation. For more details, see [Fields](#).

Field	Field Type	Description
<code>layout</code>	string	Required. The layout name.
<code>layoutType</code>	string	
<code>sections</code>	<a href="#">LayoutSectionTranslation</a> []	An array of layout section translations.

## LayoutSectionTranslation

LayoutSectionTranslation contains details for a page layout section translation. For more details, see [LayoutSection](#).

Field	Field Type	Description
<code>label</code>	string	Required. Translation for the label. Maximum of 765 characters.
<code>section</code>	string	Required. The section name.

## LookupFilterTranslation

LookupFilterTranslation shows a translation for a lookup filter error message associated with the custom object. Replaces NamedFilterTranslation.

LookupFilterTranslation is available in API version 30.0 and later.

Field	Field Type	Description
errorMessage	string	The error message that appears if the lookup filter fails.
informationalMessage	string	The information message displayed on the page. Use to describe things some users don't understand, such as why certain items are excluded in the lookup filter.

## NamedFilterTranslation

NamedFilterTranslation has been removed as of API version 30.0 and is only available in previous API versions.

NamedFilterTranslation shows a list of translations for lookup filter error messages associated with the custom object. See [NamedFilter](#) for more information.

Field	Field Type	Description
errorMessage	string	The error message that appears if the lookup filter fails.
informationalMessage	string	The information message displayed on the page. Use to describe things the user doesn't understand, such as why certain items are excluded in the lookup filter.
name	string	Required. The name of the lookup filter. If you create this field in the user interface, a name is automatically assigned. If you create this field through Metadata API, you must include the name field.

## ObjectNameCaseValue

ObjectNameCaseValue supports multiple cases and definitions of the custom object name to allow usage in various grammatical contexts.

 **Note:** Not every language supports all the possible values for the fields in ObjectNameCaseValue. For language-specific supported values, see the [fully supported languages](#) and [end-user languages](#) appendices.

Field	Field Type	Description
article	Article ( <a href="#">enumeration</a> of type string)	English has two types of articles: definite ( <i>the</i> ) and indefinite ( <i>a</i> , <i>an</i> ). The usage of these articles depends mainly on whether you're referring to any member of a group, or to a specific member of a group. The valid values are: <ul style="list-style-type: none"> <li>• Definite</li> <li>• Indefinite</li> <li>• None</li> </ul>

Field	Field Type	Description
caseType	CaseType (enumeration of type string)	The case of the custom object name. The valid values are: <ul style="list-style-type: none"> <li>• Ablative</li> <li>• Accusative</li> <li>• Adessive</li> <li>• Allative</li> <li>• Causalfinal</li> <li>• Dative</li> <li>• Delative</li> <li>• Distributive</li> <li>• Elative</li> <li>• Essive</li> <li>• Essiveformal</li> <li>• Genitive</li> <li>• Illative</li> <li>• Inessive</li> <li>• Instrumental</li> <li>• Lative</li> <li>• Locative</li> <li>• Nominative</li> <li>• Objective</li> <li>• Partitive</li> <li>• Prepositional</li> <li>• Subjective</li> <li>• Sublative</li> <li>• Superessive</li> <li>• Termanative</li> <li>• Translative</li> <li>• Vocative</li> </ul>
plural	boolean	Indicates whether the <code>value</code> field is plural ( <code>true</code> ) or singular ( <code>false</code> ).
possessive	Possessive (enumeration of type string)	The possessive case of a language is a grammatical case used to indicate a relationship of possession. The valid values are: <ul style="list-style-type: none"> <li>• First</li> <li>• None</li> <li>• Second</li> </ul>
value	string	Required. The value or label in this grammatical context.

## PicklistValueTranslation

PicklistValueTranslation contains details for translation of a picklist value from a local, custom picklist field. For more details, see [Picklist \(Including Dependent Picklist\)](#).

Field	Field Type	Description
masterLabel	string	Required. The picklist value defined on the setup page in the application. Displayed wherever a translated label isn't available.
translation	string	Required. Translation for the value.

## QuickActionTranslation

QuickActionTranslation contains details for an action label in the user interface. For more information, see [QuickAction](#).

Field	Field Type	Description
aspect	string	Identifies which quick action label the translated text belongs to. Use this field only when you want to use different strings for the quick action's field label and informational message. Valid values are <code>Master</code> and <code>InfoMessage</code> . Available in API version 53.0 and later.
label	string	Required. Translation for the label. Maximum of 765 characters.
name	string	Required. The quick action name.

## RecordTypeTranslation

RecordTypeTranslation contains details for a record type name translation. For more details, see [RecordType](#).

Field	Field Type	Description
label	string	Required. Translation for the label. Maximum of 765 characters.
name	string	Required. The record type name.
description	string	Translation for the record type description. Available in API version 42.0 and later.

## SharingReasonTranslation

SharingReasonTranslation contains details for a sharing reason translation. For more details, see [SharingReason](#).

Field	Field Type	Description
label	string	Required. Translation for the sharing reason.
name	string	Required. The sharing reason name.

## ValidationRuleTranslation

ValidationRuleTranslation contains details for a validation rule translation. For more details, see [ValidationRule](#).

Field	Field Type	Description
errorMessage	string	Required. Translation for the error message associated with the validation rule failure.
name	string	Required. The validation rule name.

## WebLinkTranslation

WebLinkTranslation contains details for a web link translation. For more details, see [WebLink](#).

Field	Field Type	Description
label	string	Required. Translation for the web link label. Maximum of 765 characters.
name	string	Required. The web link name.

## WorkflowTaskTranslation

WorkflowTaskTranslation contains details for a workflow task translation. For more details, see [Workflow](#).

Field	Field Type	Description
description	string	Translation for the workflow task description.
name	string	Required. The workflow task name.
subject	string	Translation for the workflow task subject.

## Declarative Metadata Sample Definitions

This sample XML definition shows a CustomObjectTranslation for the Description\_\_c object in German, with one custom field, Summary\_\_c. The name and location of the file containing this definition would be `objectTranslations/Description__c-de.objectTranslation`.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObjectTranslation xmlns="http://soap.sforce.com/2006/04/metadata">
  <caseValues>

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[CustomObject](#)

[Translations](#)

## CustomPageWebLink

---

Represents a custom link defined in a home page component.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

All other custom links are stored as a [WebLink](#) in a [CustomObject](#).

## Declarative Metadata File Suffix and Directory Location

There is one file per custom link definition, stored in the `weblinks` folder in the corresponding package directory. The file suffix is `.weblink`.

## Version

CustomPageWebLinks are available in API version 13.0 and later.

## Fields

Field Name	Field Type	Description
<code>availability</code>	WebLinkAvailability (enumeration of type string)	Required. Indicates whether the link is only available online ( <code>online</code> ), or if it is also available offline ( <code>offline</code> ).
<code>description</code>	string	A description of the link.
<code>displayType</code>	WebLinkDisplayType (enumeration of type string)	Represents how this link is rendered. Valid values: <ul style="list-style-type: none"> <li>• <code>link</code> for a hyperlink</li> <li>• <code>button</code> for a button</li> <li>• <code>massActionButton</code> for a button attached to a related list</li> </ul>

Field Name	Field Type	Description
encodingKey	Encoding (enumeration of type string)	<p>Required. The default encoding setting is Unicode: <code>UTF-8</code>. Change it if your template requires data in a different format. This is available if your content source is URL. Valid values include:</p> <ul style="list-style-type: none"> <li>• <code>UTF-8</code>—Unicode (UTF-8)</li> <li>• <code>ISO-8859-1</code>—General US &amp; Western Europe (ISO-8859-1, ISO-LATIN-1)</li> <li>• <code>Shift_JIS</code>—Japanese (Shift-JIS)</li> <li>• <code>ISO-2022-JP</code>—Japanese (JIS)</li> <li>• <code>EUC-JP</code>—Japanese (EUC-JP)</li> <li>• <code>x-SJIS_0213</code>—Japanese (Shift-JIS_2004)</li> <li>• <code>ks_c_5601-1987</code>—Korean (ks_c_5601-1987)</li> <li>• <code>Big5</code>—Traditional Chinese (Big5)</li> <li>• <code>GB2312</code>—Simplified Chinese (GB2312)</li> <li>• <code>Big5-HKSCS</code>—Traditional Chinese Hong Kong (Big5-HKSCS)</li> </ul>
fullName	string	The name used as a unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
hasMenubar	boolean	If the <code>openType</code> is <code>newWindow</code> , this field indicates whether to show the browser menu bar for the window ( <code>true</code> or not ( <code>false</code> )). Otherwise, leave this field empty.
hasScrollbars	boolean	If the <code>openType</code> is <code>newWindow</code> , this field indicates whether to show the scroll bars for the window ( <code>true</code> ) or not ( <code>false</code> ). Otherwise, leave this field empty.
hasToolBar	boolean	If the <code>openType</code> is <code>newWindow</code> , this field indicates whether to show the browser toolbar for the window ( <code>true</code> ) or not ( <code>false</code> ). Otherwise, leave this field empty.
height	int	Height in pixels of the window opened by the link. Required if the <code>openType</code> is <code>newWindow</code> . Otherwise, leave this field empty.
isResizable	boolean	If the <code>openType</code> is <code>newWindow</code> , this field indicates whether to allow resizing of the window ( <code>true</code> ) or not ( <code>false</code> ). Otherwise, leave this field empty.
linkType	WebLinkType (enumeration of type string)	<p>Required. Represents whether the content of the button or link is specified by a URL, an sControl, a JavaScript code block, or a Visualforce page.</p> <ul style="list-style-type: none"> <li>• <code>url</code></li> <li>• <code>sControl</code></li> <li>• <code>javascript</code></li> <li>• <code>page</code></li> <li>• <code>flow</code>—Reserved for future use.</li> </ul>

Field Name	Field Type	Description
masterLabel	string	The label for the link.
openType	WebLinkWindowType (enumeration of type string)	Required. When the link is clicked, this field specifies the window style used to display the content.  Valid values are: <ul style="list-style-type: none"> <li>• newWindow</li> <li>• sidebar</li> <li>• noSidebar</li> <li>• replace</li> <li>• onClickJavaScript</li> </ul>
page	string	If the value of <code>linkType</code> is <code>page</code> , this field represents the Visualforce page. Otherwise, leave this field empty.
position	WebLinkPosition (enumeration of type string)	If the <code>openType</code> is <code>newWindow</code> , this field indicates how the new window should be displayed. Otherwise, leave this field empty.  Valid values are: <ul style="list-style-type: none"> <li>• fullScreen</li> <li>• none</li> <li>• topLeft</li> </ul>
protected	boolean	Required. Indicates whether this component is protected ( <code>true</code> ) or not ( <code>false</code> ). Protected components cannot be linked to or referenced by components created in the installing organization.
requireRowSelection	boolean	If the <code>openType</code> is <code>massAction</code> , this field indicates whether to require individual row selection to execute the action for this button ( <code>true</code> ) or not ( <code>false</code> ). Otherwise, leave this field empty.
scontrol	string	If the value of <code>linkType</code> is <code>sControl</code> , this field represents the name of the sControl. Otherwise, leave this field empty.
showsLocation	boolean	If the <code>openType</code> is <code>newWindow</code> , this field indicates whether or not to show the browser location bar for the window. Otherwise, leave this field empty.
showsStatus	boolean	If the <code>openType</code> is <code>newWindow</code> , this field indicates whether or not to show the browser status bar for the window. Otherwise, leave this field empty.
url	string	If the value of <code>linkType</code> is <code>url</code> , this field represents the URL value. If the value of <code>linkType</code> is <code>javascript</code> , this field represents the JavaScript content. If the value is neither of these, leave this field empty.  Content must be escaped in a manner consistent with XML parsing rules.

Field Name	Field Type	Description
width	int	Width in pixels of the window opened by the link. Required if the <code>openType</code> is <code>newWindow</code> . Otherwise, leave this field empty.

## Declarative Metadata Sample Definition

The following is the definition of a Weblink. For related samples, see [HomePageComponent](#) and [HomePageLayout](#).

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomPageWebLink xmlns="http://soap.sforce.com/2006/04/metadata">
  <availability>online</availability>
  <displayType>button</displayType>
  <encodingKey>UTF-8</encodingKey>
  <hasMenubar>false</hasMenubar>
  <hasScrollbars>true</hasScrollbars>
  <hasToolBar>false</hasToolBar>
  <height>600</height>
  <isResizable>true</isResizable>
  <linkType>url</linkType>
  <masterLabel>detailPageButon</masterLabel>
  <openType>newWindow</openType>
  <position>none</position>
  <protected>false</protected>
  <showsLocation>false</showsLocation>
  <showsStatus>false</showsStatus>
  <url>http://google.com</url>
</CustomPageWebLink>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

- [HomePageComponent](#)
- [HomePageLayout](#)
- [Weblink](#)

## CustomPermission

Represents a permission that grants access to a custom feature. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

CustomPermission components have the suffix `.customPermission` and are stored in the `customPermissions` folder.

## Version

CustomPermission components are available in API version 31.0 and later.

## Special Access Rules

As of Summer '20 and later, only users who have one of these permissions can access this object:

- View Setup and Configuration
- Manage Session Permission Set Activations
- Assign Permission Sets

## Fields

Field Name	Field Type	Description
<code>connectedApp</code>	string	The name of the connected app that's associated with this permission. Limit: 80 characters.
<code>description</code>	string	The custom permission description. Limit: 255 characters.
<code>isLicensed</code>	boolean	Required. Read-only. Indicates whether the appropriate Salesforce license is required before accessing the permission ( <code>true</code> ) or not ( <code>false</code> ).
<code>label</code>	string	Required. The custom permission label. Limit: 80 characters.
<code>requiredPermission</code>	<a href="#">CustomPermissionDependencyRequired[]</a>	Indicates which custom permissions are required by the parent custom permission. This field is available in API version 32.0 and later.

## CustomPermissionDependencyRequired

`CustomPermissionDependencyRequired` determines whether a custom permission is required by the parent custom permission. A required custom permission must be enabled when its parent is enabled.

Field Name	Field Type	Description
<code>customPermission</code>	string	Required. The custom permission name.

Field Name	Field Type	Description
dependency	boolean	Required. Indicates whether this custom permission is required by the parent custom permission ( <code>true</code> ) or not ( <code>false</code> ).

## Declarative Metadata Sample Definition

The following is an example of a CustomPermission component.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomPermission xmlns="http://soap.sforce.com/2006/04/metadata">
  <connectedApp>Acme</connectedApp>
  <description>Read and edit access for Acme accounts.</description>
  <label>Acme Account Full Access</label>
  <requiredPermission>
    <customPermission>Acme_Account_Read</customPermission>
    <dependency>true</dependency>
  </requiredPermission>
</CustomPermission>
```

The following is an example `package.xml` that references the previous definition, as well as other custom permissions that are associated with a connected app.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Acme</members>
    <name>ConnectedApp</name>
  </types>
  <types>
    <members>Acme_Account_Email_Read</members>
    <members>Acme_Account_Phone_Edit</members>
    <members>Acme_Account_Full_Access</members>
    <members>Acme_Account_Read</members>
    <name>CustomPermission</name>
  </types>
  <types>
    <members>Acme_Account_Email_Read</members>
    <members>Acme_Account_Phone_Edit</members>
    <members>Acme_Account_Full_Access</members>
    <members>Acme_Account_Read</members>
    <name>PermissionSet</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## CustomSite

---

Represents a Salesforce site. Create public websites and applications that are directly integrated with your Salesforce organization, but don't require users to log in with a username and password.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

For more information, see “Salesforce Sites” in Salesforce Help.

 **Note:** CustomSite doesn't currently support syndication feeds.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Declarative Metadata File Suffix and Directory Location

Lightning Platform CustomSite components are stored in the `sites` directory of the corresponding package directory. The file name matches the site name, and the extension is `.site`.

## Version

Lightning Platform CustomSite components are available in API version 14.0 and later.

## Fields

Field	Field Type	Description
<code>active</code>	boolean	Required. Determines whether the site is active.
<code>allowHomePage</code>	boolean	Required. Determines whether the standard home page is visible to public users. This field is available in API version 15.0 and later.
<code>allowStandardAnswersPages</code>	boolean	Determines whether the standard answer pages are visible to public users. This field is available in API version 19.0 and later.
<code>allowStandardIdeasPages</code>	boolean	Required. Determines whether the standard Ideas pages are visible to public users. This field is available in API version 15.0 and later.
<code>allowStandardLookups</code>	boolean	Required. Determines whether the standard lookup pages are visible to public users. This field is available in API version 15.0 and later.
<code>allowStandardPortalPages</code>	boolean	Required. When enabled, authenticated users in this site can access standard Salesforce pages as allowed by their access controls. When disabled, authenticated users in this site can't access standard Salesforce pages, even if their access controls allow it. If your site serves only Visualforce pages, disabling this setting

Field	Field Type	Description
		helps add a layer of access protection to your site. This field is available in API version 39.0 and later.
<code>allowStandardSearch</code>	boolean	Required. Determines whether the standard search pages are visible to public users. This field is available in API version 15.0 and later.
<code>analyticsTrackingCode</code>	string	The tracking code associated with your site. Services such as Google Analytics can use this code to track page request data for your site. This field is available in API version 17.0 and later.
<code>authorizationRequiredPage</code>	string	The name of the Visualforce page to be displayed when the guest user tries to access a page for which they are not authorized.
<code>bandwidthExceededPage</code>	string	The name of the Visualforce page to be displayed when the site has exceeded its bandwidth quota.
<code>browserXssProtection</code>	boolean	Required. Determines whether protection against reflected cross-site scripting attacks is enabled. If a reflected cross-site scripting attack is detected, the browser shows a blank page with no content. Available in API version 41.0 and later.
<code>cachePublicVisualforcePagesInProxyServers</code>	boolean	Indicates whether proxy servers cache this site's publicly available pages only for unauthenticated guest users ( <code>true</code> ) or not ( <code>false</code> ). When this field is <code>false</code> , this site's cache-enabled Visualforce pages are cached in the web browser for both authenticated and unauthenticated users. The default is <code>true</code> . See <a href="#">Configure Site Caching</a> in Salesforce Help for more information.  This field is available in API version 52.0 and later.
<code>changePasswordPage</code>	string	The name of the Visualforce page to be displayed when the portal user attempts to change their password for either the portal or for Chatter Answers, when enabled.
<code>chatterAnswersForgotPasswordConfirmPage</code>	string	The name of the Visualforce page to be displayed that informs the user that an email has been sent to them with a temporary password. This field is available if Chatter Answers is enabled for your organization. This field is available in API version 27.0 and later.
<code>chatterAnswersForgotPasswordPage</code>	string	The name of the Visualforce page to be displayed when a user clicks the link to retrieve a forgotten password. This field is available if Chatter Answers is

Field	Field Type	Description
		enabled for your organization. This field is available in API version 27.0 and later.
<code>chatterAnswersHelpPage</code>	string	The name of the Visualforce page to be displayed when the user clicks the help link. This field is available if Chatter Answers is enabled for your organization. This field is available in API version 27.0 and later.
<code>chatterAnswersLoginPage</code>	string	The name of the Visualforce page to be displayed to allow users to log in to the portal. This field is available if Chatter Answers is enabled for your organization. This field is available in API version 27.0 and later.
<code>chatterAnswersRegistrationPage</code>	string	The name of the Visualforce page to be displayed to allow users to register themselves and access the portal. This field is available in API version 27.0 and later.
<code>clickjackProtectionLevel</code>	SiteClickjackProtectionLevel (enumeration of type string)	<p>Required. Sets the clickjack protection level. The options are:</p> <ul style="list-style-type: none"> <li><code>AllowAllFraming</code> — Allow framing by any page (no protection)</li> <li><code>External</code> — Allow framing of site or Experience Cloud site pages on external domains (good protection)</li> <li><code>SameOriginOnly</code> — Allow framing by the same origin only (recommended)</li> <li><code>NoFraming</code> — Don't allow framing by any page (most protection)</li> </ul> <p>This field is available in API version 30.0 and later.</p>
<code>contentSniffingProtection</code>	boolean	Required. Determines whether the browser is prevented from inferring the MIME type from the document content. If enabled, it also prevents the browser from executing some malicious files (JavaScript, Stylesheet) as dynamic content. This field is available in API version 41.0 and later.
<code>cspUpgradeInsecureRequests</code>	boolean	This field is removed in API version 52.0 and later. In API version 51.0 and earlier, the value in the field is ignored.
<code>customWebAddresses</code>	<a href="#">SiteWebAddress[]</a>	The root custom URLs associated with the site. Saving or deploying a CustomSite replaces all root custom URLs in the site with the root custom URLs in this list. Custom URLs that use a non-root path prefix are not included in this list and are not affected when saving or deploying a CustomSite. This field is available in API version 21.0 and later.

Field	Field Type	Description
<code>description</code>	string	The site description.
<code>enableAuraRequests</code>	boolean	Determines whether guest users can view features available only in Lightning ( <code>true</code> ). If set to <code>false</code> , Lightning features don't load. This field is available in API version 46.0 and later.
<code>favoriteIcon</code>	string	The name of the file to be used for the icon that appears in the browser's address field when visiting the site. Sets the favorite icon for the entire site.
<code>fileNotFoundPage</code>	string	The name of the Visualforce page to be displayed when the guest user tries to access a non-existent page.
<code>forgotPasswordPage</code>	string	The name of the Visualforce page to be displayed when a user clicks the Forgot Password link on the site's login page. This field is only applicable for Experience Cloud sites.
<code>genericErrorPage</code>	string	The name of the Visualforce page to be displayed for errors not otherwise specified.
<code>guestProfile</code>	string	Read only. The name of the profile associated with the guest user.
<code>inMaintenancePage</code>	string	The name of the Visualforce page to be displayed when the site is down for maintenance.
<code>inactiveIndexPage</code>	string	The name of the Visualforce page set as the inactive site home page.
<code>indexPage</code>	string	Required. The name of the Visualforce page set as the active site home page.
<code>masterLabel</code>	string	Required. The name of the site label in the Salesforce user interface.
<code>myProfilePage</code>	string	The name of the Visualforce page to be displayed as the site user's profile page, where users can update their contact information. This field is available in API version 20.0 and later.
<code>portal</code>	string	The name of the portal associated with this site for login access.
<code>redirectToCustomDomain</code>	boolean	Indicates whether requests for this site's system-managed URLs are redirected to the HTTPS custom domain serving this site ( <code>true</code> ) or not ( <code>false</code> ). System-managed site URLs end in <code>*.my.salesforce-sites.com</code> or <code>*.my.site.com</code> . In Experience Cloud sites, the

Field	Field Type	Description
		<p>default is <code>false</code>. In Salesforce Sites, the default is <code>true</code>.</p> <p>If multiple custom domains serve this site and this field is set to <code>true</code>, requests are routed to the site's primary custom URL only if it's an HTTPS custom domain. Otherwise, requests are redirected to the first HTTPS custom domain associated with this site, in alphanumeric order. If no HTTPS custom domain serves this site, this option has no effect.</p> <p>This field is available in API version 52.0 and later.</p>
<code>referrerPolicyOriginWhenCrossOrigin</code>	boolean	Required. Determines whether the referrer header shows only <code>Salesforce.com</code> rather than the entire URL when loading a page. This feature eliminates the potential for a referrer header to reveal sensitive information that could be present in a full URL, such as an org ID. This field is available in API version 41.0 and later.
<code>requireHttps</code>	boolean	This field is removed in API version 52.0 and later. In API version 51.0 and earlier, the value in the field is ignored.
<code>requireInsecurePortalAccess</code>	boolean	Determines whether to override your organization's security settings and exclusively use HTTP when logging in to the associated portal from your site. Removed in API version 50.0 and later.
<code>robotsTxtPage</code>	string	The name of the Visualforce page to be displayed for the <code>robots.txt</code> file used by web crawlers.
<code>selfRegPage</code>	string	Visualforce page used for self-registration.
<code>serverIsDown</code>	string	The name of the static resource to be displayed from the cache server when Salesforce servers are down. The static resource must be a public zip file 1 MB or smaller and must contain a page named <code>maintenance.html</code> at the root level of the zip file. Other resources in the zip file, such as images or CSS files, can follow any directory structure. This field is available in API version 17.0 and later.
<code>siteAdmin</code>	string	The username of the site administrator.
<code>siteGuestRecordDefaultOwner</code>	string	The username of the user who owns all new records that unauthenticated guest users create. This field is available in API version 51.0 and later.

Field	Field Type	Description
siteIframeWhiteListUrls	<a href="#">SiteIframeWhiteListUrl[]</a>	The list of external domains that you allow to frame your Salesforce site. This field is available in API 49.0 and later.
siteRedirectMappings	<a href="#">SiteRedirectMapping[]</a>	An array of all URL redirect rules set for your site. This field is available in API version 20.0 and later.
siteTemplate	string	The name of the Visualforce page to be used as the site template.
siteType	siteType	Required. Identifies whether the site is a Visualforce (Salesforce Sites), Site.com site, or ChatterNetwork (Salesforce Sites). This field is available in API version 27.0 and later.
subdomain	string	<p>Read only. The previous custom subdomain prefix for the site. For example, if your site URL is <code>mycompany.force.com/partners</code>, <code>mycompany</code> is the subdomain.</p> <p>This field is applicable and required only when the <code>myDomainSuffix</code> <code>MyDomainSettings</code> field is set to <code>MySalesforceLimited</code>, <code>CloudforceLimited</code>, or <code>DatabaseLimited</code>.</p> <p>If you enabled Salesforce Sites or Digital Experiences when the <code>myDomainSuffix</code> <code>MyDomainSettings</code> field was set to one of those values, this field returns this site's previous subdomain. Otherwise, this field returns a null value.</p>
urlPathPrefix	string	<p>The first part of the path on the site's URL that distinguishes this site from other sites. For example, if your site URL is <code>MyDomainName.my.salesforce-sites.com/partners</code>, <code>partners</code> is the <code>urlPathPrefix</code>.</p>

## SiteIframeWhiteListUrl

Represents the external domains that you allow to frame your site or experience pages.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this metadata type's name.

Field	Field Type	Description
url	string	Required. The trusted domain that you allow to frame your site or Experience Cloud site pages. Accepts these formats: <code>example</code> ,

Field	Field Type	Description
		example.com, *example.com, and https://example.com.

## SiteRedirectMapping

SiteRedirectMapping represents a URL redirect rule on your Salesforce site." in Salesforce Help.

Field	Field Type	Description
action	SiteRedirect (enumeration of type string)	Required. The type of the redirect. Available string values are: <ul style="list-style-type: none"> <li>Permanent</li> <li>Temporary</li> </ul>
isActive	boolean	The status of the redirect: active or inactive.
source	string	Required. The URL that you want to redirect. It must be a relative URL, but can have any valid extension type, such as .html or .php.
target	string	Required. The new URL you want users to visit. It can be a relative URL or a fully-qualified URL with an http:// or https:// prefix.

## SiteWebAddress

Represents the web address of a Salesforce site.

Field	Field Type	Description
certificate	string	Identifies the certificate associated with the custom domain. If the custom domain is set up for Salesforce to serve HTTPS, this field indicates which certificate to use.
domainName	string	Required. The domain of the website, in the form of www.acme.com.
primary	boolean	Required. Indicates whether this is the primary domain (true). If false, this is not the primary domain.

## Declarative Metadata Sample Definition

Here is a sample XML definition of a site.

```
<?xml version="1.0" encoding="UTF-8"?>

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Portal](#)

## CustomTab

---

Represents a custom tab. Custom tabs let you display custom object data or other web content in Salesforce. When you add a custom tab to an app in Salesforce Classic, it appears as a tab. When you add a custom tab to an app in Lightning Experience, it appears as an item in the app's navigation bar and in the App Launcher. When a tab displays a custom object, the tab name is the same as the custom object name. For page, s-control, or URL tabs, the name is arbitrary.

For more information, see *Custom Tabs* in Salesforce Help. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

The file suffix is `.tab`. There's one file for each tab, stored in the `tabs` folder in the corresponding package directory.

 **Note:** Retrieving a component of this metadata type in a project makes the component appear in any Profile and PermissionSet components that are retrieved in the same package.

## Version

Tabs are available in API version 10.0 and later.

## Fields

This metadata type contains the following fields:

Field Name	Field Type	Description
<code>actionOverrides</code>	<code>ActionOverride[]</code>	A list of the action overrides that are assigned to the tab. Only one override is allowed per <code>formFactor</code> for a given tab.  This field is available in API version 37.0 and later.
<code>auraComponent</code>	string	The name of the Aura component to display in this tab.  Only one of these fields can have a value set: <ul style="list-style-type: none"> <li>• <code>auraComponent</code></li> <li>• <code>customObject</code></li> <li>• <code>flexiPage</code></li> <li>• <code>lwcComponent</code></li> <li>• <code>page</code></li> <li>• <code>scontrol</code></li> <li>• <code>url</code></li> </ul>
<code>customObject</code>	boolean	Indicates whether this tab is for a custom object ( <code>true</code> ) or not ( <code>false</code> ). If set to <code>true</code> , the name of the tab matches the name of the custom object.  Only one of these fields can have a value set: <ul style="list-style-type: none"> <li>• <code>auraComponent</code></li> <li>• <code>customObject</code></li> <li>• <code>flexiPage</code></li> <li>• <code>lwcComponent</code></li> <li>• <code>page</code></li> <li>• <code>scontrol</code></li> <li>• <code>url</code></li> </ul>
<code>description</code>	string	The optional description text for the tab.
<code>flexiPage</code>	string	The name of the Lightning page to display in this tab.  Only one of these fields can have a value set: <ul style="list-style-type: none"> <li>• <code>auraComponent</code></li> <li>• <code>customObject</code></li> <li>• <code>flexiPage</code></li> <li>• <code>lwcComponent</code></li> <li>• <code>page</code></li> <li>• <code>scontrol</code></li> <li>• <code>url</code></li> </ul>
<code>frameHeight</code>	int	The height, in pixels of the tab frame. Required for s-control and page tabs.

Field Name	Field Type	Description
<code>fullName</code>	string	<p>The name of the tab. The value of this field depends on the type of tab, and the API version.</p> <ul style="list-style-type: none"> <li>For custom object tabs, the <code>fullName</code> is the developer-assigned name of the custom object (<code>MyCustomObject__c</code>, for example). For custom object tabs, this name must be the same as the custom object name, and <code>customObject</code> must be set to <code>true</code>.</li> <li>For web tabs, the <code>fullName</code> is the developer-assigned name of the tab (<code>MyWebTab</code>, for example).</li> </ul> <p>The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is inherited from the <a href="#">Metadata</a> component.</p>
<code>hasSidebar</code>	boolean	Indicates if the tab displays the sidebar panel.
<code>icon</code>	string	The optional reference to the image document for the tab if the tab isn't using one of the standard tab styles. This field is available in API version 14.0.
<code>label</code>	string	The label of the tab, for web tabs only.
<code>lwcComponent</code>	string	<p>The name of the Lightning web component to display in this tab.</p> <p>Only one of these fields can have a value set:</p> <ul style="list-style-type: none"> <li><code>auraComponent</code></li> <li><code>customObject</code></li> <li><code>flexiPage</code></li> <li><code>lwcComponent</code></li> <li><code>page</code></li> <li><code>scontrol</code></li> <li><code>url</code></li> </ul>
<code>motif</code>	string	Required. The tab style for the color scheme and icon for the custom tab. For example, "Custom70: Handsaw," is the handsaw icon.
<code>page</code>	string	<p>The name of the Visualforce page to display in this tab.</p> <p>Only one of these fields can have a value set:</p> <ul style="list-style-type: none"> <li><code>auraComponent</code></li> <li><code>customObject</code></li> <li><code>flexiPage</code></li> <li><code>lwcComponent</code></li> <li><code>page</code></li> <li><code>scontrol</code></li> <li><code>url</code></li> </ul>

Field Name	Field Type	Description
scontrol	string	The name of the s-control to display in this tab. Only one of these fields can have a value set: <ul style="list-style-type: none"> <li>auraComponent</li> <li>customObject</li> <li>flexiPage</li> <li>lwcComponent</li> <li>page</li> <li>scontrol</li> <li>url</li> </ul>
splashPageLink	string	The custom link used as the introductory splash page when users click the tab. References a <a href="#">HomePageComponent</a> .
url	string	The URL for the external web-page to embed in this tab. Only one of these fields can have a value set: <ul style="list-style-type: none"> <li>auraComponent</li> <li>customObject</li> <li>flexiPage</li> <li>lwcComponent</li> <li>page</li> <li>scontrol</li> <li>url</li> </ul>
urlEncodingKey	Encoding (enumeration of type string)	The default encoding setting is Unicode: UTF-8. Change it if you're passing information to a URL that requires data in a different format. This option is available when the value URL is selected in the tab type.

## Declarative Metadata Sample Definition

The following is the definition of a tab:

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomTab xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>Myriad Publishing</description>
  <frameHeight>600</frameHeight>
  <motif>Custom53: Bell</motif>
  <url>https://www.example.com</url>
  <urlEncodingKey>UTF-8</urlEncodingKey>
</CustomTab>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[CustomApplication](#)

## CustomValue

---

Represents the definition of a value used in a global value set or local custom picklist. Custom picklist fields can be local and unique, or can inherit their values from a global picklist (called a *global value set* in API version 38.0). This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

To deactivate a global picklist value, you can invoke an `update()` call on `GlobalPicklist` (API version 37.0) or `GlobalValueSet` (API version 38.0 and later) with the value omitted, or with the value's `isActive` field set to `false`. Or, you can invoke an `update()` call directly on `GlobalPicklistValue` (API version 37.0) or `CustomValue` (API version 38.0 and later) with the `isActive` field set to `false`.

 **Note:** If picklist values are missing from a component definition, they get deactivated when deployed. Deactivation occurs for picklist values of both standard and custom fields.

`CustomValue` doesn't support file-based operations and only supports CRUD-based calls. `CustomValue` is retrieved or deployed together with a `GlobalValueSet` or `CustomObject` component.

## File Suffix and Directory Location

`CustomValue` components have the suffix `.customValue`. A `CustomValue` component is returned with either a `GlobalValueSet` or `CustomObject` component.

## Version

`CustomValue` components are available in API version 38.0 and later. `CustomValue` replaces `GlobalPicklistValue` from API version 37.0.

## Fields

Field Name	Field Type	Description
<code>color</code>	string	The color assigned to the picklist value when it's used in charts on reports and dashboards. The color is in hexadecimal format; for example, <code>#FF6600</code> . If a color isn't specified, it's assigned dynamically upon chart generation.
<code>default</code>	boolean	Required. Indicates whether this value is the default selection for the global picklist and the custom picklists that share its picklist value set. This field is set to <code>true</code> by default.
<code>description</code>	string	A picklist value's description. It's useful to include a description for a picklist value so the reason for creating it can be tracked. Limit: 255 characters.

Field Name	Field Type	Description
<code>isActive</code>	boolean	Indicates whether this value is active or inactive. The default value is <code>true</code> . Users can select only active values from a picklist. An API retrieve operation for global picklist values returns all active and inactive values in the picklist. But retrieving the values of a non-global, unrestricted picklist returns only the active values.
<code>label</code>	string	The value's display label. If you don't specify the label when creating a value it defaults to the API name. Available in API version 39.0 and later.

## StandardValue

This metadata type defines a value in a value set for a standard picklist and specifies whether this value is the default value. This type extends the CustomValue metadata type and inherits all its fields.

When you deploy changes to standard picklist fields, picklist values are added as needed.

Field Name	Field Type	Description
<code>allowEmail</code>	boolean	Indicates whether this value lets users email a quote PDF ( <code>true</code> ), or not ( <code>false</code> ). This field is only relevant for the <code>status</code> field in quotes. This field is available in API version 18.0 and later.
<code>closed</code>	boolean	Indicates whether this value is associated with a closed status ( <code>true</code> ), or not ( <code>false</code> ). This field is only relevant for the standard <code>status</code> field in cases and tasks. This field is available in API version 16.0 and up to version 36.0. In version 37.0, this field is in <code>GlobalPicklistValue</code> .
<code>converted</code>	boolean	Indicates whether this value is associated with a converted status ( <code>true</code> ), or not ( <code>false</code> ). This field is relevant for only the standard <code>Lead Status</code> field in leads. Your organization can set its own guidelines for determining when a lead is qualified, but typically, you want to convert a lead as soon as it becomes a real opportunity that you want to forecast. For more information, see <a href="#">Convert Qualified Leads in Salesforce Help</a> . This field is available in API version 16.0 and later.
<code>cssExposed</code>	boolean	Indicates whether this value is available in your Self-Service Portal ( <code>true</code> ), or not ( <code>false</code> ). This field is only relevant for the standard <code>Case Reason</code> field in cases.  Self-Service provides an online support channel for your customers - allowing them to resolve their inquiries without contacting a customer service representative. For more information about Self-Service, see <a href="#">Setting Up Your Self-Service Portal in Salesforce Help</a> .   <b>Note:</b> Starting with Spring '12, the Self-Service portal isn't available for new Salesforce orgs. Existing orgs continue to have access to the Self-Service portal.  This field is available in API version 16.0 and later.

Field Name	Field Type	Description
<code>forecastCategory</code>	ForecastCategories (enumeration of type string)	<p>Indicates whether this value is associated with a forecast category (<code>true</code>), or not (<code>false</code>). This field is only relevant for the standard <code>Stage</code> field in opportunities.</p> <ul style="list-style-type: none"> <li>• Omitted</li> <li>• Pipeline</li> <li>• BestCase</li> <li>• Forecast</li> <li>• Closed</li> </ul> <p>This field is available in API version 16.0 and later.</p>
<code>highPriority</code>	boolean	<p>Indicates whether this value is a high priority item (<code>true</code>), or not (<code>false</code>). This field is only relevant for the standard <code>Priority</code> field in tasks. For more information about tasks, see <a href="#">Start Using Tasks in Salesforce Help</a>. This field is available in API version 16.0 and later.</p>
<code>probability</code>	int	<p>Indicates whether this value is a probability percentage (<code>true</code>), or not (<code>false</code>). This field is only relevant for the standard <code>Stage</code> field in opportunities. This field is available in API version 16.0 and later.</p>
<code>reverseRole</code>	string	<p>A picklist value corresponding to a reverse role name for a partner. If the role is subcontractor, then the reverse role might be general contractor. Assigning a partner role to an account in Salesforce creates a reverse partner relationship so that both accounts list the other as a partner. This field is only relevant for partner roles.</p> <p>For more information, see <a href="#">Partner Fields in Salesforce Help</a>.</p> <p>This field is available in API version 18.0 and later.</p>
<code>reviewed</code>	boolean	<p>Indicates whether this value is associated with a reviewed status (<code>true</code>), or not (<code>false</code>). This field is only relevant for the standard <code>Status</code> field in solutions. For more information about opportunities, see <a href="#">Creating Solutions in Salesforce Help</a>. This field is available in API version 16.0 and later.</p>
<code>won</code>	boolean	<p>Indicates whether this value is associated with a closed or won status (<code>true</code>), or not (<code>false</code>). This field is only relevant for the standard <code>Stage</code> field in opportunities. This field is available in API version 16.0 and later.</p>

## Declarative Metadata Sample Definition

For an example of CustomValue components within a GlobalValueSet component that's referenced by a `package.xml`, see [GlobalValueSet](#).

## Dashboard

---

Represents a dashboard. Dashboards are visual representations of data that allow you to see key metrics and performance at a glance.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field. For more information, see “Edit Dashboards in Accessibility Mode in Salesforce Classic” in the Salesforce online help.

## Declarative Metadata File Suffix and Directory Location

Dashboards are stored in the `dashboards` directory of the corresponding package directory. The file name matches the dashboard title and the extension is `.dashboard`.

## Retrieving Dashboards

You can't use the wildcard (\*) symbol with dashboards in `package.xml`. To retrieve the list of dashboards for populating `package.xml` with explicit names, call `listMetadata()` and pass in `DashboardFolder` as the type. Note that `DashboardFolder` is not returned as a type in `describeMetadata()`. `Dashboard` is returned from `describeMetadata()` with an associated attribute of `inFolder` set to true. If that attribute is set to true, you can construct the type by using the component name with the word `Folder`, such as `DashboardFolder`.

The following example shows folders in `package.xml`. The names used in `package.xml` must be developer names, not dashboard titles.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>MyDBFolder/MyDBName</members>
    <name>Dashboard</name>
  </types>
  <types>
    <members>MyDocumentFolder/MyDocumentName</members>
    <name>Document</name>
  </types>
  <types>
    <members>unfiled$public/MarketingProductInquiryResponse</members>
    <members>unfiled$public/SalesNewCustomerEmail</members>
    <name>EmailTemplate</name>
  </types>
  <types>
    <members>MyReportFolder/MyReportName</members>
    <name>Report</name>
  </types>
  <version>62.0</version>
</Package>
```

## Version

Dashboard components are available in API version 14.0 and later.

## Fields

Field	Field Type	Description
<code>backgroundEndColor</code>	string	Required. A dashboard can have a gradient color change on its charts. This field defines the second color for the gradient and <code>backgroundStartColor</code> defines the first color. If you prefer your background to be all one color or do not want a gradient color change, select the same color for this field and <code>backgroundStartColor</code> . The color is in hexadecimal format; for example <code>#FF6600</code> .
<code>backgroundFadeDirection</code>	ChartBackgroundDirection (enumeration of type string)	Required. The direction of the gradient color change, defined by the <code>backgroundStartColor</code> and <code>backgroundEndColor</code> fields. The valid values are: <ul style="list-style-type: none"> <li>• Diagonal</li> <li>• LeftToRight</li> <li>• TopToBottom</li> </ul>
<code>backgroundStartColor</code>	string	Required. The starting color for the gradient color change on the dashboard's charts. See <code>backgroundEndColor</code> for more information. The color is in hexadecimal format; for example <code>#FF6600</code> .
<code>chartTheme</code>	ChartTheme (enumeration of type string)	Determines the default theme for all dashboard charts. Replaces <code>dashboardChartTheme</code> for API v42.0 and later. <ul style="list-style-type: none"> <li>• <code>light</code>—Light-colored theme.</li> <li>• <code>dark</code>—Dark-colored theme.</li> </ul> This field is available in API version 42.0 and later.
<code>colorPalette</code>	ChartColorPalettes (enumeration of type string)	Determines the default palette for all dashboard charts. Replaces <code>dashboardColorPalette</code> for API v42.0 and later. <ul style="list-style-type: none"> <li>• <code>accessible</code></li> <li>• <code>bluegrass</code></li> <li>• <code>colorSafe</code></li> <li>• <code>Default</code></li> <li>• <code>dusk</code></li> <li>• <code>earth</code></li> <li>• <code>fire</code></li> <li>• <code>gray</code></li> <li>• <code>heat</code></li> <li>• <code>justice</code></li> <li>• <code>nightfall</code></li> <li>• <code>pond</code></li> <li>• <code>sunrise</code></li> </ul>

Field	Field Type	Description
		<ul style="list-style-type: none"> <li>tropic</li> <li>unity</li> <li>water</li> <li>watermelon</li> </ul> <p>This field is available in API version 42.0 and later.</p>
dashboardChartTheme	ChartTheme (enumeration of type string)	<p>Determines the default theme for all dashboard charts.</p> <ul style="list-style-type: none"> <li>light—Light-colored theme.</li> <li>dark—Dark-colored theme.</li> </ul> <p>This field is available to maintain backward compatibility with versions prior to API version 42.0.</p>
dashboardColorPalette	ChartColorPalettes (enumeration of type string)	<p>Determines the default palette for all dashboard charts.</p> <ul style="list-style-type: none"> <li>accessible</li> <li>bluegrass</li> <li>colorSafe</li> <li>Default</li> <li>dusk</li> <li>earth</li> <li>fire</li> <li>gray</li> <li>heat</li> <li>justice</li> <li>nightfall</li> <li>pond</li> <li>sunrise</li> <li>tropic</li> <li>unity</li> <li>water</li> <li>watermelon</li> </ul> <p>This field is available to maintain backward compatibility with versions prior to API version 42.0.</p>
dashboardFilters	<a href="#">DashboardFilter[]</a>	<p>The list of filters in a dashboard.</p> <p>This field is available in API version 23.0 and later.</p>
dashboardGridLayout	<a href="#">DashboardGridLayout</a>	<p>Lists the included <a href="#">DashboardGridComponent</a> objects, specifies the number of dashboard columns, and sets each dashboard row's height in pixels.</p> <p>This field is available in API version 35.0 and later.</p>

Field	Field Type	Description
dashboardType	DashboardType (enumeration of type string)	<p>Determines the way visibility settings are set for a dashboard. The valid values are:</p> <ul style="list-style-type: none"> <li><code>SpecifiedUser</code>—All users see data at the access level of one specific running user, specified in the <code>runningUser</code> field, regardless of their own security settings.</li> <li><code>LoggedInUser</code>—Each logged-in user sees data according to his or her own access level.</li> <li><code>MyTeamUser</code>—Managers can choose to view the dashboard from the point of view of their subordinates in the role hierarchy. This value is available in API version 20.0 and later.</li> </ul> <p>This field is available in API version 19.0 and later.</p>
description	string	Description for the dashboard. Maximum of 255 characters.
folderName	string	<p>Name of the folder that houses the dashboard.</p> <p>This field is available in API version 35.0 and later.</p>
fullName	string	<p>Inherited from <a href="#">Metadata</a>, this field is defined in the WSDL for this metadata type. It must be specified when creating, updating, or deleting. See <a href="#">createMetadata()</a> to see an example of this field specified for a call.</p> <p>This field specifies the folder and dashboard title; for example <code>folderSales/California</code>.</p>
isGridLayout	boolean	<p>Specifies whether a dashboard uses the Lightning Experience layout (<code>true</code>) or not (<code>false</code>).</p> <p>Lightning Experience allows dashboards with more than three columns with components that span multiple columns and multiple rows in size.</p> <p>This field is available in API version 35.0 and later.</p>
dashboardResultRefreshedDate	string	Required. Date that the dashboard was last refreshed.
dashboardResultRunningUser	string	Required. User currently accessing the dashboard.
leftSection	<a href="#">DashboardComponentSection</a>	Required. The left section or column of the dashboard.
middleSection	<a href="#">DashboardComponentSection</a>	The middle section or column of the dashboard.
numSubscriptions	int	Number of subscriptions reported on the dashboard. This field is available in API version 42.0 and later.
rightSection	<a href="#">DashboardComponentSection</a>	Required. The right section or column of the dashboard.

Field	Field Type	Description
<code>runningUser</code>	string	<p>The username of the user whose role and sharing settings are used to determine the data shown in the dashboard.</p> <p>When you deploy a dashboard and the value in this field is not defined or does not correspond to a valid user, the field is populated with the username of the user performing the deployment.</p> <p>Regardless of their security settings, all users viewing a dashboard see exactly the same data, because dashboards are always run using the security settings of a particular user.</p> <p> <b>Tip:</b> To avoid inappropriate exposure of sensitive data, save the dashboard to a folder that is visible only to appropriate users.</p>
<code>textColor</code>	string	Required. Color of the text on each chart in the dashboard. The color is in hexadecimal format; for example #FF6600.
<code>title</code>	string	Required. The dashboard title.
<code>titleColor</code>	string	Required. Color of the titles on each dashboard component. The color is in hexadecimal format; for example #FF6600.
<code>titleSize</code>	int	Required. Size of characters in title text. For example, a value of 12 indicates 12pt text.

## DashboardFilter

DashboardFilter represents a filter in a dashboard.

Field	Field Type	Description
<code>dashboardFilterOptions</code>	<a href="#">DashboardFilterOption</a> []	The list of items you can select in the <b>Filter Options</b> section of the Add Filter dialog.
<code>name</code>	string	Required. The filter label.

## DashboardFilterOption

DashboardFilterOption represents a filter option in a dashboard.

Field	Field Type	Description
<code>operator</code>	DashboardFilterOperation (enumeration of type string)	<p>Required. Represents the filter operation for this filter item. Valid values are:</p> <ul style="list-style-type: none"> <li><code>equals</code></li> <li><code>notEqual</code></li> <li><code>lessThan</code></li> </ul>

Field	Field Type	Description
		<ul style="list-style-type: none"> <li>greaterThan</li> <li>lessOrEqual</li> <li>greaterOrEqual</li> <li>contains</li> <li>notContain</li> <li>startsWith</li> <li>includes</li> <li>excludes</li> <li>between</li> </ul> <p> <b>Note:</b> The “between” operator takes two operands (for example, “between MinimumValue, MaximumValue”). Note also that the minimum value is inclusive, while the maximum value is exclusive. All other dashboard filter operations take a single operand only.</p> <p>This field is available in API version 24.0 and later.</p> <p>With API version 23.0, valid values are enumerated in <a href="#">CustomField</a>.</p>
values	string[]	Required. One or more values in the <b>Filter Options</b> area of the Add Filter dialog. This field is available in API version 24.0 and later.

## DashboardGridLayout

Lightning Experience features dashboards with more than three columns and components that span multiple columns and multiple rows in size. `DashboardGridLayout` lists the included dashboard components, specifies the number of dashboard columns, and sets each dashboard row’s height in pixels.

Field	Field Type	Description
dashboardGridComponents	DashboardGridComponent[]	List of <a href="#">DashboardGridComponent</a> objects in the dashboard.
numberOfColumns	int	Required. Total number of columns in the dashboard.
rowHeight	int	Required. Height of each row in pixels.

## DashboardGridComponent

Lightning Experience features dashboards with more than three columns and components that span multiple columns and multiple rows in size. `DashboardGridComponent` specifies location and size of a given dashboard component.

Field	Field Type	Description
<code>colSpan</code>	int	Required. The width of the dashboard component in columns. For example, if <code>colSpan</code> is 5, then the dashboard component spans five columns.
<code>columnIndex</code>	int	Required. The left-most column that is occupied by the dashboard component.
<code>dashboardComponent</code>	<a href="#">DashboardComponent</a>	Required. The dashboard component that is being sized and placed.
<code>rowIndex</code>	int	Required. The top-most row that is occupied by the dashboard component.
<code>rowSpan</code>	int	Required. The height of the dashboard component in rows.

## DashboardComponent

A dashboard consists of a group of different components or elements that display data. Each component can use a custom report or a custom s-control as their data source to display corporate metrics or key performance indicators. You can create several dashboard components and display them all in one dashboard aligned in up to three columns.

Field	Field Type	Description
<code>chartAxisRange</code>	ChartRangeType (enumeration of type string)	A manual or automatic axis range for bar or line charts. The valid values are: <ul style="list-style-type: none"> <li>• <code>auto</code></li> <li>• <code>manual</code></li> </ul>
<code>chartAxisRangeMax</code>	double	The maximum axis range to be displayed. This only applies to bar and line charts in which the <code>manual</code> axis range is selected for the <code>chartAxisRange</code> field.
<code>chartAxisRangeMin</code>	double	The minimum axis range to be displayed. This only applies to bar and line charts in which the <code>manual</code> axis range is selected for the <code>chartAxisRange</code> field.
<code>chartSummary</code>	<a href="#">ChartSummary</a>	Specifies the summary field for the chart data. Required if <code>isAutoSelectFromReport</code> is set to <code>false</code> . This field is available in API version 25.0 and later.
<code>componentType</code>	DashboardComponentType (enumeration of type string)	Required. Dashboard component type. The valid values are: <ul style="list-style-type: none"> <li>• <code>Bar</code></li> <li>• <code>BarGrouped</code></li> <li>• <code>BarStacked</code></li> <li>• <code>BarStacked100</code></li> </ul>

Field	Field Type	Description
		<ul style="list-style-type: none"> <li>• Column</li> <li>• ColumnGrouped</li> <li>• ColumnLine</li> <li>• ColumnLineGrouped</li> <li>• ColumnLineStacked</li> <li>• ColumnLineStacked100</li> <li>• ColumnStacked</li> <li>• ColumnStacked100</li> <li>• Donut</li> <li>• FlexTable</li> <li>• Funnel</li> <li>• Gauge</li> <li>• Line</li> <li>• lineCumulative</li> <li>• LineGrouped</li> <li>• lineGroupedCumulative</li> <li>• Metric</li> <li>• Pie</li> <li>• Scatter</li> <li>• ScatterGrouped</li> <li>• Scontrol</li> <li>• Table</li> </ul>
dashboardComponentContents	<a href="#">DashboardComponentContent</a> on page 705	A list of dashboard component contents. This field is available in API version 58.0 and later.
dashboardDynamicValues	<a href="#">DashboardDynamicValue</a> on page 710[]	A list of dashboard dynamic values. This field is available in API version 36.0 and later.
dashboardFilterColumns	<a href="#">DashboardFilterColumn</a> on page 710[]	A list of dashboard filter columns. Each report-based component must have a dashboard filter column that defines the column that the filter applies to. This field is available in API version 23.0 and later.
dashboardTableColumn	<a href="#">DashboardTableColumn</a> []	Represents a list of columns on a customized dashboard table component.
displayUnits	ChartUnits (enumeration of type string)	Chart Units. The valid values are: <ul style="list-style-type: none"> <li>• Auto</li> <li>• Integer</li> <li>• Hundreds</li> </ul>

Field	Field Type	Description
		<ul style="list-style-type: none"> <li>• Thousands</li> <li>• Millions</li> <li>• Billions</li> <li>• Trillions</li> </ul>
<code>drillDownUrl</code>	string	For charts, specifies a URL that users go to when they click the dashboard component. Use this option to send users to another dashboard, report, record detail page, or other system that uses a Web interface. This field overrides the <code>drillEnabled</code> and <code>drillToDetailEnabled</code> fields.
<code>drillEnabled</code>	boolean	Specifies whether to take users to the full or filtered source report when they click the dashboard component. Set to <code>false</code> to drill to the full source report; set to <code>true</code> to drill to the source report filtered by what they clicked. If set to <code>true</code> , users can click individual groups, axis values, or legend entries.  This overrides the <code>drillToDetailEnabled</code> field. This field is available in API version 17.0 and later.
<code>drillToDetailEnabled</code>	boolean	When enabled, users are taken to the record detail page when they click a record name, record owner, or feed post in a table or chart. When set to <code>true</code> users can click axis and legend values, chart elements, and table entries. The <code>drillDownUrl</code> and <code>drillEnabled</code> fields override this field. This field is available in API version 20.0 and later.
<code>enableHover</code>	boolean	Specifies whether to display values, labels, and percentages when hovering over charts. Hover details depend on chart type. Percentages apply to pie, donut, and funnel charts only. This field is available in API version 17.0 and later.
<code>expandOthers</code>	boolean	Specifies whether to combine all groups less than or equal to 3% of the total into a single 'Others' wedge or segment. This only applies to pie, donut, and funnel charts. Set to <code>true</code> to show all values individually on the chart; set to <code>false</code> to combine small groups into 'Others.' This field is available in API version 17.0 and later.
<code>flexComponentProperties</code>	<a href="#">DashboardFlexTableComponentProperties</a>	Defines metadata for Lightning Experience table columns and sorting. This field is available in API version 41.0 and later.
<code>footer</code>	string	Footer displayed at the bottom of the dashboard component. Maximum of 255 characters.

Field	Field Type	Description
<code>gaugeMax</code>	double	The maximum value on a gauge. A gauge is used to see how far you are from reaching a goal. It looks like a speedometer in a car.
<code>gaugeMin</code>	double	The minimum value on a gauge.
<code>groupingColumn</code>	string	Specifies the field by which to group data. This data is displayed on the X-axis for vertical column charts and on the Y-axis for horizontal bar charts.  This field is available in API version 25.0 and later.
<code>GroupingSortProperties</code>	<a href="#">DashboardComponentGroupingSortProperties</a>	This field captures sort properties of the dashboard component. If the component has one or more groupings, sort information is stored here; otherwise, it is stored in the <code>sortBy</code> field. This field is available in API version 46.0 and later.
<code>header</code>	string	Header displayed at the top of the dashboard component. Maximum of 80 characters.
<code>indicatorBreakpoint1</code>	double	The value that separates the <code>indicatorLowColor</code> from the <code>indicatorMiddleColor</code> on the dashboard.
<code>indicatorBreakpoint2</code>	double	The value that separates the <code>indicatorMiddleColor</code> from the <code>indicatorHighColor</code> on the dashboard.
<code>indicatorHighColor</code>	string	The color representing a high number range on the gauge.
<code>indicatorLowColor</code>	string	The color representing a low number range on the gauge.
<code>indicatorMiddleColor</code>	string	The color representing a medium number range on the gauge.
<code>legendPosition</code>	ChartLegendPosition (enumeration of type string)	The location of the legend with respect to the chart. The valid values are: <ul style="list-style-type: none"> <li>• Bottom</li> <li>• OnChart</li> <li>• Right</li> </ul>
<code>maxValuesDisplayed</code>	int	The maximum number of elements to include in the top-level grouping of the horizontal axis of a horizontal chart, vertical axis of a vertical chart, or selected axis of a stacked bar chart. For example, if you want to list only your top five salespeople, create an opportunity report that lists total opportunity amounts by owner and enter 5 in this field.

Field	Field Type	Description
<code>metricLabel</code>	string	Descriptive label for the metric. This is relevant if <code>metric</code> is the value of the <code>componentType</code> field.
<code>page</code>	string	Visualforce page associated with the component.
<code>pageHeightInPixels</code>	int	Display height of the Visualforce page in pixels.
<code>report</code>	string	Name of the report associated with the component.
<code>scontrol</code>	string	S-control associated with component if <code>scontrol</code> is the value of the <code>componentType</code> field. For more information, see “Defining Custom S-Controls” in the Salesforce online help.
<code>scontrolHeightInPixels</code>	int	Display height of the s-control in pixels.
<code>showPercentage</code>	boolean	Indicates if percentages are displayed for regions of gauges and wedges and segments of pie, donut, and funnel charts ( <code>true</code> ), or not ( <code>false</code> ).
<code>showPicturesOnCharts</code>	boolean	Display Chatter photos for up to 20 records in a horizontal bar chart component whose source report is grouped by a user or group name field. If there are more than 20 records with photos, record names are shown instead of photos. Set <code>Grouping Display</code> to <code>None</code> to show photos. Set the <code>Drill Down to</code> option to <code>Record Detail Page</code> to take users directly to user profile or group pages when they click photos. Chatter must be enabled for photos to be displayed. Depending on your organization's setup, you may not see photos on tables and charts.
<code>showPicturesOnTables</code>	boolean	Display Chatter photos for up to 20 records in a horizontal bar chart component whose source report is grouped by a user or group name field. If there are more than 20 records with photos, record names are shown instead of photos. Set <code>Grouping Display</code> to <code>None</code> to show photos. Set the <code>Drill Down to</code> option to <code>Record Detail Page</code> to take users directly to user profile or group pages when they click photos. Chatter must be enabled for photos to be displayed. Depending on your organization's setup, you may not see photos on tables and charts.
<code>showTotal</code>	boolean	Indicates if the total of all wedges is displayed for gauges and donut charts ( <code>true</code> ), or not ( <code>false</code> ).
<code>showValues</code>	boolean	Indicates if the values of individual records or groups are displayed for charts ( <code>true</code> ), or not ( <code>false</code> ).
<code>sortBy</code>	<a href="#">DashboardComponentFilter</a> (enumeration of type string)	The sort option for the dashboard component.

Field	Field Type	Description
<code>title</code>	string	The title of the dashboard component. Maximum of 40 characters.
<code>useReportChart</code>	boolean	Specifies whether to use the chart defined in the source report on this dashboard component. The chart settings in the source report determine how the chart displays in the dashboard, and any chart settings you define for the dashboard are overridden. If you defined a combination chart in the source report, use this option to use that combination chart on this dashboard.

## DashboardComponentContent

`dashboardComponentContent` represents the content of a dashboard's components.

Field	Field Type	Description
<code>additionalInfo</code>	string	Any additional metadata the user wants to include for the component contents.
<code>altText</code>	string	The component's alternative text.
<code>fileName</code>	string	The name of the component file.
<code>fit</code>	Fit (enumeration of type string)	The image alignment type. Valid values are: <ul style="list-style-type: none"> <li>• <code>FitHeight</code></li> <li>• <code>FitWidth</code></li> <li>• <code>Original</code></li> <li>• <code>Stretch</code></li> <li>• <code>Tile</code></li> </ul>
<code>horizontalAlignment</code>	HorizontalAlignment (enumeration of type string)	The horizontal alignment type. Valid values are: <ul style="list-style-type: none"> <li>• <code>Left</code></li> <li>• <code>Center</code></li> <li>• <code>Right</code></li> </ul>
<code>richTextContent</code>	string	The rich text content for the component..
<code>tooltip</code>	string	The dashboard component's tooltip.
<code>verticalAlignment</code>	VerticalAlignment (enumeration of type string)	The vertical alignment type. Valid values are: <ul style="list-style-type: none"> <li>• <code>Bottom</code></li> <li>• <code>Center</code></li> <li>• <code>Top</code></li> </ul>

## DashboardDynamicValue

DashboardDynamicValue represents a dynamic value in a dashboard.

Field	Field Type	Description
additionalInfo	string	Any additional metadata the user wants to include for the dynamic value.
fieldName	string	Required. The name of the field for the dynamic value.
isDynamicUser	boolean	Indicates whether the value should be retrieved as the user running the dashboard ( <code>true</code> ) or not ( <code>false</code> ).

## DashboardFilterColumn

DashboardFilterColumn represents a filter column in a dashboard.

Field	Field Type	Description
column	string	Required. The report column code for the filter.

## DashboardTableColumn

DashboardTableColumn represents a column in a customized table component in a dashboard.

Field	Field Type	Description
aggregateType	<a href="#">ReportSummaryType[]</a> (enumeration of type string)	Specifies the aggregation type for the table column.
column	string	Required. The label of the column to use in the table.
showTotal	boolean	Displays the totals for each summarizable column in the dashboard table. This field is available in API version 19.0 and later.
sortBy	<a href="#">DashboardComponentSection</a> (enumeration of type string)	The sort option for the dashboard table component. Sort on just one column per table.

## DashboardFlexTableComponentProperties

DashboardFlexTableComponentProperties represents a column in a customized table component in a dashboard.

Field	Field Type	Description
flexTableColumn	<a href="#">DashboardComponentColumn</a>	Represents a column in a Lightning Experience table component. This field is available in API version 41.0 and later.

Field	Field Type	Description
<code>flexTableSortInfo</code>	<a href="#">DashboardComponentSortInfo</a>	Represents sorting column and order in a Lightning Experience table component. This field is available in API version 41.0 and later.
<code>hideChatterPhotos</code>	boolean	If <code>true</code> , hides any photos from Chatter feeds. This field is available in API version 41.0 and later.
<code>decimalPrecision</code>	integer	For columns with numeric values, indicates the number of significant digits.

## DashboardComponentGroupingSortProperties

`DashboardComponentGroupingSortProperties` is composed of multiple elements of the type `DashboardComponentGroupingSort`.

Field	Field Type	Description
<code>groupingSorts</code>	<a href="#">DashboardComponentGroupingSort</a>	This field stores sort information for a dashboard at each grouping level of granularity. This field is available in API version 46.0 and later.

## DashboardComponentGroupingSort

`DashboardComponentGroupingSort` specifies properties for sorting on a dashboard component group.

Field	Field Type	Description
<code>groupingLevel</code>	String	Grouping at which this sort configuration is applied.
<code>inheritedReportGroupingSort</code>	String	<code>true</code> if the sort order is picked up from an underlying report for this grouping level.
<code>sortColumn</code>	String	If grouping is sorted by an aggregate, this value is the aggregate value (such as <code>sortColumn</code> ). If the grouping is sorted by its own value, this field is null.
<code>sortOrder</code>	String	<code>Ascending</code> or <code>Descending</code> to reflect the sort order.

## DashboardComponentColumn

`DashboardComponentColumn` represents a component column in a dashboard. Available in API version 41.0 and later.

Field	Field Type	Description
<code>breakPoint1</code>	double	The value that separates the <code>lowRangeColor</code> from the <code>midRangeColor</code> on the dashboard.

Field	Field Type	Description
<code>breakPoint2</code>	double	The value that separates the <code>midRangeColor</code> from the <code>highRangeColor</code> on the dashboard.
<code>breakPointOrder</code>	double	Conditional highlighting can be applied to multiple columns. This field stores the order of conditional highlights.
<code>highRangeColor</code>	int	The color representing a high number range on the column.
<code>lowRangeColor</code>	int	The color representing a low number range on the column.
<code>midRangeColor</code>	int	The color representing a mid number range on the column.
<code>reportColumn</code>	string	Required. The report column code for the filter.
<code>showTotal</code>	boolean	If <code>true</code> , the column total is displayed.
<code>type</code>	DashboardComponentColumnType (enumeration of type string)	Represents the type of Lightning Experience table column: <ul style="list-style-type: none"> <li>• Details</li> <li>• Aggregates</li> <li>• Grouping</li> </ul> This field is available in API version 41.0 and later.

## DashboardComponentSortInfo

DashboardFilterColumns represents a filter column in a dashboard.

Field	Field Type	Description
<code>ComponentSortColumn</code>	string	Indicates the column on which the table is sorted. This field is available in API version 41.0 and later.
<code>sortOrder</code>	string	Indicates whether column sorting is ascending or descending. This field is available in API version 41.0 and later.

## DashboardComponentSection

DashboardComponentSection represents one of the sections or columns in a dashboard.

Field	Field Type	Description
<code>columnSize</code>	DashboardComponentSize (enumeration of type string)	Required. The size of the column in the dashboard: <ul style="list-style-type: none"> <li>• Medium</li> <li>• Narrow</li> <li>• Wide</li> </ul>
<code>components</code>	DashboardComponent[]	The list of <a href="#">DashboardComponent</a> objects in the dashboard column.

## DashboardComponentFilter

DashboardComponentFilter is an enumeration of type string that lists the sort values for dashboard components. The valid values are:

Enumeration Value	Description
RowLabelAscending	Sorts in alphabetical order by the label.
RowLabelDescending	Sorts in reverse alphabetical order by the label.
RowValueAscending	Sorts lowest to highest by the value.
RowValueDescending	Sorts highest to lowest by the value.

## Declarative Metadata Sample Definition — Filtered Dashboard

A sample XML definition of a filtered dashboard is shown below. Note that this example is supported in API version 24.0 and later. The file name matches the dashboard title and the extension is `.dashboard`.

```
<?xml version="1.0" encoding="UTF-8"?>
<Dashboard xmlns="http://soap.sforce.com/2006/04/metadata">
  <backgroundEndColor>#FFFFFF</backgroundEndColor>
  <backgroundFadeDirection>Diagonal</backgroundFadeDirection>
  <backgroundStartColor>#FFFFFF</backgroundStartColor>
  <dashboardFilters>
    <dashboardFilterOptions>
      <operator>equals</operator>
      <values>Media</values>
    </dashboardFilterOptions>
    <dashboardFilterOptions>
      <operator>lessThan</operator>
      <values>Working</values>
    </dashboardFilterOptions>
    <dashboardFilterOptions>
      <operator>between</operator>
      <values>ABC</values>
      <values>XYZ</values>
    </dashboardFilterOptions>
    <name>Industry</name>
  </dashboardFilters>
  <dashboardFilters>
    <dashboardFilterOptions>
      <operator>equals</operator>
      <values>Analyst,Partner</values>
    </dashboardFilterOptions>
    <dashboardFilterOptions>
      <operator>startsWith</operator>

## Declarative Metadata Sample Definition — Lightning Experience Dashboard with `isGridLayout` Equals `true`

A sample XML definition of a Lightning Experience dashboard with `isGridLayout` equals `true` is shown below. Note that this example is supported in API version 35.0 and later. The file name matches the dashboard title and the extension is `.dashboard`.

```
<?xml version="1.0" encoding="UTF-8"?>
<Dashboard xmlns="http://soap.sforce.com/2006/04/metadata">
  <backgroundEndColor>#FFFFFF</backgroundEndColor>
  <backgroundFadeDirection>Diagonal</backgroundFadeDirection>
  <backgroundStartColor>#FFFFFF</backgroundStartColor>
  <dashboardType>SpecifiedUser</dashboardType>
  <gridLayout>
    <dashboardGridComponents>
      <colSpan>3</colSpan>
      <columnIndex>0</columnIndex>
      <dashboardComponent>
        <autoselectColumnsFromReport>>false</autoselectColumnsFromReport>
        <chartAxisRange>Auto</chartAxisRange>
        <chartSummary>
          <axisBinding>y</axisBinding>
          <column>RowCount</column>
        </chartSummary>
        <componentType>Donut</componentType>
        <drillEnabled>>false</drillEnabled>
        <drillToDetailEnabled>>false</drillToDetailEnabled>
        <enableHover>>false</enableHover>
        <expandOthers>>false</expandOthers>
        <groupingColumn>TITLE</groupingColumn>
        <legendPosition>Bottom</legendPosition>
        <report>unfiled$public/lead_rpt</report>
        <showPercentage>>false</showPercentage>
        <showTotal>>false</showTotal>
        <showValues>>true</showValues>
        <sortBy>RowLabelAscending</sortBy>
        <useReportChart>>false</useReportChart>
      </dashboardComponent>
      <rowIndex>0</rowIndex>
      <rowSpan>3</rowSpan>
    </dashboardGridComponents>
    <dashboardGridComponents>
      <colSpan>3</colSpan>
      <columnIndex>0</columnIndex>
      <dashboardComponent>
        <autoselectColumnsFromReport>>false</autoselectColumnsFromReport>
        <chartAxisRange>Auto</chartAxisRange>
        <chartSummary>
          <axisBinding>y</axisBinding>
          <column>RowCount</column>
        </chartSummary>
        <componentType>Pie</componentType>
        <drillEnabled>>false</drillEnabled>
        <drillToDetailEnabled>>false</drillToDetailEnabled>
        <enableHover>>false</enableHover>
      </dashboardComponent>
    </dashboardGridComponents>
  </gridLayout>
</Dashboard>
```

```

        <expandOthers>false</expandOthers>
        <groupingColumn>TITLE</groupingColumn>

```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Folder](#)

[Report](#)

## DataCategoryGroup

---

Represents a data category group.

This type extends the Metadata metadata type and inherits its `fullName` field.

 **Warning:** Using Metadata API to deploy category changes from one organization to another permanently removes categories and record categorizations that are not specified in your XML file. Salesforce recommends that you manually create data categories and record associations in an organization from Setup by entering *Data Categories* in the **Quick Find** box, then selecting **Data Categories** rather than deploying changes from a sandbox to a production organization. For more information, see [Usage](#).

Data category groups are provided to:

- Classify and filter data.
- Share data among users.

Every data category group contains items or data categories that can be organized hierarchically.

The example below shows the `Geography` data category group and its data categories.

```
Geography
  Worldwide
    North America
      United States of America
      Canada
      Mexico
    Europe
    Asia
```

 **Note:** See "Work with Data Categories" in the Salesforce online help for more information on data category groups, data categories, parent and sub categories.

## File Suffix and Directory Location

The file suffix is `.datacategorygroup`. There is one file for each data category group stored in the `datacategorygroups` folder in the corresponding package directory.

## Version

Data category groups are available in API version 18.0 and later.

## Fields

This metadata type contains the following fields:

Field Name	Field Type	Description
<code>active</code>	boolean	Required. The status of the category group. Indicates whether this category group is active, ( <code>true</code> ), or not active ( <code>false</code> ).
<code>dataCategory</code>	<a href="#">DataCategory</a> on page 722	Required. The top-level category within the data category group.
<code>description</code>	string	The description of the data category group.
<code>fullName</code>	string	Required. The unique name of the data category group. When creating a data category group, the <code>fullName</code> field and the file name (without its suffix) must match. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is inherited from the Metadata component.
<code>label</code>	string	Required. Label that represents the object in Salesforce.
<code>objectUsage</code>	<a href="#">ObjectUsage</a> on page 723	The objects that are associated with the data category group.

## DataCategory

Represents an item (or data category) in the data category group. A data category can recursively contain a list of other data categories.

Field Name	Field Type	Description
<code>dataCategory</code>	<code>DataCategory[]</code>	A recursive list of sub data categories. For example, a list of countries within a continent. You can create up to 100 categories in a data category group and have up to 5 levels in a data category group hierarchy.
<code>label</code>	string	Required. Label for the data category throughout the Salesforce user interface.
<code>name</code>	string	Required. The developer name of the data category used as a unique identifier for API access. The name can only contain characters, letters, and the underscore ( <code>_</code> ) character, must start with a letter, and cannot end with an underscore or contain two consecutive underscore characters.

 **Important:** The value for this field is defined once and cannot be changed later.

 **Warning:** If you deploy a category group that already exists in an organization, any category that is not defined in the XML file is permanently removed from your organization. For more information see Usage.

## ObjectUsage

Represents the objects that can be associated with the data category group. This association allows the object to be classified and filtered using the data categories.

Field Name	Field Type	Description
object	string[]	<p>A list of the object names that can be associated with the data category group. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>KnowledgeArticleVersion</code>—to associate articles. See "Modify Default Category Group Assignments for Articles" in the Salesforce online help for more information on data category groups association to articles.</li> <li>• <code>Question</code>—to associate questions. You can associate the <code>Question</code> object with at most one category group.</li> </ul> <p> <b>Warning:</b> If you deploy a category group that already exists in an organization, any object association that is not defined in the XML file is permanently removed from your organization. Ensure that your XML file specifies all the records associated with your category group in the organization. For more information see Usage.</p>

## Declarative Metadata Sample Definition

This sample is the definition of the `Geography` data category group and its data categories:

```
<?xml version="1.0" encoding="UTF-8"?>
<DataCategoryGroup xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>Geography</label>
  <description>Geography structure of service center locations</description>
  <fullName>geo</fullName>

  <dataCategory> <name>WW</name> <label>Worldwide</label>
    <dataCategory> <name>AMER</name> <label>North America</label>
      <dataCategory>
        <name>USA</name>
        <label>United States of America</label>
      </dataCategory>
      <dataCategory>
        <name>CAN</name>
        <label>Canada</label>
      </dataCategory>
      <dataCategory>
        <name>MEX</name>
        <label>Mexico</label>
      </dataCategory>
    </dataCategory>
  <dataCategory> <name>EMEA</name> <label>Europe, Middle East, Africa</label>
    <dataCategory>
      <name>FR</name>
```

```

        <label>France</label>
    </dataCategory>
    <dataCategory>
        <name>SP</name>
        <label>Spain</label>
    </dataCategory>
    <dataCategory>
        <name>UK</name>
        <label>United-Kingdom</label>
    </dataCategory>
</dataCategory>
<dataCategory>
    <name>APAC</name>
    <label>Asia</label>
</dataCategory>
</dataCategory>

<objectUsage>
    <object>KnowledgeArticleVersion </object>
</objectUsage>
</DataCategoryGroup>

```

## Usage

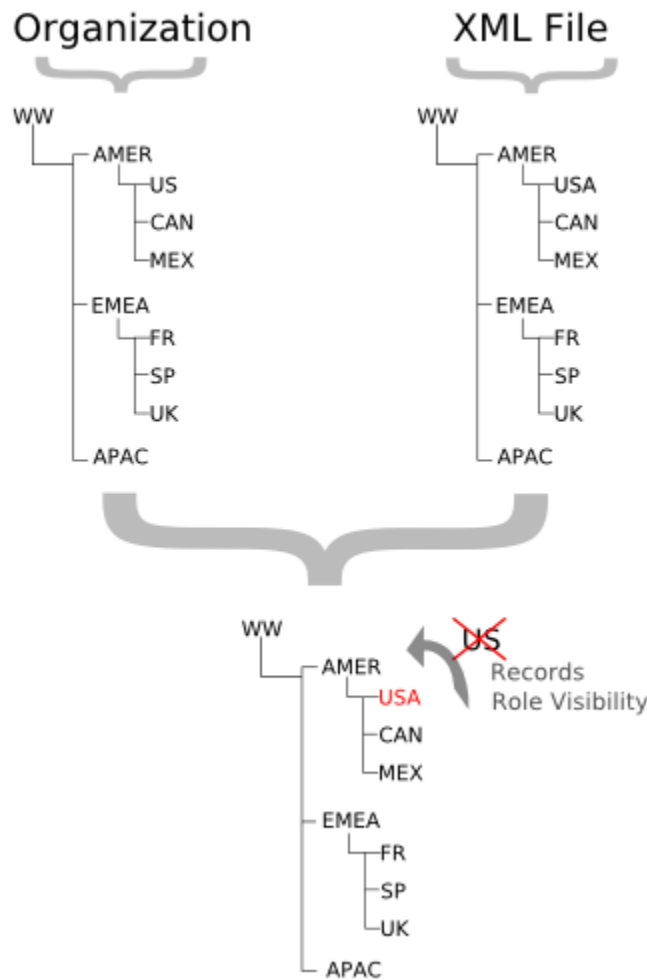

When you deploy a category group XML file, Metadata API checks whether the category group exists in the target organization. If the category group does not exist, it is created. If the category group already exists, then Metadata API:

- Adds any new category or object defined in the XML file.
  - Deletes any category that is not defined in the XML file. Records associated with the deleted categories are re-associated with the parent category.
  - Deletes any object association that is not defined in the XML file.
  - Moves any category if its hierarchical position differs from the position specified in the XML file.
-  **Note:** When a category moves to a new parent category, users that have no visibility on the new parent category lose their visibility to the repositioned category.

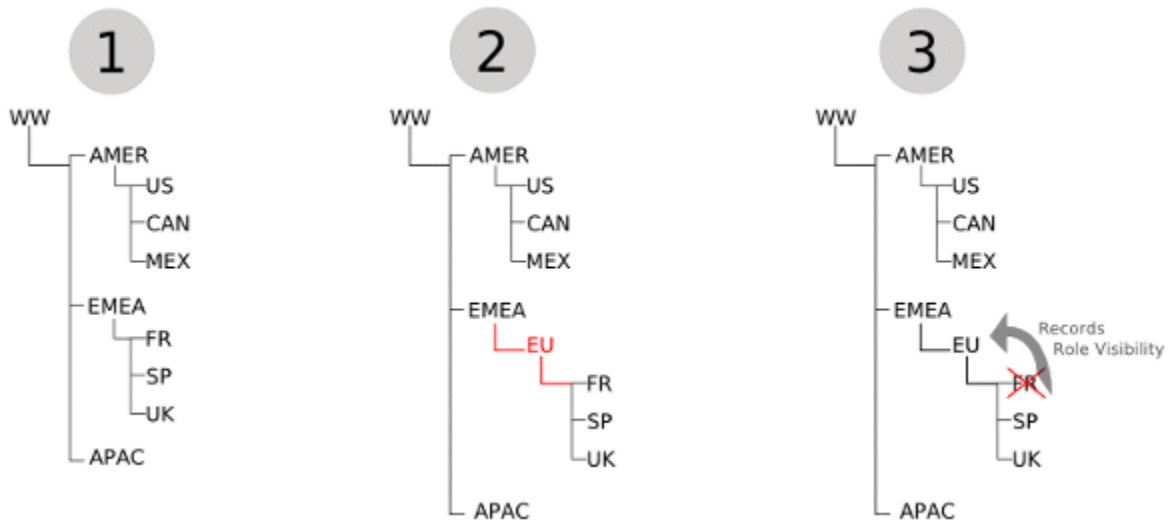

-  **Note:** For more information about category deletion, category repositioning and its impact on record categorization and visibility see "Delete a Data Category" and "Modify and Arrange Data Categories" in the Salesforce online help.

Using Metadata API to deploy category changes from one organization to another permanently removes categories and record categorizations that are not specified in your XML file. Salesforce recommends that you manually create data categories and record associations in an organization from Setup by entering *Data Categories* in the *Quick Find* box, then selecting **Data Categories** rather than deploying changes from a sandbox to a production organization.

The following example illustrates what happens if you deploy an XML representation of a *Geography* data category group hierarchy to an organization that already has this data category group defined. Note that the organization contains a *US* category, while the XML file includes a *USA* category in the same hierarchical position. The Metadata API deployment process deletes the *US* category from the organization and moves associations for any records from *US* to the parent *AMER* category. It also adds the *USA* category under *AMER*. Note that all records that were previously categorized with *US* are now associated with the *AMER* category.

The next example illustrates what can happen when you delete or move a category in a data category group and deploy its XML representation from a sandbox to a production organization that already has this data category group defined. Hierarchy 1 shows the initial data category group in the sandbox organization. In hierarchy 2, we add an **EU** category under **EMEA** and move **FR**, **SP** and **UK** below **EU**. In hierarchy 3, we delete **FR** and associate its records with its new parent, **EU**. Finally, we deploy the changes from the sandbox to the production organization.

Metadata API has no concept of the order of the changes made to the sandbox organization. It just deploys the changes from one organization to another. During the deployment, it first notices the deletion of the `FR` category and removes it from the production organization. Consequently, it moves associations for any records from `FR` to its parent on the production organization, `EMEA`. Metadata API then adds the `EU` category and moves `SP` and `UK` below it. Although the category group hierarchy looks the same in both organizations, record categorization in production is different from the sandbox organization. The records that were originally associated with `FR` in hierarchy 1 are associated with `EU` in the sandbox organization, but are associated with `EMEA` in the production organization.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DataWeaveResource

Represents the `DataWeaveScriptResource` class that is generated for all DataWeave scripts. DataWeave scripts can be directly invoked from Apex.

### Parent Type

This type extends the `MetadataWithContent` metadata type and inherits its `content` and `fullName` fields.

### File Suffix and Directory Location

DataWeaveResource components have the suffix `.dw1` and are stored in the `dw` folder.

### Version

DataWeaveResource components are available in API version 58.0 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
apiVersion	<p><b>Field Type</b> double</p> <p><b>Description</b> Required. The API version for this component.</p>
isGlobal	<p><b>Field Type</b> boolean</p> <p><b>Description</b> When set to true, the generated DataWeaveScriptResource class is global.</p>
isProtected	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Not used.</p>

## Declarative Metadata Sample Definition

The following is an example of a DataWeaveResource component.

csvToContacts.dwl

```
%dw 2.0
input records application/csv
output application/apex
---
records map(record) -> {
  FirstName: record.first_name,
  LastName: record.last_name,
  Email: record.email
} as Object {class: "Contact"}
```

csvToContacts.dwl-meta.xml

```
<?xml version="1.0" encoding="UTF-8"?>
<DataWeaveResource xmlns="http://soap.sforce.com/2006/04/metadata">
  <apiVersion>58.0</apiVersion>
  <isGlobal>true</isGlobal>
</DataWeaveResource>
```

The following is an example `package.xml` that references the `csvToContacts` definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>csvToContacts</members>
    <name>DataWeaveResource</name>
  </types>
  <version>58.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DecisionTable

---

Represents the information about a decision table.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

DecisionTable components have the suffix `.decisionTable` and are stored in the `decisionTables` folder.

## Version

DecisionTable components are available in API version 51.0 and later.

## Special Access Rules

To use this metadata type, your Salesforce org must have the Loyalty Management or the Rebate Management license.

## Fields

Field Name	Field Type	Description
<code>collectOperator</code>	DecisionTable CollectOperator (enumeration of type string)	Specifies the operator that's used when the result is filtered by the Collect operator. Valid values are: <ul style="list-style-type: none"> <li>Count</li> <li>Maximum</li> <li>Minimum</li> <li>None</li> <li>Sum</li> </ul>
<code>conditionCriteria</code>	string	Logic that's used to decide how the input fields are processed.
<code>conditionType</code>	DecisionTable ConditionType (enumeration of type string)	Condition logic that's used for input fields. Valid values are: <ul style="list-style-type: none"> <li>All</li> <li>Any</li> <li>Custom</li> </ul>
<code>dataSourceType</code>	DecisionTable DataSourceType (enumeration of type string)	Required. Specifies the type of data source that's used to create a decision table. Valid values are: <ul style="list-style-type: none"> <li>CsvUpload</li> <li>MultipleSubjects</li> <li>SingleSubject</li> </ul>
<code>decisionTableParameters</code>	<a href="#">DecisionTableParameter[]</a>	Required. Parameters that you specify in a decision table.
<code>description</code>	string	Description of the decision table.
<code>doesConsiderNullValue</code>	boolean	Indicates whether a column that has a null value is considered for lookup ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>filterResultBy</code>	DecisionTable HitPolicy (enumeration of type string)	Specifies how the results of a decision table are filtered if a set of inputs returns multiple matching outputs. Valid values are: <ul style="list-style-type: none"> <li>AnyValue</li> <li>FirstMatch</li> <li>OutputOrder</li> </ul>
<code>lastSyncDate</code>	string	Required. Latest date on which the decision table was refreshed.
<code>refreshFailureReason</code>	string	Reason why the refresh of the decision table data failed.

Field Name	Field Type	Description
refreshStatus	DecisionTable RefreshStatus (enumeration of type string)	Specifies the refresh status of the cached data in the decision table.  Valid values are: <ul style="list-style-type: none"> <li>Completed</li> <li>Failed</li> <li>InProgress</li> <li>Initiated</li> </ul>
setupName	string	Required. Name of the decision table, which appears in Salesforce Setup.
sourceObject	string	Required. Object that contains the rules based on which the decision table must provide outcomes.
status	DecisionTableStatus (enumeration of type string)	Required. Status of the decision table.  Valid values are: <ul style="list-style-type: none"> <li>Draft</li> <li>Inactive</li> <li>Active</li> <li>ActivationInProgress</li> </ul>
usageType	ExpsSetProcessType (enumeration of type string)	Type of industry or the application within the industry that's using a decision table.  Valid values are: <ul style="list-style-type: none"> <li>Bre</li> <li>ComplianceControl</li> <li>DefaultPricing</li> <li>DefaultRating</li> <li>EventOrchestration</li> <li>FinancialServicesCloud</li> <li>PlanCostCalculation</li> <li>PriceProtection</li> <li>PricingDiscovery</li> <li>ProductCategoryQualification</li> <li>ProductQualification</li> <li>RatingDiscovery</li> <li>RecordAlert</li> <li>ShipAndDebit</li> <li>TestProcess</li> <li>TransactionJournal</li> <li>WarrantyClaim</li> </ul>

## DecisionTableParameters

Represents an input or output field of a decision table.

### Fields

Field Name	Field Type	Description
fieldName	string	Required. API name of the fields that selected as an input or output for the decision table.
isGroupByField	boolean	Indicates whether an input field is used to group the business rules of the decision table.
operator	DecisionTable Operator (enumeration of type string)	Required. Operator used for the input field. Valid values are: <ul style="list-style-type: none"> <li>• Equals</li> <li>• NotEquals</li> <li>• LessThan</li> <li>• LessOrEqual</li> <li>• GreaterThan</li> <li>• GreaterOrEqual</li> <li>• Matches</li> <li>• ExistsIn</li> <li>• DoesNotExistIn</li> </ul>
sequence	integer	The sequence in which input fields are processed. This field is available in API version 52.0 and later.
sortType	DecisionTable SortType (enumeration of type string)	Sort outputs of a decision table based on the values of the input or output parameter field. This field is available in API version 56.0 and later. Valid values are: <ul style="list-style-type: none"> <li>• AscNullFirst</li> <li>• AscNullLast</li> <li>• DescNullFirst</li> <li>• DescNullLast</li> <li>• None</li> </ul> Outputs can't be sorted based on picklist and multi-select picklist fields.
usage	DecisionTable ParameterType (enumeration of type string)	Required. Usage type of a field. The usage type can be one of the following values: <ul style="list-style-type: none"> <li>• INPUT</li> <li>• OUTPUT</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a DecisionTable component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DecisionTable xmlns="http://soap.sforce.com/2006/04/metadata">
  <collectOperator>None</collectOperator>
  <conditionCriteria>1 and 2 and 3 and 4</conditionCriteria>
  <conditionType>All</conditionType>
  <dataSourceType>SingleSubject</dataSourceType>
  <decisionTableParameters>
    <fieldName>IsDeleted</fieldName>
    <operator>Equals</operator>
    <usage>INPUT</usage>
    <sequence>1</sequence>
    <isGroupByField>true</isGroupByField>
    <sortType>AscNullFirst</sortType>
    <dataType>Number</dataType>
    <fieldPath>AccountFeed.CommentsCount</fieldPath>
    <domainObject>AccountFeed</domainObject>
    <isPriorityField>false</isPriorityField>
    <decimalScale>2</decimalScale>
    <length>14</length>
    <isRequired>false</isRequired>
  </decisionTableParameters>
  <decisionTableParameters>
    <fieldName>IsActive</fieldName>
    <usage>OUTPUT</usage>
  </decisionTableParameters>
  <decisionTableParameters>
    <fieldName>LimitNumber</fieldName>
    <operator>Equals</operator>
    <usage>INPUT</usage>
    <sequence>2</sequence>
    <isGroupByField>false</isGroupByField>
  </decisionTableParameters>
  <decisionTableParameters>
    <fieldName>LimitStartDate</fieldName>
    <usage>OUTPUT</usage>
  </decisionTableParameters>
  <decisionTableParameters>
    <fieldName>GivenBadgeCount</fieldName>
    <operator>Equals</operator>
    <usage>INPUT</usage>
    <sequence>3</sequence>
    <isGroupByField>false</isGroupByField>
  </decisionTableParameters>
  <decisionTableParameters>
    <fieldName>Name</fieldName>
    <operator>Equals</operator>
    <usage>INPUT</usage>
    <sequence>4</sequence>
    <isGroupByField>false</isGroupByField>
  </decisionTableParameters>
</decisionTableSourceCriteria>
```

```

    <sourceFieldName>IsDeleted</sourceFieldName>
    <operator>Equals</operator>
    <value>>false</value>
    <sequenceNumber>1</sequenceNumber>
    <valueType>Literal</valueType>
  </decisionTableSourceCriterias>
  <description>Sample DT created for md-common tests</description>

  <uploadStatus>Completed</uploadStatus>
  <isIncrementalSyncEnabled>>false</isIncrementalSyncEnabled>
  <hasIncrementalSyncFailed>>false</hasIncrementalSyncFailed>
</DecisionTable>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>Sample DT Package</fullName>
  <description>Package created for md-common tests</description>
  <types>
    <members>Sample_DT</members>
    <name>DecisionTable</name>
  </types>
  <types>
    <members>DSL_Sample</members>
    <members>Sample_DT_Default</members>
    <name>DecisionTableDatasetLink</name>
  </types>
  <version>51.0</version>
</Package>

```

## DecisionTableDatasetLink

Represents the information about a dataset link associated with a decision table. In a dataset link, select an object for whose records, the decision table must provide an outcome. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`DecisionTableDatasetLink` components have the suffix `.decisionTableDatasetLink` and are stored in the `decisionTableDatasetLinks` folder.

## Version

DecisionTableDatasetLink components are available in API version 51.0 and later.

## Special Access Rules

To use this metadata type, your Salesforce org must have the Loyalty Management or the Rebate Management license.

## Fields

Field Name	Field Type	Description
decisionTableName	string	Required. The name of the associated decision table.
decisionTblDatasetParameters	<a href="#">DecisionTblDatasetParameters</a>	Mapping between a decision table parameter and a field of the object selected in the dataset link.
description	string	The description of the dataset link.
isDefault	boolean	Indicates whether a dataset link is the default dataset link for a decision table.
setupName	string	Required. The name of the decision table dataset link, which appears in Setup.
sourceObject	string	Required. The name of the object being evaluated.

## DecisionTblDatasetParameters

Represents the mapping between a decision table parameter and a field of the object selected in the dataset link.

The mapping allows the decision table to know which object fields must be compared to the input-output fields of the decision table.

## Fields

Field Name	Field Type	Description
datasetFieldName	string	Required. Name of the dataset field whose value must be compared against an Input type decision table parameter when providing the outcome.
fieldName	string	Required. The API name of the decision table field that is selected as an input or output for the decision table dataset link.

## Declarative Metadata Sample Definition

The following is an example of a DecisionTableDatasetLink component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DecisionTableDatasetLink xmlns="http://soap.sforce.com/2006/04/metadata">
```

```

<decisionTableName>Sample_DT</decisionTableName>
<decisionTblDatasetParameters>
  <fieldName>IsDeleted</fieldName>
  <datasetFieldName>IsDeleted</datasetFieldName>
</decisionTblDatasetParameters>
<decisionTblDatasetParameters>
  <fieldName>LimitNumber</fieldName>
  <datasetFieldName>CallDurationInSeconds</datasetFieldName>
</decisionTblDatasetParameters>
<decisionTblDatasetParameters>
  <fieldName>Name</fieldName>
  <datasetFieldName>Subject</datasetFieldName>
</decisionTblDatasetParameters>
<description>DSL created for md-common tests</description>
<isDefault>>false</isDefault>
<sourceObject>Task</sourceObject>
<setupName>DSL Sample</setupName>
</DecisionTableDatasetLink>

```

The following is an example of a default DecisionTableDatasetLink component.

```

<?xml version="1.0" encoding="UTF-8"?>
<DecisionTableDatasetLink xmlns="http://soap.sforce.com/2006/04/metadata">
  <decisionTableName>Sample_DT</decisionTableName>
  <isDefault>>true</isDefault>
  <sourceObject>WorkBadgeDefinition</sourceObject>
  <setupName>Default DSL Sample</setupName>
</DecisionTableDatasetLink>

```

The following is an example package.xml that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>Sample DT Package</fullName>
  <description>Package created for md-common tests</description>
  <types>
    <members>Sample_DT</members>
    <name>DecisionTable</name>
  </types>
  <types>
    <members>DSL_Sample</members>
    <members>Sample_DT_Default</members>
    <name>DecisionTableDatasetLink</name>
  </types>
  <version>51.0</version>
</Package>

```

## DecisionMatrixDefinition

---

Represents a definition of a decision matrix.

 **Note:** Before deploying a decision matrix or a decision matrix version to a target org, review these [decision matrix migration considerations](#).

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

DecisionMatrixDefinition components have the suffix `.decisionMatrixDefinition` and are stored in the `decisionMatrixDefinition` folder.

## Version

DecisionMatrixDefinition components are available in API version 55.0 and later.

## Fields

Field Name	Description
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Describes a decision matrix definition.</p>
<code>groupKey</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> A key for grouping matrix rows in different versions, such as a geographic region or a product code.</p>
<code>label</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The UI label of a decision matrix definition.</p>
<code>processType</code>	<p><b>Field Type</b> ExpsSetProcessType (enumeration of type string)</p> <p><b>Description</b> The process type that uses the expression set rule. Valid values are:</p> <ul style="list-style-type: none"> <li>• Bre</li> <li>• TransactionJournal</li> <li>• TierProcessing</li> <li>• CustomLoyalty</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• TestProcess</li> <li>• AiAcceleratorSubscriberChurnPrediction</li> <li>• DefaultPricing</li> <li>• RecordAlert</li> <li>• ShipAndDebit</li> <li>• WarrantyClaim</li> <li>• ProductQualification</li> <li>• ProductCategoryQualification</li> <li>• EventOrchestration</li> <li>• ComplianceControl</li> <li>• FinancialServicesCloud</li> </ul> <p>Available in API version 59.0 and later.</p>
subGroupKey	<p><b>Field Type</b> string</p> <p><b>Description</b> A subgroup key for grouping matrix rows in different versions, such as a geographic region or a product code. For example, if the <code>groupKey</code> is <code>Country</code>, the <code>subGroupKey</code> can be <code>State</code> or <code>Province</code>.</p>
type	<p><b>Field Type</b> DecisionMatrixType (enumeration of type string)</p> <p><b>Description</b> The type of a decision matrix. Valid values are:</p> <ul style="list-style-type: none"> <li>• Grouped</li> <li>• Standard</li> </ul>
versions	<p><b>Field Type</b> <a href="#">DecisionMatrixDefinitionVersion</a>[]</p> <p><b>Description</b> Represents an array of decision matrix version definitions in a decision matrix. This array must contain at least one version.</p>

## DecisionMatrixDefinitionVersion

Represents a definition of a decision matrix version.

Field Name	Description
columns	<p><b>Field Type</b> <a href="#">DecisionMatrixDefinitionVersionColumn[]</a></p> <p><b>Description</b> Represents an array of columns in a decision matrix definition version.</p>
decisionMatrixDefinition	<p><b>Field Type</b> string</p> <p><b>Description</b> The full name of a decision matrix version.</p>
endDate	<p><b>Field Type</b> dateTime</p> <p><b>Description</b> The date until which a decision matrix definition version is available for use.</p>
groupKeyValue	<p><b>Field Type</b> string</p> <p><b>Description</b> The value of the <code>groupKey</code> for a decision matrix definition version. For example, if the <code>groupKey</code> is <code>Country</code>, the <code>groupKeyValue</code> can be <code>United States</code>.</p>
label	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The UI label of a decision matrix definition version.</p>
startDate	<p><b>Field Type</b> dateTime</p> <p><b>Description</b> Required. The date from when a decision matrix definition version is available for use.</p>
status	<p><b>Field Type</b> <code>DecisionMatrixDefStatus</code> (enumeration of type string)</p> <p><b>Description</b> Required. Specifies the status of a decision matrix definition version. Valid values are:</p> <ul style="list-style-type: none"><li>• <code>Active</code></li></ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• Draft</li> <li>• Inactive</li> <li>• InvalidDraft</li> <li>• Obsolete</li> </ul>
subGroupKeyValue	<p><b>Field Type</b> string</p> <p><b>Description</b> The value of the subgroup key for a decision matrix definition version. For example, if the subGroupKey is State or Province, the subGroupKeyValue can be California.</p>
versionNumber	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. The version number of a decision matrix definition.</p>

## DecisionMatrixDefinitionVersionColumn

Represents a definition of a column in a decision matrix definition version.

Field Name	Description
columnType	<p><b>Field Type</b> DecisionMatrixColumnType (enumeration of type string)</p> <p><b>Description</b> Required. Specifies whether a column is for an input or output. Valid values are:</p> <ul style="list-style-type: none"> <li>• Input</li> <li>• Output</li> </ul>
dataType	<p><b>Field Type</b> DecisionMatrixDataType (enumeration of type string)</p> <p><b>Description</b> Required. The type of data that's stored in a column. Valid values are:</p> <ul style="list-style-type: none"> <li>• Boolean</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• Currency</li> <li>• Number</li> <li>• NumberRange</li> <li>• Percent</li> <li>• Text</li> <li>• TextRange</li> </ul>
displaySequence	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. Represents the position of a column in the column order.</p>
isWildcardColumn	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Specifies whether a column stores a wildcard value (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
name	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The full name of a decision matrix definition version column.</p>
rangeValue	<p><b>Field Type</b> string</p> <p><b>Description</b> A list of values that define range boundaries.</p>
wildcardValue	<p><b>Field Type</b> string</p> <p><b>Description</b> The wildcard value such as <code>ALL</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of a DecisionMatrixDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DecisionMatrixDefinition
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>HealthCloudUM_ValidRegions</label>
  <type>Standard</type>
  <versions>
    <fullName>HealthCloudUM_ValidRegions_V1</fullName>
    <columns>
      <columnType>Input</columnType>
      <dataType>Text</dataType>
      <displaySequence>2</displaySequence>
      <isWildcardColumn>false</isWildcardColumn>
      <name>State</name>
    </columns>
    <columns>
      <columnType>Input</columnType>
      <dataType>Text</dataType>
      <displaySequence>1</displaySequence>
      <isWildcardColumn>false</isWildcardColumn>
      <name>City</name>
    </columns>
    <columns>
      <columnType>Output</columnType>
      <dataType>Boolean</dataType>
      <displaySequence>3</displaySequence>
      <isWildcardColumn>false</isWildcardColumn>
      <name>IsValid</name>
    </columns>
    <decisionMatrixDefinition>HealthCloudUM_ValidRegions</decisionMatrixDefinition>
    <label>HealthCloudUM_ValidRegions V1</label>
    <startDate>2022-05-02T13:04:06.000Z</startDate>
    <status>Draft</status>
    <versionNumber>1</versionNumber>
  </versions>
</DecisionMatrixDefinition>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>DecisionMatrixDefinition</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DelegateGroup

---

Represents a group of users who have the same administrative privileges. These groups are different from public groups used for sharing.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

DelegateGroup components have the suffix `.delegateGroup` and are stored in the `delegateGroups` folder. The file prefix must match the developer name of the delegate group. For example, a delegate group with a developer name of `MyDelegateGroup` would have a file name of `MyDelegateGroup.delegateGroup`.

## Version

DelegateGroup components are available in API version 36.0 and later.

## Special Access Rules

Only users with the “View Setup and Configuration” permission can be delegated administrators. As of Spring '20 and later, only users with “View Setup” or “Configuration” permission can access this object.

## Fields

Field Name	Field Type	Description
<code>customObjects</code>	<code>string[]</code>	The custom objects associated with the group. Delegated administrators can customize nearly every aspect of each of those custom objects, including creating a custom tab. However, they can't create or modify relationships on the objects or set organization-wide sharing defaults. Delegated administrators must have access to custom objects to access the merge fields on those objects from formulas.
<code>groups</code>	<code>string[]</code>	The groups with users assigned by delegated administrators.
<code>label</code>	<code>string</code>	Required. The delegated group's non-API name.
<code>loginAccess</code>	<code>boolean</code>	Required. Allows users in this group to log in as users in the role hierarchy that they administer ( <code>true</code> ) or not ( <code>false</code> ). Depending on your organization settings, individual users must grant login access to allow their administrators to log in as them.
<code>permissionSetGroups</code>	<code>string[]</code>	The permission set groups that can be assigned to users in specified roles and all subordinate roles by delegated administrators.

Field Name	Field Type	Description
permissionSets	string[]	The permission sets that can be assigned to users in specified roles and all subordinate roles by delegated administrators.
profiles	string[]	The profiles that can be assigned to users by delegated administrators.
roles	string[]	The roles and subordinates for which delegated administrators of the group can create and edit users.

## Declarative Metadata Sample Definition

The following is an example of a DelegateGroup component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DelegateGroup xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>MyDelegateGroup</label>
  <loginAccess>true</loginAccess>
  <name>MyDelegateGroup</name>
  <profiles>Chatter Free User</profiles>
  <profiles>Chatter Moderator User</profiles>
  <profiles>Marketing User</profiles>
  <permissionSetGroups>My Permission Set Group</permissionSetGroups>
  <permissionSets>My Permset</permissionSets>
  <roles>LesserBossMan</roles>
</DelegateGroup>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>DelegateGroup</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DigitalExperienceBundle

Represents a text-based code structure of your organization's workspaces, organized by workspace type, and each workspace's content items.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its fullName field.

## File Suffix and Directory Location

DigitalExperienceBundle components have the suffix `.digitalExperience` and are stored in the `digitalExperiences` folder.

DigitalExperienceBundle uses workspaces and content types to organize your data in a content-focused structure.

- **Workspace:** For enhanced Lightning Web Runtime (LWR) sites, a collection of related content items that form the site when combined with data from the `DigitalExperienceConfig` metadata type.

For Marketing Cloud, a collection of related content items contained in a marketing workspace.

- **Workspace type:** A way to categorize different kinds of workspaces. For example, the workspace type for enhanced LWR sites is `site`, and the workspace type for marketing workspaces in Marketing Cloud is `marketing`. The workspace type determines which content types are available in the workspace. In the DigitalExperienceBundle folder structure, all workspaces of a given type are under that workspace type. `site` and `marketing` are the supported workspace types.
- **Content types:** A way to categorize different kinds of content in a workspace. For example, all routes in an enhanced LWR site are stored under a content type folder called `sfdc_cms__route`. Similarly, forms for a marketing workspace are stored under a content type folder called `sfdc_cms__form`.
- **Content items:** For enhanced LWR sites, the individual settings and site components that make up an enhanced LWR site. For example, each of the routes in an enhanced LWR site is a single content item.

For marketing workspaces, the content items used in marketing campaigns. For example, each form in a workspace is a single content item.

Here's an example of the DigitalExperienceBundle structure.

The image shows a file explorer on the left and a code editor on the right. The file explorer displays the following structure:

- DIGITALEXPERIENCEBUNDLE
  - digitalExperiences
    - marketing
      - Workspace1 (2)
      - sfdc\_cms\_\_image
      - sfdc\_cms\_\_languageSettings
      - Workspace1.digitalExperience-meta.xml
      - Workspace2
    - site
      - Capricorn\_Coffee1 (3)
        - sfdc\_cms\_\_appPage
        - sfdc\_cms\_\_brandingSet
        - sfdc\_cms\_\_languageSetting
        - sfdc\_cms\_\_mobilePublisher (4)
        - sfdc\_cms\_\_route
        - sfdc\_cms\_\_site
        - sfdc\_cms\_\_styles
        - sfdc\_cms\_\_theme
        - sfdc\_cms\_\_themeLayout
        - sfdc\_cms\_\_view
        - checkPasswordResetEmail
        - error
        - forgotPassword
        - home (5)
          - \_meta.json
          - content.json
        - login

The code editor shows the content of `content.json` for the `home` route:

```
1 {
2   "type" : "sfdc_cms__view",
3   "title" : "Home",
4   "contentBody" : {
5     "component" : {
6       "children" : [ {
7         "children" : [ {
8           "attributes" : {
9             "backgroundImageConfig" : "",
10            "backgroundImageOverlay" : "rgba(0,0,0,0)",
11            "componentSpacerSize" : "",
12            "layoutDirectionDesktop" : "row",
13            "layoutDirectionMobile" : "column",
14            "layoutDirectionTablet" : "column",
15            "maxContentWidth" : "",
16            "sectionColumnGutterWidth" : "",
17            "sectionConfig" : "{\\"UUID\\":\\"d62384c1-7408-4810-83a9-2",
18            "sectionMinHeight" : "",
19            "sectionVerticalAlign" : "flex-start"
20          },
21          "children" : [ {
22            "children" : [ {
23              "attributes" : {
24                "richTextValue" : "<div style=\\"display: flex; justi",
25              },
26              "definition" : "community_builder:htmlEditor",
27              "id" : "adbcc6eb-3057-41a7-9fe2-e8a8e138280c",
28              "type" : "component"
29            } ],
30            "id" : "6b5a483c-4fc6-493f-b1af-dbb53e6e1686",
31            "name" : "col1",
32            "title" : "Column 1",
```

When retrieved, DigitalExperienceBundle contains workspace type folders (1) under the digitalExperiences folder.

The marketing folder contains one or more workspace folders (2), each representing a marketing workspace in Marketing Cloud. The site folder contains one or more workspace folders (3), each representing the workspace for an individual enhanced LWR site. Each workspace folder contains an XML file with information about the workspace, such as the label. For enhanced LWR sites, be sure to keep the label value in sync with the site's network name.

Each workspace folder also contains several content type folders that represent each of the different content types (4) used in that workspace. For example, marketing workspaces support landing pages, forms, emails, and referenced images and branding.

Finally, each content type folder can contain one or more content subfolders. Each content subfolder can contain additional subfolders and several files that, when combined, represent an individual content item, such as a specific view (5).

- A `_meta.json` file that contains the metadata for the content item. Use the `_meta.json` file to learn the location of a content item within the workspace, or to move the content item to another location, including creating a new location for the content item. You can also use the `_meta.json` file to view a content item's parent-child relationships, to move the content item from one parent to another, or to remove a parent-child relationship entirely.
- A `content.json` file that contains the primary version of the content item. Each `content.json` file includes values for the content item's type, title, and content body. Use this file to edit the content's properties on your local machine or scratch org and then deploy.
- If applicable, additional `JSON` files that represent variants of the content item, such as language translations.

The `_meta.json` file contains several properties:

Property	Description
<code>apiName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>The name of the associated content item. The <code>apiName</code> allows only alphanumeric and underscore characters and must begin with a letter.</p> <p>You can use an <code>apiName</code> one time per content type in a given workspace. For example, a single workspace can contain both a view named "home" and a route named "home" but can't contain two views named "home".</p>
<code>parent</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The developer name of the content item's parent. If the content item doesn't have a parent, then either the parent value is blank or the parent property isn't displayed at all.</p>
<code>path</code>	<p><b>Field Type</b> string</p>

Property	Description
	<p><b>Description</b></p> <p>The location of the content item within the workspace's folder structure. The value is blank for content types at the root level, such as <code>appPage</code> and <code>site</code>.</p>
<code>type</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The full name of the content type from which the content item was created.</p> <p>The type is prefixed with <code>sfdc_cms__</code>. For example, all views in a site workspace have the content type <code>sfdc_cms__view</code>.</p>

## Version

DigitalExperienceBundle components are available in API version 56.0 and later.

## Special Access Rules

In Experience Cloud, can use DigitalExperienceBundle for enhanced LWR sites created in Winter '23 or later. For Aura sites and other LWR sites, use the [ExperienceBundle](#) (recommended) or the [SiteDotCom](#) on page 2031 metadata types.

In Marketing Cloud, you must have a contributor role in a marketing workspace to retrieve it. Only marketing workspaces are supported when using DigitalExperienceBundle. You can't package or deploy general workspaces.

## Fields

Field Name	Description
<code>description</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Contains the description of the workspace.</p> <p>For site workspaces, this value is empty.</p>
<code>digitalExperienceFolderShares</code>	<p><b>Field Type</b></p> <p><a href="#">DigitalExperienceFolderShare[]</a></p> <p><b>Description</b></p> <p>The list of folders in the source marketing workspace that are shared with target marketing workspaces.</p>

Field Name	Description
	Available in API version 61.0 and later.
label	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>A user-friendly name for DigitalExperienceBundle, which is defined when the DigitalExperienceBundle is created.</p>
spaceResources	<p><b>Field Type</b> <a href="#">DigitalExperience[]</a></p> <p><b>Description</b> The list of resources in this DigitalExperienceBundle. Each resource represents a content type, such as views, routes, themes, and languageSettings.</p>

## DigitalExperience

Represents content in the bundle. When retrieved as part of DigitalExperienceBundle, DigitalExperience represents all content for the requested workspace or workspaces. When retrieved on its own, DigitalExperience represents only the content types you specify.

This subtype extends the [MetadataWithContent](#) metadata type and inherits its `content` and `fullName` fields.

When you retrieve DigitalExperience, the folder structure matches that of DigitalExperienceBundle, with only the specified content returned.

Field Name	Description
fileName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>Name of the resource file.</p>
filePath	<p><b>Field Type</b> string</p> <p><b>Description</b> Path to the file within the artifact folder.</p>
format	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>Only JSON is allowed.</p>

## DigitalExperienceFolderShare

Represents a folder in a source marketing workspace that's shared with other target marketing workspaces. Available in API version 61.0 and later.

Field Name	Description
folderPath	<p><b>Field Type</b> string</p> <p><b>Description</b> The root folder of the shared workspace. The allowed value is <code>_root</code>.</p>
sharedWith	<p><b>Field Type</b> <a href="#">SharedWith[]</a></p> <p><b>Description</b> The list of target workspaces that the source workspace is shared with.</p>

## SharedWith

Represents a target marketing workspace that the source marketing workspace is shared with. Available in API version 61.0 and later.

Field Name	Description
fullyQualifiedName	<p><b>Field Type</b> string</p> <p><b>Description</b> The target workspace that the source workspace is shared with. It uses the format <code>workspace_type/target_workspace_name</code>. For example, <code>marketing/Workspace2</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of a DigitalExperienceBundle component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DigitalExperienceBundle xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>content</description>
</label>isv1</label>
</DigitalExperienceBundle>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>site/isv1</members>
    <name>DigitalExperienceBundle</name>
  </types>
```

```
<version>56.0</version>
</Package>
```

## Usage

 **Tip:** Before you update the JSON files of an Experience Builder site, we recommend making a copy of the site's folder as a backup.

To retrieve and deploy DigitalExperienceBundle, use legacy sfdx commands.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

[DigitalExperienceBundle: Marketing Workspace Bundle and Folders](#)

DigitalExperienceBundle uses the `marketing` workspace type to organize content items used in marketing campaigns in a content-focused, text-based code structure.

[DigitalExperienceBundle: Site Workspace Bundle and Folders](#)

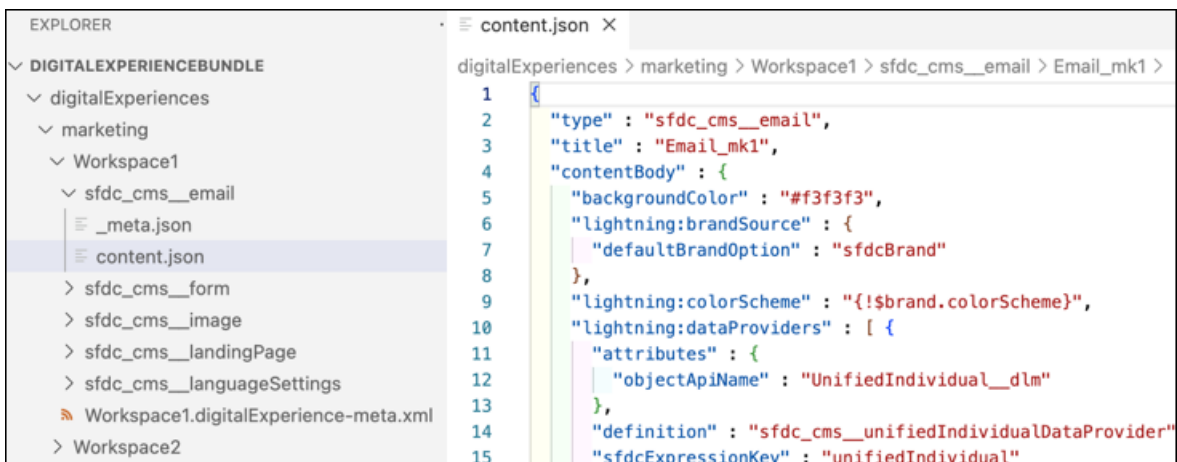

DigitalExperienceBundle uses the `site` workspace type to organize data for enhanced LWR sites in a content-focused, text-based code structure.

## DigitalExperienceBundle: Marketing Workspace Bundle and Folders

DigitalExperienceBundle uses the `marketing` workspace type to organize content items used in marketing campaigns in a content-focused, text-based code structure.

For Marketing Cloud, the `marketing` folder contains one or more workspace folders, each representing an individual marketing workspace. Each workspace folder contains a collection of related content items, such as landing pages, forms, and emails, and their associated images and branding.

The folder for each marketing workspace includes content type folders, content item subfolders, and associated data that's contained in `content.json` and `_meta.json` files.

14       "definition" : "sfdc_cms_unifiedIndividualDataProvider"
15       "sfdcExpressionKey" : "unifiedIndividual"
```

The following content type folders represent the content types that are supported in a marketing workspace. For example, forms for a marketing workspace are stored under a content type folder called `sfdc_cms__form`.

- [sfdc\\_cms\\_\\_email Folder](#)
- [sfdc\\_cms\\_\\_form Folder](#)
- [sfdc\\_cms\\_\\_image Folder](#)
- [sfdc\\_cms\\_\\_landingPage Folder](#)
- [sfdc\\_cms\\_\\_languageSettings Folder](#)

## sfdc\_cms\_\_email Folder

This content type folder contains one content subfolder per email. Each content subfolder contains two or more JSON files:

- `_meta.json`
- `content.json`
- If applicable, additional JSON files that represent variations of the content item

`<apiName>/content.json`

```
{
  "type" : "sfdc_cms__email",
  "title" : "Email_marketingSpaceA",

## sfdc\_cms\_\_image Folder

This content type folder contains one content subfolder per image. Each content subfolder contains two or more JSON files and a `_media` subfolder that contains the image file.

- `_meta.json`
- `content.json`
- If applicable, additional JSON files that represent variations of the content item

`<apiName>/content.json`

```

{
  "type" : "sfdc_cms__image",
  "title" : "Img1_mk1",
  "contentBody" : {
    "sfdc_cms:media" : {
      "source" : {
        "mimeType" : "image/png",
        "ref" : "0sNSB000001rKsr2AE",
        "type" : "file",
        "size" : 538158
      }
    }
  },
  "urlName" : "img1-mk1"
}

```

## sfdc\_cms\_\_landingPage Folder

This content type folder contains one content subfolder per landing page. Each content subfolder contains two or more JSON files:

- `_meta.json`
- `content.json`
- If applicable, additional JSON files that represent variations of the content item

`<apiName>/content.json`

```

{
  "type" : "sfdc_cms__landingPage",
  "title" : "LandingPageA_marketingSpaceA",
  "contentBody" : {
    "lightning:brandSource" : {
      "defaultBrandOption" : "sfdcBrand"
    },
    "sfdc_cms:block" : {

}

```

## sfdc\_cms\_\_languageSettings Folder

This content type folder contains one content subfolder called languages. The languages content subfolder contains two or more JSON files:

- [\\_meta.json](#)
- [content.json](#)
- If applicable, additional JSON files that represent variations of the content item

<apiName>/content.json

```

{
  "type" : "sfdc_cms__languageSettings",
  "title" : "LanguageContent",
  "contentBody" : {
    "languages" : [ {
      "locale" : "en_US",
      "label" : "English (US)",
      "isActive" : true,
      "isAuthoringOnly" : false
    } ],
  },
}

```

```

    "defaultLocale" : "en_US"
  },
  "urlName" : "languagecontent"
}

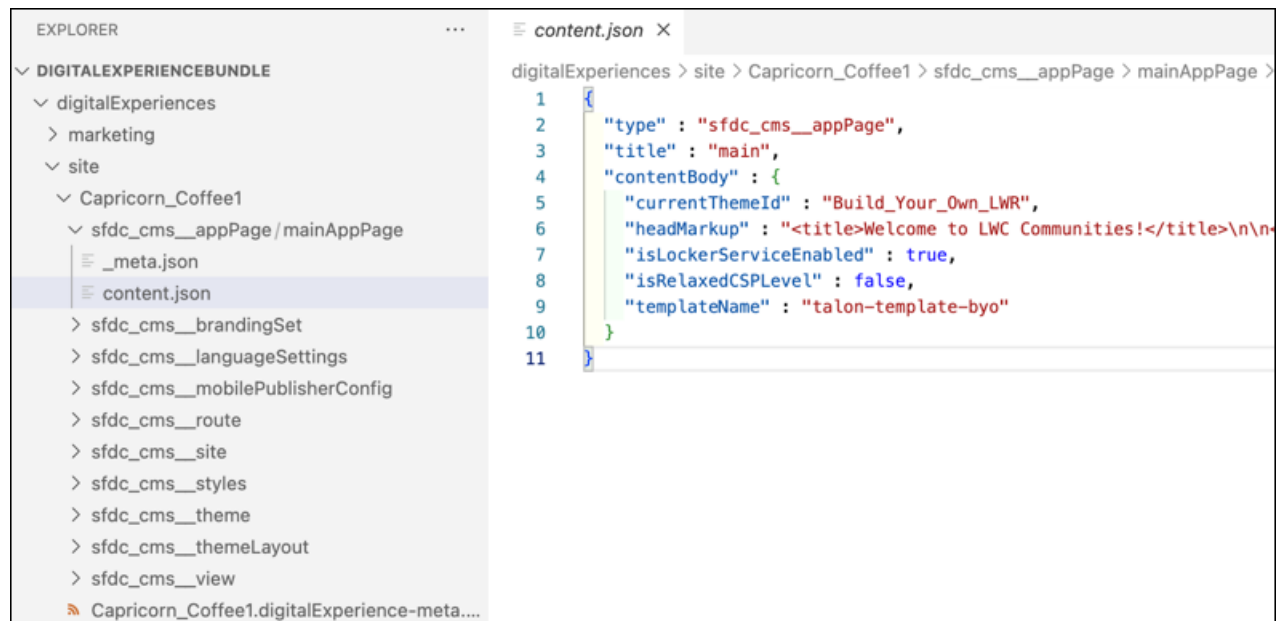

```

## DigitalExperienceBundle: Site Workspace Bundle and Folders

DigitalExperienceBundle uses the `site` workspace type to organize data for enhanced LWR sites in a content-focused, text-based code structure.

The `site` folder contains one or more workspace folders, each representing the workspace for an individual enhanced LWR site. Each workspace folder contains a collection of related content items, such as settings and site components, that form the site when combined with data from the [DigitalExperienceConfig](#) metadata type.

The workspace folder for each site includes content type folders, content item subfolders, and associated data that's contained in `content.json` and `_meta.json` files.

The following content type folders represent the content types that are supported in an enhanced LWR site. For example, all routes in an enhanced LWR site are stored under the `sfdc_cms__route` content type folder.

- [sfdc\\_cms\\_\\_appPage](#) Folder
- [sfdc\\_cms\\_\\_brandingSet](#) Folder
- [sfdc\\_cms\\_\\_languageSettings](#) Folder
- [sfdc\\_cms\\_\\_route](#) Folder
- [sfdc\\_cms\\_\\_site](#) Folder
- [sfdc\\_cms\\_\\_theme](#) Folder
- [sfdc\\_cms\\_\\_themeLayout](#) Folder
- [sfdc\\_cms\\_\\_view](#) Folder

## sfdc\_cms\_\_appPage Folder

This content type folder exists at the root level and contains one content subfolder that represents the site's single-page application. Only one `sfdc_cms__appPage` content item is allowed per site.

The content subfolder contains two or more JSON files:

- `_meta.json`
- `content.json`
- If applicable, additional JSON files that represent variations of the content item

`<apiName>/content.json`

Property	Description
<code>currentThemeId</code>	<p><b>Field Type</b> content link</p> <p><b>Description</b> Represents the <code>apiName</code> of the site's active theme.</p>
<code>headMarkup</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Allows the addition of custom markup to the site's main page <code>&lt;head&gt;</code> tag. Similar to using <b>Experience Builder &gt; Setting &gt; Advanced &gt; Head Markup</b>. See <a href="#">Salesforce Help for markup guidance</a>.</p>
<code>isLockerServiceEnabled</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether Lightning Locker is enabled (<code>true</code>) or not (<code>false</code>). The default value is <code>true</code>. Before disabling Lightning Locker, set <code>isRelaxedCSPLevel</code> to <code>true</code>.</p>
<code>isRelaxedCSPLevel</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Controls the ability to run scripts and controls script access to third-party hosts. The default is <code>false</code>. A <code>false</code> value sets a strict CSP security level, and blocks access to inline scripts and all hosts. A <code>true</code> value sets a relaxed CSP security level, and permits access to inline scripts and allowed hosts. To learn more, see <a href="#">Select a Security Level in Experience Builder Sites</a>.</p>

Property	Description
templateName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>The unique developer name of the template. Valid values are:</p> <ul style="list-style-type: none"> <li>• talon-template-byo—Represents the Build Your Own (LWR) template</li> <li>• microsite-template-marketing—Represents the Microsite template</li> </ul>
title	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>Represents the label of the appPage.</p>
type	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>Represents the content type. The only allowed value is sfdc_cms__appPage.</p>

```
{
  "type" : "sfdc_cms__appPage",
  "title" : "main",
  "contentBody" : {
    "currentThemeId" : "Build_Your_Own_LWR",
    "headMarkup" : "<meta charset=\"UTF-8\" />\n<meta name=\"viewport\"
content=\"width=device-width, initial-scale=1\" />\n<title>Welcome to LWC
Communities!</title>\n\n<link rel=\"stylesheet\" href=\"{ basePath

    "templateName" : "talon-template-byo"
  }
}
```

## sfdc\_cms\_\_brandingSet Folder

This content type folder contains one content subfolder per branding set. Each content subfolder contains two or more JSON files:

- `_meta.json`
- `content.json`
- If applicable, additional JSON files that represent variations of the content item

`<apiName>/content.json`

Property	Description
<code>brandingSetType</code>	<p><b>Field Type</b> enumeration on page 157 of type string</p> <p><b>Description</b> Represents whether the color palette stored in the branding set is for the entire site or a specific section. You can't change one branding set type to another.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• APP—The branding set applies to the entire site. There can be only one branding set of this type.</li> <li>• SCOPED—A SCOPED branding set can be applied only to a section component.</li> </ul>
<code>definitionName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Represents the name for the branding set used in the site or template's theme.</p> <p>There are two standard templates that have unique naming:</p> <ul style="list-style-type: none"> <li>• Build Your Own (LWR) uses <code>talon-template-byo:branding</code></li> <li>• Microsite uses <code>microsite-template-marketing:branding</code></li> </ul>
<code>title</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>Represents the label of the brandingSet content item.</p> <p>The maximum length is 100 characters. The title must be unique within the space's brandingSet content items.</p>
<code>type</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p>

Property	Description
	Represents the content type. The only supported value is <code>sfdc_cms__brandingSet</code> .
values	<p><b>Field Type</b> object (map)</p> <p><b>Description</b> Required.</p> <p>Represents a map of branding values that can be applied to a site.</p>

## sfdc\_cms\_\_languageSettings Folder

This content type folder contains one content subfolder called languages. The languages content subfolder contains two or more JSON files:

- [\\_meta.json](#)
- [content.json](#)
- If applicable, additional JSON files that represent variations of the content item

<apiName>/content.json

Property	Description
defaultLocale	<p><b>Field Type</b> string</p> <p><b>Description</b> Represents the default locale for a workspace. The language listed here is the default fallback language for all of the workspace's languageTypes.</p>
languages	<p><b>Field Type</b> languageType[]</p> <p><b>Description</b> Required. Represents the languages available in the space. Each languageType contains values related to that particular language.</p>
languageType.fallbacklocale	<p><b>Field Type</b> string</p> <p><b>Description</b> Represents the locale to use when no content is available for the selected locale. For example, if a site visitor chooses Japanese from the language selector but there's no content for that page in Japanese, content is displayed in the fallback locale. The fallbackLocale's isAuthoringOnly value must be false. Only one level of fallback is allowed. Here are examples for a workspace with a locale of en_US, and with Spanish, French, and Finnish as supported locales.</p> <ul style="list-style-type: none"> <li>• Not allowed: Spanish falls back to French, and French falls back to Finnish. This configuration includes two levels of fallback.</li> <li>• Allowed: Spanish falls back to French, and French falls back to English. en_US is the workspace's default.</li> <li>• Allowed: Spanish falls back to French, and French has no fallback.</li> </ul> <p>This property is displayed only if the languageType.fallbackLocale is different from the workspace's default locale.</p>
languageType.isActive	<p><b>Field Type</b> boolean</p>

Property	Description
	<p><b>Description</b></p> <p>Indicates whether the language is active (<code>true</code>) or inactive (<code>false</code>). The only supported value is <code>true</code>.</p>
<code>languageType.isAuthoringOnly</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the language is scoped only to authoring workspace (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p> <p>When set to <code>true</code>, the <code>languageType</code> and its associated translations aren't visible to site visitors. When set to <code>false</code>, site visitors can see the <code>languageType</code> and its associated translations.</p>
<code>languageType.label</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. Defines the display label for a language. The display label appears in any language selector components that you add to your site and in the language selector in Experience Builder.</p> <p>The default value is the locale name. For example, if <code>languageType.locale=fr</code>, then <code>languageType.label=French</code>.</p>
<code>languageType.locale</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. Represents the languageCode appended with the countryCode, separated by an underscore. For example, <code>en_US</code> indicates a languageCode of English, and a countryCode of United States.</p> <p>Defines the locale, or geographic region, of a language. Locales determine the display format for date and time, user names, address, and commas and periods in numbers.</p> <p>Each <code>languageType.locale</code> and <code>languageType.label</code> combination can be used only one time per workspace.</p>
<code>title</code>	<p><b>Field Type</b></p> <p>string</p>

Property	Description
	<p><b>Description</b> Required. Represents the label of the content item.</p>
type	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Represents the content type. The only allowed value is <code>sfdc_cms__languageSettings</code>.</p>

```
{
  "type" : "sfdc_cms__languageSettings",
  "title" : "LanguageContent",
  "contentBody" : {
    "languages" : [ {
      "locale" : "en_US",
      "label" : "English (US)",
      "isActive" : true,
      "isAuthoringOnly" : false
    } ],
    "defaultLocale" : "en_US"
  }
}
```

### sfdc\_cms\_\_route Folder

This content type folder contains one content subfolder for each of the site’s routes. Each route content subfolder contains two or more JSON files:

- `_meta.json`
- `content.json`
- If applicable, additional JSON files that represent variations of the content item

`<apiName>/content.json`

Property	Description
activeViewId	<p><b>Field Type</b> content link</p> <p><b>Description</b> Required. Represents the <code>apiName</code> of the route’s active view. Must reference an existing view in the same workspace.</p>

Property	Description
configurationTags	<p><b>Field Type</b> string[]</p> <p><b>Description</b> Represents the configuration tags for the route. The only allowed value is <code>all-in-static-site</code>.</p> <p> <b>Note:</b> Don't edit this property, because it's an internal property.</p>
pageAccess	<p><b>Field Type</b> <a href="#">enumeration</a> of type string</p> <p><b>Description</b> Identifies the status of a route as public or private.</p> <p>When set to the default value <code>UseParent</code>, the status of the site determines the status of the route. This value isn't editable from the user interface for routes that are always private.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>UseParent</code></li> <li>• <code>Public</code></li> <li>• <code>RequiresLogin</code></li> </ul> <p> <b>Note:</b> You can change the <code>pageAccess</code> value only if the site is authenticated.</p>
routeType	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>Identifies the type of route. The <code>routeType</code> value must be unique within a workspace. This value must match the <a href="#">viewType</a> on <a href="#">page 782</a> value in the corresponding view content item.</p>
title	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>Represents the label of the route.</p>
type	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p>

Property	Description
	Represents the content type. The only supported value is <code>sfdc_cms__route</code> .
<code>urlPrefix</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Represents the base URL for the route.</p>

```
{
  "type" : "sfdc_cms__route",
  "title" : "Error",
  "contentBody" : {
    "activeViewId" : "error",
    "configurationTags" : [ ],
    "pageAccess" : "UseParent",
    "routeType" : "error",
    "urlPrefix" : "error"
  }
}
```

## sfdc\_cms\_\_site Folder

This content type folder exists at the root level and contains one content subfolder. The content subfolder contains two or more JSON files:

- `_meta.json`
- `content.json`
- If applicable, additional JSON files that represent variations of the content item

`<apiName>/content.json`

Property	Description
<code>authenticationType</code>	<p><b>Field Type</b> enumeration of type string</p> <p><b>Description</b> Required. Indicates whether guest users have access to the site. Valid values are:</p> <ul style="list-style-type: none"> <li>• AUTHENTICATED—The site isn't public. Only authenticated users can access the site after logging in.</li> <li>• AUTHENTICATED_WITH_PUBLIC_ACCESS_ENABLED—The site is an authenticated site, but the <b>Public can access</b></li> </ul>

Property	Description
	<p><b>the site</b> checkbox is enabled in Experience Builder in <b>Settings &gt; General</b>. Guest users can access the site.</p> <ul style="list-style-type: none"> <li>UNAUTHENTICATED—The unauthenticated site is publicly available to anyone on the web, and doesn't support login or authentication. UNAUTHENTICATED is a legacy value. We recommend using AUTHENTICATED_WITH_PUBLIC_ACCESS_ENABLED access to allow guest user access.</li> </ul>
title	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Represents the label of the content item.</p>
type	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Represents the content type. The only allowed value is sfdc_cms__site.</p>

```
{
  "type" : "sfdc_cms__site",
  "title" : "Capricorn_Coffee",
  "contentBody" : {
    "authenticationType" : "AUTHENTICATED"
  }
}
```

### sfdc\_cms\_\_theme Folder

This content type folder contains one content subfolder, representing the site's theme. The content subfolder contains two or more JSON files:

- [\\_meta.json](#)
- [content.json](#)
- If applicable, additional JSON files that represent variations of the content item

<apiName>/content.json

Property	Description
activeBrandingSetId	<p><b>Field Type</b> content link</p>

Property	Description
	<p><b>Description</b> Required.</p> <p>Represents the <code>apiName</code> of the site's active branding set.</p> <p>Must reference an existing brandingSet with a type of <code>APP</code> in the same workspace.</p>
<code>definitionName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>Represents the definition name of a theme.</p> <p>Must match the template's theme definition name.</p>
<code>layouts</code>	<p><b>Field Type</b> layout[]</p> <p><b>Description</b> Required.</p> <p>Represents an array of the theme layouts available in the workspace and provides details about each theme layout.</p> <p>The template and features used in the workspace determine which layouts are required. For example, the <code>ServiceNotAvailable</code> layout is required if the site includes a Service Not Available page.</p>
<code>layouts.layoutId</code>	<p><b>Field Type</b> content link</p> <p><b>Description</b> Required.</p> <p>Represents the <code>apiName</code> of an available theme layout. Must refer to an existing theme layout in the same workspace.</p>
<code>layouts.layoutType</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Represents the name of the theme layout specified in Experience Builder.</p> <p>An inner theme layout is required. The inner theme layout is applied by default to all of a site's pages except for login pages.</p>
<code>title</code>	<p><b>Field Type</b> string</p>

Property	Description
	<p><b>Description</b> Required. Represents the name of the theme.</p>
type	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Represents the content type. The only allowed value is sfdc_cms__theme.</p>

```
{
  "type" : "sfdc_cms__theme",
  "title" : "Build Your Own (LWR)",
  "contentBody" : {
    "activeBrandingSetId" : "Build_Your_Own_LWR",
    "definitionName" : "byo",
    "layouts" : [ {
      "layoutId" : "snaThemeLayout",
      "layoutType" : "ServiceNotAvailable"
    }, {
      "layoutId" : "scopedHeaderAndFooter",
      "layoutType" : "Inner"
    } ]
  }
}
```

### sfdc\_cms\_\_themeLayout Folder

This content type folder contains one content subfolder for each theme layout in the site. Each content subfolder contains two or more JSON files:

- [\\_meta.json](#)
- [content.json](#)
- If applicable, additional JSON files that represent variations of the content item

 **Note:** We recommend that you don't add, reorder, or delete a component within a locked region using the DigitalExperienceBundle. To find out which regions are locked, in Experience Builder, view the Page Structure tab for the page that you're working on. If the region that you're modifying has a lock icon next to it, it's a locked region.

<apiName>/content.json

Property	Description
children	<p><b>Field Type</b> regionType[]</p>

Property	Description
	<p><b>Description</b> Represents individual regions within a layout.</p>
<p><code>component</code></p>	<p><b>Field Type</b> componentType</p> <p><b>Description</b> Required.  Contains the layout details for this theme layout in regions and components.</p>
<p><code>componentType.attributes</code></p>	<p><b>Field Type</b> map</p> <p><b>Description</b> A map of design attribute values used by the component definition to render the definition.</p>
<p><code>componentType.attributes.dxpStyle</code></p>	<p><b>Field Type</b> map</p> <p><b>Description</b> Lets you define visibility, padding, and margin values for a component.  Visibility controls whether the component is visible on desktop, tablet, and mobile versions of your site.  Margin and padding are map types that contain string properties for top, right, bottom, and left spacing. Padding controls space within a component. Margin controls space around the outside of a component. Units for margin and padding can be px, rem, or %, and all four spacing values must use the same unit. This field is available in API version 57.0 and later.</p>
<p><code>componentType.children</code></p>	<p><b>Field Type</b> regionType[]</p> <p><b>Description</b> Represents regions within a component.</p>
<p><code>componentType.definition</code></p>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  Represents the name of the Lightning Web Component (LWC) using the format namespace:componentName.</p>

Property	Description
	<p>Must be one of the theme layouts defined as part of the default theme, or use the target <a href="#">lightningCommunity__Theme_Layout</a>. The default theme layouts differ per theme. For example, the Build Your Own (BYO) template uses the BYO theme, with the allowed theme layouts <code>community_byo:scopedHeaderandFooter</code> and <code>community_layout:simpleThemeLayout</code>.</p>
<code>componentType.id</code>	<p><b>Field Type</b> UUID</p> <p><b>Description</b> Required. Represents the UUID of a component.</p>
<code>componentType.scopedBrandingSetId</code>	<p><b>Field Type</b> content link</p> <p><b>Description</b> Represents the brandingSet that applies to this component. The brandingSet must be of type <code>SCOPED</code>.  This property is applicable only if the component's <code>definitionName</code> is <code>community_layout:section</code>.</p>
<code>componentType.customCssClasses</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Represents the custom CSS classes applied to the host element of the component. Must be a space-delimited list of valid CSS classes. This field is available in API version 59.0 and later.</p>
<code>componentType.title</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Represents a component variation name. Available in API version 59.0 and later.</p>
<code>componentType.type</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>component</code></li> <li>• <code>mutationComponent</code></li> </ul>

Property	Description
<code>componentType.variations</code>	<p><b>Field Type</b> componentType[]</p> <p><b>Description</b> Represents a component variation within a component. Available in API version 59.0 and later.</p>
<code>componentVariationType.rule</code>	<p><b>Field Type</b> rule type</p> <p><b>Description</b> A visibility rule associated with a component variation. Available in API version 59.0 and later.</p>
<code>componentVariationType.variationId</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The unique ID of a component variation. Available in API version 59.0 and later.</p>
<code>contentOperations</code>	<p><b>Field Type</b> contentOperationType</p> <p><b>Description</b> A content operation of the variation or visibility type.</p>
<code>contentOperationsType.operations</code>	<p><b>Field Type</b> operationsType[]</p> <p><b>Description</b> Component visibility operation.</p>
<code>expressionCriteriaType.criterionNumber</code>	<p><b>Field Type</b> integer</p> <p><b>Description</b> The sequence number of an expression criteria. Available in API version 59.0 and later.</p>
<code>expressionCriteriaType.operator</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Operator of the criteria or condition in a visibility rule. Supported operators are:</p> <ul style="list-style-type: none"> <li>• EQUAL</li> <li>• NE: Does not equal</li> <li>• CONTAINS</li> </ul>

Property	Description
	<ul style="list-style-type: none"> <li>• NC: Does not contain</li> <li>• LT: Less than</li> <li>• GT: Greater than</li> <li>• LE: Less than or equal to</li> <li>• GE: Greater than or equal to</li> <li>• StartsWith</li> </ul>
<code>expressionCriteriaType.resource</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The resource of the criteria or condition in a visibility rule.</p>
<code>expressionCriteriaType.value</code>	<p><b>Field Type</b> object</p> <p><b>Description</b> The value of the criteria or condition in a visibility rule. The value can be number, boolean, or string.</p>
<code>operationsType.isActive</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> When <code>true</code>, the visibility operation is active.</p>
<code>operationsType.isHiddenOnOperationSuccess</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> When <code>true</code>, the component is hidden when the operation is successful.</p>
<code>operationsType.rule</code>	<p><b>Field Type</b> RuleType</p> <p><b>Description</b> The component visibility rule.</p>
<code>operationsType.ruleToVariationList</code>	<p><b>Field Type</b> componentVariationType[]</p> <p><b>Description</b> Variation rules associated with a specific component ID. Only 15 variations are allowed in one <code>ruleToVariationList</code>, which means only 15 variations can correspond to a specific <code>targetId</code>. Available in API version 59.0 and later.</p>

Property	Description
<code>operationsType.targetId</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The component ID where the visibility rule is applied.</p>
<code>regionType.children</code>	<p><b>Field Type</b> componentType[]</p> <p><b>Description</b> Represents individual components within the region.</p>
<code>regionType.id</code>	<p><b>Field Type</b> UUID</p> <p><b>Description</b> Required. Represents the UUID of a region.</p>
<code>regionType.name</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Represents the name of the region.</p>
<code>regionType.title</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Represents the label for a region.</p>
<code>regionType.type</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. <code>region</code> is the only allowed value.</p>
<code>regionType.variations</code>	<p><b>Field Type</b> componentType[]</p> <p><b>Description</b> Represents a component variation within a region. Available in API version 59.0 and later.</p>
<code>ruleType.criteriaType</code>	<p><b>Field Type</b> string</p>

Property	Description
	<p><b>Description</b></p> <p>The condition or criteria type of the rule. Allowed values include <code>AllCriteriaMatch</code> and <code>AnyCriterionMatches</code>.</p>
<code>ruleType.customFormula</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>A custom formula created from expression criteria for a visibility rule. Available in API version 59.0 and later.</p>
<code>ruleType.description</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The description of a visibility rule.</p>
<code>ruleType.expressionCriteria</code>	<p><b>Field Type</b></p> <p>expressionCriteriaType[]</p> <p><b>Description</b></p> <p>The expression criteria of a visibility rule.</p>
<code>ruleType.name</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The name of a visibility rule.</p>
<code>title</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Represents the label of the content item.</p>
<code>type</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Represents the content type. The only allowed value is <code>sfdc_cms__themeLayout</code>.</p>

## sfdc\_cms\_\_view Folder

This content type folder contains one content subfolder per view. Each content subfolder contains two or more JSON files:

- `_meta.json`
- `content.json`
- If applicable, additional JSON files that represent variations of the content item

Each Experience Builder site is built from single-page applications, which are web apps that load a single HTML page. Single-page applications consist of multiple views that update the page dynamically as the user interacts with it. A view is made up of regions that contain other regions or components in the rendered page for the user. Single-page applications in your site are defined in the `sfdc_cms__appPage` folder.

Each `content.json` file in the `sfdc_cms__view` folder contains a hidden region named `sfdcHiddenRegion`. The hidden region contains a component with a definition of `community_builder:seoAssistant` that represents the SEO assistant component. This component corresponds to the SEO page properties that you can configure in Experience Builder and isn't visible on your pages. To improve search engine results, use the SEO assistant component to set the `customHeadTags`, `description`, and `pageTitle` properties for your public and custom site pages. You can't edit the other properties associated with the SEO assistant component. To learn more about what the title, description, and custom head tags properties represent and which head tags are allowed, see [SEO Page Properties in Experience Builder](#).

 **Note:** We recommend that you don't add, reorder, or delete a component within a locked region using the DigitalExperienceBundle. To find out which regions are locked, in Experience Builder, view the Page Structure tab for the page that you're working on. If the region that you're modifying has a lock icon next to it, it's a locked region.

`<apiName>/content.json`

Property	Description
<code>children</code>	<p><b>Field Type</b> regionType[]</p> <p><b>Description</b> Represents individual regions within a view.</p>
<code>component</code>	<p><b>Field Type</b> componentType</p> <p><b>Description</b> Required.  Represents the view layout and contains regions and components that help render a view.</p>
<code>componentType.attributes</code>	<p><b>Field Type</b> map</p> <p><b>Description</b> A map of design attribute values used by the component definition to render the definition.</p>
<code>componentType.attributes.dxpStyle</code>	<p><b>Field Type</b> map</p>

Property	Description
	<p><b>Description</b></p> <p>Lets you define visibility, padding, and margin values for a component.</p> <p>Visibility controls whether the component is visible on desktop, tablet, and mobile versions of your site.</p> <p>Margin and padding are map types that contain string properties for top, right, bottom, and left spacing. Padding controls space within a component. Margin controls space around the outside of a component. Units for margin and padding can be px, rem, or %, and all four spacing values must use the same unit. This field is available in API version 57.0 and later.</p>
componentType.children	<p><b>Field Type</b> regionType[]</p> <p><b>Description</b> Represents regions within a component.</p>
componentType.definition	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>Represents the name of the Lightning Web Component (LWC) in the format namespace:componentName.</p>
componentType.id	<p><b>Field Type</b> UUID</p> <p><b>Description</b> Required.</p> <p>Represents the UUID of a component.</p>
componentType.scopedBrandingSetId	<p><b>Field Type</b> content link</p> <p><b>Description</b> Represents the brandingSet that applies to this component. The brandingSet must be of type SCOPED.</p> <p>This property is applicable only if the component's definitionName is community_layout:section.</p>
componentType.customCssClasses	<p><b>Field Type</b> string</p>

Property	Description
	<p><b>Description</b></p> <p>Represents the custom CSS classes applied to the host element of the component. Must be a space-delimited list of valid CSS classes. This field is available in API version 59.0 and later.</p>
<code>componentType.title</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Represents a component variation name. Available in API version 59.0 and later.</p>
<code>componentType.type</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Allowed values are:</p> <ul style="list-style-type: none"> <li>• component</li> <li>• mutationComponent</li> </ul>
<code>componentType.variations</code>	<p><b>Field Type</b></p> <p>componentType[]</p> <p><b>Description</b></p> <p>Represents a component variation within a component. Available in API version 59.0 and later.</p>
<code>componentVariationType.rule</code>	<p><b>Field Type</b></p> <p>rule type</p> <p><b>Description</b></p> <p>A visibility rule associated with a component variation. Available in API version 59.0 and later.</p>
<code>componentVariationType.variationId</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The unique ID of a component variation. Available in API version 59.0 and later.</p>
<code>contentOperations</code>	<p><b>Field Type</b></p> <p>contentOperationType</p> <p><b>Description</b></p> <p>A content operation of the variation or visibility type.</p>

Property	Description
<code>expressionCriteriaType.criterionNumber</code>	<p><b>Field Type</b> integer</p> <p><b>Description</b> The sequence number of an expression criteria. Available in API version 59.0 and later.</p>
<code>contentOperationsType.operations</code>	<p><b>Field Type</b> <code>operationsType[]</code></p> <p><b>Description</b> Component visibility operation.</p>
<code>expressionCriteriaType.operator</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Operator of the criteria or condition in a visibility rule. Supported operators are:</p> <ul style="list-style-type: none"> <li>• EQUAL</li> <li>• NE: Does not equal</li> <li>• CONTAINS</li> <li>• NC: Does not contain</li> <li>• LT: Less than</li> <li>• GT: Greater than</li> <li>• LE: Less than or equal to</li> <li>• GE: Greater than or equal to</li> <li>• StartsWith</li> </ul>
<code>expressionCriteriaType.resource</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The resource of the criteria or condition in a visibility rule.</p>
<code>expressionCriteriaType.value</code>	<p><b>Field Type</b> object</p> <p><b>Description</b> The value of the criteria or condition in a visibility rule. The value can be number, boolean, or string.</p>
<code>operationsType.isActive</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> When <code>true</code>, the visibility operation is active.</p>

Property	Description
<code>operationsType.isHiddenOnOperationSuccess</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> When <code>true</code>, the component is hidden when the operation is successful.</p>
<code>operationsType.rule</code>	<p><b>Field Type</b> RuleType</p> <p><b>Description</b> The component visibility rule.</p>
<code>operationsType.ruleToVariationList</code>	<p><b>Field Type</b> componentVariationType[]</p> <p><b>Description</b> Variation rules associated with a specific component ID. Only 15 variations are allowed in one <code>ruleToVariationList</code>, which means only 15 variations can correspond to a specific <code>targetId</code>. Available in API version 59.0 and later.</p>
<code>operationsType.targetId</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The component ID where the visibility rule is applied.</p>
<code>regionType.children</code>	<p><b>Field Type</b> componentType[]</p> <p><b>Description</b> Represents individual components within the region.</p>
<code>regionType.id</code>	<p><b>Field Type</b> UUID</p> <p><b>Description</b> Required. Represents the UUID of a region.</p>
<code>regionType.name</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Represents the name of the region.</p>

Property	Description
<code>regionType.title</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Represents the label for a region.</p>
<code>regionType.type</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. <code>region</code> is the only allowed value.</p>
<code>regionType.variations</code>	<p><b>Field Type</b> componentType[]</p> <p><b>Description</b> Represents a component variation within a region. Available in API version 59.0 and later.</p>
<code>ruleType.criteriaType</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The condition or criteria type of the rule. Allowed values include <code>AllCriteriaMatch</code> and <code>AnyCriterionMatches</code>.</p>
<code>ruleType.customFormula</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> A custom formula created from expression criteria for a visibility rule. Available in API version 59.0 and later.</p>
<code>ruleType.description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of a visibility rule.</p>
<code>ruleType.expressionCriteria</code>	<p><b>Field Type</b> expressionCriteriaType[]</p> <p><b>Description</b> The expression criteria of a visibility rule.</p>
<code>ruleType.name</code>	<p><b>Field Type</b> string</p>

Property	Description
	<p><b>Description</b></p> <p>The name of a visibility rule.</p>
themeLayoutType	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Represents the <code>apiName</code> of the view's active theme layout.</p> <p>Must reference an existing theme layout in the same workspace.</p>
title	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Represents the name of the view. Limited to 80 characters.</p> <p> <b>Note:</b> We recommend keeping the <code>title</code> value and the <code>pageTitle</code> value in sync. If you update either value for a view, ensure that you manually update the other value in the same <code>content.json</code> file to match.</p>
type	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Represents the content type. The only allowed value is <code>sfdc_cms__view</code>.</p>
viewType	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Identifies the type of view. The <code>viewType</code> value must be unique within a workspace. This value must match the <code>routeType</code> on page 768 value in the corresponding route content item.</p>

## File Suffix and Directory Location

DigitalExperienceConfig components have the suffix `.digitalExperienceConfig` and are stored in the `digitalExperienceConfigs` folder.

## Version

DigitalExperienceConfig components are available in API version 56.0 and later.

## Special Access Rules

You can use DigitalExperienceConfig for enhanced LWR sites created after the Winter '23 release.

## Fields

Field Name	Description
label	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the site.</p>
site	<p><b>Field Type</b> <a href="#">Site</a></p> <p><b>Description</b> Required. Contains site-related settings, such as the site's URL path prefix.</p>
space	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. References the workspace that contains the site's content items such as brandingSets, themes, views, and routes.</p>

## Site

Represents site-related information, such as the URL path prefix.

Field Name	Description
urlPathPrefix	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>The first part of the path on the site's URL that distinguishes this site from other sites. For example, if your site URL is <i>MyDomainName.my.site.com/partners</i>, then partners is the <code>urlPathPrefix</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of a `DigitalExperienceConfig` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DigitalExperienceConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>Capricorn_Coffee</label>
  <site>
    <urlPathPrefix>CapricornCoffee</urlPathPrefix>
  </site>
  <space>site/Capricorn_Coffee1</space>
</DigitalExperienceConfig>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Capricorn_Coffee1</members>
    <name>DigitalExperienceConfig</name>
  </types>
  <version>56.0</version>
</Package>
```

## Usage

To retrieve and deploy `DigitalExperienceConfig`, use legacy `sfdx` commands.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DisclosureDefinition

Represents information that defines a disclosure type, such as details of the publisher or vendor who created or implemented the report.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

DisclosureDefinition components have the suffix `.disclosureDefinition` and are stored in the `disclosureDefinitions` folder.

## Version

DisclosureDefinition components are available in API version 57.0 and later.

## Special Access Rules

The `DisclosureAndComplianceHubAddOn` license is required to access this object along with user access for the Disclosure Compliance Hub permission set license.

## Fields

Field Name	Description
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The description about the disclosure definition.</p>
<code>disclosureType</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The API name of the disclosure type associated with this definition.</p>
<code>isProtected</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type. The default is <code>false</code>.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p>

Field Name	Description
	A user-friendly name for DisclosureDefinition, which is defined when the DisclosureDefinition is created.

## Declarative Metadata Sample Definition

The following is an example of a DisclosureDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DisclosureDefinition
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>This is GRI Disclosure Definition</description>
  <disclosureType>disclstype10</disclosureType>
  <isProtected>>false</isProtected>
  <masterLabel>GRI</masterLabel>
</DisclosureDefinition>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>Pkg</fullName>
  <types>
    <members>GRI</members>
    <name>DisclosureDefinition</name>
  </types>
  <types>
    <members>dt12</members>
    <name>DisclosureType</name>
  </types>
  <version>57.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DisclosureDefinitionVersion

Represents the version information about the disclosure definition.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

DisclosureDefinitionVersion components have the suffix `.disclosureDefinitionVersion` and are stored in the `disclosureDefinitionVersions` folder.

## Version

DisclosureDefinitionVersion components are available in API version 57.0 and later.

## Special Access Rules

The DisclosureAndComplianceHubAddOn and OmniStudioDesignerAddOn licenses are required to access this object along with user access for the Disclosure Compliance Hub and OmniStudio Admin permission set licenses.

## Fields

Field Name	Description
<code>authoringMode</code>	<p><b>Field Type</b> AuthoringMode (enumeration of type string)</p> <p><b>Description</b> Specifies the authoring mode used to launch the disclosure authoring experience. Possible values are:</p> <ul style="list-style-type: none"> <li>• Microsoft 365 Word</li> <li>• Omniscript and Microsoft 365 Word</li> <li>• Omniscript Form</li> </ul>
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The description about the disclosure definition version.</p>
<code>disclosureDefCurrVer</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> For internal use only.</p>
<code>disclosureDefinition</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>The API name of the disclosure definition associated with this version.</p>
documentTemplateGlobalKey	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The document template global key associated with the DOCX template for the disclosure definition version.</p>
isActive	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the disclosure definition version is an active version (<code>true</code>) or not (<code>false</code>).</p> <p>The default value is <code>false</code>.</p>
isCurrentVersion	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether this is the current version of the disclosure definition specified in the <code>disclosureDefinition</code> field (<code>true</code>) or not (<code>false</code>).</p> <p>The default value is <code>false</code>.</p>
isProtected	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>An auto-generated value that doesn't impact the behavior of the metadata type. The default is <code>false</code>.</p>
masterLabel	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>A user-friendly name for <code>DisclosureDefinitionVersion</code>, which is defined when the <code>DisclosureDefinitionVersion</code> is created.</p>
omniScriptCnfgApiName	<p><b>Description</b></p> <p>The API name of the Omniscript configuration that's associated with the disclosure definition version. This field is required only when <code>authoringMode</code> isn't <code>Microsoft 365 Word</code>.</p>

Field Name	Description
omniScriptConfiguration	<p><b>Field Type</b> string</p> <p><b>Description</b> The ID of the Omniscrypt configuration record.</p> <p> <b>Note:</b> The value of this field is automatically populated using the API name of the Omniscrypt configuration specified in the omniScriptCnfgApiName field.</p>
versionNumber	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The version of the disclosure definition published by the author.</p>

## Declarative Metadata Sample Definition

The following is an example of a DisclosureDefinitionVersion component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DisclosureDefinitionVersion xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>This is GRI Disclosure Definition Version</description>
  <versionNumber>disclosure definition version number</versionNumber>
  <isActive>>false</isActive>
  <disclosureDefinition>df10</disclosureDefinition>
  <omniScriptConfiguration>omni script configuration</omniScriptConfiguration>
  <omniScriptCnfgApiName>omni script config api name</omniScriptCnfgApiName>
  <isCurrentVersion>>true</isCurrentVersion>
  <disclosureDefCurrVer>df10.Id</disclosureDefCurrVer>
  <documentTemplateGlobalKey>document template global key</documentTemplateGlobalKey>
  <authoringMode>OmniScriptForm</authoringMode>
  <masterLabel>GRI</masterLabel>
  <isProtected>>false</isProtected>
</DisclosureDefinitionVersion>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>Pkg</fullName>
  <types>
    <members>GRI</members>
    <name>DisclosureDefinitionVersion</name>
  </types>
  <types>
    <members>df10</members>
```

```

<name>DisclosureDefinition</name>
</types>
<types>
  <members>dt10</members>
  <name>DisclosureType</name>
</types>
<version>60.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DisclosureType

---

Represents the types of disclosures that are done by an individual or an organization and the associated metadata.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

DisclosureType components have the suffix `.disclosureType` and are stored in the `disclosureTypes` folder.

## Version

DisclosureType components are available in API version 57.0 and later.

## Special Access Rules

The `DisclosureAndComplianceHubAddOn` license is required to access this object along with user access for the Disclosure Compliance Hub permission set license.

## Fields

Field Name	Description
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The description about the disclosure type.</p>

Field Name	Description
disclosureBodyLogo	<p><b>Field Type</b> string</p> <p><b>Description</b> The logo ID of the standard body to which an individual or a company is making a disclosure.</p>
disclosureBodyUrl	<p><b>Field Type</b> string</p> <p><b>Description</b> The URL of the disclosure standard body.</p>
disclosureCategory	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the clause category that's used for disclosure.</p>
isProtected	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type. The default is <code>false</code>.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for DisclosureType, which is defined when the DisclosureType is created.</p>

## Declarative Metadata Sample Definition

The following is an example of a DisclosureType component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DisclosureType
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>This is ESG Disclosure Type</description>
  <disclosureBodyLogo>asdf</disclosureBodyLogo>
  <disclosureCategory>EnvSocGvnc</disclosureCategory>
  <disclosureBodyUrl>disclosure body url</disclosureBodyUrl>
  <isProtected>>false</isProtected>
```

```
<masterLabel>ESG</masterLabel>
</DisclosureType>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>Pkg</fullName>
  <types>
    <members>ESG</members>
    <name>DisclosureType</name>
  </types>
  <types>
    <name>StaticResource</name>
    <members>asdf</members>
  </types>
  <version>57.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DiscoveryAIModel

Represents the metadata associated with a model used in Einstein Discovery.

A model is a sophisticated, custom algorithm that Einstein Discovery generates based on a comprehensive, statistical understanding of past outcomes. Einstein Discovery uses models to predict future outcomes. A model accepts the values of one or more predictor variables as input and produces a predicted outcome as output, along with (optionally) top factors and improvements. In Package Manager, this type is listed as "Discovery Model".

You can also build models using a third-party modeling tool, and then import them into Salesforce using Model Manager in Analytics Studio.

**Note:** Write operations for DiscoveryAIModel objects are generally not supported.

## Declarative Metadata File Suffix and Directory Location

A DiscoveryAIModel is stored in the `discovery` folder. DiscoveryAIModels have two files:

- file with `.model` suffix contains the model's actual data
- file named `ModelName.model-meta.xml` suffix contains the model's metadata

Here is a sample `package.xml` file:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Maximize_Sales</members>
```

```

    <name>DiscoveryAIModel</name>
  </types>
  <version>53.0</version>
</Package>

```

## Version

DiscoveryAIModels are available in API version 51.0 and later.

## Fields

Field Name	Field Type	Description
algorithmType	<a href="#">DiscoveryAlgorithmType</a>	Algorithm that Einstein Discovery used to create the model associated with this story.
classificationThreshold	double	Threshold value. Applies only to binary classification models. For regression models, this is null.
description	string	Model description.
label	string	Model label. If you package a model, this label appears in Package Manager.
modelFields	<a href="#">DiscoveryModelField[]</a>	One or more model fields (variables).
modelRuntimeType	<a href="#">DiscoveryModelRuntimeType</a>	Model run-time type.
predictedField	string	Name of the field that is predicted.
predictionType	<a href="#">DiscoveryPredictionType</a>	Type of prediction. One of the following strings: <ul style="list-style-type: none"> <li>• Regression</li> <li>• Classification</li> <li>• Unknown</li> </ul>
sourceType	<a href="#">DiscoveryModelSourceType</a>	Source type.
status	<a href="#">DiscoveryAIModelStatus</a>	Model status (enabled or disabled).
trainingMetrics	string	JSON object that represents metrics about the model when it was trained.
transformations	<a href="#">DiscoveryModelTransform</a>	One or more model transformations.

## DiscoveryAlgorithmType

Represents the algorithm that Einstein Discovery used to create the model.

Field Name	Field Type	Description
Best	string	Tournament Model. Genetic algorithm used to generate high-quality solutions to optimization and search problems, like optimizing decision trees for better performance.
Glm	string	Generalized Linear Model. Regression-based algorithm.
Gbm	string	Gradient Boost Machine. Decision tree-based ensemble machine learning algorithm.
Xgboost	string	XGBoost. Decision tree-based ensemble machine learning algorithm.
Drf	string	Random Forest. Supervised learning algorithm that uses multiple decision trees, randomization, and other optimization techniques.

## DiscoveryModelField

Represents a field (variable) in the model.

Field Name	Field Type	Description
isDisparateImpact	boolean	Indicates whether the field is disparate impact ( <code>true</code> ) or not ( <code>false</code> ).
isSensitive	boolean	Indicates whether the field is sensitive ( <code>true</code> ) or not ( <code>false</code> ).
label	string	Field label displayed in the UI.
name	string	Field name.
type	<a href="#">DiscoveryModelFieldType</a>	Field type. Enumerated.
values	string[]	A list of field values.

## DiscoveryModelTransform

Represents a transformation in the model.

Field Name	Field Type	Description
config	string	The configuration for the transformation.
sourceFieldNames	string[]	A list of the source field names.
targetFieldNames	string[]	A list of the target field names.
type	<a href="#">DiscoveryAIModelTransformationType</a>	Type of transformation.

## DiscoveryAIModelTransformationType

Represents the type of transformation to apply before making a prediction.

Field Name	Field Type	Description
TypographicClustering	string	Typographic clustering transformation.
SentimentAnalysis	string	Sentiment analysis transformation.
FreeTextClustering	string	Free text clustering transformation.
NumericalImputation	string	Numerical imputation transformation.
CatagoricalImputation	string	Catagorical imputation transformation.
TimeSeriesForecast	string	Time series forecast transformation.
ExtractMonthOfYear	string	Extract month of year transformation.
ExtractDayOfWeek	string	Extract day of week transformation.
ZipCodeAnalysis	string	Zip code analysis transformation.

## DiscoveryModelFieldType

Represents the data type of a model field.

Field Name	Field Type	Description
Text	string	Text data type.
Number	string	Number data type.
Date	string	Date data type.

## DiscoveryModelRuntimeType

Represents the model run-type.

Field Name	Field Type	Description
Discovery	string	The model run-type is Einstein Discovery.
H2O	string	The model run-type is H2O.
T	string	The model run-type is Tensorflow v2.4.4.
Tf27	string	The model run-type is Tensorflow v2.7.0.
SC102	string	The model run-type is Scikit Learn v1.0.2.

## DiscoveryModelSourceType

Represents the source tool used to build the model: Discovery or an external tool (the model was uploaded into Salesforce).

Field Name	Field Type	Description
Discovery	string	Einstein Discovery built the model.
UserUpload	string	An external tool built the model. The model was then uploaded into Salesforce.

**Note:** This source type is not supported in the Metadata API.

## DiscoveryAIModelStatus

Represents the status of the model (Enabled or Disabled).

Field Name	Field Type	Description
Disabled	string	The model is disabled (inactive).
Uploading	string	The model is uploading.
UploadFailed	string	The model failed to upload.
UploadCompleted	string	The model upload is complete.
Validating	string	The model is validating.
ValidationFailed	string	The model validation failed.
ValidationCompleted	string	The model validation is complete.
Enabled	string	The model is enabled (active).

## Declarative Metadata Sample Definitions

Here is a sample DiscoveryAIModel:

```
<?xml version="1.0" encoding="UTF-8"?>
<DiscoveryAIModel xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <content xsi:nil="true"/>
  <algorithmType>Glm</algorithmType>
  <classificationThreshold>0.7383</classificationThreshold>
  <label>Maximize Tenure</label>
  <modelFields>
    <label>Field</label>
    <name>Field</name>
    <type>Text</type>
  </modelFields>
  <modelFields>
```

```

    <label>PTO</label>
    <name>PTO</name>
    <type>Number</type>
</modelFields>
<modelFields>
    <label>Level</label>
    <name>Level</name>
    <type>Text</type>
</modelFields>
<modelFields>
    <label>Salary</label>
    <name>Salary</name>
    <type>Number</type>
</modelFields>
<modelFields>
    <label>Tenure</label>
    <name>Tenure</name>
    <type>Number</type>
</modelFields>
<modelRuntimeType>Discovery</modelRuntimeType>
<predictedField>Tenure</predictedField>
<predictionType>Classification</predictionType>
<sourceType>Discovery</sourceType>
<status>Enabled</status>
</DiscoveryAIModel>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DiscoveryGoal

---

Represents the metadata associated with an Einstein Discovery prediction definition.

A prediction definition is a container object in Einstein Discovery that is associated with one or more deployed models. If a prediction definition contains multiple models, then each model produces predictions for a different segment of the data. A prediction definition can contain up to ten active models. In Package Manager, this type is listed as "Discovery Prediction".

## Declarative Metadata File Suffix and Directory Location

A DiscoveryGoal is stored in the `discovery` folder. DiscoveryGoals have a `.goal` file suffix. Here is a sample `package.xml` file:

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>employees_Tenure</members>
        <name>DiscoveryGoal</name>
    </types>
    <version>53.0</version>
</Package>

```

## Version

DiscoveryGoals are available in API version 51.0 and later.

## Fields

Field Name	Field Type	Description
active	boolean	Indicates whether the prediction definition is active (True) or not (False).
deployedModels	<a href="#">DiscoveryDeployedModel[]</a>	One or more deployed models associated with this prediction definition.
label	string	Name of the prediction definition.
modelCards	<a href="#">DiscoveryModelCard[]</a>	Model card for this prediction definition.
outcome	<a href="#">DiscoveryGoalOutcome</a>	Outcome variable of this prediction definition.
predictionType	<a href="#">DiscoveryPredictionType</a>	Type of prediction: Regression, Classification, or Unknown.
pushbackField	string	Automated writeback field for predictions. A custom field on the Salesforce object specified in <code>subscribedEntity</code> .   <b>Note:</b> Removing a pushback field from the goal metadata causes the field to be deleted from the Salesforce object as well.
pushbackType	<a href="#">DiscoveryPushbackType</a>	Type of writeback field for predictions.
subscribedEntity	string	Salesforce object associated with this model.
terminalStateFilters	<a href="#">DiscoveryFilter[]</a>	If specified, one or more filter expressions that define the conditions under which an observation has attained its terminal state (the actual outcome has been reached). For performance monitoring, Einstein Discovery determines model accuracy by comparing a model's predicted outcomes with actual (observed) outcomes.

## DiscoveryDeployedModel

Represents a model deployed in Salesforce.

Field Name	Field Type	Description
active	boolean	Indicates whether the deployed model is active (True) or inactive (False).
aiModel	string	Full name of the <code>DiscoveryAIModel</code> being deployed.

Field Name	Field Type	Description
classificationThreshold	double	Threshold value. Applies only to binary classification models. For regression models, this is null.
fieldMappings	<a href="#">DiscoveryFieldMap[]</a>	One or more mappings between model variables and either fields (in Salesforce objects) or columns (in CRM Analytics datasets).
filters	<a href="#">DiscoveryFilter[]</a>	If specified, one or more segmentation filters for the deployed model. When making a prediction, the first model that has filters matching a specific input row will be used to make the prediction. No filters indicates that the model matches all input rows.
label	string	Label for the deployed model. Appears in Model Manager.
name	string	Name of the deployed model.
prescribableFields	<a href="#">DiscoveryPrescribableField[]</a>	Actionable fields associated with improvements.

## DiscoveryFieldMap

Represents a mapping between model variables and field values.

Field Name	Field Type	Description
mappedField	string	Field in a Salesforce object or column in a CRM Analytics dataset.
modelField	string	Model variable.
subjectFieldJoinKey	string	Join key for a Salesforce object. Null if <code>sourceType</code> is <code>AnalyticsDatasetField</code> .
source	string	If the mapping is to a CRM Analytics dataset, this is the name of the dataset. Otherwise, null.
sourceFieldJoinKey	string	If the mapping is to a CRM Analytics dataset, this is the lookup column on that dataset used to perform the join. Otherwise, null.
sourceType	<a href="#">DiscoveryFieldMapSourceType</a>	Data source type for field mapping.

## DiscoveryFieldMapSourceType

Represents the data source type for field mapping: `SalesforceField` or `AnalyticsDatasetField`.

Field Name	Field Type	Description
<code>SalesforceField</code>	string	Field in a Salesforce object.
<code>AnalyticsDatasetField</code>	string	Column in a CRM Analytics dataset.

## DiscoveryFilter

Represents a field filter.

Field Name	Field Type	Description
field	string	Name of the field to filter.
operator	DiscoveryFilterOperator	Operator used to calculate the filter.
type	<a href="#">DiscoveryFilterFieldType</a>	Type of filter value.
values	<a href="#">DiscoveryFilterValue[]</a>	One or more values selected for the filter.

## DiscoveryFilterOperator

Represents a filter operator.

Field Name	Field Type	Description
Equal	string	Equal to operator (=).
NotEqual	string	Not equal to operator (<>).
GreaterThan	string	Greater than operator (>).
GreaterThanOrEqual	string	Greater than or equal to operator (>=).
LessThan	string	Less than operator (<).
LessThanOrEqual	string	Less than or equal to operator (<=).
Between	string	Between operator.
NotBetween	string	Not between operator.
InSet	string	In set operator.
NotIn	string	Not in operator.
Contains	string	Contains operator.
StartsWith	string	Starts with operator.
EndsWith	string	Ends with operator.
IsNull	string	Is null operator.
IsNotNull	string	Is not null operator.

## DiscoveryFilterFieldType

Represents the data type of the filter field.

Field Name	Field Type	Description
Text	string	Text field type.
Number	string	Number field type.
Date	string	Date field type.
DateTime	string	Datetime field type.
Boolean	string	Boolean field type.

## DiscoveryFilterValue

Represents a filter value.

Field Name	Field Type	Description
type	<a href="#">DiscoveryFilterValueType</a>	Type of filter value.
value	<a href="#">DiscoveryFilterValue</a>	Value.

## DiscoveryFilterValueType

Represents the type of filter value.

Field Name	Field Type	Description
Constant	string	Filter value is a constant.
PlaceHolder	string	Filter value is a placeholder.

## DiscoveryPrescribableField

Represents custom improvement text.

Field Name	Field Type	Description
customDefinitions	<a href="#">DiscoveryCustomPrescribableFieldDefinition[]</a>	One or more strings for custom improvement text. Uses the default improvement text if none are specified.
name	string	Name of the model field that is actionable.

## DiscoveryCustomPrescribableFieldDefinition

Represents a field definition in custom improvement text.

Field Name	Field Type	Description
filters	DiscoveryFilter[]	Represents one or more filters associated with custom improvement text.
template	string	If specified, represents the user-provided template from which the custom text is computed. If not specified, then the default text is used.

## DiscoveryModelCard

Represents a model card associated with an Einstein Discovery prediction definition.

Field Name	Field Type	Description
contactEmail	string	Contact email for this model card.
contactName	string	Contact name for this model card.
label	string	Title for this model card.
sections	string	Sections in the model card.

## DiscoveryGoalOutcome

Represents the outcome variable of the model.

Field Name	Field Type	Description
field	string	Name of the outcome variable.
fieldLabel	string	Label for the outcome variable.
goal	<a href="#">DiscoveryOutcomeGoal</a>	Goal for the outcome variable.
mappedField	string	Mapped field.

## DiscoveryOutcomeGoal

Represents the goal for an outcome.

Field Name	Field Type	Description
Minimize	string	Maximize the outcome.
Maximize	string	Minimize the outcome.
None	string	Reserved for future use.

## DiscoveryPredictionType

Represents the prediction type for a model.

Field Name	Field Type	Description
Unknown	string	Unknown prediction type.
Regression	string	Regression prediction (numeric use case).
Classification	string	Binary classification prediction.
MulticlassClassification	string	Multiclass classification prediction.

## DiscoveryPushbackType

Represents the type of writeback field. Must be set to AiRecordInsight.

Field Name	Field Type	Description
AiRecordInsight	string	Automatic writeback type. Required.
Direct	string	Currently not supported. Reserved for future use.

## Declarative Metadata Sample Definitions

Here is a sample DiscoveryGoal:

```
<?xml version="1.0" encoding="UTF-8"?>
<DiscoveryGoal xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <active>true</active>
  <deployedModels>
    <active>true</active>
    <aiModel>Maximize_Tenure</aiModel>
    <fieldMappings>

</DiscoveryGoal>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DiscoveryStory

Represents the metadata associated with a story used in Einstein Discovery.

A story defines the data and analytical settings that Einstein Discovery uses to generate insights and build predictive models. Story settings include the outcome variable, whether to maximize or minimize the outcome variable, the data to analyze in a CRM Analytics dataset, and other preferences. Story settings tell Einstein Discovery how to conduct the analysis and communicate its results. In Package Manager, this type is listed as "Discovery Story".

 **Note:** Write operations for DiscoveryStory objects are generally not supported.

## Declarative Metadata File Suffix and Directory Location

A DiscoveryStory is stored in the `discovery` folder. DiscoveryStory have two files:

- file with `.story` suffix contains the story's actual data
- file named `ModelName.story-meta.xml` suffix contains the story's metadata

Here is a sample `package.xml` file:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Subscriber_Changes</members>
    <name>DiscoveryStory</name>
  </types>
  <version>55.0</version>
</Package>
```

## Version

DiscoveryStories are available in API version 54.0 and later.

## Fields

Field Name	Field Type	Description
<code>application</code>	string	Required. The CRM Analytics app the story is associated with.
<code>autopilot</code>	DiscoveryStoryAutopilotStatus	Optional. The autopilot status for the story. One of the following strings: <ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>
<code>classificationThreshold</code>	double	Optional. The threshold for classification predictions for the story.
<code>label</code>	string	Required. The story label. If you package a story, this label appears in Package Manager.
<code>outcome</code>	<a href="#">DiscoveryStoryOutcome</a>	Required. The selected outcome of the story.

Field Name	Field Type	Description
sourceContainer	string	Required. The source ID for the story.
sourceType	DiscoveryStorySourceType	Required. The source type of the story. One of the following strings: <ul style="list-style-type: none"> <li>AnalyticsDataset</li> <li>LiveDataset</li> <li>Report</li> </ul>
validationContainder	string	Optional. The validation ID for the story.

## DiscoveryStoryOutcome

Represents the selected outcome of the generated story.

Field Name	Field Type	Description
failureValue	string	Optional. The value if the story failed.
field	string	Required. The field configuration for the story.
goal	DiscoveryStoryOutcomeGoal	Required. The story outcome goal. One of the following strings: <ul style="list-style-type: none"> <li>Maximize</li> <li>Minimize</li> <li>None</li> </ul>
label	string	Required. The story outcome label.
successValue	string	Optional. The value if the story succeeded.
type	DiscoveryStoryOutcomeType	Required. The story outcome type. One of the following strings: <ul style="list-style-type: none"> <li>Categorical</li> <li>Count</li> <li>Number</li> <li>Text</li> </ul>

## Declarative Metadata Sample Definitions

Here is a sample DiscoveryStory:

```
<?xml version="1.0" encoding="UTF-8"?>
<DiscoverStory xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <application>MyStoryApp</application>
  <autopilot>Enabled</autopilot>
  <classificationThreshold>0.7383</classificationThreshold>
  <label>SubscriberChanges</label>
  <outcome>
```

```

    <field>Subscriber</field>
    <goal>Minimize</goal>
    <label>SubscriberChangeOutcome</label>
    <successValue>Success</successValue>
    <type>Numerical</type>
  </outcome>
  <sourceContainer>01X00000000xxxx1AB</sourceContainer>
  <sourceType>AnalyticsDataset</sourceType>
</DiscoveryStory>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Document

---

Represents a Document. All documents must be in a document folder, such as `sampleFolder/TestDocument`.

This type extends the [MetadataWithContent](#) metadata type and inherits its `content` and `fullName` fields.

## Retrieving Documents

You can't use the wildcard (\*) symbol with documents in `package.xml`. To retrieve the list of documents for populating `package.xml` with explicit names, call `listMetadata()` and pass in `DocumentFolder` as the type. Note that `DocumentFolder` is not returned as a type in `describeMetadata()`. `Document` is returned from `describeMetadata()` with an associated attribute of `inFolder` set to true. If that attribute is set to true, you can construct the type by using the component name with the word `Folder`, such as `DocumentFolder`.

The following example shows folders in `package.xml`:

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>MyDBFolder/MyDBName</members>
    <name>Dashboard</name>
  </types>
  <types>
    <members>MyDocumentFolder/MyDocumentName</members>
    <name>Document</name>
  </types>
  <types>
    <members>unfiled$public/MarketingProductInquiryResponse</members>
    <members>unfiled$public/SalesNewCustomerEmail</members>
    <name>EmailTemplate</name>
  </types>
  <types>
    <members>MyReportFolder/MyReportName</members>
    <name>Report</name>
  </types>
  <version>62.0</version>
</Package>

```

For each document an accompanying metadata file named `DocumentFilename-meta.xml` is created in the document folder. For example, for a document `TestDocument.png` in the `sampleFolder` folder, there's a `TestDocument.png-meta.xml` in the `documents/sampleFolder` of the package.

## Version

Documents are available in API version 10.0 and later.

In API version 17.0 and later, you can delete a folder containing documents moved to the Recycle Bin. When you delete the folder, any related documents in the Recycle Bin are permanently deleted.

In API version 18.0 and later, documents do not need an extension.

## Fields

This metadata type contains the following fields:

Field Name	Field Type	Description
<code>content</code>	<code>base64</code>	Content of the document. Base 64-encoded binary data. Prior to making an API call, client applications must encode the binary attachment data as base64. Upon receiving a response, client applications must decode the base64 data to binary. This conversion is usually handled for you by a SOAP client. This field is inherited from the <a href="#">MetadataWithContent</a> component.
<code>description</code>	<code>string</code>	A description of the document. Enter a description to distinguish this document from others.
<code>fullName</code>	<code>string</code>	The name of the document, including the folder name. In version 17.0 and earlier, the <code>fullName</code> included the document extension. In version 18.0 and later, the <code>fullName</code> does not include the file extension. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. If this field contained characters before version 14.0 that are no longer allowed, the characters were stripped out of this field, and the previous value of the field was saved in the <code>name</code> field. This field is inherited from the <a href="#">Metadata</a> component.
<code>internalUseOnly</code>	<code>boolean</code>	Required. Indicates whether the document is confidential ( <code>true</code> ) or not ( <code>false</code> ). This field and <code>public</code> are mutually exclusive; you cannot set both to <code>true</code> .
<code>keywords</code>	<code>string</code>	Contains one or more words that describe the document. A check for matches to words in this field is performed when doing a search.
<code>name</code>	<code>string</code>	The list of characters allowed in the <code>fullName</code> field has been reduced for versions 14.0 and later. This field contains the value contained in the <code>fullName</code> field before version 14.0. This field is only populated if the value of the <code>fullName</code> field contained characters that are no longer accepted in that field.

Field Name	Field Type	Description
<code>public</code>	boolean	Required. Indicates whether the document is an image available for HTML email templates and does not require a Salesforce username and password to view in an email ( <code>true</code> ) or not ( <code>false</code> ). If the images will be used as a custom app logo or custom tab icon, both of which require a Salesforce username and password to view, set this field to <code>false</code> . This field and <code>internalUseOnly</code> are mutually exclusive; you cannot set both to <code>true</code> .

## Declarative Metadata Sample Definition

The following is the definition of a document:

```
<?xml version="1.0" encoding="UTF-8"?>
<Document xmlns="http://soap.sforce.com/2006/04/metadata">
  <internalUseOnly>false</internalUseOnly>
  <name>Q2 Campaign Analysis</name>
  <public>false</public>
  <description>Analyze Q2 campaign effectiveness</description>
</Document>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Folder](#)

## DocumentCategory

Represents a document category.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`DocumentCategory` components have the suffix `.documentCategory` and are stored in the `documentCategory` folder.

### Version

`DocumentCategory` components are available in API version 59.0 and later.

## Special Access Rules

### Fields

Field Name	Description
description	<p><b>Field Type</b> string</p> <p><b>Description</b> A description of the DocumentCategory.</p>
isProtected	<p><b>Field Type</b> boolean</p> <p><b>Description</b> An auto-generated value that doesn't impact the behavior of the metadata type. The default value is <code>false</code>.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The master label of the DocumentCategory. This internal label doesn't get translated.</p>

## Declarative Metadata Sample Definition

The following is an example of a DocumentCategory component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DocumentCategory xmlns="http://soap.sforce.com/2006/04/metadata">
  <masterLabel>Address_Proof</masterLabel>
</DocumentCategory>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>DocumentCategory</name>
  </types>
  <version>59.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DocumentCategoryDocumentType

---

Represents the junction between a DocumentCategory and a DocumentType. Puts a DocumentType in a DocumentCategory.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

DocumentCategoryDocumentType components have the suffix `.documentCategoryDocumentType` and are stored in the `documentCategoryDocumentTypes` folder.

### Version

DocumentCategoryDocumentType components are available in API version 59.0 and later.

## Special Access Rules

### Fields

Field Name	Description
<code>documentCategory</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The master label of the related DocumentCategory.</p>
<code>documentType</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The master label of the related DocumentType.</p>
<code>isProtected</code>	<p><b>Field Type</b> boolean</p>

Field Name	Description
	<p><b>Description</b></p> <p>An auto-generated value that doesn't impact the behavior of the metadata type. The default value is <code>false</code>.</p>
masterLabel	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The master label of the DocumentCategoryDocumentType. This internal label doesn't get translated.</p>

## Declarative Metadata Sample Definition

The following is an example of a DocumentCategoryDocumentType component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DocumentCategoryDocumentType xmlns="http://soap.sforce.com/2006/04/metadata">
  <documentCategory>Address_Proof</documentCategory>
  <documentType>Utility_Bill</documentType>
  <masterLabel>junction1</masterLabel>
</DocumentCategoryDocumentType>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>DocumentCategory</name>
  </types>
  <types>
    <members>*</members>
    <name>DocumentCategoryDocumentType</name>
  </types>
  <types>
    <members>*</members>
    <name>DocumentType</name>
  </types>
  <version>59.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DocumentChecklistSettings

Represents an org's DocumentChecklistItem settings. This type extends the [Metadata](#) metadata type and inherits its `fullName` field. In the package manifest, all organization settings metadata types are accessed using the Settings name. See [Settings](#) for more details.

### File Suffix and Directory Location

DocumentChecklistSettings components are stored in the `DocumentChecklist.settings` file in the `settings` folder. The `.settings` files are different from other named components because there's only one settings file for each settings component.

### Version

DocumentChecklistSettings components are available in API versions 55.0 and later.

### Fields

Field Name	Field Type	Description
<code>dciCustomSharing</code>	boolean	Indicates whether the custom sharing rule for document checklist items is enabled for your org ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>deleteDCIWithFiles</code>	boolean	Indicates whether deletion of document checklist items is enabled for your org ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .

### Declarative Metadata Sample Definition

The following is an example of a `DocumentChecklistSettings.settings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DocumentChecklistSettings
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <dciCustomSharing>true</dciCustomSharing>
  <deleteDCIWithFiles>true</deleteDCIWithFiles>
</DocumentChecklistSettings>
```

### Example Package Manifest

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>DocumentChecklist</members>
    <name>Settings</name>
```

```
</types>
<version>55.0</version>
</Package>
```

## Wildcard Support in the Manifest File

The wildcard character \* (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see [Settings](#). For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DocumentType

---

Represents a document type.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`DocumentType` components have the suffix `.documentType` and are stored in the `documentTypes` folder.

### Version

`DocumentType` components are available in API version 59.0 and later.

## Special Access Rules

### Fields

Field Name	Description
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> A description of the <code>DocumentType</code>.</p>
<code>isActive</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Specifies whether the <code>DocumentType</code> is active.</p>

Field Name	Description
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The master label of the DocumentType. This internal label doesn't get translated.</p>

## Declarative Metadata Sample Definition

The following is an example of a DocumentType component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DocumentType xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>Utility_Bill</description>
  <isActive>true</isActive>
  <masterLabel>Utility_Bill</masterLabel>
</DocumentType>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>DocumentType</name>
  </types>
  <version>59.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## DuplicateRule

Represents a rule that specifies how duplicate records in an object are detected. This type extends the Metadata metadata type and inherits its fullName field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

DuplicateRule components have the .duplicateRule suffix and are stored in the duplicateRules/ directory. The name of the component file is based on the name of the object associated with the rule. For example, the component file name

`duplicateRules/Account.Standard_Account_Duplicate_Rule.duplicateRule` describes a duplicate rule component associated with the Account object.

## Version

DuplicateRule components are available in API version 62.0 and later.

## Fields

Field Name	Field Type	Description
<code>actionOnInsert</code>	DupeActionType (enumeration of type string)	<p>Required. Determines what the duplicate rule does when users or the DuplicateRule API try to insert a record that is a duplicate. Valid values are:</p> <p><b>Allow</b></p> <p>For users, if <code>operationsOnInsert</code> is set to <code>alert</code>, the UI displays the value of <code>alertText</code> in a dialog. The dialog prompts users to continue or cancel. If the user chooses to continue, the insertion proceeds. If the user chooses to cancel, the record isn't inserted.</p> <p>The DuplicateRule API returns an error code and a message. To complete the insertion, the code must set the <code>allowSave</code> field in DuplicateRuleHeader to <code>true</code> and reissue the request.</p> <p>If <code>operationsOnInsert</code> isn't set to <code>alert</code>, the UI inserts the record without issuing an alert. The API inserts the record and doesn't return an error code.</p> <p><b>Block</b></p> <p>For users, the UI displays an error message and prevents them from inserting the new record. The DuplicateRule API returns an error and doesn't insert the record.</p>
<code>actionOnUpdate</code>	DupeActionType (enumeration of type string)	<p>Required. Determines what the duplicate rule does when users or the DuplicateRule API try to update a record, and the result is a duplicate. Valid values are:</p> <p><b>Allow</b></p> <p>For users, if <code>operationsOnUpdate</code> is set to <code>alert</code>, the UI displays the value of <code>alertText</code> in a dialog. The dialog prompts users to continue or cancel. If the user chooses to continue, the update proceeds. If the user chooses to cancel, the record isn't updated.</p> <p>The DuplicateRule API returns a message. To complete the update, the code must set the <code>allowSave</code> field in DuplicateRuleHeader to <code>true</code> and reissue the request.</p> <p>If <code>operationsOnUpdate</code> isn't set to <code>alert</code>, the UI updates the record without issuing an alert. The API updates the record and doesn't return an error code.</p>

Field Name	Field Type	Description
		<p><b>Block</b></p> <p>For users, the UI displays an error message and prevents them from continuing. The DuplicateRule API returns an error.</p>
alertText	string	<p>Text that's sent when the duplicate rule is triggered. The text is only sent if <code>isActive</code> is <code>true</code>. In the UI, the text displays as a message. The DuplicateRule API returns the message in its response.</p> <p>You can set a value for <code>alertText</code> only when you have <code>actionOnInsert</code> or <code>actionOnUpdate</code> (or both) set to <code>Allow</code>. Otherwise, you receive a validation error when you add or update this component.</p>
description	string	<p>Required. Text that describes the duplicate rule. The value is customer-supplied, but isn't visible in the UI.</p>
duplicateRuleFilter	<a href="#">DuplicateRuleFilter</a>	<p>Required. Criteria that define how to find records to consider when looking for duplicates. For example, use <code>duplicateRuleFilter</code> to exclude records from the match when looking for duplicates.</p>
duplicateRuleMatchRules	<a href="#">DuplicateRuleMatchRule</a> []	<p>Required. One or more <a href="#">MatchingRule</a> components for the DuplicateRule. A <code>MatchingRule</code> controls what constitutes a match between records.</p>
isActive	boolean	<p>Required. If <code>true</code>, the DuplicateRule detects duplicate records. Otherwise, the rule has no effect.</p>
masterLabel	string	<p>Required. Label for this DuplicateRule. This value is the internal label for the rule.</p>
operationsOnInsert	string[]	<p>Required. Controls the action to take when <code>actionOnInsert</code> is set to <code>Allow</code> and the duplicate rule is triggered. Either one or both of these values can be set in the array:</p> <p><b>alert</b></p> <p>If set, the action specified in <code>actionOnInsert</code> occurs; otherwise, the insert proceeds.</p> <p><b>report</b></p> <p>If set, the insert operation is added to the report of duplicates.</p>
operationsOnUpdate	string[]	<p>Required. Controls the action to take when <code>actionOnUpdate</code> is set to <code>Allow</code> and the duplicate rule is triggered. Either one or both of these values can be set in the array:</p> <p><b>alert</b></p> <p>If set, the action specified in <code>actionOnUpdate</code> occurs; otherwise, the update proceeds.</p> <p><b>report</b></p> <p>If set, the update operation is added to the report of duplicates.</p>

Field Name	Field Type	Description
securityOption	DupeSecurityOptionType (enumeration of type string)	Required. Determines how record sharing rules affect duplicate management. Valid values are:  <b>EnforceSharingRules</b> Sharing rules affect duplicate management. If a duplicate rule is triggered because an insert or update duplicates an existing record, but the running user doesn't have sharing access to that record, the insert or update proceeds. The sharing rule doesn't prevent the user from creating or updating the record because the record is hidden from the user. No message is issued.  <b>BypassSharingRules</b> Sharing rules don't affect duplicate management. If a duplicate rule is triggered because an insert or update duplicates an existing record, sharing rules are ignored, but other access restrictions apply.
sortOrder	int	Required. Determines the order in which duplicate rules are applied.

## DuplicateRuleMatchRule

Describes the [MatchingRule](#) associated with the `DuplicateRule`. The `MatchingRule` identifies duplicate records.

Field Name	Field Type	Description
matchRuleSObjectType	string	Required. The name of the target object of the matching rule. For example, if you define a duplicate rule for Contact records, and you want to match with Lead records, the value of <code>matchRuleSObjectType</code> is Lead.
matchingRule	string	Required. Value that corresponds to the value of <code>developerName</code> in the <a href="#">MatchingRule</a> for this duplicate rule.
objectMapping	<a href="#">ObjectMapping</a>	Required. Foreign key to an <a href="#">ObjectMapping</a> that maps fields from the duplicate rule's object to fields in the target object specified by <code>matchRuleSObjectType</code> .

## DuplicateRuleFilter

Specifies filter criteria for a `DuplicateRule`. Salesforce only applies the `DuplicateRule` if the record matches the criteria.

Field Name	Field Type	Description
booleanFilter	string	Required. A string of boolean operators that establishes the filter logic for the filter items specified in <code>duplicateRuleFilterItems</code> .
duplicateRuleFilterItems	<a href="#">DuplicateRuleFilterItem</a> []	Required. A list of <a href="#">DuplicateRuleFilterItem</a> components.

## DuplicateRuleFilterItem

This type extends the [FilterItem](#) type and inherits all its fields.

Field Name	Field Type	Description
<code>sortOrder</code>	int	Required. The order of this item in the duplicate rule filter.
<code>table</code>	string	Required. The object that has the field specified in the <code>field</code> field of <a href="#">DuplicateRuleFilterItem</a> . See the documentation for <a href="#">FilterItem</a> for the definition of <code>field</code> .

## ObjectMapping

Represents a map of fields in the input object of the DuplicateRule to fields in the output object of DuplicateRule. The input object is the object associated with the DuplicateRule. The output object can be the same object or a different object with similar fields.

For example, you can have a DuplicateRule that looks for duplicates between the Contact object and the Lead object. In this case, the input object is Contact, and the output object is Lead.

Field Name	Field Type	Description
<code>inputObject</code>	string	Required. The input object for the duplicate rule. The DuplicateRule is associated with this object. For example, if you define a duplicate rule for Contact records, and you want to match with Lead records, the value of <code>inputObject</code> is Contact.
<code>mappingFields</code>	<a href="#">ObjectMappingField[]</a>	Required. The mapping of source object fields to target object fields for the duplicate rule.
<code>outputObject</code>	string	Required. The output object for the duplicate rule. This value is the same as the value of the <code>matchRuleSubjectType</code> field in <a href="#">DuplicateRuleMatchRule</a> . Any duplicate rules that this object has are ignored when the DuplicateRule API uses the ObjectMapping.

## ObjectMappingField

A field name in the input object of the DuplicateRule, and the corresponding field name in the output object.

Field Name	Field Type	Description
<code>inputField</code>	string	Required. Field in the object specified by the <code>inputObject</code> field in <a href="#">ObjectMapping</a> . This field is mapped to the field in <code>outputField</code> , which is assumed to be a field in the object specified by the <code>outputObject</code> field in <a href="#">ObjectMapping</a> .
<code>outputField</code>	string	Required. Field in the object specified by the <code>outputObject</code> field in <a href="#">ObjectMapping</a> . The field is mapped to the field name in <code>inputField</code> , which is assumed to be a field in the object specified by the <code>inputObject</code> in <a href="#">ObjectMapping</a> .

## Declarative Metadata Sample Definition

The following is an example of a DuplicateRule component.

```
<?xml version="1.0" encoding="UTF-8"?>
<DuplicateRule xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <actionOnInsert>Allow</actionOnInsert>
  <actionOnUpdate>Allow</actionOnUpdate>
  <alertText>You are creating a duplicate record. Use an existing record
instead.</alertText>
  <description>Detects a contact that duplicates a Lead</description>
  <duplicateRuleFilter>
    <booleanFilter xsi:nil="true"/>
    <duplicateRuleFilterItems>
      <field>Username</field>
      <operation>equals</operation>
      <value>user@example.com</value>
      <sortOrder>1</sortOrder>
      <table>User</table>
    </duplicateRuleFilterItems>
  </duplicateRuleFilter>
  <duplicateRuleMatchRules>
    <matchRuleSObjectType>Lead</matchRuleSObjectType>
    <matchingRule>ContactToLeadDuplicate_matching_rule</matchingRule>
    <objectMapping>
      <inputObject>Contact</inputObject>
      <mappingFields>
        <inputField>FirstName</inputField>
        <outputField>FirstName</outputField>
      </mappingFields>
      <mappingFields>
        <inputField>LastName</inputField>
        <outputField>LastName</outputField>
      </mappingFields>
      <outputObject>Lead</outputObject>
    </objectMapping>
  </duplicateRuleMatchRules>
  <isActive>true</isActive>
  <masterLabel>ContactToLeadDuplicate</masterLabel>
  <operationsOnInsert>Alert</operationsOnInsert>
  <operationsOnInsert>Report</operationsOnInsert>
  <operationsOnUpdate>Alert</operationsOnUpdate>
  <operationsOnUpdate>Report</operationsOnUpdate>
  <securityOption>EnforceSharingRules</securityOption>
  <sortOrder>1</sortOrder>
</DuplicateRule>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>ContactToLeadDuplicate</members>
    <name>DuplicateRule</name>
```

```

</types>
<version>38.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EclairGeoData

Represents an Analytics custom map chart. Custom maps are user-defined maps that are uploaded to Analytics and are used just as standard maps are. Custom maps are accessed in Analytics from the list of maps available with the map chart type.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

EclairGeoData components have the suffix `geodata` and are stored in the `eclair` folder.

## Version

EclairGeoData components are available in API version 39.0 and later.

## Fields

Field Name	Field Type	Description
<code>maps</code>	<a href="#">EclairMap[]</a>	A list of EclairMap objects. Each EclairMap object specifies the bounding box (if any) and the map name that appears in the user interface.
<code>masterLabel</code>	string	Required. Label for this object. This display value is the internal label that is not translated.

## EclairMap

Field Name	Field Type	Description
<code>boundingBoxBottom</code>	double	When bounding-box coordinates are used, this contains the bottom coordinate.
<code>boundingBoxLeft</code>	double	When bounding-box coordinates are used, this contains the left side coordinate.
<code>boundingBoxRight</code>	double	When bounding-box coordinates are used, this contains the right side coordinate.
<code>boundingBoxTop</code>	double	When bounding-box coordinates are used, this contains the top coordinate.

Field Name	Field Type	Description
mapLabel	string	Required. The user-interface name of the map. This name appears in the maps list for the map chart in Analytics.
mapName	string	Required. Label for this object. This display value is the internal label that is not translated.
projection	string	Required. The type of map projection used to create the map. Valid values are: <ul style="list-style-type: none"> <li>• Equirectangular</li> <li>• Mercator</li> <li>• AlbersUSA</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of an EclairGeoData component:

```
<EclairGeoData xmlns="http://soap.sforce.com/2006/04/metadata"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <content xsi:nil="true"/>
  <maps>
    <boundingBoxBottom>0.0</boundingBoxBottom>
    <boundingBoxLeft>100.0</boundingBoxLeft>
    <boundingBoxRight>100.0</boundingBoxRight>
    <boundingBoxTop>0.0</boundingBoxTop>
    <mapLabel>WorldMap0 Label</mapLabel>
    <mapName>WorldMap0</mapName>
    <projection>Equirectangular</projection>
  </maps>
  <maps>
    <boundingBoxBottom>1.0</boundingBoxBottom>
    <boundingBoxLeft>101.0</boundingBoxLeft>
    <boundingBoxRight>101.0</boundingBoxRight>
    <boundingBoxTop>1.0</boundingBoxTop>
    <mapLabel>WorldMap1 Label</mapLabel>
    <mapName>WorldMap1</mapName>
    <projection>Mercator</projection>
  </maps>
  <masterLabel>WorldMapGeoDataToCreate Label</masterLabel>
</EclairGeoData>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>EclairGeoData</name>
  </types>
```

```
<version>39.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EmailServicesFunction

Represents an email service. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

EmailServicesFunction components have the suffix `.xml` and are stored in the `emailservices` folder.

### Version

EmailServicesFunction components are available in API version 42.0 and later.

## Fields

Field Name	Field Type	Description
<code>apexClass</code>	string	Required. The name of the Apex class that the email service uses to process inbound messages.
<code>attachmentOption</code>	EmailServicesAttOptions (enumeration of type string)	<p>Required. Indicates the types of attachments the email service accepts. One of the following values:</p> <ul style="list-style-type: none"> <li><code>None</code>—The email service accepts the message but discards any attachment.</li> <li><code>NoContent</code>—The attachment metadata (filename, MIME type, and so on) is provided to the Apex class, but the body is set to <code>null</code>.</li> <li><code>TextOnly</code>—The email service only accepts the following types of attachments: <ul style="list-style-type: none"> <li>Attachments with a Multipurpose Internet Mail Extension (MIME) type of text.</li> <li>Attachments with a MIME type of <code>application/octet-stream</code> and a file name that ends with either a <code>.vcf</code> or <code>.vcs</code> extension. These are saved as <code>text/x-vcard</code> and <code>text/calendar</code> MIME types, respectively.</li> </ul> </li> <li><code>BinaryOnly</code>—The email service only accepts binary attachments, such as image, audio, application, and video files.</li> <li><code>All</code>—The email service accepts any type of attachment.</li> </ul>

Field Name	Field Type	Description
<code>authenticationFailureAction</code>	EmailServicesErrorAction (enumeration of type string)	<p>Required. Indicates what the email service does with messages that fail or do not support any of the authentication protocols if the <code>isAuthenticationRequired</code> field is true.</p> <p>One of the following values:</p> <ul style="list-style-type: none"> <li>• <code>UseSystemDefault</code>—The system default is used.</li> <li>• <code>Bounce</code>—The email service returns the message to the sender with a notification that explains why the message was rejected.</li> <li>• <code>Discard</code>—The email service deletes the message without notifying the sender.</li> <li>• <code>Requeue</code>—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected.</li> </ul>
<code>authorizationFailureAction</code>	EmailServicesErrorAction (enumeration of type string)	<p>Required. Indicates what the email service does with messages received from senders who are not listed in the <code>authorizedSenders</code> field on either the email service or email service address.</p> <p>One of the following values:</p> <ul style="list-style-type: none"> <li>• <code>UseSystemDefault</code>—The system default is used.</li> <li>• <code>Bounce</code>—The email service returns the message to the sender with a notification that explains why the message was rejected.</li> <li>• <code>Discard</code>—The email service deletes the message without notifying the sender.</li> <li>• <code>Requeue</code>—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected.</li> </ul>
<code>authorizedSenders</code>	string	Configures the email service to only accept messages from the email addresses or domains listed in this field. If the email service receives a message from an unlisted email address or domain, the email service performs the action specified in the <code>authorizationFailureAction</code> field. Leave this field blank if you want the email service to receive email from any email address.
<code>emailServicesAddresses</code>	<a href="#">EmailServicesAddress[]</a>	A list of EmailServiceAddress records.
<code>errorRoutingAddress</code>	email	The destination email address for error notification email messages when <code>isErrorRoutingEnabled</code> is true.
<code>functionInactiveAction</code>	EmailServicesErrorAction (enumeration of type string)	<p>Required. Indicates what the email service does with messages it receives when the email service itself is inactive.</p> <p>One of the following values:</p> <ul style="list-style-type: none"> <li>• <code>UseSystemDefault</code>—The system default is used.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li><b>Bounce</b>—The email service returns the message to the sender with a notification that explains why the message was rejected.</li> <li><b>Discard</b>—The email service deletes the message without notifying the sender.</li> <li><b>Requeue</b>—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected.</li> </ul>
<code>functionName</code>	string	<p>Required. The name of the email service in the API. This name can contain only underscores and alphanumeric characters and must be unique in your org. The value in this 64-character field must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p> <p>In managed packages, this field prevents naming conflicts on package installations. This field is automatically generated, but you can supply your own value if you create the record using the API. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>functionName</code> for each record. If no <code>functionName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
<code>isActive</code>	boolean	Indicates whether this object is active ( <code>true</code> ) or not ( <code>false</code> ).
<code>isAuthenticationRequired</code>	boolean	Configures the email service to verify the legitimacy of the sending server before processing a message. The email service uses the SPF, SenderId, and DomainKeys protocols to verify the sender's legitimacy: If the sending server passes at least one of these protocols and does not fail any, the email service accepts the email. If the server fails a protocol or does not support any of the protocols, the email service performs the action specified in the <code>authenticationFailureAction</code> field.
<code>isErrorRoutingEnabled</code>	boolean	When incoming email messages can't be processed, indicates whether error notification email messages are routed to a chosen address or to the senders.
<code>isTextAttachmentsAsBinary</code>	boolean	If <code>true</code> , text attachments are supplied to the Apex code as a <code>Messaging.BinaryAttachment</code> instead of as a <code>Messaging.TextAttachment</code> . This means that the body is supplied as an Apex Blob instead of as an Apex String.
<code>isTlsRequired</code>	boolean	Not currently in use.

Field Name	Field Type	Description
<code>overLimitAction</code>	EmailServicesErrorAction (enumeration of type string)	<p>Required. Indicates what the email service does with messages if the total number of messages processed by all email services combined has reached the daily limit for your organization.</p> <p>One of the following values:</p> <ul style="list-style-type: none"> <li>• <code>UseSystemDefault</code>—The system default is used.</li> <li>• <code>Bounce</code>—The email service returns the message to the sender with a notification that explains why the message was rejected.</li> <li>• <code>Discard</code>—The email service deletes the message without notifying the sender.</li> <li>• <code>Requeue</code>—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected.</li> </ul> <p>The system calculates the limit by multiplying the number of user licenses by 1,000.</p>

## EmailServicesAddress

Each email service has one or more email addresses to which users can send messages for processing. An email service only processes messages it receives at one of its addresses.

Field Name	Field Type	Description
<code>authorizedSenders</code>	string	Configures the email service address to only accept messages from the email addresses or domains listed in this field. If the email service address receives a message from an unlisted email address or domain, the email service performs the action specified in the <code>authorizationFailureAction</code> field of its associated email service. Leave this field blank if you want the email service address to receive email from any email address.
<code>developerName</code>	string	<p>Required. The name of the object in the API. This name can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This 25-character field must be unique among other EmailServicesAddress records under the same EmailServiceFunction parent.</p> <p>In managed packages, this field prevents naming conflicts on package installations. This field is automatically generated, but you can supply your own value if you create the record using the API. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>developerName</code> for each record. If no <code>developerName</code> is</p>

Field Name	Field Type	Description
		specified, performance might be slow while Salesforce generates one for each record.
<code>isActive</code>	boolean	Indicates whether this object is active ( <code>true</code> ) or not ( <code>false</code> ).
<code>localPart</code>	string	Required. The local-part of the email service address, which is the string that comes before the <code>@</code> symbol. For the local-part of a Salesforce email address, all alphanumeric characters are valid, plus the following special characters: <code>! # \$ % &amp; amp; ' * / = ? ^ _ + - ` {   } ~ ,</code> The dot character ( <code>.</code> ) is also valid as long as it's not the first or last character. Email addresses aren't case sensitive.
<code>runAsUser</code>	string	Required. The username of the user whose permissions the email service assumes when processing messages sent to this address.

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EmailTemplate

Represents a template for an email, mass email, list email, or Sales Engagement email. Supported in first-generation managed packages only.

This type extends the [MetadataWithContent](#) metadata type and inherits its `content` and `fullName` fields.

 **Note:** First-generation packaging only is supported for Lightning email templates.

## File Suffix and Directory Location

The file suffix is `.email` for the template file. The accompanying metadata file is named `EmailTemplateName-meta.xml`.

EmailTemplate components are stored in the `email` folder in the corresponding package directory. For example, for an email template named `SampleTemplate` in the `sampleFolder` folder, there's a `SampleTemplate-meta.xml` in the `email/sampleFolder` of the package.

## Retrieving Email Templates

You can't use the wildcard (`*`) symbol with email templates in `package.xml`. To retrieve the list of email templates for populating `package.xml` with explicit names, call `listMetadata()` and pass in `EmailTemplate` as the type.

The following example shows folders in `package.xml`:

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
```

```

    <members>MyDBFolder/MyDBName</members>
    <name>Dashboard</name>
</types>
<types>
    <members>MyDocumentFolder/MyDocumentName</members>
    <name>Document</name>
</types>
<types>
    <members>unfiled$public/MarketingProductInquiryResponse</members>
    <members>unfiled$public/SalesNewCustomerEmail</members>
    <name>EmailTemplate</name>
</types>
<types>
    <members>MyReportFolder/MyReportName</members>
    <name>Report</name>
</types>
<version>62.0</version>
</Package>

```

## Version

Email templates are available in API version 12.0 and later.

## Fields

This metadata type contains the following fields:

Field Name	Field Type	Description
apiVersion	double	The API version if it's a Visualforce email template. Every Visualforce email template has an API version specified at creation. This field is available in API version 16.0 and later.
attachedDocuments	string[]	A list of references to documents in your organization. These documents are included as attachments in the email template. Each document is referenced by its path, for example <code>MyFolder/MyDocument.txt</code> .
attachments	<a href="#">Attachment</a> []	A list of attachments for the email template.
available	boolean	Required. Indicates whether this template is offered to users when sending an email ( <code>true</code> ) or not ( <code>false</code> ).
content	base64Binary	Content of the email template. Base 64-encoded binary data. Before making an API call, client applications must encode the binary attachment data as base64. Upon receiving a response, client applications must decode the base64 data to binary. This conversion is handled for you by a SOAP client. This field contains: <ul style="list-style-type: none"> <li>Binary content of the email body if <code>type</code> is set to <code>text</code></li> <li>HTML email content if <code>type</code> is set to <code>html</code></li> <li>HTML body if <code>type</code> is set to <code>custom</code></li> <li>Visualforce body if <code>type</code> is set to <code>visualforce</code></li> </ul>

Field Name	Field Type	Description
		This field is inherited from the <a href="#">MetadataWithContent</a> component.
description	string	The email template description describes the reason for creating the template.
encodingKey	Encoding (enumeration of type string)	<p>Required for Classic email templates. The default encoding setting is Unicode: UTF-8. Change it if your template requires data in a different format.</p> <p>Valid values include:</p> <ul style="list-style-type: none"> <li>UTF-8—Unicode (UTF-8)</li> <li>ISO-8859-1—General US &amp; Western Europe (ISO-8859-1, ISO-LATIN-1)</li> <li>Shift_JIS—Japanese (Shift-JIS)</li> <li>ISO-2022-JP—Japanese (JIS)</li> <li>EUC-JP—Japanese (EUC-JP)</li> <li>x-SJIS_0213—Japanese (Shift-JIS_2004)</li> <li>ks_c_5601-1987—Korean (ks_c_5601-1987)</li> <li>Big5—Traditional Chinese (Big5)</li> <li>GB2312—Simplified Chinese (GB2312)</li> <li>Big5-HKSCS—Traditional Chinese Hong Kong (Big5-HKSCS)</li> </ul> <p>Lightning email templates don't use this field. Instead, the encoding values are taken directly from the user's encoding settings.</p>
fullName	string	The email template developer name used as a unique identifier for API access. The <code>fullName</code> can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. If this field contained characters before version 14.0 that are no longer allowed, the characters were stripped out of this field, and the previous value of the field was saved in the <code>name</code> field. This field is inherited from the <a href="#">Metadata</a> component.
letterhead	string	The letterhead name associated with this email template. Only available when <code>type</code> is set to <code>html</code> .
name	string	Required. Email template name. The list of characters allowed in the <code>fullName</code> field has been reduced for versions 14.0 and later. This field contains the value contained in the <code>fullName</code> field before version 14.0.
packageVersions	<a href="#">PackageVersion</a> []	<p>The list of package versions for any managed packages containing components that are referenced by this email template. This field is only relevant for Visualforce email templates.</p> <p>For more information about managed packages, see <a href="#">Second-Generation Managed Packages</a> in the <i>Salesforce DX Developer Guide</i>. This field is available in API version 16.0 and later.</p>
relatedEntityType	Object Name (enumeration of type string)	Reserved for future use with Lightning Experience.

Field Name	Field Type	Description
<code>style</code>	EmailTemplateStyle (enumeration of type string)	Required. The style of the template. This field is only available when <code>type</code> is set to <code>html</code> .  Valid style values include: <ul style="list-style-type: none"> <li>• <code>none</code></li> <li>• <code>freeForm</code></li> <li>• <code>formalLetter</code></li> <li>• <code>promotionRight</code></li> <li>• <code>promotionLeft</code></li> <li>• <code>newsletter</code></li> <li>• <code>products</code></li> </ul>
<code>subject</code>	string	The email subject.  The limit is 1,000 characters for Lightning email templates and 230 characters for Classic email templates.
<code>textOnly</code>	string	The text of the email body if <code>type</code> is set to <code>html</code> or <code>custom</code> .
<code>type</code>	EmailTemplateType (enumeration of type string)	Required. The email template type.  The valid values are: <ul style="list-style-type: none"> <li>• <code>text</code> - all users can create or change text email templates.</li> <li>• <code>html</code> - administrators and users with the “Edit HTML Templates” permission can create HTML email templates based on a letterhead.</li> <li>• <code>custom</code> - administrators and users with the “Edit HTML Templates” permission can create custom HTML email templates without using a letterhead. You must either know HTML or obtain the HTML code to insert in your email template.</li> <li>• <code>visualforce</code> - administrators and users with the Customize Application permission can create email templates using Visualforce.</li> </ul>
<code>UiType</code>	EmailTemplateUiType (enumeration of type string)	Indicates the user interface where this template is usable. Valid values are: <ul style="list-style-type: none"> <li>• <code>Aloha</code> (Salesforce Classic)</li> <li>• <code>SFX</code> (Lightning Experience)</li> <li>• <code>SFX_Sample</code> (Lightning Experience Sample)</li> </ul> <p>If <code>UiType</code> is <code>SFX</code>, the <code>type</code> must be <code>custom</code>.</p> <p>Packaging is supported for Salesforce Classic email templates only.</p>

 Example:

```
<EmailTemplate>
  <available>true</available>
```

```

<description>Notification that user has been added to a community.</description>
<encodingKey>UTF-8</encodingKey>
<name>Communities: New Member Welcome Email</name>
<style>none</style>
<subject>Welcome to {!Community_Name}</subject>
<type>custom</type>
<uiType>Aloha</uiType>
</EmailTemplate>

```

## Attachment

Attachment represents an email attachment.

Field	Field Type	Description
content	base64Binary	Required. The attachment content. Base 64-encoded binary data. Before making an API call, client applications must encode the binary attachment data as base64. Upon receiving a response, client applications must decode the base64 data to binary. This conversion is handled for you by a SOAP client.
name	string	Required. The attachment file name.

## Declarative Metadata Sample Definition

Here's a sample XML definition of an email template.

```

<?xml version="1.0" encoding="UTF-8"?>
<EmailTemplate xmlns="http://soap.sforce.com/2006/04/metadata">
  <available>true</available>
  <description>Sample Email Template</description>
  <encodingKey>ISO-8859-1</encodingKey>
  <name>Sample Email Template</name>
  <style>none</style>
  <subject>Sample email subject</subject>
  <textOnly>Your case has been resolved.</textOnly>
  <type>custom</type>
</EmailTemplate>

```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Letterhead](#)

## EmbeddedServiceBranding

---

Represents the branding for each Embedded Service deployment. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

This object works only with the legacy chat products. For Messaging for In-app and Web, use the [BrandingSet](#) object.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### File Suffix and Directory Location

EmbeddedServiceBranding components are stored in the `developer_name.EmbeddedServiceBranding` file in the `EmbeddedServiceBranding` folder.

### Version

EmbeddedServiceBranding is available in API version 39.0 and later.

### Fields

Field Name	Field Type	Description
<code>contrastInvertedColor</code>	string	Accent branding color used in the embedded component, displayed as a hexadecimal value. Changes made to this field in the API aren't reflected in the embedded component.
<code>contrastPrimaryColor</code>	string	Accent branding color used in the embedded component, displayed as a hexadecimal value.
<code>embeddedServiceConfig</code>	string	Required. The Embedded Service configuration that this branding applies to.
<code>font</code>	string	Font used in the text of the embedded component.
<code>height</code>	int	Height of the embedded component. Available in API version 43.0 and later.
<code>masterLabel</code>	string	Required. The name of the Embedded Service configuration node.
<code>navBarColor</code>	string	Color used for the header in the embedded component, displayed as a hexadecimal value.
<code>navBarTextColor</code>	string	Color used for the text and icons in the header in the embedded component, displayed as a hexadecimal value. Available in API version 49.0 and later.
<code>primaryColor</code>	string	Primary branding color used in the embedded component, displayed as a hexadecimal value.
<code>secondaryColor</code>	string	Secondary branding color used in the embedded component, displayed as a hexadecimal value.

Field Name	Field Type	Description
secondaryNavBarColor	string	Secondary branding color used for the header in the embedded component, displayed as a hexadecimal value. It applies to the header in the chat feature when it's trying to reconnect because of lost internet connection. Available in API version 49.0 and later.
width	int	Width of the embedded component. Available in API version 43.0 and later.

## Declarative Metadata Sample Definition

The following is an example of an EmbeddedServiceBranding file.

```
<?xml version="1.0" encoding="UTF-8"?>
<EmbeddedServiceBranding xmlns="http://soap.sforce.com/2006/04/metadata">
  <contrastInvertedColor>#ffffff</contrastInvertedColor>
  <contrastPrimaryColor>#333333</contrastPrimaryColor>
  <embeddedServiceConfig>EswConfig001</embeddedServiceConfig>
  <font>Salesforce Sans</font>
  <height>498</height>
  <masterLabel>EmbeddedServiceBranding_Parent04IRM000000002a_16033cd2c16</masterLabel>
  <navBarColor>#222222</navBarColor>
  <primaryColor>#222222</primaryColor>
  <secondaryColor>#005290</secondaryColor>
  <width>320</width>
</EmbeddedServiceBranding>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EmbeddedServiceConfig

Represents a setup node for creating an Embedded Service for Web deployment. This type extends the Metadata metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

EmbeddedServiceConfig components have the suffix `.EmbeddedServiceConfig` and are stored in the `EmbeddedServiceConfig` folder.

## Version

EmbeddedServiceConfig is available in API version 37.0 and later.

## Fields

Field Name	Field Type	Description
areGuestUsersAllowed	boolean	Specifies whether a user must be logged in to access an embedded component. Available in API version 45.0 and later.
authMethod	<a href="#">EmbeddedServiceAuthMethod</a> (enumeration of type string)	Type of login method selected for this Embedded Service deployment. Valid values are: <ul style="list-style-type: none"> <li>• <code>CommunitiesLogin</code>—Customers log in using Communities.</li> <li>• <code>CustomLogin</code>—Customers log in using your own custom authentication.</li> </ul> Available in API version 43.0 and later.
branding	string	The branding set that has all of the branding configurations for this Embedded Service configuration. Available in API version 52.0 and later.
customMinimizedComponent	string	The custom Lightning component that's used in this Embedded Service deployment in its minimized state. Available in API version 43.0 to 45.0.
deploymentFeature	<a href="#">EmbeddedServiceDeploymentType</a> (enumeration of type string)	The conversation type of this Embedded Service deployment. Valid values are: <ul style="list-style-type: none"> <li>• <code>EmbeddedMessaging</code>—Messaging for In-App and Messaging for Web deployments</li> <li>• <code>Flows</code></li> <li>• <code>FieldService</code></li> <li>• <code>LiveAgent</code></li> <li>• <code>None</code></li> </ul> Available in API version 52.0 and later.
deploymentType	<a href="#">EmbeddedServiceDeploymentType</a> (enumeration of type string)	The platform this Embedded Service is deployed to. Valid values are: <ul style="list-style-type: none"> <li>• <code>Mobile</code>—For future use</li> <li>• <code>Web</code></li> </ul> Available in API version 51.0 and later.
embeddedServiceAppointmentSettings	<a href="#">EmbeddedServiceAppointmentSettings</a>	The settings of the Embedded Service deployment whose <code>deploymentFeature</code> is <code>FieldService</code> . Available in API version 46.0 and later.
embeddedServiceCustomComponents	<a href="#">EmbeddedServiceCustomComponent</a> on page 846[]	The custom components used in this Embedded Service deployment. Available in API version 44.0 and later.
embeddedServiceCustomLabels	<a href="#">EmbeddedServiceCustomLabel</a> on page 847[]	The custom labels used in this Embedded Service deployment. Available in API version 44.0 and later.

Field Name	Field Type	Description
<code>embeddedServiceCustomizations</code>	<a href="#">EmbeddedServiceCustomization</a> on page 847 []	The customizations used in this Embedded Service deployment. Each customization is associated with a static resource. Available in API version 50.0 and later.
<code>embeddedServiceFlowConfig</code>	<a href="#">EmbeddedServiceFlowConfig</a> on page 851 []	Represents a setup node for creating an embedded flow. Available in API version 45.0 and later.
<code>embeddedServiceFlows</code>	<a href="#">EmbeddedServiceFlow</a> on page 851 []	All of the flows used by this Embedded Service deployment. Available in API version 45.0 and later.
<code>embeddedServiceLayouts</code>	<a href="#">EmbeddedServiceLayout</a> []	The layout of an Appointment Management deployment of an Embedded Service. Available in API version 44.0 and later.
<code>isEnabled</code>	boolean	Indicates if this Embedded Service deployment is enabled ( <code>true</code> ).
<code>isTermsAndConditionsEnabled</code>	boolean	Indicates whether Terms and Conditions is displayed. Displaying Terms and Conditions is supported if the <code>deploymentFeature</code> is either <code>EmbeddedMessaging</code> or <code>LiveAgent</code> . The default is <code>false</code> . Available in API version 59.0 and later.
<code>isTermsAndConditionsRequired</code>	boolean	Indicates whether acceptance of the Terms and Conditions is required before starting a chat. Displaying Terms and Conditions is supported if the <code>deploymentFeature</code> is either <code>EmbeddedMessaging</code> or <code>LiveAgent</code> . The default is <code>false</code> . Available in API version 59.0 and later.
<code>masterLabel</code>	string	Required. The name of the Embedded Service configuration node. Available in API version 37.0 and later.
<code>shouldHideAuthDialog</code>	boolean	Specifies whether the prompt that the customer log in again during a flow is hidden ( <code>true</code> ) or not ( <code>false</code> ). When it's hidden, the customer is taken directly to your login page. This field is set to <code>false</code> by default. Available in API version 43.0 and later.
<code>site</code>	string	Required. The name of the Experience site or website connected to this Embedded Service deployment. Available in API version 37.0 and later.

## EmbeddedServiceAppointmentSettings

Returns the settings of an Embedded Service deployment whose `deploymentFeature` is `FieldService`. Available in API version 46.0 and later.

Field Name	Description
<code>appointmentConfirmImg</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The URL of the image to display when an appointment is confirmed.</p>

Field Name	Description
enabled	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Indicates whether this deployment is enabled. The default is <code>false</code>.</p>
homeImg	<p><b>Field Type</b> string</p> <p><b>Description</b> The URL of the image to display on the appointment management widget home screen.</p>
logoImg	<p><b>Field Type</b> string</p> <p><b>Description</b> The URL of the logo to display in the appointment management widget.</p>
shouldShowExistingAppointment	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether existing appointments are displayed in the appointment management widget. The default is <code>false</code>.</p>
shouldShowNewAppointment	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether new appointments are displayed in the appointment management widget. The default is <code>false</code>.</p>

## EmbeddedServiceCustomComponent

Returns a custom component that's associated with an EmbeddedServiceConfig setup.

Field Name	Field Type	Description
customComponent	string	The name of the custom component.
customComponentType	EmbeddedServiceCustomComponent (enumeration of type string)	<p>The type of custom component. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>LA_Prechat</code> (component for pre-chat in Embedded Chat)</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>LA_Minimized</code> (component for the minimized chat window)</li> <li>• <code>LA_PlainTextChatMessage</code> (component for the text area in Embedded Chat)</li> </ul>

## EmbeddedServiceCustomLabel

Returns a custom label that's associated with an EmbeddedServiceConfig setup.

Field Name	Field Type	Description
<code>customLabel</code>	string	The customized label that appears in the embedded component.
<code>feature</code>	EmbeddedServiceFeature (enumeration of type string)	The feature that this embedded component uses. Valid values are: <ul style="list-style-type: none"> <li>• <code>Base</code></li> <li>• <code>ChannelMenu</code></li> <li>• <code>EmbeddedMessaging</code>—Messaging for In-App and Messaging for Web deployments</li> <li>• <code>FieldService</code></li> <li>• <code>Flows</code></li> <li>• <code>LiveAgent</code></li> <li>• <code>NotInUse</code></li> </ul>
<code>labelKey</code>	EmbeddedServiceLabelKey (enumeration of type string)	The type of label for this embedded component. The value corresponds to the label within a label group (substate of chat state or page type).

## EmbeddedServiceCustomization

Returns the customization associated with the Embedded Service feature. Available in API version 50.0 and later.

Field Name	Field Type	Description
<code>customizationName</code>	string	Required. The name of the customization applied to the embedded service. This name can contain only underscores and alphanumeric characters and must be unique in an EmbeddedServiceConfig setup. It must begin with a letter, not include

Field Name	Field Type	Description
		spaces, not end with an underscore, and not contain two consecutive underscores.
description	string	A description of the customization.
embeddedServiceResources	<a href="#">EmbeddedServiceResource</a> on page 850[]	Required. The reference to the static resource that contains the javascript file of the customization.

## EmbeddedServiceForm

Returns the form that's used for pre-chat. Available in API version 62 and later.

Field Name	Field Type	Description
displayContext	EmbeddedServiceFormDisplayContext (enumeration of type string)	Required. Indicates when we display this form. Values are: <ul style="list-style-type: none"> <li>• <code>Session</code>- The pre-chat form is displayed every session.</li> <li>• <code>Conversation</code>- Tthe pre-chat form is displayed every conversation.</li> <li>• <code>None</code>- Don't select this option.</li> </ul>
isActive	Boolean	Indicates whether the form is active. The default value is false.

## EmbeddedServiceFormField

Represents an individual field in a prechat form. Available in API version 62 or higher.

Field Name	Field Type	Description
formField	string or enum	Required. Maps to either a <code>StandardMessingChannelParameter</code> or a <code>CustomMessagingChannelParameter</code>
messagingChannelParameterType	<code>MessagingChannelParameterType</code> (enumeration of type string) OR <code>StandardMessagingChannelParameter</code> (enumeration of type string)	Required. Indicates whether <code>formField</code> points to a <code>StandardMessagingChannelParameter</code> or a <code>CustomMessagingChannelParameter</code> . Please match the Enum value here to the <code>formField</code> passed in. Valid values for <code>MessagingChannelParameterType</code> are: <ul style="list-style-type: none"> <li>• <code>Standard</code> - select this field when you want to reference a <code>StandardMessagingChannelParameter</code></li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>Custom</code> - select this field when you want to reference a <code>CustomMessagingChannelParameter</code></li> </ul> Valid values for <code>StandardMessagingChannelParameter</code> are: <ul style="list-style-type: none"> <li>• <code>FirstName</code></li> <li>• <code>LastName</code></li> <li>• <code>Email</code></li> <li>• <code>Subject</code></li> </ul>
<code>formFieldType</code>	<code>EmbeddedServiceFormFieldType</code> (enumeration of type string)	Required. Indicates the type of data is passed by the End User when filling out the Prechat form. Valid values are: <ul style="list-style-type: none"> <li>• <code>Text</code></li> <li>• <code>Email</code></li> <li>• <code>Phone</code></li> <li>• <code>Number</code></li> <li>• <code>Checkbox</code></li> <li>• <code>ChoiceList</code></li> </ul>
<code>displayOrder</code>	Integer	Indicates the relative order of the form field in the prechat form. For Prechat fields where <code>isHidden</code> is set to <code>true</code> <code>displayOrder</code> must be set to <code>-1</code> . For Prechat fields where <code>isHidden</code> is set to <code>false</code> , this value must be greater than or equal to <code>0</code> .
<code>isRequired</code>	Boolean	Indicates whether a Prechat form field is required. If <code>isHidden</code> is set to <code>true</code> , <code>isRequired</code> must be set to <code>false</code> .
<code>isHidden</code>	Boolean	Indicates whether a Prechat form field is displayed in the UI. <code>isHidden</code> can only be set to <code>true</code> if the <code>formField</code> field is set to <code>CustomMessagingChannelParameter</code> and <code>messagingChannelParameterType</code> is set to <code>Custom</code> .
<code>choiceList</code>	ChoiceList	The choice list that's associated with <code>EmbeddedServiceFormField</code> . <code>ChoiceList</code> can only be associated if the <code>formField</code> is set to <code>CustomMessagingChannelParameter</code> and

Field Name	Field Type	Description
		messagingChannelParameterType is set to Custom.
embeddedServiceCustomLabels	EmbeddedServiceCustomLabel[]	The custom label for this field.

## embeddedServiceMessagingChannel

Returns the settings of an Embedded Service deployment whose

```
deploymentFeature
```

is EmbeddedMessaging. Available in API version 62 or higher.

Field Name	Field Type	Description
businessHours	String	The Business Hours record that's associated with this specific embedded service deployment.
isEnabled	Boolean	Required. Indicates whether this embedded service deployment is enabled.
messagingChannel	String	Required. The MessagingChannel record that's associated with this specific embedded service deployment.
shouldShowDeliveryReceipts	Boolean	Required. Indicates whether delivery receipts are shown in the UI.
shouldShowEmojiSelection	Boolean	Required. Indicates whether emoji selection is shown in the UI.
shouldShowReadReceipts	Boolean	Required. Indicates whether read receipts are shown in the UI.
shouldShowTypingIndicators	Boolean	Required. Indicates whether typing indicators are shown in the UI.
shouldStartNewLineOnEnter	Boolean	Required. Indicates whether pressing Enter starts a new line of text in the UI.

## EmbeddedServiceResource

Returns the static resource associated with the Embedded Service Chat feature customization. Available in API version 50.0 and later.

Field Name	Field Type	Description
resource	string	Required. The ID of the static resource that contains the javascript file of the customization.

Field Name	Field Type	Description
resourceType	EmbeddedServiceResourceType (enumeration of type string)	Required. The embedded service feature to customize. Valid values are: <ul style="list-style-type: none"> <li>• <code>ChatInvitation</code>—Use for Chat deployments.</li> <li>• <code>SettingsFile</code>—Use if you're configuring a settings file for a Channel Menu deployment.</li> </ul>

## EmbeddedServiceFlow

Returns an embedded flow that's associated with an EmbeddedServiceConfig setup.

Field Name	Field Type	Description
flow	string	The developer name of the flow.
flowType	EmbeddedServiceFlowType(enumeration of type string)	The type of flow. Valid values are: <ul style="list-style-type: none"> <li>• <code>FS_CancelAppointment</code></li> <li>• <code>FS_Flow</code></li> <li>• <code>FS_ModifyAppointment</code></li> <li>• <code>FS_NewAppointment</code></li> <li>• <code>LA_Survey</code></li> </ul>
isAuthenticationRequired	boolean	Indicates whether users are required to log in to access the Embedded Service component. The value can't be <code>true</code> for the <code>FS_Flow</code> value and must be <code>true</code> for all other values.

## EmbeddedServiceFlowConfig

Returns the EmbeddedServiceFlowConfig type.

Field Name	Field Type	Description
enabled	boolean	Indicates whether the embedded flow is enabled.

## EmbeddedServiceLayout

Returns the layout of an Embedded Service deployment whose `deploymentFeature` is `FieldService`. Available in API version 44.0 and later.

Field Name	Description
embeddedServiceLayoutRules	The appointment statuses that the layout of the Embedded Service deployment is valid for.
layout	The FlexiPage that represents the layout of this Embedded Service deployment.
layoutType	The type of layout applied to the Embedded Service deployment. Values are: <ul style="list-style-type: none"> <li>FS_AppointmentHome</li> </ul>

## EmbeddedServiceLayoutRule

Returns an appointment status for which the Embedded Service layout is valid for. This subtype is for Embedded Service deployments whose deploymentFeature is FieldService. Available in API version 44.0 and later.

Field Name	Field Type	Description
appointmentStatus	string	The service appointment status that the EmbeddedServiceLayout subtype is valid for.

## Declarative Metadata Sample Definition

The following is an example of an EmbeddedServiceConfig file.

```
<?xml version="1.0" encoding="UTF-8"?>
<EmbeddedServiceConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <areGuestUsersAllowed>false</areGuestUsersAllowed>
  <deploymentType>Mobile</deploymentType>
  <deploymentFeature>EmbeddedMessaging</deploymentFeature>
  <masterLabel>ESWOne</masterLabel>
  <shouldHideAuthDialog>false</shouldHideAuthDialog>

  <embeddedServiceMessagingChannel>
    <isEnabled>true</isEnabled>
    <shouldShowTypingIndicators>false</shouldShowTypingIndicators>
    <shouldShowReadReceipts>false</shouldShowReadReceipts>
    <shouldShowDeliveryReceipts>false</shouldShowDeliveryReceipts>
    <shouldShowEmojiSelection>false</shouldShowEmojiSelection>
    <shouldStartNewLineOnEnter>false</shouldStartNewLineOnEnter>
    <messagingChannel>EM1</messagingChannel>
  </embeddedServiceMessagingChannel>

  <embeddedServiceForms>
    <isActive>true</isActive>
    <displayContext>Session</displayContext>

    <embeddedServiceFormFields>
```

```

    <displayOrder>0</displayOrder>
    <formField>_FirstName</formField>
    <messagingChannelParameterType>Standard</messagingChannelParameterType>
    <formFieldType>Text</formFieldType>
    <isHidden>>false</isHidden>
    <isRequired>>true</isRequired>
    <embeddedServiceCustomLabels>

<customLabel>EM_PreChat_Base_PrechatCustomFieldLabel_133xx0000004GG2_5523048</customLabel>

    <labelKey>EM_PreChat_Base_PrechatCustomFieldLabel</labelKey>
    <feature>EmbeddedMessaging</feature>
  </embeddedServiceCustomLabels>
</embeddedServiceFormFields>
<embeddedServiceFormFields>
  <displayOrder>1</displayOrder>
  <formField>_LastName</formField>
  <messagingChannelParameterType>Standard</messagingChannelParameterType>
  <formFieldType>Text</formFieldType>
  <isHidden>>false</isHidden>
  <isRequired>>true</isRequired>
  <embeddedServiceCustomLabels>

<customLabel>EM_PreChat_Base_PrechatCustomFieldLabel_133xx0000004GG2_5523058</customLabel>

    <labelKey>EM_PreChat_Base_PrechatCustomFieldLabel</labelKey>
    <feature>EmbeddedMessaging</feature>
  </embeddedServiceCustomLabels>
</embeddedServiceFormFields>
<embeddedServiceFormFields>
  <displayOrder>2</displayOrder>
  <formField>FavoriteFood_name</formField>
  <messagingChannelParameterType>Custom</messagingChannelParameterType>
  <formFieldType>ChoiceList</formFieldType>
  <isHidden>>false</isHidden>
  <isRequired>>true</isRequired>
  <choiceList>Food</choiceList>
</embeddedServiceFormFields>
</embeddedServiceForms>
</EmbeddedServiceConfig>

```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EmbeddedServiceFieldService

Represents a setup node for creating an embedded Appointment Management deployment. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

**!** **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

EmbeddedServiceFieldService components are stored in a `developer_name.EmbeddedServiceFieldService` file in the `EmbeddedServiceFieldService` folder.

## Version

EmbeddedServiceFieldService is available in API version 43.0 and later.

## Fields

Field Name	Field Type	Description
<code>appointmentBookingFlowName</code>	string	Name of the appointment booking flow for this embedded Appointment Management (beta) deployment.
<code>cancelApptBookingFlowName</code>	string	Name of the appointment cancellation flow for this embedded Appointment Management (beta) deployment.
<code>embeddedServiceConfig</code>	string	Required. The name of the Embedded Service configuration node.
<code>enabled</code>	boolean	Required. Indicates whether this embedded Appointment Management deployment is enabled ( <code>true</code> ).
<code>fieldServiceConfirmCardImg</code>	string	URL of the image used for the confirmation card in embedded Appointment Management (beta).
<code>fieldServiceHomeImg</code>	string	URL of the image used for the home screen in embedded Appointment Management (beta).
<code>fieldServiceLogoImg</code>	string	URL of the logo used for the home screen in embedded Appointment Management (beta).
<code>masterLabel</code>	string	Required. Name of the embedded Appointment Management (beta) deployment.
<code>modifyApptBookingFlowName</code>	string	Name of the appointment modification flow for this embedded Appointment Management (beta) deployment.
<code>shouldShowExistingAppointment</code>	boolean	Specifies whether to display a button on the home screen for customers to access their existing appointments ( <code>true</code> ) or not ( <code>false</code> ). This field is <code>false</code> by default.
<code>shouldShowNewAppointment</code>	boolean	Specifies whether to display a button on the home screen for customers to create a new appointment ( <code>true</code> ) or not ( <code>false</code> ). This field is <code>false</code> by default.

## Declarative Metadata Sample Definition

The following is an example of an EmbeddedServiceFieldService file.

```
<?xml version="1.0" encoding="UTF-8"?>
<EmbeddedServiceFieldService xmlns="http://soap.sforce.com/2006/04/metadata">
  <appointmentBookingFlowName>ESW_FS_BookAppt_Main_Flow</appointmentBookingFlowName>
  <cancelApptBookingFlowName>ESW_FS_CancelAppt_Flow</cancelApptBookingFlowName>
  <embeddedServiceConfig>EswFS</embeddedServiceConfig>
  <enabled>true</enabled>

  <fieldServiceConfirmCardImg>https://google.com/AppointmentConfirmationImg.png</fieldServiceConfirmCardImg>

  <fieldServiceHomeImg>https://google.com/HeroImg.png</fieldServiceHomeImg>
  <fieldServiceLogoImg>https://google.com/logo.png</fieldServiceLogoImg>

  <masterLabel>EmbeddedServiceFieldService_Parent04IRM00000007p2AA_162d4270834</masterLabel>

  <modifyApptBookingFlowName>ESW_FS_ModifyAppt_Main_Flow</modifyApptBookingFlowName>
  <shouldShowExistingAppointment>true</shouldShowExistingAppointment>
  <shouldShowNewAppointment>true</shouldShowNewAppointment>
</EmbeddedServiceFieldService>
```

## Usage

**Note:** Any changes you make to the image fields override what you've entered in Setup. We recommend setting your image URLs in Setup.

## EmbeddedServiceFlowConfig

Represents a setup node for creating an embedded flow. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

EmbeddedServiceFlowConfig components are stored in the `developer_name.EmbeddedServiceFlowConfig` file in the `EmbeddedServiceFlowConfig` folder.

## Version

EmbeddedServiceFlowConfig is available in API version 45.0 and later.

## Fields

Field Name	Field Type	Description
enabled	boolean	Indicates whether the embedded flow is enabled ( <code>true</code> ) or not ( <code>false</code> ). Defaults to <code>false</code> .

## Declarative Metadata Sample Definition

The following is an example of an EmbeddedServiceFlowConfig file.

```
<?xml version="1.0" encoding="UTF-8"?>
<EmbeddedServiceFlowConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <enabled>true</enabled>
</EmbeddedServiceFlowConfig>
```

## EmbeddedServiceLiveAgent

Represents a setup node for creating an embedded chat deployment. This type extends the Metadata metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

EmbeddedServiceLiveAgent components are stored in the `developer_name.EmbeddedServiceLiveAgent` file in the EmbeddedServiceLiveAgent folder.

## Version

EmbeddedServiceLiveAgent is available in API version 38.0 and later.

## Fields

Field Name	Field Type	Description
<code>avatarImg</code>	string	Avatar image for this embedded chat deployment.
<code>customPrechatComponent</code>	string	The custom Lightning Component that's used for the pre-chat page in this embedded chat deployment.
<code>embeddedServiceConfig</code>	string	Required. The name of the embedded service configuration node.
<code>embeddedServiceQuickActions</code>	<a href="#">EmbeddedServiceQuickAction</a>	The quick action used by the pre-chat form.
<code>enabled</code>	boolean	Required. Indicates whether this embedded chat deployment is enabled ( <code>true</code> ).
<code>fontSize</code>	<a href="#">EmbeddedServiceFontSize</a> (enumeration of type string)	Required. The font size for the text in the embedded chat window. One of the following values: <ul style="list-style-type: none"> <li>• Small</li> <li>• Medium</li> <li>• Large</li> </ul>

Field Name	Field Type	Description
headerBackgroundImg	string	Header background image for this embedded chat window. Removed in API version 49.0.
isOfflineCaseEnabled	boolean	Indicates whether offline support is enabled for this embedded chat deployment. Available in API version 43.0 and later.
isQueuePositionEnabled	boolean	Indicates whether queue position (displaying the chat visitor's place in line while they wait for an agent) is enabled for this embedded chat deployment. Available in API version 43.0 and later.
liveAgentChatUrl	string	The rest endpoint for chats.
liveAgentContentUrl	string	The rest endpoint for cChat content.
liveChatButton	string	Required. Reference to a chat button created in Chat setup.
liveChatDeployment	string	Required. Reference to a deployment created in Chat setup.
masterLabel	string	Required. Name of the embedded chat deployment.
offlineCaseBackgroundImg	string	Offline support case form background image for this embedded chat window. Available in API version 43.0 and later.
prechatBackgroundImg	string	Pre-chat background image for this embedded chat window.
prechatEnabled	string	Required. Indicates whether the embedded chat pre-chat form is enabled for this deployment.
prechatJson	string	JSON object of all the fields of the selected pre-chat form in Chat setup.
scenario	EmbeddedServiceScenario (enumeration of type string)	Required. The scenario for the embedded chat window that determines which objects to relate to the chat. One of the following values: <ul style="list-style-type: none"> <li>• Sales</li> <li>• Service</li> <li>• Basic</li> </ul>
smallCompanyLogoImg	string	Company logo image for this embedded chat window.
waitingStateBackgroundImg	string	Chat waiting image for this embedded chat window.

## EmbeddedServiceQuickAction

Returns a quick action that's associated with an EmbeddedServiceLiveAgent setup. The quick action includes the pre-chat form fields that the embedded chat window displays and shows the order in which the fields are displayed.

Field Name	Field Type	Description
embeddedServiceLiveAgent	string	Reference to the embedded chat deployment.
order	int	Order in which this quick action appears in the embedded chat pre-chat form.
quickActionDefinition	string	Reference to a quick action.

Field Name	Field Type	Description
quickActionType	EmbeddedServiceQuickActionType (enumeration of type string)	Quick action type. One of the following values: <ul style="list-style-type: none"> <li>Prechat–Pre-chat</li> <li>OfflineCase–Offline support (Cases)</li> </ul> Available in API version 43.0 and later.

## Declarative Metadata Sample Definition

The following is an example of an EmbeddedServiceLiveAgent file.

```
<?xml version="1.0" encoding="UTF-8"?>
<EmbeddedServiceLiveAgent xmlns="http://soap.sforce.com/2006/04/metadata">
  <avatarImg>https://google.com/avatar.png</avatarImg>
  <customPrechatComponent>auraCustomPrechat</customPrechatComponent>
  <embeddedServiceConfig>EswConfig001</embeddedServiceConfig>
  <embeddedServiceQuickActions>

</EmbeddedServiceLiveAgent>

```

## Usage

EmbeddedServiceLiveAgent represents a Chat configuration that is added to your web page. The EmbeddedServiceLiveAgent record contains a unique combination of a chat button and the Chat deployment that the administrator selects during setup.

To create an EmbeddedServiceLiveAgent record:

1. Create a Chat Deployment record.
2. Create a Chat Button record.
3. Create an EmbeddedServiceConfig record.
4. Set the fields for the Chat Deployment record, Chat Button record, and EmbeddedServiceConfig record as references on the EmbeddedServiceLiveAgent record.

Any changes you make to the image fields override what you've entered in Setup. We recommend setting your image URLs in Setup.

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EmbeddedServiceMenuSettings

---

Represents a setup node for creating a channel menu deployment. Channel menus list the ways in which customers can contact your business. This type extends the Metadata metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

EmbeddedServiceMenuSettings components are stored in the `developer_name.EmbeddedServiceMenuSettings` folder.

## Version

EmbeddedServiceMenuSettings components are available in API version 47.0 and later.

## Fields

Field Name	Field Type	Description
<code>branding</code>	string	The developer name of the associated BrandingSet.
<code>embeddedServiceCustomLabels</code>	<a href="#">EmbeddedServiceCustomLabel</a> []	Represents a customized label that appears in the embedded component for a particular channel menu deployment.
<code>embeddedServiceCustomizations</code>	<a href="#">EmbeddedServiceCustomization</a> on page 860[]	The customizations used in this Embedded Service deployment. Each customization is associated with a static resource. Available in API version 50.0 and later.
<code>embeddedServiceMenuItems</code>	<a href="#">EmbeddedServiceMenuItem</a> []	Represents a channel menu item that lists a way in which customers can contact your business.
<code>isEnabled</code>	boolean	If <code>true</code> (default), the deployment is enabled. If <code>false</code> , the deployment is disabled.
<code>masterLabel</code>	string	Required. The name of the channel menu deployment.
<code>site</code>	string	Required. The name of the Experience site or website connected to this channel menu deployment.

## EmbeddedServiceCustomLabel

Represents the custom labels used in your channel menu deployment.

Field Name	Field Type	Description
<code>customLabel</code>	string	The customized label that appears in the channel menu.
<code>feature</code>	<a href="#">EmbeddedServiceFeature</a> ( <a href="#">enumeration</a> of type string)	The feature using the custom label. For channel menu deployments, the value is <code>ChannelMenu</code> .
<code>labelKey</code>	<a href="#">EmbeddedServiceLabelKey</a> ( <a href="#">enumeration</a> of type string)	The type of label for this embedded component. The value corresponds to the label within a label group (substate of chat state or page type).

## EmbeddedServiceCustomization

Returns the customization associated with the Embedded Service feature. Available in API version 50.0 and later.

Field Name	Field Type	Description
<code>customizationName</code>	string	Required. The name of the customization applied to the embedded service. This name can contain only underscores and

Field Name	Field Type	Description
		alphanumeric characters and must be unique in an EmbeddedServiceConfig setup. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
description	string	A description of the customization.
embeddedServiceResources	<a href="#">EmbeddedServiceResource</a> on page 861[]	Required. The reference to the static resource that contains the javascript file of the customization.

## EmbeddedServiceResource

Returns the static resource associated with the Embedded Service Chat feature customization. Available in API version 50.0 and later.

Field Name	Field Type	Description
resource	string	Required. The ID of the static resource that contains the javascript file of the customization.
resourceType	EmbeddedServiceResourceType ( <a href="#">enumeration</a> of type string)	Required. The embedded service feature to customize. Only the Chat feature is supported. Valid values are: <ul style="list-style-type: none"> <li>• ChatInvitation</li> </ul>

## EmbeddedServiceMenuItem

Represents an item in a channel menu.

Field Name	Field Type	Description
channel	string	The ID of the channel type. If <code>channelType</code> is <code>Phone</code> or <code>CustomURL</code> , this field is <code>null</code> .
channelType	EmbeddedServiceChannelType ( <a href="#">enumeration</a> of type string)	The type of communication channel. Values are: <ul style="list-style-type: none"> <li>• EmbeddedMessaging</li> <li>• EmbeddedServiceConfig</li> <li>• MessagingChannel</li> <li>• Phone</li> <li>• CustomURL</li> </ul>
customUrl	string	A custom URL that appears in the menu. The <code>shouldOpenUrlInSameTab</code> field determines where the URL opens.

Field Name	Field Type	Description
displayOrder	int	The item's order in the menu, such as 1 or 2.
embeddedServiceCustomLabels	<a href="#">EmbeddedServiceCustomLabel[]</a>	Represents the custom labels used in your channel menu item.
iconUrl	string	The icon URL for the menu item. Icons can be used only for phone, SMS, custom URL, and chat menu items.
isDisplayedOnPageLoad	boolean	If <code>true</code> , the menu item is displayed on page load. Available in API version 49.0 and later.
itemName	string	A unique custom name for the menu item, which is visible in the user interface.
osOptionsHideInIOS	boolean	If <code>true</code> , the menu item is hidden in iOS.
osOptionsHideInLinuxOS	boolean	If <code>true</code> , the menu item is hidden in Linux operating system.
osOptionsHideInMacOS	boolean	If <code>true</code> , the menu item is hidden in Mac operating system.
osOptionsHideInOtherOS	boolean	If <code>true</code> , the menu item is hidden in any operating system other than iOS, Linux, Mac, and Windows.
osOptionsHideInWindowsOS	boolean	If <code>true</code> , the menu item is hidden in Windows operating system.
phoneNumber	string	The phone number for menu items whose <code>channelType</code> is <code>Phone</code> .
shouldOpenUrlInSameTab	boolean	If the menu item's <code>channelType</code> is <code>CustomURL</code> , this field indicates whether the link opens in the same tab ( <code>true</code> ) or a new tab ( <code>false</code> ).

## Declarative Metadata Sample Definition

The following is an example of an `EmbeddedServiceMenuSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<EmbeddedServiceMenuSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <embeddedServiceCustomLabels>

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EnablementMeasureDefinition

---

Represents an Enablement measure, which specifies the job-related activity that a user performs to complete a milestone or outcome in an Enablement program. A measure identifies a source object and optional related objects, with optional field filters and filter logic, for tracking the activity. To avoid deployment errors, deploy measures before you deploy programs.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

EnablementMeasureDefinition components have the suffix `.enablementMeasureDefinition` and are stored in the `enablementMeasureDefinitions` folder.

### Version

EnablementMeasureDefinition components are available in API version 61.0 and later.

### Special Access Rules

To access Enablement measures, the Design and Deliver Enablement Programs permission is required. This permission is available with the Enablement add-on license.

### Fields

Field Name	Description
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> An internal description for the measure to help Enablement admins understand the activity that's tracked.</p>
<code>developerName</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. The unique programmatic name for the measure record.</p>
masterLabel	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. A user-friendly name for the measure, which is defined when the measure is created.</p>
sourceMeasureObject	<p><b>Field Type</b></p> <p><a href="#">EnablementMeasureSourceObjectDefinition</a></p> <p><b>Description</b></p> <p>Required. The source object that tracks the activity you're measuring.</p>
status	<p><b>Field Type</b></p> <p>EnblProgramMeasureStatus (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. Indicates whether the measure is published for use in Enablement programs.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• <b>Draft</b>—The measure is saved, but not activated for use in programs.</li> <li>• <b>Published</b>—The measure is activated for use in programs. In Lightning Experience, this value is Active.</li> </ul>

## EnablementMeasureSourceObjectDefinition

Defines the source object, fields, field values, and calculation method for the job-related activity you're measuring.

Field Name	Description
aggregateFieldApiName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The unique programmatic name for the field that the <code>aggregateFunction</code> uses for calculating.</p> <p>For example, if you're measuring how much revenue a sales rep has won, the value of <code>aggregateFunction</code> is <code>Sum</code> and the value of <code>aggregateFieldApiName</code> is <code>Amount</code>, which is the programmatic name of the <code>Amount</code> field on the <code>Opportunity</code> object.</p>
aggregateFunction	<p><b>Field Type</b></p> <p>EnablementAggregationType (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. The method for calculating progress towards the milestone or outcome from records that qualify for the measure's criteria.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• Average</li> <li>• Count</li> <li>• Sum</li> </ul> <p>For example, if you're measuring the number of deals won, the function is <code>Count</code>. If the function is <code>Average</code> or <code>Sum</code>, <code>aggregateFieldApiName</code> is required.</p>
<code>dateFieldApiName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b></p> <p>Required. The unique programmatic name for the field that defines when users get credit for the activity you're measuring. For example, if you're measuring the number of deals won, this value can be <code>CloseDate</code>, the programmatic name of the Close Date field on the Opportunity object.</p>
<code>displayFieldApiName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b></p> <p>Required. The unique programmatic name for the field that primarily identifies records that qualify for the activity you're measuring. For example, if you're measuring the number of deals won, you're tracking the Opportunity object, and maybe you want to identify opportunities by their name. In this case, this field can be <code>Name</code>, the programmatic name of the Opportunity Name field on the Opportunity object.</p>
<code>filterLogic</code>	<p><b>Field Type</b> string</p> <p><b>Description</b></p> <p>An expression that determines how to evaluate the optional field filters for the object.</p>
<code>filters</code>	<p><b>Field Type</b> <a href="#">EnablementMeasureFilterDefinition[]</a></p> <p><b>Description</b></p> <p>The fields on the object and corresponding field values that further specify criteria for the activity you're measuring.</p>
<code>objectApiName</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. The unique programmatic name for the source object that tracks the activity you're measuring. For example, if you're measuring the number of deals won, this value is <code>Opportunity</code>, the programmatic name of the Opportunity object.</p>
<code>relatedMeasureObjects</code>	<p><b>Field Type</b></p> <p><a href="#">EnablementMeasureRelatedObjectDefinition[]</a></p> <p><b>Description</b></p> <p>The optional related objects that further specify criteria for the activity you're measuring. Related objects can also specify additional filters.</p>
<code>userFieldApiName</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The unique programmatic name for the field that defines who gets credit for the activity you're measuring. For example, if you're measuring the number of deals won by a sales rep, this value can be <code>OwnerId</code>, the developer name of the Opportunity Owner field on the Opportunity object.</p>

## EnablementMeasureFilterDefinition

Represents the fields on the source object or related objects and the corresponding field values that further specify criteria for the activity you're measuring.

Field Name	Description
<code>fieldApiName</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The unique programmatic name for the field that you're filtering by. For example, if you're tracking activity on the Opportunity object and want to filter by the Stage field, this value can be <code>StageName</code>.</p>
<code>fieldValue</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The field value to filter by. For example, if you're tracking activity on the Opportunity object and want to filter by the Stage field, this value can be <code>Closed Won</code>.</p>
<code>operator</code>	<p><b>Field Type</b></p> <p>EnablementFilterOperator (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required. The logic for evaluating the specified field and field value.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• Contains</li> <li>• DoesNotContain</li> <li>• DoesNotEqual</li> <li>• EndsWith</li> <li>• Equals</li> <li>• GreaterThan</li> <li>• GreaterThanOrEqual</li> <li>• In</li> <li>• IsNull</li> <li>• LessThan</li> <li>• LessThanOrEqual</li> <li>• NotIn</li> <li>• StartsWith</li> </ul>
sequenceNumber	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Required. A number that specifies the order of the filter, relative to other filters, starting at 1.</p>

## EnablementMeasureRelatedObjectDefinition

Represents objects related to the source object. Related objects can further specify criteria for the activity you're measuring. Related objects can also have additional filters. For example, maybe you're measuring deals won for a specific product line. In this case, the source object is Opportunity, the related object is Opportunity Product, and the related object can have a filter for the specific product name.

Field Name	Description
filterLogic	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>An expression that determines how to evaluate the optional field filters for the object.</p>
filters	<p><b>Field Type</b></p> <p><a href="#">EnablementMeasureFilterDefinition[]</a></p>

Field Name	Description
	<p><b>Description</b></p> <p>The fields on the related object and the corresponding field values that further specify criteria for the activity you're measuring.</p>
idFieldApiName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The programmatic name of the field that links the related object to the primary object. For example, if the primary object is Opportunity and the related object is Opportunity Product, this value is <code>OpportunityId</code>, the developer name of the Opportunity field on the Opportunity Product object.</p>
objectApiName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The unique programmatic name for the related object. For example, if the related object is Opportunity Product, this value is <code>OpportunityLineItem</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of an EnablementMeasureDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<EnablementMeasureDefinition xmlns="http://soap.sforce.com/2006/04/metadata">
  <description>Total amount in pipeline measure</description>
  <developerName>TotalAmountInPipeline</developerName>
  <masterLabel>Total Amount in Pipeline</masterLabel>
  <status>Draft</status>
  <sourceMeasureObject>
    <aggregateFieldApiName>Amount</aggregateFieldApiName>
    <aggregateFunction>Sum</aggregateFunction>
    <dateFieldApiName>CreatedDate</dateFieldApiName>
    <displayFieldApiName>Name</displayFieldApiName>
    <objectApiName>Opportunity</objectApiName>
    <userFieldApiName>OwnerId</userFieldApiName>
    <filters>
      <fieldApiName>StageName</fieldApiName>
      <fieldValue>Closed Won</fieldValue>
      <operator>Equals</operator>
      <sequenceNumber>1</sequenceNumber>
    </filters>
  </sourceMeasureObject>
  <relatedMeasureObjects>
    <objectApiName>OpportunityLineItem</objectApiName>
    <idFieldApiName>OpportunityId</idFieldApiName>
    <filterLogic>1 OR 2</filterLogic>
    <filters>
      <fieldApiName>UnitPrice</fieldApiName>
    </filters>
  </relatedMeasureObjects>
</EnablementMeasureDefinition>
```

```

        <fieldValue>10000</fieldValue>
        <operator>GreaterThan</operator>
        <sequenceNumber>1</sequenceNumber>
    </filters>
    <filters>
        <fieldApiName>TotalPrice</fieldApiName>
        <fieldValue>10000</fieldValue>
        <operator>GreaterThan</operator>
        <sequenceNumber>2</sequenceNumber>
    </filters>
</relatedMeasureObjects>
</sourceMeasureObject>
</EnablementMeasureDefinition>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>TotalAmountInPipeline</members>
        <name>EnablementMeasureDefinition</name>
    </types>
    <version>61.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EnablementProgramDefinition

Represents an Enablement program, which includes exercises and measurable milestones to help users such as sales reps achieve specific outcomes related to your company's revenue goals.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`EnablementProgramDefinition` components have the suffix `.enablementProgramDefinition` and are stored in the `enablementProgramDefinitions` folder.

### Version

`EnablementProgramDefinition` components are available in API version 61.0 and later.

## Special Access Rules

To access Enablement programs, the Design and Deliver Enablement Programs permission is required. This permission is available with the Enablement add-on license.

For partner programs in supported Experience Cloud sites, a [supported Partner Relationship Management \(PRM\) add-on license](#) is also required.

## Fields

Field Name	Description
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A summary of the program's goals and content that's visible to users.</p>
<code>developerName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The unique programmatic name for the program record.</p>
<code>doesAllowSelfEnrollment</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether users can self-enroll in programs that are shared with them (<code>true</code>) or take only assigned programs (<code>false</code>). The default value is <code>false</code>.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for the program, which is defined when the program is created.</p>
<code>name</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the program that's visible to users.</p>
<code>network</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The Experience Cloud site where a program is published for partner users.</p>

Field Name	Description
sections	<p><b>Field Type</b> EnablementProgramSection[]</p> <p><b>Description</b> Groups of milestones and exercises within a program.</p>
tasks	<p><b>Field Type</b> EnablementProgramTask[]</p> <p><b>Description</b> The outcome, milestones, and exercises in the program.</p>
type	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Indicates whether the program is for sales users in Lightning Experience (Enablement) or partner users in supported Experience Cloud sites (PtnrEnablement).</p>

## EnablementProgramSection

Represents a logical, trackable group of milestones and exercises within an Enablement program. When users take programs, they can expand or collapse sections.

Field Name	Description
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The unique programmatic name for the section.</p>
name	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The title of the section that's visible to users when they take the program.</p>
sequenceNumber	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. A number that specifies the order of the section, relative to other sections, starting at 0.</p>

Field Name	Description
tasks	<p><b>Field Type</b> <a href="#">EnablementProgramTask[]</a></p> <p><b>Description</b> The milestones and exercises in the section.</p>

## EnablementProgramTask

Represents an outcome, milestone, or exercise in an Enablement program. A program task is also known as a program item.

Field Name	Description
day	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. The day of the program when the item is due, relative to the program's start date. For example, if a user is expected to complete an exercise where they watch a product demo by day 2, this field's value is 2. For an outcome, this field specifies the number of days the full program takes. For example, if your program lasts 60 days, the value of this field is 60 for the outcome. This field's value contributes to the program's due date that users see when they take the program.</p>
description	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A summary of the outcome, milestone, or exercise that's visible to users when they take the program.</p>
developerName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The unique programmatic name for the outcome, milestone, or exercise.</p>
exercise	<p><b>Field Type</b> <a href="#">EnablementProgramTaskExercise</a></p> <p><b>Description</b> The content used with an exercise.  If <code>taskSubCategory</code> is <code>ActionItem</code>, this field isn't included when retrieving metadata.</p>
milestone	<p><b>Field Type</b> <a href="#">EnablementProgramTaskMilestone</a></p>

Field Name	Description
	<p><b>Description</b></p> <p>The definition of an outcome or milestone, including the Enablement measures used and the criteria for completing the goal.</p>
name	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The title of the outcome, milestone, or exercise that's visible to users when they take the program.</p>
sequenceNumber	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Required. A number that specifies the order of the milestone or exercise, relative to other milestones or exercises that have the same due date in the program or in the same section, starting at 0. This number determines the order of items that users see for that day in the program.</p>
taskCategory	<p><b>Field Type</b></p> <p>ProgramTaskDefCategory (enumeration of type string)</p> <p><b>Description</b></p> <p>Required. The type of the program item.</p> <p>Values are:</p> <ul style="list-style-type: none"> <li>• Exercise</li> <li>• Milestone</li> </ul> <p>Milestone is used for both the program's outcome and incremental milestones.</p>
taskSubCategory	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The type of exercise. This value determines the content associated with the exercise. For example, if the field value is <code>video</code>, the exercise must reference video content from the Enablement workspace in the Digital Experiences app. Possible values are:</p> <ul style="list-style-type: none"> <li>• ActionItem</li> <li>• AudioRecording</li> <li>• CustomExercise—Available in API version 62.0 and later.</li> <li>• Document</li> <li>• FeedbackRequest</li> <li>• Other</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• OtherExercise</li> <li>• ScheduledEvent</li> <li>• TextLesson</li> <li>• Trailhead</li> <li>• Video</li> </ul> <p>When <code>taskCategory</code> is Milestone, the value of <code>taskSubCategory</code> must be Other.</p>

## EnablementProgramTaskExercise

Represents the content used with an exercise in an Enablement program.

Field Name	Description
<code>cmsContent</code>	<p><b>Field Type</b>  <a href="#">EnablementProgramTaskCmsContent</a></p> <p><b>Description</b>            The definition of content managed in the Enablement workspace in the Digital Experiences app when <code>taskSubCategory</code> on <code>EnablementProgramTask</code> is <code>AudioRecording</code>, <code>Document</code>, <code>OtherExercise</code>, <code>ScheduledEvent</code>, <code>TextLesson</code>, or <code>Video</code>.</p>
<code>customContent</code>	<p><b>Field Type</b>  <a href="#">EnablementProgramTaskCustomContent</a></p> <p><b>Description</b>            The definition of content used with a custom exercise type when <code>taskSubCategory</code> on <code>EnablementProgramTask</code> is <code>CustomExercise</code>.</p>
<code>externalContent</code>	<p><b>Field Type</b>  <a href="#">EnablementProgramTaskExternalContent</a></p> <p><b>Description</b>            The definition of Trailhead content when <code>taskSubCategory</code> on <code>EnablementProgramTask</code> is <code>Trailhead</code>.</p>
<code>feedbackContent</code>	<p><b>Field Type</b>  <a href="#">EnablementProgramTaskFeedbackContent</a></p> <p><b>Description</b>            The definition of an assessment survey or Einstein prompt template when <code>taskSubCategory</code> on <code>EnablementProgramTask</code> is <code>FeedbackRequest</code>.</p>

## EnablementProgramTaskCmsContent

Defines content managed in the Enablement workspace in the Digital Experiences app for the Audio Recording, Document, Other, Scheduled Event, Text Lesson, or Video exercise types.

Field Name	Description
apiName	<p><b>Field Type</b> string</p> <p><b>Description</b></p> <p>Required in API version 62.0. The unique programmatic ID of the Digital Experiences content for the exercise. This string's format is <b><i>workspaceType/workspaceApiName.contentFQN/contentApiName</i></b>, which matches the <code>fullName</code> field value on the corresponding DigitalExperience metadata type.</p> <p>For example, a Link content record from the Enablement workspace has this API name: <code>enablement/sfdcEnablement_EnablementWorkspace.sfdc_enablement__link/link_API_name</code></p>
contentKey	<p><b>Field Type</b> string</p> <p><b>Description</b></p> <p>Not used in API version 62.0.</p>

## EnablementProgramTaskCustomContent

Defines content used with a custom exercise type.

Field Name	Description
content	<p><b>Field Type</b> string</p> <p><b>Description</b></p> <p>A serialized string returned by the Apex class that's specified in the corresponding <a href="#">LearningItemType</a> metadata type's <code>apexSerializerDeserializer</code> field. This string identifies the content used with the custom exercise type so the custom exercise can be recreated in the destination org. This string:</p> <ul style="list-style-type: none"> <li>• Can't exceed 250 characters</li> <li>• Must contain only alphanumeric characters</li> </ul> <p>For details, see <a href="#">Implement Custom Exercise Types for Enablement Programs</a> in the <i>Sales Programs and Partner Tracks with Enablement Developer Guide</i>.</p>

## EnablementProgramTaskExternalContent

Defines Trailhead content for the Trailhead exercise type.

Field Name	Description
externalId	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The API name of the Trailhead module used with the exercise.</p>
providerType	<p><b>Field Type</b> ProgramExtContentDefProvider (enumeration of type string)</p> <p><b>Description</b> Required. The supported external content platform or system. Values are:</p> <ul style="list-style-type: none"> <li>• Trailhead</li> </ul>

## EnablementProgramTaskFeedbackContent

Defines the assessment survey or Einstein prompt template for the Feedback Request exercise type.

Field Name	Description
inviteeCount	<p><b>Field Type</b> int</p> <p><b>Description</b> The number of peers or managers that the user is required to invite for giving feedback when <code>type</code> is <code>PeerFeedback</code>. Each peer or manager receives an invitation to the assessment survey associated with the Feedback Request exercise. When <code>type</code> is <code>AIFeedback</code>, this value is always 1.</p>
promptTemplate	<p><b>Field Type</b> string</p> <p><b>Description</b> The prompt template to use with this exercise when <code>type</code> is <code>AIFeedback</code>.</p>
surveyDeveloperName	<p><b>Field Type</b> string</p> <p><b>Description</b> The unique programmatic name for the assessment survey that's sent to peers and managers when <code>type</code> is <code>PeerFeedback</code>.</p>

Field Name	Description
type	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The type of feedback used with the exercise. Values are:</p> <ul style="list-style-type: none"> <li>• <b>AIFeedback</b>—Users submit a video call, and Einstein generates feedback from the call's transcription. With this type, <code>promptTemplate</code> is required.</li> <li>• <b>PeerFeedback</b>—Users submit a URL to a sample of their work, and select peers and managers to review their work. Selected peers and managers complete an assessment survey. With this type, <code>surveyId</code> is required.</li> </ul>

## EnablementProgramTaskMilestone

Defines the requirements for an outcome or milestone, including the Enablement measures used for tracking activity and the criteria for completing the outcome or milestone.

Field Name	Description
compositeMilestoneType	<p><b>Field Type</b> EnblCompositeMilestoneType (enumeration of type string)</p> <p><b>Description</b> The type of logic to use for evaluating the activity from two Enablement measures in a composite milestone. Values are:</p> <ul style="list-style-type: none"> <li>• Addition</li> <li>• Division</li> <li>• Percentage</li> </ul>
isMilestoneAnOutcome	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Indicates whether the program item is the program's outcome (<code>true</code>) or an incremental milestone (<code>false</code>).</p>
milestoneMeasures	<p><b>Field Type</b> <a href="#">EnablementProgramTaskMilestoneMeasure[]</a></p> <p><b>Description</b> The Enablement measures used with the outcome or milestone.</p>
milestoneTarget	<p><b>Field Type</b> double</p>

Field Name	Description
	<p><b>Description</b></p> <p>The target value for a user to achieve to get credit for completing the outcome or milestone. The unit depends on the specific measure used with the outcome or milestone. For example, if the measure is the dollar amount of all closed opportunities, then the field value is measured in dollars.</p>
minimumSampleSize	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>The number of records to evaluate when calculating progress for an outcome or milestone that uses an average-based measure. Use this field with <code>milestoneTarget</code>. For example, if you want users to achieve an average deal size of \$50,000 after closing 4 deals, then this field's value is 4 and <code>milestoneTarget</code> is 50000.</p>

## EnablementProgramTaskMilestoneMeasure

Defines the Enablement measure used with an outcome or milestone.

Field Name	Description
measureDefinitionDeveloperName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The unique programmatic name of the Enablement measure used with the outcome or milestone.</p>
sequenceNumber	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>A number that specifies the order of the Enablement measure when multiple measures are used with one outcome or milestone, starting at 0. For example, in a composite milestone that uses the Percentage function, the measure that provides the numerator value is sequence 0 and the measure that provides the denominator value is sequence 1.</p>

## Declarative Metadata Sample Definition

The following is an example of an EnablementProgramDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<EnablementProgramDefinition xmlns="http://soap.sforce.com/2006/04/metadata">

</EnablementProgramDefinition>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>Get_Started_Close_First_Deal_Program</members>
        <name>EnablementProgramDefinition</name>
    </types>
    <version>61.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EnblProgramTaskSubCategory

Represents a custom exercise type that an Enablement admin adds to an Enablement program in Program Builder. A custom exercise type also requires a corresponding `EnblProgramTaskDefinition` record for Program Builder and corresponding `LearningItem` and `LearningItemType` records for when users take the exercise in the Guidance Center.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

EnblProgramTaskSubCategory components have the suffix `.enblProgramTaskSubCategory` and are stored in the `enblProgramTaskSubCategories` folder.

## Version

EnblProgramTaskSubCategory components are available in API version 62.0 and later.

## Special Access Rules

- For Enablement admins to create, update, and delete Enablement programs, the Design and Deliver Enablement Programs permission is required. This permission is enabled by default as part of the Manage Enablement Essentials permission set, which comes with the Enablement add-on license.
- For users who take Enablement programs, the Take Enablement Programs permission is required. This permission is enabled by default as part of the Use Enablement Programs permission set, which comes with the Enablement add-on license.

 **Important:** Custom exercises aren't compatible with Partner Enablement programs.

## Fields

Field Name	Description
<code>developerName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The unique programmatic name for the EnblProgramTaskSubCategory record.</p>
<code>icon</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The icon to use for the custom exercise type in Program Builder. Use the format <b><i>iconType</i>: <i>iconName</i></b>, where the values correspond to icon categories and names from the <a href="#">Salesforce Lightning Design System</a>.</p> <ul style="list-style-type: none"> <li>• <b><i>iconType</i></b> is the type of icon, such as <code>standard</code> or <code>doctype</code>.</li> <li>• <b><i>iconName</i></b> is the icon name, such as <code>flow</code> or <code>slide</code>.</li> </ul> <p>For example, to use the Standard type Flow icon, this value is <code>standard:flow</code>. For details, see <a href="#">Implement Custom Exercise Types for Enablement Programs</a> in the <i>Sales Programs and Partner Tracks with Enablement Developer Guide</i>.</p>

Field Name	Description
learningItemType	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The programmatic name of the <a href="#">LearningItemType</a> record that represents this custom exercise type in the Guidance Center when users take a program.</p>
masterLabel	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for the <a href="#">EnblProgramTaskSubCategory</a>, which is defined when it's created.</p>

## Declarative Metadata Sample Definition

The following is an example of an [EnblProgramTaskSubCategory](#) component for a custom exercise type that shows a screen flow.

```
<?xml version="1.0" encoding="UTF-8"?>
<EnblProgramTaskSubCategory xmlns="http://soap.sforce.com/2006/04/metadata">
  <developerName>ScreenFlowTaskSubCategory</developerName>
  <icon>standard:flow</icon>
  <learningItemType>ScreenFlowLearningItemType</learningItemType>
  <masterLabel>Screen Flow Exercise</masterLabel>
</EnblProgramTaskSubCategory>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>ScreenFlowTaskSubCategory</members>
    <name>EnblProgramTaskSubCategory</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EntitlementProcess

Represents the settings for an entitlement process.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

Entitlement process values are stored in files in the `entitlementProcesses` directory. Each file has the name of a process and the suffix `.entitlementProcess`. Each file contains one entitlement process or, if entitlement versioning is enabled, one version of an entitlement process.

The name of the file is the name of the entitlement process with the version appended to the end, if applicable (for example, an entitlement process named “gold\_support” can have the file name “gold\_support\_v2.entitlementProcess”). This file name corresponds to the `slaProcess.NameNorm` field exposed through SOAP API. This file name is distinct from the `name` field, which represents what displays in the user interface and, if versioning is enabled, can be shared among multiple versions of the same entitlement process. The `slaProcess.NameNorm` field contains the lowercase version of the `name` field shown in the user interface.

## Version

Entitlement processes are available in API version 27.0 and later.

## Fields

Field Name	Field Type	Description
<code>active</code>	boolean	Indicates whether the entitlement process is active ( <code>true</code> ) or not ( <code>false</code> ).
<code>businessHours</code>	string	The business hours that apply to the entitlement process. This field is available in API version 30.0 and later.
<code>description</code>	string	The description of the entitlement process.
<code>entryStartDateField</code>	string	For milestone processes on which a case enters the process based on a custom date/time field on the case, specifies which date and time are used. Valid values are: <ul style="list-style-type: none"> <li>• <code>SlaStartDate</code> (entitlement process start date)</li> <li>• <code>CreatedDate</code> (date case was opened)</li> <li>• <code>ClosedDate</code> (date case was closed)</li> <li>• <code>LastModifiedDate</code> (date case was last modified)</li> <li>• <code>StopStartDate</code> (date case was stopped)</li> </ul>
<code>exitCriteriaBooleanFilter</code>	string	For milestone processes on which a case exits the process when custom criteria are met, and for which filter logic is added, specifies that logic.
<code>exitCriteriaFilterItems</code>	<a href="#">FilterItem</a> []	For milestone processes on which a case exits the process when custom criteria are met, specifies those criteria.
<code>exitCriteriaFormula</code>	string	For milestone processes on which a case exits the process when a custom formula evaluates to true, specifies that formula.

Field Name	Field Type	Description
<code>isVersionDefault</code>	boolean	Indicates whether the entitlement process is the default version ( <code>true</code> ) or not ( <code>false</code> ).  This field is available in API version 28.0 and later.
<code>milestones</code>	<a href="#">EntitlementProcessMilestoneItem</a> []	Represents a milestone on the entitlement process.
<code>name</code>	string	The name of the entitlement process as it displays in the user interface.
<code>SObjectType</code>	string	Indicates the type of record that the entitlement process can run on.
<code>versionMaster</code>	string	Identifies the sequence of versions to which this entitlement process belongs. This field's contents can be any value as long as it's identical among all versions of the entitlement process.  This field is available in API version 28.0 and later.
<code>versionNotes</code>	string	The description of the entitlement process version.  This field is available in API version 28.0 and later.
<code>versionNumber</code>	int	The version number of the entitlement process. Must be 1 or greater.  This field is available in API version 28.0 and later.

## EntitlementProcessMilestoneItem

Represents a milestone item on an entitlement process.

### Fields

Field Name	Field Type	Description
<code>businessHours</code>	string	The business hours that apply to the milestone.  This field is available in API version 30.0 and later.
<code>criteriaBooleanFilter</code>	string	For milestones that apply only when criteria are met and for which filter logic is added, specifies that logic.
<code>milestoneCriteriaFilterItems</code>	<a href="#">FilterItem</a> []	For milestones that apply only when criteria are met, specifies those criteria.
<code>milestoneCriteriaFormula</code>	string	For milestones that apply only when a formula evaluates to true, specifies that formula.
<code>milestoneName</code>	string	The name of the milestone.

Field Name	Field Type	Description
minutesCustomClass	string	The name of the Apex class that is used to calculate the trigger time. This field is available in API version 30.0 and later.
minutesToComplete	int	The number of minutes from when the case enters the entitlement process that the milestone occurs.
successActions	<a href="#">WorkflowActionReference</a> []	The actions triggered when the milestone is completed.
timeTriggers	<a href="#">EntitlementProcessMilestoneTimeTrigger</a> []	The time triggers on an entitlement process milestone.
useCriteriaStartTime	boolean	When the milestone starts: when the milestone criteria are met (true) or when the case enters the entitlement process (false).

## EntitlementProcessMilestoneTimeTrigger

Represents the time trigger on an entitlement process milestone.

### Fields

Field Name	Field Type	Description
actions	<a href="#">WorkflowActionReference</a> []	The actions to take when the time trigger is reached, if, at that time, the milestone isn't completed.
timeLength	int	The length of time between the time trigger activation and the milestone target completion date. This length of time can be a negative or positive value. Negative values indicate that the target completion date hasn't yet arrived and correspond to warning time triggers. Positive values indicate that the target completion date has passed and correspond to violation time triggers.
workflowTimeTriggerUnit	MilestoneTimeUnits (enumeration of type string)	Specifies the type of unit used to determine when a workflow is triggered. Valid values are: <ul style="list-style-type: none"> <li>• Minutes</li> <li>• Hours</li> <li>• Days</li> </ul>

## Declarative Metadata Sample Definition

Here's a sample entitlement process.

```
<?xml version="1.0" encoding="UTF-8"?>
<EntitlementProcess xmlns="http://soap.sforce.com/2006/04/metadata">
  <active>true</active>
  <description>eppersone</description>
```

```

<entryStartDateField>SlaStartDate</entryStartDateField>
<exitCriteriaBooleanFilter>1 OR 2</exitCriteriaBooleanFilter>
<exitCriteriaFilterItems>
  <field>Case.IsClosed</field>
  <operation>equals</operation>
  <value>>true</value>
</exitCriteriaFilterItems>
<exitCriteriaFilterItems>
  <field>Case.Description</field>
  <operation>startsWith</operation>
  <value>foo</value>
</exitCriteriaFilterItems>
<milestones>
  <milestoneName>m1</milestoneName>
  <minutesToComplete>1</minutesToComplete>
  <successActions>
    <name>emailBob</name>
    <type>Alert</type>
  </successActions>
  <timeTriggers>
    <actions>
      <name>emailAlice</name>
      <type>Alert</type>
    </actions>
    <actions>
      <name>setEscalateToTrue</name>
      <type>FieldUpdate</type>
    </actions>
    <timeLength>1</timeLength>
    <workflowTimeTriggerUnit>Minutes</workflowTimeTriggerUnit>
  </timeTriggers>
  <timeTriggers>
    <actions>
      <name>setStopToTrue</name>
      <type>FieldUpdate</type>
    </actions>
    <timeLength>2</timeLength>
    <workflowTimeTriggerUnit>Minutes</workflowTimeTriggerUnit>
  </timeTriggers>
  <useCriteriaStartTime>>false</useCriteriaStartTime>
</milestones>
<milestones>
  <milestoneCriteriaFilterItems>
    <field>Case.Priority</field>
    <operation>equals</operation>
    <value>High</value>
  </milestoneCriteriaFilterItems>
  <milestoneName>m2</milestoneName>
  <minutesToComplete>120</minutesToComplete>
  <useCriteriaStartTime>>true</useCriteriaStartTime>
  <successActions>
    <name>emailBob</name>
    <type>Alert</type>
  </successActions>

```

```
</milestones>
</EntitlementProcess>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EntitlementTemplate

Represents an entitlement template. Entitlement templates are predefined terms of customer support that you can quickly add to products. For example, you can create entitlement templates for Web or phone support so that users can easily add entitlements to products offered to customers.

EntitlementTemplate extends the [Metadata](#) metadata type and inherits its `fullName` field.

## Declarative Metadata File Suffix and Directory Location

EntitlementTemplate components are stored in the `entitlementTemplates` directory of the corresponding package directory. The file name matches the unique name of the entitlement template, and the extension is `.entitlementTemplate`.

## Version

Lightning Platform EntitlementTemplate components are available in API version 18.0 and higher.

## Fields

Field	Field Type	Description
<code>businessHours</code>	string	The entitlement's supported business hours.
<code>casesPerEntitlement</code>	int	The total number of cases the entitlement supports.
<code>entitlementProcess</code>	string	The entitlement process associated with the entitlement. Entitlement processes are timelines that include all the steps (milestones) that your support team must complete to resolve cases. Each process includes logic to determine how to enforce the correct service level for your customers.
<code>isPerIncident</code>	boolean	<code>true</code> if entitlements created from this template service a limited number of cases; <code>false</code> otherwise.
<code>term</code>	int	The number of days the entitlement is in effect.
<code>type</code>	string	The type of entitlement, such as Web or phone support.

## Declarative Metadata Sample Definition

A sample XML definition of an entitlement template is shown below.

```
<?xml version="1.0" encoding="UTF-8"?>
<EntitlementTemplate xmlns="http://soap.sforce.com/2006/04/metadata">
  <businessHours>AlternateBusinessHours</businessHours>
  <casesPerEntitlement>12</casesPerEntitlement>
  <entitlementProcess>Process1</entitlementProcess>
  <isPerIncident>true</isPerIncident>
  <term>33</term>
  <type>Phone Support</type>
</EntitlementTemplate>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EscalationRules

Represents case escalation rules to escalate cases automatically if they aren't resolved within a certain time. You can access rules metadata for all applicable objects, for a specific object, or for a specific rule on a specific object.

The `package.xml` syntax for accessing all escalation rules for all objects is:

```
<types>
  <members>*</members>
  <name>EscalationRules</name>
</types>
```

All rules for a specific object use a similar syntax without the wildcard. For example, all escalation rules for the Case object would use this syntax:

```
<types>
  <members>Case</members>
  <name>EscalationRules</name>
</types>
```

You can also access specific escalation rules for an object. The following example only accesses the "samplerule" and "newrule" escalation rules on the Case object. Notice that for this example the type name syntax is `EscalationRule` and not `EscalationRules`.

```
<types>
  <members>Case.samplerule</members>
  <members>Case.newrule</members>
  <name>EscalationRule</name>
</types>
```

## File Suffix and Directory Location

EscalationRules for an object have the suffix `.escalationRules` and are stored in the `escalationRules` folder. For example, all Case escalation rules are stored in the `Case.escalationRules` file.

## Version

EscalationRules components are available in API version 27.0 and later.

## Fields

Field Name	Field Type	Description
<code>escalationRule</code>	<a href="#">EscalationRule[]</a> on page 891	Represents one escalation rule and specifies whether it's active or not. Escalation rules are processed in the order they appear in the EscalationRules container.

## EscalationRule

Field Name	Field Type	Description
<code>active</code>	boolean	Indicates whether the escalation rule is active ( <code>true</code> ) or not ( <code>false</code> ).
<code>fullname</code>	string	Inherited from <a href="#">Metadata</a> , this field is defined in the WSDL for this metadata type. It must be specified when creating, updating, or deleting. See <a href="#">createMetadata()</a> to see an example of this field specified for a call.  This value can't be <code>null</code> .
<code>ruleEntry</code>	<a href="#">RuleEntry[]</a>	Contains the definitions of the rule entries in the escalation rule.

## RuleEntry

Represents the fields used by the rule.

Field Name	Field Type	Description
<code>booleanFilter</code>	string	Advanced filter conditions that were specified for the rule.
<code>businessHours</code>	string	The hours when escalation actions are performed. Specify only if <code>businessHoursSource</code> is set to <code>Static</code> .
<code>businessHoursSource</code>	BusinessHoursSourceType (enumerations of type string)	Valid values are: <ul style="list-style-type: none"> <li>• <code>None</code></li> <li>• <code>Case</code></li> <li>• <code>Static</code></li> </ul>
<code>criteriaItems</code>	<a href="#">FilterItem</a>	The items in the list that define the assignment criteria.
<code>disableEscalationWhenModified</code>	boolean	Indicates whether the escalation is disabled when the record is modified ( <code>true</code> ) or not ( <code>false</code> ).

Field Name	Field Type	Description
escalationAction	EscalationAction[]	The actions to perform when the escalation criteria are met.
escalationStartTime	EscalationStartTimeType (enumeration of type string)	Indicates the start time for the escalation. Valid values are: <ul style="list-style-type: none"> <li>CaseCreation</li> <li>CaseLastModified</li> </ul>
formula	string	The validation formula. Specify either <code>formula</code> or <code>criteriaItems</code> , but not both fields.

## EscalationAction

Describes the action to take for an escalation rule.

Field Name	Field Type	Description
assignedTo	string	The name of the user or queue the item is assigned to.
assignedToTemplate	string	Specifies the template to use for the email that is automatically sent to the new owner specified by the escalation rule.  Lightning email templates aren't packageable. We recommend using a Classic email template.
assignedToType	AssignToLookupValueType (enumeration of type string)	Valid values are: <ul style="list-style-type: none"> <li>User</li> <li>Queue</li> </ul>
minutesToEscalation	int	The number of minutes until the escalation occurs.
notifyCaseOwner	boolean	Indicates that the owner of the case is notified when the case is escalated <code>true</code> or not ( <code>false</code> ).
notifyEmail	string	Specifies the email address of the user to notify.
notifyTo	string	Specifies the user to notify.
notifyToTemplate	string	Specifies the template to user for the notification email.

## Declarative Metadata Sample Definition

The following is an example EscalationRules component:

```
<EscalationRules xmlns="http://soap.sforce.com/2006/04/metadata">
  <escalationRule>
    <fullName>samplerule</fullName>
    <active>>false</active>
  </escalationRule>
</EscalationRules>
```

```

<ruleEntry>
  <businessHours>test</businessHours>
  <businessHoursSource>Static</businessHoursSource>
  <criteriaItems>
    <field>Case.Description</field>
    <operation>contains</operation>
    <value>test</value>
  </criteriaItems>
  <escalationAction>
    <assignedTo>someuser@org.com</assignedTo>
    <assignedToTemplate>emailtemplatename</assignedToTemplate>
    <assignedToType>User</assignedToType>
    <minutesToEscalation>1440</minutesToEscalation>
    <notifyCaseOwner>false</notifyCaseOwner>
  </escalationAction>
  <escalationStartTime>CaseLastModified</escalationStartTime>
</ruleEntry>
</escalationRule>
</EscalationRules>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EventDelivery

---

Represents how an event instance maps to a target payload. Removed in API version 46.0. This type extends the Metadata metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

Event delivery components have the suffix file path `.delivery`, and are stored in the `eventDeliveries` folder.

### Version

Event delivery components are available in API versions 41.0 to 45.0.

### Limits

Your org can have a maximum of 2500 EventDelivery object instances.

### Fields

Field Name	Field Type	Description
<code>eventParameters</code>	<code>EventParameterMap[]</code>	An array of parameters to deliver in addition to the published event's data.

Field Name	Field Type	Description
eventSubscription	string	Required. The ID of the subscription to deliver the data to.
referenceData	string	User-defined non-unique identifier.
type	EventDeliveryType (enumeration of type string)	Required. Determines what action occurs when the event is delivered to the listeners on behalf of the subscribers.  Valid values are: <ul style="list-style-type: none"> <li>StartFlow—When the event occurs, it's delivered to a flow of type CustomEvent. Those flows are built through Process Builder.</li> <li>ResumeFlow—Reserved for future use.</li> </ul>

## EventParameterMap

Parameters to deliver in addition to the published event's data.

If `type` is `StartFlow`, you must include a parameter where `parameterName` is `FlowVersionName` and `parameterValue` is the name of the flow that you want to start. The flow name must include its version number. For example, `myFlow-3`.

Each event delivery can have up to 10 parameters.

Field Name	Field Type	Description
parameterName	string	The parameter name.
parameterValue	string	The parameter value.

## Declarative Metadata Sample Definition

The following is an example of an event delivery file.

```
<?xml version="1.0" encoding="UTF-8"?>
<EventDelivery xmlns="http://soap.sforce.com/2006/04/metadata">
  <eventParameters>
    <parameterName>FlowVersionName</parameterName>
    <parameterValue>My_Event_Based_Process-1</parameterValue>
  </eventParameters>
  <eventSubscription>MySubscription</eventSubscription>
  <referenceData>My_Event_Based_Process_1</referenceData>
  <type>StartFlow</type>
</EventDelivery>
```

The following is an example `package.xml` that deploys or retrieves all the available event delivery metadata in your org.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>EventDelivery</members>
    <name>*</name>
  </types>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EventRelayConfig

---

Represents the configuration of an event relay, which relays platform events and change data capture events from Salesforce to Amazon EventBridge.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`EventRelayConfig` components have the suffix `.eventRelay` and are stored in the `eventRelays` folder.

### Version

`EventRelayConfig` components are available in API version 56.0 and later.

### Special Access Rules

- You must have the Customize Application permission to deploy and retrieve this type.
- You can update only the `state` and `relayOption` fields and not `eventChannel` or `destinationResourceName`.

### Fields

Field Name	Description
<code>destinationResourceName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The developer name of the named credential, which stores the AWS account information. The <code>destinationResourceName</code> value contains the <code>callout:</code> prefix. For example: <code>callout:MyRelayNamedCredential</code></p>
<code>eventChannel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The full name of the event channel used in the event relay. For example: <code>MyRelayChannel__chn</code></p>

Field Name	Description
label	<p><b>Field Type</b> string</p> <p><b>Description</b> The label for the event relay. The label is displayed in the user interface. Make sure you use a meaningful label that describes your event relay and try to make it unique.</p>
relayOption	<p><b>Field Type</b> string</p> <p><b>Description</b> A JSON-encoded string that contains an option for resuming an event relay after the system recovers from an error. This option is used if the event relay can't resume after the last relayed event. The options available are:</p> <ul style="list-style-type: none"> <li>• { "ReplayRecovery": "LATEST" } —(Default) Start relaying events from new events received in the event bus. Use this option if you aren't interested in missed events while the relay was down.</li> <li>• { "ReplayRecovery": "EARLIEST" } —Resend all events stored in the event bus and relay new events thereafter. The event bus stores events for up to three days. Use this option if you want to reprocess all stored events and catch up on missed events.</li> </ul>
state	<p><b>Field Type</b> EventRelayAdminState (enumeration of type string)</p> <p><b>Description</b> The execution state of the event relay. Possible values are:</p> <ul style="list-style-type: none"> <li>• RUN—The event relay is running and actively relaying event messages from Salesforce to Amazon EventBridge.</li> <li>• PAUSE—An administrator paused the event relay. No events are relayed to Amazon EventBridge during this status. All current state information is saved.</li> <li>• STOP—(Default) The event relay is stopped and no events are relayed to Amazon EventBridge. All current state information is deleted.</li> </ul> <p>The event relay is created with a default state of <code>STOP</code> if you don't specify this field. If you specify this field when creating an event relay, the only valid value you can set is <code>STOP</code>.</p> <ul style="list-style-type: none"> <li>• DELETE—Reserved for future use.</li> </ul>
usageType	<p><b>Field Type</b> string</p> <p><b>Description</b> Reserved for future use.</p>

## Declarative Metadata Sample Definition

The following is an example of an EventRelayConfig component with the file name Carbon\_Comparison\_Relay.eventRelay.

```
<?xml version="1.0" encoding="UTF-8"?>
<EventRelayConfig xmlns="http://soap.sforce.com/2006/04/metadata">
  <destinationResourceName>callout:AWS_Account</destinationResourceName>
  <eventChannel>Carbon_Comparison_Channel__chn</eventChannel>
  <label>Carbon Comparison Relay</label>
  <relayOption>{"ReplayRecovery\":"LATEST"}</relayOption>
  <state>STOP</state>
</EventRelayConfig>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Carbon_Comparison_Relay</members>
    <name>EventRelayConfig</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## EventSubscription

---

Represents a subscription to an event type. Removed in API version 46.0. This type extends the [Metadata](#) metadata type and inherits its fullName field.

## File Suffix and Directory Location

EventSubscription components have the suffix file path .subscription, and are stored in the eventSubscriptions folder.

## Version

Event subscription components are available in API versions 41.0 to 45.0.

## Limits

Your org can have a maximum of:

- 4,000 total event subscriptions
- 2,000 active event subscriptions

## Fields

Field Name	Field Type	Description
active	boolean	If the subscription isn't active, it never receives any events.
eventParameters	<a href="#">EventParameterMap</a> []	An array of parameters that must be true for published events.
eventType	string	Required. The name of the platform event.
referenceData	string	Required. If the subscriber is a flow of type CustomEvent, referenceData is <b>flowName_versionNumber</b> . For example, Printer_Management_2.

## EventParameterMap

An array of parameters that must be true for published events. For example, subscribe to Vendor Response events only if Status\_\_c is Shipped.

Each event subscription can have up to 10 parameters.

Field Name	Field Type	Description
parameterName	string	Required. The published event's field name.
parameterValue	string	The value that must be true.

## Declarative Metadata Sample Definition

The following is an example of an active event subscription.

```
<?xml version="1.0" encoding="UTF-8"?>
<EventSubscription xmlns="http://soap.sforce.com/2006/04/metadata">
  <active>true</active>
  <eventType>Printer_Status__e</eventType>
  <referenceData>Printer_Management</referenceData>
</EventSubscription>
```

The following is an example of an inactive event subscription that sets event parameters.

```
<?xml version="1.0" encoding="UTF-8"?>
<EventSubscription xmlns="http://soap.sforce.com/2006/04/metadata">
  <name>MySubscription</name>
  <active>false</active>
  <eventParameters>
    <parameterName>Ink_Status__c</parameterName>
    <parameterValue>low</parameterValue>
  </eventParameters>
  <eventParameters>
    <parameterName>Serial_Number__c</parameterName>
    <parameterValue>00123456789</parameterValue>
  </eventParameters>
  <eventType>Printer_Status__e</eventType>
```

```
<referenceData>My_Event_Based_Process_1</referenceData>
</EventSubscription>
```

The following is an example `package.xml` that deploys or retrieves all the available event subscription metadata in your org.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>EventSubscription</name>
  </types>
  <version>41.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ExperienceBundle

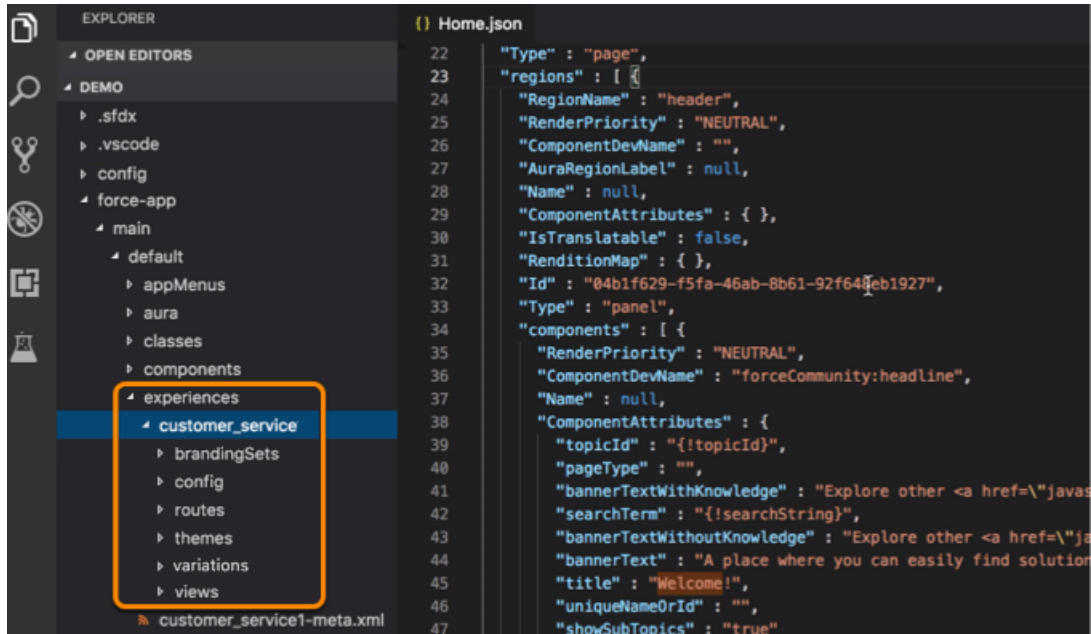

---

Represents a text-based code structure of the settings and site components, such as pages, branding sets, and themes that make up an Experience Builder site. Developers can quickly update and deploy Experience Builder sites *programmatically* using their preferred development tools. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

ExperienceBundle components have the suffix `.json` and are stored in the `experiences` folder when retrieved. Each Experience Builder site in your org has its own folder. Each of these folders contains [other folders for the supported properties](#).

The ExperienceBundle can contain one or more site definitions under the `experiences` folder. Each site definition has resource folders for [brandingSets](#), [config](#), [routes](#), [themes](#), [variations](#), and [views](#), each with additional, related configuration information in JSON files. Here's an example site definition, showing the resource folders.

## Version

ExperienceBundle components are available in API version 46.0 and later.

## Special Access Rules

To use the ExperienceBundle metadata type for Aura-based Experience Builder sites, from Setup, enter *Digital Experiences* in the Quick Find box, and then select **Settings**. Select **Enable ExperienceBundle Metadata API**, and save your changes. LWR sites use ExperienceBundle by default.

## Fields

Field Name	Field Type	Description
experienceResources	<a href="#">ExperienceResources[]</a>	The list of resources in this ExperienceBundle. Each resource represents an artifact of a site such as <a href="#">brandingSets</a> , <a href="#">config</a> , <a href="#">routes</a> , <a href="#">themes</a> , <a href="#">variations</a> , and <a href="#">views</a> .
label	string	Required. Represents the name of the ExperienceBundle.
type	SiteType (enumeration of type string)	Required. Identifies the kind of site. Only Experience Builder sites are supported, using the value <code>ChatterNetworkPicasso</code> .
urlPathPrefix	string	Specify a URL prefix for an Experience Builder site. For example, in the site URL <code>SitesSubdomainName.force.com/customers</code> , <code>customers</code> is the <code>UrlPathPrefix</code> .

 **Note:** For authenticated LWR sites created before Winter '23 and Aura sites, the URL path prefix ends in `/s`, and the part of the path without the `/s` must match the Network metadata type's URL. For unauthenticated LWR sites and authenticated LWR sites created after

Field Name	Field Type	Description
		<p>Winter '23 through Experience Builder or Connect API, this path doesn't contain /s, and the path can be anything as long as there's no conflict.</p> <p><b>Sample meta.xml file</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;ExperienceBundle xmlns="http://soap.sforce.com/2006/04/metadata"&gt;   &lt;label&gt;SampleStarterSite2&lt;/label&gt;   &lt;type&gt;ChatterNetworkPicasso&lt;/type&gt;  &lt;urlPathPrefix&gt;SampleStarterSite2/s&lt;/urlPathPrefix&gt; &lt;/ExperienceBundle&gt;</pre>

## ExperienceResources

Represents a list of sites in the bundle.

Field Name	Field Type	Description
experienceResource	<a href="#">ExperienceResource[]</a>	The list of resources in this ExperienceBundle. Each resource represents a property for the site, such as <a href="#">brandingSets</a> , <a href="#">config</a> , <a href="#">routes</a> , <a href="#">themes</a> , and <a href="#">views</a> .

## ExperienceResource

Represents specific site information included in the ExperienceBundle.

Each type has a folder in the structure. Each folder contains one or more files providing information about that type and the site. Each corresponds to a specific folder and file in the ExperienceBundle.

Field Name	Field Type	Description
fileName	string	Required. Name of resource file.
format	string	Required. Only JSON is allowed.
source	base64	The JSON content of each file.
type	string	Required. The type of the resource. Valid values are: <ul style="list-style-type: none"> <li>• brandingSets</li> <li>• config</li> <li>• routes</li> <li>• themes</li> <li>• views</li> </ul>

## Folders and Bundled Definitions

Each ExperienceBundle includes folders and associated data that is contained in JSON files.

### brandingSets Folder

This folder contains one JSON file per branding set, named `brandingSets_name.json`. Each file has the same structure and properties.

`<brandingSets_name>.json`

Property	Type	Description
<code>brandingSetType</code>	string	<p>Required in LWR sites. Not applicable for Aura sites. Represents whether the color palette stored in the branding set is for the entire site or a specific section. You can't change one branding set type to another. Available in API Version 52.0 and later.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>APP</code>: The branding set applies to the entire site. There can be only one branding set of this type.</li> <li>• <code>SCOPED</code>: The branding set applies to a specific section.</li> </ul>
<code>definitionName</code>	string	<p>Required. Represents the name for the branding set that is used in grouping branding sets under a theme. Defined as <code>theme:branding-theme</code>.</p> <p>For example, if the site theme is Stella, the <code>definitionName</code> would be <code>stella:branding-stella</code>.</p> <p>In addition, there are several standard templates that have unique naming:</p> <ul style="list-style-type: none"> <li>• Customer Account Portal uses <code>cpt:branding-cpt</code></li> <li>• Customer Service uses <code>service:branding-service</code></li> <li>• Help Center uses <code>helpCenter:branding-helpCenter</code></li> <li>• Partner Central uses <code>prm:branding-prm</code></li> <li>• Build Your Own uses <code>starter:branding-starter</code></li> </ul> <p> <b>Note:</b> The combination of <code>definitionName</code> + <code>label</code> must be unique in your org.</p>
<code>id</code>	UUID	Represents the component's GUID.
<code>label</code>	string	<p>Represents the name of the branding set.</p> <p> <b>Note:</b> The combination of <code>definitionName</code> + <code>label</code> must be unique in your org.</p>
<code>type</code>	string	Represents the component type. The only supported value is <code>brandingSet</code> .

Property	Type	Description
values	map	Required. Represents a map of branding values that can be applied to a site.

```
{
  "values" : {
    "HeaderBackgroundColor" : "#FFFFFF",
    "TextTransformStyle" : "none",
    "BorderColor" : "#D4D4D4",
    "DetailTextColor" : "#5A5A5A",
    "HeaderFonts" : "Ek Mukta",
    "CardBackgroundColor" : "rgba(255, 255, 255, 0)",
    "LoginBackgroundColor" : "#F4F4F4",
    "_ActionColorTrans" : "rgba(25, 124, 190, 0.9)",
    "LoginBackgroundImage" :
    "../../../../../../../../sfsites/picasso/core/external/salesforceIdentity/images/background.jpg?v=1",
    "PageBackgroundColor" : "#F5F7FA",
    "_HeaderTextColor" : "rgba(34, 34, 34, .8)",
    "_NavigationMenuHoverColor" : "rgba(255, 255, 255, .2)",
    "_HeaderInputBackgroundColor" : "rgba(255, 255, 255, .4)",
    "TextColor" : "#222222",
    "NavigationMenuTextColor" : "#222222",
    "_HeaderPlaceholderTextColor" : "rgba(85, 85, 85, .8)",
    "_OverlayTextColorShadow" : "#000000",
    "ActionColor" : "#0099DE",
    "CompanyLogo" : "",
    "_LinkColorDarker" : "#135F90",
    "_ActionColorDarker" : "#135F90",
    "_HoverColor" : "rgba(25, 124, 190, 0.05)",
    "ErrorFontColor" : "#ff9e9e",
    "OverlayTextColor" : "#FFFFFF",
    "PrimaryFont" : "Ek Mukta",
    "LinkColor" : "#3558D6"
  },
  "definitionName" : "cpt:branding-cpt",
  "label" : "Customer Account Portal",
  "id" : "283407c3-5938-4a6b-b97f-621cda6968c8",
  "type" : "brandingSet"
}
```

## config Folder

The config folder contains several JSON files.

- `sitename.json`
- `languages.json`
- `nativeConfig.json`
- `page_name.json`

 **Note:** One for each single-page application in the site: `loginAppPage.json` and `mainAppPage.json`

*sitename.json* File Properties

Property	Type	Description
<code>authenticationType</code>	string	<p>For LWR sites, indicates whether guest users have access to the site.</p> <p> <b>Note:</b> For Aura sites, use <code>isAvailableToGuests</code> instead.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li><code>AUTHENTICATED</code>: The site isn't public. Only authenticated users can access the site after logging in.</li> <li><code>AUTHENTICATED_WITH_PUBLIC_ACCESS_ENABLED</code>: The site is an authenticated site, but the <b>Public can access the site</b> checkbox is enabled in Experience Builder in <b>Settings &gt; General</b>. Guest users can access the site.</li> <li><code>UNAUTHENTICATED</code>: The unauthenticated site is publicly available to anyone on the web, and doesn't support login or authentication. Guest users can access the site. <code>UNAUTHENTICATED</code> isn't supported for LWR sites created after Winter '23 through Experience Builder or Connect API. To allow guest user access, we recommend using <code>AUTHENTICATED_WITH_PUBLIC_ACCESS_ENABLED</code>.</li> </ul> <p>Available in API version 51.0 and later.</p>
<code>forgotPasswordRouteId</code>	UUID	<p>Represents the ID of the route to use when a user forgets their password.</p> <p> <b>Note:</b> Unsupported if the active Experience Builder template for the site doesn't support login (such as Help Center).</p>
<code>isAvailableToGuests</code>	boolean	<p>For Aura sites, indicates whether public users have access to the site (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p> <p> <b>Note:</b> For LWR sites, use <code>authenticationType</code> instead.</p>
<code>isFilteredComponentsView</code>	boolean	<p>Indicates whether the list of components is filtered based on the current page type (<code>true</code>) or not (<code>false</code>). Some components require specific parameters from the page and don't work unless you manually configure them. The default value is <code>false</code>.</p>
<code>isLockerServiceEnabled</code>	boolean	<p>Indicates whether Lightning Locker is enabled (<code>true</code>) or disabled (<code>false</code>). The default value is <code>true</code>.</p> <p>Before disabling Lightning Locker, you must set <code>isRelaxedCSPLLevel</code> to <code>true</code>. Available in API version 55.0 and later.</p>
<code>isProgressiveRenderingEnabled</code>	boolean	<p>Indicates whether the display order of page components is prioritized (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>.</p>
<code>loginAppPageId</code>	UUID	<p>Represents the ID of the login page.</p> <p> <b>Note:</b> Unsupported if the active Experience Builder template for the site doesn't support login (such as Help Center).</p>

Property	Type	Description
mainAppPageId	UUID	Required. Represents the ID of the main page.
preferredDomain	string	Represents the name of the domain to use for indexing a site's pages. Improves search engine results. Available in API version 48.0 and later.
preferredDomainId	string	Represents the domain to use for indexing a site's pages. Improves search engine results. Removed in API version 48.0. Use <code>preferredDomain</code> instead.
selfRegistrationRouteId	UUID	Represents the ID of the login route to use for self-registration.  <b>Note:</b> Unsupported if the active Experience Builder template for the site doesn't support login (such as Help Center).
type	string	Represents the component type. The only supported value is <code>site</code> .

### trustedSitesForScript container

When implemented, there's one `trustedSitesForScript` container in `sitename.json`.

Property	Type	Description
id	UUID	Represents the component's GUID.
isActive	boolean	Indicates if allowlisted item is active ( <code>true</code> ) and must be respected or inactive ( <code>false</code> ) and must not be treated as an allowlisted source. Default is <code>false</code> .
trustedSiteName	string	Name of the allowlisted source as it appears in the UI.
trustedSiteUrl	string	The fully qualified URL of the allowlisted source.
type	string	Represents the component type. The only supported value is <code>trustedSitesForScripts</code> .

```
{
  "isAvailableToGuests" : false,
  "isFilteredComponentsView" : false,
  "mainAppPageId" : "df9907cb-6e68-4ca1-8bb2-51173ca5374e",
  "loginAppPageId" : "58e9939a-84b2-498d-bbc5-7a89d89087fa",
  "selfRegistrationRouteId" : "ad5c8bf1-297f-4ad3-b47c-0e35d85f10ef",
  "forgotPasswordRouteId" : "e3139f6f-44d8-4eec-be9d-3609ce063039",
  "isProgressiveRenderingEnabled" : false,
  "preferredDomain" : "none",
  "selfRegistrationRouteId" : "b8fe8ab1-f266-41e1-a63b-4791165f3c1d",
  "trustedSitesForScript" : [ {
    "id" : "92c489e2-0b7b-4a48-9c88-bef7e8fe6f1b",
    "isActive" : true,
    "trustedSiteName" : "test",
```

```

    "trustedSiteUrl" : "https://123.com",
    "type" : "trustedSitesForScripts"
  }, {
    "id" : "92c489e2-0b7b-4a48-9c88-bef7e8fe6f1c",
    "isActive" : true,
    "trustedSiteName" : "test1",
    "trustedSiteUrl" : "https://1234.com",
    "type" : "trustedSitesForScripts"
  } ],
  "type" : "site"
}

```

#### languages.json File Properties

Property	Type	Description
defaultCode	string	Required. Represents the base language code plus the country code where used.
defaultLabel	string	Required. Defines the display label for the language.
id	UUID	Represents the component's GUID.
type	string	Represents the component type. The only supported value is <code>languageContainer</code> .

There's one section per supported language as a container in `languages.json`

#### language container

Property	Type	Description
countryCode	string	<p>Represents the country code of the selected language. This string can be empty. It applies only when the selected language has variations depending on the country, like Arabic (Algeria) and Arabic (Bahrain). In this case, use <code>countryCode</code> to distinguish between them.</p> <p>For example: <code>{ "languageCode" : "ar", "CountryCode" : "DZ", "Label" : "Arabic (Algeria) (DZ)", }, { "Code" : "ar", "CountryCode" : "BH", "Label" : "Arabic (Bahrain) (BH)", }</code></p>
fallbackLanguageId	UUID	<p>Represents the language to use when no content is available for the selected language. For example, if a site visitor chooses <b>Japanese</b> from the language selector, but there's no content for that page in Japanese, then content is displayed in the fallback language.</p> <p>Only one level of fallback is allowed for LWR sites. Here are examples for an LWR site where English is the default language, and Spanish, French, and Finnish are available site languages.</p> <ul style="list-style-type: none"> <li>Not allowed: Spanish falls back to French, and French falls back to Finnish. This configuration includes two levels of fallback.</li> </ul>

Property	Type	Description
		<ul style="list-style-type: none"> <li>Allowed: Spanish falls back to French, and French falls back to English. This configuration is allowed because English is the site's default language.</li> <li>Allowed: Spanish falls back to French, and French has no fallback. This configuration includes only one level of fallback.</li> </ul>
id	UUID	Represents the component's GUID.
isActive	boolean	Indicates whether a language is available to site visitors in the language selector ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>true</code> .
label	string	Defines the display label for a language. The display label appears in any language selector components that you add to your site and in the language selector in Experience Builder.
languageCode	string	Represents the language code for the selected language.
type	string	Represents the component type. The only supported value is <code>language</code> .

```
{
  "defaultCode" : "en_US",
  "defaultLabel" : "English (US)",
  "id" : "04597c83-0b9d-4f16-9f4d-4ec28bd553b4",
  "type" : "languageContainer",
  "languages" : [ {
    "languageCode" : "af",
    "countryCode" : "",
    "isActive" : true,
    "label" : "Afrikaans",
    "fallbackLanguageId" : "c6e7fe67-55e0-47b3-ad58-bf49539249f0",
    "id" : "22036d6f-11ce-4f7b-b7f0-f2c409f817ea",
    "type" : "language"
  }
  ]
}
```

The page file represents single-page applications in the site. One file per page, named `page_name.json`.

 **Note:** Each Experience Builder site is actually a single-page application, which is a web app that loads a single HTML page. Single-page applications use multiple [views](#) to update the page dynamically as the user interacts with it.

nativeConfig.json **File Properties**

Property	Type	Description
showHamburgerMenu	boolean	Required. Controls whether the hamburger menu is shown.
mobilePublisherAppUpdateConfig	boolean	Required. Controls whether and which App Version Update message is shown. To avoid service disruptions, users must be on the app version that supports enhanced domains.
id	UUID	Represents the component's GUID.

Property	Type	Description
type	string	Represents the component type. The only supported value is <code>nativeConfig</code> .

```
{
  "id": "a70a0e5e-0400-4531-94dc-8f587daa5946",
  "nativeMobileNavConfig": {
    "showBackButton": true,
    "showHamburgerMenuWithBackButton": false
  },
  "mobilePublisherAppUpdateConfig": {
    "enableAppUpdate" : true,
    "forceAppUpdate" : true,
    "minVersion" : {
      "ios" : {
        "version" : "10.0"
      },
      "android" : {
        "version" : "10.1"
      }
    }
  },
  "nativeTabMenu": {
    "branding": {
      "iconTintColorUnselected": "#C9C5C5",
      "barTintColor": "#FF00FF",
      "iconTintColor": "#555321"
    },
    "menuItems": [
      {
        "iconAsset": "icon_homepng",
        "targetUrl": "/"
      },
      {
        "name": "Test",
        "iconAsset": "icon_filespng",
        "targetUrl": "/files"
      }
    ]
  },
  "showNavMenu": true,
  "type": "nativeConfig"
}
```

#### nativeMobileNavConfig container

A required container for the configuration for the Native Navigation Bar component.

Property	Type	Description
showBackButton	boolean	Controls whether the Back button is shown on iOS devices.

Property	Type	Description
<code>showHamburgerMenuWithBackButton</code>	boolean	Controls whether the hamburger menu is shown, in addition to the Back button, on iOS devices.

### mobilePublisherAppUpdateConfig container

A required container for the configuration of the App Version Update message.

Property	Type	Description
<code>enableAppUpdate</code>	boolean	<p>Controls whether the App Version Update message is shown, to encourage users to update by giving them a choice of whether to do so.</p> <p>Set the properties to <code>"enableAppUpdate" : true</code>, and <code>"forceAppUpdate" : false</code> to show the message that encourages your users to update.</p> <p>If you don't want to show an update message, for example if all your users are on the correct version or your site uses a custom domain, set the property to <code>"enableAppUpdate" : false</code>, and don't use the <code>forceAppUpdate</code> property.</p>
<code>forceAppUpdate</code>	boolean	<p>Controls whether the App Version Update message to require users to update is shown.</p> <p>Set the properties to <code>"enableAppUpdate" : true</code>, and <code>"forceAppUpdate" : true</code> to show the message that requires your users to update.</p>
<code>minVersion</code>	string	Controls the iOS and Android Minimum App Versions. These property values are currently hard coded to ensure that the app versions supporting enhanced domains are used.

### nativeTabMenu container

A required container for the configuration of the hamburger menu and Back button behavior.

Property	Type	Description
<code>branding</code>	map	<p>Settings for the Native Navigation Bar component branding. Valid keys are:</p> <ul style="list-style-type: none"> <li>• <code>iconTintColorUnselected</code></li> <li>• <code>iconTintColor</code></li> <li>• <code>barTintColor</code></li> </ul> <p>Supply a valid 6 digit hexadecimal as the value for all properties.</p>
<code>menuItems</code>	list	Items which must be displayed in the Native Navigation Bar component.

**menuitems container**

A container within the nativeTabMenu container that specifies the items displayed in the tab bar of the Native Navigation Bar component.

Property	Type	Description
name	string	Optional. The label of the tab bar menu item.
targetUrl	string	Required. The relative URL to which the tab bar menu item points.
iconAsset	string	Required. Name of the ContentAsset to use for the tab bar menu item.

*page\_name.json* **File Properties**

Property	Type	Description
cmsSettings	map	Settings for the CMS Connect header and footer. Valid values are: <ul style="list-style-type: none"> <li>• headerName</li> <li>• headerUrl</li> <li>• headerPersonalization</li> <li>• footerName</li> <li>• footerUrl</li> <li>• footerPersonalization</li> </ul> Both source and target org must have the CMSConnect and CMSPersonalization org perms enabled for settings to be retrieved.
currentThemeId	UUID	Required. Represents the UUID of the site's current theme. This field is available for <code>mainAppPage.json</code> and <code>loginAppPage.json</code> (where applicable).
headMarkup	string	Required. Allows the addition of custom markup to the site's main page <code>&lt;head&gt;</code> tag. Similar to using <b>Experience Builder &gt; Setting &gt; Advanced &gt; Head Markup</b> See <a href="#">Salesforce Help for markup guidance</a> .
id	UUID	Required. Represents the component's GUID.
isRelaxedCSPLevel	boolean	Controls the ability to run scripts and script access to third-party hosts. The default is <code>false</code> . This field is available for <code>mainAppPage.json</code> and <code>loginAppPage.json</code> (where applicable).
label	string	Required. Represents the name of the page.
templateName	string	Required. The unique developer name of the template. Allowed values are: <ul style="list-style-type: none"> <li>• Help Center Template (which represents the Help Center template)</li> <li>• CPT Community Template (which represents the Customer Account Portal template)</li> <li>• Service Community Template (which represents the Customer Service template)</li> <li>• Starter Template (which represents the Build Your Own template)</li> <li>• PRM Community Template (which represents the Partner Central template)</li> </ul>

Property	Type	Description
		<ul style="list-style-type: none"> <li>talon-template-byo (which represents the Build Your Own (LWR) template)</li> <li><i>Custom_template_name</i> (which is the name of a customized template that was exported as a Bolt Solution)</li> </ul>
type	string	Required. Represents the component type. The only supported value is appPage.

```
{
  "headMarkup" : null,
  "isRelaxedCSPLLevel" : false,
  "templateName" : "Starter Template",
  "cmsSettings" : { },
  "currentThemeId" : "ff52089c-6ad9-4dd9-b5b5-251d4a117ce3",
  "label" : "main",
  "id" : "df9907cb-6e68-4ca1-8bb2-51173ca5374e",
  "type" : "appPage"
}
```

## routes Folder

The `routes` folder contains one JSON file per page, named `<page_name>.json`.

`<page_name>.json`

Property	Type	Description
activeViewId	UUID	Required. Represents the default view of the route. Used when there are no defined audiences or the user doesn't match any audience.  Available in API version 48.0 and later.
appPageId	UUID	Required. Represents the single page application (SPA) page for the route. It points to either <code>main.json</code> or <code>login.json</code> .
configurationTags	string[]	Required. Represents the configuration tags for the route. The only supported value is <code>allow-in-static-site</code> . Available in API Version 51.0 and later.   <b>Note:</b> This is an internal property and must not be edited.
devName	string[]	Required. Represents the unique API name that's defined when creating a new route. Available in API version 59.0 and later.
id	UUID	Required. Represents the component GUID. Inherited from the component.
label	string	Required. Represents the name of the route. Inherited from the component.
objectApiName	string	Required. The name of the custom object API. (Not available for standard objects.)

Property	Type	Description
pageAccess	string	Required. Identifies the status of a route as public or private. When set to the default value <code>UseParent</code> , the status of the site determines the status of the route. Not editable from the user interface for routes that are always private. Valid values are <code>UseParent</code> , <code>Public</code> , and <code>RequiresLogin</code> .
routeType	string	Required. Identifies the type of route. Value is unique among all routes that share the same SPA page. The value in <code>viewType</code> must match.
type	string	Required. Represents the component type. The only supported value is <code>route</code> .
urlPrefix	string	Required. Represents the base URL for the route.

```
{
  "urlPrefix" : "",
  "appPageId" : "b5fe94e2-071f-47b2-b76d-427a624cb407",
  "configurationTags" : "allow-in-static-site"
  "routeType" : "home",
  "pageAccess" : "UseParent",
  "label" : "Home",
  "id" : "c7263124-7bc4-4147-a39a-25fe7e305b98",
  "type" : "route"
}
```

## themes Folder

The `themes` folder contains one JSON file per theme named `theme_name.json`.

`theme_name.json`

Property	Type	Description
activeBrandingSetId	UUID	The id of the branding set currently in use. The branding set's <code>definitionName</code> must match the theme's <code>brandingSetReference</code> .
customCSS	string	Custom CSS for pages created in the Experience Builder template.
developerName	string	Required. The unique developer name of the theme. Most themes derive their names directly, for example Jepson uses <code>jepson</code> for its <code>developerName</code> . Standard templates have unique values: <ul style="list-style-type: none"> <li>• <code>cpt</code> for Customer Account Portal</li> <li>• <code>service</code> for Customer Service</li> <li>• <code>helpCenter</code> for Help Center</li> <li>• <code>prm</code> for Partner Central</li> <li>• <code>starter</code> for Build Your Own</li> </ul>
id	UUID	Required. Represents the component's GUID.
label	string	Represents the name of the theme.

Property	Type	Description
layouts	map	Required. Maps ThemeLayoutType to UUID, and contains the definition of the ThemeLayout. Login and Inner theme layouts are always required.
type	string	Required. Represents the component type. The only supported value is theme.

```
{
  "developerName" : "cpt",
  "layouts" : {
    "Login" : "12162c3e-06ac-43a9-adc7-db36ae5140b0",
    "Inner" : "c09d58be-0622-4fc4-806a-ed34174929f9"
  },
  "customCSS" : "",
  "activeBrandingSetId" : "283407c3-5938-4a6b-b97f-621cda6968c8",
  "label" : "Customer Account Portal",
  "id" : "ff52089c-6ad9-4dd9-b5b5-251d4a117ce3",
  "type" : "theme",
  "views" : [ {
    "componentName" : "salesforceIdentity:loginBody2",
    "label" : "Login",
    "id" : "12162c3e-06ac-43a9-adc7-db36ae5140b0",
    "type" : "view",
    "regions" : [ {
      "regionName" : "header",
      "id" : "f8354922-11f2-495d-9d89-0a51943af2b0",
      "type" : "region",
      "components" : [ ]
    } ]
  } ]
}
```

 **Note:** Views can be children of a theme. These children are structured the same as [views](#) in the views folder.

## variations Folder

Experience variations let you change the default behavior of the Experience Builder site based on the audience. The `variations` folder contains one JSON file per experience variation. The file is named `experienceVariation_name.json`.

 **Note:**

- Experience variations are available in API version 47.0 and later.
- The name of your JSON file must match the `developerName` of your variation to avoid issues when deploying a site more than one time.

Four distinct types of variations are supported: branding sets, page variations, component visibility, and component attributes. The different variations are indicated through the `componentVariant` container.

For example, you want the site to show a page variation for the home page when a user meets certain audience criteria. To achieve this, create an audience and then target that audience to your experience variation using `targetId` in the `componentVariant` container of the experience variation definition file.

*experienceVariation\_name.json*

Property	Type	Description
componentVariants	list	Required. A list of component variants that belong to this experience variation.  <b>Note:</b> Only one component variant per experience variation is allowed.
developerName	string	Required. The unique developer name of the experience variation. This name is used in the <code>targetValue</code> field of a Personalization API target and can't be updated after it's set.  <b>Note:</b> For more information, see <a href="#">Audience</a> .
id	UUID	Required. Represents the GUID of the component.
type	string	Required. Represents the type of the component. The only supported value is <code>experienceVariation</code> .

When implemented, there's one container in each *experienceVariation\_name.json* file describing the variation.

#### componentVariant container

Property	Type	Description
id	UUID	Required. Represents the GUID of the component.
propertyOverrides	map	Required. Defines the property overrides for the given theme, route, or component <code>targetId</code> .  For example, if the <code>targetId</code> is pointing to a theme, you can override the <code>defaultBrandingSet</code> property of the theme to use a different branding set for this experience variation.  Supported property overrides:  <b>activeBrandingSetId</b> Defines which branding set to use when <code>targetId</code> is a theme. Uses the format: <pre>"activeBrandingSetId" : "ID_of_brandingset"</pre> <b>activeViewId</b> Defines which page variation to use when <code>targetId</code> is a route. Uses the format: <pre>"activeViewId" : "ID_of_view"</pre> <b>componentAttributes</b> Supported only for CMS Collection components and navigation components, such as Navigation Menu or Tile Menu. Components can be placed in header and footer regions, and also in the view body. <ul style="list-style-type: none"><li>Defines which navigation linkset to display when <code>targetId</code> is a navigation component.</li></ul>

Property	Type	Description
		<p>The value of the property is a JSON container with a single key-value pair denoting the attribute and the value of the attribute.</p> <p><code>NavigationMenuEditorRefresh</code> is the only supported attribute. Uses the format:</p> <pre>"componentAttributes" : {   "NavigationMenuEditorRefresh" :   "<b>linkset_name</b>" }</pre> <ul style="list-style-type: none"> <li>Defines which content collection to display when <code>targetId</code> is a CMS Collection component.</li> </ul> <p>The value of the property is a JSON container with a single key-value pair denoting the path to the attribute and the value of the attribute. <code>config/dataProviderDefinition/attributes/dataProviderInfo/apiName</code> is the only supported attribute. Uses the format:</p> <pre>"componentAttributes" : {   "config/dataProviderDefinition/attributes /dataProviderInfo/apiName": "<b>collection_name</b>" }</pre>
		<p><b>isVisible</b></p> <p>Defines whether a component is visible for the audience when <code>targetId</code> is a component. Unsupported for components in header or footer regions. Uses the format:</p> <pre>"isVisible": <b>boolean</b></pre> <ul style="list-style-type: none"> <li> <b>Note:</b> <ul style="list-style-type: none"> <li>Only one entry in the map is allowed.</li> <li>For a component, you can vary either its visibility or attributes but not both together.</li> </ul> </li> </ul>
<code>targetId</code>	UUID	Required. The UUID of the item whose properties you're overriding. Must be the ID of a theme, route, or component.
<code>type</code>	string	Required. Represents the type of the component. The only supported value is <code>experienceVariation</code> .

#### Example of an experience variation for a branding set

```
{
  "id": "64e93604-78fa-11e9-8f9e-2a86e4085a59",
  "developerName": "BrandingVariation",
  "type": "experienceVariation",
  "componentVariants": [{
    "id": "4bf0af78-8d73-11e9-bc42-526af7764f64",
```

```

    "type": "componentVariant",
    // Theme UUID
    "targetId": "c810858e-78fa-11e9-8f9e-2a86e4085a59",
    "propertyOverrides": {
      // Brandingset UUID
      "activeBrandingSetId": "be9f4760-78fa-11e9-8f9e-2a86e4085a59"
    }
  }
}

```

#### Example of an experience variation for a page variation

```

{
  "id": "64e93604-78fa-11e9-8f9e-2a86e4085a59",
  "developerName": "PageVariation",
  "type": "experienceVariation",
  "componentVariants": [{
    "id": "4bf0af78-8d73-11e9-bc42-526af7764f64",
    "type": "componentVariant",
    // Route UUID
    "targetId": "c810858e-78fa-11e9-8f9e-2a86e4085a59",
    "propertyOverrides": {
      // View UUID
      "activeViewId": "be9f4760-78fa-11e9-8f9e-2a86e4085a59"
    }
  }
]}

```

#### Example of an experience variation for component visibility

```

{
  "id": "64e93604-78fa-11e9-8f9e-2a86e4085a59",
  "developerName": "ComponentVisibilityVariation",
  "type": "experienceVariation",
  "componentVariants": [{
    "id": "4bf0af78-8d73-11e9-bc42-526af7764f64",
    "type": "componentVariant",
    // Component UUID
    "targetId": "c810858e-78fa-11e9-8f9e-2a86e4085a59",
    "propertyOverrides": {
      "isVisible": true
    }
  }
]}

```

#### Example of a component variation for a CMS Collection component

```

{
  "id" : "6ce1260f-cb01-45a0-8947-f2d85602a3db"
  "developerName": "Home_CMS_Collection_Component_Properties",
  "type": "experienceVariation",
  "componentVariants": [{
    "id" : "3gh1260f-cb01-45a0-8947-f2d92037a4db"
    "type": "componentVariant",
    "targetId": "d77369e6-7230-43e7-9b59-6e91c47b3273",
    "propertyOverrides": {

```

```

        "componentAttributes": {
"config/dataProviderDefinition/attributes/dataProviderInfo/apiName":"SilverCollection"
        }
    },
    }],
}

```

### Example of a component variation for Navigation Menu component

```

{
  "id" : "8cf943b8-525d-4c13-a719-6ebc7d61a81e",
  "developerName" : "Default_Navigation_Menu_Component_Properties",
  "type" : "experienceVariation",
  "componentVariants" : [{
    "id" : "5be1260f-cb01-45a0-8947-f2d85602a4db",
    "type" : "componentVariant",
    "targetId" : "fdf9eb51-ddc5-4e79-9ea8-5b94f5ca8db4",
    "propertyOverrides" : {
      "componentAttributes" : {
        "NavigationMenuEditorRefresh" : "NavMenu1"
      }
    }
  }],
}

```

## views Folder

The `views` folder contains several JSON files that each define a view. Each Experience Builder site is built from single-page applications, which are web apps that load a single HTML page. Single-page applications consist of multiple views that update the page dynamically as the user interacts with it.

A *view* is made up of *regions* that contain other regions or *components* in the rendered page for the user. Within the `views` folder there's one file per view, named `view_name.json`.

 **Note:** Single-page applications in your site are defined in the [page files](#) of the `config` folder.

`view_name.json`

Property	Type	Description
<code>appPageId</code>	UUID	Required. Single page application (SPA) page ID of the view. It points to either <code>main.json</code> or <code>login.json</code> .
<code>componentName</code>	string	Required. The FQN of the layout component. The component must implement <code>forceCommunity:layout</code> or, for theme layouts, <code>forceCommunity:themeLayout</code>
<code>id</code>	UUID	Required. Represents the GUID of the component.
<code>label</code>	string	Required. The name that appears in <b>Experience Builder &gt; Settings &gt; Theme &gt; Configure</b> .
<code>themeLayoutType</code>	string	Theme layout type of the view (exposed only for views).

Property	Type	Description
type	string	Required. Represents the type of the component. The only supported value is <code>view</code> .
viewType	string	Required. Matches <code>routeType</code> for the route.

There are one or more regions as a container in each `<view_name>.json`

#### region container

Property	Type	Description
id	UUID	Required. Represents the component GUID.
regionLabel	string	Specifies region labels for tabs.  <b>Note:</b> This property is present only for tab regions that are children of a component.
regionName	string	Required. Matches the design attribute in the design file of the layout component.
type	string	Required. Represents the component type. The only supported value is <code>region</code> .

Each `<view_name>.json` file contains a hidden region called `sfdcHiddenRegion`. The hidden region contains a component that represents the SEO assistant component. In Aura sites, the component's definition is `forceCommunity:seoAssistant`, and in LWR sites, the component's definition is `community_builder:seoAssistant`. This component corresponds to the SEO page properties that you can configure in Experience Builder and isn't visible on your pages. To improve search engine results, use the SEO assistant component to set the `customHeadTags`, `description`, and `pageTitle` properties for your public and custom site pages. You can't edit the other properties associated with the SEO assistant component. To learn more about what the title, description, and custom head tags properties represent and which head tags are allowed, see [SEO Page Properties in Experience Builder](#).

There are one or more components as a container in the region section of each `<view_name>.json`

#### component container

Property	Type	Description
componentAttributes	HashMap	Required. The design attribute values of the component.
componentName	string	Required. The FQN of the component. Only components that can be used in the component panel in Experience Builder can be used in this field.
id	UUID	Required. Represents the component GUID.  <b>Note:</b> If you add a component to ExperienceBundle, you can enter any value because the system automatically generates a UUID for the component when deployed.

Property	Type	Description
renderPriority	enums.priority	Sets priority value for progressive rendering of the component. Possible Values: HIGHEST, HIGH, NEUTRAL   <b>Note:</b> Only evaluated if the site has progressive rendering turned on in <b>Experience Builder &gt; Settings &gt; Advanced</b> .
renditionMap	HashMap	Map of different rendition keys to UUIDs of RenditionComponents.
scopedBrandingSetID	UUID	Required for LWR sites. Not applicable for Aura sites. Represents the ID of a branding set for a specific <code>community_layout:section</code> component. Available in API Version 52.0 and later.
type	string	Required. Represents the component type. The only supported value is <code>component</code> .

Each component can have a rendition container in each `<view_name>.json`

#### rendition container

Property	Type	Description
id	UUID	Required. Represents the component GUID.
renditionValue	map	Map of different variations of a component, such as different languages of text.
type	string	Required. Represents the component type. The only supported value is <code>renditionComponent</code> .

```
{
  "themeLayoutType" : "Inner",
  "viewType" : "account-management",
  "appPageId" : "df9907cb-6e68-4ca1-8bb2-51173ca5374e",

    "type" : "renditionComponent"
  } ]
} ]
} ]
}

```

## Declarative Metadata Sample Definition

Here's an example of an ExperienceBundle declaration. For individual folder and file examples for the bundled code, see [brandingSets](#), [config](#), [routes](#), [themes](#), [variations](#), and [views](#).

```

<xsd:complexType name="ExperienceBundle">
  <xsd:complexContent>
    <xsd:extension base="tns:Metadata">
      <xsd:sequence>
        <xsd:element name="experienceResources" minOccurs="0"
type="tns:ExperienceResources"/>
        <xsd:element name="label" type="xsd:string"/>
        <xsd:element name="type" type="tns:SiteType"/>
      </xsd:sequence>
    </xsd:extension>
  </xsd:complexContent>
</xsd:complexType>
<xsd:complexType name="ExperienceResources">
  <xsd:sequence>
    <xsd:element name="experienceResource" minOccurs="0" maxOccurs="unbounded"

```

```
type="tns:ExperienceResource"/>
  </xsd:sequence>
</xsd:complexType>
<xsd:complexType name="ExperienceResource">
  <xsd:sequence>
    <xsd:element name="fileName" type="xsd:string"/>
    <xsd:element name="format" type="xsd:string"/>
    <xsd:element name="source" minOccurs="0" type="xsd:base64Binary"/>
    <xsd:element name="type" type="xsd:string"/>
  </xsd:sequence>
</xsd:complexType>
```

## Usage

 **Tip:** Before you update the .json files of an Experience Builder site, we recommend making a copy of the site's folder as a backup.

When you add a component to ExperienceBundle, you can enter any value for the `id`, because the system automatically generates a UUID for the component when deployed.

When deploying an Experience Builder site with ExperienceBundle, ensure that the SiteDotCom type isn't included in the manifest file.

ExperienceBundle doesn't support retrieving and deploying across different API versions. If you're trying to upgrade ExperienceBundle metadata from an earlier API version to a later one—for example, from API version 48.0 to 49.0—take the following steps:

1. Set the API version in the package.xml manifest file to 48.0 and deploy the package.
2. Then, set the API version in package.xml to 49.0.
3. To get the latest ExperienceBundle updates, retrieve the package.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[ExperienceBundleSettings](#)

[Developer Guide: ExperienceBundle for Experience Builder Sites](#)

## ExperiencePropertyTypeBundle (Beta)

---

Represents a property type. When you create a custom property type for a Lightning web component, deploy this bundle to your org.

-  **Note:** This feature is a Beta Service. Customer may opt to try such Beta Service in its sole discretion. Any use of the Beta Service is subject to the applicable Beta Services Terms provided at [Agreements and Terms](#).
-  **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Structure and Directory Location

ExperiencePropertyTypeBundle components are stored in the `experiencePropertyTypeBundles` folder. Here's an example of how the folder is structured.

```

+--myMetadataPackage
  +--experiencePropertyTypeBundles (1)
    +--addressProperty (2)
      +--schema.json (3)
      +--design.json (4)
  
```

- In the `experiencePropertyTypeBundles` folder (1) is a folder for each custom property type.
- Each custom property type folder is named in the format `propertyName`. In this example (2), the name is `addressProperty`.
- Each `propertyName` folder contains a JSON file or files that define the property type.
  - A `schema.json` file (3), which is a JSON schema that drives the property type validation
  - An optional `design.json` file (4), which provides the user experience and property editor information for that property type

## Version

ExperiencePropertyTypeBundle components are available in API version 58.0 and later.

## Special Access Rules

The ExperiencePropertyTypeBundle metadata type is available only for use with Lightning web components on LWR sites.

## Fields

Field Name	Description
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Explanatory text about the property type.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for ExperiencePropertyTypeBundle, which is defined when the ExperiencePropertyTypeBundle is created.</p>
<code>resources</code>	<p><b>Field Type</b> <a href="#">ExperiencePropertyTypeBundleResource[]</a></p>

Field Name	Description
	<p><b>Description</b></p> <p>A list of source files in the experiencePropertyTypeBundles folder.</p>

## ExperiencePropertyTypeBundleResource

Represents a resource inside ExperiencePropertyTypeBundle.

Field Name	Description
fileName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The file name of the resource.</p>
filePath	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required. The file path of the resource.</p>
source	<p><b>Field Type</b></p> <p>base64Binary</p> <p><b>Description</b></p> <p>Required. The content of the resource.</p>

## Declarative Metadata Sample Definition

This package.xml file retrieves all the ExperiencePropertyTypeBundle components in an org.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ExperiencePropertyTypeBundle</name>
  </types>
  <version>58.0</version>
</Package>
```

In the retrieved .zip file, each property type is nested under an experiencePropertyTypeBundles folder.

This example shows the directory structure in the .zip file of a property type named addressProperty.

```
experiencePropertyTypeBundles
  addressProperty
    schema.json
    design.json
```

Here are the contents of the files in the addressProperty directory. The addressProperty is a complex type that includes subproperties for firstName, lastName, address, city, state, and postal code. Each subproperty is a primitive type.

Contents of schema.json:

```
{
  "title": "Simple Address Type",
  "lightning:type": "lightning__objectType",
  "properties": {
    "firstName": {
      "lightning:type": "lightning__textType",
      "title": "First Name"
    },
    "lastName": {
      "lightning:type": "lightning__textType",
      "title": "Last Name"
    },
    "address": {
      "lightning:type": "lightning__textType",
      "title": "Address Line 1"
    },
    "city": {
      "lightning:type": "lightning__textType",
      "title": "City"
    },
    "state": {
      "lightning:type": "lightning__textType",
      "title": "State"
    },
    "postalCode": {
      "lightning:type": "lightning__numberType",
      "title": "Postal Code"
    }
  },
  "required": ["firstName", "lastName"]
}
```

Contents of design.json (an optional file):

```
{
  "definition": "lightning/tabsetLayout",
  "children": [
    {
      "definition": "lightning/tabLayout",
      "attributes": {
        "label": "First Tab"
      },
      "children": [
        {
          "definition": "lightning/propertyLayout",
          "attributes": {
            "property": "aProperty"
          }
        },
        {
          "definition": "lightning/propertyLayout",

```

```

        "attributes": {
            "property": "bProperty"
        }
    },
]
},
{
    "definition": "lightning/tabLayout",
    "attributes": {
        "label": "Second Tab"
    },
    "children": [
        {
            "definition": "lightning/propertyLayout",
            "attributes": {
                "property": "cProperty"
            }
        },
    ],
]
},
]
}

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

[External Link: Custom Property Types and Property Editors \(Beta\)](#)

## ExplainabilityMsgTemplate

---

Represents information about the template that contains the decision explanation message for a specified expression set step type.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`ExplainabilityMsgTemplate` components have the suffix `.explainabilityMsgTemplate` and are stored in the `ExplainabilityMsgTemplates` folder.

### Version

`ExplainabilityMsgTemplate` components are available in API version 56.0 and later.

## Fields

Field Name	Description
expressionSetStepType	<p><b>Field Type</b> ExpressionSetStepType (enumeration of type string)</p> <p><b>Description</b> Required. The step type in an expression set that uses the explainability message template. Valid values are:</p> <ul style="list-style-type: none"> <li>• Aggregation</li> <li>• Branch</li> <li>• BusinessElement</li> <li>• Calculation</li> <li>• Condition</li> <li>• DecisionTableLookup</li> <li>• ListEnabledGroup</li> <li>• ListFilter</li> <li>• MatrixLookup</li> <li>• ReferenceProcedure</li> </ul>
evaluationResult	<p><b>Field Type</b> EvaluationResult (enumeration of type string)</p> <p><b>Description</b> Required. The type of result for which the message template can be used. The step type for which the result is evaluated can be a condition, conditional group, or branch. Valid values are:</p> <ul style="list-style-type: none"> <li>• Failed</li> <li>• Passed</li> <li>• NoResult</li> </ul>
isDefault	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the decision explainer template for a specified step type is default (true) or not (false).</p>
masterLabel	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>Master label the for ExplainabilityMsgTemplate.</p>
message	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The message associated with the template for a specific expression set step type.</p>

## Declarative Metadata Sample Definition

The following is an example of an ExplainabilityMsgTemplate component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExplainabilityMsgTemplate xmlns="http://soap.sforce.com/2006/04/metadata">
  <evaluationResult>Passed</evaluationResult>
  <expressionSetStepType>Condition</expressionSetStepType>
  <isDefault>>false</isDefault>
  <masterLabel>ML EMT testDM</masterLabel>
  <message>EMT Testing</message>
</ExplainabilityMsgTemplate>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ExplainabilityMsgTemplate</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ExpressionSetDefinition

Represents an expression set definition.

 **Note:** Before deploying an expression set or an expression set version to a target org, review these [Expression Set Migration Considerations](#).

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

ExpressionSetDefinition components have the suffix `.expressionSetDefinition` and are stored in the `expressionSetDefinition` folder.

## Version

ExpressionSetDefinition components are available in API version 55.0 and later.

## Fields

Field Name	Description
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of an expression set definition.</p>
<code>executionScale</code>	<p><b>Field Type</b> ExpsSetExecutionScale (enumeration of type string)</p> <p><b>Description</b> Specifies the scale of the inputs that an expression set processes. The scale determines where the expression set is executed.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• High</li> <li>• Low</li> </ul> <p>Available in API version 61.0 and later.</p>
<code>interfaceSourceType</code>	<p><b>Field Type</b> ExpsSetInterfaceSourceType (enumeration of type string)</p> <p><b>Description</b> The interface source type designed by the consuming cloud that's making a customized expression set builder available to its users.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• Constraint (Available in API version 62.0 and later).</li> <li>• DiscoveryProcedure (Available in API version 61.0 and later).</li> <li>• EventOrchestration (Available in API version 61.0 and later).</li> <li>• PricingProcedure</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• <code>QualificationProcedure</code></li> <li>• <code>RatingDiscoveryProcedure</code> (Available in API version 61.0 and later).</li> <li>• <code>Sample</code></li> </ul> <p>Available in API version 59.0 and later.</p>
<code>label</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The UI label of an expression set definition.</p>
<code>processType</code>	<p><b>Field Type</b> <code>ExpsSetProcessType</code> (enumeration of type string)</p> <p><b>Description</b> The process type that uses the expression set rule. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>Bre</code>—Business Rules Engine</li> <li>• <code>TransactionJournal</code></li> <li>• <code>TierProcessing</code></li> <li>• <code>CustomLoyalty</code></li> </ul>
<code>template</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Defines whether an expression set is a template or not.</p>
<code>versions</code>	<p><b>Field Type</b> <a href="#">ExpressionSetDefinitionVersion[]</a></p> <p><b>Description</b> Represents an array of expression set version definitions in an expression set.</p> <p> <b>Note:</b> This array must contain at least one version.</p>

## ExpressionSetDefinitionVersion

Represents a definition of an expression set version.

Field Name	Description
<code>description</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b> Describes the version of an expression set definition.</p>
endDate	<p><b>Field Type</b> dateTime</p> <p><b>Description</b> The date until which the expression set definition is available for use.</p>
expressionSetDefinition	<p><b>Field Type</b> string</p> <p><b>Description</b> The full name of an expression set definition.</p>
label	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The UI label of an expression set definition.</p>
rank	<p><b>Field Type</b> int</p> <p><b>Description</b> The rank of the <code>Expression Set Definition Version</code>. When more than one enabled version matches an expression set call, and the start date time to end date time spans overlap, the version with the highest rank is chosen. Available in API version 62.0 and later.</p>
shouldShowExplExternally	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether the decision explanation is exposed to external users (<code>true</code>) or not (<code>false</code>). The default value is <code>false</code>. Available in API version 56.0 and later.</p>
startDate	<p><b>Field Type</b> dateTime</p> <p><b>Description</b> Required. The date from when the expression set definition is available for use.</p>
status	<p><b>Field Type</b> ExpssetStatus (enumeration of type string)</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required.</p> <p>The status of an expression set definition.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Draft</li> <li>• Inactive</li> <li>• InvalidDraft</li> <li>• Obsolete</li> </ul>
steps	<p><b>Field Type</b></p> <p><a href="#">ExpressionSetStep[]</a></p> <p><b>Description</b></p> <p>Represents an array of steps created in an expression set version.</p>
uiTier	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether the API call originated from the design time builder or a package.</p> <p> <b>Note:</b> This field is for internal use only.</p>
variables	<p><b>Field Type</b></p> <p><a href="#">ExpressionSetVariable[]</a></p> <p><b>Description</b></p> <p>Represents an array of variables in an expression set version.</p>
versionNumber	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Required.</p> <p>The version number of an expression set definition.</p>

## ExpressionSetStep

Represents a step in an expression set version.

Field Name	Description
actionType	<p><b>Field Type</b></p> <p>BusinessKnowledgeModel (enumeration of type string)</p>

**Field Name****Description****Description**

Specifies the type of action this step executes.

Valid values are:

- AiAcceleratorSubscriberChurnPrediction
- ApexAction
- AssetDiscovery
- AssignBadgeToMember
- AssignParameterValues
- AssignmentElement
- BaseRate
- BreAggregator
- BreAggregatorAssignment
- ChangeMemberTier
- CheckMemberBadgeAssignment
- CommercePricing (Available in API version 62.0 and later.)
- ComplianceCheck
- ComplianceControlLog (Available in API version 62.0 and later.)
- CreditPoints
- Crud
- DebitPoints
- DerivedPricing
- DiscountDistributionService
- EvaluateCategoryDisqualification (Available in API version 62.0 and later.)
- EvaluateCategoryQualification (Available in API version 62.0 and later.)
- FlowAction (Available in API version 62.0 and later.)
- FormulaBasedRating (Available in API version 62.0 and later.)
- FormulaBasedPricing
- GetMemberAttributesValues
- GetMemberPointBalance
- GetMemberPromotions
- GetMemberTier
- GetOutputsFromDecisionMatrix
- GetOutputsFromDecisionTable
- GroupingAndAggregateRating (Available in API version 62.0 and later.)
- IncreaseUsageForCumulativePromotion
- IntegrationOrchestration
- IssueVoucher

Field Name	Description
	<ul style="list-style-type: none"> <li>• <code>ManualRatingDiscount</code> (Available in API version 62.0 and later.)</li> <li>• <code>MapProduct</code></li> <li>• <code>MinimumPrice</code> (Available in API version 62.0 and later.)</li> <li>• <code>PricingSettings</code></li> <li>• <code>PromotionsDiscount</code></li> <li>• <code>RateAdjustmentByAttributeResolution</code> (Available in API version 62.0 and later.)</li> <li>• <code>RateAdjustmentByTierResolution</code> (Available in API version 62.0 and later.)</li> <li>• <code>RateAdjustmentMatrix</code> (Available in API version 62.0 and later.)</li> <li>• <code>RateAssignment</code> (Available in API version 62.0 and later.)</li> <li>• <code>RateCardEntryResolution</code> (Available in API version 62.0 and later.)</li> <li>• <code>RateCardResolution</code> (Available in API version 62.0 and later.)</li> <li>• <code>RatingAttributeDiscount</code></li> <li>• <code>RatingRoundingValues</code> (Available in API version 62.0 and later.)</li> <li>• <code>RatingSetting</code></li> <li>• <code>RatingTierDiscount</code></li> <li>• <code>RatingVolumeDiscount</code></li> <li>• <code>RecordAction</code></li> <li>• <code>RoundingValues</code></li> <li>• <code>RuleFetch</code></li> <li>• <code>RunFlow</code></li> <li>• <code>RunProgramProcess</code></li> <li>• <code>SampleCustomElementWithExpressionAndListFilter</code></li> <li>• <code>StopPricing</code></li> <li>• <code>StopRating</code> (Available in API version 62.0 and later.)</li> <li>• <code>TestCustomElement</code></li> <li>• <code>UpdateCurrentValueForMemberAttribute</code></li> <li>• <code>UpdatePointBalance</code></li> <li>• <code>UpdateUsageForCumulativePromotion</code></li> <li>• <code>VolumeTierDiscount</code></li> </ul>
advancedCondition	<p><b>Field Type</b>  <a href="#">ExpressionSetAdvancedCondition</a></p> <p><b>Description</b>  Represents an advanced condition step.</p>
aggregation	<p><b>Field Type</b>  <a href="#">ExpressionSetAggregation</a></p>

Field Name	Description
	<p><b>Description</b> Represents an aggregation step.</p>
assignment	<p><b>Field Type</b> <a href="#">ExpressionSetAssignment</a></p> <p><b>Description</b> Represents an assignment step.</p>
conditionExpression	<p><b>Field Type</b> <a href="#">ExpressionSetConditionExpression</a></p> <p><b>Description</b> Represents a condition step.</p>
customElement	<p><b>Field Type</b> <a href="#">ExpressionSetCustomElement</a></p> <p><b>Description</b> Represents a custom element step that contains the input and output mappings. Available in API version 56.0 and later.</p>
decisionTable	<p><b>Field Type</b> <a href="#">ExpressionSetDecisionTable</a></p> <p><b>Description</b> Represents a decision matrix or decision table step.</p>
description	<p><b>Field Type</b> string</p> <p><b>Description</b> Describes an expression set definition version step.</p>
failedExplainerTemplate	<p><b>Field Type</b> string</p> <p><b>Description</b> The explainability message template that's used when the result type of a condition step in an expression set is Failed.</p>
failedMessageTokenMappings	<p><b>Field Type</b> ExplainabilityMessageTemplateTokenMapping (enumeration of type string)</p> <p><b>Description</b> List of the token resource mappings of the failed explainability message template. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>expressionSetMessageToken</code></li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• resourceReference</li> </ul> <p>Available in API version 59.0 and later.</p>
label	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The UI label of an expression set definition version step.</p>
name	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The full name of an expression set definition version step.</p>
noResultExplainerTemplate	<p><b>Field Type</b> string</p> <p><b>Description</b> The explainability message template that's used when the result type of a condition step in an expression set is No Result. Available in API version 59.0 and later.</p>
noResultMessageTokenMappings	<p><b>Field Type</b> ExplainabilityMessageTemplateTokenMapping (enumeration of type string)</p> <p><b>Description</b> List of the token resource mappings of the no result explainability message template. Valid values are:</p> <ul style="list-style-type: none"> <li>• expressionSetMessageToken</li> <li>• resourceReference</li> </ul> <p>Available in API version 59.0 and later.</p>
parentStep	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the parent step in an expression set definition version that's associated with a step.</p>
passedExplainerTemplate	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>The explainability message template that's used when the result type of a condition step in an expression set is Passed.</p>
passedMessageTokenMappings	<p><b>Field Type</b> ExplainabilityMessageTemplateTokenMapping (enumeration of type string)</p> <p><b>Description</b></p> <p>List of the token resource mappings of the passed explainability message template. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>expressionSetMessageToken</code></li> <li>• <code>resourceReference</code></li> </ul> <p>Available in API version 59.0 and later.</p>
resultIncluded	<p><b>Field Type</b> boolean</p> <p><b>Description</b></p> <p>Indicates whether the step output must be included in the expression result (true) or not (false).</p>
sequenceNumber	<p><b>Field Type</b> int</p> <p><b>Description</b></p> <p>Required.</p> <p>The sequence number of a step in an expression set definition version.</p>
shouldExposExecPathMsgOnly	<p><b>Field Type</b> boolean</p> <p><b>Description</b></p> <p>Indicates whether the message in the explainability message template is exposed for only the branch path that was run.</p>
shouldExposeConditionDetails	<p><b>Field Type</b> boolean</p> <p><b>Description</b></p> <p>Indicates whether the details of the condition are shown in the decision explanation.</p>
shouldShowExplExternally	<p><b>Field Type</b> boolean</p> <p><b>Description</b></p> <p>Indicates whether the decision explanations are shown to external users.</p>

Field Name	Description
stepType	<p><b>Field Type</b> ExpsSetStepType (enumeration of type string)</p> <p><b>Description</b> Required. Specifies the type of step in an expression set definition version. Valid values are:</p> <ul style="list-style-type: none"> <li>• AdvancedCondition</li> <li>• Branch</li> <li>• BusinessKnowledgeModel</li> <li>• Condition</li> <li>• DefaultPath</li> <li>• SubExpression</li> </ul>
subExpression	<p><b>Field Type</b> <a href="#">ExpressionSetSubExpression</a></p> <p><b>Description</b> Represents a sub expression step.</p>

## ExpressionSetAdvancedCondition

Represents an advanced condition step.

Field Name	Description
conditionLogic	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The condition that's defined for an advanced condition.</p>
criteria	<p><b>Field Type</b> <a href="#">ExpressionSetConditionCriteria []</a></p> <p><b>Description</b> Represents an array of criteria defined in the advanced condition.</p>
errorMessage	<p><b>Field Type</b> string</p> <p><b>Description</b> An error message for a failed advanced condition.</p>

Field Name	Description
resultParameter	<p><b>Field Type</b> string</p> <p><b>Description</b> An expression set definition version variable associated with the result of a step.</p>
successMessage	<p><b>Field Type</b> string</p> <p><b>Description</b> A success message for a successful advanced condition.</p>

## ExpressionSetConditionCriteria

Represents a criterion defined in an advanced condition.

Field Name	Description
operator	<p><b>Field Type</b> ExpsSetConditionOperator (enumeration of type string)</p> <p><b>Description</b> Required. Specifies the operator for evaluating an expression. Valid values are:</p> <ul style="list-style-type: none"> <li>• Contains</li> <li>• DoesNotContain</li> <li>• Equals</li> <li>• GreaterThan</li> <li>• GreaterThanOrEquals</li> <li>• IsNull</li> <li>• IsNotNull</li> <li>• LessThan</li> <li>• LessThanOrEquals</li> <li>• NoEquals</li> </ul>
sequenceNumber	<p><b>Field Type</b> int</p> <p><b>Description</b> Required. The position of the condition in a step that contains multiple conditions.</p>

Field Name	Description
sourceFieldName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>The expression set definition version variable associated with the result of a condition criterion.</p>
value	<p><b>Field Type</b> string</p> <p><b>Description</b> Specifies the condition of a criterion.</p>
valueType	<p><b>Field Type</b> ExpsSetValueType (enumeration of type string)</p> <p><b>Description</b> Specifies the type of value.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• Formula</li> <li>• Literal</li> <li>• Lookup</li> <li>• Parameter</li> <li>• Picklist</li> </ul>

## ExpressionSetAggregation

Represents an aggregation step.

Field Name	Description
aggregatedParameter	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>The expression set definition version variable associated with the result of a condition criterion.</p>
aggregateFunction	<p><b>Field Type</b> ExpsSetAggregationFunction (enumeration of type string)</p> <p><b>Description</b> Required.</p>

Field Name	Description
	<p>Specifies the aggregation function used in a step.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• Avg</li> <li>• Max</li> <li>• Min</li> <li>• Sum</li> </ul>
<code>expression</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>Specifies the expression of an aggregation.</p>

## ExpressionSetAssignment

Represents an assignment step.

Field Name	Description
<code>aggregatedParameter</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>The expression set definition version variable associated with a step detail.</p>
<code>expression</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>The expression that's defined for a step.</p>

## ExpressionSetConditionExpression

Represents a condition in a condition step.

Field Name	Description
<code>errorMessage</code>	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>An error message for a failed condition.</p>
<code>expression</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The expression that's defined for a step.</p>
<code>resultParameter</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The expression set definition version variable associated with the result of a step.</p>
<code>successMessage</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>A success message for a successful condition.</p>

## ExpressionSetCustomElement

Represents a custom element in an expression set. Available in API version 56.0 and later.

Field Name	Description
<code>parameters</code>	<p><b>Field Type</b></p> <p><a href="#">ExpressionSetElementParameter[]</a></p> <p><b>Description</b></p> <p>Represents the list of parameters in the custom element.</p>

## ExpressionSetElementParameter

Represents a parameter within a custom element of an expression set. Available in API version 56.0 and later.

Field Name	Description
<code>input</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Required.</p> <p>Indicates whether the custom element parameter is input (<code>true</code>) or not (<code>false</code>).</p>

Field Name	Description
	The default value is <code>true</code> .
<code>name</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the custom element parameter.</p>
<code>output</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. Indicates whether the custom element parameter is output (<code>true</code>) or not (<code>false</code>). The default value is <code>true</code>.</p>
<code>type</code>	<p><b>Field Type</b> ExpsSetValueType (enumeration of type string)</p> <p><b>Description</b> The type of custom element parameter. Values are:</p> <ul style="list-style-type: none"> <li>• Formula</li> <li>• Literal</li> <li>• Lookup</li> <li>• Parameter</li> <li>• PickList</li> </ul> <p>The default value is <code>Parameter</code>.</p>
<code>value</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the expression set variable.</p>

## ExpressionSetDecisionTable

Represents a decision table or decision matrix in a step.

Field Name	Description
decisionTableName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The decision matrix or decision table name used in a step.</p>
mappings	<p><b>Field Type</b> <a href="#">ExpressionSetElementParameter[]</a></p> <p><b>Description</b> The mapping information between various parameters in an ExpressionSetDecisionTable. Available in API version 59.0 and later.</p>
type	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The type in a step. It can be a decision table or decision matrix.</p>

## ExpressionSetSubExpression

Represents a sub expression in a step.

Field Name	Description
expressionSet	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The sub expression name used in a step.</p>
mappings	<p><b>Field Type</b> <a href="#">ExpressionSetElementParameter[]</a></p> <p><b>Description</b> The mapping information between various parameters in an ExpressionSetDecisionTable. Available in API version 61.0 and later.</p>

## ExpressionSetVariable

Represents a definition of an expression set variable.

Field Name	Description
collection	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether a variable stores a collection of values (<code>true</code>) or not (<code>false</code>).</p>
dataType	<p><b>Field Type</b> ExpsSetDataType (enumeration of type string)</p> <p><b>Description</b> Required. The data type of an expression set variable. Valid values are:</p> <ul style="list-style-type: none"> <li>• ActionOutput</li> <li>• Boolean</li> <li>• Currency</li> <li>• Date</li> <li>• DateTime</li> <li>• DecisionMatrix</li> <li>• DecisionTable</li> <li>• Numeric</li> <li>• Percent</li> <li>• Subject</li> <li>• SubExpression</li> <li>• Text</li> </ul>
decimalPlaces	<p><b>Field Type</b> int</p> <p><b>Description</b> The decimal digits in the currency, number, or percent data type for an expression set variable.</p>
description	<p><b>Field Type</b> string</p> <p><b>Description</b> The description of the variable used in an expression set.</p>
fields	<p><b>Field Type</b> <a href="#">ExpressionSetVariableField</a> []</p> <p><b>Description</b> Represents an array of fields in an object that is used as a variable in an expression set.</p>

Field Name	Description
input	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether an expression set variable is used as an input (<code>true</code>) in an expression or not (<code>false</code>).</p>
lookupName	<p><b>Field Type</b> string</p> <p><b>Description</b> The API name of a decision matrix, a decision table, or a sub expression.</p>
lookupType	<p><b>Field Type</b> ExpsSetVariableLookupType (enumeration of type string)</p> <p><b>Description</b> The type of the lookup used in an expression set definition. Valid values are:</p> <ul style="list-style-type: none"> <li>• DecisionMatrix</li> <li>• DecisionTable</li> <li>• SubExpression</li> </ul>
name	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  The full name of the variable used in an expression set definition.</p>
objectName	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the sObject.</p>
output	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether an expression set variable is used as an output in an expression(<code>true</code>) or not (<code>false</code>).</p>
resultStep	<p><b>Field Type</b> string</p> <p><b>Description</b> The step that produces the expression set variable.</p>

Field Name	Description
type	<p><b>Field Type</b> ExpsSetVariableType (enumeration of type string)</p> <p><b>Description</b> Required. The type of variable in an expression set definition. Valid values are:</p> <ul style="list-style-type: none"> <li>• Constant</li> <li>• ContextDynamicAttributeTag (Available in API version 62.0 and later.)</li> <li>• Formula</li> <li>• Variable</li> </ul>
value	<p><b>Field Type</b> string</p> <p><b>Description</b> Represents a constant value or a formula.</p> <p> <b>Note:</b> It stores the default value of a variable.</p>

## ExpressionSetVariableField

Represents a definition of a field in an object that is used as a variable in an expression set.

Field Name	Description
dataType	<p><b>Field Type</b> ExpsSetDataType (enumeration of type string)</p> <p><b>Description</b> Required. Specifies the type of data stored in an expression set variable. Valid values are:</p> <ul style="list-style-type: none"> <li>• ActionOutput</li> <li>• Boolean</li> <li>• Currency</li> <li>• Date</li> <li>• DateTime</li> <li>• DecisionMatrix</li> <li>• DecisionTable</li> <li>• Numeric</li> <li>• Percent</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• Subject</li> <li>• SubExpression</li> <li>• Text</li> </ul>
decimalPlaces	<p><b>Field Type</b> int</p> <p><b>Description</b> The decimal digits in the currency, number, or percent data type for an expression set variable.</p>
fields	<p><b>Field Type</b> <a href="#">ExpressionSetVariableField</a> []</p> <p><b>Description</b> Represents an array of fields in an object that is used as a variable in an expression set.</p>
lookupName	<p><b>Field Type</b> string</p> <p><b>Description</b> The API name of a decision matrix, a decision table, or a sub expression.</p>
lookupType	<p><b>Field Type</b> ExpsSetVariableLookupType (enumeration of type string)</p> <p><b>Description</b> Required. The type of lookup used in an expression set definition. Valid values are:</p> <ul style="list-style-type: none"> <li>• DecisionMatrix</li> <li>• DecisionTable</li> <li>• SubExpression</li> </ul>
name	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The full name of the field used in an expression set variable.</p>
objectName	<p><b>Field Type</b> string</p> <p><b>Description</b> The name of the sObject.</p>

## Declarative Metadata Sample Definition

The following is an example of an ExpressionSetDefinition component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExpressionSetDefinition xmlns="http://soap.sforce.com/2006/04/metadata">

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ExpressionSetDefinition</name>
  </types>
  <version>62.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ExpressionSetMessageToken

---

Represents an interface to retrieve, deploy, create, update, or delete information on Expression Set Message Token.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

ExpressionSetMessageToken components have the suffix `expressionSetMessageToken` and are stored in the `ExpressionSetMessageToken` folder.

## Version

ExpressionSetMessageToken components are available in API version 59.0 and later.

## Special Access Rules

InteractionCalculation.orgHasBREandDESAccess Org permission set license is required for users to access this metadata type.

## Fields

Field Name	Description
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Description of the expression set message token.</p>
<code>developerName</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Developer name of the expression set message token.</p>
<code>masterLabel</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A user-friendly name for ExpressionSetMessageToken, which is defined when the ExpressionSetMessageToken is created.</p>

## Declarative Metadata Sample Definition

The following is an example of an ExpressionSetMessageToken component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExpressionSetMessageToken xmlns="http://soap.sforce.com/2006/04/metadata">
  <developerName>token</developerName>
```

```
<description>Description</description>
<masterLabel>token</masterLabel>
</ExpressionSetMessageToken>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ExpressionSetMessageToken</name>
  </types>
  <version>59.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ExpressionSetObjectAlias

---

Represents information about the alias of the source object that's used in an expression set.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`ExpressionSetObjectAlias` components have the suffix `.expressionSetObjectAlias` and are stored in the `expressionSetObjectAlias` folder.

### Version

`ExpressionSetObjectAlias` components are available in API version 56.0 and later.

### Fields

Field Name	Description
<code>dataType</code>	<p><b>Field Type</b> ExpsSetObjectDataType (enumeration of type string)</p> <p><b>Description</b> Required. The data type of the object alias.</p>

Field Name	Description
	Values are: <ul style="list-style-type: none"> <li>• JSON</li> <li>• sObject</li> </ul>
mappings	<b>Field Type</b> <a href="#">ExpressionSetObjectAliasField[]</a> <b>Description</b> The mapping between a source field and its corresponding field alias.
objectApiName	<b>Field Type</b> string <b>Description</b> Required. The API name of the top-level object, when the data type is sObject. The key of the top-level object, when the data type is JSON.
usageType	<b>Field Type</b> ExpsSetProcessType (enumeration of type string) <b>Description</b> Required. The type of application associated with the industry that's using an expression set. Your Salesforce org admin can define the values.

## ExpressionSetObjectAliasField

The fields associated with the source object for which the object alias is created.

Field Name	Description
fieldAlias	<b>Field Type</b> string <b>Description</b> Required. The field alias associated with the source field name.
sourceFieldName	<b>Field Type</b> string <b>Description</b> Required.

Field Name	Description
	The name of the source field for which the field alias is created. The source field name under an object alias must be unique.

## Declarative Metadata Sample Definition

The following is an example of an ExpressionSetObjectAlias component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExpressionSetObjectAlias xmlns="http://soap.sforce.com/2006/04/metadata">
  <dataType>sObject</dataType>
  <mappings>
    <fieldAlias>dum2</fieldAlias>
    <sourceFieldName>CreatedBy.Contact.Name</sourceFieldName>
  </mappings>
  <mappings>
    <fieldAlias>dum3</fieldAlias>
    <sourceFieldName>CreatedBy.Name</sourceFieldName>
  </mappings>
  <mappings>
    <fieldAlias>dum1</fieldAlias>
    <sourceFieldName>Owner.Contact.Name</sourceFieldName>
  </mappings>
  <objectApiName>Account</objectApiName>
  <usageType>Bre</usageType>
</ExpressionSetObjectAlias>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package
  xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ExpressionSetObjectAlias</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ExternalAuthIdentityProvider

Represents an external authentication (auth) identity provider. Use an external auth identity provider to simplify the configuration process for the authentication providers used by your named credentials. An external auth identity provider links to an external credential and securely stores credentials in Salesforce for an external service provider, such as Facebook, Google, or GitHub.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`ExternalAuthIdentityProvider` components have the suffix `.externalAuthIdentityProvider` and are stored in the `externalAuthIdentityProviders` folder.

## Version

`ExternalAuthIdentityProvider` components are available in API version 62.0 and later.

## Special Access Rules

Only users with the `Customize Application` permission or the `Manage Named Credentials` permission can access this type.

## Fields

Field Name	Description
<code>authenticationFlow</code>	<p><b>Field Type</b> IdentityProviderAuthFlow (enumeration of type string)</p> <p><b>Description</b> Required. Authentication flow to get tokens to call protected APIs. Values are:</p> <ul style="list-style-type: none"> <li>• <code>AuthorizationCode</code></li> </ul>
<code>authenticationProtocol</code>	<p><b>Field Type</b> IdentityProviderAuthProtocol (enumeration of type string)</p> <p><b>Description</b> Required. The authentication protocol that's required to access the external system. Values are:</p> <ul style="list-style-type: none"> <li>• <code>OAuth</code></li> </ul>
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> A meaningful description of the external auth identity provider.</p>
<code>externalAuthIdentityProviderParameters</code>	<p><b>Field Type</b> <a href="#">ExternalAuthIdentityProviderParameter[]</a></p>

Field Name	Description
	<p><b>Description</b></p> <p>One or more sets of parameters that further configure the external auth identity provider.</p>
label	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>Name of the external auth identity provider.</p>

## ExternalAuthIdentityProviderParameter

Represents the parameters that configure an external auth identity provider.

Field Name	Description
description	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>A human-readable description of this external auth identity provider parameter.</p>
parameterName	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The name of the external auth identity provider parameter.</p>
parameterType	<p><b>Field Type</b></p> <p>ExtlIdentityProviderParmType (enumeration of type string)</p> <p><b>Description</b></p> <p>Required.</p> <p>The type of external auth identity provider parameter. The value of this field drives the behavior of the parameter. Values are:</p> <ul style="list-style-type: none"> <li>• AuthorizeUrl</li> <li>• CreatedByNamespace</li> <li>• TokenUrl</li> <li>• UserInfoUrl</li> </ul>
parameterValue	<p><b>Field Type</b></p> <p>string</p>

Field Name	Description
	<p><b>Description</b></p> <p>If the <code>parameterType</code> field describes a literal value then the literal value is stored in this field.</p>

## Declarative Metadata Sample Definition

The following is an example of an `ExternalAuthIdentityProvider` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExternalAuthIdentityProvider xmlns="http://soap.sforce.com/2006/04/metadata">
  <authenticationFlow>AuthorizationCode</authenticationFlow>
  <authenticationProtocol>OAuth</authenticationProtocol>
  <description>OAuth Browser flow for connected app</description>
  <externalAuthIdentityProviderParameters>
    <parameterName>TokenUrl</parameterName>
    <parameterType>TokenUrl</parameterType>
    <parameterValue>https://localhost:6101/services/oauth2/token</parameterValue>
  </externalAuthIdentityProviderParameters>
  <externalAuthIdentityProviderParameters>
    <parameterName>AuthorizeUrl</parameterName>
    <parameterType>AuthorizeUrl</parameterType>
    <parameterValue>https://localhost:6101/services/oauth2/authorize</parameterValue>
  </externalAuthIdentityProviderParameters>
  <label>exampleExtlIdp</label>
</ExternalAuthIdentityProvider>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ExternalAuthIdentityProvider</name>
  </types>
  <version>62.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ExternalClientApplication

Represents the header file for an external client application configuration.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

ExternalClientApplication components have the suffix `.eca` and are stored in the `externalClientApps` folder.

## Version

ExternalClientApplication components are available in API version 59.0 and later.

## Special Access Rules

Access to the ExternalClientApplication type requires orgs to enable the Opt in to External Client Apps permission in Setup.

## Fields

Field Name	Description
<code>contactEmail</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The email address that Salesforce uses to contact the external client app admin for the subscriber org.</p>
<code>contactPhone</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The phone number that Salesforce uses to contact the external client app admin for the subscriber org.</p>
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> A description for the app.</p>
<code>distributionState</code>	<p><b>Field Type</b> ExtlClntAppDistState (enumeration of type string)</p> <p><b>Description</b> The distribution state of an external client app. Values are:</p> <ul style="list-style-type: none"> <li>• Local</li> <li>• Managed. For internal use only.</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• Packaged</li> </ul>
iconUrl	<p><b>Field Type</b> string</p> <p><b>Description</b> The URL for the icon image.</p>
infoUrl	<p><b>Field Type</b> string</p> <p><b>Description</b> Reserved for future use.</p>
isProtected	<p><b>Field Type</b> boolean</p> <p><b>Description</b> A package construct that developers use to control the visibility of components in subscriber orgs. Default is false.</p>
label	<p><b>Field Type</b> string</p> <p><b>Description</b> The label for the external client app.</p>
logoUrl	<p><b>Field Type</b> string</p> <p><b>Description</b> The URL for the logo image.</p>
managedType	<p><b>Field Type</b> ExtlClntAppManagedType (enumeration of type string)</p> <p><b>Description</b> For internal use only.</p>
orgScopedExternalApp	<p><b>Field Type</b> string</p> <p><b>Description</b> A unique ID consisting of the org ID and the name of this external client app. Either defined by the developer or auto-generated during the first deployment. The expected value uses this format: <i>[Organization_ID]:[External Client App Name]</i>.</p>

## Declarative Metadata Sample Definition

This example shows an ExternalClientApplication component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExternalClientApplication xmlns="http://soap.sforce.com/2006/04/metadata">
  <contactEmail>johndoe@example.com</contactEmail>
  <description>Test external client app</description>
  <distributionState>Local</distributionState>
  <iconUrl>https://icon.example.com</iconUrl>
  <infoUrl>https://info.example.com</infoUrl>
  <logoUrl>https://logo.example.com</logoUrl>
  <label>myeca</label>
  <isProtected>>false</isProtected>
  <orgScopedExternalApp>Org_ID:External_Client_App_Name</orgScopedExternalApp>
</ExternalClientApplication>
```

This example package.xml references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ExternalClientApplication</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlClntAppOauthSettings</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlClntAppGlobalOauthSettings</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlClntAppOauthConfigurablePolicies</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlClntAppConfigurablePolicies</name>
  </types>
  <version>60.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ExternalCredential

---

Represents the details of how Salesforce authenticates to the external system.

 **Note:** All credentials stored within this entity are encrypted under a framework that is consistent with other encryption frameworks on the platform. Salesforce encrypts your credentials by auto-creating org-specific keys. Credentials encrypted using the previous encryption scheme have been migrated to the new framework.

## Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

ExternalCredential components have the suffix `.externalCredential` and are stored in the `externalCredentials` folder.

## Version

ExternalCredential components are available in API version 56.0 and later.

## Special Access Rules

There are no additional access requirements that are specific to this type.

## Fields

Field Name	Description
<code>authenticationProtocol</code>	<p><b>Field Type</b> AuthenticationProtocol (enumeration of type string)</p> <p><b>Description</b> Required.</p> <p>The authentication protocol that's required to access the external system. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>AwsSv4</code></li> <li>• <code>Basic</code></li> <li>• <code>Custom</code> — User-created authentication. Specify the permission set, sequence number, and authentication parameters. Each authentication parameter requires a name and value.</li> <li>• <code>Jwt</code> — Reserved for future use</li> <li>• <code>JwtExchange</code> — Reserved for future use</li> <li>• <code>NoAuthentication</code> —Reserved for future use</li> <li>• <code>Oauth</code></li> <li>• <code>Password</code> — Reserved for future use</li> </ul> <p>For connections to Amazon Web Services using Signature Version 4, use <code>AwsSv4</code>. For connections using a direct token system, select <code>Jwt</code>.</p>

Field Name	Description
	<p>For Simple URL data sources, select <code>Custom</code> with no parameters.</p> <p>For cloud-based Files Connect external systems, select <code>OAuth</code>. For on-premises systems, select <code>Password</code>.</p>
<code>description</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> A meaningful description of the external credential.</p>
<code>externalCredentialParameters</code>	<p><b>Field Type</b> <a href="#">ExternalCredentialParameter[]</a></p> <p><b>Description</b> One or more sets of parameters that further configure the external credential.</p>
<code>label</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the external credential.</p>

## ExternalCredentialParameter

Represents the parameters that configure an external credential. External credential parameters are used to configure external credential callouts through a combination of the type, name, and value and lookup fields. Available in API version 56.0 and later.

These parameters are used internally to provide a flexible architecture and are exposed here for packaging reasons.

Field Name	Description
<code>authProvider</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Reference to an authentication provider that the <code>AuthProvider</code> component represents, which defines the service that provides the login process and approves access to the external system.</p>
<code>certificate</code>	<p><b>Type</b> string</p> <p><b>Description</b> If the value of <code>parameterType</code> is <code>SigningCertificate</code>, then this field references the certificate.</p>

Field Name	Description
description	<p><b>Field Type</b> string</p> <p><b>Description</b> A human-readable description of this external credential parameter.</p>
externalAuthIdentityProvider	<p><b>Field Type</b> string</p> <p><b>Description</b> Reference to an external authentication identity provider that the <code>externalAuthIdentityProvider</code> component represents. The <code>externalAuthIdentityProvider</code> defines the service that provides the login process and approves access to the external system.</p> <p>To simplify the configuration process for the authentication providers used by your named credentials, use an <code>externalAuthIdentityProvider</code> instead of an <code>authProvider</code>. Link the external auth identity provider to an external credential.</p>
parameterGroup	<p><b>Field Type</b> string</p> <p><b>Description</b> Groups a parameter along with its respective principal. For example, with dynamic scopes, the user can apply a scope <code>AuthParameter</code> only when authenticated against a specific principal with a matching <code>parameterGroup</code> value.</p> <p>If a value for <code>parameterGroup</code> isn't provided, <code>parameterGroup</code> defaults to the <code>parameterName</code> value for <code>PER_USER</code> and <code>NAMED_PRINCIPAL</code>. For all other parameters <code>parameterGroup</code> defaults to <code>DEFAULT_GROUP</code>.</p>
parameterName	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.</p> <p>The name of the external credential parameter.</p>
parameterType	<p><b>Field Type</b> ExternalCredentialParamType (enumeration of type string)</p> <p><b>Description</b> Required.</p> <p>The type of external credential parameter. The value of this field drives the behavior of the parameter. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>AdditionalRefreshStatusCode</code>: Allows the user to specify 4xx HTTP status codes that trigger Salesforce to refresh expired or invalid access tokens, in addition to the standard 401 HTTP status code response.</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li data-bbox="633 252 1459 462">• <b>AuthHeader:</b> Allows the user to specify custom authentication headers to be added to the callout at run time. When using <code>AuthHeader</code>, the <code>parameterName</code> field must be the header name as a string, and <code>parameterValue</code> must be a formula of a header value that is evaluated at run time. <code>sequenceNumber</code> determines the order in which headers are sent out in the callout. Headers with lower numbers are sent out first.</li> <li data-bbox="633 472 1459 609">• <b>AuthParameter:</b> Allows users to add additional authentication settings. <code>parameterName</code> defines the parameter to set. For example, <code>AwsRegion</code> sets the AWS Region parameter to apply for an AWS Signature V4 authentication protocol and <code>parameterValue</code> is the value for the AWS Region.</li> <li data-bbox="633 619 1459 724">• <b>AuthProtocolVariant:</b> Used to specify a variant of an authentication protocol. For example, <code>AwsSts</code> as a variant when the <code>ParameterName</code> is <code>AwsSv4</code> and the <code>ParameterValue</code> is <code>AwsSv4_STS</code>.</li> <li data-bbox="633 735 1459 798">• <b>AuthProvider:</b> Specifies that this parameter configures an authentication provider referenced by the <code>authProvider</code> field.</li> <li data-bbox="633 808 1459 913">• <b>AuthProviderUrl:</b> Specifies the authentication endpoint URL. For example, if the authentication type is OAuth with JWT Bearer Flow, then <code>parameterValue</code> is an authentication token endpoint.</li> <li data-bbox="633 924 1459 1092">• <b>AuthProviderUrlQueryParameter:</b> Allows the user to specify custom query parameters to be added to the callout to the authentication provider at run time. Currently, supported only for AWS Signature V4 with STS. The allowed <code>AuthProviderUrlQueryParameter</code> values are <code>AwsExternalId</code> and <code>AwsDuration</code>, used with AWS STS.</li> <li data-bbox="633 1102 1459 1207">• <b>AwsStsPrincipal:</b> Configures AWS Signature V4 along with STS. <code>parameterName</code> is <code>AwsStsPrincipal</code> and <code>parameterValue</code> isn't specified.</li> <li data-bbox="633 1218 1459 1249">• <b>CreatedByNamespace:</b> Reserved for internal use.</li> <li data-bbox="633 1260 1459 1365">• <b>ExternalAuthIdentityProvider:</b> Specifies that this parameter configures an authentication provider referenced by the <code>externalAuthIdentityProvider</code> field.</li> <li data-bbox="633 1375 1459 1407">• <b>GlobalNamedPrincipal:</b> Reserved for internal use.</li> <li data-bbox="633 1417 1459 1522">• <b>JwtBodyClaim:</b> Specifies a JWT (JSON Web Token) body claim, where <code>parameterName</code> is the key and <code>parameterValue</code> is the value. For example, the parameter name for a JWT audience is <code>aud</code>.</li> <li data-bbox="633 1533 1459 1638">• <b>JwtHeaderClaim:</b> Specifies a JWT header claim, where <code>parameterName</code> is the key and <code>parameterValue</code> is the value. For example, the parameter name for a JWT key identifier is <code>kid</code>.</li> <li data-bbox="633 1648 1459 1711">• <b>NamedPrincipal:</b> Specifies that the parameter uses the same set of user credentials for all users who access the external system.</li> <li data-bbox="633 1722 1459 1753">• <b>PerUserPrincipal:</b> Provides access control at the individual user level.</li> <li data-bbox="633 1764 1459 1869">• <b>SigningCertificate:</b> Specifies the certificate used for an authentication signature. Use the <code>certificate</code> field to specify the certificate name. Used for OAuth with JWT Bearer Flow and <code>AwsSv4</code> STS with RolesAnywhere authentication.</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• <code>SystemUserPrincipal</code>: Reserved for internal use.</li> </ul>
<code>parameterValue</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> If the <code>parameterType</code> field describes a literal value then the literal value is stored in this field.</p>
<code>principal</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> If the value of the <code>parameterType</code> field is either <code>NamedPrincipal</code> or <code>PerUserPrincipal</code>, this field points to a permission set. That value then determines the set of users that are allowed to use credentials provided by the credential provider. The value of the <code>parameterName</code> field specifies the name of this principal.</p> <p><b>First available in API version 56.0, this field is removed in API version 58.0 and later.</b></p>
<code>sequenceNumber</code>	<p><b>Field Type</b> int</p> <p><b>Description</b> Specifies the order of principals to apply when a user participates in more than one principal. For example, a user could be part of multiple permission sets that are applicable for a credential provider. Priority is from lower to higher numbers.</p> <p>You can set this field only when <code>parameterType</code> is <code>NamedPrincipal</code>.</p>

## Declarative Metadata Sample Definition

The following is an example of an `ExternalCredential` component.

```
<ExternalCredential xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>SampleExternalCredential</label>
  <authenticationProtocol>AwsSv4</authenticationProtocol>
  <externalCredentialParameters>
    <parameterName>Principal</parameterName>
    <parameterType>NamedPrincipal</parameterType>
    <sequenceNumber>1</sequenceNumber>
  </externalCredentialParameters>
  <externalCredentialParameters>
    <parameterName>AwsService</parameterName>
    <parameterValue>iam</parameterValue>
    <parameterType>AuthParameter</parameterType>
  </externalCredentialParameters>
</externalCredentialParameters>
```

```

    <parameterName>AwsRegion</parameterName>
    <parameterValue>us-east-1</parameterValue>
    <parameterType>AuthParameter</parameterType>
  </externalCredentialParameters>
</ExternalCredential>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ExternalCredential</name>
  </types>
  <version>56.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

## ExternalAIModel

---

Represents the state of a given model for an Einstein for Service feature, such as Einstein Reply Recommendations.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

ExternalAIModel components have the suffix `.externalAIModel` and are stored in the `externalAIModels` folder.

### Version

ExternalAIModel components are available in API version 51.0 and later.

## Special Access Rules

This type is available only when an org is configured to access the application in the `applicationSourceType` field. For example, if `applicationSourceType` is set to `ARTICLE_RECOMMENDATION`, this type is available only if Einstein Article Recommendations is enabled in the org and the Main Services Agreement has been accepted.

## Fields

Field Name	Field Type	Description
<code>applicationSourceType</code>	<code>ApplicationSourceType</code> (enumeration of type string)	Required. The target application for the configuration. Valid values are: <ul style="list-style-type: none"> <li>• <code>REPLY_RECOMMENDATION</code>— Einstein Reply Recommendations</li> <li>• <code>ARTICLE_RECOMMENDATION</code>— Einstein Article Recommendations</li> <li>• <code>UTTERANCE_RECOMMENDATION</code>— Einstein Bot utterances</li> <li>• <code>FAQ</code>— Einstein Bot frequently asked questions</li> </ul>
<code>externalModelKey</code>	string	Required. Unique key which identifies external model corresponding this applicationType
<code>externalModelStatus</code>	<code>ExternalModelStatus</code> (enumeration of type string)	Required. The current state of a given model. Valid values are: <ul style="list-style-type: none"> <li>• <code>DISABLED</code></li> <li>• <code>ENABLED</code></li> <li>• <code>PAUSED</code></li> </ul>
<code>name</code>	string	Required. A reference to the configuration.
<code>threshold</code>	double	Threshold override value for this model. Nillable.
<code>trainingJobName</code>	string	Training job path corresponding to the given model. Nillable.

## Declarative Metadata Sample Definition

The following is an example of an ExternalAIModel component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExternalAIModel xmlns="http://soap.sforce.com/2006/04/metadata">
  <applicationSourceType>REPLY_RECOMMENDATION</applicationSourceType>
  <externalModelKey>0f16dea6-b886-44df-9cfa-4d96b51d6594</externalModelKey>
  <externalModelStatus>ENABLED</externalModelStatus>
  <name>SR1601228426202</name>
  <threshold>0.9</threshold>
  <trainingJobName>TestJob</trainingJobName>
</ExternalAIModel>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ExternalAIModel</name>
  </types>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type doesn't support the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ExternalServiceRegistration

Represents the External Service configuration for an org. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

## File Suffix and Directory Location

`ExternalServiceRegistration` components have the suffix `.externalServiceRegistration` and are stored in the `externalServiceRegistrations` folder.

## Version

`ExternalServiceRegistration` components are available in API version 39.0 and later.

 **Note:** In API version 47.0 and earlier, External Services supported Interagent and a limited subset of OpenAPI 2.0. As of API version 48.0, External Services supports OpenAPI 2.0 but doesn't support InteragentHyperSchema. As of API version 54.0, External Services supports a limited subset of OpenAPI 3.0. See [External Services Considerations](#) in Salesforce Help.

## Fields

Field Name	Field Type	Description
<code>description</code>	string	The external service description defined when the service is created.
<code>label</code>	string	Required. The service name as it appears on the External Services wizard.
<code>namedCredential</code>	string	The reference by name to be used for the service.
<code>NamedCredentialReferenceId</code>	reference	The reference by ID to be used for the named credential. When used, supersedes <code>namedCredential</code> . Available in API version 57.0 and later.
<code>operations</code>	<a href="#">ExternalServiceOperation</a> []	Items defined for this operation.
<code>registrationProvider</code>	string	Reserved for future use.

Field Name	Field Type	Description
registrationProviderType	ExternalProviderType (enumeration of type string)	Indicates the source of the API specification registered with the External Services wizard. Valid values include: <ul style="list-style-type: none"> <li>• <code>Custom</code> - The API spec was manually configured.</li> <li>• <code>ExternalConnector</code> - Reserved for future use.</li> <li>• <code>Heroku</code> - (Pilot) The API spec represents a Heroku app. Reserved for future use.</li> <li>• <code>MuleSoft</code> - The API spec was selected from MuleSoft.</li> <li>• <code>SchemaInferred</code> - The API spec was provided during the HTTP Callout configuration process. Available in API version 57.0 and later.</li> </ul>
schema	string	The content of the OpenAPI 2.0 or OpenAPI 3.0 schema in JSON or YAML format. Nillable.
schemaAbsoluteUrl	string	The full, absolute URL to the schema. Populated when a user selects <b>Absolute URL</b> during registration.
schemaType	string	The schema format. OpenAPI for Open API 2.0 or InteragentHyperSchema for API version 47.0 and earlier. If not specified, schema type is derived based on the schema content. Nillable.
schemaUploadFileExtension	string	The file's extension. Populated when a user selects <b>Upload from local</b> during registration.
schemaUploadFileName	string	The file's name without the file extension. Populated when a user selects <b>Upload from local</b> during registration.
schemaUrl	string	The path should begin with "/" and be relative to the named credential endpoint.
serviceBinding	string	Used to map non-supported media types for this external service registration to supported media types. Nillable. Available in API version 53.0 and later.
status	string	Required. Indicates service registration status. Valid values include: <ul style="list-style-type: none"> <li>• <code>complete</code> - The API spec is valid and the registration is ready to use.</li> <li>• <code>incomplete</code> - The service registration hasn't completed.</li> </ul>
systemVersion	int	The internal version of External Services used to register the API specification. Available in API version 55.0 and later. <ul style="list-style-type: none"> <li>• 1 - Retired legacy External Services.</li> <li>• 2 - External Services with limitations on object and operation name length.</li> <li>• 3 - Current version. External Services with automatically derived developer names fitting within 80 characters.</li> </ul>

## ExternalServiceOperation

Field Name	Field Type	Description
active	boolean	Required. Indicates whether the operation is active ( <code>true</code> ), or inactive ( <code>false</code> ).
name	string	Required. The operation's name.

## Declarative Metadata Sample Definition

The following is an example of an `ExternalServiceRegistration` component that references an external credit service.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExternalServiceRegistration xmlns="http://soap.sforce.com/2006/04/metadata">
  <label>BankService</label>
  <namedCredential>Bank</namedCredential>
  <schema>{
    "swagger": "2.0",
    "basePath": "/",
    "info": {
      "version": "1.0",
      "title": "External Service for demo bank",
      "description": "### External Service for demo bank",
      "x-vcap-service-name": "DemoBankRestServices"
    },
    ...
    "paths": {
      "/accounts/{accountName}": {
        ...
      }
    },
    "definitions": {
      "accountDetails": {
        ...
      },
      "errorModel": {
        ...
      }
    }
  }
}</schema>
<schemaType>OpenApi</schemaType>
<schemaUrl>/accounts/schema</schemaUrl>
<status>Complete</status>
</ExternalServiceRegistration>
```

## serviceBinding

The following JSON-encoded string defines the mapping of a non-supported media type to a supported media type for external service request and response body serialization.

```
{ "compatibleMediaTypes": {  
  "application/x-acme-json": "application/json"  
}}
```

The non-supported media type `application/x-acme-json` is mapped to the supported media type `application/json` for this External Services registration. The External Services runtime takes into account the non-supported media type for request and response header processing and serializes the request and response content by the mapped supported media type.

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

SEE ALSO:

[Salesforce Help: Media Type Mapping in External Service Registrations](#)

## ExtlCIntAppConfigurablePolicies

---

Represents the policies for an external client app to disable or enable plugins.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`ExtlCIntAppConfigurablePolicies` components have the suffix `.ecaP1cy` and are stored in the `extlCIntAppPolicies` folder.

### Version

`ExtlCIntAppConfigurablePolicies` components are available in API version 60.0 and later.

### Special Access Rules

The View all External Client Apps, view their settings, and edit their policies user permission is required for users with admin roles to configure OAuth policies.

## Fields

Field Name	Description
externalClientApplication	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the external client app associated with the OAuth plugins.</p>
isEnabled	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Required. If <code>true</code>, all plugins are enabled unless individually disabled. If <code>false</code>, all plugins are disabled. The default value is <code>true</code>. Available in API version 60.0 and later.</p>
isOAuthPluginEnabled	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If <code>true</code>, the OAuth plugin is enabled. If <code>false</code> the OAuth plugin is disabled. The default value is <code>true</code>. Available in API version 60.0 and later.</p>
label	<p><b>Field Type</b> string</p> <p><b>Description</b> The OAuth policies name for the external client app.</p>

## Declarative Metadata Sample Definition

This example shows an ExtlClntAppConfigurablePolicies component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExtlClntAppConfigurablePolicies xmlns="http://soap.sforce.com/2006/04/metadata">
  <externalClientApplication>myeca</externalClientApplication>
  <isEnabled>true</isEnabled>
  <isOAuthPluginEnabled>true</isOAuthPluginEnabled>
  <label>myecapolicy</label>
</ExtlClntAppConfigurablePolicies>
```

This example `package.xml` references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
```

```

    <name>ExternalClientApplication</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlClntAppOauthSettings</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlClntAppGlobalOauthSettings</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlClntAppOauthConfigurablePolicies</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlClntAppConfigurablePolicies</name>
  </types>
  <version>60.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ExtlClntAppGlobalOauthSettings

---

Represents the global settings for the OAuth plugin in an external client app. These settings include private and sensitive OAuth consumer information that can't be packaged and must not be added to source control.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`ExtlClntAppGlobalOauthSettings` components have the suffix `.ecaGlb1Oauth` and are stored in the `extlClntAppGlobalOauthSets` folder.

### Version

`ExtlClntAppGlobalOauthSettings` components are available in API version 59.0 and later.

## Special Access Rules

Access to the OAuth plugin requires orgs to enable the Allow Access to OAuth Consumer Secrets via Metadata API permission in Setup. The View External Client Apps Consumer Secrets in Metadata user permission is required for users with developer roles to configure global OAuth settings.

## Fields

Field Name	Description
callbackUrl	<p><b>Field Type</b> string</p> <p><b>Description</b> The endpoint that Salesforce calls back to your external client app during OAuth. It's the OAuth redirect_uri.</p>
certificate	<p><b>Field Type</b> string</p> <p><b>Description</b> If the app uses a certificate, the PEM-encoded certificate string. When provided, it enables the JWT Bearer flow. Available in API version 60.0 and later.</p>
consumerKey	<p><b>Field Type</b> string</p> <p><b>Description</b> A value used by the consumer for identification to Salesforce. Referred to as client_id in OAuth 2.0.</p>
consumerSecret	<p><b>Field Type</b> string</p> <p><b>Description</b> A value that is combined with the consumerKey and used by the consumer for identification to Salesforce. Referred to as client_secret in OAuth 2.0.</p>
externalClientApplication	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Name of the external client application.</p>
idTokenConfig	<p><b>Field Type</b> <a href="#">ExternalAppldTokenConfig</a></p> <p><b>Description</b> The settings for the ID token.</p>

Field Name	Description
<code>isClientCredentialsFlowEnabled</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If set to <code>true</code>, the OAuth 2.0 client credentials flow is enabled. Available in API version 60.0 and later.</p>
<code>isCodeCredFlowEnabled</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If set to <code>true</code>, the external client app can use the Authorization Code and Credentials Flow and its variations for headless login, passwordless login, and guest user identity services in an off-platform app. Headless registration isn't currently supported for external client apps. The default value is <code>false</code>.</p> <p>To use this field, the Authorization Code and Credentials Flow must be enabled for your org in OAuth and OpenID Connect settings.</p> <p>Available in API version 61.0 and later.</p>
<code>isCodeCredPostOnly</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If set to <code>true</code>, for the Authorization Code and Credentials Flow, the external client app is required to send the user's credentials to the Salesforce <code>services/oauth2/authorize</code> endpoint in the body of a POST request. If set to <code>false</code>, the app can send a POST or GET request with the user's credentials in the request body or in a Basic authorization header. The default value is <code>false</code>.</p> <p>To use this field, the Authorization Code and Credentials Flow must be enabled for your external client app. Headless registration, a variation of this flow, isn't currently supported for external client apps.</p> <p>Available in API version 61.0 and later.</p>
<code>isConsumerSecretOptional</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If set to <code>false</code> (default), the external app's client secret is required in exchange for an access token in the OAuth 2.0 web server flow. If set to <code>true</code>, the external app's client secret is optional.</p>
<code>isDeviceFlowEnabled</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If set to <code>true</code>, the external client app can use the OAuth 2.0 device flow. Available in API version 60.0 and later.</p>

Field Name	Description
<code>isIntrospectAllTokens</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If set to <code>true</code>, authorizes the external app to introspect all access and refresh all tokens. If set to <code>false</code> (default), the external client app can introspect its own tokens.</p>
<code>isNamedUserJwtEnabled</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If set to <code>true</code>, the external client app issues JSON Web Token (JWT)-based access tokens. If set to <code>false</code>, it issues opaque access tokens. The default value is <code>false</code>. For installed apps, JWT-based access tokens must also be enabled in your external client app's OAuth policies. Available in API version 61.0 and later.</p>
<code>isPkceRequired</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If set to <code>true</code> (default) Proof Key for Code for Exchange (PKCE) is required for OAuth integration. If set to <code>false</code>, PKCE is optional.</p>
<code>isRefreshTokenRotationEnabled</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If set to <code>true</code>, the refresh token rotation is enabled. Available in API version 60.0 and later.</p>
<code>isSecretRequiredForRefreshToken</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If set to <code>true</code> (default), the app's client secret is required in the authorization request of a refresh token and hybrid refresh token flow. If set to <code>false</code> and an app sends the client secret in the authorization request, Salesforce still validates it.</p>
<code>isSecretRequiredForTokenExchange</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If set to <code>true</code>, the app's client secret is required for token exchange. Available in API version 60.0 and later.</p>
<code>isTokenExchangeEnabled</code>	<p><b>Field Type</b> boolean</p>

Field Name	Description
	<p><b>Description</b></p> <p>If set to <code>true</code>, token exchange is enabled. Available in API version 60.0 and later.</p>
<code>label</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>External Client Application Global OAuth Settings name.</p>
<code>shouldRotateConsumerKey</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>If set to <code>true</code>, the OAuth external client app's consumer key is replaced with a newly generated key on metadata deploy.. To maintain security, if this field is set to <code>true</code>, you must include the ignore warnings attribute in the deploy command. Default is <code>false</code>.</p>
<code>shouldRotateConsumerSecret</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>If set to <code>true</code>, the OAuth external client app's consumer secret is replaced with a newly generated secret on metadata deploy. To maintain security, if this field is set to <code>true</code>, you must include the ignore warnings attribute in the deploy command. Default is <code>false</code>.</p>

## ExternalAppIdTokenConfig

Represents configurations that determine the ID token attributes.

Field Name	Description
<code>idTokenAudience</code>	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>The audience that this ID token is intended for.</p>
<code>idTokenIncludeAttributes</code>	<p><b>Field Type</b></p> <p>boolean</p> <p><b>Description</b></p> <p>Indicates whether attributes are included in the ID token (<code>true</code>) or not (<code>false</code>).</p>
<code>idTokenIncludeStandardClaims</code>	<p><b>Field Type</b></p> <p>boolean</p>

Field Name	Description
	<p><b>Description</b></p> <p>Indicates whether standard claims about the authentication event are included in the ID token (<code>true</code>) or not (<code>false</code>).</p>
<code>idTokenValidityInMinutes</code>	<p><b>Field Type</b></p> <p><code>int</code></p> <p><b>Description</b></p> <p>The length of time that the ID token is valid for after it's issued. The value can be 1–720 minutes.</p>

## Declarative Metadata Sample Definition

This example shows an `ExtlCIntAppGlobalOauthSettings` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExtlCIntAppGlobalOauthSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <callbackUrl>https://www.example.com</callbackUrl>
  <externalClientApplication>myeca</externalClientApplication>
  <idTokenConfig>
    <idTokenAudience>SalesforceAudience</idTokenAudience>
    <idTokenIncludeStandardClaims>true</idTokenIncludeStandardClaims>
    <idTokenValidityInMinutes>0</idTokenValidityInMinutes>
  </idTokenConfig>
  <isConsumerSecretOptional>false</isConsumerSecretOptional>
  <isIntrospectAllTokens>false</isIntrospectAllTokens>
  <isPkceRequired>true</isPkceRequired>
  <isSecretRequiredForRefreshToken>false</isSecretRequiredForRefreshToken>
  <label>myecaglobalset</label>
  <shouldRotateConsumerKey>false</shouldRotateConsumerKey>
  <shouldRotateConsumerSecret>false</shouldRotateConsumerSecret>
</ExtlCIntAppGlobalOauthSettings>
```

This example `package.xml` references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ExternalClientApplication</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlCIntAppOauthSettings</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlCIntAppGlobalOauthSettings</name>
  </types>
</Package>
```

```

    <members>*</members>
    <name>ExtlCIntAppOAuthConfigurablePolicies</name>
</types>
<types>
    <members>*</members>
    <name>ExtlCIntAppConfigurablePolicies</name>
</types>
<version>60.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ExtlCIntAppOAuthConfigurablePolicies

---

Represents the policies configured by the admin for an OAuth-enabled external client app.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

`ExtlCIntAppOAuthConfigurablePolicies` components have the suffix `.ecaOAuthP1cy` and are stored in the `extlCIntAppOAuthPolicies` folder.

### Version

`ExtlCIntAppOAuthConfigurablePolicies` components are available in API version 59.0 and later.

### Special Access Rules

The View all External Client Apps, view their settings, and edit their policies user permission is required for users with admin roles to configure OAuth policies.

### Fields

Field Name	Description
<code>apexHandler</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Name of the Apex handler. Available in API version 61.0 and later.</p>

Field Name	Description
<code>clientCredentialsFlowUser</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The execution user for the OAuth 2.0 client credentials flow. Salesforce returns access tokens on behalf of this user. This user must have the API Only permission. Available in API version 60.0 and later.</p>
<code>commaSeparatedCustomScopes</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Custom scope names in a comma-separated list. Available in API version 61.0 and later.</p>
<code>commaSeparatedPermissionSet</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Permission set IDs in a comma-separated list.</p>
<code>customAttributes</code>	<p><b>Field Type</b> <a href="#">ExtIntAppOAuthPoliciesAttribute[]</a></p> <p><b>Description</b> Unique attributes to be included as admin defaults. The maximum number accepted is 128. Each custom attribute must have a unique key and use an available field.</p>
<code>executeHandlerAs</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Username of the Apex handler's execution user. Available in API version 61.0 and later.</p>
<code>externalClientApplication</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. The name of the external client app associated with this OAuth policies file.</p>
<code>guestJwtTimeout</code>	<p><b>Field Type</b> int</p> <p><b>Description</b> The amount of time before a JWT-based access token issued to a guest user expires. Values are:</p> <ul style="list-style-type: none"> <li>• 1—1 Minute</li> <li>• 5—5 Minutes</li> </ul>

Field Name	Description
	<ul style="list-style-type: none"> <li>• 10—10 Minutes</li> <li>• 15—15 Minutes</li> <li>• 30—30 Minutes</li> </ul> <p>Available in API version 61.0 and later.</p>
<code>ipRelaxationPolicyType</code>	<p><b>Field Type</b> string</p> <p><b>Description</b> The policy that determines IP restrictions. Values are:</p> <ul style="list-style-type: none"> <li>• Enforce</li> <li>• Bypass</li> <li>• Bypass_2factor</li> <li>• Enforce_RelaxRefresh</li> </ul>
<code>isClientCredentialsFlowEnabled</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If <code>true</code>, the client credentials flow is enabled. The default value is <code>false</code>. Available in API version 60.0 and later.</p>
<code>isGuestCodeCredFlowEnabled</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If <code>true</code>, the external client app can use the guest user variation of the Authorization Code and Credentials Flow. To use this flow variation, the external client app must also be configured to issue JWT-based access tokens. The default value is <code>false</code>. Available in API version 61.0 and later.</p>
<code>isNamedUserJwtEnabled</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If <code>true</code>, the external client app issues JWT-based access tokens instead of opaque access tokens. The default value is <code>false</code>. Available in API version 61.0 and later.</p>
<code>isTokenExchangeFlowEnabled</code>	<p><b>Field Type</b> boolean</p> <p><b>Description</b> If <code>true</code><b>true</b>, the token exchange flow is enabled. The default value is <code>false</code>. Available in API version 60.0 and later.</p>

Field Name	Description
label	<p><b>Field Type</b> string</p> <p><b>Description</b> The OAuth policies name for the external client app.</p>
namedUserJwtTimeout	<p><b>Field Type</b> int</p> <p><b>Description</b> The amount of time before a JWT-based access token issued to a named user expires. Values are:</p> <ul style="list-style-type: none"> <li>• 1—1 Minute</li> <li>• 5—5 Minutes</li> <li>• 10—10 Minutes</li> <li>• 15—15 Minutes</li> <li>• 30—30 Minutes</li> </ul> <p>Available in API version 61.0 and later.</p>
permittedUsersPolicyType	<p><b>Field Type</b> PermittedUsersPolicyType (enumeration of type string)</p> <p><b>Description</b> The policy that determines which users are allowed in the external client app. Values are:</p> <ul style="list-style-type: none"> <li>• AdminApprovedPreAuthorized</li> <li>• AllSelfAuthorized</li> </ul>
policyAction	<p><b>Field Type</b> PolicyAction (enumeration of type string)</p> <p><b>Description</b> Requires users to verify their identity with two-factor authentication when they log in to the external client app. Use <code>RaiseSessionLevel</code> along with <code>requiredSessionLevel</code> to determine the security posture. Values are:</p> <ul style="list-style-type: none"> <li>• Block</li> <li>• RaiseSessionLevel</li> </ul>
refreshTokenPolicyType	<p><b>Field Type</b> RefreshTokenPolicyType (enumeration of type string)</p> <p><b>Description</b> The type of policy that determines when a token must be refreshed. Values are:</p>

Field Name	Description
	<ul style="list-style-type: none"> <li>• Infinite</li> <li>• SpecificInactivity</li> <li>• SpecificLifetime</li> <li>• Zero</li> </ul>
refreshTokenValidityPeriod	<p><b>Field Type</b> int</p> <p><b>Description</b> The number of units of measure used to specify validity when refresh token policy type is set to <code>SpecificInactivity</code> or <code>SpecificLifetime</code>.</p>
refreshTokenValidityUnit	<p><b>Field Type</b> string</p> <p><b>Description</b> The unit of measurement that is used to specify validity when refresh token policy type is set to <code>SpecificInactivity</code> or <code>SpecificLifetime</code>. Values are:</p> <ul style="list-style-type: none"> <li>• Days</li> <li>• Hours</li> <li>• Months</li> </ul>
requiredSessionLevel	<p><b>Field Type</b> SessionSecurityLevel (enumeration of type string)</p> <p><b>Description</b> Defines the security posture. Values are:</p> <ul style="list-style-type: none"> <li>• HIGH_ASSURANCE</li> <li>• LOW</li> <li>• STANDARD</li> </ul>
sessionTimeoutInMinutes	<p><b>Field Type</b> int</p> <p><b>Description</b> Length of time the external client app's session lasts.</p>
singleLogoutUrl	<p><b>Field Type</b> string</p> <p><b>Description</b> URL where Salesforce sends a logout request when users log out of Salesforce.</p>

Field Name	Description
startUrl	<p><b>Field Type</b> string</p> <p><b>Description</b> URL where users are directed after they authenticate.</p>

## ExtlCntAppOauthPoliciesAttribute

Represents admin-defined attributes that provide personal information to customize the external client app for a specific use case.

Field Name	Description
formula	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  The existing field that includes the desired information. For example, <code>Organization.Country</code>.</p>
key	<p><b>Field Type</b> string</p> <p><b>Description</b> Required.  A unique name for the attribute. For example, <code>country</code>.</p>

## Declarative Metadata Sample Definition

This example shows an ExtlCntAppOauthConfigurablePolicies component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExtlCntAppOauthConfigurablePolicies xmlns="http://soap.sforce.com/2006/04/metadata">
  <externalClientApplication>myeca</externalClientApplication>
  <label>myecapolicy</label>
  <apexHandler>MyEcaOauthApexHandler</apexHandler>
  <executeHandlerAs>admin@example.org</executeHandlerAs>
  <refreshTokenPolicyType>SpecificLifetime</refreshTokenPolicyType>
  <refreshTokenValidityPeriod>1</refreshTokenValidityPeriod>
  <refreshTokenValidityUnit>Days</refreshTokenValidityUnit>
  <ipRelaxationPolicyType>Enforce</ipRelaxationPolicyType>
  <permittedUsersPolicyType>AdminApprovedPreAuthorized</permittedUsersPolicyType>
  <commaSeparatedPermissionSet>PermSetExample</commaSeparatedPermissionSet>
  <commaSeparatedCustomScopes>CustomScopeExample</commaSeparatedCustomScopes>
  <sessionTimeoutInMinutes>1</sessionTimeoutInMinutes>
  <requiredSessionLevel>HIGH_ASSURANCE</requiredSessionLevel>
  <policyAction>RaiseSessionLevel</policyAction>
</ExtlCntAppOauthConfigurablePolicies>
```

```

    <singleLogoutUrl>https://www.example.com</singleLogoutUrl>
    <startUrl>https://www.example.com</startUrl>
</ExtlClntAppOauthConfigurablePolicies>

```

This example package.xml that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ExternalClientApplication</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlClntAppOauthSettings</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlClntAppGlobalOauthSettings</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlClntAppOauthConfigurablePolicies</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlClntAppConfigurablePolicies</name>
  </types>
  <version>60.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the package.xml manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## ExtlClntAppOauthSettings

---

Represents the settings configuration for the external client app's OAuth plugin.

### Parent Type

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

### File Suffix and Directory Location

ExtlClntAppOauthSettings components have the suffix `.ecaOauth` and are stored in the `extlClntAppOauthSettings` folder.

## Version

ExtlCIntAppOauthSettings components are available in API version 59.0 and later.

## Special Access Rules

Access to the OAuth plugin requires orgs to enable the Allow Access to OAuth Consumer Secrets via Metadata API permission in Setup. The View External Client Apps Consumer Secrets in Metadata user permission is required for users with developer roles to configure OAuth settings.

## Fields

Field Name	Description
areAttributesIncludedInAssetToken	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether custom attributes associated with the external client app are included in the JSON Web Token (JWT) payload of an asset token issued as a result of the asset token flow. The default value is <code>false</code>.</p> <p>Available in API version 61.0 and later.</p>
areCustomPermsIncludedInAssetToken	<p><b>Field Type</b> boolean</p> <p><b>Description</b> Indicates whether custom permissions associated with the external client app are included in the JWT payload of an asset token issued as a result of the asset token flow. The default value is <code>false</code>.</p> <p>Available in API version 61.0 and later.</p>
assetTokenAudiences	<p><b>Field Type</b> string</p> <p><b>Description</b> Required for the OAuth asset token flow. The audience (<code>aud</code>) claim in the JWT payload of an asset token issued by the external client app. This claim identifies who the asset token is intended for. The value must be an array of case-sensitive strings, each containing a <code>StringOrURI</code> value. Specify an audience for each intended consumer of the asset token.</p> <p>Available in API version 61.0 and later.</p>
assetTokenSigningCertificate	<p><b>Field Type</b> string</p>

Field Name	Description
	<p><b>Description</b></p> <p>Required for the asset token flow. The ID of the self-signed certificate used to sign asset tokens issued by the external client app. The certificate size is limited to 4 KB. If your certificate is too large, try using a DER-encoded file to reduce the size.</p> <p>Available in API version 61.0 and later.</p>
assetTokenValidity	<p><b>Field Type</b></p> <p>int</p> <p><b>Description</b></p> <p>Required for the asset token flow. The period of time for which the asset token is valid after it's issued, expressed as the number of seconds from 1970-01-01T0:0:0Z measured in UTC. The validity period must be within 3 minutes of the expiration time of the assertion.</p> <p>Available in API version 61.0 and later.</p>
clientAssertionCertificate	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>A certificate that's used to sign a client attestation JSON Web Token (JWT), which is required for requests to the OAuth 2.0 authorization challenge endpoint for headless identity flows for first-party apps. To confirm that the app that sent the request is your first-party app, Salesforce validates the client attestation JWT against this certificate.</p>
commaSeparatedOauthScopes	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>OAuth scopes for the external client app, written as a comma-separated list.</p>
customAttributes	<p><b>Field Type</b></p> <p><a href="#">ExtlCntAppOauthSettingsAttribute[]</a></p> <p><b>Description</b></p> <p>Unique attributes to be included as developer defaults. The maximum number accepted is 128. Each custom attribute must have a unique key and use an available field.</p>
externalClientApplication	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The external client app associated with this OAuth plugin.</p>
isFirstPartyAppEnabled	<p><b>Field Type</b></p> <p>boolean</p>

Field Name	Description
	<p><b>Description</b></p> <p>Determines whether a first-party app can send requests to the OAuth 2.0 authorization challenge endpoint on this Experience Cloud site. This endpoint support headless identity flows using the OAuth 2.0 for First-Party Applications draft protocol.</p>
label	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Label for the external client app.</p>
oauthLink	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>An auto-generated value that combines the org ID and the OAuth Consumer ID.</p>
singleLogoutUrl	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>URL where Salesforce sends a logout request when users log out of Salesforce.</p>
trustedIpRanges	<p><b>Field Type</b></p> <p><a href="#">ExtlCIntAppOauthIpRange[]</a></p> <p><b>Description</b></p> <p>Specifies the ranges of IP addresses that can access the app without requiring the user to authenticate with the external client app. The maximum number of IP ranges is 128.</p>

## ExtlCIntAppOauthSettingsAttribute

Represents developer-defined attributes that are used to include additional information in the external client apps. Developers use these attributes to customize the app for specific use cases.

Field Name	Description
formula	<p><b>Field Type</b></p> <p>string</p> <p><b>Description</b></p> <p>Required.</p> <p>The existing field that includes the desired information. For example, <code>Organization.Country</code>.</p>

Field Name	Description
key	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. A unique name for the attribute. For example, <code>country</code>.</p>

## ExtlCntAppOauthIpRange

Represents the range of IP addresses that are trusted by the external client app.

Field Name	Description
description	<p><b>Field Type</b> string</p> <p><b>Description</b> Identifies the purpose of the range, such as which part of a network corresponds to this range.</p>
endIpAddress	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. Last address in the IP range, inclusive. Required with start address.</p>
startIpAddress	<p><b>Field Type</b> string</p> <p><b>Description</b> Required. First address in the IP range, inclusive. Required with end address.</p>

## Declarative Metadata Sample Definition

The following is an example of an ExtlCntAppOauthSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ExtlCntAppOauthSettings xmlns="http://soap.sforce.com/2006/04/metadata">
  <externalClientApplication>myeca</externalClientApplication>
  <label>My Oauth Settings</label>
  <trustedIpRanges>
    <startIpAddress>10.55.2.0</startIpAddress>
    <endIpAddress>10.55.2.255</endIpAddress>
  </trustedIpRanges>
</ExtlCntAppOauthSettings>
```

```

    <description>Building 6</description>
  </trustedIpRanges>
  <trustedIpRanges>
    <startIpAddress>10.55.12.0</startIpAddress>
    <endIpAddress>10.55.12.255</endIpAddress>
  </trustedIpRanges>
  <customAttributes>
    <key>userattribute</key>
    <formula>User.Country</formula>
  </customAttributes>
  <commaSeparatedOAuthScopes>Basic, Web</commaSeparatedOAuthScopes>
</ExtlClntAppOAuthSettings>

```

The following is an example `package.xml` that references the previous definition.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>ExternalClientApplication</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlClntAppOAuthSettings</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlClntAppGlobalOAuthSettings</name>
  </types>
  <types>
    <members>*</members>
    <name>ExtlClntAppOAuthConfigurablePolicies</name>
  </types>
  <version>59.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## FeatureParameterBoolean

---

Represents a boolean feature parameter in the Feature Management App (FMA). Feature parameters let you drive app behavior and track activation metrics in subscriber orgs that install your package. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

FeatureParameterBoolean components have the suffix `.featureParameterBoolean`. The components are stored in the `featureParameters` folder, which contains components for all the feature parameter metadata types.

## Version

FeatureParameterBoolean components are available in API version 41.0 and later.

## Special Access Rules

Available to package developers who have access to the Feature Management App (FMA). For details, see [Manage Features](#) in the *Second-Generation Managed Packaging Developer Guide*.

## Fields

Field Name	Field Type	Description
<code>dataFlowDirection</code>	<a href="#">FeatureParameterDataFlowDirection</a>	After a package containing the components is installed, indicates whether the feature parameter's value is editable in your License Management Org (LMO) and read-only in your customer's org or the other way around.
<code>masterLabel</code>	string	The feature parameter name that appears in the user interface.
<code>value</code>	boolean	The default value for this feature parameter. You can reference this value in your code, just like you reference other values in a subscriber's org.

## FeatureParameterDataFlowDirection

Represents the direction of the data flow between your License Management Org (LMO) and the customer's org.

Field Name	Field Type	Description
<code>FeatureParameterDataFlowDirection</code>	string	After a package containing the components is installed, indicates whether the feature parameter's value is editable in your License Management Org (LMO) and read-only in your customer's org or the other way around. Valid values are: <ul style="list-style-type: none"> <li>• <code>LmoToSubscriber</code></li> <li>• <code>SubscriberToLmo</code></li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a FeatureParameterBoolean component.

```
<?xml version="1.0" encoding="UTF-8"?>
<FeatureParameterBoolean xmlns="http://soap.sforce.com/2006/04/metadata">
  <dataflowDirection>SubscriberToLmo</dataflowDirection>
  <masterLabel>Budget Tracking Enabled</masterLabel>
  <value>false</value>
</FeatureParameterBoolean>
```

The following is an example `package.xml` that references the previous definition (and the definitions for the other feature parameter types).

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>FeatureParameterBoolean</name>
  </types>
  <types>
    <members>*</members>
    <name>FeatureParameterDate</name>
  </types>
  <types>
    <members>*</members>
    <name>FeatureParameterInteger</name>
  </types>
  <version>41.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## FeatureParameterDate

Represents a date feature parameter in the Feature Management App (FMA). Feature parameters let you drive app behavior and track activation metrics in subscriber orgs that install your package. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

FeatureParameterDate components have the suffix `.featureParameterDate`. The components are stored in the `featureParameters` folder, which contains components for all the feature parameter metadata types.

## Version

FeatureParameterDate components are available in API version 41.0 and later.

## Special Access Rules

Available to package developers who have access to the Feature Management App (FMA). For details, see [Manage Features](#) in the *Second-Generation Managed Packaging Developer Guide*.

## Fields

Field Name	Field Type	Description
dataFlowDirection	FeatureParameterDataFlowDirection	After a package containing the components is installed, indicates whether the feature parameter's value is editable in your License Management Org (LMO) and read-only in your customer's org or the other way around.
masterLabel	string	The feature parameter name that appears in the user interface.
value	date	The default value for this feature parameter. You can reference this value in your code, just like you reference other values in a subscriber's org.

## FeatureParameterDataFlowDirection

Represents the direction of the data flow between your License Management Org (LMO) and the customer's org.

Field Name	Field Type	Description
FeatureParameterDataFlowDirection	string	After a package containing the components is installed, indicates whether the feature parameter's value is editable in your License Management Org (LMO) and read-only in your customer's org or the other way around. Valid values are: <ul style="list-style-type: none"> <li>• LmoToSubscriber</li> <li>• SubscriberToLmo</li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a FeatureParameterDate component.

```
<?xml version="1.0" encoding="UTF-8"?>
<FeatureParameterDate xmlns="http://soap.sforce.com/2006/04/metadata">
  <dataflowDirection>SubscriberToLmo</dataflowDirection>
  <masterLabel>Activation Date</masterLabel>
</FeatureParameterDate>
```

```
<value>2017-10-23</value>
</FeatureParameterDate>
```

The following is an example `package.xml` that references the previous definition (and the definitions for the other feature parameter types).

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>FeatureParameterBoolean</name>
  </types>
  <types>
    <members>*</members>
    <name>FeatureParameterDate</name>
  </types>
  <types>
    <members>*</members>
    <name>FeatureParameterInteger</name>
  </types>
  <version>41.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## FeatureParameterInteger

Represents an integer feature parameter in the Feature Management App (FMA). Feature parameters let you drive app behavior and track activation metrics in subscriber orgs that install your package. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

`FeatureParameterInteger` components have the suffix `.featureParameterInteger`. The components are stored in the `featureParameters` folder, which contains components for all the feature parameter metadata types.

## Version

`FeatureParameterInteger` components are available in API version 41.0 and later.

## Special Access Rules

Available to package developers who have access to the Feature Management App (FMA). For details, see [Manage Features](#) in the *Second-Generation Managed Packaging Developer Guide*.

## Fields

Field Name	Field Type	Description
<code>dataFlowDirection</code>	<a href="#">FeatureParameterDataFlowDirection</a>	After a package containing the components is installed, indicates whether the feature parameter's value is editable in your License Management Org (LMO) and read-only in your customer's org or the other way around.
<code>masterLabel</code>	string	The feature parameter name that appears in the user interface.
<code>value</code>	int	The default value for this feature parameter. You can reference this value in your code, just like you reference other values in a subscriber's org.

## FeatureParameterDataFlowDirection

Represents the direction of the data flow between your License Management Org (LMO) and the customer's org.

Field Name	Field Type	Description
<code>FeatureParameterDataFlowDirection</code>	string	After a package containing the components is installed, indicates whether the feature parameter's value is editable in your License Management Org (LMO) and read-only in your customer's org or the other way around. Valid values are: <ul style="list-style-type: none"> <li>• <code>LmoToSubscriber</code></li> <li>• <code>SubscriberToLmo</code></li> </ul>

## Declarative Metadata Sample Definition

The following is an example of a `FeatureParameterInteger` component.

```
<?xml version="1.0" encoding="UTF-8"?>
<FeatureParameterInteger xmlns="http://soap.sforce.com/2006/04/metadata">
  <dataflowDirection>SubscriberToLmo</dataflowDirection>
  <masterLabel>Current Project Count</masterLabel>
  <value>42</value>
</FeatureParameterInteger>
```

The following is an example `package.xml` that references the previous definition (and the definitions for the other feature parameter types).

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>FeatureParameterBoolean</name>
  </types>
  <types>
    <members>*</members>
    <name>FeatureParameterDate</name>
  </types>
  <types>
    <members>*</members>
    <name>FeatureParameterInteger</name>
  </types>
  <version>41.0</version>
</Package>
```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## FieldRestrictionRule

---

Represents a field visibility rule that controls whether a field is visible to a user, based on the field's inclusion in a field set. If Enhanced Personal Information Management setting was enabled before Spring '22, field visibility is based on the field's compliance categorization. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

 **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

## File Suffix and Directory Location

`FieldRestrictionRule` components have the suffix `.rule` and are stored in the `fieldRestrictionRules` folder.

## Version

`FieldRestrictionRule` components are available in API version 52.0 and later.

## Special Access Rules

- To access this type, you must have the Manage Sharing permission.
- To create and manage Employee field visibility rules, you must be assigned a Workplace Command Center permission set license and the Provides access to Workplace Command Center features system permission.
- To create and manage User field visibility rules, you must enable Digital Experiences and the Enhanced Personal Information Management feature.

## Fields

Field Name	Field Type	Description
<code>active</code>	boolean	Indicates whether the rule is active ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .
<code>classification</code>	string[]	Required. The data classification compliance categorization or field set that is targeted by the rule. The rule applies to fields that are marked with this categorization or included in this field set. If you enabled Enhanced Personal Information Management before Spring '22 (API version 54.0), you can use Salesforce's default compliance categorization values or values that you add yourself. If you enabled Enhanced Personal Information Management after Spring '22 (API version 54.0), use the <code>PersonalInfo_EPIM</code> field set or a field set that you add yourself.
<code>classificationType</code>	ClassificationType (enumeration of type string)	The type of classification method used in your org. If you enabled Enhanced Personal Information Management before Spring '22 (API version 54.0), use <code>ComplianceCategory</code> . If you enabled Enhanced Personal Information Management after Spring '22, use <code>FieldSet</code> . <ul style="list-style-type: none"> <li>• <code>ComplianceCategory</code>—</li> <li>• <code>FieldSet</code>—</li> </ul> The default value is <code>ComplianceCategory</code> . Available in API version 54.0 and later.
<code>description</code>	string	Required. The description of the rule.
<code>enforcementType</code>	EnforcementType (enumeration of type string)	Required. The type of rule. Possible values are: <ul style="list-style-type: none"> <li>• <code>FieldRestrict</code>—Field visibility rule. Only this value is valid.</li> <li>• <code>Restrict</code>—Do not use.</li> <li>• <code>Scoping</code>—Do not use.</li> </ul>
<code>masterLabel</code>	string	Required. The name of the rule.
<code>recordFilter</code>	string	Required. The criteria that determine which fields are visible to the specified users. For example, the field can check if the logged-in user matches the Employee's ID.
<code>targetEntity</code>	string	Required. The object for which you're creating the rule. Only the Employee and User objects are supported.
<code>userCriteria</code>	string	Required. The users that this rule applies to, such as all active users or users with a specified role or profile.
<code>version</code>	int	Required. The rule's version number.

## Declarative Metadata Sample Definition

The following is an example of a FieldRestrictionRule component, which uses the ComplianceCategory classification type. The classification value is one of Salesforce's default compliance categorization values, but you can create a custom compliance categorization value to use instead.

```
<?xml version="1.0" encoding="UTF-8"?>
<FieldRestrictionRule xmlns="http://soap.sforce.com/2006/04/metadata">
  <active>true</active>
  <classification>PII</classification>
  <classificationType>ComplianceCategory</classificationType>
  <description>Is Owner of Employee</description>
  <enforcementType>FieldRestrict</enforcementType>
  <masterLabel>Is Owner Field Restriction Rule</masterLabel>
  <recordFilter>OwnerId = $User.Id</recordFilter>
  <targetEntity>Employee</targetEntity>
  <userCriteria>$User.IsActive = true</userCriteria>
  <version>1</version>
</FieldRestrictionRule>
```

The following is an example of a FieldRestrictionRule component, which uses the FieldSet classification type. The classification value is Salesforce's default field set for personal information, but you can create a field set to use instead.

```
<?xml version="1.0" encoding="UTF-8"?>
<FieldRestrictionRule xmlns="http://soap.sforce.com/2006/04/metadata">
  <active>true</active>
  <classification>PersonalInfo_EPIM</classification>
  <classificationType>FieldSet</classificationType>
  <description>Is Owner of Employee</description>
  <enforcementType>FieldRestrict</enforcementType>
  <masterLabel>Is Owner Field Restriction Rule</masterLabel>
  <recordFilter>OwnerId = $User.Id</recordFilter>
  <targetEntity>Employee</targetEntity>
  <userCriteria>$User.IsActive = true</userCriteria>
  <version>1</version>
</FieldRestrictionRule>
```

The following is an example package.xml that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>*</members>
    <name>FieldRestrictionRule</name>
  </types>
  <version>52.0</version>
</Package>
```

## FlexiPage

Represents the metadata associated with a Lightning page. A Lightning page represents a customizable screen made up of regions containing Lightning components.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

**Note:** These pages are known as FlexiPages in the API, but are referred to as Lightning pages in the rest of the Salesforce documentation and UI.

**Note:** In API version 49.0 and later, arrays in a FlexiPage are represented as `valueList`. Each array element is represented as `valueListItem`, and the element name is represented as `value`. In API version 48.0 and earlier, arrays are represented as `value` and array elements are formatted as a comma-separated list. Any FlexiPage retrieved using API version 49.0 or later uses `valueList` to represent component property array values, regardless of which API version was used to create the FlexiPage.

Lightning pages are used in several places.

- In the Salesforce mobile app, a Lightning page is the home page for an app that appears in the navigation menu.
- In Lightning Experience, Lightning pages can be used:
  - To customize the layout of record pages, the Salesforce Home page, and the Email Application pane in the Outlook and Gmail integrations.
  - As the home page for an app.
  - As the utility bar for a Lightning app.

For more information on Lightning pages, see [Salesforce Help](#).

**Note:** The namespace prefix is important to help identify the source of items like fields, custom objects, and more. For example, when working with FlexiPages, we recommend keeping namespaces for object fields, because removing them can cause unexpected results such as name collisions.

## File Suffix and Directory Location

FlexiPage components have the suffix `.flexipage` and are stored in the `flexipages` folder.

## Version

FlexiPage components are available in API version 29.0 and later.

## Fields

Field Name	Field Type	Description
<code>description</code>	string	The optional description text of the Lightning page.
<code>events</code>	<a href="#">FlexiPageEvent[]</a>	The list of events associated with the Lightning page. This field is available in API version 53.0 and later.
<code>flexiPageRegions</code>	<a href="#">FlexiPageRegion[]</a>	The list of regions of a page.
<code>masterLabel</code>	string	Required. The label for the Lightning page, which displays in Setup.

Field Name	Field Type	Description
<code>pageTemplate</code>	string	<p>Deprecated. Use this field in API versions 33.0 to 38.0 only. In later versions, use <code>template</code>.</p> <p>Required. The template associated with the Lightning page.</p>
<code>parentFlexiPage</code>	string	<p>The name of the Lightning page that this page inherits behavior from.</p> <p>This field is available in API version 37.0 or later.</p>
<code>platformActionList</code>	<a href="#">PlatformActionList</a>	<p>The list of all actions, and their order, that display on a Lightning app page. In the Salesforce mobile app, the actions appear in the action bar.</p> <p>This field is available in API version 34.0 and later.</p>
<code>quickActionList</code>	<a href="#">QuickActionList</a>	<p>The list of quick actions associated with the Lightning page.</p>
<code>subjectType</code>	string	<p>The object the Lightning page is associated with. For Lightning pages of type <code>AppPage</code> or <code>HomePage</code>, this field is <code>null</code>.</p> <p>After the value of this field is set, it can't be changed.</p> <p>This field is available in API version 37.0 or later.</p>
<code>template</code>	<a href="#">FlexiPageTemplateInstance</a>	<p>Required. The template associated with the Lightning page.</p> <p>This field is available in API version 39.0 and later.</p>
<code>type</code>	<code>FlexiPageType</code> (enumeration of type string)	<p>Required. The type of a page. In API versions 32.0 through 36.0, this field can only have a value of <code>AppPage</code>.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>CdpRecordPage</code>—A Lightning page that is used to override a <code>CDPNearCoreObject</code> record page in Lightning Experience. This value is available in API version 54.0 and later for orgs that have Data Cloud enabled.</li> <li>• <code>AppPage</code>—A Lightning page that is used as the home page for a custom app.</li> <li>• <code>CommAppPage</code>—A Lightning page that is used to represent a custom page, as created in the Experience Builder. This value is available in API version 37.0 and later.</li> <li>• <code>CommCheckoutPage</code>—A Lightning page that is used to create a B2B Commerce checkout, as created in the Experience Builder. This value is available in API version 46.0 and later.</li> <li>• <code>CommFlowPage</code>—A Lightning page used to override a flow page, as created in the Experience Builder. This value is available in API version 45.0 and later.</li> <li>• <code>CommForgotPasswordPage</code>—A Lightning page that's used to override a forgot-password page, as created</li> </ul>

Field Name	Field Type	Description
		<p>in Experience Builder. This value is available in API version 39.0 and later.</p> <ul style="list-style-type: none"> <li>• <code>CommFlowPage</code>—An out-of-the-box flow page, as created in Experience Builder. This value is available in API version 45.0 and later.</li> <li>• <code>CommGlobalSearchResultPage</code>—A Lightning page used to override the global search result page, as created in Experience Builder. This value is available in API version 41.0 and later.</li> <li>• <code>CommLoginPage</code>—A Lightning page that’s used to override the login page, as created in Experience Builder. This value is available in API version 39.0 and later.</li> <li>• <code>CommNoSearchResultsPage</code>—An Experience Builder site page for B2B searches that return no results. The URL for this page is <code>no-results/:term</code>. The page starts out empty. You can add any component to it that accepts parameters to achieve the desired “no results” experience. For example, you can place an HTML Editor component or CMS components for recommendations, banners, help, and support. This value is available in API version 48.0 and later.</li> <li>• <code>CommObjectPage</code>—A Lightning page used to override an object page, as created in Experience Builder. This value is available in API version 38.0 and later.</li> <li>• <code>CommOrderConfirmationPage</code>—A Lightning page that is used to create a B2B Commerce order confirmation page in checkout, as created in the Experience Builder. This value is available in API version 46.0 and later.</li> <li>• <code>CommQuickActionCreatePage</code>—A Lightning page used to override the create record page, as created in Experience Builder. This value is available in API version 38.0 and later.</li> <li>• <code>CommRecordPage</code>—A Lightning page used to override a record page, as created in the Experience Builder. This value is available in API version 38.0 and later.</li> <li>• <code>CommRelatedListPage</code>—A Lightning page used to override a related list page, as created in the Experience Builder. This value is available in API version 38.0 and later.</li> <li>• <code>CommSearchResultPage</code>—A Lightning page used to override the search result page, as created in Experience Builder. This value is available in API version 38.0 and later.</li> <li>• <code>CommSelfRegisterPage</code>—A Lightning page used to override the self-registration page, as created in</li> </ul>

Field Name	Field Type	Description
		<p>Experience Builder. This value is available in API version 39.0 and later.</p> <ul style="list-style-type: none"> <li>• <code>CommThemeLayoutPage</code>—A Lightning page used to override a theme layout page, as created in the Experience Builder. This value is available in API version 38.0 and later.</li> <li>• <code>EmbeddedServicePage</code> This value is available in API version 45.0 and later.</li> <li>• <code>EmailContentPage</code> — A page that contains the builder markup for your email content. When you edit email content in the builder, the FlexiPage object remembers where you put the components. Because they include builder markup, you can't retrieve or deploy FlexiPages when type is <code>EmailContentPage</code>.</li> <li>• <code>EmailTemplatePage</code> — A page that contains the builder markup for your email template. When you edit an email template in the builder, the FlexiPage object remembers where you put the components. Because they include builder markup, you can't retrieve or deploy FlexiPages when type is <code>EmailTemplatePage</code> or <code>EmailContentPage</code>.</li> <li>• <code>ForecastingPage</code> —A Lightning page that is used to override the default forecasts page in Lightning Experience. This value is available in API version 57.0 and later.</li> <li>• <code>HomePage</code>—A Lightning page that is used to override the Home page in Lightning Experience. This value is available in API version 37.0 and later.</li> <li>• <code>MailAppAppPage</code>—An email application pane used to override the default layout in the Outlook and Gmail integrations. This value is available in API version 38.0 and later.</li> <li>• <code>OmniSupervisorPageType</code>—A Lightning page used to customize the user interface on the Omni-Channel Supervisor page. This value is available in API version 60.0 and later.</li> <li>• <code>RecordPage</code>—A Lightning page used to override an object record page in Lightning Experience. This value is available in API version 37.0 and later.</li> <li>• <code>RecordPreview</code> A Lightning page used to override standard lookup previews when hovering over previewable records in Lightning Experience. This value is available in API version 45.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li><code>UtilityBar</code>—A Lightning page used as the utility bar in Lightning Experience apps. This value is available in API version 38.0 and later.</li> <li><code>VoiceExtension</code>—A Lightning page used to customize user interfaces and agent actions in the Omni-Channel widget for Service Cloud Voice. This value is available in API version 57.0 and later.</li> </ul> <p>This field is available in API version 32.0 and later.</p>

## FlexiPageEvent

An event associated with the Lightning page. Available in API version 53.0 and later.

Field Name	Field Type	Description
<code>sourceName</code>	string	<p>Required. The name of the event source item. If the source is a custom Lightning web component, this field is the name of the component.</p> <p>In API 53.0, a source can be only a Lightning web component.</p>
<code>sourceProperties</code>	<a href="#">FlexiPageEventSourceProperty[]</a>	The list of properties associated with the event source.
<code>sourceType</code>	<code>FlexipageEventSourceTypeEnum</code> (enumeration of type string)	<p>Required. The type of item assigned as the event source.</p> <p>In API version 53.0, this field can have only a value of <code>Component</code>.</p>
<code>targets</code>	<a href="#">FlexiPageEventTarget[]</a>	The list of targets associated with the event source.

## FlexiPageEventSourceProperty

A property associated with an event. Available in API version 53.0 and later.

Field Name	Field Type	Description
<code>name</code>	string	Required. In API version 53.0 and later, the value of this field can be only <code>eventName</code> .
<code>value</code>	string	<p>Required. If the <code>name</code> field value is <code>eventName</code>, this field is the name of the event.</p> <p>If the event source is a Lightning web component, this value must be the same as the event name defined in the source component's <code>js-meta.xml</code> file.</p>

## FlexiPageEventTarget

A target associated with an event source on the Lightning page. Available in API version 53.0 and later.

Field Name	Field Type	Description
mappings	<a href="#">FlexiPageEventPropertyMapping</a> []	A list of key-value pairs for an event's source-to-target bindings.
method	string	Required. The only valid value is <code>updateProperties</code> .
name	string	Required. The name of the event target. Valid values are: <ul style="list-style-type: none"> <li><code>flexipage:componentService</code></li> </ul>
properties	<a href="#">FlexiPageEventTargetProperty</a> []	List of properties of the event target.
type	<a href="#">FlexiPageEventTargetTypeEnum</a> (enumeration of type string)	Required. The type of item assigned as the event target. Valid values are: <ul style="list-style-type: none"> <li><code>FlexipageServices</code>—A component on the Lightning page.</li> </ul>

## FlexiPageEventPropertyMapping

A key-value pair for an event's source-to-target bindings. Available in API version 53.0 and later.

Field Name	Field Type	Description
name	string	Required. Name of the target property that changes when the event is triggered.
value	string	Value of the target property when the event occurs. For properties of type string, integer, and boolean, you can use an expression to define their value. Valid expression format is <code>{ !Event.eventPropertyName }</code> . Event is the only context supported for expressions in interactions.

## FlexiPageEventTargetProperty

A property on the event source's target represented as a key-value pair. Available in API version 53.0 and later.

Field Name	Field Type	Description
name	string	Required. In API version 53.0 and later, the value of this field can be only <code>componentIdentifier</code>

Field Name	Field Type	Description
value	string	Required. The <a href="#">ComponentInstance</a> identifier value for the component.

## FlexiPageRegion

FlexiPage Region represents the properties of a region of a page. A region can contain a record list component or a recent items component that can be scoped to a set of entities.

 **Note:** A Lightning page region can contain up to 100 components.

Field Name	Field Type	Description
appendable	RegionFlagStatus ( <a href="#">enumeration</a> of type string)	<p>This field is available in Digital Experiences in API 45.0 or later, but is reserved for future use for all other areas.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>disabled</li> <li>enabled</li> </ul> <p>This field is assessed in combination with <code>replaceable</code> and <code>prependable</code></p> <ul style="list-style-type: none"> <li>If all the properties are set to <code>enabled</code>, the region is unlocked</li> <li>If all the properties are set to <code>disabled</code>, the region is locked</li> <li>If none of the properties are specified OR any of these three properties are missing, the region is unlocked.</li> </ul> <p>This field is available in API version 35.0 or later.</p>
componentInstances	<a href="#">ComponentInstance</a> []	<p>Properties and name of the component instance.</p> <p>This field was removed in API version 49.0. In API version 49.0 and later, use the <code>itemInstances</code> field instead.</p>
itemInstances	<a href="#">ItemInstance</a> []	<p>Array of item instances, which can contain components and fields.</p> <p>This field is available in API version 49.0 or later.</p>
mode	FlexiPageRegionMode ( <a href="#">enumeration</a> of type string)	<p>This field is reserved for future use.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>Append</li> <li>Prepend</li> <li>Replace</li> </ul> <p>This field is available in API version 35.0 or later.</p>

Field Name	Field Type	Description
name	string	Required. Unique name of the FlexiPage region.
prependable	RegionFlagStatus (enumeration of type string)	<p>This field is available in Digital Experiences in API 45.0 or later, but is reserved for future use for all other areas.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>disabled</li> <li>enabled</li> </ul> <p>This field is assessed in combination with <code>appendable</code> and <code>replaceable</code>.</p> <ul style="list-style-type: none"> <li>If all the properties are set to <code>enabled</code>, the region is unlocked</li> <li>If all the properties are set to <code>disabled</code>, the region is locked</li> <li>If none of the properties are specified OR any of these three properties are missing, the region is unlocked.</li> </ul> <p>This field is available in API version 35.0 or later.</p>
replaceable	RegionFlagStatus (enumeration of type string)	<p>This field is available in Digital Experiences in API 45.0 or later, but is reserved for future use for all other areas.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>disabled</li> <li>enabled</li> </ul> <p>This field is assessed in combination with <code>appendable</code> and <code>prependable</code>.</p> <ul style="list-style-type: none"> <li>If all the properties are set to <code>enabled</code>, the region is unlocked</li> <li>If all the properties are set to <code>disabled</code>, the region is locked</li> <li>If none of the properties are specified OR any of these three properties are missing, the region is unlocked.</li> </ul> <p>This field is available in API version 35.0 or later.</p>
type	FlexiPageRegionType (enumeration of type string)	<p>Required. The type of FlexiPage region.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li><code>Background</code>—Represents a region for background utility items, which aren't visible in the UI. Supported for utility bars only.</li> <li><code>Facet</code></li> <li><code>Region</code></li> </ul> <p>This field is available in API version 35.0 or later.</p>

## ItemInstance

Instance of a component or field on a Lightning page. Available in API version 49.0 or later.

Field Name	Field Type	Description
<code>componentInstance</code>	<a href="#">ComponentInstance</a>	Properties and name of the component instance.
<code>fieldInstance</code>	<a href="#">FieldInstance</a>	API name, label, and visibility rule information of the field component. This field is available only on Lightning pages that use Dynamic Forms.

## ComponentInstance

Instance of a component in a page, such as a filter list.

Field Name	Field Type	Description
<code>componentInstanceProperties</code>	<a href="#">ComponentInstanceProperty[]</a>	The value of a single property in a component instance.
<code>componentName</code>	string	Required. The name of a single instance of a component.
<code>identifier</code>	string	Required. The unique name of the ComponentInstance. Provides a way to uniquely identify an individual instance of a component on a Lightning page. This field has a maximum limit of 120 characters.  This field is available in API version 53.0 and later.
<code>visibilityRule</code>	<a href="#">UiFormulaRule</a>	A set of one or more filters that define the conditions under which the component displays on the page.  If the rule evaluates to <code>true</code> , the component displays on the page. If <code>false</code> , it doesn't display. If this field is <code>null</code> , the component displays by default.  This field is available in API version 41.0 and later.

## ComponentInstanceProperty

Value of a single property in a component instance. ComponentInstanceProperty has a maximum limit of 10,000 characters.

Field Name	Field Type	Description
<code>name</code>	string	Name of the property, unique within the component instance. For Lightning components, this value is the <code>&lt;aura:attribute&gt;</code> as defined in the <code>.cmp</code> file.
<code>type</code>	<a href="#">ComponentInstancePropertyTypeEnum</a> (enumeration of type string)	If this field value is <code>null</code> , then the ComponentInstanceProperty values apply to the Lightning component. If this field value is <code>decorator</code> , then the

Field Name	Field Type	Description
		<p>ComponentInstanceProperty values apply to the <i>component decorator</i> for the Lightning component.</p> <p>The component decorator is a wrapper around a Lightning component. The decorator can apply more capabilities to the component when it renders on a specific page in Lightning Experience. For example, you can configure a component decorator around a component on the Lightning Experience utility bar to set the component’s height or width when opened. The <code>UtilityBar</code> is the only page type that supports component decorators.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>decorator</code></li> </ul> <p>This field is available in API version 38.0 or later.</p>
<code>value</code>	<code>string</code>	<p>Reference or value of the property.</p> <p>When defining a Related List component, to use a parent record set the <code>parentFieldApiName</code> value to <b><i>object.field_name</i></b>. If you don’t want to use a parent record, set the value to <b><i>object.Id</i></b>.</p>
<code>valueList</code>	<a href="#">ComponentInstancePropertyList</a>	An array of values in a component instance. Available in API version 49.0 and later.

## Tabs

When you give a standard label to a tab in a Tabs component—such as Activity, Collaborate, or Details—and when the `name` field is set to `title`, the `value` field uses a system-defined value instead of the label. Here are some examples of the system-defined values:

- `Standard.Tab.activity`
- `Standard.Tab.collaborate`
- `Standard.Tab.detail`
- `Standard.Tab.feed`
- `Standard.Tab.preview`
- `Standard.Tab.relatedLists`

For example, let’s say you have a Lightning page that contains a tab with the standard label “Activity”. If you query the definition that page, you see the system-defined name of the tab, not the label, in `value`.

```
<componentInstances>
  <componentInstanceProperties>
    <name>title</name>
    <value>Standard.Tab.activity</value>
  </componentInstanceProperties>
  <componentName>flexipage:tab</componentName>
</componentInstances>
```

## Save Options

Save options are available on pages of type `RecordPage` only, when users edit an account or when they create, edit, or clone a case or lead. Save options are configured as a `ComponentInstanceProperty` under `FlexiPageTemplateInstance`.

Set the `ComponentInstanceProperty` name to `saveOptions` and use `value` to define the checkbox values. The `value` field in this case is not a `ComponentInstancePropertyList`, but instead is a string representation of a JSON array of name and value pairs representing each checkbox name and its value.

API Name	Available Objects	Available Values	UI Label
UseDefaultAssignmentRule	Account	<ul style="list-style-type: none"> <li>NONE</li> <li>APPLY_OPTION_WITHOUT_CHECKBOX_DISPLAY</li> <li>SHOW_CHECKBOX_WITH_DEFAULT_OFF</li> <li>SHOW_CHECKBOX_WITH_DEFAULT_ON</li> </ul>	Evaluate this account against territory rules on save
UseDefaultAssignmentRule	Lead	<ul style="list-style-type: none"> <li>NONE</li> <li>SHOW_CHECKBOX_WITH_DEFAULT_OFF</li> <li>SHOW_CHECKBOX_WITH_DEFAULT_ON</li> </ul>	Assign using active assignment rule
UseDefaultAssignmentRule	Case	<ul style="list-style-type: none"> <li>NONE</li> <li>APPLY_OPTION_WITHOUT_CHECKBOX_DISPLAY</li> <li>SHOW_CHECKBOX_WITH_DEFAULT_OFF</li> <li>SHOW_CHECKBOX_WITH_DEFAULT_ON</li> </ul>	Assign using active assignment rule
triggerOtherEmail	Case	<ul style="list-style-type: none"> <li>NONE</li> <li>SHOW_CHECKBOX_WITH_DEFAULT_OFF</li> <li>SHOW_CHECKBOX_WITH_DEFAULT_ON</li> </ul>	Send notification email to Contact

Value	UI Result
NONE	Don't display the checkbox and don't apply any save options during save.
APPLY_OPTION_WITHOUT_CHECKBOX_DISPLAY	Don't display the checkbox, but apply the save option value during save.
SHOW_CHECKBOX_WITH_DEFAULT_OFF	Display the checkbox, unchecked by default.
SHOW_CHECKBOX_WITH_DEFAULT_ON	Display the checkbox, checked by default.

For example, you can set cases, when saved, to run the **Assign using active assignment rule** without displaying a checkbox, and display the **Send notification email to Contact** checkbox, checked by default.

```
saveOptions =
[{"name": "UseDefaultAssignmentRule", "value": "APPLY_OPTION_WITHOUT_CHECKBOX_DISPLAY"},
{"name": "triggerOtherEmail", "value": "SHOW_CHECKBOX_WITH_DEFAULT_ON"}]
```

 **Note:** Set assignment rules, territory rules, and email templates before configuring them as save options.

## ComponentInstancePropertyList

Value of an element in an array in a component instance.

Field Name	Field Type	Description
<code>valueListItems</code>	<code>ComponentInstancePropertyListItem[]</code>	An array of elements in a component instance.

## ComponentInstancePropertyListItem

Name of an element in an array in a component instance.

Field Name	Field Type	Description
<code>value</code>	<code>string</code>	Name of an element in an array in a component instance.

In API version 49.0 and later, arrays in a FlexiPage are represented as `valueList`. Each array element is represented as `valueListItem`, and the element name is represented as `value`.

For example, if you have an array of actions with API names `Clone` and `Edit`, the array is represented as `valueList`, with two `valueListItems`. One `valueListItems` has the `value Clone`, and one `valueListItems` has the `value Edit`.

```
<componentInstances>
  <componentInstanceProperties>
    <name>actionApiName</name>
    <valueList>
      <valueListItems>
        <value>Clone</value>
      </valueListItems>
      <valueListItems>
        <value>Edit</value>
      </valueListItems>
    </valueList>
  </componentInstanceProperties>
</componentInstances>
```

## UiFormulaRule

A set of one or more filters that define the conditions under which a component displays on a Lightning page. For example, you could construct a filter that causes a rich text component on an opportunity page to display only when the Amount is greater than \$1,000,000. Available in API version 41.0 and later.

Field Name	Field Type	Description
<code>booleanFilter</code>	<code>string</code>	Specifies advanced filter conditions such as 1 AND 2.

Field Name	Field Type	Description
<code>criteria</code>	<code>UiFormulaCriterion[]</code>	List of one or more filters that, when evaluated, determine component visibility.

## UiFormulaCriterion

A single filter that when evaluated, helps define component visibility on a Lightning page. Available in API version 41.0 and later.

Field Name	Field Type	Description
<code>leftValue</code>	string	Required. The field upon which the filter is based. For example, <code>AMOUNT</code> .
<code>operator</code>	string	Required. Defines the operator used to filter the data. Valid values are: <ul style="list-style-type: none"> <li>CONTAINS</li> <li>EQUAL</li> <li>NE—not equal</li> <li>GT—greater than</li> <li>GE—greater than or equal</li> <li>LE—less than or equal</li> <li>LT—less than</li> </ul>
<code>rightValue</code>	string	The value by which you want to evaluate the component's visibility. For example, <code>1000000</code> .

You can use these expressions in the `leftValue` field when setting filters for component visibility.

- `{!$Client.FormFactor}`—Use this expression to control component visibility based on the device the page is being rendered on. Valid values are `Small` (phone), `Medium` (tablet), and `Large` (Lightning Experience desktop). Setting the value to `Small` for record pages is supported only in orgs that are enabled for the new Salesforce mobile app. This expression is supported for app pages in API version 41.0 and later, and record pages in API version 47.0 and later.
- `{!$Permission.CustomPermission.permissionName}`—Use this expression to control component visibility based on the custom permissions of the user viewing the Lightning page. Supported for app, Home, and record pages only.
- `{!$Permission.StandardPermission.permissionName}`—Use this expression to control component visibility based on the standard permissions of the user viewing the Lightning page. Supported for app, Home, and record pages only.
- `{!Record.field}`—Supported for record pages only.
- `{!$User.field}`—Supported for app, Home, and record pages only.

For example, to display a component only when it renders on a phone, add this filter: `{!$Client.FormFactor} EQUAL "SMALL"`. Or, to display a component only to the System Administrator, use `{!$User.Profile.Name} EQUAL "System Administrator"`.

Expressions in component visibility rules can span no more than five fields. For example, `{!Record.Account.Owner.Manager.Manager.Manager.LastName}` has six spans and therefore isn't supported.

## FieldInstance

Represents a single field component that resides on a Lightning page. Available in API version 49.0 and later. This subtype is available only on Lightning Pages that have enabled Dynamic Forms.

Field Name	Field Type	Description
<code>fieldInstanceProperties</code>	<a href="#">FieldInstanceProperty</a> on page 1015[]	Properties of the field instance. Contains a name and value pair for each property associated with the field.
<code>fieldItem</code>	string	The API name of the field, prefixed with its context. For example, record fields are prefixed with <code>Record..</code>
<code>identifier</code>	string	Required. The unique name of the <code>FieldInstance</code> . Provides a way to uniquely identify an individual instance of a field on a Dynamic Forms-enabled Lightning page. This field has a maximum limit of 120 characters.  This field is available in API version 53.0 and later.
<code>visibilityRule</code>	<a href="#">UiFormulaRule</a>	A set of one or more filters that define the conditions under which the component displays on the page. If the rule evaluates to <code>true</code> , the component displays on the page. If <code>false</code> , it doesn't display. If this field is <code>null</code> , the component displays by default.

## FieldInstanceProperty

Represents a single property of a field instance. Available in API version 49.0 and later. This subtype is available only on Lightning pages that have enabled Dynamic Forms.

Field Name	Field Type	Description
<code>name</code>	string	Name of the property, unique within the field instance.  Valid values are: <ul style="list-style-type: none"> <li><code>conditionalFormatRuleset</code> Available in API version 62.0 and later.</li> <li><code>uiBehavior</code> Available in API version 49.0 and later.</li> </ul>
<code>value</code>	string	Reference or value of the property.  When the <code>name</code> value is <code>uiBehavior</code> , valid values for this field are: <ul style="list-style-type: none"> <li>None</li> <li>Readonly</li> <li>Required</li> </ul>

## FlexiPageTemplateInstance

FlexiPageTemplateInstance represents an instance of a Lightning page template.

Field Name	Field Type	Description
name	string	Required. The name of a single instance of a template.
properties	<a href="#">ComponentInstanceProperty[]</a>	<p>The value of a single property in a template instance.</p> <p>Valid only for:</p> <ul style="list-style-type: none"> <li>• <code>CommThemeLayoutPage</code></li> <li>• Dynamic Forms-enabled pages of type <code>RecordPage</code> that are associated with account, case, or lead objects</li> </ul> <p>Contains a name and value pair for each theme layout property associated with the page template. In Experience Builder, the theme layout and its properties appear in the Theme area.</p>

## PlatformActionList

PlatformActionList represents the list of actions, and their order, that display on a Lightning app page. Available in API version 34.0 and later.

Field Name	Field Type	Description
actionListContext	<a href="#">PlatformActionListContext</a> (enumeration of type string)	<p>Required. The context of the action list. Valid values are:</p> <ul style="list-style-type: none"> <li>• Assistant</li> <li>• BannerPhoto</li> <li>• Chatter</li> <li>• Dockable</li> <li>• FeedElement</li> <li>• Flexipage</li> <li>• Global</li> <li>• ListView</li> <li>• ListViewDefinition</li> <li>• ListViewRecord</li> <li>• Lookup</li> <li>• MruList</li> <li>• MruRow</li> <li>• ObjectHomeChart</li> <li>• Photo</li> <li>• Record</li> <li>• RecordEdit</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• RelatedList</li> <li>• RelatedListRecord</li> </ul>
platformActionListItems	PlatformActionListItem[]	The actions in the PlatformActionList.
relatedSourceEntity	string	When the <code>ActionListContext</code> is <code>RelatedList</code> or <code>RelatedListRecord</code> , this field represents the API name of the related list to which the action belongs.

## PlatformActionListItem

PlatformActionListItem represents an action in the PlatformActionList. Available in API version 34.0 and later.

Field Name	Field Type	Description
actionName	string	Required. The API name for the action in the list.
actionType	PlatformActionType (enumeration of type string)	Required. The type of action. Valid values are: <ul style="list-style-type: none"> <li>• <code>ActionLink</code>—An indicator on a feed element that targets an API, a web page, or a file, represented by a button in the Salesforce Chatter feed UI.</li> <li>• <code>CustomButton</code>—When clicked, opens a URL or a Visualforce page in a window or executes JavaScript.</li> <li>• <code>InvocableAction</code></li> <li>• <code>ProductivityAction</code>—Productivity actions are predefined and attached to a limited set of objects. Productivity actions include Send Email, Call, Map, View Website, and Read News. Except for the Call action, you can't edit productivity actions.</li> <li>• <code>QuickAction</code>—A global or object-specific action.</li> <li>• <code>StandardButton</code>—A predefined Salesforce button such as New, Edit, and Delete.</li> </ul>
sortOrder	int	Required. The placement of the action in the list.
subtype	string	The subtype of the action. For quick actions, the subtype is <code>QuickActionType</code> . For custom buttons, the subtype is <code>WebLinkTypeEnum</code> . For action links, subtypes are <code>Api</code> , <code>ApiAsync</code> , <code>Download</code> , and <code>Ui</code> . Standard buttons and productivity actions have no subtype.

## Declarative Metadata Sample Definition

Here's a sample XML FlexiPage component definition for a custom opportunity record page. It includes a tab set and a rich text component with visibility rules assigned to it.

 **Note:** As an Experience Builder site page, three initial regions in the definition show the header region as locked, the content region as unlocked, and the footer region as unlocked.

```
<?xml version="1.0" encoding="UTF-8"?>
<FlexiPage xmlns="http://soap.sforce.com/2006/04/metadata">
  <flexiPageRegions>

<type>RecordPage</type>
</FlexiPage>

```

And, here's the sample `package.xml` file that references the FlexiPage component definition:

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>New Opportunity Page</fullName>
  <types>
    <members>New_Opportunity_Page</members>
    <name>FlexiPage</name>
  </types>
  <version>49.0</version>
</Package>

```

## Wildcard Support in the Manifest File

This metadata type supports the wildcard character \* (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see [Deploying and Retrieving Metadata with the Zip File](#).

## Flow

Represents the metadata associated with a flow. Use Flow to create an application that takes users through a series of pages to query and update records in the database. You can also execute logic and provide branching capability based on user input to build dynamic applications.

**Important:** Where possible, we changed non-inclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

For information about the corresponding UI-based flow building tool, see Flow Builder in Salesforce Help.

Here are the limitations related to how you can use Metadata API to work with flows:

- You can't use Metadata API to access a flow installed from a managed package unless the flow is a template.
- Spaces in a flow file name can lead to errors when you deploy the flow. You can include spaces at the beginning or end of a name, but these spaces are removed when you deploy the flow.

- You can deploy changes to an active flow if in a non-production org, such as a scratch or sandbox org. To deploy changes in a production org, you must enable the **Deploy processes and flows as active** preference. After you deploy changes to an active flow, the flow's detail page shows a new flow version that's active. The new version includes your changes.
  - You can delete a flow version if it isn't active and doesn't have any paused interviews. If the flow version has paused interviews, wait for those interviews to resume and finish, or delete them.
-  **Warning:** Don't edit the metadata of retrieved Process Builder processes, such as flow components whose `processType` is `Workflow` or `InvocableProcess`. If you deploy process metadata that you edited, you can't open the process in the target org.

## Declarative Metadata File Suffix and Directory Location

Flows are stored in the `Flow` directory of the corresponding package directory. The file name matches the flow's unique full name, and the extension is `.flow`.

## Version

The flow Metadata API is available in API version 24.0 and later.

## Flow

This metadata type represents a valid definition of a flow. This type extends the [Metadata](#) metadata type and inherits its `fullName` field.

Field Name	Field Type	Description
<code>actionCalls</code>	Array of <a href="#">FlowActionCall</a> objects	An array of nodes that defines calls to action. This field is available in API version 31.0 and later.
<code>apexPluginCalls</code>	Array of <a href="#">FlowApexPluginCall</a> objects	An array of nodes that defines calls to Apex plug-ins.
<code>apiVersion</code>	number	The API version that defines the execution behavior of the flow. This field is available in API version 50.0 and later. Flows created before API version 50.0 show an API version of 0 on the Flows list view in Setup. To show the correct API version number, create another version of the flow, and set the API version for running the flow to 49.0 or later.
<code>assignments</code>	Array of <a href="#">FlowAssignment</a> objects	An array of assignment nodes.
<code>choices</code>	Array of <a href="#">FlowChoice</a> objects	An array of static choice options.
<code>collectionProcessors</code>	Array of <a href="#">FlowCollectionProcessor</a> on page 1052 objects	An array of nodes that process collections. This field is available in API version 50.0 and later.
<code>constants</code>	Array of <a href="#">FlowConstant</a> objects	An array of constants.
<code>decisions</code>	Array of <a href="#">FlowDecision</a> objects	An array of decision nodes.

Field Name	Field Type	Description
<code>description</code>	string	Description of the flow.
<code>dynamicChoiceSets</code>	Array of <a href="#">FlowDynamicChoiceSet</a> objects	An array that constructs a set of choice options based on a database lookup.
<code>environments</code>	FlowEnvironment (enumeration of type string)	<p>The environment in which the flow can run. Valid values are:</p> <ul style="list-style-type: none"> <li><code>Default</code>—The flow can run from a Visualforce component, Lightning page, flow action, or custom Aura component.</li> <li><code>Offline</code>—The flow can run only offline. Flow types that support offline flows must set this value. This value is available in API version 62.0 and later.</li> <li><code>Slack</code>—The flow can run in Slack and the default environment. You specify the Slack flow environment when you save the flow.</li> </ul> <p>This field is available in API version 55.0 and later.</p>
<code>exitRules</code>	Array of <a href="#">FlowExitRule</a> objects	An array of exit rules that determine when to end the flow for a user in a segment-triggered flow. This field is available in API version 61.0 and later.
<code>experiments</code>	Array of <a href="#">FlowExperiment</a> objects	An array of experiments. This field is available in API version 61.0 and later.
<code>formulas</code>	Array of <a href="#">FlowFormula</a> objects	An array of formulas.
<code>fullName</code>	string	<p>Required. Inherited from the Metadata component. Name of the file in Metadata API.</p> <p>A unique name for the flow that contains only underscores and alphanumeric characters. The name must be unique across the org, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p> <p>To deploy or retrieve a version, you can specify the version number. For example, <code>sampleFlow-3</code> specifies version 3 of the flow whose unique name is <code>sampleFlow</code>. If you don't specify a version number, the flow is the latest version.</p> <p>In API version 43.0 and earlier, this field included the version number. In API version 44 and later, this field no longer includes the version number.</p>
<code>interviewLabel</code>	string	<p>Label for the interview. This label helps users and administrators differentiate interviews from the same flow.</p> <p>In the user interface, this label appears in the Paused Flow Interviews component on the user's Home tab and in the list of paused flow interviews in Setup.</p>

Field Name	Field Type	Description
<code>isAdditionalPermissionRequiredToRun</code>	boolean	Override the default behavior and restrict access to enabled profiles or permission sets by setting this property to <code>true</code> . The default value is <code>false</code> . This field is available in API version 47.0 and later.
<code>isTemplate</code>	boolean	Indicates whether the process or flow is a template. The default value is <code>false</code> . When installed from managed packages, subscribers can't view or clone processes or flows because of intellectual property (IP) protection. But when those processes and flows are templates, subscribers can open them in a builder, clone them, and customize the clones. This field is available in API version 45.0 and later.
<code>label</code>	string	Required. Label for the flow.
<code>loops</code>	Array of <a href="#">FlowLoop</a> objects	An array of nodes for iterating through collections. This field is available in API version 30.0 and later.
<code>migratedFromWorkflowRuleName</code>	string	The name of the workflow rule that the flow was migrated from. This field is available in API version 54.0 and later.
<code>orchestratedStages</code>	Array of <a href="#">FlowOrchestratedStage</a> objects	An array of stage nodes in an orchestration. This field is available in API version 53.0 and later.
<code>processMetadataValues</code>	Array of <a href="#">FlowMetadataValue</a> objects	Metadata values for the flow. This field is available in API version 31.0 and later.
<code>processType</code>	<a href="#">FlowProcessType</a> (enumeration of type string)	The type of the flow, as determined by the active version, or the latest version, if there's no active version. Valid values are: <ul style="list-style-type: none"> <li><code>ActionCadenceAutoLaunchedFlow</code>—A flow that's executed when a user completes a cadence step. This value is available in API version 56.0 and later.</li> <li><code>ActionCadenceStepFlow</code>—A screen flow used as a cadence step. This value is available in API version 56.0 and later.</li> <li><code>Appointments</code>—A flow for Lightning Scheduler. This value is available in API version 44.0 and later.</li> <li><code>AutoLaunchedFlow</code>—A flow that doesn't require user interaction.</li> <li><code>CheckoutFlow</code>—A flow used in Lightning B2B Commerce to create a checkout in a store. This value is available in API version 48.0 and later.</li> <li><code>ContactRequestFlow</code>—A flow that lets customers request to be contacted by customer support. This flow is used to create contact request records. This value is available in API version 45.0 and later.</li> <li><code>CustomerLifecycle</code>—A Salesforce Surveys flow that lets you associate survey questions with different stages in</li> </ul>

Field Name	Field Type	Description
		<p>customer lifecycles. This value is available in API version 49.0 and later and only when the Customer Lifecycle Designer license is enabled.</p> <ul style="list-style-type: none"> <li>• <code>CustomEvent</code>—A process that is invoked when it receives a platform event message. In the UI, it's an event process. This value is available in API version 41.0 and later.</li> <li>• <code>DataCaptureFlow(Beta)</code>— In the UI, Data Capture flows configure the Form tab in the Field Service mobile app. When the Data Capture flow is launched, its Flow metadata is publicly available in JavaScript format. This value is available in API version 62.0 and later.</li> <li>• <code>DcvtFrameworkDataCaptureFlow</code>—This flow sets up the Form tab, which mobile workers can access through the related list on a service appointment record. This value is available in API version 62.0 and later.</li> <li>• <code>EvaluationFlow</code>—A flow for evaluating custom entry and exit conditions in an orchestration. Uses the <code>isOrchestrationConditionMet</code> output variable and discards values from any other output variables. This value is available in API version 54.0 and later.</li> <li>• <code>FieldServiceMobile</code>—A flow for the Field Service mobile app. This value is available in API version 39.0 and later.</li> <li>• <code>FieldServiceWeb</code>—A flow for embedded Appointment Booking. Its UI label is Field Service Embedded Flow. This value is available in API version 41.0 and later.</li> <li>• <code>Flow</code>—A flow that requires user interaction because it contains one or more screens or local actions, choices, or dynamic choices. In the UI and Salesforce Help, it's a screen flow. Screen flows can be launched from the UI, such as with a flow action, Lightning page, or web tab.</li> <li>• <code>FSLending</code>—A flow for Financial Services Cloud Mortgage. This value is available in API version 46.0 and later.</li> <li>• <code>IndicatorResultFlow</code>—A flow for Outcome Management that calculates and creates indicator results for a selected indicator performance period. This value is available with the Outcome Management license in API version 60.0 and later.</li> <li>• <code>IndividualObjectLinkingFlow</code>—A flow that associates individuals with interactions such as voice calls, messaging sessions, or case-related emails. This value is available in API version 58.0 and later.</li> <li>• <code>InvocableProcess</code>—A process that another process or the Invocable Actions resource in REST API invokes. This value is available in API version 38.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>Journey</code>—An audience-driven flow for Marketing Cloud. This value is available in API version 57.0 and later.</li> <li>• <code>LoginFlow</code>—A flow for login. This value is available in API version 51.0 and later.</li> <li>• <code>LoyaltyManagementFlow</code>—A flow for the Loyalty Management app that's invocable by loyalty program processes. This value is available in API version 54.0 and later.</li> <li>• <code>Orchestrator</code>—An orchestration that organizes flows into groups of steps contained in a series of stages. This value is available in API version 53.0 and later.</li> <li>• <code>PromptFlow</code>—A flow for Prompt Builder. Pass data between Prompt Builder and the flow. This value is available in API version 60.0 and later.</li> <li>• <code>RecommendationStrategy</code>—Build recommendations for your users. A recommendation launches its assigned flow. This value is available in API version 54.0 and later. See <a href="#">Flow Builder Strategies</a>.</li> <li>• <code>RoutingFlow</code>—A flow for Salesforce Omni-Channel routing and other business logic. This value is available in API version 52.0 and later.</li> <li>• <code>Survey</code>—A flow for Salesforce Surveys. From the UI, this type of flow is created in Survey Builder. This value is available in API version 42.0 and later.</li> <li>• <code>SurveyEnrich</code>—A Salesforce Surveys flow that uses the Survey Data Mapper. From the UI, this type of flow is created in the Survey Builder and requires an associated survey flow type. This value is available in API version 49.0 or later and only when the Customer Lifecycle Designer license is enabled.</li> <li>• <code>Workflow</code>—A process that is invoked when a record is created or edited. In the UI and Salesforce Help, it's a record change process.</li> </ul>
		<p>Across flow versions, you can change the type only from <code>Flow</code> to <code>AutoLaunchedFlow</code> or vice versa. Before you change the flow type, make sure that the flow contains only the elements, resources, and functionality that the new flow type supports.</p>
		<p>These values are reserved for future or Salesforce internal use.</p> <ul style="list-style-type: none"> <li>• <code>ActionCadenceFlow</code></li> <li>• <code>ActionPlan</code></li> <li>• <code>AppProcess</code></li> <li>• <code>ApprovalWorkflow</code></li> <li>• <code>CartAsyncFlow</code></li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>DigitalForm</li> <li>JourneyBuilderIntegration</li> <li>LoginFlow</li> <li>ManagedContentFlow</li> <li>OrchestrationFlow</li> <li>SalesEntryExperienceFlow</li> <li>TransactionSecurityFlow</li> <li>UserProvisioningFlow</li> </ul> <p>This field is available in API version 31.0 and later.</p>
recordCreates	Array of <a href="#">FlowRecordCreate</a> objects	An array of nodes for creating records in the database.
recordDeletes	Array of <a href="#">FlowRecordDelete</a> objects	An array of nodes for deleting records in the database.
recordLookups	Array of <a href="#">FlowRecordLookup</a> objects	An array of nodes for looking up records in the database.
recordRollbacks	Array of <a href="#">FlowRecordRollback</a> objects	An array of nodes for rolling back transactions in the screen flow. This field is available in API version 52.0 and later.
recordUpdates	Array of <a href="#">FlowRecordUpdate</a> objects	An array of nodes for updating records in the database.
runInMode	FlowRunInMode (enumeration of type string)	<p>The context that the flow runs in. Valid values are:</p> <ul style="list-style-type: none"> <li><code>DefaultMode</code>—How the flow is launched determines whether the flow runs in user context or in system context. In the UI, this value appears as <b>User or System Context—Depends on How Flow is Launched</b>.</li> <li><code>SystemModeWithSharing</code>—The flow respects org-wide default settings, role hierarchies, sharing rules, manual sharing, teams, and territories. The flow doesn't respect object permissions, field-level access, or other permissions of the running user. In the UI, this value appears as <b>System Context with Sharing—Enforces Record-Level Access</b>.</li> <li><code>SystemModeWithoutSharing</code>—The flow can access all data. In the UI, this value appears as <b>System Context without Sharing—Access All Data</b>. This value is available in API version 49.0 and later.</li> </ul> <p>This field is available in API version 48.0 and later.</p>
screens	Array of <a href="#">FlowScreen</a> objects	An array of screen nodes.
segment	string	Reserved for future use.

Field Name	Field Type	Description
stages	Array of <a href="#">FlowStage</a> objects	An array of stage resources that you can use throughout the flow. This field is available in API version 42.0 and later.
start	<a href="#">FlowStart</a> object	The flow's Start element, which specifies how and when the flow starts. This field is available in API version 47.0 and later.
startElementReference	string	Specifies which node or element is the starting point in the flow. This field isn't used in flows created or saved in Flow Builder in Winter '20 and later. Those flows use the <code>start</code> field instead to specify how the flow starts.
status	FlowVersionStatus (enumeration of type string)	The activation status of the flow. Valid values are: <ul style="list-style-type: none"> <li>• <code>Active</code></li> <li>• <code>Draft</code>—In the UI, this status appears as <code>Inactive</code>.</li> <li>• <code>Obsolete</code>—In the UI, this status appears as <code>Inactive</code>.</li> <li>• <code>InvalidDraft</code>—In the UI, this status appears as <code>Draft</code>.</li> </ul>
steps	Array of <a href="#">FlowStep</a> objects	An array of step nodes.
subflows	Array of <a href="#">FlowSubflow</a> objects	An array of subflows. This field is available in API version 25.0 and later.
textTemplates	Array of <a href="#">FlowTextTemplate</a> objects	An array of text templates.
timeZoneSidKey	string	The ID that defines the time zone in which the flow runs. This field is available in API version 56.0 and later.
transforms	Array of <a href="#">FlowTransform</a> objects	An array of data transformations. This field is available in API version 59.0 and later.
triggerOrder	int	The run order of a record-triggered flow, from 1 to 2,000. See <a href="#">Guidelines for Defining the Run Order of Record-Triggered Flows for an Object</a> in Salesforce Help. This field is available in API version 54.0 and later.
variables	Array of <a href="#">FlowVariable</a> objects	An array of variable definitions.
waits	Array of <a href="#">FlowWait</a> objects	An array of wait nodes. This field is available in API version 32.0 and later.

## FlowActionCall

Defines a call to an action from the flow. It extends [FlowNode](#).

This metadata type is available in API version 31.0 and later.

Field Name	Field Type	Description
<code>actionName</code>	string	Required. Name for the action. Must be unique across actions with the same <code>actionType</code> .
<code>actionType</code>	InvokableActionType (enumeration of type string)	<p>Required. The action type. Valid values are:</p> <ul style="list-style-type: none"> <li><code>activateSessionPermSet</code>—Activates a session-based permission set for the running user.</li> <li><code>addMessageToChat</code>—Adds a message to an existing Salesforce Anywhere chat. This value is available in API version 49.0 and later.</li> <li><code>addMessageToQuipChat</code>—Adds a Quip message to an existing chat room. This value is available in API version 46.0 and later.</li> <li><code>addMessageToQuipDocument</code>—Adds a Quip message to an existing Quip document, spreadsheet, or slide. This value is available in API version 46.0 and later.</li> <li><code>addQuipDocumentToFolder</code>—Adds an existing Quip document, spreadsheet, or slide to an existing folder. This value is available in API version 46.0 and later.</li> <li><code>addUsersToChat</code>—Adds users to an existing Salesforce Anywhere chat. This value is available in API version 49.0 and later.</li> <li><code>addUsersToQuipDocument</code>—Adds users, identified by their email addresses, to an existing Quip document, spreadsheet, or slide. This value is available in API version 46.0 and later.</li> <li><code>addUsersToQuipChat</code>—Adds users, identified by their email addresses, to an existing Quip chat room. This value is available in API version 46.0 and later.</li> <li><code>attachQuipDocumentToRecord</code>—Attaches a Quip document, spreadsheet, or slide to a Salesforce record. This value is available in API version 46.0 and later.</li> <li><code>apex</code>—Invokes an Apex method that has the <code>@invocableMethod</code> annotation.</li> <li><code>archiveKnowledgeArticles</code>—Archives a list of published Knowledge articles. This value is available in API version 45.0 and later.</li> <li><code>assignKnowledgeArticles</code>—Mass assigns knowledge articles from article list views. This value is available in API version 44.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>automateRefund</code>—Initiate a refund to the customer. This value is available in API version 60.0 and later.</li> <li>• <code>buildIdentityVerification</code>—Calls an action that builds the identity verification context using the identity verification process definition specified in <code>IdVerfProcessDefinition</code> and information passed into the flow. Stores the result in the <code>VerificationContext</code> variable. This value is available in API version 55.0 and later.</li> <li>• <code>cdpPublishCalculatedInsight</code>—Run the calculated insight in Data Cloud. Available in API version 60.0 and later.</li> <li>• <code>cdpPublishSegment</code>—Publish a segment in Data Cloud. Available in API version 60.0 and later.</li> <li>• <code>cdpRefreshDataStream</code>—Refresh a data stream in Data Cloud. Available in API version 60.0 and later.</li> <li>• <code>cdpRunIdentityResolution</code>—Runs a Data Cloud identity resolution process. This value is available in API version 57.0 and later.</li> <li>• <code>chat</code>—Creates a Salesforce Anywhere chat. This value is available in API version 49.0 and later.</li> <li>• <code>chatterPost</code>—Posts to Chatter.</li> <li>• <code>choosePricebook</code>—Selects a price book.</li> <li>• <code>contactRequestAction</code>—Creates a contact request record. This value is available in API version 45.0 and later.</li> <li>• <code>component</code>—Invokes the Lightning component that implements the <code>lightning:availableForFlowActions</code> interface and that is referenced by <code>actionName</code>. This value is available in API version 43.0 and later.</li> <li>• <code>contentWorkspaceEnableFolders</code>—Enables folders in a library.</li> <li>• <code>copyQuipDocument</code>—Creates a copy of an existing Quip document, spreadsheet, or slide, and gives it a new title. This value is available in API version 46.0 and later.</li> <li>• <code>createDraftFromOnlineKnowledgeArticle</code>—Creates a draft from a published knowledge article. This value is available in API version 45.0 and later.</li> <li>• <code>createFieldGnrnPromptTplResp</code>—Creates a field generation prompt template response. This value is available in API version 62.0 and later.</li> </ul>

Field Name	Field Type	Description
		<ul style="list-style-type: none"> <li>• <code>createInvoiceFromFulfillmentOrder</code>—Creates an invoice from a purchase order. Available to B2B Commerce. This value is available in API version 49.0 and later.</li> <li>• <code>createQuipChat</code>—Creates a Quip chat room. This value is available in API version 46.0 and later.</li> <li>• <code>createQuipDocument</code>—Creates a Quip document, spreadsheet, or slide. This value is available in API version 46.0 and later.</li> <li>• <code>createQuipFolder</code>—Creates a Quip folder. This value is available in API version 46.0 and later.</li> <li>• <code>customNotificationAction</code>—Sends a custom notification. This value is available in API version 46.0 and later.</li> <li>• <code>dataCloudIngestionApi</code>—Send data to Data Cloud using Ingestion API. This value is available in API version 61.0 and later.</li> <li>• <code>deactivateSessionPermSet</code>—Deactivates a session-based permission set for the running user.</li> <li>• <code>deleteKnowledgeArticle</code>—Deletes a draft version (translation or master-language) or an entire archived knowledge article. This value is available in API version 46.0 and later.</li> <li>• <code>dynamicSendSurveyInvitation</code>—Sends customized notifications to users about important events or updates to the records that they're working on. This value is available in API version 51.0 and later.</li> <li>• <code>editQuipDocument</code>—Modifies the contents of an existing Quip document, spreadsheet, or slide. This value is available in API version 46.0 and later.</li> <li>• <code>emailAlert</code>—Sends an email by referencing a workflow email alert</li> <li>• <code>emailSimple</code>—Sends an email by using flow resources</li> <li>• <code>externalConnector</code>—Reserved for future use.</li> <li>• <code>externalService</code>—Invokes an External Service operation that makes an HTTP request to an external system made available by an External Service schema registered through Setup. This value is available in API version 46.0 and later.</li> <li>• <code>findMatchingIndividuals</code>—Finds contact, lead, or employee records that match a search term.</li> <li>• <code>flow</code>—Invokes an autolaunched flow. This action type isn't available for flows with a processType of Flow or</li> </ul>

Field Name	Field Type	Description
		<p data-bbox="922 254 1430 352">AutolaunchedFlow. To invoke an autolaunched flow from one of those types, use FlowSubflow. This value is available in API version 32.0 and later.</p> <ul data-bbox="886 369 1450 1892" style="list-style-type: none"> <li data-bbox="886 369 1450 499">• <code>getActivitySummary</code>—Gets a summary of activity data associated with a specified record, including emails, calls, and meetings. This value is available in API version 60.0 and later.</li> <li data-bbox="886 516 1450 680">• <code>getArticleSmartLinkUrl</code>—Gets the Smart Link URL of the Salesforce Knowledge article. Smart links go to the right article and version, even when a new version is published or the URL name changes. This value is available in API version 54.0 and later.</li> <li data-bbox="886 697 1450 861">• <code>getResourcesForMnlScheduling</code>—Recommends resources to use to manually schedule the start of a care visit or recurring visits. You must enable Home Health to use this action. This value is available in API version 61.0 and later.</li> <li data-bbox="886 877 1450 1041">• <code>getVerificationData</code>—Calls an invocable action to get verification data for <code>selectedPrimaryVerificationContext</code> and adds the results to <code>selectedPrimaryVerificationContext</code>.
