getFlagsOnComment(communityId, commentId, visibility, pageSize, pageParam)

Get a page of moderation flags with specified visibility on a comment.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String commentId, ConnectApi.CommunityFlagVisibility visibility, Integer pageSize, String pageParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`getFlagsOnFeedElement(communityId, feedElementId)`

Get the moderation flags on a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

Return Value

Type: `ConnectApi.ModerationCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`getFlagsOnFeedElement(communityId, feedElementId, visibility)`

Get the moderation flags with specified visibility on a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`getFlagsOnFeedElement(communityId, feedElementId, pageParam, pageSize)`

Get a page of moderation flags on a feed element.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId, String pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

pageParam
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

Return Value

Type: `ConnectApi.ModerationCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`getFlagsOnFeedElement(communityId, feedElementId, visibility, pageSize, pageParam)`

Get a page of moderation flags with specified visibility on a feed element.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility, Integer pageSize,
String pageParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedElementId`
Type: String

ID of the feed element.

`visibility`
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

`pageParam`
Type: String

Page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: `ConnectApi.ModerationCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`removeFlagFromComment(communityId, commentId, userId)`

Remove a moderation flag from a comment.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags removeFlagFromComment(String communityId,
String commentId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

commentId
Type: String

ID for a comment.

userId
Type: String

ID of the context user for whom the flag is removed. Specify `null` to remove the flag for all users.

Return Value

Type: Void

Usage

To remove a moderation flag, the context user must have added the flag or must have the Moderate Experiences Feeds permission.

removeFlagFromFeedElement(communityId, feedElementId, userId)

Remove a moderation flag from a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static void removeFlagFromFeedElement(String communityId, String feedElementId,
String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

userId
Type: String

ID of the context user for whom the flag is removed. Specify `null` to remove the flag for all users.

Return Value

Type: `ConnectApi.ModerationCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To remove a moderation flag, the context user must have added the flag or must have the Moderate Experiences Feeds permission.

Retired CommunityModeration Methods

These methods for `CommunityModeration` are retired.

IN THIS SECTION:

addFlagToFeedItem(communityId, feedItemId)
Add a moderation flag to a feed item.

addFlagToFeedItem(communityId, feedItemId, visibility)
Add a moderation flag with specified visibility to a feed item.

getFlagsOnFeedItem(communityId, feedItemId)
Get the moderation flags on a feed item.

getFlagsOnFeedItem(communityId, feedItemId, visibility)
Get the moderation flags with specified visibility on a feed item.

removeFlagsOnFeedItem(communityId, feedItemId, userId)
Remove a moderation flag from a feed item.

`addFlagToFeedItem(communityId, feedItemId)`

Add a moderation flag to a feed item.

API Version

29.0–31.0

Important: In version 32.0 and later, use addFlagToFeedElement(communityId, feedElementId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToFeedItem(String communityId, String feedItemId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a feed item, Allow members to flag content must be selected for an Experience Cloud site.

`addFlagToFeedItem(communityId, feedItemId, visibility)`

Add a moderation flag with specified visibility to a feed item.

API Version

30.0–31.0

Important: In version 32.0 and later, use addFlagToFeedElement(communityId, feedElementId, visibility).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToFeedItem(String communityId, String feedItemId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.

- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a feed item, Allow members to flag content must be selected for an Experience Cloud site.

`getFlagsOnFeedItem(communityId, feedItemId)`

Get the moderation flags on a feed item.

API Version

29.0–31.0

Important: In version 32.0 and later, use getFlagsOnFeedElement(communityId, feedElementId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnFeedItem(String communityId, String feedItemId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`feedItemId`
Type: String

ID for a feed item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`getFlagsOnFeedItem(communityId, feedItemId, visibility)`

Get the moderation flags with specified visibility on a feed item.

API Version

30.0–31.0

Important: In version 32.0 and later, use getFlagsOnFeedElement(communityId, feedElementId, visibility).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnFeedItem(String communityId, String feedItemId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Visibility behavior of a flag for various user types. Values are:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To get moderation flags, the context user must have the Moderate Experiences Feeds permission.

`removeFlagsOnFeedItem(communityId, feedItemId, userId)`

Remove a moderation flag from a feed item.

API Version

29.0–31.0

Important: In version 32.0 and later, use removeFlagFromFeedElement(communityId, feedElementId, userId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags removeFlagsOnFeedItem(String communityId,
String feedItemId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedItemId
Type: String

ID for a feed item.

userId
Type: String

ID of the context user for whom the flag is removed. Specify `null` to remove the flag for all users.

Return Value

Type: Void

Usage

To remove a moderation flag, the context user must have added the flag or must have the Moderate Experiences Feeds permission.

ContentHub Class

Access Files Connect repositories and their files and folders.

Namespace

ConnectApi

ContentHub Methods

These methods are for `ContentHub`. All methods are static.

Use `ContentHub` methods to work with Files Connect repositories.

IN THIS SECTION:

addRepositoryItem(repositoryId, repositoryFolderId, file)
Add a repository item.

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)
Add a repository item in an Experience Cloud site.

addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)
Add a repository item, including the binary file.

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)
Add a repository item, including the binary file, in an Experience Cloud site.

getAllowedItemTypes(repositoryId, repositoryFolderId)
Get the item types that the context user is allowed to create in the repository folder.

getAllowedItemTypes(repositoryId, repositoryFolderId, filter)
Get the item types, filtered by type, that the context user is allowed to create in the repository folder.

getAllowedItemTypes(communityId, repositoryId, repositoryFolderId)
Get the item types that the context user is allowed to create in the repository folder in an Experience Cloud site.

getAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter)
Get the item types, filtered by type, that the context user is allowed to create in the repository folder in an Experience Cloud site.

getFilePreview(repositoryId, repositoryFileId, formatType)
Get a repository file preview.

getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)
Get a page or page range of a repository file preview.

getFilePreview(communityId, repositoryId, repositoryFileId, formatType)
Get a repository file preview in an Experience Cloud site.

getFilePreview(communityId, repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)
Get a page or page range of a repository file preview in an Experience Cloud site.

getItemType(repositoryId, repositoryItemTypeId)
Get information about an item type associated with a repository.

getItemType(communityId, repositoryId, repositoryItemTypeId)
Get information about an item type associated with a repository in an Experience Cloud site.

getPreviews(repositoryId, repositoryFileId)
Get information about a repository file's supported previews.

getPreviews(communityId, repositoryId, repositoryFileId)
Get information about a repository file's supported previews in an Experience Cloud site.

getRepositories()
Get a list of repositories.

getRepositories(communityId)
Get a list of repositories in an Experience Cloud site.

getRepositories(pageParam, pageSize)
Get a page of repositories.

getRepositories(communityId, pageParam, pageSize)
Get a page of repositories in an Experience Cloud site.

getRepository(repositoryId)
Get a repository.

getRepository(communityId, repositoryId)
Get a repository in an Experience Cloud site.

getRepositoryFile(repositoryId, repositoryFileId)
Get a repository file.

getRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)
Get a repository file with or without permissions information.

getRepositoryFile(communityId, repositoryId, repositoryFileId)
Get a repository file in an Experience Cloud site.

getRepositoryFile(communityId, repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)
Get a repository file with or without permissions information in an Experience Cloud site.

getRepositoryFolder(repositoryId, repositoryFolderId)
Get a repository folder.

getRepositoryFolder(communityId, repositoryId, repositoryFolderId)
Get a repository folder in an Experience Cloud site.

getRepositoryFolderItems(repositoryId, repositoryFolderId)
Get repository folder items.

getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId)
Get repository folder items in an Experience Cloud site.

getRepositoryFolderItems(repositoryId, repositoryFolderId, pageParam, pageSize)
Get a page of repository folder items.

getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize)
Get a page of repository folder items in an Experience Cloud site.

updateRepositoryFile(repositoryId, repositoryFileId, file)
Update the name of a repository file.

updateRepositoryFile(repositoryId, repositoryFileId, file, fileData)
Update the content of a repository file.

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file)
Update the name of a repository file in an Experience Cloud site.

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData)
Update the content of a repository file in an Experience Cloud site.

`addRepositoryItem(repositoryId, repositoryFolderId, file)`

Add a repository item.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: ConnectApi.ContentHubItemInput

The item type ID and fields of the item type.

Return Value

Type: ConnectApi.RepositoryFolderItem

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example creates a file without binary content (metadata only) in a Google Drive repository folder. After the file is created, we show the file's ID, name, description, external URL, and download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs';

final ConnectApi.ContentHubItemInput newItem = new ConnectApi.ContentHubItemInput();
newItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
for creation/update
newItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
final ConnectApi.ContentHubFieldValueInput fieldValueInput = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInput.name = 'name';
fieldValueInput.value = 'new folder item name.txt';
newItem.fields.add(fieldValueInput);

//Metadata: description field
final ConnectApi.ContentHubFieldValueInput fieldValueInputDesc = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputDesc.name = 'description';
fieldValueInputDesc.value = 'It does describe it';
```

```
newItem.fields.add(fieldValueInputDesc);

final ConnectApi.RepositoryFolderItem newFolderItem =
ConnectApi.ContentHub.addRepositoryItem(gDriveRepositoryId, gDriveFolderId, newItem);
final ConnectApi.RepositoryFileSummary newFile = newFolderItem.file;
System.debug(String.format('New file - id: \'\'{0}\'\', name: \'\'{1}\'\', description:
\'\'{2}\'\' \n external URL: \'\'{3}\'\', download URL: \'\'{4}\'\'', new String[]{
newFile.id, newFile.name, newFile.description, newFile.externalDocumentUrl,
newFile.downloadUrl}));
```

SEE ALSO:

- setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, result)
- *Apex Developer Guide*: Testing ConnectApi Code

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)

Add a repository item in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String communityId,
String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

Return Value

Type: `ConnectApi.RepositoryFolderItem`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, result)

Apex Developer Guide: Testing ConnectApi Code

addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)

Add a repository item, including the binary file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput
fileData)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

fileData
Type: `ConnectApi.BinaryInput`

The binary file.

Return Value

Type: ConnectApi.RepositoryFolderItem

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example creates a file with binary content and metadata in a Google Drive repository folder. After the file is created, we show the file's ID, name, description, external URL, and download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs';

final ConnectApi.ContentHubItemInput newItem = new ConnectApi.ContentHubItemInput();
newItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
for creation/update
newItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
Final String newFileName = 'new folder item name.txt';
final ConnectApi.ContentHubFieldValueInput fieldValueInput = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInput.name = 'name';
fieldValueInput.value = newFileName;
newItem.fields.add(fieldValueInput);

//Metadata: description field
final ConnectApi.ContentHubFieldValueInput fieldValueInputDesc = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputDesc.name = 'description';
fieldValueInputDesc.value = 'It does describe it';
newItem.fields.add(fieldValueInputDesc);

//Binary content
final Blob newFileBlob = Blob.valueOf('awesome content for brand new file');
final String newFileMimeType = 'text/plain';
final ConnectApi.BinaryInput fileBinaryInput = new ConnectApi.BinaryInput(newFileBlob,
newFileMimeType, newFileName);

final ConnectApi.RepositoryFolderItem newFolderItem =
ConnectApi.ContentHub.addRepositoryItem(gDriveRepositoryId, gDriveFolderId, newItem,
fileBinaryInput);
final ConnectApi.RepositoryFileSummary newFile = newFolderItem.file;
System.debug(String.format('New file - id: \'\'{0}\'\', name: \'\'{1}\'\', description:
\'\'{2}\'\' \n external URL: \'\'{3}\'\', download URL: \'\'{4}\'\'', new String[]{
```

```
newFile.id, newFile.name, newFile.description, newFile.externalDocumentUrl,
newFile.downloadUrl}));
```

SEE ALSO:

setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, fileData, result)

Apex Developer Guide: Testing ConnectApi Code

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)

Add a repository item, including the binary file, in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String communityId,
String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file,
ConnectApi.BinaryInput fileData)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

fileData
Type: `ConnectApi.BinaryInput`

The binary file.

Return Value

Type: `ConnectApi.RepositoryFolderItem`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData, result)

Apex Developer Guide: Testing ConnectApi Code

`getAllowedItemTypes(repositoryId, repositoryFolderId)`

Get the item types that the context user is allowed to create in the repository folder.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String repositoryId, String repositoryFolderId)
```

Parameters

`repositoryId`
Type: String

The ID of the repository.

`repositoryFolderId`
Type: String

The ID of the repository folder.

Return Value

Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, result)

Apex Developer Guide: Testing ConnectApi Code

`getAllowedItemTypes(repositoryId, repositoryFolderId, filter)`

Get the item types, filtered by type, that the context user is allowed to create in the repository folder.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String
repositoryId, String repositoryFolderId, ConnectApi.ConnectContentHubItemType filter)
```

Parameters

`repositoryId`
Type: String

The ID of the repository.

`repositoryFolderId`
Type: String

The ID of the repository folder.

`filter`
Type: `ConnectApi.ContentHubItemType`

Item types. Values are:

- `Any`—Includes files and folders.
- `FilesOnly`—Includes files only.
- `FoldersOnly`—Includes folders only.

Return Value

Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example calls `getAllowedItemTypes(repositoryId, repositoryFolderId, ConnectApi.ContentHubItemType.FilesOnly)` to get the first `ConnectApi.ContentHubItemTypeSummary.id` of a file. The context user can create allowed files in a repository folder in the external system.

```
final ConnectApi.ContentHubAllowedItemTypeCollection allowedItemTypesColl =
ConnectApi.ContentHub.getAllowedItemTypes(repositoryId, repositoryFolderId,
ConnectApi.ContentHubItemType.FilesOnly);
final List<ConnectApi.ContentHubItemTypeSummary> allowedItemTypes =
allowedItemTypesColl.allowedItemTypes;
string allowedFileItemTypeId = null;
if(allowedItemTypes.size() > 0){
   ConnectApi.ContentHubItemTypeSummary allowedItemTypeSummary = allowedItemTypes.get(0);

   allowedFileItemTypeId = allowedItemTypeSummary.id;
}
```

SEE ALSO:

- setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, filter, result)
- *Apex Developer Guide*: Testing ConnectApi Code

`getAllowedItemTypes(communityId, repositoryId, repositoryFolderId)`

Get the item types that the context user is allowed to create in the repository folder in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String
communityId, String repositoryId, String repositoryFolderId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetAllowedItemTypes(communityId, repositoryId, repositoryFolderId, result)

Apex Developer Guide: Testing ConnectApi Code

`getAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter)`

Get the item types, filtered by type, that the context user is allowed to create in the repository folder in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String
communityId, String repositoryId, String repositoryFolderId,
ConnectApi.ConnectContentHubItemType filter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

filter
Type: `ConnectApi.ContentHubItemType`

Item types. Values are:

- `Any`—Includes files and folders.
- `FilesOnly`—Includes files only.
- `FoldersOnly`—Includes folders only.

Return Value

Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter, result)

Apex Developer Guide: Testing ConnectApi Code

`getFilePreview(repositoryId, repositoryFileId, formatType)`

Get a repository file preview.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String repositoryId, String
repositoryFileId, ConnectApi.FilePreviewFormat formatType)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType

Type: ConnectApi.FilePreviewFormat

Specifies the format of the file preview. Values are:

- `Jpg`—Preview format is JPG.
- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you're concerned that feature-rich SVG previews don't work in your org, choose alternative file previews. To use JPG file previews, enter *general* in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.

Return Value

Type: ConnectApi.FilePreview

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example calls `getFilePreview(repositoryId, repositoryFileId, ConnectApi.FilePreviewFormat.Thumbnail)` to get the thumbnail format preview along with its respective URL and number of thumbnail renditions. For each thumbnail format, we show every rendition URL available.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'document:1-zcA1BaeoQbo2_yNFiHCcK6QJTPmOke-kHFC4TYg3rk';final ConnectApi.FilePreview
filePreview =
ConnectApi.ContentHub.getFilePreview(gDriveRepositoryId, gDriveFileId,
ConnectApi.FilePreviewFormat.Thumbnail);System.debug(String.format('Preview - URL:
\'\'{0}\'\', format: \'\'{1}\'\', nbr of
renditions for this format: {2}', new String[]{ filePreview.url,
filePreview.format.name(),String.valueOf(filePreview.previewUrls.size())}));for(ConnectApi.FilePreviewUrl
 filePreviewUrl : filePreview.previewUrls){
   System.debug('-----> Rendition URL: ' + filePreviewUrl.previewUrl);
}
```

setTestGetFilePreview(repositoryId, repositoryFileId, formatType, result)

Apex Developer Guide: Testing ConnectApi Code

getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)

Get a page or page range of a repository file preview.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType, Integer startPageNumber, Integer endPageNumber)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: ConnectApi.FilePreviewFormat

Specifies the format of the file preview. Values are:

- `Jpg`—Preview format is JPG.
- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you're concerned that feature-rich SVG previews don't work in your org, choose alternative file previews. To use JPG file previews, enter *general* in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.

startPageNumber
Type: Integer

The starting page number in the range of file preview URLs.

endPageNumber
Type: Integer

The ending page number in the range of file preview URLs.

Return Value

Type: `ConnectApi.FilePreview`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

`getFilePreview(communityId, repositoryId, repositoryFileId, formatType)`

Get a repository file preview in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String communityId, String
repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`repositoryId`
Type: String

The ID of the repository.

`repositoryFileId`
Type: String

The ID of the repository file.

`formatType`
Type: `ConnectApi.FilePreviewFormat`

Specifies the format of the file preview. Values are:

- `Jpg`—Preview format is JPG.
- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.

- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

`getItemType(repositoryId, repositoryItemTypeId)`

Get information about an item type associated with a repository.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubItemTypeDetail getItemType(String repositoryId,
String repositoryItemTypeId)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryItemTypeId
Type: String

The ID of the repository item type.

Return Value

Type: `ConnectApi.ContentHubItemTypeDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetItemType(repositoryId, repositoryItemTypeId, result)

Apex Developer Guide: Testing ConnectApi Code

`getItemType(communityId, repositoryId, repositoryItemTypeId)`

Get information about an item type associated with a repository in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubItemTypeDetail getItemType(String communityId, String
repositoryId, String repositoryItemTypeId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryItemTypeId
Type: String

The ID of the repository item type.

Return Value

Type: `ConnectApi.ContentHubItemTypeDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

`getPreviews(repositoryId, repositoryFileId)`

Get information about a repository file's supported previews.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreviewCollection getPreviews(String repositoryId, String repositoryFileId)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

Return Value

Type: `ConnectApi.FilePreviewCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets all supported preview formats and their respective URLs and number of renditions. For each supported preview format, we show every rendition URL available.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'document:1-zcA1BaeoQbo2_yNFiHCcK6QJTPmOke-kHFC4TYg3rk';
final ConnectApi.FilePreviewCollection previewsCollection =
ConnectApi.ContentHub.getPreviews(gDriveRepositoryId, gDriveFileId);
for(ConnectApi.FilePreview filePreview : previewsCollection.previews){
   System.debug(String.format('Preview - URL: \'\'{0}\'\', format: \'\'{1}\'\', nbr of
renditions for this format: {2}', new String[]{ filePreview.url,
filePreview.format.name(),String.valueOf(filePreview.previewUrls.size())}));
   for(ConnectApi.FilePreviewUrl filePreviewUrl : filePreview.previewUrls){
      System.debug('-----> Rendition URL: ' + filePreviewUrl.previewUrl);
      }
}
```

SEE ALSO:

setTestGetPreviews(repositoryId, repositoryFileId, result)

getPreviews(communityId, repositoryId, repositoryFileId)

Get information about a repository file's supported previews in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreviewCollection getPreviews(String communityId, String repositoryId, String repositoryFileId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

Return Value

Type: `ConnectApi.FilePreviewCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

`getRepositories()`

Get a list of repositories.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepositoryCollection getRepositories()
```

Return Value

Type: ConnectApi.ContentHubRepositoryCollection

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets all repositories and gets the first SharePoint online repository found.

```
final string sharePointOnlineProviderType ='ContentHubSharepointOffice365';
final ConnectApi.ContentHubRepositoryCollection repositoryCollection =
ConnectApi.ContentHub.getRepositories();
ConnectApi.ContentHubRepository sharePointOnlineRepository = null;
for(ConnectApi.ContentHubRepository repository : repositoryCollection.repositories){
   if(sharePointOnlineProviderType.equalsIgnoreCase(repository.providerType.type)){
      sharePointOnlineRepository = repository;
      break;
   }
}
```

`getRepositories(pageParam, pageSize)`

Get a page of repositories.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepositoryCollection getRepositories(Integer
pageParam, Integer pageSize)
```

Parameters

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

Return Value

Type: `ConnectApi.ContentHubRepositoryCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

`getRepositoryFile(repositoryId, repositoryFileId)`

Get a repository file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail getRepositoryFile(String repositoryId,
String repositoryFileId)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

Return Value

Type: `ConnectApi.RepositoryFileDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'file:0B0lTys1KmM3sTmxKNjVJbWZja00';
final ConnectApi.RepositoryFileDetail file =
ConnectApi.ContentHub.getRepositoryFile(gDriveRepositoryId, gDriveFileId);
System.debug(String.format('File - name: \'\'{0}\'\', size: {1}, external URL: \'\'{2}\'\',
 download URL: \'\'{3}\'\'',
   new String[]{ file.name, String.valueOf(file.contentSize), file.externalDocumentUrl,
file.downloadUrl}));
```

SEE ALSO:

setTestGetRepositoryFile(repositoryId, repositoryFileId, result)

getRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)

Get a repository file with or without permissions information.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail getRepositoryFile(String repositoryId,
String repositoryFileId, Boolean includeExternalFilePermissionsInfo)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

includeExternalFilePermissionsInfo
Type: Boolean

Specifies whether to include permission information, such as whether the file is shared and what are the available permission types.

Managing external file permissions is supported for Google Drive, SharePoint Online, and OneDrive for Business.

Return Value

Type: ConnectApi.RepositoryFileDetail

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'file:0B0lTys1KmM3sTmxKNjVJbWZja00';

final ConnectApi.RepositoryFileDetail file =
ConnectApi.ContentHub.getRepositoryFile(gDriveRepositoryId, gDriveFileId, true);
System.debug(String.format('File - name: \'\'{0}\'\', size: {1}, external URL: \'\'{2}\'\',
 download URL: \'\'{3}\'\'', new String[]{ file.name, String.valueOf(file.contentSize),
file.externalDocumentUrl, file.downloadUrl}));
final ConnectApi.ExternalFilePermissionInformation externalFilePermInfo =
file.externalFilePermissionInformation;

//permission types
final List<ConnectApi.ContentHubPermissionType> permissionTypes =
```

```
externalFilePermInfo.externalFilePermissionTypes;
for(ConnectApi.ContentHubPermissionType permissionType : permissionTypes){
   System.debug(String.format('Permission type - id: \'\'{0}\'\', label: \'\'{1}\'\'', new
 String[]{ permissionType.id, permissionType.label}));
}

//permission groups
final List<ConnectApi.RepositoryGroupSummary> groups =
externalFilePermInfo.repositoryPublicGroups;
for(ConnectApi.RepositoryGroupSummary ggroup : groups){

`getRepositoryFolder(communityId, repositoryId, repositoryFolderId)`

Get a repository folder in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderDetail getRepositoryFolder(String communityId,
String repositoryId, String repositoryFolderId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: `ConnectApi.RepositoryFolderDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

`getRepositoryFolderItems(repositoryId, repositoryFolderId)`

Get repository folder items.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItemsCollection getRepositoryFolderItems(String repositoryId, String repositoryFolderId)
```

Parameters

`repositoryId`
Type: String

The ID of the repository.

`repositoryFolderId`
Type: String

The ID of the repository folder.

Return Value

Type: `ConnectApi.RepositoryFolderItemsCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets the collection of items in a repository folder. For files, we show the file's name, size, external URL, and download URL. For folders, we show the folder's name, description, and external URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs';
final ConnectApi.RepositoryFolderItemsCollection folderItemsColl =
ConnectApi.ContentHub.getRepositoryFolderItems(gDriveRepositoryId,gDriveFolderId);
final List<ConnectApi.RepositoryFolderItem> folderItems = folderItemsColl.items;
System.debug('Number of items in repository folder: ' + folderItems.size());
for(ConnectApi.RepositoryFolderItem item : folderItems){
   ConnectApi.RepositoryFileSummary fileSummary = item.file;
   if(fileSummary != null){
      System.debug(String.format('File item - name: \'\'{0}\'\', size: {1}, external URL:
 \'\'{2}\'\', download URL: \'\'{3}\'\'', new String[]{ fileSummary.name,
String.valueOf(fileSummary.contentSize), fileSummary.externalDocumentUrl,
fileSummary.downloadUrl}));
      }else{
         ConnectApi.RepositoryFolderSummary folderSummary = item.folder;
         System.debug(String.format('Folder item - name: \'\'{0}\'\', description:
\'\'{1}\'\'',  new String[]{ folderSummary.name, folderSummary.description}));
      }
}
```

SEE ALSO:

`getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId)`

Get repository folder items in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItemsCollection getRepositoryFolderItems(String
communityId, String repositoryId, String repositoryFolderId)
```

Parameters

`communityId`

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: `ConnectApi.RepositoryFolderItemsCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, result)

`getRepositoryFolderItems(repositoryId, repositoryFolderId, pageParam, pageSize)`

Get a page of repository folder items.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItemsCollection getRepositoryFolderItems(String repositoryId, String repositoryFolderId, Integer pageParam, Integer pageSize)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

Return Value

Type: `ConnectApi.RepositoryFolderItemsCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRepositoryFolderItems(repositoryId, repositoryFolderId, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

`getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize)`

Get a page of repository folder items in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItemsCollection getRepositoryFolderItems(String communityId, String repositoryId, String repositoryFolderId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

Return Value

Type: `ConnectApi.RepositoryFolderItemsCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

updateRepositoryFile(repositoryId, repositoryFileId, file)

Update the name of a repository file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String repositoryId,
String repositoryFileId, ConnectApi.ContentHubItemInput file)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file

Type: ConnectApi.ContentHubItemInput

The item type ID and fields of the item type.

When updating the metadata of a repository file, only the name field can be updated.

Return Value

Type: ConnectApi.RepositoryFileDetail

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example updates the name of a file in a Google Drive repository. After the file is updated, we show the file's ID, name, description, external URL, download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs', gDriveFileId =
'document:1q9OatVpcyYBK-JWzp_PhR75ulQghwFP15zhkamKrRcQ';

final ConnectApi.ContentHubItemInput updatedItem = new ConnectApi.ContentHubItemInput();
updatedItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
 for creation/update
updatedItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
final ConnectApi.ContentHubFieldValueInput fieldValueInputName = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputName.name = 'name';
fieldValueInputName.value =  'updated file name.txt';
updatedItem.fields.add(fieldValueInputName);

final ConnectApi.RepositoryFileDetail updatedFile =
ConnectApi.ContentHub.updateRepositoryFile(gDriveRepositoryId, gDriveFileId, updatedItem);
System.debug(String.format('Updated file - id: \'\'{0}\'\', name: \'\'{1}\'\', description:
 \'\'{2}\'\',\n external URL: \'\'{3}\'\', download URL: \'\'{4}\'\'',  new String[]{
updatedFile.id, updatedFile.name, updatedFile.description, updatedFile.externalDocumentUrl,
 updatedFile.downloadUrl}));
```

SEE ALSO:

setTestUpdateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData, result)

Apex Developer Guide: Testing ConnectApi Code

updateRepositoryFile(repositoryId, repositoryFileId, file, fileData)

Update the content of a repository file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String repositoryId,
String repositoryFileId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput
fileData)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file
Type: ConnectApi.ContentHubItemInput

The item type ID and fields of the item type.

When updating the metadata of a repository file, only the name field can be updated.

fileData
Type: ConnectApi.BinaryInput

The binary file.

Return Value

Type: ConnectApi.RepositoryFileDetail

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example updates the content and name of a file in a Google Drive repository. After the file is updated, we show the file's ID, name, description, external URL, and download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs', gDriveFileId =
'document:1q9OatVpcyYBK-JWzp_PhR75ulQghwFP15zhkamKrRcQ';

final ConnectApi.ContentHubItemInput updatedItem = new ConnectApi.ContentHubItemInput();
```

```
updatedItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
 for creation/update
updatedItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
final ConnectApi.ContentHubFieldValueInput fieldValueInputName = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputName.name = 'name';
fieldValueInputName.value =  'updated file name.txt';
updatedItem.fields.add(fieldValueInputName);

//Binary content
final Blob updatedFileBlob = Blob.valueOf('even more awesome content for updated file');
final String updatedFileMimeType = 'text/plain';
final ConnectApi.BinaryInput fileBinaryInput = new ConnectApi.BinaryInput(updatedFileBlob,
 updatedFileMimeType, updatedFileName);

final ConnectApi.RepositoryFileDetail updatedFile =
ConnectApi.ContentHub.updateRepositoryFile(gDriveRepositoryId, gDriveFileId, updatedItem);
System.debug(String.format('Updated file - id: \'\'{0}\'\', name: \'\'{1}\'\', description:
 \'\'{2}\'\',\n external URL: \'\'{3}\'\', download URL: \'\'{4}\'\'',  new String[]{
updatedFile.id, updatedFile.name, updatedFile.description, updatedFile.externalDocumentUrl,
 updatedFile.downloadUrl}));
```

SEE ALSO:

setTestUpdateRepositoryFile(repositoryId, repositoryFileId, file, result)

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file)

Update the name of a repository file in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String communityId,
String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

When updating the metadata of a repository file, only the name field can be updated.

Return Value

Type: `ConnectApi.RepositoryFileDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`updateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData)`

Update the content of a repository file in an Experience Cloud site.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String communityId,
String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file,
ConnectApi.BinaryInput fileData)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

When updating the metadata of a repository file, only the name field can be updated.

fileData
Type: `ConnectApi.BinaryInput`

The binary file.

Return Value

Type: `ConnectApi.RepositoryFileDetail`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

ContentHub Test Methods

These test methods are for `ContentHub`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, result)`

Register a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(repositoryId, repositoryFolderId, file)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestAddRepositoryItem(String repositoryId, String
repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.RepositoryFolderItem
result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

result
Type: `ConnectApi.RepositoryFolderItem`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

addRepositoryItem(repositoryId, repositoryFolderId, file)

Apex Developer Guide: Testing ConnectApi Code

setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, result)

Register a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestAddRepositoryItem(String communityId, String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file,
ConnectApi.RepositoryFolderItem result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

result
Type: `ConnectApi.RepositoryFolderItem`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)

`setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, fileData, result)`

Register a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestAddRepositoryItem(String repositoryId, String
repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput fileData,
ConnectApi.RepositoryFolderItem result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: ConnectApi.ContentHubItemInput

The item type ID and fields of the item type.

fileData
Type: ConnectApi.BinaryInput

The binary file.

result
Type: ConnectApi.RepositoryFolderItem

Object containing test data.

Return Value

Type: Void

SEE ALSO:

addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)

Apex Developer Guide: Testing ConnectApi Code

setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData, result)

Register a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestAddRepositoryItem(String communityId, String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput
fileData, ConnectApi.RepositoryFolderItem result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

fileData
Type: `ConnectApi.BinaryInput`

The binary file.

result
Type: `ConnectApi.RepositoryFolderItem`

Object containing test data.

Return Value

Type: Void

`setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, result)`

Register a `ConnectApi.ContentHubAllowedItemTypeCollection` object to be returned when the matching `getAllowedItemTypes(repositoryId, repositoryFolderId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetAllowedItemTypes(String repositoryId, String
repositoryFolderId, ConnectApi.ContentHubAllowedItemTypeCollection result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

result
Type: ConnectApi.ContentHubAllowedItemTypeCollection

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getAllowedItemTypes(repositoryId, repositoryFolderId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, filter, result)

Register a `ConnectApi.ContentHubAllowedItemTypeCollection` object to be returned when the matching `getAllowedItemTypes(repositoryId, repositoryFolderId, filter)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetAllowedItemTypes(String repositoryId, String
repositoryFolderId, ConnectApi.ContentHubItemType filter,
ConnectApi.ContentHubAllowedItemTypeCollection result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

filter
Type: ConnectApi.ContentHubItemType

Item types. Values are:

- `Any`—Includes files and folders.
- `FilesOnly`—Includes files only.
- `FoldersOnly`—Includes folders only.

result
Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

setTestGetFilePreview(repositoryId, repositoryFileId, formatType, result)

Register a `ConnectApi.FilePreview` object to be returned when the matching `getFilePreview(repositoryId, repositoryFileId, formatType)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetFilePreview(String repositoryId, String repositoryFileId,
ConnectApi.FilePreviewFormat formatType, ConnectApi.FilePreview result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: ConnectApi.FilePreviewFormat

Specifies the format of the file preview. Values are:

- `Jpg`—Preview format is JPG.
- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

If you're concerned that feature-rich SVG previews don't work in your org, choose alternative file previews. To use JPG file previews, enter *general* in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.

result
Type: ConnectApi.FilePreview

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getFilePreview(repositoryId, repositoryFileId, formatType)

Apex Developer Guide: Testing ConnectApi Code

setTestGetFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber, result)

Register a `ConnectApi.FilePreview` object to be returned when the matching `getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetFilePreview(String repositoryId, String repositoryFileId,
ConnectApi.FilePreviewFormat formatType, Integer startPageNumber, Integer endPageNumber,
ConnectApi.FilePreview result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: ConnectApi.FilePreviewFormat

Specifies the format of the file preview. Values are:

- `Jpg`—Preview format is JPG.
- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.

- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRepositories(communityId, result)`

Register a `getRepositories(communityId)` object to be returned when the matching `ConnectApi.ContentHubRepositoryCollection` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositories(String communityId,
ConnectApi.ContentHubRepositoryCollection result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`result`
Type: `ConnectApi.ContentHubRepositoryCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepositories(communityId)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRepositories(pageParam, pageSize, result)`

Register a `ConnectApi.ContentHubRepositoryCollection` object to be returned when the matching `getRepositories(pageParam, pageSize)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositories(Integer pageParam, Integer pageSize,
ConnectApi.ContentHubRepositoryCollection result)
```

Parameters

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

result
Type: `ConnectApi.ContentHubRepositoryCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepositories(pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRepositories(communityId, pageParam, pageSize, result)`

Register a `ConnectApi.ContentHubRepositoryCollection` object to be returned when the matching `getRepositories(communityId, pageParam, pageSize)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositories(String communityId, Integer pageParam, Integer pageSize, ConnectApi.ContentHubRepositoryCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

result
Type: ConnectApi.ContentHubRepositoryCollection

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepositories(communityId, pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

setTestGetRepository(repositoryId, result)

Register a `ConnectApi.ContentHubRepository` object to be returned when the matching `getRepository(repositoryId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepository(String repositoryId,
ConnectApi.ContentHubRepository result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

result
Type: ConnectApi.ContentHubRepository

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepository(repositoryId)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRepository(communityId, repositoryId, result)`

Register a `ConnectApi.ContentHubRepository` object to be returned when the matching `getRepository(communityId, repositoryId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepository(String communityId, String repositoryId,
ConnectApi.ContentHubRepository result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`repositoryId`
Type: String

The ID of the repository.

`result`
Type: `ConnectApi.ContentHubRepository`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepository(communityId, repositoryId)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRepositoryFile(repositoryId, repositoryFileId, result)`

Register a `ConnectApi.RepositoryFileDetail` object to be returned when the matching `getRepositoryFile(repositoryId, repositoryFileId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFile(String repositoryId, String repositoryFileId,
ConnectApi.RepositoryFileDetail result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

result
Type: `ConnectApi.RepositoryFileDetail`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepositoryFile(repositoryId, repositoryFileId)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo, result)`

Register a `ConnectApi.RepositoryFileDetail` object to be returned when the matching `getRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFile(String repositoryId, String repositoryFileId,
Boolean includeExternalFilePermissionsInfo, ConnectApi.RepositoryFileDetail result)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

includeExternalFilePermissionsInfo
Type: Boolean

Specifies whether to include permission information, such as whether the file is shared and what are the available permission types.

Managing external file permissions is supported for Google Drive, SharePoint Online, and OneDrive for Business.

result
Type: `ConnectApi.RepositoryFileDetail`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFolder(String communityId, String repositoryId, String repositoryFolderId, ConnectApi.RepositoryFolderDetail result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`repositoryId`
Type: String

The ID of the repository.

`repositoryFolderId`
Type: String

The ID of the repository folder.

`result`
Type: `ConnectApi.RepositoryFolderDetail`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRepositoryFolder(communityId, repositoryId, repositoryFolderId)

API Version

40.0

Signature

```
public static Void setTestUpdateRepositoryFile(String communityId, String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput fileData, ConnectApi.RepositoryFileDetail result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

fileData
Type: `ConnectApi.BinaryInput`

The binary file.

result
Type: `ConnectApi.RepositoryFileDetail`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

ConversationApplicationDefinition Class

Access information about a conversation application definition.

Namespace

ConnectApi

ConversationApplicationDefinition Methods

These methods are for `ConversationApplicationDefinition`. All methods are static.

IN THIS SECTION:

getConversationApplicationDefinition(integrationName)
Get information about an integration's conversation application definition and the associated bot.

`getConversationApplicationDefinition(integrationName)`

Get information about an integration's conversation application definition and the associated bot.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ConversationApplicationDefinitionDetailRespresentation
getConversationApplicationDefinition(String integrationName)
```

Parameters

integrationName
Type: String

Name of the conversation application.

Return Value

Type: `ConnectApi.ConversationApplicationDefinitionDetailRespresentation`

Usage

To access this method, enable the bot feature, and the user must be an admin or have the Manage Bots or Manage Bots Training Data user permissions.

Datacloud Class

Purchase Data.com contact or company records, and retrieve purchase information.

Namespace

ConnectApi

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

IN THIS SECTION:

Datacloud Methods
These methods are for `Datacloud`. All methods are static.

Datacloud Methods

These methods are for `Datacloud`. All methods are static.

IN THIS SECTION:

getCompaniesFromOrder(orderId, pageSize, page)
Get a list of purchased company records for an order.

getCompany(companyId)
Get a company record.

getContact(contactId)
Get a contact.

getContactsFromOrder(orderId, page, pageSize)
Get a list of purchased contacts for an order.

getOrder(orderId)
Get an order.

getUsage(userId)
Get purchase usage information for a user.

postOrder(orderInput)
Purchase records that are listed in an input file.

getCompaniesFromOrder(orderId, pageSize, page)

Get a list of purchased company records for an order.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudCcompanies getCompaniesFromOrder(String orderId, String pageSize, String page)
```

Parameters

orderId
Type: String

ID of an order.

page
Type: Integer

Number of the page that you want returned.

pageSize
Type: Integer

Number of companies to show on a page. The default *pageSize* is 25.

Return Value

Type: ConnectApi.DatacloudCompanies

getCompany(companyId)

Get a company record.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudCompany getCompany(String companyId)
```

Parameters

companyId
Type: String

ID of a company in the Data.com database.

Return Value

Type: ConnectApi.DatacloudCompany

getContact(contactId)

Get a contact.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudContact getContact(String contactId)
```

Parameters

contactId
Type: String

ID of a contact in the Data.com database.

Return Value

Type: ConnectApi.DatacloudContact

getContactsFromOrder(orderId, page, pageSize)

Get a list of purchased contacts for an order.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DataCloudContacts getContactsFromOrder(String orderId, String page, String pageSize)
```

Parameters

orderId
Type: String

ID of an order.

page
Type: Integer

Number of the page that you want returned.

pageSize
Type: Integer

Number of contacts to show on a page. The default *pageSize* is 25.

Return Value

Type: `ConnectApi.DataCloudContacts`

getOrder(orderId)

Get an order.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DataCloudOrder getOrder(String orderId)
```

Parameters

orderId
Type: String

ID of an order.

Return Value

Type: ConnectApi.DatacloudOrder

getUsage(userId)

Get purchase usage information for a user.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudPurchaseUsage getUsage(String userId)
```

Parameters

userId
Type: String

ID of a user.

Return Value

Type: ConnectApi.DatacloudPurchaseUsage

postOrder(orderInput)

Purchase records that are listed in an input file.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudOrder postOrder(ConnectApi.DatacloudOrderInput
orderInput)
```

Parameters

orderInput
Type: ConnectApi.DatacloudOrderInput

A list that contains IDs for the contacts or companies that you want to see.

Return Value

Type: ConnectApi.DatacloudOrder

Example

```
ConnectApi.DatacloudOrderInput inputOrder=new ConnectApi.DatacloudOrderInput();
List<String> ids=new List<String>();
ids.add('1234');
inputOrder.companyIds=ids;
ConnectApi.DatacloudOrder datacloudOrderRep = ConnectApi.Datacloud.postOrder(inputOrder);
```

EinsteinLLM Class

Get a list of prompt templates and generate LLM responses for prompt templates.

Namespace

ConnectApi

EinsteinLLM Methods

These methods are for `EinsteinLLM`. All methods are static.

IN THIS SECTION:

generateMessagesForPromptTemplate(promptTemplateDevName, promptTemplateGenerationsInput)
Generates a response using the specified prompt template and input parameters.

getPromptTemplates(query, sortBy, offset, pageLimit, fields, type, relatedEntity, isActive)
Get a list of prompt templates using the specified filters.

`generateMessagesForPromptTemplate(promptTemplateDevName, promptTemplateGenerationsInput)`

Generates a response using the specified prompt template and input parameters.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.EinsteinPromptTemplateGenerationsRepresentation
generateMessagesForPromptTemplate(String promptTemplateDevName,
ConnectApi.EinsteinPromptTemplateGenerationsInput promptTemplateGenerationsInput)
```

Parameters

promptTemplateDevName
Type: String

Developer name or ID of a prompt template record.

promptTemplateGenerationsInput
Type: ConnectApi.EinsteinPromptTemplateGenerationsInput

Input for generating a response using the specified prompt template.

Return Value

Type: ConnectApi.EinsteinPromptTemplateGenerationsRepresentation

Example

In this example, call `generateMessagesForPromptTemplate(promptTemplateDevName, promptTemplateGenerationsInput)` to resolve a Sales Email prompt template. For more examples, see Resolve a Prompt Template.

```
// Create input
ConnectApi.EinsteinPromptTemplateGenerationsInput promptGenerationsInput = new
ConnectApi.EinsteinPromptTemplateGenerationsInput();
promptGenerationsInput.isPreview = false;

// Build input map
Map<String,ConnectApi.WrappedValue> valueMap = new Map<String,ConnectApi.WrappedValue>();

Map<String, String> recipientEntityRecordIdMap = new Map<String, String>();
recipientEntityRecordIdMap.put('id', '00Qxx000002ToPvEAK');

Map<String, String> senderEntityRecordIdMap = new Map<String, String>();
senderEntityRecordIdMap.put('id', '005xx000001XiWLAA0');

ConnectApi.WrappedValue recipientEntityWrappedValue = new ConnectApi.WrappedValue();
recipientEntityWrappedValue.value = recipientEntityRecordIdMap;

ConnectApi.WrappedValue senderEntityWrappedValue = new ConnectApi.WrappedValue();
senderEntityWrappedValue.value = senderEntityRecordIdMap;
```

```
valueMap.put('Input:Account', recipientEntityWrappedValue);
valueMap.put('Input:Recipient', recipientEntityWrappedValue);
valueMap.put('Input:Sender', senderEntityWrappedValue);

promptGenerationsInput.inputParams = valueMap;

// Set additional configuration values
promptGenerationsInput.additionalConfig = new ConnectApi.EinsteinLlmAdditionalConfigInput();
promptGenerationsInput.additionalConfig.applicationName =
'PromptTemplateGenerationsInvocable';

// Call the service
ConnectApi.EinsteinPromptTemplateGenerationsRepresentation generationsOutput =
ConnectApi.EinsteinLLM.generateMessagesForPromptTemplate('0hfxx0000000KTNAA2',
promptGenerationsInput);

// Consume response
System.debug('Prompt Testing: ' + generationsOutput.prompt);
```

`getPromptTemplates(query, sortBy, offset, pageLimit, fields, type, relatedEntity, isActive)`

Get a list of prompt templates using the specified filters.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.EinsteinPromptRecordCollectionOutputRepresentation
getPromptTemplates(String query, String sortBy, Integer offset, Integer pageLimit,
List<String> fields, String type, String relatedEntity, Boolean isActive)
```

Parameters

query
Type: String

User-entered search string. If `null`, all prompt template records are returned.

sortBy
Type: String

Field to sort the returned prompt template records by, such as `createdDate`. If `null`, records are returned in the order they're retrieved.

offset
Type: Integer

Used for pagination. Number of rows to skip between returned prompt template records. The default value is `0`.

`pageLimit`
Type: Integer

Used for pagination. Maximum number of prompt template records returned per page. The default value is `50`.

`fields`
Type: List<String>

Comma-separated list of prompt template record fields to return, such as `createdDate`. If `null`, all fields are returned.

`type`
Type: String

Prompt template type to filter records by, such as `einstein_gpt__salesEmail`. If `null`, records of all types are returned.

`relatedEntity`
Type: String

Related entity to filter records by, such as `Contact`. If `null`, all records with all related entities are returned.

`isActive`
Type: Boolean

Specifies whether to return active prompt templates only. The default is `false`.

Return Value

Type: `ConnectApi.EinsteinPromptRecordCollectionOutputRepresentation`

Usage

To get a list of prompt templates, you must have Einstein Generative AI enabled and the Execute Prompt Templates user permission.

Example

```
ConnectApi.EinsteinPromptRecordCollectionOutputRepresentation promptTemplateList =
ConnectApi.EinsteinLLM.getPromptTemplates('Summarize', 'CreatedDate', 0, 5, null,
'einstein_gpt__flex', null, true);

// Get information from the prompt templates in the list
    if (promptTemplateList != null && promptTemplateList.promptRecords != null) {
    for (ConnectApi.EinsteinPromptRecordRepresentation promptTemplate :
promptTemplateList.promptRecords) {
        System.debug('Prompt Template ID: ' + promptTemplate.id);
        for (String fieldName : promptTemplate.fields.keySet()) {
            System.debug('Field Name: ' + fieldName + ', Value: ' +
promptTemplate.fields.get(fieldName).value);
        }
    }
} else {
    System.debug('No prompt templates found.');
}
```

EmailMergeFieldService Class

Extract a list of merge fields for an object. A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Namespace

ConnectApi

EmailMergeFieldService Methods

These methods are for `EmailMergeFieldService`. All methods are static.

IN THIS SECTION:

getMergeFields(objectApiNames)
Extract the merge fields for a specific object.

`getMergeFields(objectApiNames)`

Extract the merge fields for a specific object.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.EmailMergeFieldInfo getMergeFields(List<String> objectApiNames)
```

Parameters

`objectApiNames`
Type: List<String>

The API names for the objects being referenced.

Return Value

Type: `ConnectApi.EmailMergeFieldInfo`

EmployeeProfiles Class

Get, set and crop, and delete employee banner photos and photos.

Namespace

ConnectApi

EmployeeProfiles Methods

These methods are for `EmployeeProfiles`. All methods are static.

IN THIS SECTION:

deleteBannerPhoto(employeeId)
Delete an employee's banner photo.

deletePhoto(employeeId)
Delete an employee's photo.

getBannerPhoto(employeeId)
Get an employee's banner photo.

getPhoto(employeeId)
Get an employee's photo.

setBannerPhoto(employeeId, fileId, versionNumber)
Set an uploaded file as an employee's banner photo.

setBannerPhoto(employeeId, fileUpload)
Set a file that hasn't been uploaded as an employee's banner photo.

setBannerPhotoWithAttributes(employeeId, bannerPhoto)
Set and crop an uploaded file as an employee's banner photo.

setBannerPhotoWithAttributes(employeeId, bannerPhoto, fileUpload)
Set and crop a file that hasn't been uploaded as an employee's banner photo.

setPhoto(employeeId, fileId, versionNumber)
Set an uploaded file as an employee's photo.

setPhoto(employeeId, fileUpload)
Set a file that hasn't been uploaded as an employee's photo.

setPhotoWithAttributes(employeeId, photo)
Set and crop an uploaded file as an employee's photo.

setPhotoWithAttributes(employeeId, photo, fileUpload)
Set and crop a file that hasn't been uploaded as an employee's photo.

`deleteBannerPhoto(employeeId)`

Delete an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static Void deleteBannerPhoto(String employeeId)
```

Parameters

employeeId
Type: String

ID of the employee.

Return Value

Type: Void

deletePhoto(employeeId)

Delete an employee's photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static Void deletePhoto(String employeeId)
```

Parameters

employeeId
Type: String

ID of the employee.

Return Value

Type: Void

getBannerPhoto(employeeId)

Get an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto getBannerPhoto(String employeeId)
```

Parameters

employeeId
Type: String

ID of the employee.

Return Value

Type: ConnectApi.BannerPhoto

getPhoto(employeeId)

Get an employee's photo.

API Version

51.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo getPhoto(String employeeId)
```

Parameters

employeeId
Type: String

ID of the employee.

Return Value

Type: ConnectApi.Photo

setBannerPhoto(employeeId, fileId, versionNumber)

Set an uploaded file as an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String employeeId, String fileId,
Integer versionNumber)
```

Parameters

employeeId
Type: String

ID of the employee.

fileId
Type: String

ID of the uploaded file to use as the employee banner photo. The file must be an image and be smaller than 2 GB.

versionNumber
Type: Integer

Version number of the file. Specify an existing version number or, to get the latest version, specify `null`.

Return Value

Type: `ConnectApi.BannerPhoto`

setBannerPhoto(employeeId, fileUpload)

Set a file that hasn't been uploaded as an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String employeeId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

employeeId
Type: String

ID of the employee.

fileUpload
Type: ConnectApi.BinaryInput

File to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.BannerPhoto

Usage

Photos are processed asynchronously and might not be visible right away.

setBannerPhotoWithAttributes(employeeId, bannerPhoto)

Set and crop an uploaded file as an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String employeeId,
ConnectApi.BannerPhotoInput bannerPhoto)
```

Parameters

employeeId
Type: String

ID of the employee.

bannerPhoto
Type: ConnectApi.BannerPhotoInput

A `ConnectApi.BannerPhotoInput` object that specifies the ID and version of the file, and how to crop the file.

Return Value

Type: ConnectApi.BannerPhoto

Usage

Photos are processed asynchronously and might not be visible right away.

setBannerPhotoWithAttributes(employeeId, bannerPhoto, fileUpload)

Set and crop a file that hasn't been uploaded as an employee's banner photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String employeeId,
ConnectApi.BannerPhotoInput bannerPhoto, ConnectApi.BinaryInput fileUpload)
```

Parameters

employeeId
Type: String

ID of the employee.

bannerPhoto
Type: ConnectApi.BannerPhotoInput

A `ConnectApi.BannerPhotoInput` object specifying the cropping parameters.

fileUpload
Type: ConnectApi.BinaryInput

File to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.BannerPhoto

Usage

Photos are processed asynchronously and might not be visible right away.

setPhoto(employeeId, fileId, versionNumber)

Set an uploaded file as an employee's photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhoto(String employeeId, String fileId, Integer versionNumber)
```

Parameters

employeeId
Type: String

ID of the employee.

fileId
Type: String

ID of the uploaded file to use as the employee photo. The file must be an image and be smaller than 2 GB.

versionNumber
Type: Integer

Version number of the file. Specify an existing version number or, to get the latest version, specify `null`.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

setPhoto(employeeId, fileUpload)

Set a file that hasn't been uploaded as an employee's photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhoto(String employeeId, ConnectApi.BinaryInput fileUpload)
```

Parameters

employeeId
Type: String

ID of the employee.

fileUpload
Type: ConnectApi.BinaryInput

File to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.Photo

Usage

Photos are processed asynchronously and might not be visible right away.

setPhotoWithAttributes(employeeId, photo)

Set and crop an uploaded file as an employee's photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String employeeId,
ConnectApi.PhotoInput photo)
```

Parameters

employeeId
Type: String

ID of the employee.

photo
Type: ConnectApi.PhotoInput

A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

Return Value

Type: ConnectApi.Photo

Usage

Photos are processed asynchronously and might not be visible right away.

`setPhotoWithAttributes(employeeId, photo, fileUpload)`

Set and crop a file that hasn't been uploaded as an employee's photo.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String employeeId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

employeeId
Type: String

ID of the employee.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the cropping parameters.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

Exchanges Class

Preview and submit cart to exchange orders.

Namespace

ConnectApi

Exchanges Methods

These methods are for `Exchanges`. All methods are static.

IN THIS SECTION:

previewCartToExchangeOrder(previewCartToExchangeOrderInput)

Retrieves a preview of an exchange order, taking into account the order summary balance and the difference between the return order and the cart that represents the exchange order.

submitCartToExchangeOrder(submitCartToExchangeOrderInput)

Creates an exchange order summary, based on the return order and the cart used for exchanges. The new exchange order summary is attached to the original order summary (created before any exchanges occurred). You can also provide optional payment information and optional information about order summary sequences, which affect the newly created exchange order summary.

previewCartToExchangeOrder(previewCartToExchangeOrderInput)

Retrieves a preview of an exchange order, taking into account the order summary balance and the difference between the return order and the cart that represents the exchange order.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.PreviewCartToExchangeOrderOutputRepresentation
previewCartToExchangeOrder(ConnectApi.PreviewCartToExchangeOrderInputRepresentation
previewCartToExchangeOrderInput)
```

Parameters

previewCartToExchangeOrderInput

Type: `ConnectApi.PreviewCartToExchangeOrderInputRepresentation` on page 1909

Information required to preview a cart to exchange order.

Return Value

Type: `ConnectApi.PreviewCartToExchangeOrderOutputRepresentation` on page 2233

submitCartToExchangeOrder(submitCartToExchangeOrderInput)

Creates an exchange order summary, based on the return order and the cart used for exchanges. The new exchange order summary is attached to the original order summary (created before any exchanges occurred). You can also provide optional payment information and optional information about order summary sequences, which affect the newly created exchange order summary.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.SubmitCartToExchangeOrderOutputRepresentation
submitCartToExchangeOrder(ConnectApi.SubmitCartToExchangeOrderInputRepresentation
submitCartToExchangeOrderInput)
```

Parameters

submitCartToExchangeOrderInput
Type: ConnectApi.SubmitCartToExchangeOrderInputRepresentation on page 1917

Information required to submit a cart to exchange order.

Return Value

Type: ConnectApi.SubmitCartToExchangeOrderOutputRepresentation on page 2299

ExtendedCommerceDelivery Class

Access information about delivery estimation.

Namespace

ConnectApi

ExtendedCommerceDelivery Methods

This method is for `ExtendedCommerceDelivery`. It is static.

IN THIS SECTION:

estimateDeliveryDate(estimateDeliveryDateInput, externalReference)
Forecast an expected delivery date and time based on delivery estimation settings and the selected shipping carrier method. Provide information on when a package is expected to be shipped and delivered.

`estimateDeliveryDate(estimateDeliveryDateInput, externalReference)`

Forecast an expected delivery date and time based on delivery estimation settings and the selected shipping carrier method. Provide information on when a package is expected to be shipped and delivered.

API Version

63.0

Available to Guest Users

63.0

Requires Chatter

No

Signature

```
public static ConnectApi.EstimateDeliveryDateOutputRepresentation
estimateDeliveryDate(ConnectApi.EstimateDeliveryDateInputRepresentation
estimateDeliveryDateInput, String externalReference)
```

Parameters

estimateDeliveryDateInput
Type: Datetime

ConnectApi.EstimateDeliveryDateInputRepresentation on page 1855

Estimated delivery date.

externalReference
Type: String

Delivery estimation setup external reference ID.

Return Value

Type: ConnectApi.EstimateDeliveryDateOutputRepresentation on page 2084

ExternalEmailServices Class

Access information about integration with external email services, such as sending email within Salesforce through an external email account.

Namespace

ConnectApi

ExternalEmailServices Methods

These methods are for `ExternalEmailService`. All methods are static.

IN THIS SECTION:

getUserOauthInfo(landingPage)
Get information about whether an external email service has been authorized to send email on behalf of a user.

`getUserOauthInfo(landingPage)`

Get information about whether an external email service has been authorized to send email on behalf of a user.

API Version

37.0

Requires Chatter

No

Signature

```
public static getUserOauthInfo(String landingPage)
```

Parameters

landingPage
Type: String

The landing page that the user starts on when they are finished with the OAuth authorization process.

Return Value

Type: `ConnectApi.UserOauthInfo`

SEE ALSO:

Apex Developer Guide: Testing ConnectApi Code

ExternalManagedAccount Class

Get externally managed accounts.

Namespace

ConnectApi

ExternalManagedAccount Methods

These methods are for `ExternalManagedAccount`. All methods are static.

IN THIS SECTION:

getCommunitiesExternalManagedAccounts(communityId)
Get externally managed accounts available to the context user across all Experience Cloud sites.

getCommunitiesExternalManagedAccounts(communityId, includeMyAccount)
Get externally managed accounts available to the context user, including the context user's account, across all Experience Cloud sites.

getExternalManagedAccounts(webstoreId)
Get externally managed accounts for a store.

getExternalManagedAccounts(webstoreId, includeMyAccount)
Get externally managed accounts, including the context user's account, for a store.

getCommunitiesExternalManagedAccounts(communityId)

Get externally managed accounts available to the context user across all Experience Cloud sites.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalManagedAccountCollectionOutput
getCommunitiesExternalManagedAccounts(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Note: Regardless of the ID specified, this method returns externally managed accounts available to the context user across all Experience Cloud sites.

Return Value

Type: `ConnectApi.ExternalManagedAccountCollectionOutput`

getCommunitiesExternalManagedAccounts(communityId, includeMyAccount)

Get externally managed accounts available to the context user, including the context user's account, across all Experience Cloud sites.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalManagedAccountCollectionOutput
getCommunitiesExternalManagedAccounts(String communityId, Boolean includeMyAccount)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Note: Regardless of the ID specified, this method returns externally managed accounts available to the context user across all Experience Cloud sites.

`includeMyAccount`
Type: Boolean

Specifies whether to return the context user's account (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ExternalManagedAccountCollectionOutput`

`getExternalManagedAccounts(webstoreId)`

Get externally managed accounts for a store.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalManagedAccountCollectionOutput
getExternalManagedAccounts(String webstoreId)
```

Parameters

`webstoreId`
Type: String

ID of the webstore.

Return Value

Type: `ConnectApi.ExternalManagedAccountCollectionOutput`

`getExternalManagedAccounts(webstoreId, includeMyAccount)`

Get externally managed accounts, including the context user's account, for a store.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalManagedAccountCollectionOutput
getExternalManagedAccounts(String webstoreId, Boolean includeMyAccount)
```

Parameters

webstoreId
Type: String

ID of the webstore.

includeMyAccount
Type: Boolean

Specifies whether to return the context user's account (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ExternalManagedAccountCollectionOutput`

FieldService Class

Preview and create shifts from a pattern or filter fields on recordset filter criteria.

Namespace

ConnectApi

FieldService Methods

These methods are for `FieldService`. All methods are static.

IN THIS SECTION:

createShiftsFromPattern(shiftsFromPatternInput, shiftPatternId)
Create up to 2,000 shifts from a pattern.

evaluateRecordsetFilterCriteria(recordsetFilterCriteriaInput)
Filter records on recordset filter criteria.

previewShiftsFromPattern(shiftsFromPatternInput, shiftPatternId)
Preview up to 2,000 shifts from a pattern.

`createShiftsFromPattern(shiftsFromPatternInput, shiftPatternId)`

Create up to 2,000 shifts from a pattern.

API Version

51.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ShiftsFromPattern
createShiftsFromPattern(ConnectApi.ShiftsFromPatternInput shiftsFromPatternInput, String
shiftPatternId)
```

Parameters

shiftsFromPatternInput
Type: ConnectApi.ShiftsFromPatternInput

A `ConnectApi.ShiftsFromPatternInput` object providing the pattern.

shiftPatternId
Type: String

ID of the shift pattern.

Return Value

Type: ConnectApi.ShiftsFromPattern

evaluateRecordsetFilterCriteria(recordsetFilterCriteriaInput)

Filter records on recordset filter criteria.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecordsetFilterCriteriaOutput
evaluateRecordsetFilterCriteria(ConnectApi.RecordsetFilterCriteriaInput
recordsetFilterCriteriaInput)
```

Parameters

recordsetFilterCriteriaInput
Type: ConnectApi.RecordsetFilterCriteriaInput

An `ConnectApi.RecordsetFilterCriteriaInput` object providing a set of recordset filter criteria and records.

Return Value

Type: ConnectApi.RecordsetFilterCriteriaOutput

Usage

Field service must be enabled.

`previewShiftsFromPattern(shiftsFromPatternInput, shiftPatternId)`

Preview up to 2,000 shifts from a pattern.

API Version

51.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ShiftsFromPattern
previewShiftsFromPattern(ConnectApi.ShiftsFromPatternInput shiftsFromPatternInput,
String shiftPatternId)
```

Parameters

`shiftsFromPatternInput`
Type: `ConnectApi.ShiftsFromPatternInput`

A `ConnectApi.ShiftsFromPatternInput` object providing the pattern.

`shiftPatternId`
Type: String

ID of the shift pattern.

Return Value

Type: `ConnectApi.ShiftsFromPattern`

FulfillmentOrder Class

Fulfill orders in Order Management.

Namespace

ConnectApi

FulfillmentOrder Methods

These methods are for `FulfillmentOrder`. All methods are static.

IN THIS SECTION:

cancelFulfillmentOrderLineItems(fulfillmentOrderId, cancelFulfillmentOrderLineItemsInput)
Cancel FulfillmentOrderLineItems from a FulfillmentOrder. This action doesn't cancel the associated OrderItemSummaries, so reallocate the canceled quantities to a new FulfillmentOrder.

createFulfillmentOrders(fulfillmentOrderInput)
Create one or more FulfillmentOrders and FulfillmentOrderLineItems for an OrderDeliveryGroupSummary, which defines a delivery method and recipient for an OrderSummary. You specify the OrderItemSummaries to allocate, which can be fulfilled from different locations. Specifying multiple fulfillment groups creates one FulfillmentOrder for each location. For each OrderItemSummary, a FulfillmentOrderLineItem is created and assigned to the corresponding FulfillmentOrder.

createInvoice(fulfillmentOrderId, invoiceInput)
Create an invoice for a FulfillmentOrder that doesn't have one.

createMultipleFulfillmentOrder(multipleFulfillmentOrderInput)
Create FulfillmentOrders for multiple OrderDeliveryGroups in a single request.

createMultipleInvoices(invoicesInput)
Create Invoices for multiple FulfillmentOrders.

cancelFulfillmentOrderLineItems(fulfillmentOrderId, cancelFulfillmentOrderLineItemsInput)

Cancel FulfillmentOrderLineItems from a FulfillmentOrder. This action doesn't cancel the associated OrderItemSummaries, so reallocate the canceled quantities to a new FulfillmentOrder.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.FulfillmentOrderCancelLineItemsOutputRepresentation
cancelFulfillmentOrderLineItems(String fulfillmentOrderId,
ConnectApi.FulfillmentOrderLineItemsToCancelInputRepresentation
cancelFulfillmentOrderLineItemsInput)
```

Parameters

fulfillmentOrderId
Type: String

ID of the FulfillmentOrder.

cancelFulfillmentOrderLineItemsInput
Type: ConnectApi.FulfillmentOrderLineItemsToCancelInputRepresentation

List of FulfillmentOrderLineItems to cancel.

Return Value

Type: ConnectApi.FulfillmentOrderCancelLineItemsOutputRepresentation

Example

```
String fulfillmentOrderId = '0a3xx0000000085AAA';
List<ConnectApi.FulfillmentOrderLineItemInputRepresentation> itemToCancelList = new
List<ConnectApi.FulfillmentOrderLineItemInputRepresentation>();

for(FulfillmentOrderLineItem fulfillmentOrderLineItem :
fulfillmentOrder.FulfillmentOrderLineItems){
  ConnectApi.FulfillmentOrderLineItemInputRepresentation itemToCancel = new
ConnectApi.FulfillmentOrderLineItemInputRepresentation();
  itemToCancel.fulfillmentOrderLineItemId = fulfillmentOrderLineItem.Id;
  itemToCancel.quantity = 1;
  itemToCancelList.add(itemToCancel);
}

ConnectAPI.FulfillmentOrderLineItemsToCancelInputRepresentation input = new
ConnectAPI.FulfillmentOrderLineItemsToCancelInputRepresentation();
input.fulfillmentOrderLineItemsToCancel = itemToCancelList;

ConnectAPI.FulfillmentOrderCancelLineItemsOutputRepresentation result =
ConnectAPI.FulfillmentOrder.cancelFulfillmentOrderLineItems(fulfillmentOrderId, input);
```

createFulfillmentOrders(fulfillmentOrderInput)

Create one or more FulfillmentOrders and FulfillmentOrderLineItems for an OrderDeliveryGroupSummary, which defines a delivery method and recipient for an OrderSummary. You specify the OrderItemSummaries to allocate, which can be fulfilled from different locations. Specifying multiple fulfillment groups creates one FulfillmentOrder for each location. For each OrderItemSummary, a FulfillmentOrderLineItem is created and assigned to the corresponding FulfillmentOrder.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.FulfillmentOrderOutputRepresentation
createFulfillmentOrders(ConnectApi.FulfillmentOrderInputRepresentation
fulfillmentOrderInput)
```

Parameters

fulfillmentOrderInput

Type: ConnectApi.FulfillmentOrderInputRepresentation

OrderItemSummaries to allocate, with location and delivery information.

Return Value

Type: ConnectApi.FulfillmentOrderOutputRepresentation

Example

```
String orderSummaryId = '1Osxx0000004CCG';
String fulfillmentType = 'warehouse';

String warehouseFromLocationId = [SELECT Id from Location WHERE LocationType='Warehouse'
LIMIT 1].Id;

ConnectApi.FulfillmentOrderInputRepresentation fulfillmentOrderInput = new
ConnectApi.FulfillmentOrderInputRepresentation();
fulfillmentOrderInput.orderSummaryId = orderSummaryId;

List<OrderDeliveryGroupSummary> orderDeliveryGroupSummaryList = [SELECT Id FROM
OrderDeliveryGroupSummary WHERE OrderSummaryId =: orderSummaryId];

for (OrderDeliveryGroupSummary orderDeliveryGroupSummary: orderDeliveryGroupSummaryList){

  fulfillmentOrderInput.orderDeliveryGroupSummaryId = orderDeliveryGroupSummary.Id;
  List<ConnectApi.FulfillmentGroupInputRepresentation> fulfillmentGroups = new
List<ConnectApi.FulfillmentGroupInputRepresentation>();
  ConnectApi.FulfillmentGroupInputRepresentation fulfillmentGroup = new
ConnectApi.FulfillmentGroupInputRepresentation();
  fulfillmentGroup.fulfilledFromLocationId = warehouseFromLocationId;
  fulfillmentGroup.fulfillmentType = fulfillmentType;

  List<ConnectApi.OrderItemSummaryInputRepresentation> orderItemSummaries = new
List<ConnectApi.OrderItemSummaryInputRepresentation>();

  List<OrderItemSummary> orderItemSummaryList = [Select Id, quantity FROM OrderItemSummary
 WHERE OrderSummaryId =: orderSummaryId AND OrderDeliveryGroupSummaryId =:
orderDeliveryGroupSummary.Id];
  for(OrderItemSummary orderItemSummary : orderItemSummaryList){
    ConnectApi.OrderItemSummaryInputRepresentation oisInputRepresentation = new
ConnectApi.OrderItemSummaryInputRepresentation();
    oisInputRepresentation.orderItemSummaryId = orderItemSummary.Id;
    oisInputRepresentation.quantity = orderItemSummary.quantity;
    orderItemSummaries.add(oisInputRepresentation);
  }

  fulfillmentGroup.orderItemSummaries = orderItemSummaries;
  fulfillmentGroups.add(fulfillmentGroup);
  fulfillmentOrderInput.fulfillmentGroups = fulfillmentGroups;

}

ConnectApi.FulfillmentOrderOutputRepresentation result =
ConnectAPI.FulfillmentOrder.createFulfillmentOrders(fulfillmentOrderInput);
```

createInvoice(fulfillmentOrderId, invoiceInput)

Create an invoice for a FulfillmentOrder that doesn't have one.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.FulfillmentOrderInvoiceOutputRepresentation createInvoice(String
fulfillmentOrderId, ConnectApi.FulfillmentOrderInvoiceInputRepresentation invoiceInput)
```

Parameters

fulfillmentOrderId
Type: String

ID of the FulfillmentOrder.

invoiceInput
Type: ConnectApi.FulfillmentOrderInvoiceInputRepresentation

Required input with no data.

Return Value

Type: ConnectApi.FulfillmentOrderInvoiceOutputRepresentation

Example

```
String fulfillmentOrderId = '0a3xx0000000085AAA';

ConnectApi.FulfillmentOrderInvoiceInputRepresentation input = new
ConnectApi.FulfillmentOrderInvoiceInputRepresentation();
ConnectAPI.FulfillmentOrderInvoiceOutputRepresentation result =
ConnectApi.FulfillmentOrder.createInvoice(fulfillmentOrderId, input);
```

createMultipleFulfillmentOrder(multipleFulfillmentOrderInput)

Create FulfillmentOrders for multiple OrderDeliveryGroups in a single request.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.MultipleFulfillmentOrderOutputRepresentation
createMultipleFulfillmentOrder(ConnectApi.MultipleFulfillmentOrderInputRepresentation
multipleFulfillmentOrderInput)
```

Parameters

multipleFulfillmentOrderInput
Type: ConnectApi.MultipleFulfillmentOrderInputRepresentation

Wraps a list of inputs for creating fulfillment orders.

Return Value

Type: ConnectApi.MultipleFulfillmentOrderOutputRepresentation

createMultipleInvoices(invoicesInput)

Create Invoices for multiple FulfillmentOrders.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.MultipleFulfillmentOrderInvoicesOutputRepresentation
createMultipleInvoices(ConnectApi.MultipleFulfillmentOrderInvoicesInputRepresentation
invoicesInput)
```

Parameters

invoicesInput
Type: ConnectApi.MultipleFulfillmentOrderInvoicesInputRepresentation

The FulfillmentOrders to create Invoices for.

Return Value

Type: ConnectApi.MultipleFulfillmentOrderInvoicesOutputRepresentation

Knowledge Class

Get information about trending articles in Experience Cloud sites.

Namespace

ConnectApi

Knowledge Methods

These methods are for `Knowledge`. All methods are static.

IN THIS SECTION:

getTopViewedArticlesForTopic(communityId, topicId, maxResults)
Get the top viewed articles for a topic.

getTrendingArticles(communityId, maxResults)
Get trending articles for an Experience Cloud site.

getTrendingArticlesForTopic(communityId, topicId, maxResults)
Get the trending articles for a topic in an Experience Cloud site.

`getTopViewedArticlesForTopic(communityId, topicId, maxResults)`

Get the top viewed articles for a topic.

API Version

41.0

Available to Guest Users

41.0

Requires Chatter

No

Signature

```
public static ConnectApi.KnowledgeArticleVersionCollection
getTopViewedArticlesForTopic(String communityId, String topicId, Integer maxResults)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`topicId`
Type: String

ID of the topic.

`maxResults`
Type: Integer

The maximum number of articles returned for each topic ID. Values can be from 1 to 25. The default value is 5.

Return Value

Type: `ConnectApi.KnowledgeArticleVersionCollection`

`getTrendingArticles(communityId, maxResults)`

Get trending articles for an Experience Cloud site.

API Version

36.0

Available to Guest Users

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.KnowledgeArticleVersionCollection getTrendingArticles(String communityId, Integer maxResults)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`maxResults`
Type: Integer

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

Return Value

Type: `ConnectApi.KnowledgeArticleVersionCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTrendingArticles(communityId, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getTrendingArticlesForTopic(communityId, topicId, maxResults)`

Get the trending articles for a topic in an Experience Cloud site.

API Version

36.0

Available to Guest Users

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.KnowledgeArticleVersionCollection
getTrendingArticlesForTopic(String communityId, String topicId, Integer maxResults)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`topicId`
Type: String

ID of the topic.

`maxResults`
Type: Integer

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

Return Value

Type: `ConnectApi.KnowledgeArticleVersionCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTrendingArticlesForTopic(communityId, topicId, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

Knowledge Test Methods

These test methods are for `Knowledge`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestGetTrendingArticles(communityId, maxResults, result)`

Register a `ConnectApi.KnowledgeVersionArticleCollection` object to be returned when the matching `ConnectApi.getTrendingArticles` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

36.0

Signature

```
public static Void setTestGetTrendingArticles(String communityId, Integer maxResults,
ConnectApi.KnowledgeArticleVersionCollection result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`maxResults`
Type: Integer

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

`result`
Type: `ConnectApi.KnowledgeArticleVersionCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getTrendingArticles(communityId, maxResults)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetTrendingArticlesForTopic(communityId, topicId, maxResults, result)`

Register a `ConnectApi.KnowledgeVersionArticleCollection` object to be returned when the matching `ConnectApi.getTrendingArticlesForTopic` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

36.0

Signature

```
public static Void setTestGetTrendingArticlesForTopic(String communityId, String topicId,
Integer maxResults, ConnectApi.KnowledgeArticleVersionCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

ID of the topic.

maxResults
Type: Integer

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

result
Type: `ConnectApi.KnowledgeArticleVersionCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getTrendingArticlesForTopic(communityId, topicId, maxResults)

Apex Developer Guide: Testing ConnectApi Code

LightningScheduler Class

Create and update service appointments.

Namespace

ConnectApi

LightningScheduler Methods

These methods are for `LightningScheduler`. All methods are static.

IN THIS SECTION:

createServiceAppointment(createServiceAppointmentInput)
Create a service appointment.

updateServiceAppointment(updateServiceAppointmentInput)
Update a service appointment.

createServiceAppointment(createServiceAppointmentInput)

Create a service appointment.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.ServiceAppointmentOutput
createServiceAppointment(ConnectApi.CreateServiceAppointmentInput
createServiceAppointmentInput)
```

Parameters

createServiceAppointmentInput
Type: `ConnectApi.CreateServiceAppointmentInput`

Input parameters to create a service appointment.

Return Value

Type: `ConnectApi.ServiceAppointmentOutput`

Usage

Considerations for using engagement channel types with the `service-appointments` resource:

- Enable **Schedule Appointments Using Engagement Channels** in Salesforce Scheduler Settings in your Salesforce org.
- When you create or modify appointments, shifts must be defined in the scheduling policy. For more information on setting up shifts in the scheduling policy, see Define Shift Rules in Scheduling Policy.

  Note: Engagement channel types are not supported with operating hours rules in the scheduling policy.

- When you use engagement channel type and shifts to create a service appointment, Salesforce Scheduler considers the default value for the Appointment Type (if not specified). However, Salesforce Scheduler only considers the engagement channel type and Appointment Type is ignored.

Example

For an account (existing user):

```
ConnectApi.ExtendedFieldInput extendedFieldEmail = new ConnectApi.ExtendedFieldInput();
extendedFieldEmail.name = 'Email';
extendedFieldEmail.value = 'rachael.adams@salesforce.com';

ConnectApi.ExtendedFieldInput extendedFieldPhone = new ConnectApi.ExtendedFieldInput();
extendedFieldPhone.name = 'Phone';
extendedFieldPhone.value = '1234567890';

List<ConnectApi.ExtendedFieldInput> extendedFieldList = new
List<ConnectApi.ExtendedFieldInput>();
extendedFieldList.add(extendedFieldEmail);
extendedFieldList.add(extendedFieldPhone);

ConnectApi.ServiceAppointmentInput serviceAppInput = new
ConnectApi.ServiceAppointmentInput();
serviceAppInput.extendedFields = extendedFieldList;
serviceAppInput.engagementChannelTypeId = '0eFRM00000000Bv2AI';
serviceAppInput.serviceTerritoryId = '0Hhxx0000004C92CAE';
serviceAppInput.workTypeId = '08qxx0000004C92AAE';
serviceAppInput.parentRecordId = '001xx000003GYR1AAO';
serviceAppInput.schedStartTime = DateTime.valueOf('2021-05-28 12:15:00');
serviceAppInput.schedEndTime = DateTime.valueOf('2021-05-28 12:45:00');
serviceAppInput.appointmentMode = 'Group';
serviceAppInput.attendeeLimit = 20;

ConnectApi.AssignedResourcesInput asResourceInput = new ConnectApi.AssignedResourcesInput();
asResourceInput.serviceResourceId = '0Hnxx0000004CAiCAM';
asResourceInput.isRequiredResource = true;
asResourceInput.isPrimaryResource = true;

List<ConnectApi.AssignedResourcesInput> asResourceInputList = new
List<ConnectApi.AssignedResourcesInput>();
asResourceInputList.add(asResourceInput);

ConnectApi.CreateServiceAppointmentInput createInput = new
ConnectApi.CreateServiceAppointmentInput();
createInput.serviceAppointment = serviceAppInput;
createInput.assignedResources = asResourceInputList;

try{
   ConnectApi.ServiceAppointmentOutput appointmentResult =
ConnectApi.LightningScheduler.createServiceAppointment(createInput);
   String serviceAppointmentId = appointmentResult.result.serviceAppointmentId;
   List<String> assignedResourceIds = appointmentResult.result.assignedResourceIds;
}catch(ConnectApi.ConnectApiException ex){
   //Handle Exception
}
```

For a lead (authenticated guest user):

```
ConnectApi.LeadInput leadInput = new ConnectApi.LeadInput();
leadInput.firstName = 'Rachel';
leadInput.lastName = 'Adams';
leadInput.phone = '012-345-6789';
leadInput.email = 'rachel.adams@salesforce.com';
leadInput.company = 'Salesforce';

ConnectApi.ExtendedFieldInput extendedFieldEmail = new ConnectApi.ExtendedFieldInput();
extendedFieldEmail.name = 'Email';
extendedFieldEmail.value = 'rachael.adams@salesforce.com';

ConnectApi.ExtendedFieldInput extendedFieldPhone = new ConnectApi.ExtendedFieldInput();
extendedFieldPhone.name = 'Phone';
extendedFieldPhone.value = '1234567890';

List<ConnectApi.ExtendedFieldInput> extendedFieldList = new
List<ConnectApi.ExtendedFieldInput>();
extendedFieldList.add(extendedFieldEmail);
extendedFieldList.add(extendedFieldPhone);

ConnectApi.ServiceAppointmentInput serviceAppInput = new
ConnectApi.ServiceAppointmentInput();
serviceAppInput.extendedFields = extendedFieldList;
serviceAppInput.engagementChannelTypeId = '0eFRM00000000Bv2AI';
serviceAppInput.serviceTerritoryId = '0Hhxx0000004C92CAE';
serviceAppInput.workTypeId = '08qxx0000004C92AAE';
serviceAppInput.schedStartTime = DateTime.valueOf('2021-05-28 12:15:00');
serviceAppInput.schedEndTime = DateTime.valueOf('2021-05-28 12:45:00');

ConnectApi.AssignedResourcesInput asResourceInput = new ConnectApi.AssignedResourcesInput();
asResourceInput.serviceResourceId = '0Hnxx0000004CAiCAM';
asResourceInput.isRequiredResource = true;
asResourceInput.isPrimaryResource = true;

List<ConnectApi.AssignedResourcesInput> asResourceInputList = new
List<ConnectApi.AssignedResourcesInput>();
asResourceInputList.add(asResourceInput);

ConnectApi.CreateServiceAppointmentInput createInput = new
ConnectApi.CreateServiceAppointmentInput();
createInput.serviceAppointment = serviceAppInput;
createInput.assignedResources = asResourceInputList;
createInput.lead = leadInput;

try{
   ConnectApi.ServiceAppointmentOutput appointmentResult =
ConnectApi.LightningScheduler.createServiceAppointment(createInput);
   String serviceAppointmentId = appointmentResult.result.serviceAppointmentId;
   List<String> assignedResourceIds = appointmentResult.result.assignedResourceIds;
}catch(ConnectApi.ConnectApiException ex){
```

```
    //Handle Exception
}
```

Service Appointments

updateServiceAppointment(updateServiceAppointmentInput)

Update a service appointment.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.ServiceAppointmentOutput
updateServiceAppointment(ConnectApi.UpdateServiceAppointmentInput
updateServiceAppointmentInput)
```

Parameters

updateServiceAppointmentInput

Type: ConnectApi.UpdateServiceAppointmentInput

Input parameters to update a service appointment.

Return Value

Type: ConnectApi.ServiceAppointmentOutput

Usage

Considerations for using engagement channel types with the `service-appointments` resource:

- Enable **Schedule Appointments Using Engagement Channels** in Salesforce Scheduler Settings in your Salesforce org.
- When you create or modify appointments, shifts must be defined in the scheduling policy. For more information on setting up shifts in the scheduling policy, see Define Shift Rules in Scheduling Policy.

  Note: Engagement channel types are not supported with operating hours rules in the scheduling policy.

- When you use engagement channel type and shifts to modify an appointment, Salesforce Scheduler considers the default value for the Appointment Type (if not specified). However, Salesforce Scheduler only considers the engagement channel type and Appointment Type is ignored.

Example

```
ConnectApi.ExtendedFieldInput extendedFieldEmail = new ConnectApi.ExtendedFieldInput();
extendedFieldEmail.name = 'Email';
extendedFieldEmail.value = 'rachel.adams@salesforce.com.example';

ConnectApi.ExtendedFieldInput extendedFieldPhone = new ConnectApi.ExtendedFieldInput();
extendedFieldPhone.name = 'Phone';
extendedFieldPhone.value = '0123456789';

ConnectApi.ExtendedFieldInput extendedFieldStatus = new ConnectApi.ExtendedFieldInput();
extendedFieldStatus.name = 'Status';
extendedFieldStatus.value = 'None';

List<ConnectApi.ExtendedFieldInput> extendedFieldList = new
List<ConnectApi.ExtendedFieldInput>();
extendedFieldList.add(extendedFieldEmail);
extendedFieldList.add(extendedFieldPhone);
extendedFieldList.add(extendedFieldStatus);

ConnectApi.ServiceAppointmentInput serviceAppInput = new
ConnectApi.ServiceAppointmentInput();
serviceAppInput.extendedFields = extendedFieldList;
serviceAppInput.serviceTerritoryId = '0Hhxx0000004C92CAE';
serviceAppInput.workTypeId = '08qxx0000004C92AAE';
serviceAppInput.schedStartTime = DateTime.valueOf('2021-05-28 12:15:00');
serviceAppInput.schedEndTime = DateTime.valueOf('2021-05-28 12:45:00');

ConnectApi.AssignedResourcesInput asResourceInput = new ConnectApi.AssignedResourcesInput();
asResourceInput.serviceResourceId = '0Hnxx0000004CAiCAM';
asResourceInput.isRequiredResource = true;
asResourceInput.isPrimaryResource = true;

//Multi-resource
ConnectApi.AssignedResourcesInput asResourceInputReq = new
ConnectApi.AssignedResourcesInput();
asResourceInputReq.serviceResourceId = '0Hnxx0000004CAgCAM';
asResourceInputReq.isRequiredResource = true;
asResourceInputReq.isPrimaryResource = false;

List<ConnectApi.AssignedResourcesInput> asResourceInputList = new
List<ConnectApi.AssignedResourcesInput>();
asResourceInputList.add(asResourceInput);
asResourceInputList.add(asResourceInputReq);

ConnectApi.UpdateServiceAppointmentInput updateInput = new
ConnectApi.UpdateServiceAppointmentInput();
updateInput.serviceAppointment = serviceAppInput;
updateInput.assignedResources = asResourceInputList;
updateInput.serviceAppointmentId = '08pxx0000004CYqAAM';

try{
   ConnectApi.ServiceAppointmentOutput appointmentResult =
ConnectApi.LightningScheduler.updateServiceAppointment(updateInput);
```

```
    String serviceAppointmentId = appointmentResult.result.serviceAppointmentId;
    List<String> assignedResourceIds = appointmentResult.result.assignedResourceIds;
}catch(ConnectApi.ConnectApiException ex){
    //Handle Exception
}
```

Service Appointments

ManagedContent Class

Clone managed content. Create and get managed content. Delete and replace variants. Get channels. Get a managed content space. Get targets that managed content space folders can be shared with. Get and update targets that managed content space folders are shared with. Publish and unpublish content.

Namespace

ConnectApi

ManagedContent Methods

These methods are for `ManagedContent`. All methods are static.

IN THIS SECTION:

cloneManagedContentDocument(contentKeyOrId, ManagedContentCloneInputParam)
Clone a piece of managed content.

createManagedContent(ManagedContentInputParam)
Create managed content.

createManagedContentWithMedia(ManagedContentInputParam, contentData)
Create managed content with content data.

deleteManagedContentVariant(variantId)
Delete a managed content variant.

getAllContent(channelId, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate)
Get all managed content versions for a channel.

getAllContent(channelId, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)
Get all managed content versions for a channel with absolute URLs.

getAllDeliveryChannels(pageParam, pageSize)
Get managed content delivery channels for the context user.

getAllManagedContent(communityId, pageParam, pageSize, language, managedContentType)
Get all managed content versions for an Experience Cloud site.

getAllManagedContent(communityId, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)
Get all managed content versions for an Experience Cloud site with absolute URLs.

getContentByContentKeys(channelId, contentKeys, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)

Get managed content versions for a channel using a list of content keys.

getContentByIds(channelId, managedContentIds, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate)

Get managed content versions for a channel using a list of managed content IDs.

getContentByIds(channelId, managedContentIds, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)

Get managed content versions for a channel with absolute URLs using a list of managed content IDs.

getManagedContentByContentKeys(communityId, contentKeys, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions for an Experience Cloud site using a list of content keys.

getManagedContentByIds(communityId, managedContentIds, pageParam, pageSize, language, managedContentType)

Get managed content versions for an Experience Cloud site using a list of managed content IDs.

getManagedContentByIds(communityId, managedContentIds, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions for an Experience Cloud site with absolute URLs using a list of managed content IDs.

getManagedContentByTopics(communityId, topics, pageParam, pageSize, language, managedContentType)

Get managed content versions using a list of content topic names.

getManagedContentByTopics(communityId, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions with absolute URLs using a list of content topic names.

getManagedContentByTopicsAndContentKeys(communityId, contentKeys, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions using a list of content keys and content topic names.

getManagedContentByTopicsAndIds(communityId, managedContentIds, topics, pageParam, pageSize, language, managedContentType)

Get managed content versions using a list of managed content IDs and content topic names.

getManagedContentByTopicsAndIds(communityId, managedContentIds, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions with absolute URLs using a list of managed content IDs and content topic names.

getManagedContentSpace(contentSpaceId)

Get a managed content space.

getMCSFolderShares(folderId)

Get targets that a managed content space folder is shared with.

getMCSFolderShareTargets(folderId)

Get targets that a managed content space folder can be shared with.

patchMCSFolderShares(folderId, mcsFolderShareCollectionUpdateInput)

Update the targets that a managed content space folder is shared with.

publish(publishInput)

Publish content.

replaceManagedContentVariant(variantId, ManagedContentVariantInputParam)

Replace a managed content variant.

replaceManagedContentVariantWithMedia(variantId, ManagedContentVariantInputParam, contentData)
Replace a managed content variant, including content data.

unpublish(unpublishInput)
Unpublish content.

cloneManagedContentDocument(contentKeyOrId, ManagedContentCloneInputParam)

Clone a piece of managed content.

API Version

61.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDocumentClone cloneManagedContentDocument(String contentKeyOrId, ConnectApi.ManagedContentDocumentCloneInput ManagedContentCloneInputParam)
```

Parameters

contentKeyOrId
Type: String

Content key or ID of the managed content to clone.

ManagedContentCloneInputParam
Type: ConnectApi.ManagedContentDocumentCloneInput

`ConnectApi.ManagedContentDocumentCloneInput` class specifying the details for the cloned content.

Return Value

Type: ConnectApi.ManagedContentDocumentClone

createManagedContent(ManagedContentInputParam)

Create managed content.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDocument
createManagedContent(ConnectApi.ManagedContentDocumentInput ManagedContentInputParam)
```

Parameters

ManagedContentInputParam

Type: ConnectApi.ManagedContentDocumentInput

A `ConnectApi.ManagedContentDocumentInput` input class with information to create managed content.

Return Value

Type: ConnectApi.ManagedContentDocument

createManagedContentWithMedia(ManagedContentInputParam, contentData)

Create managed content with content data.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDocument
createManagedContentWithMedia(ConnectApi.ManagedContentDocumentInput
ManagedContentInputParam, ConnectApi.BinaryInput contentData)
```

Parameters

ManagedContentInputParam

Type: ConnectApi.ManagedContentDocumentInput

A `ConnectApi.ManagedContentDocumentInput` input class with information to create managed content.

contentData

Type: ConnectApi.BinaryInput

A new binary file of the content data for the managed content.

Return Value

Type: ConnectApi.ManagedContentDocument

deleteManagedContentVariant(variantId)

Delete a managed content variant.

API Version

60.0

Requires Chatter

No

Signature

```
public static Void deleteManagedContentVariant(String variantId)
```

Parameters

variantId
Type: String

ID of the variant to delete.

Return Value

Type: Void

getAllContent(channelId, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate)

Get all managed content versions for a channel.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getAllContent(String channelId,
Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean
includeMetadata, String startDate, String endDate)
```

Parameters

channelId
Type: String

ID of the channel.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

includeMetadata
Type: Boolean

Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

startDate
Type: String

Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

endDate
Type: String

Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getAllContent(channelId, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)

Get all managed content versions for a channel with absolute URLs.

API Version

50.0

Available to Guest Users

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getAllContent(String channelId,
Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean
includeMetadata, String startDate, String endDate, Boolean showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

includeMetadata
Type: Boolean

Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

startDate
Type: String

Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

endDate
Type: String

Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

`getAllDeliveryChannels(pageParam, pageSize)`

Get managed content delivery channels for the context user.

API Version

48.0–61.0

In version 62.0 and later, use `getChannels(pageParam, pageSize)` in the `ManagedContentDelivery` class to get all delivery channels.

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentChannelCollection getAllDeliveryChannels(Integer pageParam, Integer pageSize)
```

Parameters

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ManagedContentChannelCollection`

`getAllManagedContent(communityId, pageParam, pageSize, language, managedContentType)`

Get all managed content versions for an Experience Cloud site.

API Version

47.0

Available to Guest Users

47.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getAllManagedContent(String communityId, Integer pageParam, Integer pageSize, String language, String managedContentType)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getAllManagedContent(communityId, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get all managed content versions for an Experience Cloud site with absolute URLs.

API Version

50.0

Available to Guest Users

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getAllManagedContent(String communityId, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getContentByContentKeys(channelId, contentKeys, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)

Get managed content versions for a channel using a list of content keys.

API Version

51.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getContentByContentKeys(String channelId, List<String> contentKeys, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean includeMetadata, String startDate, String endDate, Boolean showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

contentKeys
Type: List<String>

List of up to 50 content keys for the managed content. A content key is a universally unique identifier (UUID) such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

includeMetadata
Type: Boolean

Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

startDate
Type: String

Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

endDate
Type: String

Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getContentByIds(channelId, managedContentIds, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate)

Get managed content versions for a channel using a list of managed content IDs.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getContentByIds(String channelId, List<String> managedContentIds, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean includeMetadata, String startDate, String endDate)
```

Parameters

channelId
Type: String

ID of the channel.

managedContentIds
Type: List<String>

Comma-separated list of managed content IDs. HTTP/2 clients support up to 200 IDs. HTTP/1.1 clients don't.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

includeMetadata
Type: Boolean

Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

startDate
Type: String

Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

endDate
Type: String

Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

`getContentByIds(channelId, managedContentIds, pageParam, pageSize, language, managedContentType, includeMetadata, startDate, endDate, showAbsoluteUrl)`

Get managed content versions for a channel with absolute URLs using a list of managed content IDs.

API Version

50.0

Available to Guest Users

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getContentByIds(String
channelId, List<String> managedContentIds, Integer pageParam, Integer pageSize, String
language, String managedContentType, Boolean includeMetadata, String startDate, String
endDate, Boolean showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

managedContentIds
Type: List<String>

Comma-separated list of managed content IDs. HTTP/2 clients support up to 200 IDs. HTTP/1.1 clients don't.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

includeMetadata
Type: Boolean

Specifies whether to include metadata in the response (`true`) or not (`false`). The default value is `false`.

startDate
Type: String

Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

endDate
Type: String

Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: ConnectApi.ManagedContentVersionCollection

getManagedContentByContentKeys(communityId, contentKeys, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions for an Experience Cloud site using a list of content keys.

API Version

51.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection
getManagedContentByContentKeys(String communityId, List<String> contentKeys, Integer
pageParam, Integer pageSize, String language, String managedContentType, Boolean
showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

contentKeys
Type: List<String>

List of up to 50 content keys for the managed content. A content key is a universally unique identifier (UUID) such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByIds(communityId, managedContentIds, pageParam, pageSize, language, managedContentType)

Get managed content versions for an Experience Cloud site using a list of managed content IDs.

API Version

47.0

Available to Guest Users

47.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getManagedContentByIds(String communityId, List<String> managedContentIds, Integer pageParam, Integer pageSize, String language, String managedContentType)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

managedContentIds
Type: List<String>

Comma-separated list of managed content IDs. HTTP/2 clients support up to 200 IDs. HTTP/1.1 clients don't.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByIds(communityId, managedContentIds, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions for an Experience Cloud site with absolute URLs using a list of managed content IDs.

API Version

50.0

Available to Guest Users

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getManagedContentByIds(String communityId, List<String> managedContentIds, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

managedContentIds
Type: List<String>

Comma-separated list of managed content IDs. HTTP/2 clients support up to 200 IDs. HTTP/1.1 clients don't.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByTopics(communityId, topics, pageParam, pageSize, language, managedContentType)

Get managed content versions using a list of content topic names.

API Version

47.0

Available to Guest Users

47.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getManagedContentByTopics(String communityId, List<String> topics, Integer pageParam, Integer pageSize, String language, String managedContentType)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

topics
Type: List<String>

Comma-separated list of up to 15 content topic names.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByTopics(communityId, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions with absolute URLs using a list of content topic names.

API Version

50.0

Available to Guest Users

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection getManagedContentByTopics(String communityId, List<String> topics, Integer pageParam, Integer pageSize, String language, String managedContentType, Boolean showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

topics
Type: List<String>

Comma-separated list of up to 15 content topic names.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByTopicsAndContentKeys(communityId, contentKeys, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions using a list of content keys and content topic names.

API Version

51.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection
getManagedContentByTopicsAndContentKeys(String communityId, List<String> contentKeys,
List<String> topics, Integer pageParam, Integer pageSize, String language, String
managedContentType, Boolean showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

contentKeys
Type: List<String>

List of up to 50 content keys for the managed content. A content key is a universally unique identifier (UUID) such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

topics
Type: List<String>

Comma-separated list of up to 15 content topic names.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByTopicsAndIds(communityId, managedContentIds, topics, pageParam, pageSize, language, managedContentType)

Get managed content versions using a list of managed content IDs and content topic names.

API Version

47.0

Available to Guest Users

47.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection
getManagedContentByTopicsAndIds(String communityId, List<String> managedContentIds,
List<String> topics, Integer pageParam, Integer pageSize, String language, String
managedContentType)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

managedContentIds
Type: List<String>

Comma-separated list of managed content IDs. HTTP/2 clients support up to 200 IDs. HTTP/1.1 clients don't.

topics
Type: List<String>

Comma-separated list of up to 15 content topic names.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentByTopicsAndIds(communityId, managedContentIds, topics, pageParam, pageSize, language, managedContentType, showAbsoluteUrl)

Get managed content versions with absolute URLs using a list of managed content IDs and content topic names.

API Version

50.0

Available to Guest Users

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVersionCollection
getManagedContentByTopicsAndIds(String communityId, List<String> managedContentIds,
List<String> topics, Integer pageParam, Integer pageSize, String language, String
managedContentType, Boolean showAbsoluteUrl)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

managedContentIds
Type: List<String>

Comma-separated list of managed content IDs. HTTP/2 clients support up to 200 IDs. HTTP/1.1 clients don't.

topics
Type: List<String>

Comma-separated list of up to 15 content topic names.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you pass in `null`, the default size is 25.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language.

managedContentType
Type: String

Developer name of the content type, such as `cms_document` or `cms_image`.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentVersionCollection`

getManagedContentSpace(contentSpaceId)

Get a managed content space.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentSpace getManagedContentSpace(String
contentSpaceId)
```

Parameters

contentSpaceId
Type: String

ID of the managed content space.

Return Value

Type: ConnectApi.ManagedContentSpace

getMCSFolderShares(folderId)

Get targets that a managed content space folder is shared with.

To get the targets that a managed content space folder can be shared with, use getMCSFolderShareTargets(folderId).

API Version

63.0

Requires Chatter

No

Signature

```
public static ConnectApi.MCSFolderShareCollection getMCSFolderShares(String folderId)
```

Parameters

folderId
Type: String

ID of the folder.

Return Value

Type: ConnectApi.MCSFolderShareCollection

getMCSFolderShareTargets(folderId)

Get targets that a managed content space folder can be shared with.

To get the targets that a managed content space folder is shared with, use getMCSFolderShares(folderId).

API Version

63.0

Requires Chatter

No

Signature

```
public static ConnectApi.MCSFolderShareTargetCollection getMCSFolderShareTargets(String folderId)
```

Parameters

folderId
Type: String

ID of the folder.

Return Value

Type: ConnectApi.MCSFolderShareTargetCollection

patchMCSFolderShares(folderId, mcsFolderShareCollectionUpdateInput)

Update the targets that a managed content space folder is shared with.

Workspaces are the only supported sharing targets. To get the targets that a managed content space folder is shared with, use `getMCSFolderShares(folderId)`. To get the targets that a managed content space folder can be shared with, use `getMCSFolderShareTargets(folderId)`.

API Version

63.0

Requires Chatter

No

Signature

```
public static ConnectApi.MCSFolderShareCollection patchMCSFolderShares(String folderId, ConnectApi.MCSFolderShareCollectionUpdateInput mcsFolderShareCollectionUpdateInput)
```

Parameters

folderId
Type: String

ID of the folder.

mcsFolderShareCollectionUpdateInput
Type: ConnectApi.MCSFolderShareCollectionUpdateInput

`ConnectApi.MCSFolderShareCollectionUpdateInput` input class with the targets to share and unshare.

Return Value

Type: ConnectApi.MCSFolderShareCollection

publish(publishInput)

Publish content.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentPublishOutput
publish(ConnectApi.ManagedContentPublishInput publishInput)
```

Parameters

publishInput
Type: ConnectApi.ManagedContentPublishInput

A ConnectApi.ManagedContentPublishInput request body specifying the content to publish.

Return Value

Type: ConnectApi.ManagedContentPublishOutput

replaceManagedContentVariant(variantId, ManagedContentVariantInputParam)

Replace a managed content variant.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVariant replaceManagedContentVariant(String
variantId, ConnectApi.ManagedContentVariantUpdateInput ManagedContentVariantInputParam)
```

Parameters

variantId
Type: String

ID of the managed content variant to replace.

ManagedContentVariantInputParam
Type: ConnectApi.ManagedContentVariantUpdateInput

A ConnectApi.ManagedContentVariantUpdateInput input class with information about the managed content variant that is replacing the existing variant.

Return Value

Type: ConnectApi.ManagedContentVariant

replaceManagedContentVariantWithMedia(variantId, ManagedContentVariantInputParam, contentData)

Replace a managed content variant, including content data.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentVariant
replaceManagedContentVariantWithMedia(String variantId,
ConnectApi.ManagedContentVariantUpdateInput ManagedContentVariantInputParam,
ConnectApi.BinaryInput contentData)
```

Parameters

variantId
Type: String

ID of the managed content variant to replace.

ManagedContentVariantInputParam
Type: ConnectApi.ManagedContentVariantUpdateInput

A ConnectApi.ManagedContentVariantUpdateInput input class with information about the managed content variant that is replacing the existing variant.

contentData
Type: ConnectApi.BinaryInput

A new binary file to replace the content data of the managed content variant.

Return Value

Type: ConnectApi.ManagedContentVariant

`unpublish(unpublishInput)`

Unpublish content.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentUnpublishOutput
unpublish(ConnectApi.ManagedContentUnpublishInput unpublishInput)
```

Parameters

`unpublishInput`
Type: `ConnectApi.ManagedContentUnpublishInput`

A `ConnectApi,ManagedContentUnpublishInput` request body specifying the content to unpublish.

Return Value

Type: `ConnectApi.ManagedContentUnpublishOutput`

Retired ManagedContent Methods

These methods for `ManagedContent` are retired.

IN THIS SECTION:

getAllDeliveryChannels(pageParam, pageSize)
Get managed content delivery channels for the context user.

`getAllDeliveryChannels(pageParam, pageSize)`

Get managed content delivery channels for the context user.

API Version

48.0–61.0

In version 62.0 and later, use `getChannels(pageParam, pageSize)` in the `ManagedContentDelivery` class to get all delivery channels.

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentChannelCollection getAllDeliveryChannels(Integer pageParam, Integer pageSize)
```

Parameters

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ManagedContentChannelCollection`

ManagedContentChannels Class

Get managed content channels. Create, get, update, or delete a managed content channel.

Namespace

ConnectApi

ManagedContentChannels Methods

These methods are for `ManagedContentChannels`. All methods are static.

IN THIS SECTION:

deleteManagedContentChannel(channelId)
Delete a managed content channel.

getManagedContentChannel(channelId)
Get a managed content channel.

getManagedContentChannels(pageParam, pageSize, showDetails)
Get managed content channels.

patchManagedContentChannel(channelId, ManagedContentChannelInput)
Update a managed content channel.

postManagedContentChannel(ManagedContentCreateInputParam)
Create a managed content channel.

deleteManagedContentChannel(channelId)

Delete a managed content channel.

API Version

62.0

Requires Chatter

No

Signature

```
public static Void deleteManagedContentChannel(String channelId)
```

Parameters

channelId
Type: String

ID of the managed content channel to delete.

Return Value

Type: Void

getManagedContentChannel(channelId)

Get a managed content channel.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentChannel getManagedContentChannel(String channelId)
```

Parameters

channelId
Type: String

ID of the managed content channel.

Return Value

Type: ConnectApi.ManagedContentChannel

getManagedContentChannels(pageParam, pageSize, showDetails)

Get managed content channels.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentChannelsRepresentation
getManagedContentChannels(Integer pageParam, Integer pageSize, Boolean showDetails)
```

Parameters

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25.

showDetails
Type: Boolean

Specifies whether to show the channels' detailed information (`true`) or summary information only (`false`). If you pass in `null`, the default is `false`.

Return Value

Type: `ConnectApi.ManagedContentChannelsRepresentation`

patchManagedContentChannel(channelId, ManagedContentChannelInput)

Update a managed content channel.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentChannel patchManagedContentChannel(String
channelId, ConnectApi.ManagedContentChannelUpdateRepresentation
ManagedContentChannelInput)
```

Parameters

channelId
Type: String

ID of the managed content channel to update.

ManagedContentChannelInput
Type: ConnectApi.ManagedContentChannelUpdateRepresentation

ConnectApi.ManagedContentChannelUpdateRepresentation input class with the updates.

Return Value

Type: ConnectApi.ManagedContentChannel

postManagedContentChannel(ManagedContentCreateInputParam)

Create a managed content channel.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentChannel
postManagedContentChannel(ConnectApi.ManagedContentChannelCreateRepresentation
ManagedContentCreateInputParam)
```

Parameters

ManagedContentCreateInputParam
Type: ConnectApi.ManagedContentChannelCreateRepresentation

ConnectApi.ManagedContentChannelCreateRepresentation input class describing the managed content channel.

Return Value

Type: ConnectApi.ManagedContentChannel

ManagedContentDelivery Class

Get collection items. Get a managed content channel. Get managed content.

Namespace

ConnectApi

ManagedContentDelivery Methods

These methods are for `ManagedContentDelivery`. All methods are static.

IN THIS SECTION:

getChannels(pageParam, pageSize)
Get managed content delivery channels for the context user.

getCollectionItemsForChannel(channelId, collectionKeyOrId, language)
Get collection items for a channel.

getCollectionItemsForChannel(channelId, collectionKeyOrId, language, pageToken, pageSize)
Get a page of collection items for a channel.

getCollectionItemsForSite(siteId, collectionKeyOrId, language)
Get collection items for an Experience Cloud site.

getCollectionItemsForSite(siteId, collectionKeyOrId, language, pageToken, pageSize)
Get a page of collection items for an Experience Cloud site.

getManagedContentDeliveryChannel(channelId)
Get a managed content delivery channel.

getManagedContentForChannel(channelId, contentKeyOrId, showAbsoluteUrl)
Get a piece of published content for a channel.

getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl)
Get a piece of published content in a specified language for a channel.

getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)
Get a piece of published content in a specified language with references for a channel.

getManagedContentForSite(siteId, contentKeyOrId, showAbsoluteUrl)
Get a piece of published content for an Experience Cloud site.

getManagedContentForSite(siteId, contentKeyOrId, language, showAbsoluteUrl)
Get a piece of published content in a specified language for an Experience Cloud site.

getManagedContentForSite(siteId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)
Get a piece of published content in a specified language with references for an Experience Cloud site.

getManagedContentsForChannel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize, showAbsoluteUrl)
Get a collection of published contents for a channel.

getManagedContentsForSite(siteId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize, showAbsoluteUrl)

Get a collection of published contents for an Experience Cloud site.

`getChannels(pageParam, pageSize)`

Get managed content delivery channels for the context user.

API Version

62.0

Available to Guest Users

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryChannelsRepresentation getChannels(Integer pageParam, Integer pageSize)
```

Parameters

pageParam

Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ManagedContentDeliveryChannelsRepresentation`

`getCollectionItemsForChannel(channelId, collectionKeyOrId, language)`

Get collection items for a channel.

API Version

56.0

Available to Guest Users

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentCollectionItems
getCollectionItemsForChannel(String channelId, String collectionKeyOrId, String language)
```

Parameters

channelId
Type: String

ID of the channel.

collectionKeyOrId
Type: String

Collection key or ID of the collection. A collection key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

Return Value

Type: `ConnectApi.ManagedContentCollectionItems`

Example

This example gets a collection of a custom content type that includes references to images and uses the `ConnectApi.ConnectUtilities.unwrapApexWrapper()` utility.

```
ConnectApi.ManagedContentCollectionItems collection =

ConnectApi.ManagedContentDelivery.getCollectionItemsForChannel('0apXXXXXXXXXXXXXX','MCVXXXXXXXXXXXXXXXXXXXXXXXX','en_US');

System.debug(collection.items); //before ApexWrapper is unwrapped

for(ConnectApi.ManagedContentCollectionItem item : collection.items)
{
 //unwrap ApexWrapper
 Map<String,Object> unwrappedItem =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(item.body.get('contentBody'));

 //replace the wrapped object with the unwrapped object
 item.body.put('contentBody', unwrappedItem);
}

System.debug(collection.items); //after ApexWrapper is unwrapped
```

`getCollectionItemsForChannel(channelId, collectionKeyOrId, language, pageToken, pageSize)`

Get a page of collection items for a channel.

API Version

63.0

Available to Guest Users

63.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentCollectionItems
getCollectionItemsForChannel(String channelId, String collectionKeyOrId, String language,
Integer pageToken, Integer pageSize)
```

Parameters

channelId
Type: String

ID of the channel.

collectionKeyOrId
Type: String

Collection key or ID of the collection. A collection key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

pageToken
Type: Integer

Integer specifying a page token of items. If you pass in null, the default value is 0, which returns the first page token.

pageSize
Type: Integer

Number of items per page. Valid values are from 1 through 250. If you pass in null, the default size is 50.

Return Value

Type: `ConnectApi.ManagedContentCollectionItems`

`getCollectionItemsForSite(siteId, collectionKeyOrId, language)`

Get collection items for an Experience Cloud site.

API Version

56.0

Available to Guest Users

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentCollectionItems getCollectionItemsForSite(String siteId, String collectionKeyOrId, String language)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

collectionKeyOrId
Type: String

Collection key or ID of the collection. A collection key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

Return Value

Type: `ConnectApi.ManagedContentCollectionItems`

Example

This example gets a collection of a custom content type that includes references to images and uses the `ConnectApi.ConnectUtilities.unwrapApexWrapper()` utility.

```
ConnectApi.ManagedContentCollectionItems collection =

ConnectApi.ManagedContentDelivery.getCollectionItemsForSite('0DMXXXXXXXXXXXXXX','MCVXXXXXXXXXXXXXXXXXXXXXXX','en_US');

System.debug(collection.items); //before ApexWrapper is unwrapped
```

```
for(ConnectApi.ManagedContentCollectionItem item : collection.items)
{
 //unwrap ApexWrapper
 Map<String,Object> unwrappedItem =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(item.body.get('contentBody'));

 //replace the wrapped object with the unwrapped object
 item.body.put('contentBody', unwrappedItem);
}

System.debug(collection.items); //after ApexWrapper is unwrapped
```

getCollectionItemsForSite(siteId, collectionKeyOrId, language, pageToken, pageSize)

Get a page of collection items for an Experience Cloud site.

API Version

63.0

Available to Guest Users

63.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentCollectionItems getCollectionItemsForSite(String
siteId, String collectionKeyOrId, String language, Integer pageToken, Integer pageSize)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

collectionKeyOrId
Type: String

Collection key or ID of the collection. A collection key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

pageToken
Type: Integer

Integer specifying a page token of items. If you pass in null, the default value is 0, which returns the first page token.

pageSize
Type: Integer

Number of items per page. Valid values are from 1 through 250. If you pass in null, the default size is 50.

Return Value

Type: ConnectApi.ManagedContentCollectionItems

getManagedContentDeliveryChannel(channelId)

Get a managed content delivery channel.

API Version

62.0

Available to Guest Users

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryChannelRepresentation
getManagedContentDeliveryChannel(String channelId)
```

Parameters

channelId
Type: String

ID of the channel.

Return Value

Type: ConnectApi.ManagedContentDeliveryChannelRepresentation

getManagedContentForChannel(channelId, contentKeyOrId, showAbsoluteUrl)

Get a piece of published content for a channel.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument
getManagedContentForChannel(String channelId, String contentKeyOrId, Boolean
showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

Usage

This method returns content only if it's published in the default language of the channel. If you request content that isn't published in the default language of the channel, you get a `ConnectApi.NotFoundException`. To get content for a channel in another language use `getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl)` or `getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)` on page 1511.

Example

This example gets a custom content type with an image reference and uses the `ConnectApi.ConnectUtilities.unwrapApexWrapper()` utility.

```
ConnectApi.ManagedContentDeliveryDocument res =
    ConnectApi.ManagedContentDelivery.getManagedContentForChannel
('0apXXXXXXXXXXXXXX','MCLXXXXXXXXXXXXXXXXXXXXXXXXX',true);

//before contentBody field ApexWrapper is unwrapped
system.debug(res.contentBody);
```

```
//unwrap contentBody field in res
Map<String,Object> contentBody =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(res.contentBody);

//after contentBody field ApexWrapper is unwrapped, but image field still wrapped
system.debug(contentBody);

//before image field ApexWrapper is unwrapped
system.debug(contentBody.get('Image'));

//unwrap Image field in contentBody
Map<String,Object> Image =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(contentBody.get('Image'));

//after image field ApexWrapper is unwrapped
system.debug(Image);

//replace wrapped primary_image in contentBody with unwrapped version
contentBody.put('Image', Image);

//after contentBody field ApexWrapper is unwrapped, with image field also unwrapped
system.debug(contentBody);
```

`getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl)`

Get a piece of published content in a specified language for a channel.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument
getManagedContentForChannel(String channelId, String contentKeyOrId, String language,
Boolean showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. The requested language must be added to the channel, otherwise, you get a `ConnectApi.NotFoundException`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

getManagedContentForChannel(channelId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)

Get a piece of published content in a specified language with references for a channel.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument
getManagedContentForChannel(String channelId, String contentKeyOrId, String language,
Boolean showAbsoluteUrl, Integer referenceDepth, Boolean expandReferences, Boolean
referencesAsList)
```

Parameters

channelId
Type: String

ID of the channel.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. The requested language must be added to the channel, otherwise, you get a `ConnectApi.NotFoundException`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

referenceDepth
Type: Integer

An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocument` output class is null. If unspecified, the default value is 0.

expandReferences
Type: Boolean

Specifies whether to include details of references (`true`) or summaries of references (`false`) in the output class. If unspecified, the default value is `false`.

referencesAsList
Type: Boolean

Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocument` output class (`true`). If you specify `false`, the references are returned as key value pairs in the `references` property. If unspecified, the default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

getManagedContentForSite(siteId, contentKeyOrId, showAbsoluteUrl)

Get a piece of published content for an Experience Cloud site.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument getManagedContentForSite(String siteId, String contentKeyOrId, Boolean showAbsoluteUrl)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

Example

This example gets a custom content type with an image reference and uses the `ConnectApi.ConnectUtilities.unwrapApexWrapper()` utility.

```
ConnectApi.ManagedContentDeliveryDocument res =
    ConnectApi.ManagedContentDelivery.getManagedContentForSite
('0DMXXXXXXXXXXXXXXX','MCLXXXXXXXXXXXXXXXXXXXXXXXXXX',true);

//before contentBody field ApexWrapper is unwrapped
system.debug(res.contentBody);

//unwrap contentBody field in res
Map<String,Object> contentBody =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(res.contentBody);

//after contentBody field ApexWrapper is unwrapped, but image field still wrapped
system.debug(contentBody);

//before image field ApexWrapper is unwrapped
system.debug(contentBody.get('Image'));

//unwrap Image field in contentBody
Map<String,Object> Image =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(contentBody.get('Image'));

//after image field ApexWrapper is unwrapped
system.debug(Image);
```

```
//replace wrapped primary_image in contentBody with unwrapped version
contentBody.put('Image', Image);

//after contentBody field ApexWrapper is unwrapped, with image field also unwrapped
system.debug(contentBody);
```

getManagedContentForSite(siteId, contentKeyOrId, language, showAbsoluteUrl)

Get a piece of published content in a specified language for an Experience Cloud site.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument getManagedContentForSite(String siteId, String contentKeyOrId, String language, Boolean showAbsoluteUrl)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

`getManagedContentForSite(siteId, contentKeyOrId, language, showAbsoluteUrl, referenceDepth, expandReferences, referencesAsList)`

Get a piece of published content in a specified language with references for an Experience Cloud site.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocument getManagedContentForSite(String siteId, String contentKeyOrId, String language, Boolean showAbsoluteUrl, Integer referenceDepth, Boolean expandReferences, Boolean referencesAsList)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

contentKeyOrId
Type: String

Content key or ID of the content. A content key is a unique identifier such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space.

showAbsoluteUrl
Type: Boolean

For public channels only, specifies whether to return the absolute `unauthenticatedUrl` in the output class. The default value is `false`.

referenceDepth
Type: Integer

An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocument` output class is null. If unspecified, the default value is 0.

expandReferences
Type: Boolean

Specifies whether to include details of references (`true`) or summaries of references (`false`) in the output class. If unspecified, the default value is `false`.

referencesAsList
Type: Boolean

Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocument` output class (`true`). If you specify `false`, the references are returned as key value pairs in the `references` property. If unspecified, the default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocument`

getManagedContentsForChannel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize, showAbsoluteUrl)

Get a collection of published contents for a channel.

API Version

58.0

Available to Guest Users

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocumentCollection
getManagedContentsForChannel(String channelId, List<String> managedContentIds,
List<String> contentKeys, String contentTypeFQN, String language, String
publishStartDate, String publishEndDate, Boolean includeContentBody, Integer
referenceDepth, Boolean expandReferences, Boolean referencesAsList, Integer pageParam,
Integer pageSize, Boolean showAbsoluteUrl)
```

Parameters

channelId
Type: String

ID of the channel.

managedContentIds
Type: List<String>

Comma-separated list of up to 100 managed content IDs. Specify either managed content IDs or content keys.

contentKeys
Type: List<String>

Comma-separated list of up to 50 content keys. Specify either managed content IDs or content keys.

contentTypeFQN
Type: String

Fully qualified name of the managed content type.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the configured fallback language or the channel's default language. If the content isn't available in the fallback language and the channel's default language, we return an error.

publishStartDate
Type: String

ISO 8601 formatted publish start date.

publishEndDate
Type: String

ISO 8601 formatted publish end date.

includeContentBody
Type: Boolean

Specifies whether to return the content body (`true`) or the content summary (`false`). If unspecified, the default value is `false`.

referenceDepth
Type: Integer

An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class is null. If unspecified, the default value is 0.

expandReferences
Type: Boolean

Specifies whether to include details of references (`true`) or summaries of references (`false`) in the output class. If unspecified, the default value is `false`.

referencesAsList
Type: Boolean

Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class (`true`). If you specify `false`, the references are returned as key value pairs in the `references` property. If unspecified, the default value is `false`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25. If you specify `true` for *expandReferences* or *includeContentBody*, the maximum page size you can specify is 25.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocumentCollection`

Example

This example gets Event custom content type records and uses the `ConnectApi.ConnectUtilities.unwrapApexWrapper()` utility.

```
ConnectApi.ManagedContentDeliveryDocumentCollection resCol =
    ConnectApi.ManagedContentDelivery.getManagedContentsForChannel('0apXXXXXXXXXXXXXXX',
null, new List<String>{'MCLXXXXXXXXXXXXXXXXXXXXXXXXX'}, 'Event', null, null, null, true,
3, true, false, null, 25, true);

Map<String, Object> contentBodyMap = new Map<String,Object>();

for(ConnectApi.AbstractManagedContentDeliveryDocument res1 : resCol.contents)
{
 //cast the abstract object as the ManagedContentDeliveryDocument subclass that contains
contentBody
 ConnectApi.ManagedContentDeliveryDocument res =
(ConnectApi.ManagedContentDeliveryDocument)res1;

 //before contentBody field ApexWrapper is unwrapped
 system.debug(res.contentBody);

 //unwrap contentBody field in res
 Map<String,Object> contentBody =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(res.contentBody);

 //after contentBody field ApexWrapper is unwrapped, but image field still wrapped
 system.debug(contentBody);

 //before image field ApexWrapper is unwrapped
 system.debug(contentBody.get('Image'));

 //unwrap Image field in contentBody
 Map<String,Object> Image =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(contentBody.get('Image'));

 //after image field ApexWrapper is unwrapped
 system.debug(Image);

 //replace wrapped primary_image in contentBody with unwrapped version
 contentBody.put('Image', Image);

 //after contentBody field ApexWrapper is unwrapped, with image field also unwrapped
 system.debug(contentBody);
```

```
 //put unwrapped contentBody in map
 contentBodyMap.put(res.contentKey, contentBody);

}

//check unwrapped contentBody map
System.debug(contentBodyMap);
```

getManagedContentsForSite(siteId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize, showAbsoluteUrl)

Get a collection of published contents for an Experience Cloud site.

API Version

58.0

Available to Guest Users

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocumentCollection
getManagedContentsForSite(String siteId, List<String> managedContentIds, List<String>
contentKeys, String contentTypeFQN, String language, String publishStartDate, String
publishEndDate, Boolean includeContentBody, Integer referenceDepth, Boolean
expandReferences, Boolean referencesAsList, Integer pageParam, Integer pageSize, Boolean
showAbsoluteUrl)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

managedContentIds
Type: List<String>

Comma-separated list of up to 100 managed content IDs. Specify either managed content IDs or content keys.

contentKeys
Type: List<String>

Comma-separated list of up to 50 content keys. Specify either managed content IDs or content keys.

contentTypeFQN
Type: String

Fully qualified name of the managed content type.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the configured fallback language or the channel's default language. If the content isn't available in the fallback language and the channel's default language, we return an error.

publishStartDate
Type: String

ISO 8601 formatted publish start date.

publishEndDate
Type: String

ISO 8601 formatted publish end date.

includeContentBody
Type: Boolean

Specifies whether to return the content body (`true`) or the content summary (`false`). If unspecified, the default value is `false`.

referenceDepth
Type: Integer

An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class is null. If unspecified, the default value is 0.

expandReferences
Type: Boolean

Specifies whether to include details of references (`true`) or summaries of references (`false`) in the output class. If unspecified, the default value is `false`.

referencesAsList
Type: Boolean

Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class (`true`). If you specify `false`, the references are returned as key value pairs in the `references` property. If unspecified, the default value is `false`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25. If you specify `true` for *expandReferences* or *includeContentBody*, the maximum page size you can specify is 25.

showAbsoluteUrl
Type: Boolean

Specifies whether to show absolute URLs in the output class (`true`) or not (`false`). The default value is `false`.

Return Value

Type: ConnectApi.ManagedContentDeliveryDocumentCollection

Example

This example gets custom content type Event records and uses the ConnectApi.ConnectUtilities.unwrapApexWrapper() utility.

```
ConnectApi.ManagedContentDeliveryDocumentCollection resCol =
    ConnectApi.ManagedContentDelivery.getManagedContentsForSite('0DMXXXXXXXXXXXXXX', null,
 new List<String>{'MCLXXXXXXXXXXXXXXXXXXXXXXXXXX'}, 'Event', null, null, null, true, 3,
true, false, null, 25, true);

Map<String, Object> contentBodyMap = new Map<String,Object>();

for(ConnectApi.AbstractManagedContentDeliveryDocument res1 : resCol.contents)
{
 //cast the abstract object as the ManagedContentDeliveryDocument subclass that contains
contentBody
 ConnectApi.ManagedContentDeliveryDocument res =
(ConnectApi.ManagedContentDeliveryDocument)res1;

 //before contentBody field ApexWrapper is unwrapped
 system.debug(res.contentBody);

 //unwrap contentBody field in res
 Map<String,Object> contentBody =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(res.contentBody);

 //after contentBody field ApexWrapper is unwrapped, but image field still wrapped
 system.debug(contentBody);

 //before image field ApexWrapper is unwrapped
 system.debug(contentBody.get('Image'));

 //unwrap Image field in contentBody
 Map<String,Object> Image =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(contentBody.get('Image'));

 //after image field ApexWrapper is unwrapped
 system.debug(Image);

 //replace wrapped primary_image in contentBody with unwrapped version
 contentBody.put('Image', Image);

 //after contentBody field ApexWrapper is unwrapped, with image field also unwrapped
 system.debug(contentBody);

 //put unwrapped contentBody in map
 contentBodyMap.put(res.contentKey, contentBody);

}
```

```
//check unwrapped contentBody map
System.debug(contentBodyMap);
```

Retired ManagedContentDelivery Methods

These methods for `ManagedContentDelivery` are retired.

IN THIS SECTION:

getManagedContentChannel(channelId)
Get a managed content delivery channel.

getManagedContentsForChannel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize)
Get a collection of published contents for a channel.

getManagedContentsForSite(siteId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize)
Get a collection of published contents for an Experience Cloud site.

`getManagedContentChannel(channelId)`

Get a managed content delivery channel.

API Version

54.0–61.0

In version 62.0 and later, use `getManagedContentDeliveryChannel(channelId)` to get a managed content delivery channel.

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentChannelDetail getManagedContentChannel(String channelId)
```

Parameters

`channelId`
Type: String

ID of the channel.

Return Value

Type: ConnectApi.ManagedContentChannelDetail

getManagedContentsForChannel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize)

Get a collection of published contents for a channel.

API Version

55.0—57.0

In version 58.0 and later, use getManagedContentsForChannel(channelId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize, showAbsoluteUrl).

Available to Guest Users

55.0—57.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocumentCollection
getManagedContentsForChannel(String channelId, List<String> managedContentIds,
List<String> contentKeys, String contentTypeFQN, String language, String
publishStartDate, String publishEndDate, Boolean includeContentBody, Integer
referenceDepth, Boolean expandReferences, Boolean referencesAsList, Integer pageParam,
Integer pageSize)
```

Parameters

channelId
Type: String

ID of the channel.

managedContentIds
Type: List<String>

Comma-separated list of up to 100 managed content IDs. Specify either managed content IDs or content keys.

contentKeys
Type: List<String>

Comma-separated list of up to 50 content keys. Specify either managed content IDs or content keys.

contentTypeFQN
Type: String

Fully qualified name of the managed content type.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the configured fallback language or the channel's default language. If the content isn't available in the fallback language and the channel's default language, we return an error.

publishStartDate
Type: String

ISO 8601 formatted publish start date.

publishEndDate
Type: String

ISO 8601 formatted publish end date.

includeContentBody
Type: Boolean

Specifies whether to return the content body (`true`) or the content summary (`false`). If unspecified, the default value is `false`.

referenceDepth
Type: Integer

An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class is null. If unspecified, the default value is 0.

expandReferences
Type: Boolean

Specifies whether to include details of references (`true`) or summaries of references (`false`) in the output class. If unspecified, the default value is `false`.

referencesAsList
Type: Boolean

Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class (`true`). If you specify `false`, the references are returned as key value pairs in the `references` property. If unspecified, the default value is `false`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25. If you specify `true` for *expandReferences* or *includeContentBody*, the maximum page size you can specify is 25.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocumentCollection`

getManagedContentsForSite(siteId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize)

Get a collection of published contents for an Experience Cloud site.

API Version

55.0—57.0

In version 58.0 and later, use `getManagedContentsForSite(siteId, managedContentIds, contentKeys, contentTypeFQN, language, publishStartDate, publishEndDate, includeContentBody, referenceDepth, expandReferences, referencesAsList, pageParam, pageSize, showAbsoluteUrl)`.

Available to Guest Users

55.0—57.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentDeliveryDocumentCollection
getManagedContentsForSite(String siteId, List<String> managedContentIds, List<String>
contentKeys, String contentTypeFQN, String language, String publishStartDate, String
publishEndDate, Boolean includeContentBody, Integer referenceDepth, Boolean
expandReferences, Boolean referencesAsList, Integer pageParam, Integer pageSize)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

managedContentIds
Type: List<String>

Comma-separated list of up to 100 managed content IDs. Specify either managed content IDs or content keys.

contentKeys
Type: List<String>

Comma-separated list of up to 50 content keys. Specify either managed content IDs or content keys.

contentTypeFQN
Type: String

Fully qualified name of the managed content type.

language
Type: String

Language locale for the managed content, for example, `en_US`. If the requested translation isn't available, the language defaults to the configured fallback language or the channel's default language. If the content isn't available in the fallback language and the channel's default language, we return an error.

`publishStartDate`
Type: String

ISO 8601 formatted publish start date.

`publishEndDate`
Type: String

ISO 8601 formatted publish end date.

`includeContentBody`
Type: Boolean

Specifies whether to return the content body (`true`) or the content summary (`false`). If unspecified, the default value is `false`.

`referenceDepth`
Type: Integer

An integer 0–3 specifying the depth of references. If you specify 0, the `references` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class is null. If unspecified, the default value is 0.

`expandReferences`
Type: Boolean

Specifies whether to include details of references (`true`) or summaries of references (`false`) in the output class. If unspecified, the default value is `false`.

`referencesAsList`
Type: Boolean

Specifies whether to return the references as a list in the `referencesList` property of the `ConnectApi.ManagedContentDeliveryDocumentCollection` output class (`true`). If you specify `false`, the references are returned as key value pairs in the `references` property. If unspecified, the default value is `false`.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25. If you specify `true` for *`expandReferences`* or *`includeContentBody`*, the maximum page size you can specify is 25.

Return Value

Type: `ConnectApi.ManagedContentDeliveryDocumentCollection`

ManagedContentSpaces Class

Get channels in a managed content space. Add or remove channels from a managed content space.

Namespace

ConnectApi

ManagedContentSpaces Methods

These methods are for `ManagedContentSpaces`. All methods are static.

IN THIS SECTION:

getManagedContentSpaceChannels(contentSpaceId, pageParam, pageSize)
Get channels for a managed content space.

patchManagedContentSpaceChannels(contentSpaceId, spaceChannels)
Add or remove channels from a managed content space.

`getManagedContentSpaceChannels(contentSpaceId, pageParam, pageSize)`

Get channels for a managed content space.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentSpaceChannelsRepresentation
getManagedContentSpaceChannels(String contentSpaceId, Integer pageParam, Integer
pageSize)
```

Parameters

contentSpaceId
Type: String

ID of the managed content space.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Number of items per page. Valid values are from 1 through 250. If you pass in `null`, the default size is 25. Items are sorted by the last modified date.

Return Value

Type: ConnectApi.ManagedContentSpaceChannelsRepresentation

patchManagedContentSpaceChannels(contentSpaceId, spaceChannels)

Add or remove channels from a managed content space.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedContentSpaceChannelsRepresentation
patchManagedContentSpaceChannels(String contentSpaceId,
ConnectApi.ManagedContentSpaceChannelsInputRepresentation spaceChannels)
```

Parameters

contentSpaceId
Type: String

ID of the managed content space.

spaceChannels
Type: ConnectApi.ManagedContentSpaceChannelsInputRepresentation

`ConnectApi.ManagedContentSpaceChannelsInputRepresentation` input class with the channels to add or remove from the managed content space.

Return Value

Type: ConnectApi.ManagedContentSpaceChannelsRepresentation

ManagedTopics Class

Get managed topics in an Experience Cloud site. Create, delete, and reorder managed topics.

Namespace

ConnectApi

ManagedTopics Methods

These methods are for `ManagedTopics`. All methods are static.

IN THIS SECTION:

createManagedTopic(communityId, recordId, managedTopicType)
Create a managed topic of a specific type for an Experience Cloud site.

createManagedTopic(communityId, recordId, managedTopicType, parentId)
Create a child managed topic for an Experience Cloud site.

createManagedTopicByName(communityId, name, managedTopicType)
Create a managed topic of a specific type by name for an Experience Cloud site.

createManagedTopicByName(communityId, name, managedTopicType, parentId)
Create a child managed topic by name for an Experience Cloud site.

deleteManagedTopic(communityId, managedTopicId)
Delete a managed topic from an Experience Cloud site.

getManagedTopic(communityId, managedTopicId)
Get a managed topic in an Experience Cloud site.

getManagedTopic(communityId, managedTopicId, depth)
Get a managed topic, including its parent and children managed topics, in an Experience Cloud site.

getManagedTopics(communityId)
Get the featured and navigational managed topics for an Experience Cloud site.

getManagedTopics(communityId, managedTopicType)
Get managed topics of the specified type for an Experience Cloud site.

getManagedTopics(communityId, managedTopicType, depth)
Get managed topics of the specified type, including their parent and children managed topics, in an Experience Cloud site.

getManagedTopics(communityId, managedTopicType, recordIds, depth)
Get managed topics of the specified type, including their parent and children managed topics, that are associated with topics in an Experience Cloud site.

getManagedTopics(communityId, managedTopicType, pageParam, pageSize)
Get a page of managed topics.

reorderManagedTopics(communityId, managedTopicPositionCollection)
Reorder the relative positions of managed topics in an Experience Cloud site.

`createManagedTopic(communityId, recordId, managedTopicType)`

Create a managed topic of a specific type for an Experience Cloud site.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopic(String communityId, String
recordId, ConnectApi.ManagedTopicType managedTopicType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID of the topic.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Specify the type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

You can create up to 25 `Featured` and 5,000 `Content` topics. You can create up to eight levels of `Navigational` managed topics with 25 top-level topics and 10 children topics per level for a maximum of 2,775 `Navigational` topics.

Return Value

Type: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

`createManagedTopic(communityId, recordId, managedTopicType, parentId)`

Create a child managed topic for an Experience Cloud site.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopic(String communityId, String recordId, ConnectApi.ManagedTopicType managedTopicType, String parentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID of the topic.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Specify `Navigational` for the type of managed topic to create a child managed topic.

You can create up to 25 `Featured` and 5,000 `Content` topics. You can create up to eight levels of `Navigational` managed topics with 25 top-level topics and 10 children topics per level for a maximum of 2,775 `Navigational` topics.

parentId
Type: String

ID of the parent managed topic.

You can create up to eight levels (parent, direct children, their children, etc.) of managed topics and up to 10 children managed topics per managed topic.

Return Value

Type: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

`createManagedTopicByName(communityId, name, managedTopicType)`

Create a managed topic of a specific type by name for an Experience Cloud site.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopicByName(String communityId,
String name, ConnectApi.ManagedTopicType managedTopicType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

name
Type: String

Name of the topic.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Specify the type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

You can create up to 25 `Featured` and 5,000 `Content` topics. You can create up to eight levels of `Navigational` managed topics with 25 top-level topics and 10 children topics per level for a maximum of 2,775 `Navigational` topics.

Return Value

Type: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

`createManagedTopicByName(communityId, name, managedTopicType, parentId)`

Create a child managed topic by name for an Experience Cloud site.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopicByName(String communityId,
String name, ConnectApi.ManagedTopicType managedTopicType, String parentId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

name
Type: String

Name of the topic.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Specify `Navigational` for the type of managed topic to create a child managed topic.

You can create up to 25 `Featured` and 5,000 `Content` topics. You can create up to eight levels of `Navigational` managed topics with 25 top-level topics and 10 children topics per level for a maximum of 2,775 `Navigational` topics.

parentId
Type: String

ID of the parent managed topic.

You can create up to eight levels (parent, direct children, their children, etc.) of managed topics and up to 10 children managed topics per managed topic.

Return Value

Type: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

`deleteManagedTopic(communityId, managedTopicId)`

Delete a managed topic from an Experience Cloud site.

API Version

32.0

Requires Chatter

No

Signature

```
public static deleteManagedTopic(String communityId, String managedTopicId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicId
Type: String

ID of managed topic.

Return Value

Type: Void

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can delete managed topics.

`getManagedTopic(communityId, managedTopicId)`

Get a managed topic in an Experience Cloud site.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic getManagedTopic(String communityId, String managedTopicId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicId
Type: String

ID of managed topic.

Return Value

Type: `ConnectApi.ManagedTopic`

`getManagedTopic(communityId, managedTopicId, depth)`

Get a managed topic, including its parent and children managed topics, in an Experience Cloud site.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic getManagedTopic(String communityId, String managedTopicId, Integer depth)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicId
Type: String

ID of managed topic.

depth
Type: Integer

Specify an integer 1–8. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopic`

`getManagedTopics(communityId)`

Get the featured and navigational managed topics for an Experience Cloud site.

To get the content topics for an Experience Cloud site, use `getManagedTopics(communityId, managedTopicType)`.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

getManagedTopics(communityId, managedTopicType)

Get managed topics of the specified type for an Experience Cloud site.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

If you specify `Content`, up to 50 topics are returned. If you want more than 50 `Content` topics, use `getManagedTopics(communityId, managedTopicType, pageParam, pageSize)`.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

getManagedTopics(communityId, managedTopicType, depth)

Get managed topics of the specified type, including their parent and children managed topics, in an Experience Cloud site.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType, Integer depth)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Type of managed topic.

- `Content`—Topics that are associated with native content.

- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

depth
Type: Integer

Specify an integer 1–8. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

getManagedTopics(communityId, managedTopicType, recordIds, depth)

Get managed topics of the specified type, including their parent and children managed topics, that are associated with topics in an Experience Cloud site.

API Version

38.0

Available to Guest Users

38.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType, List<String> recordIds, Integer depth)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.

- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

`recordIds`
Type: List<String>

A list of up to 100 topic IDs associated with the managed topics.

If you list more than 10 topic IDs, you can't specify 2–8 for *`depth`*.

`depth`
Type: Integer

Specify an integer 1–8. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

`getManagedTopics(communityId, managedTopicType, pageParam, pageSize)`

Get a page of managed topics.

API Version

44.0

Available to Guest Users

44.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType, Integer pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`managedTopicType`
Type: `ConnectApi.ManagedTopicType`

Type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 50.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

reorderManagedTopics(communityId, managedTopicPositionCollection)

Reorder the relative positions of managed topics in an Experience Cloud site.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection reorderManagedTopics(String communityId,
ConnectApi.ManagedTopicPositionCollectionInput managedTopicPositionCollection)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicPositionCollection
Type: `ConnectApi.ManagedTopicPositionCollectionInput`

A collection of relative positions of managed topics. This collection can include only `Featured` and `Navigational` topics and doesn't have to include all managed topics.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

Usage

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can reorder managed topics.

You can reorder parent managed topics or children managed topics with the same parent. If you don't include all managed topics in the `ConnectApi.ManagedTopicPositionCollectionInput`, the managed topics are reordered by respecting the positions indicated in the `ConnectApi.ManagedTopicPositionCollectionInput` and then by pushing down any managed topics that aren't included in the `ConnectApi.ManagedTopicPositionCollectionInput` to the next available position.

Example

If you have these managed topics:

Managed Topic	Position
ManagedTopicA	0
ManagedTopicB	1
ManagedTopicC	2
ManagedTopicD	3
ManagedTopicE	4

And you reorder managed topics by including this information in `ConnectApi.ManagedTopicPositionCollectionInput`:

Managed Topic	Position
ManagedTopicD	0
ManagedTopicE	2

The result is:

Managed Topic	Position
ManagedTopicD	0
ManagedTopicA	1
ManagedTopicE	2
ManagedTopicB	3
ManagedTopicC	4

Retired ManagedTopics Methods

These methods for `ManagedTopics` are retired.

IN THIS SECTION:

getManagedTopics(communityId, managedTopicType, recordId, depth)
Get managed topics of the specified type, including their parent and children managed topics, that are associated with a given topic in an Experience Cloud site.

getManagedTopics(communityId, managedTopicType, recordId, depth)

Get managed topics of the specified type, including their parent and children managed topics, that are associated with a given topic in an Experience Cloud site.

API Version

35.0–37.0

Important: In version 38.0 and later, use `getManagedTopics(communityId, managedTopicType, recordIds, depth)`.

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType, String recordId, Integer depth)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Type of managed topic.

- `Content`—Topics that are associated with native content.
- `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.

A topic can be associated with all three managed topic types, so a topic can be a `Featured`, `Navigational`, and `Content` topic.

recordId
Type: String

ID of the topic associated with the managed topics.

depth
Type: Integer

Specify an integer 1–8. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

MarketingIntegration Class

Get, save, and submit a microsites marketing integration form for an Experience Cloud site.

Namespace

ConnectApi

MarketingIntegration Methods

The following are methods for `MarketingIntegration`. All methods are static.

`MarketingIntegration` methods make calls to Marketing Cloud Engagement REST APIs to create, query, and insert data to the data extension object. If the API returns errors, ConnectinApex error messages include the error code and message from Marketing Cloud Engagement.

IN THIS SECTION:

getForm(siteId, formId)
Get a marketing integration form for an Experience Cloud site.

saveForm(siteId, formInput)
Save a marketing integration form for an Experience Cloud site.

submitForm(siteId, formId, formSubmissionInput)
Submit a marketing integration form for an Experience Cloud site.

`getForm(siteId, formId)`

Get a marketing integration form for an Experience Cloud site.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.Form getForm(String siteId, String formId)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

formId
Type: String

ID of the form.

Return Value

Type: ConnectApi.Form

saveForm(siteId, formInput)

Save a marketing integration form for an Experience Cloud site.

API Version

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.Form saveForm(String siteId, ConnectApi.FormInput formInput)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

formInput
Type: ConnectApi.FormInput

A ConnectApi.FormInput object to save.

Return Value

Type: ConnectApi.Form

Usage

This method attempts to create a read-only data extension in Marketing Cloud Engagement. A Marketing Cloud Engagement admin can change the read-only setting. We recommend keeping the data extension as read-only to maintain schema consistency with the form.

`submitForm(siteId, formId, formSubmissionInput)`

Submit a marketing integration form for an Experience Cloud site.

API Version

53.0

Available to Guest Users

53.0

Requires Chatter

No

Signature

```
public static ConnectApi.FormSubmission submitForm(String siteId, String formId,
ConnectApi.FormSubmissionInput formSubmissionInput)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

formId
Type: String

ID of the form.

formSubmissionInput
Type: `ConnectApi.FormSubmissionInput`

A `ConnectApi.FormSubmissionInput` object to submit.

Return Value

Type: `ConnectApi.FormSubmission`

Mentions Class

Access information about mentions. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.

Namespace

ConnectApi

Mentions Methods

These methods are for `Mentions`. All methods are static.

All methods in this class require Chatter and are subject to the per user, per namespace, per hour rate limit.

IN THIS SECTION:

getMentionCompletions(communityId, q, contextId)
Get the first page of possible users and groups to mention in a feed item body or comment body.

getMentionCompletions(communityId, q, contextId, type, pageParam, pageSize)
Get a page of possible mention proposals of the specified type.

getMentionValidations(communityId, parentId, recordIds, visibility)
Get information about whether the mentions are valid for the context user.

`getMentionCompletions(communityId, q, contextId)`

Get the first page of possible users and groups to mention in a feed item body or comment body.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.MentionCompletionPage getMentionCompletions (String communityId,
String q, String contextId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

contextId
Type: String

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

Return Value

Type: `ConnectApi.MentionCompletionPage`

Usage

Call this method to generate a page of proposed mentions that a user can choose from when they enter characters after @ in a feed item body or a comment body.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetMentionCompletions(communityId, q, contextId, result)

Apex Developer Guide: Testing ConnectApi Code

`getMentionCompletions(communityId, q, contextId, type, pageParam, pageSize)`

Get a page of possible mention proposals of the specified type.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Mentions getMentionCompletions (String communityId, String q,
String contextId, ConnectApi.MentionCompletionType type, Integer pageParam, Integer
pageSize)
```

Parameters

`communityId`

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`q`

Type: String

A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

`contextId`

Type: String

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

type
Type: `ConnectApi.MentionCompletionType`

Type of mention completion.

- `All`—All mention completions, regardless of the type of record to which the mention refers.
- `Group`—Mention completions for groups.
- `User`—Mention completions for users.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.MentionCompletionPage`

Usage

Call this method to generate a page of proposed mentions that a user can choose from when they enter characters after @ in a feed item body or a comment body.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetMentionCompletions(communityId, q, contextId, type, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

`getMentionValidations(communityId, parentId, recordIds, visibility)`

Get information about whether the mentions are valid for the context user.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Mentions getMentionValidations(String communityId, String
parentId, List<String> recordIds, ConnectApi.FeedItemVisibilityType visibility)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

parentId
Type: String

The feed item parent ID.

recordIds
Type: List<String>

A comma-separated list of IDs to be mentioned. The maximum value is 25.

visibility
Type: `ConnectApi.FeedItemVisibilityType`

Type of users who can see a feed item.

- `AllUsers`—Visibility is not limited to internal users.
- `InternalUsers`—Visibility is limited to internal users.

Return Value

Type: `ConnectApi.MentionValidations`

Usage

Call this method to check whether the record IDs returned from a call to `ConnectApi.Mentions.getMentionCompletions` are valid for the context user. For example, the context users can't mention private groups they don't belong to. If such a group were included in the list of mention validations, the `ConnectApi.MentionValidations.hasErrors` property would be `true` and the group would have a `ConnectApi.MentionValidation.valdiationStatus` of `Disallowed`.

Mentions Test Methods

These test methods are for `Mentions`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestGetMentionCompletions(communityId, q, contextId, result)`

Register a `ConnectApi.MentionCompletionPage` object to be returned when `getMentionCompletions(String, String, String)` is called in a test context.

API Version

29.0

Signature

```
public static Void setTestGetMentionCompletions (String communityId, String q, String contextId, ConnectApi.MentionCompletionPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

contextId
Type: String

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

result
Type: `ConnectApi.MentionCompletionPage`

A `ConnectApi.MentionCompletionPage` object containing test data.

Return Value

Type: Void

SEE ALSO:

getMentionCompletions(communityId, q, contextId)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetMentionCompletions(communityId, q, contextId, type, pageParam, pageSize, result)`

Register a `ConnectApi.MentionCompletionPage` object to be returned when `getMentionCompletions(String, String, String, ConnectApi.MentionCompletionType, Integer, Integer)` is called in a test context.

API Version

29.0

Signature

```
public static Void setTestGetMentionCompletions (String communityId, String q, String contextId, ConnectApi.MentionCompletionType type, Integer pageParam, Integer pageSize, ConnectApi.MentionCompletionPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

contextId
Type: String

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

type
Type: `ConnectApi.MentionCompletionType`

Type of mention completion.

- `All`—All mention completions, regardless of the type of record to which the mention refers.
- `Group`—Mention completions for groups.
- `User`—Mention completions for users.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.MentionCompletionPage`

A `ConnectApi.MentionCompletionPage` object containing test data.

Return Value

Type: Void

SEE ALSO:

getMentionCompletions(communityId, q, contextId, type, pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

Missions Class

Export and purge mission activity for users. Get a user's mission progress. Update mission activity counts for users.

Namespace

ConnectApi

Missions Methods

These methods are for `Missions`. All methods are static.

All methods in this class require Chatter and are subject to the per user, per namespace, per hour rate limit.

IN THIS SECTION:

exportUserMissionsActivities(communityId, userId)
Export mission activity for a user.

getUserMissionsProgress(communityId, userId)
Get mission activity progress for a user.

purgeUserMissionsActivities(communityId, userId)
Start a job to purge mission activity for a user.

purgeUserMissionsActivities(communityId)
Start a job to purge mission activity for all users.

updateUserMissionActivityCount(activityType, activityCount, communityId, userId)
Update the mission activity count for a user.

`exportUserMissionsActivities(communityId, userId)`

Export mission activity for a user.

API Version

45.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserMissionActivitiesJob exportUserMissionsActivities(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.UserMissionActivitiesJob`

Usage

You can export these activities with this method.

- `FeedItemAnswerAQuestion`—User answered a question.
- `FeedItemLikeSomething`—User liked a post or comment.
- `FeedItemMarkAnswerAsBest`—User marked an answer as the best answer.
- `FeedItemPostQuestion`—User posted a question.
- `FeedItemReceiveAComment`—User received a comment on a post.
- `FeedItemReceiveALike`—User received a like on a post or comment.
- `FeedItemReceiveAnAnswer`—User received an answer to a question.
- `FeedItemWriteAComment`—User commented on a post.
- `FeedItemWriteAPost`—User made a post.
- `FeedItemYourAnswerMarkedBest`—User's answer was marked as the best answer.

`getUserMissionsProgress(communityId, userId)`

Get mission activity progress for a user.

API Version

46.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserMissionActivityCollection getUserMissionsProgress(String communityId, String userId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID of the user.

Return Value

Type: `ConnectApi.UserMissionActivityCollection`

`purgeUserMissionsActivities(communityId, userId)`

Start a job to purge mission activity for a user.

API Version

45.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserMissionActivitiesJob purgeUserMissionsActivities(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.UserMissionActivitiesJob`

Usage

This method purges these activities.

- `FeedItemAnswerAQuestion`—User answered a question.
- `FeedItemLikeSomething`—User liked a post or comment.
- `FeedItemMarkAnswerAsBest`—User marked an answer as the best answer.
- `FeedItemPostQuestion`—User posted a question.
- `FeedItemReceiveAComment`—User received a comment on a post.
- `FeedItemReceiveALike`—User received a like on a post or comment.
- `FeedItemReceiveAnAnswer`—User received an answer to a question.
- `FeedItemWriteAComment`—User commented on a post.
- `FeedItemWriteAPost`—User made a post.
- `FeedItemYourAnswerMarkedBest`—User's answer was marked as the best answer.

`purgeUserMissionsActivities(communityId)`

Start a job to purge mission activity for all users.

API Version

49.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserMissionActivitiesJob purgeUserMissionsActivities(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.UserMissionActivitiesJob`

Usage

This method purges these activities.

- `FeedItemAnswerAQuestion`—User answered a question.
- `FeedItemLikeSomething`—User liked a post or comment.
- `FeedItemMarkAnswerAsBest`—User marked an answer as the best answer.
- `FeedItemPostQuestion`—User posted a question.
- `FeedItemReceiveAComment`—User received a comment on a post.
- `FeedItemReceiveALike`—User received a like on a post or comment.
- `FeedItemReceiveAnAnswer`—User received an answer to a question.
- `FeedItemWriteAComment`—User commented on a post.
- `FeedItemWriteAPost`—User made a post.
- `FeedItemYourAnswerMarkedBest`—User's answer was marked as the best answer.

`updateUserMissionActivityCount(activityType, activityCount, communityId, userId)`

Update the mission activity count for a user.

API Version

45.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserMissionActivityStatus
updateUserMissionActivityCount(ConnectApi.UserMissionActivityType activityType, Integer
activityCount, String communityId, String userId)
```

Parameters

activityType
Type: ConnectApi.UserMissionActivityType

Type of mission activity for a user. Values are:

- FeedItemAnswerAQuestion—User answered a question.
- FeedItemLikeSomething—User liked a post or comment.
- FeedItemMarkAnswerAsBest—User marked an answer as the best answer.
- FeedItemPostQuestion—User posted a question.
- FeedItemReceiveAComment—User received a comment on a post.
- FeedItemReceiveALike—User received a like on a post or comment.
- FeedItemReceiveAnAnswer—User received an answer to a question.
- FeedItemWriteAComment—User commented on a post.
- FeedItemWriteAPost—User made a post.
- FeedItemYourAnswerMarkedBest—User's answer was marked as the best answer.

activityCount
Type: Integer

Number of mission activities of the specified type for the user.

communityId
Type: String

ID for an Experience Cloud site, internal, or null.

userId
Type: String

ID of the user.

Return Value

Type: ConnectApi.UserMissionActivityStatus

NamedCredentials Class

Create, refresh, get, delete, replace, and update credentials. Create and get external credentials. Create and get named credentials. Create, get, delete, and update external auth identity providers. Get the URL for the OAuth token flow for an external credential.

Note: Managed packages can access only the named credentials and external credentials that are included in or created from the package's Apex code. If a managed package tries to access non-packaged named credentials and external credentials that a Salesforce admin created in the org, an error occurs.

Namespace

ConnectApi

NamedCredentials Methods

These methods are for `NamedCredentials`. All methods are static.

IN THIS SECTION:

createCredential(requestBody)
Create a credential.

createCredential(requestBody, action)
Refresh an OAuth or AWS Roles Anywhere credential.

createExternalAuthIdentityProvider(requestBody)
Create an external auth identity provider.

createExternalAuthIdentityProviderCredentials(fullName, requestBody)
Create external auth identity provider credentials.

createExternalCredential(requestBody)
Create an external credential.

createNamedCredential(requestBody)
Create a named credential.

deleteCredential(externalCredential, principalName, principalType)
Delete a credential.

deleteCredential(externalCredential, principalName, principalType, authenticationParameters)
Delete a credential with authentication parameters.

deleteExternalAuthIdentityProvider(fullName)
Delete an external auth identity provider.

getCredential(externalCredential, principalName, principalType)
Get a credential.

getExternalAuthIdentityProvider(fullName)
Get an external auth identity provider.

getExternalAuthIdentityProviderCredentials(fullName)
Get external auth identity provider credentials.

getExternalAuthIdentityProviders()
Get a list of external auth identity providers in the org.

getExternalCredential(developerName)
Get an external credential, including the named credentials and principals associated with it and the type and status of each principal.

getExternalCredentials()
Get external credentials that the user can authenticate to.

getNamedCredential(developerName)
Get a named credential.

getNamedCredentials()
Get a list of named credentials for the org.

getOAuthCredentialAuthUrl(requestBody)
Get the URL for the OAuth token flow for an external credential.

patchCredential(requestBody)
Update custom credentials.

updateCredential(requestBody)
Replace a credential.

updateExternalAuthIdentityProvider(fullName, requestBody)
Update an external auth identity provider.

updateExternalAuthIdentityProviderCredentials(fullName, requestBody)
Replace external auth identity provider credentials.

`createCredential(requestBody)`

Create a credential.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.Credential createCredential(ConnectApi.CredentialInput
requestBody)
```

Parameters

`requestBody`
Type: `ConnectApi.CredentialInput`

A `ConnectApi.CredentialInput` class.

Return Value

Type: `ConnectApi.Credential`

createCredential(requestBody, action)

Refresh an OAuth or AWS Roles Anywhere credential.

API Version

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.Credential createCredential(ConnectApi.CredentialInput
requestBody, ConnectApi.CreateCredentialAction action)
```

Parameters

requestBody
Type: ConnectApi.CredentialInput

A ConnectApi.CredentialInput class.

action
Type: ConnectApi.CreateCredentialAction

Action to take when creating the credential. Value is:

- Refresh

Return Value

Type: ConnectApi.Credential

createExternalAuthIdentityProvider(requestBody)

Create an external auth identity provider.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalAuthIdentityProvider
createExternalAuthIdentityProvider(ConnectApi.ExternalAuthIdentityProviderInput
requestBody)
```

Parameters

requestBody
Type: ConnectApi.ExternalAuthIdentityProviderInput on page 1858

A ConnectApi.ExternalAuthIdentityProviderInput input class.

Return Value

Type: ConnectApi.ExternalAuthIdentityProvider on page 2086

createExternalAuthIdentityProviderCredentials(fullName, requestBody)

Create external auth identity provider credentials.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalAuthIdentityProviderCredentials
createExternalAuthIdentityProviderCredentials(String fullName,
ConnectApi.ExternalAuthIdentityProviderCredentialsInput requestBody)
```

Parameters

fullName
Type: String

Full name of the external auth identity provider to create credentials for.

requestBody
Type: ConnectApi.ExternalAuthIdentityProviderCredentialsInput on page 1857

A ConnectApi.ExternalAuthIdentityProviderCredentialsInput input class

Return Value

Type: ConnectApi.ExternalAuthIdentityProviderCredentials on page 2088

createExternalCredential(requestBody)

Create an external credential.

API Version

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalCredential
createExternalCredential(ConnectApi.ExternalCredentialInput requestBody)
```

Parameters

requestBody
Type: ConnectApi.ExternalCredentialInput

Input used to create or update an external credential.

Return Value

Type: ConnectApi.ExternalCredential

createNamedCredential(requestBody)

Create a named credential.

API Version

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.NamedCredential
createNamedCredential(ConnectApi.NamedCredentialInput requestBody)
```

Parameters

requestBody
Type: ConnectApi.NamedCredentialInput

Input used to create or update a named credential.

Return Value

Type: ConnectApi.NamedCredential

deleteCredential(externalCredential, principalName, principalType)

Delete a credential.

This method deletes the user external credentials that store the encrypted access tokens used for named credential callouts, not the external credential itself. You can delete an external credential only in the UI or by using REST API.

API Version

56.0

Requires Chatter

No

Signature

```
public static Void deleteCredential(String externalCredential, String principalName,
ConnectApi.CredentialPrincipalType principalType)
```

Parameters

externalCredential
Type: String

Fully qualified developer name of the external credential.

principalName
Type: String

Name of the external credential named principal.

principalType
Type: `ConnectApi.CredentialPrincipalType`

Type of credential principal. Values are:

- `AwsStsPrincipal`
- `NamedPrincipal`
- `PerUserPrincipal`

Return Value

Type: Void

`deleteCredential(externalCredential, principalName, principalType, authenticationParameters)`

Delete a credential with authentication parameters.

This method deletes the user external credentials that store the encrypted access tokens used for named credential callouts, not the external credential itself. You can delete an external credential only in the UI or by using REST API.

API Version

59.0

Requires Chatter

No

Signature

```
public static Void deleteCredential(String externalCredential, String principalName,
ConnectApi.CredentialPrincipalType principalType, List<String> authenticationParameters)
```

Parameters

externalCredential
Type: String

Fully qualified developer name of the external credential.

principalName
Type: String

Name of the external credential named principal.

principalType
Type: ConnectApi.CredentialPrincipalType

Type of credential principal. Values are:

- `AwsStsPrincipal`
- `NamedPrincipal`
- `PerUserPrincipal`

authenticationParameters
Type: List<String>

List of authentication parameters only for custom protocols, for example `myApiKey,myApiSecret`. If unspecified, all credentials are deleted.

Return Value

Type: Void

deleteExternalAuthIdentityProvider(fullName)

Delete an external auth identity provider.

API Version

62.0

Requires Chatter

No

Signature

```
public static Void deleteExternalAuthIdentityProvider(String fullName)
```

Parameters

fullName
Type: String

Full name of the external auth identity provider to delete.

Return Value

Type: Void

getCredential(externalCredential, principalName, principalType)

Get a credential.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.Credential getCredential(String externalCredential, String
principalName, ConnectApi.CredentialPrincipalType principalType)
```

Parameters

externalCredential
Type: String

Fully qualified developer name of the external credential.

principalName
Type: String

Name of the external credential named principal.

principalType
Type: ConnectApi.CredentialPrincipalType

Type of credential principal. Values are:

- AwsStsPrincipal
- NamedPrincipal
- PerUserPrincipal

Return Value

Type: ConnectApi.Credential

getExternalAuthIdentityProvider(fullName)

Get an external auth identity provider.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalAuthIdentityProvider
getExternalAuthIdentityProvider(String fullName)
```

Parameters

fullName
Type: String

Full name of the external auth identity provider.

Return Value

Type: ConnectApi.ExternalAuthIdentityProvider on page 2086

getExternalAuthIdentityProviderCredentials(fullName)

Get external auth identity provider credentials.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalAuthIdentityProviderCredentials
getExternalAuthIdentityProviderCredentials(String fullName)
```

Parameters

fullName
Type: String

Full name of the external auth identity provider.

Return Value

Type: `ConnectApi.ExternalAuthIdentityProviderCredentials` on page 2088

`getExternalAuthIdentityProviders()`

Get a list of external auth identity providers in the org.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalAuthIdentityProviderList
getExternalAuthIdentityProviders()
```

Return Value

Type: `ConnectApi.ExternalAuthIdentityProviderList` on page 2088

`getExternalCredential(developerName)`

Get an external credential, including the named credentials and principals associated with it and the type and status of each principal.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalCredential getExternalCredential(String developerName)
```

Parameters

`developerName`
Type: String

Fully qualified developer name of the external credential.

Return Value

Type: `ConnectApi.ExternalCredential`

getExternalCredentials()

Get external credentials that the user can authenticate to.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalCredentialList getExternalCredentials()
```

Return Value

Type: ConnectApi.ExternalCredentialList

getNamedCredential(developerName)

Get a named credential.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.NamedCredential getNamedCredential(String developerName)
```

Parameters

developerName
Type: String

Fully qualified developer name of the named credential.

Return Value

Type: ConnectApi.NamedCredential

getNamedCredentials()

Get a list of named credentials for the org.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.NamedCredentialList getNamedCredentials()
```

Return Value

Type: ConnectApi.NamedCredentialList

getOAuthCredentialAuthUrl(requestBody)

Get the URL for the OAuth token flow for an external credential.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.OAuthCredentialAuthUrl
getOAuthCredentialAuthUrl(ConnectApi.OAuthCredentialAuthUrlInput requestBody)
```

Parameters

requestBody
Type: ConnectApi.OAuthCredentialAuthUrlInput

A `ConnectApi.OAuthCredentialAuthUrlInput` class indicating the OAuth authentication flow.

Return Value

Type: ConnectApi.OAuthCredentialAuthUrl

Usage

Accepts input parameters representing a specific external credential and, optionally, a named principal. Returns the URL a user must visit to begin the authentication flow, ultimately returning authentication tokens to Salesforce. Use this method as part of building a customized or branded user interface to help users initiate authentication.

Example

```
ConnectApi.OAuthCredentialAuthUrlInput input = new ConnectApi.OAuthCredentialAuthUrlInput();

input.externalCredential = 'MyExternalCredentialDeveloperName';
input.principalType = ConnectApi.CredentialPrincipalType.PerUserPrincipal;
input.principalName = 'MyPrincipal'; // Only required when principalType = NamedPrincipal

ConnectApi.OAuthCredentialAuthUrl output =
ConnectApi.NamedCredentials.getOAuthCredentialAuthUrl(input);

String authenticationUrl = output.authenticationUrl; // Redirect users to this URL to
authenticate in the browser
```

`patchCredential(requestBody)`

Update custom credentials.

This method updates custom credentials. To replace a credential, use `updateCredential(requestBody)`.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.Credential patchCredential(ConnectApi.CredentialInput
requestBody)
```

Parameters

requestBody
Type: `ConnectApi.CredentialInput`

A `ConnectApi.CredentialInput` class. Only the custom credentials in the input class are updated.

Return Value

Type: `ConnectApi.Credential`

`updateCredential(requestBody)`

Replace a credential.

This method uses the `ConnectApi.CredentialInput` and the `ConnectApi.CredentialValueInput` input classes to replace a credential's values. In the UI, these values appear as the credential's authentication parameters. To update a credential, use `patchCredential(requestBody)`.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.Credential updateCredential(ConnectApi.CredentialInput
requestBody)
```

Parameters

requestBody
Type: ConnectApi.CredentialInput

A ConnectApi.CredentialInput class.

Return Value

Type: ConnectApi.Credential

updateExternalAuthIdentityProvider(fullName, requestBody)

Update an external auth identity provider.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalAuthIdentityProvider
updateExternalAuthIdentityProvider(String fullName,
ConnectApi.ExternalAuthIdentityProviderInput requestBody)
```

Parameters

fullName
Type: String

Full name of the external auth identity provider to update.

requestBody
Type: ConnectApi.ExternalAuthIdentityProviderInput on page 1858

A ConnectApi.ExternalAuthIdentityProviderInput input class.

Return Value

Type: `ConnectApi.ExternalAuthIdentityProvider` on page 2086

`updateExternalAuthIdentityProviderCredentials(fullName, requestBody)`

Replace external auth identity provider credentials.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ExternalAuthIdentityProviderCredentials
updateExternalAuthIdentityProviderCredentials(String fullName,
ConnectApi.ExternalAuthIdentityProviderCredentialsInput requestBody)
```

Parameters

`fullName`
Type: String

The external auth identity provider credentials to replace.

`requestBody`
Type: `ConnectApi.ExternalAuthIdentityProviderCredentialsInput` on page 1857

A `ConnectApi.ExternalAuthIdentityProviderCredentialsInput` input class.

Return Value

Type: `ConnectApi.ExternalAuthIdentityProviderCredentials` on page 2088

NavigationMenu Class

Get navigation menu items for an Experience Cloud site.

Namespace

ConnectApi

NavigationMenu Methods

These methods are for `NavigationMenu`. All methods are static.

IN THIS SECTION:

getCommunityNavigationMenu(communityId, navigationLinkSetId, navigationLinkSetDeveloperName, publishStatus, includeImageUrl, addHomeMenuItem, menuItemTypesToSkip)

Get navigation menu items for an Experience Cloud site.

getCommunityNavigationMenu(communityId, navigationLinkSetId, navigationLinkSetDeveloperName, publishStatus, includeImageUrl, addHomeMenuItem, menuItemTypesToSkip, effectiveAccountId)

Get navigation menu items for an Experience Cloud based on an effective account.

getCommunityNavigationMenu(communityId, navigationLinkSetId, navigationLinkSetDeveloperName, publishStatus, includeImageUrl, addHomeMenuItem, menuItemTypesToSkip)

Get navigation menu items for an Experience Cloud site.

API Version

52.0

Available to Guest Users

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.NavigationMenuItemCollection getCommunityNavigationMenu(String communityId, String navigationLinkSetId, String navigationLinkSetDeveloperName, ConnectApi.PublishStatus publishStatus, Boolean includeImageUrl, Boolean addHomeMenuItem, List<ConnectApi.NavigationMenuItemType> menuItemTypesToSkip)
```

Parameters

communityId
Type: String

ID of an Experience Cloud site.

navigationLinkSetId
Type: String

ID of the navigation link set.

navigationLinkSetDeveloperName
Type: String

Developer name of the navigation link set.

publishStatus
Type: ConnectApi.PublishStatus

Publish status of the navigation menu item. Values are:

- `Draft`
- `Live`

`includeImageUrl`
Type: Boolean

Specifies whether to include the image URL with the menu item (`true`) or not (`false`).

`addHomeMenuItem`
Type: Boolean

Specifies whether to add the Home menu item (`true`) or not (`false`).

`menuItemTypesToSkip`
Type: List<`ConnectApi.NavigationMenuItemType`>

List of menu item types to filter out of the results. Values are:

- `DataSourceDriven`—Menu items dynamically added from a data source.
- `Event`—Event, such as logging in, logging out, or switching accounts.
- `ExternalLink`—URL outside of your site.
- `GlobalAction`—Lets users create records that aren't related to other records.
- `InternalLink`—Relative URL inside your site.
- `MenuLabel`—Menu label.
- `Modal`—Modal, such as Account Switcher.
- `NavigationalTopic`—Dropdown list with links to the navigational topics in your site.
- `SalesforceObject`—Objects such as accounts, cases, contacts, and custom objects.
- `SystemLink`—System link, such as a link to Builder, Workspaces, or Setup.

Return Value

Type: `ConnectApi.NavigationMenuItemCollection`

Usage

Supported navigation menu item types are:

- `DataSourceDriven`—Menu items dynamically added from a data source.
- `Event`—Event, such as logging in, logging out, or switching accounts.
- `ExternalLink`—URL outside of your site.
- `GlobalAction`—Lets users create records that aren't related to other records.
- `InternalLink`—Relative URL inside your site.
- `MenuLabel`—Menu label.
- `Modal`—Modal, such as Account Switcher.
- `NavigationalTopic`—Dropdown list with links to the navigational topics in your site.
- `SalesforceObject`—Objects such as accounts, cases, contacts, and custom objects.
- `SystemLink`—System link, such as a link to Builder, Workspaces, or Setup.

`getCommunityNavigationMenu(communityId, navigationLinkSetId, navigationLinkSetDeveloperName, publishStatus, includeImageUrl, addHomeMenuItem, menuItemTypesToSkip, effectiveAccountId)`

Get navigation menu items for an Experience Cloud based on an effective account.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.NavigationMenuItemCollection getCommunityNavigationMenu(String communityId, String navigationLinkSetId, String navigationLinkSetDeveloperName, ConnectApi.PublishStatus publishStatus, Boolean includeImageUrl, Boolean addHomeMenuItem, List<ConnectApi.NavigationMenuItemType> menuItemTypesToSkip, String effectiveAccountId)
```

Parameters

communityId
Type: String

ID of an Experience Cloud site.

navigationLinkSetId
Type: String

ID of the navigation link set.

navigationLinkSetDeveloperName
Type: String

Developer name of the navigation link set.

publishStatus
Type: `ConnectApi.PublishStatus`

Publish status of the navigation menu item. Values are:

- `Draft`
- `Live`

includeImageUrl
Type: Boolean

Specifies whether to include the image URL with the menu item (`true`) or not (`false`).

addHomeMenuItem
Type: Boolean

Specifies whether to add the Home menu item (`true`) or not (`false`).

`menuItemTypesToSkip`
Type: List<`ConnectApi.NavigationMenuItemType`>

List of menu item types to filter out of the results. Values are:

- `DataSourceDriven`—Menu items dynamically added from a data source.
- `Event`—Event, such as logging in, logging out, or switching accounts.
- `ExternalLink`—URL outside of your site.
- `GlobalAction`—Lets users create records that aren't related to other records.
- `InternalLink`—Relative URL inside your site.
- `MenuLabel`—Menu label.
- `Modal`—Modal, such as Account Switcher.
- `NavigationalTopic`—Dropdown list with links to the navigational topics in your site.
- `SalesforceObject`—Objects such as accounts, cases, contacts, and custom objects.
- `SystemLink`—System link, such as a link to Builder, Workspaces, or Setup.

`effectiveAccountId`
Type: String

ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user.

Return Value

Type: `ConnectApi.NavigationMenuItemCollection`

Usage

Supported navigation menu item types are:

- `DataSourceDriven`—Menu items dynamically added from a data source.
- `Event`—Event, such as logging in, logging out, or switching accounts.
- `ExternalLink`—URL outside of your site.
- `GlobalAction`—Lets users create records that aren't related to other records.
- `InternalLink`—Relative URL inside your site.
- `MenuLabel`—Menu label.
- `Modal`—Modal, such as Account Switcher.
- `NavigationalTopic`—Dropdown list with links to the navigational topics in your site.
- `SalesforceObject`—Objects such as accounts, cases, contacts, and custom objects.
- `SystemLink`—System link, such as a link to Builder, Workspaces, or Setup.

NextBestAction Class

Execute recommendation strategies, get recommendations, manage recommendation reactions.

Namespace

ConnectApi

Usage

Community users can't access this class. Portal and guest users can access strategies only through the Suggested Actions component.

NextBestAction Methods

These methods are for `NextBestAction`. All methods are static.

IN THIS SECTION:

deleteRecommendationReaction(reactionId)
Delete a recommendation reaction.

executeStrategy(strategyName, maxResults, contextRecordId)
Execute a strategy.

executeStrategy(strategyName, maxResults, contextRecordId, debugTrace)
Execute a strategy and request a trace.

executeStrategy(strategyName, strategyInput)
Execute a strategy using an input class.

getRecommendation(recommendationId)
Get a recommendation.

getRecommendationReaction(reactionId)
Get a recommendation reaction.

getRecommendationReactions(onBehalfOfId, createdById, targetId, contextRecordId, pageParam, pageSize)
Get recommendation reactions.

setRecommendationReaction(reaction)
Record user reactions to recommendations.

`deleteRecommendationReaction(reactionId)`

Delete a recommendation reaction.

API Version

45.0

Requires Chatter

No

Signature

```
public static Void deleteRecommendationReaction(String reactionId)
```

Parameters

`reactionId`
Type: String

ID of the recommendation reaction or other sObject that caused the user to react.

Return Value

Type: Void

Usage

Users with the Manage Next Best Action Recommendations or Modify All Data permission can delete recommendation reactions.

executeStrategy(strategyName, maxResults, contextRecordId)

Execute a strategy.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.NBARecommendations executeStrategy(String strategyName, Integer
maxResults, String contextRecordId)
```

Parameters

strategyName
Type: String

Name of the strategy.

maxResults
Type: Integer

Maximum number of results. Valid values are from 1 to 25. The default is 3.

contextRecordId
Type: String

ID of the context record. For example, if the next best action is on a case detail page, the ID of the case.

Return Value

Type: `ConnectApi.NBARecommendations`

executeStrategy(strategyName, maxResults, contextRecordId, debugTrace)

Execute a strategy and request a trace.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.NBARecommendations executeStrategy(String strategyName, Integer maxResults, String contextRecordId, Boolean debugTrace)
```

Parameters

strategyName
Type: String

Name of the strategy.

maxResults
Type: Integer

Maximum number of results. Valid values are from 1 to 25. The default is 3.

contextRecordId
Type: String

ID of the context record. For example, if the next best action is on a case detail page, the ID of the case.

debugTrace
Type: Boolean

Specifies whether to return trace and debug information in the response (`true`) or not (`false`).

Return Value

Type: `ConnectApi.NBARecommendations`

executeStrategy(strategyName, strategyInput)

Execute a strategy using an input class.

API Version

45.0

Available to Guest Users

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.NBARecommendations executeStrategy(String strategyName,
ConnectApi.NBAStrategyInput strategyInput)
```

Parameters

strategyName
Type: String

Name of the strategy.

strategyInput
Type: ConnectApi.NBAStrategyInput

A ConnectApi.NBAStrategyInput body.

Return Value

Type: ConnectApi.NBARecommendations

getRecommendation(recommendationId)

Get a recommendation.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.Recommendation getRecommendation(String recommendationId)
```

Parameters

recommendationId
Type: String

ID of the recommendation.

Return Value

Type: ConnectApi.Recommendation

getRecommendationReaction(reactionId)

Get a recommendation reaction.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationReaction getRecommendationReaction(String reactionId)
```

Parameters

reactionId
Type: String

ID of the recommendation reaction or other sObject that caused the user to react.

Return Value

Type: ConnectApi.RecommendationReaction

Usage

Users with the Manage Next Best Action Recommendations or Modify All Data permission can get recommendation reactions.

getRecommendationReactions(onBehalfOfId, createdById, targetId, contextRecordId, pageParam, pageSize)

Get recommendation reactions.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationReactions getRecommendationReactions(String onBehalfOfId, String createdById, String targetId, String contextRecordId, Integer pageParam, Integer pageSize)
```

Parameters

onBehalfOfId
Type: String

Use the ID of the user who is indirectly reacting to the recommendation to filter the results.

createdById
Type: String

Use the ID of the user or record that created the recommendation reaction to filter the results.

targetId
Type: String

Use the ID of the target to filter the results.

contextRecordId
Type: String

Use the ID of a context record to filter the results.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.RecommendationReactions`

Usage

Users with the Manage Next Best Action Recommendations or Modify All Data permission can get recommendation reactions.

`setRecommendationReaction(reaction)`

Record user reactions to recommendations.

API Version

45.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationReaction
setRecommendationReaction(ConnectApi.RecommendationReactionInput reaction)
```

Parameters

reaction
Type: ConnectApi.RecommendationReactionInput

A ConnectApi.RecommendationReactionInput object representing a reaction to a recommendation produced by a recommendation strategy.

Return Value

Type: ConnectApi.RecommendationReaction

OmnichannelInventoryService Class

Route orders to inventory locations in Order Management.

Namespace

ConnectApi

OmnichannelInventoryService Methods

These methods are for OmnichannelInventoryService. All methods are static.

IN THIS SECTION:

createReservation(createReservationInputRepresentation)
Create an inventory reservation in Omnichannel Inventory.

fulfillReservation(fulfillReservationInputRepresentation)
Fulfill one or more inventory reservations.

getInventoryAvailability(inventoryAvailabilityInputRepresentation)
Retrieve inventory availability data for one or more products at one or more inventory locations or location groups.

getInventoryAvailabilityUploadStatus(uploadId)
Retrieve the status of an inventory availability upload job.

getPublishLocationStructureStatus(uploadId)
Retrieve the status of a publish location structure job.

publishLocationStructure()

Asynchronously publish information about your inventory locations and location groups to Omnichannel Inventory. The publish includes records whose IsEnabled and ShouldSyncWithOci fields are both `true`. This method returns an ID that you can use to retrieve the status of the publish job.

releaseReservation(releaseReservationInputRepresentation)

Release one or more existing inventory reservations to free up that inventory.

submitInventoryAvailabilityUpload(fileUpload)

Upload an inventory availability data file to Omnichannel Inventory.

transferReservation(transferReservationInputRepresentation)

Transfer one or more inventory reservations between locations or location groups. This API doesn't change physical quantities, but reduces the reserved quantity at the source and increases it at the destination.

updateReservation(updateReservationInputRepresentation)

Updates an existing reservation in Omnichannel Inventory. Add, remove, and update quantities for existing SKUs in the reservation.

createReservation(createReservationInputRepresentation)

Create an inventory reservation in Omnichannel Inventory.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCICreateReservationOutputRepresentation
createReservation(ConnectApi.OCICreateReservationInputRepresentation
createReservationInputRepresentation)
```

Parameters

createReservationInputRepresentation

Type: ConnectApi.OCICreateReservationInputRepresentation

Data to reserve inventory at one or more Omnichannel Inventory locations or location groups.

Return Value

Type: ConnectApi.OCICreateReservationOutputRepresentation

fulfillReservation(fulfillReservationInputRepresentation)

Fulfill one or more inventory reservations.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIFulfillReservationOutputRepresentation
fulfillReservation(ConnectApi.OCIFulfillReservationInputRepresentation
fulfillReservationInputRepresentation)
```

Parameters

fulfillReservationInputRepresentation
Type: ConnectApi.OCIFulfillReservationInputRepresentation

Wraps a list of inventory reservations to fulfill.

Return Value

Type: ConnectApi.OCIFulfillReservationOutputRepresentation

getInventoryAvailability(inventoryAvailabilityInputRepresentation)

Retrieve inventory availability data for one or more products at one or more inventory locations or location groups.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIGetInventoryAvailabilityOutputRepresentation
getInventoryAvailability(ConnectApi.OCIGetInventoryAvailabilityInputRepresentation
inventoryAvailabilityInputRepresentation)
```

Parameters

inventoryAvailabilityInputRepresentation
Type: ConnectApi.OCIGetInventoryAvailabilityInputRepresentation

Details of a request to retrieve inventory availability.

Return Value

Type: ConnectApi.OCIGetInventoryAvailabilityOutputRepresentation

getInventoryAvailabilityUploadStatus(uploadId)

Retrieve the status of an inventory availability upload job.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIUploadInventoryAvailabilityStatusOutputRepresentation
getInventoryAvailabilityUploadStatus(String uploadId)
```

Parameters

uploadId
Type: String

The upload ID of the upload job.

Return Value

Type: ConnectApi.OCIUploadInventoryAvailabilityStatusOutputRepresentation

getPublishLocationStructureStatus(uploadId)

Retrieve the status of a publish location structure job.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIPublishLocationStructureStatusOutputRepresentation
getPublishLocationStructureStatus(String uploadId)
```

Parameters

uploadId
Type: String

The upload ID of the publish job.

Return Value

Type: ConnectApi.OCIPublishLocationStructureStatusOutputRepresentation

publishLocationStructure()

Asynchronously publish information about your inventory locations and location groups to Omnichannel Inventory. The publish includes records whose IsEnabled and ShouldSyncWithOci fields are both *true*. This method returns an ID that you can use to retrieve the status of the publish job.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIPublishLocationStructureOutputRepresentation
publishLocationStructure()
```

Return Value

Type: ConnectApi.OCIPublishLocationStructureOutputRepresentation

releaseReservation(releaseReservationInputRepresentation)

Release one or more existing inventory reservations to free up that inventory.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIReleaseReservationOutputRepresentation
releaseReservation(ConnectApi.OCIReleaseReservationInputRepresentation
releaseReservationInputRepresentation)
```

Parameters

releaseReservationInputRepresentation
Type: ConnectApi.OCIReleaseReservationInputRepresentation

Details of one or more inventory reservations to release.

Return Value

Type: `ConnectApi.OCIReleaseReservationOutputRepresentation`

`submitInventoryAvailabilityUpload(fileUpload)`

Upload an inventory availability data file to Omnichannel Inventory.

API Version

51.0 (NDJSON), 63.0 (CSV)

Requires Chatter

No

Signature

```
public static ConnectApi.OCIUploadInventoryAvailabilityOutputRepresentation
submitInventoryAvailabilityUpload(ConnectApi.BinaryInput fileUpload)
```

Parameters

`fileUpload`
Type: `ConnectApi.BinaryInput`

NDJSON or CSV file containing inventory availability data.

Return Value

Type: `ConnectApi.OCIUploadInventoryAvailabilityOutputRepresentation`

Usage

To create an inventory data file, format the data as a series of NDJSON or CSV entries that represent locations and individual inventory records.

Inventory Import Data Considerations:

- Separate the top-level entries with line feeds, not commas. Each entry must be on a single line.
- When the system reads a location entry, it assigns the subsequent inventory entries to that location until it reads another location entry.
- Legacy NDJSON requires that you specify a header record for each location entry (`{"location":"wickenburg","mode":"UPDATE"}`). The header isn't required for a high-performance NDJSON layout or CSV file.
- Each inventory record entry requires a unique recordId. Best practice is to use a UUID. The recordId protects against importing duplicate data. The recordId is provided in NDJSON and automatically generated for CSV.
- Each inventory record entry requires an effectiveDate.
- If provided, each futures entry requires a nonzero quantity and a future expectedDate.

Note: The file must be in NDJSON or CSV format. For larger collections, use the Commerce API or split the data into multiple files. The Commerce API accepts GZIP, NDJSON, or CSV files up to 100 MB.

This example illustrates the data format:

Note: For readability, this example shows the first few entries on multiple lines. In the import file, each location and inventory record entry must be on a single line.

```
{
  "location":"Warehouse-A",  // location identifier
  "mode":"UPDATE"  // must be UPDATE (other operations might be available in future releases)
}
{
  "recordId":"0a87539d-f3dd-47bc-91c7-9c752e39dbe0",  // unique identifier for the inventory
 record
  "onHand":10,
  "sku":"12389156",
  "effectiveDate":"2020-12-08T14:05:22.790896-07:00",
  "futures":[  // list of future restocks
    {
    "quantity":1,
    "expectedDate":"2021-04-18T14:05:22.781-07:00"
    },
    {
    "quantity":5,
    "expectedDate":"2021-05-18T14:05:22.781-07:00"
    }
  ],
  "safetyStockCount":0
}
{
  "recordId":"0a87539d-f3dd-47bc-91c7-9c752e312345",
  "onHand":10,
  "sku":"9485728",
  "effectiveDate":"2020-12-08T14:05:22.790896-07:00",
  "futures":[
    {
    "quantity":10,
    "expectedDate":"2021-04-18T14:05:22.781-07:00"
    }
  ],
  "safetyStockCount":0
}
{"location":"Warehouse-B","mode":"UPDATE"}
{"recordId":"0a87539d-f3dd-47bc-91c7-9c752e312a8","onHand":10,"sku":"12389156","effectiveDate":"2020-12-08T14:05:22.790896-07:00","futures":[{"quantity":1,"expectedDate":"2021-04-18T14:05:22.781-07:00"}],"safetyStockCount":0}
{"recordId":"0a87539d-f3dd-47bc-91c7-9c752e39dbe5","onHand":10,"sku":"98621","effectiveDate":"2020-12-08T14:05:22.790896-07:00","futures":[{"quantity":5,"expectedDate":"2021-04-18T14:05:22.781-07:00"}],"safetyStockCount":0}
```

`transferReservation(transferReservationInputRepresentation)`

Transfer one or more inventory reservations between locations or location groups. This API doesn't change physical quantities, but reduces the reserved quantity at the source and increases it at the destination.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCITransferReservationOutputRepresentation
transferReservation(ConnectApi.OCITransferReservationInputRepresentation
transferReservationInputRepresentation)
```

Parameters

transferReservationInputRepresentation
Type: ConnectApi.OCITransferReservationInputRepresentation

Wraps a list of inventory reservation transfers and specifies whether a single failure cancels the entire list.

Return Value

Type: ConnectApi.OCITransferReservationOutputRepresentation

updateReservation(updateReservationInputRepresentation)

Updates an existing reservation in Omnichannel Inventory. Add, remove, and update quantities for existing SKUs in the reservation.

API Version

61.0

Requires Chatter

No

Signature

```
public static ConnectApi.OCIUpdateReservationOutputRepresentation
updateReservation(ConnectApi.OCIUpdateReservationInputRepresentation
updateReservationInputRepresentation)
```

Parameters

updateReservationInputRepresentation
Type: ConnectApi.OCIUpdateReservationInputRepresentation on page 1901

Data to update one or more Omnichannel Inventory item reservations.

Return Value

Type: ConnectApi.OCIUpdateReservationOutputRepresentation on page 2202

OMSAnalytics Class

Get products with return rates, get text classified into different classifications using text analysis, and capture the return reasons from external sources based on the product ids.

Namespace

ConnectApi

IN THIS SECTION:

OMSAnalytics Class
These methods are for `OMSAnalytics`. All methods are static.

OMSAnalytics Class

These methods are for `OMSAnalytics`. All methods are static.

Namespace

ConnectApi

IN THIS SECTION:

getTextClassificationsBulkResults(ids)
Gets text classification results for request IDs.

productsExpand(scope, products, expand)
Fetches expanded details of a product that aren't found in the sObject. The expanded variable fields, such as return reasons, are added as output. This method supports an extensibility framework that lets the context user override the existing implementation so they can fetch the data from third-party apps. The application doesn't require two separate APIs to get return reasons.

productsReturnRate(pageParam, pageSize)
Gets pages of data showing the return rates of products that are calculated by the Customer Data Platform. Return data is paginated in descending order.

productsReturnRate(pageParam, pageSize)
Get a page of products and their return rates.

productsReturnRate(pageParam, pageSize, products)
Get a page of products and their return rates for a list of product IDs.

submitTextClassificationsRequest(textClassificationsRequestInput, llmType)
Submits a text classification request to Einstein

`getTextClassificationsBulkResults(ids)`

Gets text classification results for request IDs.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.TextClassificationsBulkResultsOutputRepresentation
getTextClassificationsBulkResults(List<String> ids)
```

Parameters

ids
Type: List(String)

List of request IDs.

Return Value

Type: ConnectApi.TextClassificationsBulkResultsOutputRepresentation

Example

```
List <String> requestIds = new List <String> ();
        requestIds.add(requestId);
        ConnectApi.TextClassificationsBulkResultsOutputRepresentation output =
ConnectApi.OMSAnalytics.getTextClassificationsBulkResults(requestIds);
```

productsExpand(scope, products, expand)

Fetches expanded details of a product that aren't found in the sObject. The expanded variable fields, such as return reasons, are added as output. This method supports an extensibility framework that lets the context user override the existing implementation so they can fetch the data from third-party apps. The application doesn't require two separate APIs to get return reasons.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductsListOutputRepresentation productsExpand(String scope,
List<String> products, List<ConnectApi.ProductExpandType> expand)
```

Parameters

scope
Type: String

The scope for the extensibility framework. Requires a web store ID.

products
Type: List)String)

A list of IDs to fetch details for.

expand
Type: List)String)

Output representation for expand feature.

Return Value

Type: `ConnectApi.ProductsListOutputRepresentation`

Example

```
String scope = 'webstoreId eq ' + ws.Id;
        ConnectApi.ProductsListOutputRepresentation output =
ConnectApi.OMSAnalytics.productsExpand(scope, productIds, new List
<ConnectApi.ProductExpandType> {
        ConnectApi.ProductExpandType.ReturnReasons
        });
```

productsReturnRate(pageParam, pageSize)

Gets pages of data showing the return rates of products that are calculated by the Customer Data Platform. Return data is paginated in descending order.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductReturnRateListOutputRepresentation
productsReturnRate(Integer pageParam, Integer pageSize)
```

Parameters

page
Type: String

The page number for the list of products. Starts at 0.

products
Type: List)String)

A list of IDs to fetch details for.

pageSize
Type: List)Integer)

The number of products that are returned on each page.

Return Value

Type: ConnectApi.ProductReturnRateListOutputRepresentation

Example

```
ConnectApi.ProductReturnRateListOutputRepresentation output =
ConnectApi.OMSAnalytics.productsReturnRate(page, pageSize);
```

productsReturnRate(pageParam, pageSize)

Get a page of products and their return rates.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductReturnRateListOutputRepresentation
productsReturnRate(Integer pageParam, Integer pageSize)
```

Parameters

pageParam
Type: Integer

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ProductReturnRateListOutputRepresentation`

productsReturnRate(pageParam, pageSize, products)

Get a page of products and their return rates for a list of product IDs.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductReturnRateListOutputRepresentation
productsReturnRate(Integer pageParam, Integer pageSize, List<String> products)
```

Parameters

pageParam
Type: Integer

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

products
Type: List<String>

List of product IDs.

Return Value

Type: `ConnectApi.ProductReturnRateListOutputRepresentation`

`submitTextClassificationsRequest(textClassificationsRequestInput, llmType)`

Submits a text classification request to Einstein

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.TextClassificationsOutputRepresentation
submitTextClassificationsRequest(ConnectApi.TextClassificationsInputRepresentation
textClassificationsRequestInput, String llmType)
```

Parameters

textClassificationsRequestInput
Type: ConnectApi.TextClassificationsInputRepresentation

Text classification containing a list of text strings and classifiers. Each text string is classified into classifiers based on analysis.

llmType
Type: List)String)

The large language model that's used for analysis. Supports Open AI only.

Return Value

Type: ConnectApi.TextClassificationsOutputRepresentation

Example

```
ConnectApi.TextClassificationsInputRepresentation textClassificationsInputRepresentation
= new ConnectApi.TextClassificationsInputRepresentation();
textClassificationsInputRepresentation.textList = textList;
textClassificationsInputRepresentation.classifiers = classifiers;
List < String > requestIds = new List < String > ();
```

Orchestration Class

Get orchestration instances.

Namespace

ConnectApi

Orchestration Methods

These methods are for `Orchestration`. All methods are static.

IN THIS SECTION:

getOrchestrationInstance(instanceId)
Get an orchestration instance associated with an orchestration instance ID.

getOrchestrationInstanceCollection(relatedRecordId)
Get orchestration instances associated with a Salesforce record that's configured as a context record for orchestration interactive steps.

`getOrchestrationInstance(instanceId)`

Get an orchestration instance associated with an orchestration instance ID.

API Version

63.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrchestrationInstance getOrchestrationInstance(String
instanceId)
```

Parameters

instanceId
Type: String

The ID of orchestration instance to get details for.

Return Value

Type: ConnectApi.OrchestrationInstance

getOrchestrationInstanceCollection(relatedRecordId)

Get orchestration instances associated with a Salesforce record that's configured as a context record for orchestration interactive steps.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrchestrationInstanceCollection
getOrchestrationInstanceCollection(String relatedRecordId)
```

Parameters

relatedRecordId
Type: String

The ID of a record configured as a context record for orchestration interactive steps.

Return Value

Type: ConnectApi.OrchestrationInstanceCollection

OrderPaymentSummary Class

Work with payments in Order Management.

Namespace

ConnectApi

OrderPaymentSummary Methods

These methods are for `OrderPaymentSummary`. All methods are static.

IN THIS SECTION:

createOrderPaymentSummary(orderPaymentSummaryInput)
Create an OrderPaymentSummary for an OrderSummary. Specify a payment authorization or payments that share the same payment method. In an org with the multicurrency feature enabled, the OrderPaymentSummary inherits the CurrencyIsoCode value from the OrderSummary.

createOrderPaymentSummary(orderPaymentSummaryInput)

Create an OrderPaymentSummary for an OrderSummary. Specify a payment authorization or payments that share the same payment method. In an org with the multicurrency feature enabled, the OrderPaymentSummary inherits the CurrencyIsoCode value from the OrderSummary.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.CreateOrderPaymentSummaryOutputRepresentation
createOrderPaymentSummary(ConnectApi.CreateOrderPaymentSummaryInputRepresentation
orderPaymentSummaryInput)
```

Parameters

orderPaymentSummaryInput
Type: `ConnectApi.CreateOrderPaymentSummaryInputRepresentation`

The OrderSummary and payment authorization or payments.

Return Value

Type: `ConnectApi.CreateOrderPaymentSummaryOutputRepresentation`

Example

```
String orderSummaryId = '1Osxx0000004CCG';
String paymentId1 = '0a3xx0000000085AAA';
String paymentId2 = '0a3xx0000000085BBB';

ConnectApi.CreateOrderPaymentSummaryInputRepresentation orderPaymentSummaryInput = new
ConnectApi.CreateOrderPaymentSummaryInputRepresentation();
orderPaymentSummaryInput.orderSummaryId = orderSummaryId;
List<String> paymentList = new List<String>();
```

```
paymentList.add(paymentId1);
paymentList.add(paymentId2);
orderPaymentSummaryInput.paymentIds = paymentList;

ConnectApi.CreateOrderPaymentSummaryOutputRepresentation result =
ConnectAPI.OrderPaymentSummary.createOrderPaymentSummary(orderPaymentSummaryInput);
```

OrderSummary Class

Work with orders in Order Management.

Namespace

ConnectApi

OrderSummary Methods

These methods are for `OrderSummary`. All methods are static.

IN THIS SECTION:

adjustPreview(orderSummaryId, adjustInput)

Retrieve the expected results of adjusting the price of one or more OrderItemSummaries from an OrderSummary, without actually executing the adjustment. The response data contains the financial changes that would result from submitting the proposed adjustment.

adjustSubmit(orderSummaryId, adjustInput)

Adjust the price of one or more OrderItemSummaries from an OrderSummary, and create corresponding change orders.

createCreditMemo(orderSummaryId, creditMemoInput)

Create a credit memo to represent the refund for one or more change orders associated with an OrderSummary.

createMultipleInvoices(invoicesInput)

Create Invoices to represent the charges for one or more change orders. Create Invoices for change orders that increase order amounts, such as for return fees. When you ensure the refund for a return, include the invoices for any associated return fees in the request.

ensureFundsAsync(orderSummaryId, ensureFundsInput)

Ensure funds for an Invoice and apply them to it. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

Ensure refunds for a CreditMemo or excess funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and don't affect the background operation status.

multipleEnsureFundsAsync(multipleEnsureFundsInput)

Ensure and apply funds for one or more Invoices. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

previewCancel(orderSummaryId, changeInput)

Retrieve the expected change order values for canceling one or more OrderItemSummaries from an OrderSummary, without actually executing the cancel.

previewReturn(orderSummaryId, changeInput)

Retrieve the expected change order values for a simple return of one or more OrderItemSummaries from an OrderSummary, without actually executing the return.

submitCancel(orderSummaryId, changeInput)

Cancel one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order.

submitReturn(orderSummaryId, changeInput)

Return one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order. This return is a simple return that creates a change order but not a ReturnOrder.

`adjustPreview(orderSummaryId, adjustInput)`

Retrieve the expected results of adjusting the price of one or more OrderItemSummaries from an OrderSummary, without actually executing the adjustment. The response data contains the financial changes that would result from submitting the proposed adjustment.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.AdjustOrderSummaryOutputRepresentation adjustPreview(String
orderSummaryId, ConnectApi.AdjustOrderItemSummaryInputRepresentation adjustInput)
```

Parameters

orderSummaryId

Type: String

ID of the OrderSummary.

adjustInput

Type: `ConnectApi.AdjustOrderItemSummaryInputRepresentation`

Price adjustments to order item summaries that together make up a price adjustment to an order, with options for adjusting items in the process of being fulfilled.

Return Value

Type: `ConnectApi.AdjustOrderSummaryOutputRepresentation`

Usage

When a price adjustment is applied to an OrderItemSummary, its quantities are considered in three groups:

Pre-fulfillment
QuantityAvailableToFulfill, which is equal to QuantityOrdered - QuantityCanceled - QuantityAllocated

In-fulfillment
QuantityAllocated - QuantityFulfilled

Post-fulfillment
QuantityAvailableToReturn, which is equal to QuantityFulfilled - QuantityReturnInitiated

You can apply adjustments to these groups in three different ways, controlled by the `allocatedItemsChangeOrderType` input property:

- Distribute the adjustment evenly between pre-fulfillment and post-fulfillment quantities. Ignore in-fulfillment quantities. Submitting the adjustment would create one change order for the adjustments to pre-fulfillment quantities and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Submitting the adjustment would create one change order for the adjustments to both pre-fulfillment and in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Submitting the adjustment would create one change order for the adjustments to pre-fulfillment quantities, one change order for the adjustments to in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

adjustSubmit(orderSummaryId, adjustInput)

`adjustSubmit(orderSummaryId, adjustInput)`

Adjust the price of one or more OrderItemSummaries from an OrderSummary, and create corresponding change orders.

API Version

49.0

Requires Chatter

No

Signature

```
public static ConnectApi.AdjustOrderSummaryOutputRepresentation adjustSubmit(String
orderSummaryId, ConnectApi.AdjustOrderItemSummaryInputRepresentation adjustInput)
```

Parameters

`orderSummaryId`
Type: String

ID of the OrderSummary.

adjustInput
Type: ConnectApi.AdjustOrderItemSummaryInputRepresentation

Price adjustments to order item summaries that together make up a price adjustment to an order, with options for adjusting items in the process of being fulfilled.

Return Value

Type: ConnectApi.AdjustOrderSummaryOutputRepresentation

Usage

When a price adjustment is applied to an OrderItemSummary, its quantities are considered in three groups:

Pre-fulfillment
QuantityAvailableToFulfill, which is equal to QuantityOrdered - QuantityCanceled - QuantityAllocated

In-fulfillment
QuantityAllocated - QuantityFulfilled

Post-fulfillment
QuantityAvailableToReturn, which is equal to QuantityFulfilled - QuantityReturnInitiated

You can apply adjustments to these groups in three different ways, controlled by the *allocatedItemsChangeOrderType* input property:

- Distribute the adjustment evenly between pre-fulfillment and post-fulfillment quantities. Ignore in-fulfillment quantities. Create one change order for the adjustments to pre-fulfillment quantities and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Create one change order for the adjustments to both pre-fulfillment and in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Create one change order for the adjustments to pre-fulfillment quantities, one change order for the adjustments to in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.

After submitting a price adjustment, process refunds as appropriate:

- If the discount only applied to OrderItemSummaries for which payment hasn't been captured, it doesn't require a refund. This situation normally applies to OrderItemSummaries in the US that haven't been fulfilled.
- If the discount applied to OrderItemSummaries that haven't been fulfilled and for which payment has been captured, process a refund. In this case, pass the *totalExcessFundsAmount* from the output representation to the ensureRefundsAsync() method.
- If the discount applied to OrderItemSummaries that have been fulfilled, process a refund. Pass the *postFulfillmentChangeOrderId* from the output representation to the createCreditMemo() method, then pass the CreditMemo to the ensureRefundsAsync() method.
- If the discount applied to both fulfilled and unfulfilled OrderItemSummaries for which payment has been captured, process both refunds. Pass the *postFulfillmentChangeOrderId* from the output representation to the createCreditMemo()

method, then pass the credit memo and the *totalExcessFundsAmount* from the output representation to the `ensureRefundsAsync()` method.

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

adjustPreview(orderSummaryId, adjustInput)

createCreditMemo(orderSummaryId, creditMemoInput)

Create a credit memo to represent the refund for one or more change orders associated with an OrderSummary.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.CreateCreditMemoOutputRepresentation createCreditMemo(String
orderSummaryId, ConnectApi.CreateCreditMemoInputRepresentation creditMemoInput)
```

Parameters

orderSummaryId
Type: String

ID of the OrderSummary.

creditMemoInput
Type: `ConnectApi.CreateCreditMemoInputRepresentation`

The list of change order IDs.

Return Value

Type: `ConnectApi.CreateCreditMemoOutputRepresentation`

createMultipleInvoices(invoicesInput)

Create Invoices to represent the charges for one or more change orders. Create Invoices for change orders that increase order amounts, such as for return fees. When you ensure the refund for a return, include the invoices for any associated return fees in the request.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.CreateMultipleInvoicesFromChangeOrdersOutputRepresentation
createMultipleInvoices(ConnectApi.CreateMultipleInvoicesFromChangeOrdersInputRepresentation
invoicesInput)
```

Parameters

invoicesInput
Type: ConnectApi.CreateMultipleInvoicesFromChangeOrdersInputRepresentation

Data about the change orders to create Invoices for.

Return Value

Type: ConnectApi.CreateMultipleInvoicesFromChangeOrdersOutputRepresentation

SEE ALSO:

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

createReturnOrder(returnOrderInput)

returnItems(returnOrderId, returnItemsInput)

ensureFundsAsync(orderSummaryId, ensureFundsInput)

Ensure funds for an Invoice and apply them to it. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.EnsureFundsAsyncOutputRepresentation ensureFundsAsync(String
orderSummaryId, ConnectApi.EnsureFundsAsyncInputRepresentation ensureFundsInput)
```

Parameters

isConsiderReservedBalanceAmount
Type: Boolean

If true, the reserved balance amount is used for the Order Summary to fund the invoice. If not enough reserved balance amount, any available balance that isn't reserved by another Order Summary is used. If false, any available balance is used.

orderSummaryId
Type: String

ID of the OrderSummary.

ensureFundsInput
Type: `ConnectApi.EnsureFundsAsyncInputRepresentation`

The ID of the Invoice.

Return Value

Type: `ConnectApi.EnsureFundsAsyncOutputRepresentation`

Usage

This method checks the OrderPaymentSummaries associated with the specified OrderSummary for funds to apply to the Invoice balance following this logic:

Note: If multiple OrderPaymentSummaries have equal `BalanceAmount` values, their order of selection is random.

1. Verify that the Invoice balance doesn't exceed the total `BalanceAmount` of all the OrderPaymentSummaries associated with the OrderSummary.
2. If an OrderPaymentSummary has a `BalanceAmount` equal to the Invoice balance, apply the funds from that OrderPaymentSummary.
3. If no exact match was found, apply funds from the OrderPaymentSummary with the largest `BalanceAmount`.
4. If the Invoice still has a balance to ensure, repeat steps 2 and 3 until the full balance is ensured or no captured funds remain.
5. If the Invoice still has a balance, look for an OrderPaymentSummary with an authorized amount equal to the remaining Invoice balance. If one exists, capture and apply the funds from that OrderPaymentSummary.
6. If no exact match was found, capture and apply funds from the OrderPaymentSummary with the largest authorized amount.
7. If the Invoice still has a balance to ensure, repeat steps 5 and 6 until the full balance is ensured.

Note: If the method creates a payment, the payment record's ClientContext value isn't predictable. Don't use it in custom logic.

SEE ALSO:

multipleEnsureFundsAsync(multipleEnsureFundsInput)

`ensureRefundsAsync(orderSummaryId, ensureRefundsInput)`

Ensure refunds for a CreditMemo or excess funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and don't affect the background operation status.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.EnsureRefundsAsyncOutputRepresentation ensureRefundsAsync(String orderSummaryId, ConnectApi.EnsureRefundsAsyncInputRepresentation ensureRefundsInput)
```

Parameters

isConsiderReservedBalanceAmount
Type: Boolean

If true, the refundable amount is used to open the payment balance for the reservedBalanceAmount in the Order Payment Summaries. The remaining refundable amount considers the sequence of order payment summaries, if provided. If false, any reserved balance amount for exchanges is refunded.

orderSummaryId
Type: String

ID of the OrderSummary.

ensureRefundsInput
Type: `ConnectApi.EnsureRefundsAsyncInputRepresentation`

ID of a credit memo to ensure refunds for, an amount of excess funds to refund, or both. At least one is required. Also includes any invoices for fees that reduce the refund amount, such as return fees. If multiple payment methods are available, you can specify how to distribute the refund.

Return Value

Type: `ConnectApi.EnsureRefundsAsyncOutputRepresentation`

Usage

This method applies the refund to the OrderPaymentSummaries associated with the specified OrderSummary following this logic.

Note: If multiple OrderPaymentSummaries have equal `AvailableToRefund` amounts, their order of selection is random.

1. Verify that the CreditMemo balance and excess funds amount don't exceed the total `AvailableToRefund` amount of all the OrderPaymentSummaries associated with the OrderSummary.
2. If `sequences` is specified, follow these steps.
   a. Traverse the `sequences` list in order and apply the specified refund amounts to the specified OrderPaymentSummaries.
   b. If the specified CreditMemo and excess funds are fully refunded, or if `isAllowPartial` is true, then the action stops here.
3. If a CreditMemo is specified, follow these steps.
   a. If an OrderPaymentSummary has an `AvailableToRefund` amount matching the CreditMemo's remaining balance, apply the refund to that payment.
   b. If no exact match was found but one or more OrderPaymentSummary has a large enough `AvailableToRefund` amount to cover the balance, use the OrderPaymentSummary with the smallest `AvailableToRefund` amount.
   c. If no single OrderPaymentSummary has a large enough `AvailableToRefund` amount, use multiple OrderPaymentSummaries in descending order of `AvailableToRefund` amount. This ensures the fewest OrderPaymentSummaries are used.

4. If only one OrderPaymentSummary is specified but has multiple payments, follow these steps.
   a. If a payment has an amount matching the CreditMemo's remaining balance, apply the refund to that payment.
   b. If no exact match was found but one or more payment has a large enough amount to cover the balance, use the payment with the smallest amount.
   c. If no single payment has a large enough amount, use multiple payments in descending order of amount. This ensures the fewest payments are used.
5. If an excess funds amount is specified, follow these steps.
   a. Examine those OrderPaymentSummaries. If one has an `AvailableToRefund` amount matching the excess funds amount, apply the refund to that OrderPaymentSummary.
   b. If no exact match was found but one or more OrderPaymentSummary has a large enough `AvailableToRefund` amount to cover the balance, use the OrderPaymentSummary with the smallest `AvailableToRefund` amount.
   c. If no single OrderPaymentSummary has a large enough `AvailableToRefund` amount, use multiple OrderPaymentSummaries in descending order of `AvailableToRefund` amount. This ensures the fewest OrderPaymentSummaries are used.

Note: If the method creates a refund, the refund record's ClientContext value isn't predictable. Don't use it in custom logic.

SEE ALSO:

createReturnOrder(returnOrderInput)

returnItems(returnOrderId, returnItemsInput)

createMultipleInvoices(invoicesInput)

`multipleEnsureFundsAsync(multipleEnsureFundsInput)`

Ensure and apply funds for one or more Invoices. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

API Version

56.0

Requires Chatter

No

Signature

```
public static ConnectApi.MultipleAsyncOutputRepresentation
multipleEnsureFundsAsync(ConnectApi.MultipleEnsureFundsAsyncInputRepresentation
multipleEnsureFundsInput)
```

Parameters

`multipleEnsureFundsInput`
Type: `ConnectApi.MultipleEnsureFundsAsyncInputRepresentation`

List of Invoices and the associated OrderSummaries.

Return Value

Type: `ConnectApi.MultipleAsyncOutputRepresentation`

Usage

For each Invoice in the request, this method checks the OrderPaymentSummaries associated with the specified OrderSummary for funds to apply to the Invoice balance following this logic.

Note: If multiple OrderPaymentSummaries have equal `BalanceAmount` values, their order of selection is random.

1. Verify that the Invoice balance doesn't exceed the total `BalanceAmount` of all the OrderPaymentSummaries associated with the OrderSummary.
2. If an OrderPaymentSummary has a `BalanceAmount` equal to the invoice balance, apply the funds from that OrderPaymentSummary.
3. If no exact match was found, apply funds from the OrderPaymentSummary with the largest `BalanceAmount`.
4. If the Invoice still has a balance to ensure, repeat steps 2 and 3 until the full balance is ensured or no captured funds remain.
5. If the Invoice still has a balance, look for an OrderPaymentSummary with an authorized amount equal to the remaining Invoice balance. If one exists, capture and apply the funds from that OrderPaymentSummary.
6. If no exact match was found, capture and apply funds from the OrderPaymentSummary with the largest authorized amount.
7. If the Invoice still has a balance to ensure, repeat steps 5 and 6 until the full balance is ensured.

Note: If the method creates a payment, the payment record's ClientContext value isn't predictable. Don't use it in custom logic.

SEE ALSO:

ensureFundsAsync(orderSummaryId, ensureFundsInput)

`previewCancel(orderSummaryId, changeInput)`

Retrieve the expected change order values for canceling one or more OrderItemSummaries from an OrderSummary, without actually executing the cancel.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.PreviewCancelOutputRepresentation previewCancel(String
orderSummaryId, ConnectApi.ChangeInputRepresentation changeInput)
```

Parameters

orderSummaryId
Type: String

ID of the OrderSummary.

changeInput
Type: ConnectApi.ChangeInputRepresentation

A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Return Value

Type: ConnectApi.PreviewCancelOutputRepresentation

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

submitCancel(orderSummaryId, changeInput)

previewReturn(orderSummaryId, changeInput)

Retrieve the expected change order values for a simple return of one or more OrderItemSummaries from an OrderSummary, without actually executing the return.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.PreviewReturnOutputRepresentation previewReturn(String
orderSummaryId, ConnectApi.ChangeInputRepresentation changeInput)
```

Parameters

orderSummaryId
Type: String

ID of the OrderSummary.

changeInput
Type: ConnectApi.ChangeInputRepresentation

A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Return Value

Type: `ConnectApi.PreviewReturnOutputRepresentation`

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

submitReturn(orderSummaryId, changeInput)

`submitCancel(orderSummaryId, changeInput)`

Cancel one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.SubmitCancelOutputRepresentation submitCancel(String
orderSummaryId, ConnectApi.ChangeInputRepresentation changeInput)
```

Parameters

`orderSummaryId`
Type: String

ID of the OrderSummary.

`changeInput`
Type: `ConnectApi.ChangeInputRepresentation`

A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Return Value

Type: `ConnectApi.SubmitCancelOutputRepresentation`

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

previewCancel(orderSummaryId, changeInput)

`submitReturn(orderSummaryId, changeInput)`

Return one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order. This return is a simple return that creates a change order but not a ReturnOrder.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.SubmitReturnOutputRepresentation submitReturn(String
orderSummaryId, ConnectApi.ChangeInputRepresentation changeInput)
```

Parameters

orderSummaryId
Type: String

ID of the OrderSummary.

changeInput
Type: `ConnectApi.ChangeInputRepresentation`

A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Return Value

Type: `ConnectApi.SubmitReturnOutputRepresentation`

Usage

After submitting a return, process a refund. Pass the *changeOrderId* from the output representation to the `createCreditMemo()` method, then pass the credit memo to the `ensureRefundsAsync()` method.

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

previewReturn(orderSummaryId, changeInput)

OrderSummaryCreation Class

Create Order Summaries in Order Management.

Namespace

ConnectApi

OrderSummaryCreation Methods

These methods are for `OrderSummaryCreation`. All methods are static.

IN THIS SECTION:

createOrderSummary(orderSummaryInput)
Create an OrderSummary based on an order. That order is considered the original order for the OrderSummary. Subsequent change orders that apply to the OrderSummary are also represented as orders. You can specify whether the order is managed in Salesforce Order Management or by an external system. Most Salesforce Order Management APIs can run only on orders that it manages.

`createOrderSummary(orderSummaryInput)`

Create an OrderSummary based on an order. That order is considered the original order for the OrderSummary. Subsequent change orders that apply to the OrderSummary are also represented as orders. You can specify whether the order is managed in Salesforce Order Management or by an external system. Most Salesforce Order Management APIs can run only on orders that it manages.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrderSummaryOutputRepresentation
createOrderSummary(ConnectApi.OrderSummaryInputRepresentation orderSummaryInput)
```

Parameters

`orderSummaryInput`
Type: `ConnectApi.OrderSummaryInputRepresentation`

Input object that wraps the ID of the source order.

Return Value

Type: `ConnectApi.OrderSummaryOutputRepresentation`

Organization Class

Access information about an org.

Namespace

ConnectApi

Organization Methods

These methods are for `Organization`. All methods are static.

IN THIS SECTION:

getSettings()
Get information about the context user and the org, including which features are enabled.

`getSettings()`

Get information about the context user and the org, including which features are enabled.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi. OrganizationSettings getSettings()
```

Return Value

Type: `ConnectApi.OrganizationSettings`

PardotBusinessUnitContext Class

Get the Pardot business units the context user has access to.

Namespace

ConnectApi

PardotBusinessUnitContext Methods

These methods are for `PardotBusinessUnitContext`. All methods are static.

IN THIS SECTION:

getBusinessUnitContext()
Get the Pardot business units the context user has access to.
getBusinessUnitContextByIsCurrentStatus(isCurrent)
Get the Pardot business units the context user has access to by specifying the current status.

`getBusinessUnitContext()`

Get the Pardot business units the context user has access to.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.PardotBusinessUnitContextOutput getBusinessUnitContext()
```

Return Value

Type: ConnectApi.PardotBusinessUnitContextOutput

getBusinessUnitContextByIsCurrentStatus(isCurrent)

Get the Pardot business units the context user has access to by specifying the current status.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.PardotBusinessUnitContextOutput
getBusinessUnitContextByIsCurrentStatus(Boolean isCurrent)
```

Parameters

isCurrent
Type: Boolean

Specifies whether to return only the business unit that's selected as the context user's current business unit context in the business unit switcher of the Pardot Lightning app (`true`) or to return only the business units that aren't selected as the context user's current business unit context (`false`).

Return Value

Type: ConnectApi.PardotBusinessUnitContextOutput

Payments Class

Authorize a payment, capture an authorized payment, and refund an authorized payment.

Namespace

ConnectApi

Payments Methods

These methods are for `Payments`. All methods are static.

To access Payments methods, you need these permissions.

- Salesforce Order Management License
- PaymentsAPIUser user permission. This permission is available with the Salesforce Order Management License. Your Salesforce admin assigns it to your profile.

IN THIS SECTION:

authorize(authorizePayment)
Authorize a payment.

postAuth(postAuthorizePayment)
Confirms that the merchant is ready to capture payment of an existing pre-authorized transaction.

reverseAuthorization(AuthReversalInput, authorizationId)
Reverses a payment authorization.

capture(AuthCaptureInput, authorizationId)
Capture an authorized payment.

refund(ReferencedRefundInput, paymentId)
Refund an authorized payment.

sale(sale)
Captures a payment without any prior authorization and creates a payment entity. The payment sale transaction is a combination of an Authorize transaction and Capture transaction. This payment sale method allows merchants to request that the funds are transferred to the merchant account in a single command, with no further action (such as charging a credit card) from the merchant.

tokenizePaymentMethod(tokenizePaymentMethodInput)
Method to take the input parameters of the payment method you want to tokenize and then pass them to the payment gateway's tokenization service. The results of the tokenization request are returned as a response from the payment gateway.

`authorize(authorizePayment)`

Authorize a payment.

API Version

51.0

Requires Chatter

No

Signature

```
global static ConnectApi.AuthorizationResponse authorize(ConnectApi.AuthorizationRequest
authorizePayment)
```

Parameters

authorizePayment
Type: ConnectApi.AuthorizationRequest

Represents a payment authorization.

Return Value

Type: ConnectApi.AuthorizationResponse

postAuth(postAuthorizePayment)

Confirms that the merchant is ready to capture payment of an existing pre-authorized transaction.

API Version

54.0

Requires Chatter

No

Signature

```
global static ConnectApi.PostAuthorizationResponse postAuth(ConnectApi.PostAuthRequest
postAuthorizePayment)
```

Parameters

postAuthorizePayment
Type: ConnectApi.PostAuthRequest

Information about the payment, payment method, and payment gateway from the original payment authorization.

Return Value

Type: ConnectApi.PostAuthorizationResponse

reverseAuthorization(AuthReversalInput, authorizationId)

Reverses a payment authorization.

API Version

51.0

Requires Chatter

No

Signature

```
global static ConnectApi.AuthorizationReversalResponse
reverseAuthorization(ConnectApi.AuthorizationReversalRequest AuthReversalInput, String
authorizationId)
```

Parameters

AuthReversalInput
Type: ConnectApi.AuthorizationReversalRequest

Input information for the payment authorization reversal.

authorizationId
Type: String

The ID of the payment authorization to be reversed.

Return Value

Type: ConnectApi.AuthorizationReversalResponse

capture(AuthCaptureInput, authorizationId)

Capture an authorized payment.

API Version

50.0

Requires Chatter

No

Signature

```
global static ConnectApi.CaptureResponse capture(ConnectApi.CaptureRequest
AuthCaptureInput, String authorizationId)
```

Parameters

AuthCaptureInput
Type: ConnectApi.CaptureRequest

A `ConnectApi.CaptureRequest` object with information about the payment capture.

authorizationId
Type: String

ID of the payment authorization. Required.

Return Value

Type: ConnectApi.CaptureResponse

refund(ReferencedRefundInput, paymentId)

Refund an authorized payment.

To access Payments methods, you need these permissions.

- Salesforce Order Management License
- PaymentsAPIUser user permission. This permission is available with the Salesforce Order Management License. Your Salesforce admin assigns it to your profile.

API Version

50.0

Requires Chatter

No

Signature

```
global static ConnectApi.ReferencedRefundResponse
refund(ConnectApi.ReferencedRefundRequest ReferencedRefundInput, String paymentId)
```

Parameters

ReferencedRefundInput
Type: ConnectApi.ReferencedRefundRequest

A ConnectApi.ReferencedRefundRequest object with information about the refund.

paymentId
Type: String

ID of the payment to be refunded. Required.

Return Value

Type: ConnectApi.ReferencedRefundResponse

sale(sale)

Captures a payment without any prior authorization and creates a payment entity. The payment sale transaction is a combination of an Authorize transaction and Capture transaction. This payment sale method allows merchants to request that the funds are transferred to the merchant account in a single command, with no further action (such as charging a credit card) from the merchant.

API Version

54.0

Requires Chatter

No

Signature

```
global static ConnectApi.SaleResponse sale(ConnectApi.SaleRequest sale)
```

Parameters

sale
Type: ConnectApi.SaleRequest

Payment sale input class.

Return Value

Type: ConnectApi.SaleResponse

tokenizePaymentMethod(tokenizePaymentMethodInput)

Method to take the input parameters of the payment method you want to tokenize and then pass them to the payment gateway's tokenization service. The results of the tokenization request are returned as a response from the payment gateway.

API Version

52.0

Requires Chatter

No

Signature

```
global static ConnectApi.PaymentMethodTokenizationResponse
tokenizePaymentMethod(ConnectApi.PaymentMethodTokenizationRequest
tokenizePaymentMethodInput)
```

Parameters

tokenizePaymentMethodInput
Type: ConnectApi.PaymentMethodTokenizationRequest

Information about the payment method to be tokenized.

Return Value

Type: ConnectApi.PaymentMethodTokenizationResponse

Usage

Accepts input parameters representing a payment method and passes them in a tokenization request to the payment gateway. The results of the tokenization request are returned as a response from the payment gateway. If the tokenization was successful, the response

contains the tokenized value and details about the tokenization process. Otherwise, the response contains an error message and details about the error.

Example

```
ConnectApi.PaymentMethodTokenizationRequest request = new
ConnectApi.PaymentMethodTokenizationRequest();
request.paymentGatewayId = '0b0xx0000001Ja5AAE';
ConnectApi.CardPaymentMethodRequest cpmRequest = new ConnectApi.CardPaymentMethodRequest();
cpmRequest.cardHolderName = 'Jo Manager';
cpmRequest.expiryMonth = 11;
cpmRequest.expiryYear = 2222;
cpmRequest.cardNumber = '4111111111111111';
cpmRequest.cvv = '111';
cpmRequest.cardCategory = ConnectApi.CardCategory.CreditCard;
cpmRequest.cardType = ConnectApi.CardType.Visa.name();
request.cardPaymentMethod = cpmRequest;
ConnectApi.PaymentMethodTokenizationResponse response =
ConnectApi.Payments.tokenizePaymentMethod(request);
```

Personalization Class

Get assigned personalization audiences that match the user context. Create, get, update, and delete an audience. Get personalization targets that match the user context, based on the assigned audiences that include the user. Create and update targets. Get and delete a target.

Namespace

ConnectApi

Note: Personalization varies what the user can see in the browser but doesn't secure data in any way. To prevent users accessing sensitive data, use standard Salesforce security features, such as sharing rules and permission sets.

Personalization Methods

These methods are for `Personalization`. All methods are static.

IN THIS SECTION:

createAudience(communityId, audience)
Create an audience.

createTargets(communityId, target)
Create targets.

deleteAudience(communityId, audienceId)
Delete an audience.

deleteTarget(communityId, targetId)
Delete a target.

getAudience(communityId, audienceId, includeAudienceCriteria)
Get an audience.

getAudienceBatch(communityId, audienceIds)
Get audience information for a comma-separated list of audience IDs.

getAudiences(communityId, ipAddress, domain, userId, publishStatus, includeAudienceCriteria, targetTypes, recordId)
Get a list of assigned audiences that match the user context and record information.

getAudiences(communityId, ipAddress, domain, userId, publishStatus, includeAudienceCriteria, targetTypes)
Get a list of assigned audiences that match the user context.

getTarget(communityId, targetId)
Get a target.

getTargetBatch(communityId, targetIds)
Get target information for a comma-separated list of target IDs.

getTargets(communityId, ipAddress, domain, userId, publishStatus, recordId, targetTypes, includeAudience, includeAllMatchingTargetsWithinGroup, groupNames)
Get a list of targets that match the user context, based on the assigned audiences that include the user.

updateAudience(communityId, audienceId, audience)
Update an audience.

updateTargets(communityId, target)
Update targets.

`createAudience(communityId, audience)`

Create an audience.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.Audience createAudience(String communityId,
ConnectApi.AudienceInput audience)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

audience
Type: `ConnectApi.AudienceInput`

A `ConnectApi.AudienceInput` object that defines the audience.

Return Value

Type: ConnectApi.Audience

createTargets(communityId, target)

Create targets.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.TargetCollection createTargets(String communityId,
ConnectApi.TargetCollectionInput target)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

target
Type: ConnectApi.TargetCollectionInput

A `ConnectApi.TargetCollectionInput` object that defines the targets.

Return Value

Type: ConnectApi.TargetCollection

deleteAudience(communityId, audienceId)

Delete an audience.

API Version

48.0

Requires Chatter

No

Signature

```
public static Void deleteAudience(String communityId, String audienceId)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

audienceId
Type: String

ID of the audience.

Return Value

Type: Void

deleteTarget(communityId, targetId)

Delete a target.

API Version

48.0

Requires Chatter

No

Signature

```
public static Void deleteTarget(String communityId, String targetId)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

targetId
Type: String

ID of the target.

Return Value

Type: Void

getAudience(communityId, audienceId, includeAudienceCriteria)

Get an audience.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.Audience getAudience(String communityId, String audienceId,
Boolean includeAudienceCriteria)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

audienceId
Type: String

ID of the audience.

includeAudienceCriteria
Type: Boolean

Specifies whether to include audience criteria (`true`) or not (`false`). If unspecified, defaults to `false`.

Return Value

Type: `ConnectApi.Audience`

getAudienceBatch(communityId, audienceIds)

Get audience information for a comma-separated list of audience IDs.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.BatchResult[] getAudienceBatch(String communityId, List<String>
audienceIds)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

audienceIds
Type: List<String>

Comma-separated list of audience IDs.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.Audience` object and errors for audiences that didn't load.

getAudiences(communityId, ipAddress, domain, userId, publishStatus, includeAudienceCriteria, targetTypes, recordId)

Get a list of assigned audiences that match the user context and record information.

API Version

51.0

Available to Guest Users

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.AudienceCollection getAudiences(String communityId, String ipAddress, String domain, String userId, ConnectApi.PublishStatus publishStatus, Boolean includeAudienceCriteria, List<String> targetTypes, String recordId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

ipAddress
Type: String

IP address of the user. If `null`, no audiences with location criteria are returned.

domain
Type: String

Name of the user's Salesforce custom domain. If `null`, no audiences with domain criteria are returned.

`userId`
Type: String

ID of the user. If `null`, defaults to the ID of the context user.

`publishStatus`
Type: `ConnectApi.PublishStatus`

Publish status of the audience. Values are:

- `Draft`
- `Live`

If `null`, defaults to `Live`.

`includeAudienceCriteria`
Type: Boolean

Specifies whether to include audience criteria (`true`) or not (`false`). If unspecified, defaults to `false`.

`targetTypes`
Type: List<String>

Comma-separated list of target types to filter the results. Supported values include:

- `ExperienceVariation` (version 48.0 and later)
- Custom object API names, such as ***`CustomObjectName`***`__c` (version 48.0 and later)
- `NavigationLinkSet` (version 49.0 and later)
- `Topic` (version 49.0 and later)
- `CollaborationGroup` (version 49.0 and later)
- `KnowledgeArticle` (version 49.0 and later)
- `ContentDocument` (version 49.0 and later)
- `ManagedContent` (version 49.0 and later)
- `Report` (version 49.0 and later)
- `Dashboard` (version 49.0 and later)

If `null`, all target types are returned.

`recordId`
Type: String

ID of the record for field based criteria. If `null`, all applicable audiences with field based criteria are returned.

Return Value

Type: `ConnectApi.AudienceCollection`

`getAudiences(communityId, ipAddress, domain, userId, publishStatus, includeAudienceCriteria, targetTypes)`

Get a list of assigned audiences that match the user context.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.AudienceCollection getAudiences(String communityId, String
ipAddress, String domain, String userId, ConnectApi.PublishStatus publishStatus, Boolean
includeAudienceCriteria, List<String> targetTypes)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

ipAddress
Type: String

IP address of the user. If `null`, no audiences with location criteria are returned.

domain
Type: String

Name of the user's Salesforce custom domain. If `null`, no audiences with domain criteria are returned.

userId
Type: String

ID of the user. If `null`, defaults to the ID of the context user.

publishStatus
Type: `ConnectApi.PublishStatus`

Publish status of the audience. Values are:

- `Draft`
- `Live`

If `null`, defaults to `Live`.

includeAudienceCriteria
Type: Boolean

Specifies whether to include audience criteria (`true`) or not (`false`). If unspecified, defaults to `false`.

targetTypes
Type: List<String>

Comma-separated list of target types to filter the results. Supported values include:

- `ExperienceVariation` (version 48.0 and later)

- Custom object API names, such as ***CustomObjectName***__c (version 48.0 and later)
- NavigationLinkSet (version 49.0 and later)
- Topic (version 49.0 and later)
- CollaborationGroup (version 49.0 and later)
- KnowledgeArticle (version 49.0 and later)
- ContentDocument (version 49.0 and later)
- ManagedContent (version 49.0 and later)
- Report (version 49.0 and later)
- Dashboard (version 49.0 and later)

If null, all target types are returned.

Return Value

Type: ConnectApi.AudienceCollection

getTarget(communityId, targetId)

Get a target.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.Target getTarget(String communityId, String targetId)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

targetId
Type: String

ID of the target.

Return Value

Type: ConnectApi.Target

`getTargetBatch(communityId, targetIds)`

Get target information for a comma-separated list of target IDs.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.BatchResult[] getTargetBatch(String communityId, List<String>
targetIds)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

targetIds
Type: List<String>

Comma-separated list of target IDs.

Return Value

Type: `ConnectApi.BatchResult`

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.Target` object and errors for targets that didn't load.

`getTargets(communityId, ipAddress, domain, userId, publishStatus, recordId, targetTypes, includeAudience, includeAllMatchingTargetsWithinGroup, groupNames)`

Get a list of targets that match the user context, based on the assigned audiences that include the user.

API Version

48.0

Available to Guest Users

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.TargetCollection getTargets(String communityId, String
ipAddress, String domain, String userId, ConnectApi.PublishStatus publishStatus, String
recordId, List<String> targetTypes, Boolean includeAudience, Boolean
includeAllMatchingTargetsWithinGroup, List<String> groupNames)
```

Parameters

communityId
Type: String

ID of the Experience Cloud site.

ipAddress
Type: String

IP address of the user. If `null`, no audiences with location criteria are returned.

domain
Type: String

Name of the user's Salesforce custom domain. If `null`, no audiences with domain criteria are returned.

userId
Type: String

ID of the user. If `null`, the default is the ID of the context user.

publishStatus
Type: `ConnectApi.PublishStatus`

Publish status of the target. Values are:

- `Draft`
- `Live`

recordId
Type: String

ID of the record, if you want to specify field based criteria in audiences.

targetTypes
Type: List<String>

Comma-separated list of target types to filter the results. Supported values include:

- `ExperienceVariation` (version 48.0 and later)
- Custom object API names, such as ***`CustomObjectName`*****`__c`** (version 48.0 and later)
- `NavigationLinkSet` (version 49.0 and later)
- `Topic` (version 49.0 and later)
- `CollaborationGroup` (version 49.0 and later)
- `KnowledgeArticle` (version 49.0 and later)
- `ContentDocument` (version 49.0 and later)

- `ManagedContent` (version 49.0 and later)
- `Report` (version 49.0 and later)
- `Dashboard` (version 49.0 and later)

If `null`, all target types are returned.

`includeAudience`
Type: Boolean

Specifies whether to include the matching audience (`true`) or not (`false`). If `null`, the default is `false`.

`includeAllMatchingTargetsWithinGroup`
Type: Boolean

Specifies whether to include all the matching targets within a target group (`true`) or not (`false`). If `null`, the default is `false`. If `false`, the first matching target within each group, based on priority within the group, is returned.

`groupNames`
Type: List<String>

A comma-separated list of group names. Groups bundle related target and audience pairs.

Return Value

Type: `ConnectApi.TargetCollection`

`updateAudience(communityId, audienceId, audience)`

Update an audience.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.Audience updateAudience(String communityId, String audienceId,
ConnectApi.AudienceInput audience)
```

Parameters

`communityId`
Type: String

ID of the Experience Cloud site.

`audienceId`
Type: String

ID of the audience.

`audience`
Type: `ConnectApi.AudienceInput`

A `ConnectApi.AudienceInput` object that defines the updates to the audience.

Return Value

Type: `ConnectApi.Audience`

`updateTargets(communityId, target)`

Update targets.

API Version

48.0

Requires Chatter

No

Signature

```
public static ConnectApi.TargetCollection updateTargets(String communityId,
ConnectApi.TargetCollectionUpdateInput target)
```

Parameters

`communityId`
Type: String

ID of the Experience Cloud site.

`target`
Type: `ConnectApi.TargetCollectionUpdateInput`

A `ConnectApi.TargetCollectionUpdateInput` object that defines the updates for the targets.

Return Value

Type: `ConnectApi.TargetCollection`

PickTicket Class

Create tickets to fulfill orders.

Namespace

ConnectApi

PickTicket Methods

These methods are for `PickTicket`. All methods are static.

IN THIS SECTION:

distributePickedQuantities(distributePickedQuantitiesInput)
Distribute picked quantities among orders in a pick ticket.

distributePickedQuantities(distributePickedQuantitiesInput)

Distribute picked quantities among orders in a pick ticket.

API Version

58.0

Requires Chatter

No

Signature

```
public static ConnectApi.DistributePickedQuantitiesOutputRepresentation
distributePickedQuantities(ConnectApi.DistributePickedQuantitiesInputRepresentation
distributePickedQuantitiesInput)
```

Parameters

distributePickedQuantitiesInput
Type: `ConnectApi.DistributePickedQuantitiesInputRepresentation`

Input to distribute picked quantities.

Return Value

Type: `ConnectApi.DistributePickedQuantitiesOutputRepresentation`

QuestionAndAnswers Class

Access question and answers suggestions.

Namespace

ConnectApi

IN THIS SECTION:

QuestionAndAnswers Methods
These methods are for `QuestionAndAnswers`. All methods are static.

QuestionAndAnswers Methods

These methods are for `QuestionAndAnswers`. All methods are static.

All methods in this class require Chatter and are subject to the per user, per namespace, per hour rate limit.

IN THIS SECTION:

getSuggestions(communityId, q, subjectId, includeArticles, maxResults)
Get question and answers suggestions.

setTestGetSuggestions(communityId, q, subjectId, includeArticles, maxResults, result)
Register a `ConnectApi.QuestionAndAnswersSuggestions` object to be returned when `getSuggestions` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

updateQuestionAndAnswers(communityId, feedElementId, questionAndAnswersCapability)
Choose or change the best answer for a question.

`getSuggestions(communityId, q, subjectId, includeArticles, maxResults)`

Get question and answers suggestions.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.QuestionAndAnswersSuggestions getSuggestions(String communityId,
String q, String subjectId, Boolean includeArticles, Integer maxResults)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`q`
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`subjectId`
Type: String

Specify a subject ID to search only questions on that object. If the ID is a topic or a user, the ID is ignored.

`includeArticles`
Type: Boolean

Specify `true` to include knowledge articles in the search results. To return only questions, specify `false`.

`maxResults`
Type: Integer

The maximum number of results to return for each type of item. Possible values are 1–10. The default value is 5.

Return Value

Type: `ConnectApi.QuestionAndAnswersSuggestions`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetSuggestions(communityId, q, subjectId, includeArticles, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetSuggestions(communityId, q, subjectId, includeArticles, maxResults, result)`

Register a `ConnectApi.QuestionAndAnswersSuggestions` object to be returned when `getSuggestions` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetSuggestions(String communityId, String q, String subjectId,
Boolean includeArticles, Integer maxResults, ConnectApi.QuestionAndAnswersSuggestions
result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`q`
Type: String

Required and can't be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`subjectId`
Type: String

Specify a subject ID to search only questions on that object. If the ID is a topic or a user, the ID is ignored.

`includeArticles`
Type: Boolean

Specify `true` to include knowledge articles in the search results. To return only questions, specify `false`.

maxResults
Type: Integer

The maximum number of results to return for each type of item. Possible values are 1–10. The default value is 5.

result
Type: `ConnectApi.QuestionAndAnswersSuggestions`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getSuggestions(communityId, q, subjectId, includeArticles, maxResults)

Apex Developer Guide: Testing ConnectApi Code

updateQuestionAndAnswers(communityId, feedElementId, questionAndAnswersCapability)

Choose or change the best answer for a question.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.QuestionAndAnswersCapability updateQuestionAndAnswers(String communityId, String feedElementId, ConnectApi.QuestionAndAnswersCapabilityInput questionAndAnswersCapability)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

questionAndAnswersCapability
Type: `ConnectApi.QuestionAndAnswersCapabilityInput`

Specify the best answer (comment ID) for the question.

Return Value

Type: `ConnectApi.QuestionAndAnswersCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Example

```
ConnectApi.QuestionAndAnswersCapabilityInput qaInput = new
ConnectApi.QuestionAndAnswersCapabilityInput();
qaInput.bestAnswerId = '0D7D000000001MAKAY';

ConnectApi.QuestionAndAnswersCapability qa =
ConnectApi.QuestionAndAnswers.updateQuestionAndAnswers(null, '0D5D0000000XZjJ', qaInput);
```

Recommendations Class

Get and reject Chatter, custom, and static recommendations. Create, get, update, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

For Next Best Action recommendations, see NextBestAction Class.

Namespace

ConnectApi

Recommendations Methods

These methods are for `Recommendations`. All methods are static.

All methods in this class require Chatter and are subject to the per user, per namespace, per hour rate limit.

IN THIS SECTION:

createRecommendationAudience(communityId, recommendationAudience)
Create an audience for a custom recommendation.

createRecommendationAudience(communityId, name)
Create an audience for a custom recommendation.

createRecommendationDefinition(communityId, recommendationDefinition)
Create a custom recommendation definition.

createRecommendationDefinition(communityId, name, title, actionUrl, actionUrlName, explanation)
Create a custom recommendation definition with the specified parameters.

createScheduledRecommendation(communityId, scheduledRecommendation)
Create a scheduled custom recommendation.

createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId, channel)
Create a scheduled custom recommendation with the specified parameters.

deleteRecommendationAudience(communityId, recommendationAudienceId)
Delete a custom recommendation audience.

deleteRecommendationDefinition(communityId, recommendationDefinitionId)
Delete a custom recommendation definition.

deleteRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)
Delete a custom recommendation definition photo.

deleteScheduledRecommendation(communityId, scheduledRecommendationId, deleteDefinitionIfLast)
Delete a scheduled custom recommendation.

getRecommendationAudience(communityId, recommendationAudienceId)
Get information about a custom recommendation audience.

getRecommendationAudienceMembership(communityId, recommendationAudienceId)
Get the members of a custom recommendation audience.

getRecommendationAudienceMembership(communityId, recommendationAudienceId, pageParam, pageSize)
Get a page of custom recommendation audience members.

getRecommendationAudiences(communityId)
Get custom recommendation audiences.

getRecommendationAudiences(communityId, pageParam, pageSize)
Get a page of custom recommendation audiences.

getRecommendationDefinition(communityId, recommendationDefinitionId)
Get a custom recommendation definition.

getRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)
Get a custom recommendation definition photo.

getRecommendationDefinitions(communityId)
Get custom recommendation definitions.

getRecommendationForUser(communityId, userId, action, objectId)
Get the Chatter, custom, or static recommendation for the context user for the specified action and object ID.

getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)
Get the Chatter recommendations, such as user, group, file, article, record, and topic recommendations for the context user. Get the custom and static recommendations for the context user.

getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)
Get the Chatter, custom, and static recommendations for the context user for the specified action.

getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)
Get the Chatter, custom, and static recommendations for the context user for the specified action and object category.

getScheduledRecommendation(communityId, scheduledRecommendationId)
Get a scheduled custom recommendation.

getScheduledRecommendations(communityId, channel)
Get scheduled custom recommendations.

rejectRecommendationForUser(communityId, userId, action, objectId)
Reject a Chatter, custom, or static recommendation for the context user for the specified action and object ID.

rejectRecommendationForUser(communityId, userId, action, objectEnum)
Reject a static recommendation for the context user.

updateRecommendationAudience(communityId, recommendationAudienceId, recommendationAudience)
Update a custom recommendation audience.

updateRecommendationDefinition(communityId, recommendationDefinitionId, name, title, actionUrl, actionUrlName, explanation)
Update a custom recommendation definition with the specified parameters.

updateRecommendationDefinition(communityId, recommendationDefinitionId, recommendationDefinition)
Update a custom recommendation definition.

updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileUpload)
Update a custom recommendation definition photo with a file that hasn't been uploaded.

updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileId, versionNumber)
Update a custom recommendation definition photo with an uploaded file.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo)
Update a custom recommendation definition photo with an uploaded file that requires cropping.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo, fileUpload)
Update a custom recommendation definition photo with a file that hasn't been uploaded and requires cropping.

updateScheduledRecommendation(communityId, scheduledRecommendationId, scheduledRecommendation)
Update a scheduled custom recommendation.

updateScheduledRecommendation(communityId, scheduledRecommendationId, rank, enabled, recommendationAudienceId)
Update a scheduled custom recommendation with the specified parameters.

`createRecommendationAudience(communityId, recommendationAudience)`

Create an audience for a custom recommendation.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationAudience createRecommendationAudience(String
communityId, ConnectApi.RecommendationAudienceInput recommendationAudience)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationAudience
Type: `ConnectApi.RecommendationAudienceInput`

A `ConnectApi.RecommendationAudienceInput` object.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

createRecommendationAudience(communityId, name)

Create an audience for a custom recommendation.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationAudience createRecommendationAudience(String communityId, String name)
```

Parameters

communityId
: Type: String

  ID for an Experience Cloud site, `internal`, or `null`.

name
: Type: String

  Name of the audience.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

createRecommendationDefinition(communityId, recommendationDefinition)

Create a custom recommendation definition.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationDefinition createRecommendationDefinition(String communityId, ConnectApi.RecommendationDefinitionInput recommendationDefinition)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinition
Type: `ConnectApi.RecommendationDefinitionInput`

A `ConnectApi.RecommendationDefinitionInput` object.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Recommendation definitions allow you to create custom recommendations that appear in Experience Cloud sites, encouraging users to watch videos, take training and more.

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

These recommendations appear by default on the Customer Service template. They appear on the home and question detail pages and in the feed in Salesforce mobile web. They also appear anywhere community managers add recommendations using Experience Builder in the Customer Service template.

So that users don't see the same recommendations all the time, Salesforce periodically removes and brings back custom recommendations that haven't been accepted or dismissed.

createRecommendationDefinition(communityId, name, title, actionUrl, actionUrlName, explanation)

Create a custom recommendation definition with the specified parameters.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationDefinition createRecommendationDefinition(String communityId, String name, String title, String actionUrl, String actionUrlName, String explanation)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

name
Type: String

Name of the custom recommendation definition. The name is displayed in Setup.

title
Type: String

Title of the custom recommendation definition.

actionUrl
Type: String

URL for acting on the custom recommendation, for example, the URL to join a group.

actionUrlName
Type: String

Text label for the action URL in the user interface, for example, "Launch."

explanation
Type: String

Explanation, or body, of the custom recommendation.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Recommendation definitions allow you to create custom recommendations that appear in Experience Cloud sites, encouraging users to watch videos, take training and more.

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

These recommendations appear by default on the Customer Service template. They appear on the home and question detail pages and in the feed in Salesforce mobile web. They also appear anywhere community managers add recommendations using Experience Builder in the Customer Service template.

So that users don't see the same recommendations all the time, Salesforce periodically removes and brings back custom recommendations that haven't been accepted or dismissed.

createScheduledRecommendation(communityId, scheduledRecommendation)

Create a scheduled custom recommendation.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String communityId, ConnectApi.ScheduledRecommendationInput scheduledRecommendation)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

scheduledRecommendation
Type: `ConnectApi.ScheduledRecommendationInput`

A `ConnectApi.ScheduledRecommendationInput` object.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId, channel)

Create a scheduled custom recommendation with the specified parameters.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String communityId, String recommendationDefinitionId, Integer rank, Boolean enabled, String recommendationAudienceId, ConnectApi.RecommendationChannel channel)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

rank
Type: Integer

Relative rank of the scheduled custom recommendation indicated by ascending whole numbers starting with 1.

Setting the rank is comparable to an insertion into an ordered list. The scheduled custom recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled custom recommendations after it is pushed down. See Ranking scheduled custom recommendations example.

If the specified `rank` is larger than the size of the list, the scheduled custom recommendation is put at the end of the list. The `rank` of the scheduled custom recommendation is the size of the list, instead of the one specified.

If a `rank` is not specified, the scheduled custom recommendation is put at the end of the list.

enabled
Type: Boolean

Indicates whether scheduling is enabled. If `true`, the custom recommendation is enabled and appears in Experience Cloud sites. If `false`, custom recommendations in feeds in Salesforce mobile web aren't removed, but no new custom recommendations appear. In Customer Service and Partner Central sites, disabled custom recommendations no longer appear.

recommendationAudienceId
Type: String

ID of the custom recommendation definition that this scheduled recommendation schedules.

channel
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.

- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

Use these channel values; you can't rename or create other channels.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Ranking scheduled custom recommendations example

If you have these scheduled custom recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Custom Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

`deleteRecommendationAudience(communityId, recommendationAudienceId)`

Delete a custom recommendation audience.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static Void deleteRecommendationAudience(String communityId, String
recommendationAudienceId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the custom recommendation audience.

Return Value

Type: Void

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`deleteRecommendationDefinition(communityId, recommendationDefinitionId)`

Delete a custom recommendation definition.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static Void deleteRecommendationDefinition(String communityId, String
recommendationDefinitionId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

Return Value

Type: Void

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`deleteRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)`

Delete a custom recommendation definition photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static Void deleteRecommendationDefinitionPhoto(String communityId, String
recommendationDefinitionId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

Return Value

Type: Void

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`deleteScheduledRecommendation(communityId, scheduledRecommendationId, deleteDefinitionIfLast)`

Delete a scheduled custom recommendation.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static Void deleteScheduledRecommendation(String communityId, String scheduledRecommendationId, Boolean deleteDefinitionIfLast)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

scheduledRecommendationId
Type: String

ID of the scheduled custom recommendation.

deleteDefinitionIfLast
Type: Boolean

If `true` and if this is the last scheduled custom recommendation of a custom recommendation definition, deletes the custom recommendation definition. Default is `false`.

Return Value

Type: Void

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Deleting a scheduled custom recommendation is comparable to a deletion in an ordered list. All scheduled custom recommendations after the deleted scheduled custom recommendation receive a new, higher rank automatically.

`getRecommendationAudience(communityId, recommendationAudienceId)`

Get information about a custom recommendation audience.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationAudience getRecommendationAudience(String communityId, String recommendationAudienceId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`recommendationAudienceId`
Type: String

ID of the custom recommendation audience.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationAudienceMembership(communityId, recommendationAudienceId)`

Get the members of a custom recommendation audience.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserReferencePage getRecommendationAudienceMembership(String communityId, String recommendationAudienceId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the custom recommendation audience.

Return Value

Type: `ConnectApi.UserReferencePage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationAudienceMembership(communityId, recommendationAudienceId, pageParam, pageSize)`

Get a page of custom recommendation audience members.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserReferencePage getRecommendationAudienceMembership(String communityId, String recommendationAudienceId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the custom recommendation audience.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of members per page.

Return Value

Type: `ConnectApi.UserReferencePage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationAudiences(communityId)`

Get custom recommendation audiences.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationAudiencePage getRecommendationAudiences(String
communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.RecommendationAudiencePage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationAudiences(communityId, pageParam, pageSize)`

Get a page of custom recommendation audiences.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationAudiencePage getRecommendationAudiences(String communityId, Integer pageParam, Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of audiences per page.

Return Value

Type: `ConnectApi.RecommendationAudiencePage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission

can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationDefinition(communityId, recommendationDefinitionId)`

Get a custom recommendation definition.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationDefinition getRecommendationDefinition(String communityId, String recommendationDefinitionId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`recommendationDefinitionId`
Type: String

ID of the custom recommendation definition.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)`

Get a custom recommendation definition photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo getRecommendationDefinitionPhoto(String communityId,
String recommendationDefinitionId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

Return Value

Type: `ConnectApi.Photo`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationDefinitions(communityId)`

Get custom recommendation definitions.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationDefinitionPage getRecommendationDefinitions(String
communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.RecommendationDefinitionPage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getRecommendationForUser(communityId, userId, action, objectId)`

Get the Chatter, custom, or static recommendation for the context user for the specified action and object ID.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationForUser(String
communityId, String userId, ConnectApi.RecommendationActionType action, String objectId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID for the context user or the keyword `me`.

`action`
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

`objectId`
Type: String

Specifies the object to act on.

- If *action* is follow, *objectId* is a user ID, file ID, record ID, or topic ID (version 36.0 and later).
- If *action* is join, *objectId* is a group ID.
- If *action* is view, *objectId* is a user ID, file ID, group ID, record ID, custom recommendation ID (version 34.0 and later), the enum Today for static recommendations (version 35.0 and later), or an article ID (version 37.0 and later).

Return Value

Type: ConnectApi.RecommendationCollection

Usage

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecommendationForUser(communityId, userId, action, objectId, result)

Apex Developer Guide: Testing ConnectApi Code

getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)

Get the Chatter recommendations, such as user, group, file, article, record, and topic recommendations for the context user. Get the custom and static recommendations for the context user.

API Version

36.0

Available to Guest Users

38.0

Note: Only article and file recommendations are available to guest users.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType contextAction, String contextObjectId, ConnectApi.RecommendationChannel channel, Integer maxResults)
```

Parameters

communityId

Type: String

ID for an Experience Cloud site, internal, or null.

userId
Type: String

ID for the context user or the keyword `me`.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *contextAction* and *contextObjectId* together. For example, if you just followed Pam, you specify `follow` for *contextAction* and Pam's user ID for *contextObjectId*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)`

Get the Chatter, custom, and static recommendations for the context user for the specified action.

API Version

36.0

Available to Guest Users

38.0

Note: Only article and file recommendations are available to guest users.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String
communityId, String userId, ConnectApi.RecommendationActionType action,
ConnectApi.RecommendationActionType contextAction, String contextObjectId,
ConnectApi.RecommendationChannel channel, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *`contextAction`* and *`contextObjectId`* together. For example, if you just followed Pam, you specify `follow` for *`contextAction`* and Pam's user ID for *`contextObjectId`*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)`

Get the Chatter, custom, and static recommendations for the context user for the specified action and object category.

API Version

36.0

Available to Guest Users

38.0

Note: Only article and file recommendations are available to guest users.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, String objectCategory, ConnectApi.RecommendationActionType contextAction, String contextObjectId, ConnectApi.RecommendationChannel channel, Integer maxResults)
```

Parameters

`communityId`

Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectCategory
Type: String

- If *action* is `follow`, *objectCategory* is `users`, `files`, `topics`, or `records`.
- If *action* is `join`, *objectCategory* is `groups`.
- If *action* is `view`, *objectCategory* is `users`, `files`, `groups`, `records`, `custom`, `apps`, or `articles` (version 37.0 and later).

You can also specify a key prefix, the first three characters of the object ID, as the *objectCategory*. Valid values are:

- If *action* is `follow`, *objectCategory* is `005` (users), `069` (files), `0TO` (topics), or `001` (accounts), for example.
- If *action* is `join`, *objectCategory* is `0F9` (groups).
- If *action* is `view`, *objectCategory* is `005` (users), `069` (files), `0F9` (groups), `0RD` (custom recommendations), `T` (static recommendations), `001` (accounts), or `kA0` (articles), for example, (version 370 and later).

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

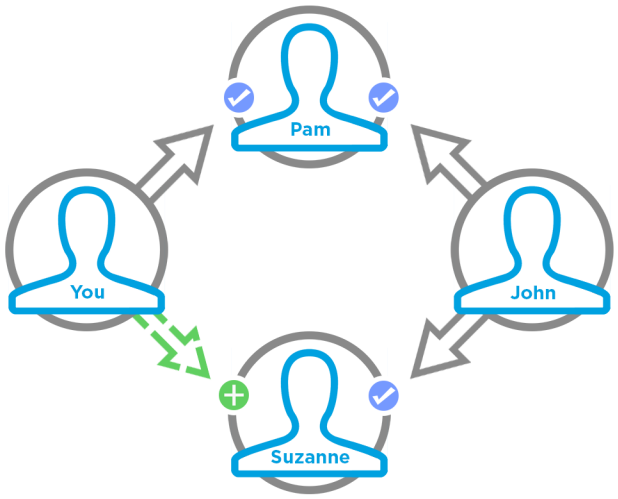
channel
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

`maxResults`
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.



Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *`contextAction`* and *`contextObjectId`* together. For example, if you just followed Pam, you specify `follow` for *`contextAction`* and Pam's user ID for *`contextObjectId`*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getScheduledRecommendation(communityId, scheduledRecommendationId)`

Get a scheduled custom recommendation.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ScheduledRecommendation getScheduledRecommendation(String communityId, String scheduledRecommendationId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`scheduledRecommendationId`
Type: String

ID of the scheduled custom recommendation.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`getScheduledRecommendations(communityId, channel)`

Get scheduled custom recommendations.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ScheduledRecommendationPage getScheduledRecommendations(String communityId, ConnectApi.RecommendationChannel channel)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

channel
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

Return Value

Type: `ConnectApi.ScheduledRecommendationPage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`rejectRecommendationForUser(communityId, userId, action, objectId)`

Reject a Chatter, custom, or static recommendation for the context user for the specified action and object ID.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static rejectRecommendationForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, String objectId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation. Supported values are:

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectId
Type: String

Specifies the object to take action on.

- If *`action`* is `follow`, *`objectId`* is a user ID, file ID, record ID, or topic ID (version 36.0 and later).
- If *`action`* is `join`, *`objectId`* is a group ID.
- If *`action`* is `view`, *`objectId`* is a custom recommendation ID, the enum `Today` for static recommendations, or an article ID (version 37.0 and later).

Return Value

Type: Void

`rejectRecommendationForUser(communityId, userId, action, objectEnum)`

Reject a static recommendation for the context user.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static rejectRecommendationForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, ConnectApi.RecommendedObjectType objectEnum)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation. Supported values are:

- `view`—View a static recommendation.

objectEnum
Type: `ConnectApi.RecommendedObjectType`

Specifies the object type to take action on.

- `Today`—Static recommendations that don't have an ID, for example, the Today app recommendation.

Return Value

Type: Void

updateRecommendationAudience(communityId, recommendationAudienceId, recommendationAudience)

Update a custom recommendation audience.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationAudience updateRecommendationAudience(String communityId, String recommendationAudienceId, ConnectApi.RecommendationAudienceInput recommendationAudience)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the custom recommendation audience.

recommendationAudience
Type: `ConnectApi.RecommendationAudienceInput`

A `ConnectApi.RecommendationAudienceInput` object.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

updateRecommendationDefinition(communityId, recommendationDefinitionId, name, title, actionUrl, actionUrlName, explanation)

Update a custom recommendation definition with the specified parameters.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationDefinition updateRecommendationDefinition(String communityId, String recommendationDefinitionId, String name, String title, String actionUrl, String actionUrlName, String explanation recommendationDefinition)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

name
Type: String

Name of the custom recommendation definition. The name is displayed in Setup.

title
Type: String

Title of the custom recommendation definition.

actionUrl
Type: String

URL for acting on the custom recommendation, for example, the URL to join a group.

actionUrlName
Type: String

Text label for the action URL in the user interface, for example, "Launch."

explanation
Type: String

Explanation, or body, of the custom recommendation.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`updateRecommendationDefinition(communityId, recommendationDefinitionId, recommendationDefinition)`

Update a custom recommendation definition.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationDefinition updateRecommendationDefinition(String communityId, String recommendationDefinitionId, ConnectApi.RecommendationDefinitionInput recommendationDefinition)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

recommendationDefinition
Type: `ConnectApi.RecommendationDefinitionInput`

A `ConnectApi.RecommendationDefinitionInput` object containing the properties to update.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileUpload)`

Update a custom recommendation definition photo with a file that hasn't been uploaded.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo updateRecommendationDefinitionPhoto(String communityId,
String recommendationDefinitionId, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

`updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileId, versionNumber)`

Update a custom recommendation definition photo with an uploaded file.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo updateRecommendationDefinitionPhoto(String communityId,
String recommendationDefinitionId, String fileId, Integer versionNumber)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

fileId
Type: String

ID of a file already uploaded. The file must be an image, and be smaller than 2 GB.

versionNumber
Type: Integer

Version number of the existing file. Specify either an existing version number, or `null` to get the latest version.

Return Value

Type: `ConnectApi.Photo`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo)

Update a custom recommendation definition photo with an uploaded file that requires cropping.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo updateRecommendationDefinitionPhotoWithAttributes(String communityId, String recommendationDefinitionId, ConnectApi.PhotoInput photo)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

Return Value

Type: `ConnectApi.Photo`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo, fileUpload)

Update a custom recommendation definition photo with a file that hasn't been uploaded and requires cropping.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo updateRecommendationDefinitionPhotoWithAttributes(String communityId, String recommendationDefinitionId, ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

photo
Type: ConnectApi.PhotoInput

A ConnectApi.PhotoInput object specifying the cropping parameters.

fileUpload
Type: ConnectApi.BinaryInput

File to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.Photo

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

updateScheduledRecommendation(communityId, scheduledRecommendationId, scheduledRecommendation)

Update a scheduled custom recommendation.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ScheduledRecommendation updateScheduledRecommendation(String communityId, String scheduledRecommendationId, ConnectApi.ScheduledRecommendationInput scheduledRecommendation)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, internal, or null.

scheduledRecommendationId
Type: String

ID of the scheduled custom recommendation.

scheduledRecommendation
Type: ConnectApi.ScheduledRecommendationInput

A `ConnectApi.ScheduledRecommendationInput` object containing the properties to update.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Ranking scheduled custom recommendations example

If you have these scheduled custom recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Custom Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

`updateScheduledRecommendation(communityId, scheduledRecommendationId, rank, enabled, recommendationAudienceId)`

Update a scheduled custom recommendation with the specified parameters.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ScheduledRecommendation updateScheduledRecommendation(String communityId, String scheduledRecommendationId, Integer rank, Boolean enabled, String recommendationAudienceId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

scheduledRecommendationId
Type: String

ID of the scheduled custom recommendation.

rank
Type: Integer

Relative rank of the scheduled custom recommendation indicated by ascending whole numbers starting with 1.

Setting the rank is comparable to an insertion into an ordered list. The scheduled custom recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled custom recommendations after it is pushed down. See Ranking scheduled custom recommendations example.

If the specified `rank` is larger than the size of the list, the scheduled custom recommendation is put at the end of the list. The `rank` of the scheduled custom recommendation is the size of the list, instead of the one specified.

If a `rank` is not specified, the scheduled custom recommendation is put at the end of the list.

enabled
Type: Boolean

Indicates whether scheduling is enabled. If `true`, the custom recommendation is enabled and appears in Experience Cloud sites. If `false`, custom recommendations in feeds in Salesforce mobile web aren't removed, but no new custom recommendations appear. In Customer Service and Partner Central sites, disabled custom recommendations no longer appear.

recommendationAudienceId
Type: String

ID of the custom recommendation definition that this scheduled recommendation schedules.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Ranking scheduled custom recommendations example

If you have these scheduled custom recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Custom Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

Recommendations Test Methods

These test methods are for `Recommendations`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

IN THIS SECTION:

setTestGetRecommendationForUser(communityId, userId, action, objectId, result)

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults, result)

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults, result)

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults, result)

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationForUser(communityId, userId, action, objectId, result)

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, String objectId,
ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectId
Type: String

Specifies the object to take action on.

- If *`action`* is `follow`, *`objectId`* is a user ID, file ID, record ID, or topic ID (version 36.0 and later).
- If *`action`* is `join`, *`objectId`* is a group ID.
- If *`action`* is `view`, *`objectId`* is a user ID, file ID, group ID, record ID, custom recommendation ID, the enum `Today` for static recommendations, or an article ID (version 37.0 and later).

result
Type: ConnectApi.RecommendationCollection

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationForUser(communityId, userId, action, objectId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults, result)

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType contextAction, String contextObjectId,
ConnectApi.RecommendationChannel channel, Integer maxResults,
ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result
Type: `ConnectApi.RecommendationCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults, result)`

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, ConnectApi.RecommendationActionType
contextAction, String contextObjectId, ConnectApi.RecommendationChannel channel, Integer
maxResults, ConnectApi.RecommendationCollection result)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID for the context user or the keyword `me`.

`action`
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

`contextAction`
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *`contextAction`* and *`contextObjectId`* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`contextObjectId`
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is follow, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is view, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify null.

channel
Type: ConnectApi.RecommendationChannel

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- CustomChannel1—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- CustomChannel2—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- CustomChannel3—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- CustomChannel4—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- CustomChannel5—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- DefaultChannel—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result
Type: ConnectApi.RecommendationCollection

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)

Apex Developer Guide: Testing ConnectApi Code

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults, result)

Register a ConnectApi.RecommendationCollection object to be returned when getRecommendationsForUser is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, String objectCategory,
ConnectApi.RecommendationActionType contextAction, String contextObjectId,
ConnectApi.RecommendationChannel channel, Integer maxResults,
ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectCategory
Type: String

- If *action* is `follow`, *objectCategory* is `users`, `files`, `records`, or `topics`.
- If *action* is `join`, *objectCategory* is `groups`.
- If *action* is `view`, *objectCategory* is `users`, `files`, `groups`, `records`,`custom`, `apps`, or `articles` (version 37.0 and later).

You can also specify a key prefix, the first three characters of the object ID, as the *objectCategory*. Valid values are:

- If *action* is `follow`, *objectCategory* is `005` (users), `069` (files), `0TO` (topics), or `001` (accounts), for example.
- If *action* is `join`, *objectCategory* is `0F9` (groups).
- If *action* is `view`, *objectCategory* is `005` (users), `069` (files), `0F9` (groups), `0RD` (custom recommendations), `T` (static recommendations), `001` (accounts), or `kA0` (articles), for example, (version 370 and later).

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *`contextAction`* and *`contextObjectId`* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`contextObjectId`
Type: String

ID of the object that the context user just performed an action on.

- If *`contextAction`* is `follow`, *`contextObjectId`* is a user ID, file ID, record ID, or topic ID.
- If *`contextAction`* is `view`, *`contextObjectId`* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *`contextAction`* and *`contextObjectId`* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`channel`
Type: `ConnectApi.RecommendationChannel`

A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

`maxResults`
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

`result`
Type: `ConnectApi.RecommendationCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)

Apex Developer Guide: Testing ConnectApi Code

Retired Recommendations Methods

These methods for `Recommendations` are retired.

IN THIS SECTION:

createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId)
Create a scheduled custom recommendation with the specified parameters.

getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults)
Get the Chatter recommendations, such as user, group, file, and record recommendations for the context user. Get the custom and static recommendations for the context user.

getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults)
Get the Chatter, custom, and static recommendations for the context user for the specified action.

getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults)
Get the Chatter, custom, and static recommendations for the context user for the specified action and object category.

getScheduledRecommendations(communityId)
Get scheduled custom recommendations.

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults, result)
Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults, result)
Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults, result)
Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

`createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId)`

Create a scheduled custom recommendation with the specified parameters.

API Version

35.0 only

Important: In version 36.0 and later, use `createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId, channel)`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String communityId, String recommendationDefinitionId, Integer rank, Boolean enabled, String recommendationAudienceId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the custom recommendation definition.

rank
Type: Integer

Relative rank of the scheduled custom recommendation indicated by ascending whole numbers starting with 1.

Setting the rank is comparable to an insertion into an ordered list. The scheduled custom recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled custom recommendations after it is pushed down. See Ranking scheduled custom recommendations example.

If the specified `rank` is larger than the size of the list, the scheduled custom recommendation is put at the end of the list. The `rank` of the scheduled custom recommendation is the size of the list, instead of the one specified.

If a `rank` is not specified, the scheduled custom recommendation is put at the end of the list.

enabled
Type: Boolean

Indicates whether scheduling is enabled. If `true`, the custom recommendation is enabled and appears in Experience Cloud sites. If `false`, custom recommendations in feeds in Salesforce mobile web aren't removed, but no new custom recommendations appear. In Customer Service and Partner Central sites, disabled custom recommendations no longer appear.

recommendationAudienceId
Type: String

ID of the custom recommendation definition that this scheduled recommendation schedules.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

Ranking scheduled custom recommendations example

If you have these scheduled custom recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Custom Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

`getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults)`

Get the Chatter recommendations, such as user, group, file, and record recommendations for the context user. Get the custom and static recommendations for the context user.

API Version

33.0–35.0

Important: In version 36.0 and later, use `getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *contextAction* and *contextObjectId* together. For example, if you just followed Pam, you specify `follow` for *contextAction* and Pam's user ID for *contextObjectId*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults)`

Get the Chatter, custom, and static recommendations for the context user for the specified action.

API Version

33.0–35.0

Important: In version 36.0 and later, use `getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *contextAction* and *contextObjectId* together. For example, if you just followed Pam, you specify `follow` for *contextAction* and Pam's user ID for *contextObjectId*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults)`

Get the Chatter, custom, and static recommendations for the context user for the specified action and object category.

API Version

33.0–35.0

Important: In version 36.0 and later, use `getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String
communityId, String userId, ConnectApi.RecommendationActionType action, String
```

```
objectCategory, ConnectApi.RecommendationActionType contextAction, String
contextObjectId, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectCategory
Type: String

- If *action* is `follow`, *objectCategory* is `users`, `files`, or `records`.
- If *action* is `join`, *objectCategory* is `groups`.
- If *action* is `view`, *objectCategory* is `users`, `files`, `groups`, `records`, `custom`, or `apps`.

You can also specify a key prefix, the first three characters of the object ID, as the *objectCategory*. Valid values are:

- If *action* is `follow`, *objectCategory* is `005` (users), `069` (files), or `001` (accounts), for example.
- If *action* is `join`, *objectCategory* is `0F9` (groups).
- If *action* is `view`, *objectCategory* is `005` (users), `069` (files), `0F9` (groups), `0RD` (custom recommendations), `T` (static recommendations), or `001` (accounts), for example.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

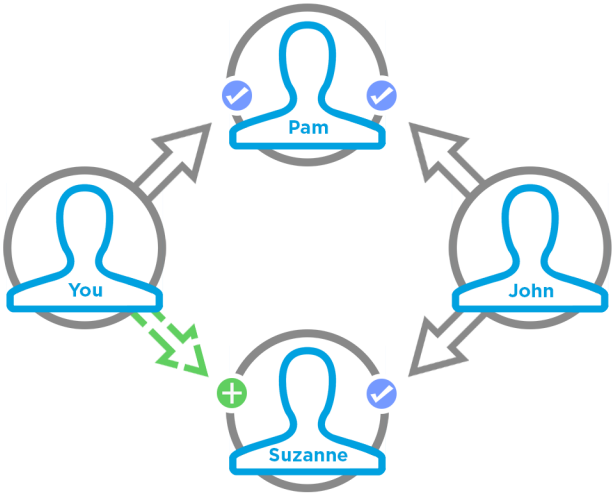
ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.



Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *contextAction* and *contextObjectId* together. For example, if you just followed Pam, you specify `follow` for *contextAction* and Pam's user ID for *contextObjectId*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getScheduledRecommendations(communityId)`

Get scheduled custom recommendations.

API Version

35.0 only

Important: In version 36.0 and later, use `getScheduledRecommendations(communityId, channel)`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.ScheduledRecommendationPage getScheduledRecommendations(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.ScheduledRecommendationPage`

Usage

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults, result)

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

33.0–35.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer maxResults, ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result
Type: `ConnectApi.RecommendationCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults, result)`

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

33.0–35.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, ConnectApi.RecommendationActionType
contextAction, String contextObjectId, Integer maxResults,
ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result
Type: `ConnectApi.RecommendationCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults, result)`

Register a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

33.0–35.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, String objectCategory,
ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer
maxResults, ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

`objectCategory`
Type: String

- If *`action`* is `follow`, *`objectCategory`* is `users`, `files`, or `records`.
- If *`action`* is `join`, *`objectCategory`* is `groups`.
- If *`action`* is `view`, *`objectCategory`* is `users`, `files`, `groups`, `records`,`custom`, or `apps`.

You can also specify a key prefix, the first three characters of the object ID, as the *`objectCategory`*. Valid values are:

- If *`action`* is `follow`, *`objectCategory`* is `005` (users), `069` (files), or `001` (accounts), for example.
- If *`action`* is `join`, *`objectCategory`* is `0F9` (groups).
- If *`action`* is `view`, *`objectCategory`* is `005` (users), `069` (files), `0F9` (groups), `0RD` (custom recommendations), `T` (static recommendations), or `001` (accounts), for example.

`contextAction`
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *`contextAction`* and *`contextObjectId`* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`contextObjectId`
Type: String

ID of the object that the context user just performed an action on.

- If *`contextAction`* is `follow`, *`contextObjectId`* is a user ID, file ID, or record ID.
- If *`contextAction`* is `view`, *`contextObjectId`* is a user ID, file ID, group ID, or record ID.

Use *`contextAction`* and *`contextObjectId`* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`maxResults`
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

`result`
Type: `ConnectApi.RecommendationCollection`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults)

Apex Developer Guide: Testing ConnectApi Code

Records Class

Access information about record motifs, which are small icons used to distinguish record types in the Salesforce UI.

Namespace

ConnectApi

Records Methods

These methods are for `Records`. All methods are static.

IN THIS SECTION:

getMotif(communityId, idOrPrefix)
Get a motif that contains the URLs for a set of small, medium, and large motif icons for a record. It can also contain a base color for the record.

getMotifBatch(communityId, idOrPrefixList)
Get a motif for a list of objects.

`getMotif(communityId, idOrPrefix)`

Get a motif that contains the URLs for a set of small, medium, and large motif icons for a record. It can also contain a base color for the record.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi.Motif getMotif(String communityId, String idOrPrefix)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

idOrPrefix
Type: String

An ID or key prefix.

Return Value

Type: `ConnectApi.Motif`

Usage

Each Salesforce record type has its own set of motif icons.

getMotifBatch(communityId, idOrPrefixList)

Get a motif for a list of objects.

API Version

31.0

Requires Chatter

No

Signature

```
public static ConnectApi.BatchResult[] getMotifBatch(String communityId, List<String>
idOrPrefixList)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

idOrPrefixList
Type: List<String>

A list of object IDs or prefixes.

Return Value

Type: `ConnectApi.BatchResult`[]

The `ConnectApi.BatchResult.getResult()` method returns a `ConnectApi.Motif` object and errors for motifs that didn't load.

Example

```
String communityId = null;
List<String> prefixIds = new List<String> { '001', '01Z', '069' };

// Get info about the motifs of all records in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.Records.getMotifBatch(communityId,
prefixIds);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the color of each motif.
        ConnectApi.Motif motif;
        if(batchResult.getResult() instanceof ConnectApi.Motif) {
            motif = (ConnectApi.Motif) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(motif.color);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

RegisterGuestBuyer Class

Register a guest buyer for a webstore using an account ID, enabling a guest buyer to order on behalf of another buyer.

Namespace

ConnectApi

RegisterGuestBuyer Methods

These methods are for `RegisterGuestBuyer`. All methods are static. Your org must have the Order Management Growth license or Order Management as part of Connected Commerce.

IN THIS SECTION:

registerGuestBuyer(webstoreId, accountId)
Register a guest buyer for a webstore using an account ID. This method enables a guest buyer to order on behalf of another buyer.

`registerGuestBuyer(webstoreId, accountId)`

Register a guest buyer for a webstore using an account ID. This method enables a guest buyer to order on behalf of another buyer.

API Version

60.0

Requires Chatter

No

Signature

```
public static ConnectApi.RegisterGuestBuyerOutputRepresentation registerGuestBuyer(String webstoreId, String accountId)
```

Parameters

webstoreId
Type: String

ID of the webstore.

accountId
Type: String

ID of the account for which the request is made.

Return Value

Type: `ConnectApi.RegisterGuestBuyerOutputRepresentation` on page 2275

Repricing Class

Perform functions related to repricing orders in Order Management.

Namespace

ConnectApi

Repricing Methods

These methods are for `Repricing`. All methods are static.

IN THIS SECTION:

productDetails(webstoreId, skuOrProductId, effectiveAccountId, currencyCode, locale)
Get details of a product in a web store.

searchProducts(webstoreId, searchTerm, pageParam, pageSize, effectiveAccountId, facets)
Search products in a webstore.

`productDetails(webstoreId, skuOrProductId, effectiveAccountId, currencyCode, locale)`

Get details of a product in a web store.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductDetailsOutputRepresentation productDetails(String webstoreId, String skuOrProductId, String effectiveAccountId, String currencyCode, String locale)
```

Parameters

webstoreId
Type: String

ID of the WebStore.

skuOrProductId
Type: String

SKU or ID of the Product.

effectiveAccountId
Type: String

Effective Account ID. Required for B2B stores. For other stores, pass null.

currencyCode
Type: String

ISO currency code. If you pass null, the default store value is used.

locale
Type: String

Locale. If you pass null, the default store value is used.

excludeAttributeSetInfo
Type: String

Specifies whether the attribute set information for the product is returned.

excludeMedia
Type: String

Specifies whether the media groups and default images of the product are returned.

excludeQuantityRule
Type: String

Specifies whether the quantity rule information for the product is returned.

excludeVariationInfo
Type: String

Specifies whether the variation information for the product is returned.

excludePrices
Type: String

Specifies whether the prices for the product is returned.

Return Value

Type: `ConnectApi.ProductDetailsOutputRepresentation`

searchProducts(webstoreId, searchTerm, pageParam, pageSize, effectiveAccountId, facets)

Search products in a webstore.

API Version

59.0

Requires Chatter

No

Signature

```
public static ConnectApi.ProductSearchOutputRepresentation searchProducts(String webstoreId, String searchTerm, Integer pageParam, Integer pageSize, String effectiveAccountId, String facets)
```

Parameters

webstoreId
Type: String

ID of the webstore.

searchTerm
Type: String

Term used for the search.

pageParam
Type: Integer

Maximum number of search results pages to return. If you don't specify a value, the default is 1.

pageSize
Type: Integer

Number of items per page. Valid values are from 1 through 100. If you don’t specify a value, the default size is 20.

effectiveAccountId
Type: String

ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user.

facets
Type: String

A list of facet names to filter the search.For example, `["size_medium", "color_red"]` is encoded to `WyJzaXplX21lZGl1bSIsICJjb2xvcl9yZWQiXQ==`

Return Value

Type: `ConnectApi.ProductSearchOutputRepresentation` on page 2252

ReturnOrder Class

Process ReturnOrders in Order Management, limited to 2,000 requests per hour.

Namespace

ConnectApi

ReturnOrder Methods

These methods are for `ReturnOrder`. All methods are static.

IN THIS SECTION:

createReturnOrder(returnOrderInput)
Create a ReturnOrder and ReturnOrderLineItems for items belonging to an OrderSummary.

returnItems(returnOrderId, returnItemsInput)
Process ReturnOrderLineItems belonging to a ReturnOrder. Processing a ReturnOrderLineItem generates a change Order and makes that ReturnOrderLineItem read-only. The change order for a returned item or delivery charge has a positive amount and should be used to create a credit memo. The change order for a return fee has a negative amount and should be used to create an invoice. If a processed ReturnOrderLineItem has any remaining expected quantity, then the API creates a separate ReturnOrderLineItem representing that quantity.

`createReturnOrder(returnOrderInput)`

Create a ReturnOrder and ReturnOrderLineItems for items belonging to an OrderSummary.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.ReturnOrderOutputRepresentation
createReturnOrder(ConnectApi.ReturnOrderInputRepresentation returnOrderInput)
```

Parameters

returnOrderInput
Type: ConnectApi.ReturnOrderInputRepresentation

Data for creating a ReturnOrder and ReturnOrderLineItems.

Return Value

Type: ConnectApi.ReturnOrderOutputRepresentation

SEE ALSO:

returnItems(returnOrderId, returnItemsInput)

returnItems(returnOrderId, returnItemsInput)

Process ReturnOrderLineItems belonging to a ReturnOrder. Processing a ReturnOrderLineItem generates a change Order and makes that ReturnOrderLineItem read-only. The change order for a returned item or delivery charge has a positive amount and should be used to create a credit memo. The change order for a return fee has a negative amount and should be used to create an invoice. If a processed ReturnOrderLineItem has any remaining expected quantity, then the API creates a separate ReturnOrderLineItem representing that quantity.

API Version

52.0

Requires Chatter

No

Signature

```
public static ConnectApi.ReturnItemsOutputRepresentation returnItems(String
returnOrderId, ConnectApi.ReturnItemsInputRepresentation returnItemsInput)
```

Parameters

returnOrderId
Type: String

ID of the ReturnOrder.

returnItemsInput
Type: ConnectApi.ReturnItemsInputRepresentation

Data about products and delivery charges to return, as well as associated return fees.

Return Value

Type: `ConnectApi.ReturnItemsOutputRepresentation`

SEE ALSO:

createMultipleInvoices(invoicesInput)

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

createReturnOrder(returnOrderInput)

Routing Class

Route orders to inventory locations in Order Management.

Namespace

ConnectApi

Routing Methods

These methods are for `Routing`. All methods are static.

IN THIS SECTION:

confirmHeldFOCapacity(confirmHeldFOCapacityInput)

Confirm held fulfillment order capacity at one or more locations. This call decreases a location's held capacity and increases its assigned fulfillment order count. Confirm held capacity when you assign a fulfillment order to a location.

findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)

Returns combinations of inventory locations that can fulfill an order within a specified limit of shipment splits. By default, checks up to 1,000,000 potential routes, returning a maximum of 10,000 results.

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

For one or more order summaries, find inventory availability using Omnichannel Inventory and identify the fulfillment routes with fewest splits. By default, checks up to 1,000,000 potential routes, returning a maximum of 10,000 results. This method combines the functionality of the `getInventoryAvailability()` and `findRoutesWithFewestSplits()` methods.

getFOCapacityValues(getFOCapacityValuesInput)

Get information about the current fulfillment order capacity of one or more locations.

holdFOCapacity(holdFOCapacityInput)

Hold fulfillment order capacity at a location. Holding capacity at a location reserves a space for a fulfillment order that you'll assign to it.

rankAverageDistance(rankAverageDistanceInputRepresentation)

Calculates the average distance from sets of inventory locations to an order recipient, and ranks them. Use this method to compare the average shipping distances for different sets of locations that can fulfill an order. While this method is executing, you can't invoke another Apex callout.

releaseHeldFOCapacity(releaseHeldFOCapacityInput)

Release held fulfillment order capacity at one or more locations. This call decreases a location's held capacity without changing its assigned fulfillment order count. Release held capacity when you cancel the assignment of a fulfillment order to a location.

confirmHeldFOCapacity(confirmHeldFOCapacityInput)

Confirm held fulfillment order capacity at one or more locations. This call decreases a location's held capacity and increases its assigned fulfillment order count. Confirm held capacity when you assign a fulfillment order to a location.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.ConfirmHeldFOCapacityOutputRepresentation
confirmHeldFOCapacity(ConnectApi.ConfirmHeldFOCapacityInputRepresentation
confirmHeldFOCapacityInput)
```

Parameters

confirmHeldFOCapacityInput
Type: ConnectApi.ConfirmHeldFOCapacityInputRepresentation

The input includes, for each fulfillment order, the location where capacity is held for it.

Return Value

Type: ConnectApi.ConfirmHeldFOCapacityOutputRepresentation

findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)

Returns combinations of inventory locations that can fulfill an order within a specified limit of shipment splits. By default, checks up to 1,000,000 potential routes, returning a maximum of 10,000 results.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.FindRoutesWithFewestSplitsOutputRepresentation
findRoutesWithFewestSplits(ConnectApi.FindRoutesWithFewestSplitsInputRepresentation
findRoutesWithFewestSplitsInputRepresentation)
```

Parameters

findRoutesWithFewestSplitsInputRepresentation
Type: ConnectApi.FindRoutesWithFewestSplitsInputRepresentation

The input includes the ordered item quantities, data about available inventory, and, optionally, a maximum allowable number of shipment splits.

Return Value

Type: ConnectApi.FindRoutesWithFewestSplitsOutputRepresentation

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

For one or more order summaries, find inventory availability using Omnichannel Inventory and identify the fulfillment routes with fewest splits. By default, checks up to 1,000,000 potential routes, returning a maximum of 10,000 results. This method combines the functionality of the `getInventoryAvailability()` and `findRoutesWithFewestSplits()` methods.

API Version

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation
findRoutesWithFewestSplitsUsingOCI(ConnectApi.FindRoutesWithFewestSplitsUsingOCIInputRepresentation
findRoutesWithFewestSplitsUsingOCIInput)
```

Parameters

findRoutesWithFewestSplitsUsingOCIInput
Type: ConnectApi.FindRoutesWithFewestSplitsUsingOCIInputRepresentation

The input includes, for each order, the ordered item quantities, the assigned location group or locations, and, optionally, a maximum allowable number of shipment splits and a list of locations to exclude from the calculation.

Return Value

Type: ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation

SEE ALSO:

getInventoryAvailability(inventoryAvailabilityInputRepresentation)

findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)

getFOCapacityValues(getFOCapacityValuesInput)

Get information about the current fulfillment order capacity of one or more locations.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.GetFOCapacityValuesOutputRepresentation
getFOCapacityValues(ConnectApi.GetFOCapacityValuesRequestInputRepresentation
getFOCapacityValuesInput)
```

Parameters

getFOCapacityValuesInput
Type: ConnectApi.GetFOCapacityValuesRequestInputRepresentation

Locations to get fulfillment order capacity information about.

Return Value

Type: ConnectApi.GetFOCapacityValuesOutputRepresentation

holdFOCapacity(holdFOCapacityInput)

Hold fulfillment order capacity at a location. Holding capacity at a location reserves a space for a fulfillment order that you'll assign to it.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.HoldFOCapacityOutputRepresentation
holdFOCapacity(ConnectApi.HoldFOCapacityInputRepresentation holdFOCapacityInput)
```

Parameters

holdFOCapacityInput
Type: ConnectApi.HoldFOCapacityInputRepresentation

The input includes, for each fulfillment order, the location to hold capacity for it.

Return Value

Type: ConnectApi.HoldFOCapacityOutputRepresentation

rankAverageDistance(rankAverageDistanceInputRepresentation)

Calculates the average distance from sets of inventory locations to an order recipient, and ranks them. Use this method to compare the average shipping distances for different sets of locations that can fulfill an order. While this method is executing, you can't invoke another Apex callout.

API Version

51.0

Requires Chatter

No

Signature

```
public static ConnectApi.RankAverageDistanceOutputRepresentation
rankAverageDistance(ConnectApi.RankAverageDistanceInputRepresentation
rankAverageDistanceInputRepresentation)
```

Parameters

rankAverageDistanceInputRepresentation
Type: ConnectApi.RankAverageDistanceInputRepresentation

An order recipient's geographic location and information about sets of inventory locations that can fulfill the order.

Return Value

Type: ConnectApi.RankAverageDistanceOutputRepresentation

releaseHeldFOCapacity(releaseHeldFOCapacityInput)

Release held fulfillment order capacity at one or more locations. This call decreases a location's held capacity without changing its assigned fulfillment order count. Release held capacity when you cancel the assignment of a fulfillment order to a location.

API Version

55.0

Requires Chatter

No

Signature

```
public static ConnectApi.ReleaseHeldFOCapacityOutputRepresentation
releaseHeldFOCapacity(ConnectApi.ReleaseHeldFOCapacityInputRepresentation
releaseHeldFOCapacityInput)
```

Parameters

releaseHeldFOCapacityInput
Type: ConnectApi.ReleaseHeldFOCapacityInputRepresentation

The input includes, for each fulfillment order, the location that holds the capacity to release.

Return Value

Type: ConnectApi.ReleaseHeldFOCapacityOutputRepresentation

SalesforceInbox Class

Access information about Automated Activity Capture, which is available in Einstein and Salesforce Inbox.

Namespace

ConnectApi

SalesforceInbox Methods

These methods are for `SalesforceInbox`. All methods are static.

IN THIS SECTION:

shareActivity(activityId, sharingInfo)
Share emails or events with certain groups of users.

shareActivity(activityId, sharingInfo)

Share emails or events with certain groups of users.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ActivitySharingResult shareActivity(String activityId,
ConnectApi.ActivitySharingInput sharingInfo)
```

Parameters

activityId
Type: String

The ID of the activity.

sharingInfo
Type: ConnectApi.ActivitySharingInput

A ConnectApi.ActivitySharingInput object.

Return Value

Type: ConnectApi.ActivitySharingResult

Usage

This method is a feature of both Sales Cloud Einstein and Inbox. It lets users connect their email and calendar to Salesforce. Then, their emails and events are automatically added to related Salesforce records. Users can specify who their individual emails and events are shared with.

Search Class

Search objects using keywords or a natural language query.

Namespace

ConnectApi

Search Methods

These methods are for Search. All methods are static.

IN THIS SECTION:

answer(q)
Search objects using a natural language query and return an answer.

answer(q, objectApiName)
Search an object using a natural language query and return an answer.

answer(q, objectApiName, displayFields)
Search an object using a natural language query and display fields.

findAndGroup(q)
Search objects using keyword search and return result groups.

findAndGroup(q, configurationName)
Search objects using keyword search and a configuration. The search returns result groups.

findAndGroup(q, configurationName, highlights)
Search objects using keyword search, a configuration, and highlights. The search returns result groups.

find(objectApiName, request)
Search an object using keywords and return results.

`answer(q)`

Search objects using a natural language query and return an answer.

API Version

63.0

Available to Guest Users

63.0

Requires Chatter

No

Signature

```
public static ConnectApi.SearchAnswer answer(String q)
```

Parameters

q
Type: String

Natural language query to search for in the org.

Return Value

Type: `ConnectApi.SearchAnswer`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`answer(q, objectApiName)`

Search an object using a natural language query and return an answer.

API Version

63.0

Available to Guest Users

63.0

Requires Chatter

No

Signature

```
public static ConnectApi.SearchAnswer answer(String q, String objectApiName)
```

Parameters

q
Type: String

Natural language query to search for in the org.

objectApiName
Type: String

API name of the object.

Return Value

Type: ConnectApi.SearchAnswer

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

answer(q, objectApiName, displayFields)

Search an object using a natural language query and display fields.

API Version

63.0

Available to Guest Users

63.0

Requires Chatter

No

Signature

```
public static ConnectApi.SearchAnswer answer(String q, String objectApiName, List<String>
displayFields)
```

Parameters

q
Type: String

Natural language query to search for in the org.

objectApiName
Type: String

API name of the object.

displayFields
Type: List<String>

List of fields to display and return in the search answer. The default is the citation field.

Return Value

Type: `ConnectApi.SearchAnswer`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`findAndGroup(q)`

Search objects using keyword search and return result groups.

API Version

63.0

Available to Guest Users

63.0

Requires Chatter

No

Signature

```
public static ConnectApi.SearchResultGroups findAndGroup(String q)
```

Parameters

q

Type: String

One or more keywords to search for in the org.

Return Value

Type: `ConnectApi.SearchResultGroups`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`findAndGroup(q, configurationName)`

Search objects using keyword search and a configuration. The search returns result groups.

API Version

63.0

Available to Guest Users

63.0

Requires Chatter

No

Signature

```
public static ConnectApi.SearchResultGroups findAndGroup(String q, String
configurationName)
```

Parameters

q

Type: String

One or more keywords to search for in the org.

configurationName

Type: String

Search configuration to apply.

Return Value

Type: `ConnectApi.SearchResultGroups`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`findAndGroup(q, configurationName, highlights)`

Search objects using keyword search, a configuration, and highlights. The search returns result groups.

API Version

63.0

Available to Guest Users

63.0

Requires Chatter

No

Signature

```
public static ConnectApi.SearchResultGroups findAndGroup(String q, String
configurationName, Boolean highlights)
```

Parameters

q
Type: String

One or more keywords to search for in the org.

configurationName
Type: String

Search configuration to apply.

highlights
Type: Boolean

Specifies whether search generates a text highlight (`true`) or not (`false`).

Return Value

Type: `ConnectApi.SearchResultGroups`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`find(objectApiName, request)`

Search an object using keywords and return results.

API Version

63.0

Available to Guest Users

63.0

Requires Chatter

No

Signature

```
public static ConnectApi.ScopedSearchResults find(String objectApiName,
ConnectApi.SearchRequest request)
```

Parameters

objectApiName
Type: String

API name of the object to search.

request
Type: `ConnectApi.SearchRequest`

`ConnectApi.SearchRequest` input class with more information about what and how to search.

Return Value

Type: `ConnectApi.ScopedSearchResults`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Search Test Methods

These test methods are for `Search`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestAnswer(q, result)`

Registers a `ConnectApi.SearchAnswer` object to be returned when the matching `answer(q)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

63.0

Signature

```
public static Void setTestAnswer(String q, ConnectApi.SearchAnswer result)
```

Parameters

q
Type: String

Natural language query to search for in the org.

result
Type: `ConnectApi.SearchAnswer`

Object containing test data.

Return Value

Type: Void

setTestAnswer(q, objectApiName, result)

Registers a `ConnectApi.SearchAnswer` object to be returned when the matching `answer(q, objectApiName)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

63.0

Signature

```
public static Void setTestAnswer(String q, String objectApiName, ConnectApi.SearchAnswer result)
```

Parameters

q
Type: String

Natural language query to search for in the org.

objectApiName
Type: String

API name of the object.

result
Type: `ConnectApi.SearchAnswer`

Object containing test data.

Return Value

Type: Void

setTestAnswer(q, objectApiName, displayFields, result)

Registers a `ConnectApi.SearchAnswer` object to be returned when the matching `answer(q, objectApiName, displayFields)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

62.0

Signature

```
public static Void setTestAnswer(String q, String objectApiName, List<String> displayFields, ConnectApi.SearchAnswer result)
```

Parameters

q
Type: String

Natural language query to search for in the org.

objectApiName
Type: String

API name of the object.

displayFields
Type: List<String>

List of fields to display and return in the search results. By default, the fields displayed are defined by the search layout.

result
Type: `ConnectApi.SearchAnswer`

Object containing test data.

Return Value

Type: Void

setTestFindAndGroup(q, result)

Registers a `ConnectApi.SearchResultGroups` object to be returned when the matching `findAndGroup(q)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

63.0

Signature

```
public static Void setTestFindAndGroup(String q, ConnectApi.SearchResultGroups result)
```

Parameters

q
Type: String

One or more keywords to search for in the org.

result
Type: `ConnectApi.SearchResultGroups`

Object containing test data.

Return Value

Type: Void

setTestFindAndGroup(q, configurationName, result)

Registers a `ConnectApi.SearchResultGroups` object to be returned when the matching `findAndGroup(q, configurationName)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

63.0

Signature

```
public static Void setTestFindAndGroup(String q, String configurationName,
ConnectApi.SearchResultGroups result)
```

Parameters

q
Type: String

One or more keywords to search for in the org.

configurationName
Type: String

Search configuration to apply.

result
Type: `ConnectApi.SearchResultGroups`

Object containing test data.

Return Value

Type: Void

`setTestFindAndGroup(q, configurationName, highlights, result)`

Registers a `ConnectApi.SearchResultGroups` object to be returned when the matching `findAndGroup(q, configurationName, highlights)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

63.0

Signature

```
public static Void setTestFindAndGroup(String q, String configurationName, Boolean
highlights, ConnectApi.SearchResultGroups result)
```

Parameters

q
Type: String

One or more keywords to search for in the org.

configurationName
Type: String

Search configuration to apply.

highlights
Type: Boolean

Specifies whether search generates a text highlight (`true`) or not (`false`).

result
Type: `ConnectApi.SearchResultGroups`

Object containing test data.

Return Value

Type: Void

`setTestFind(objectApiName, request, result)`

Registers a `ConnectApi.ScopedSearchResults` object to be returned when the matching `find(objectApiName, request)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

63.0

Signature

```
public static Void setTestFind(String objectApiName, ConnectApi.SearchRequest request,
ConnectApi.ScopedSearchResults result)
```

Parameters

objectApiName
Type: String

API name of the object to search.

request
Type: `ConnectApi.SearchRequest`

`ConnectApi.SearchRequest` input class with more information about what and how to search.

result
Type: `ConnectApi.ScopedSearchResults`

Object containing test data.

Return Value

Type: Void

Sites Class

Search an Experience Cloud site.

Namespace

ConnectApi

Sites Methods

These methods are for `Sites`. All methods are static.

IN THIS SECTION:

searchSite(siteId, queryTerm, pageToken, pageSize, language)
Search an Experience Cloud site.

`searchSite(siteId, queryTerm, pageToken, pageSize, language)`

Search an Experience Cloud site.

API Version

54.0

Available to Guest Users

54.0

Requires Chatter

No

Signature

```
public static ConnectApi.SiteSearchResult searchSite(String siteId, String queryTerm,
String pageToken, Integer pageSize, String language)
```

Parameters

siteId
Type: String

ID for the Experience Cloud site.

queryTerm
Type: String

White-space separated words used to search for relevant content. Provide a maximum of 1024 characters, composed of up to 32 words and white spaces. Logical operators aren't supported.

pageToken
Type: String

Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 240. If you pass in `null`, the default size is 25.

`language`
Type: String

Language locale for the context user. If unspecified or if the specified language locale isn't available, the default value is `en_US`.

Return Value

Type: `ConnectApi.SiteSearchResult`

SmartDataDiscovery Class

Get predictions on Salesforce objects.

Use the `ConnectApi.SmartDataDiscovery.predict` method to get predictions on Salesforce objects. For more information, see Get Predictions in Apex.

SocialEngagement Class

Manage information about social accounts or fan pages for social networks.

Namespace

ConnectApi

SocialEngagement Methods

These methods are for `SocialEngagement`. All methods are static.

IN THIS SECTION:

deleteSocialPost(socialPostId, socialAccountId)
Delete a social post from its social network.

followSocialPersona(socialPersonaId, socialAccountId)
Follow a social persona in its social network.

followSocialPostPersona(socialPostId, socialAccountId)
Follow a social persona on a social post in its social network.

getIntents(socialPostId)
Get available intents for a social post.

getManagedSocialAccount(id)
Get a managed social account that is in the org and assigned to the user.

getManagedSocialAccounts()
Gets a list of managed social accounts that are in the org and assigned to the user.

getManagedSocialAccounts(socialNetwork)
Get a list of managed social accounts that are in the org and assigned to the user.

getRelationship(id, socialPersonaId)
Get the follow relationship between a managed social account and a social persona.

hideSocialPost(socialPostId, socialAccountId)
Hide a social post in its social network.

likeSocialPost(socialPostId, socialAccountId)
Like a social post in its social network.

massApprove(massApproval)
Approve or reject the publishing of a large number of social posts.

recallApproval(socialPostId)
Recall an approval request to publish a social post.

unfollowSocialPersona(socialPersonaId, socialAccountId)
Stop following a social persona in its social network.

unfollowSocialPostPersona(socialPostId, socialAccountId)
Stop following a social persona of a social post in its social network.

unhideSocialPost(socialPostId, socialAccountId)
Unhide a social post in its social network.

unlikeSocialPost(socialPostId, socialAccountId)
Unlike a social post in its social network.

`deleteSocialPost(socialPostId, socialAccountId)`

Delete a social post from its social network.

Note: Deleting a social post from its social network doesn't delete the record from Salesforce.

API Version

46.0

Requires Chatter

No

Signature

```
public static ConnectApi.DeleteSocialPostIntent deleteSocialPost(String socialPostId,
String socialAccountId)
```

Parameters

socialPostId
Type: String

ID of the social post to delete.

socialAccountId
Type: String

ID of the social account that deletes the post.

Return Value

Type: ConnectApi.DeleteSocialPostIntent

followSocialPersona(socialPersonaId, socialAccountId)

Follow a social persona in its social network.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.FollowSocialPersonaIntent followSocialPersona(String
socialPersonaId, String socialAccountId)
```

Parameters

socialPersonaId
Type: String

ID of the social persona to follow.

socialAccountId
Type: String

ID of the social account that follows the social persona.

Return Value

Type: ConnectApi.FollowSocialPersonaIntent

followSocialPostPersona(socialPostId, socialAccountId)

Follow a social persona on a social post in its social network.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.FollowSocialPersonaIntent followSocialPostPersona(String
socialPostId, String socialAccountId)
```

Parameters

socialPostId
Type: String

ID of the social post authored by the social persona to follow.

socialAccountId
Type: String

ID of the social account that follows the social persona.

Return Value

Type: ConnectApi.FollowSocialPersonaIntent

getIntents(socialPostId)

Get available intents for a social post.

API Version

45.0

Requires Chatter

No

Signature

```
public static ConnectApi.SocialPostIntents getIntents(String socialPostId)
```

Parameters

socialPostId
Type: String

ID of a social post.

Return Value

Type: ConnectApi.SocialPostIntents

getManagedSocialAccount(id)

Get a managed social account that is in the org and assigned to the user.

API Version

44.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedSocialAccount getManagedSocialAccount(String id)
```

Parameters

id
Type: String

Description: Internal SFDC ID for this managed social account.

Return Value

Type: ConnectApi.ManagedSocialAccount

getManagedSocialAccounts()

Gets a list of managed social accounts that are in the org and assigned to the user.

API Version

44.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedSocialAccounts getManagedSocialAccounts()
```

Return Value

Type: ConnectApi.ManagedSocialAccounts

getManagedSocialAccounts(socialNetwork)

Get a list of managed social accounts that are in the org and assigned to the user.

API Version

44.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedSocialAccounts
getManagedSocialAccounts(ConnectApi.SocialNetworkProvider socialNetwork)
```

Parameters

socialNetwork
Type: ConnectApi.SocialNetworkProvider

Description: Filters results based on the social network. Values are:

- Facebook
- GooglePlus
- Instagram
- InstagramBusiness
- KakaoTalk
- Kik
- Line
- LinkedIn
- Messenger
- Other
- Pinterest
- QQ
- Rypple
- SinaWeibo
- SMS
- Snapchat
- Telegram
- Twitter
- VKontakte
- WeChat
- WhatsApp
- YouTube

Return Value

Type: ConnectApi.ManagedSocialAccounts

getRelationship(id, socialPersonaId)

Get the follow relationship between a managed social account and a social persona.

API Version

46.0

Requires Chatter

No

Signature

```
public static ConnectApi.SocialAccountRelationship getRelationship(String id, String socialPersonaId)
```

Parameters

id
Type: String

ID of the managed social account.

socialPersonaId
Type: String

ID of the social persona.

Return Value

Type: `ConnectApi.SocialAccountRelationship`

hideSocialPost(socialPostId, socialAccountId)

Hide a social post in its social network.

API Version

46.0

Requires Chatter

No

Signature

```
public static ConnectApi.HideSocialPostIntent hideSocialPost(String socialPostId, String socialAccountId)
```

Parameters

socialPostId
Type: String

ID of the social post to hide.

socialAccountId
Type: String

ID of the social account that hides the post.

Return Value

Type: ConnectApi.HideSocialPostIntent

likeSocialPost(socialPostId, socialAccountId)

Like a social post in its social network.

API Version

46.0

Requires Chatter

No

Signature

```
public static ConnectApi.LikeSocialPostIntent likeSocialPost(String socialPostId, String socialAccountId)
```

Parameters

socialPostId
Type: String

ID of the social post to like.

socialAccountId
Type: String

ID of the social account that likes the post.

Return Value

Type: ConnectApi.LikeSocialPostIntent

massApprove(massApproval)

Approve or reject the publishing of a large number of social posts.

API Version

46.0

Requires Chatter

No

Signature

```
public static ConnectApi.SocialPostMassApprovalOutput
massApprove(ConnectApi.SocialPostMassApprovalInput massApproval)
```

Parameters

massApproval
Type: ConnectApi.SocialPostMassApprovalInput

A ConnectApi.SocialPostMassApprovalInput body that includes a list of social post IDs and the action to approve or reject publishing them.

Return Value

Type: ConnectApi.SocialPostMassApprovalOutput

recallApproval(socialPostId)

Recall an approval request to publish a social post.

API Version

46.0

Requires Chatter

No

Signature

```
public static Void recallApproval(String socialPostId)
```

Parameters

socialPostId
Type: String

ID of the social post.

Return Value

Type: Void

unfollowSocialPersona(socialPersonaId, socialAccountId)

Stop following a social persona in its social network.

API Version

45.0

Requires Chatter

No

Signature

```
public static Void unfollowSocialPersona(String socialPersonaId, String socialAccountId)
```

Parameters

socialPersonaId
Type: String

ID of the social persona to stop following.

socialAccountId
Type: String

ID of the social account that stops following the social persona.

Return Value

Type: Void

unfollowSocialPostPersona(socialPostId, socialAccountId)

Stop following a social persona of a social post in its social network.

API Version

45.0

Requires Chatter

No

Signature

```
public static Void unfollowSocialPostPersona(String socialPostId, String socialAccountId)
```

Parameters

socialPostId
Type: String

ID of the social post authored by the social persona to stop following.

socialAccountId
Type: String

ID of the social account that stops following the social persona.

Return Value

Type: Void

unhideSocialPost(socialPostId, socialAccountId)

Unhide a social post in its social network.

API Version

46.0

Requires Chatter

No

Signature

```
public static Void unhideSocialPost(String socialPostId, String socialAccountId)
```

Parameters

socialPostId
Type: String

ID of the social post to unhide.

socialAccountId
Type: String

ID of the social account that unhides the post.

Return Value

Type: Void

unlikeSocialPost(socialPostId, socialAccountId)

Unlike a social post in its social network.

API Version

46.0

Requires Chatter

No

Signature

```
public static Void unlikeSocialPost(String socialPostId, String socialAccountId)
```

Parameters

socialPostId
Type: String

ID of the social post to unlike.

socialAccountId
Type: String

ID of the social account that unlikes the post.

Return Value

Type: Void

Surveys Class

Send survey invitations by email.

Namespace

ConnectApi

Surveys Methods

These methods are for `Surveys`. All methods are static.

IN THIS SECTION:

sendSurveyInvitationEmail(surveyID, SurveyEmailInput)
Email survey invitations to up to 300 participants. You can email either leads, contacts, or users in your org. Either a link to launch the survey or a question can be embedded in the email invitations.

`sendSurveyInvitationEmail(surveyID, SurveyEmailInput)`

Email survey invitations to up to 300 participants. You can email either leads, contacts, or users in your org. Either a link to launch the survey or a question can be embedded in the email invitations.

API Version

50.0

Requires Chatter

No

Signature

```
public static ConnectApi.SurveyInvitationEmailOutput sendSurveyInvitationEmail(String
surveyID, ConnectApi.SurveyInvitationEmailInput SurveyEmailInput)
```

Parameters

surveyID
Type: String

ID of the survey.

SurveyEmailInput
Type: ConnectApi.SurveyInvitationEmailInput

A ConnectApi.SurveyInvitationEmailInput object.

Return Value

Type: ConnectApi.SurveyInvitationEmailOutput

TaxPlatform Class

Apply or cancel tax.

Namespace

ConnectApi

TaxPlatform Methods

These methods are for TaxPlatform. All methods are static.

IN THIS SECTION:

calculateTax(calculateTax)
Apply tax or cancel tax.

calculateTax(calculateTax)

Apply tax or cancel tax.

API Version

55.0

Requires Chatter

No

Signature

```
global static ConnectApi.CalculateTaxResponse calculateTax(ConnectApi.CalculateTaxRequest
calculateTax)
```

Parameters

calculateTax
Type: ConnectApi.CalculateTaxRequest

Represents a request to calculate tax for one or more line items.

Return Value

Type: `ConnectApi.CalculateTaxResponse`

Topics Class

Access information about topics, such as their descriptions, the number of people talking about them, related topics, and information about groups contributing to the topic. Update a topic's name or description, merge topics, and add and remove topics from records and feed items.

Namespace

ConnectApi

Topics Methods

These methods are for `Topics`. All methods are static.

These methods in this class require Chatter and are subject to the per user, per namespace, per hour rate limit.

- `getGroupsRecentlyTalkingAboutTopic(communityId, topicId)`
- `getRecentlyTalkingAboutTopicsForGroup(communityId, groupId)`
- `getRecentlyTalkingAboutTopicsForUser(communityId, userId)`

All other methods in this class count toward the Salesforce Platform total API request allocations, which are per org and span a 24-hour period.

IN THIS SECTION:

assignTopic(communityId, recordId, topicId)
Assign a topic to a record or feed item.

assignTopicByName(communityId, recordId, topicName)
Assign a topic to a record or feed item.

createTopic(communityId, name, description)
Create a topic.

createTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory, topicNames)
Create topic and article assignment rules by data category.

deleteTopic(communityId, topicId)
Delete a topic.

getGroupsRecentlyTalkingAboutTopic(communityId, topicId)
Get information about the five groups that most recently contributed to a topic.

getRecentlyTalkingAboutTopicsForGroup(communityId, groupId)
Get up to five topics most recently used in a group.

getRecentlyTalkingAboutTopicsForUser(communityId, userId)
Get up to five topics most recently used by a user.

getRelatedTopics(communityId, topicId)
Get up to five topics most closely related to a topic.

getTopic(communityId, topicId)
Get a topic.

getTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory)
Get topic and article assignment rules by data category.

getTopics(communityId, recordId)
Get the first page of topics assigned to a record or feed item.

getTopics(communityId)
Get the first page of topics for the org or Experience Cloud site.

getTopics(communityId, sortParam)
Get the first page of sorted topics for the org or community.

getTopics(communityId, pageParam, pageSize)
Get a page of topics.

getTopics(communityId, pageParam, pageSize, sortParam)
Get a page of sorted topics.

getTopics(communityId, q, sortParam)
Get the sorted topics that match the search criteria.

getTopics(communityId, q, pageParam, pageSize)
Get a page of topics that match the search criteria.

getTopics(communityId, q, pageParam, pageSize, sortParam)
Get a page of sorted topics that match the search criteria.

getTopics(communityId, q, exactMatch)
Get the topic that matches the exact, case-insensitive name.

getTopicsOrFallBackToRenamedTopics(communityId, q, exactMatch, fallBackToRenamedTopics)
Get the most recent renamed topic match, if there isn't an exact match.

getTopicSuggestions(communityId, recordId, maxResults)
Get up to a specified number of suggested topics for a record or feed item.

getTopicSuggestions(communityId, recordId)
Get suggested topics for a record or feed item.

getTopicSuggestionsForText(communityId, text, maxResults)
Get up to a specified number of suggested topics for a string of text.

getTopicSuggestionsForText(communityId, text)
Get suggested topics for a string of text.

getTrendingTopics(communityId)
Get trending topics for the org or Experience Cloud site.

getTrendingTopics(communityId, maxResults)
Get up to a specified number of trending topics for the org or Experience Cloud site.

mergeTopics(communityId, topicId, idsToMerge)
Merge up to five secondary topics with a primary topic.

reassignTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory, topicNames)
Reassign topic and article assignment rules by data category by deleting the existing rules and creating new rules.

reassignTopicsByName(communityId, recordId, topicNames)

Reassign all the topics on a record or feed item, that is, remove all the assigned topics on a record or feed item and add topics. Optionally, provide a list of suggested topics to assign to a record or feed item to improve future topic suggestions.

unassignTopic(communityId, recordId, topicId)

Remove a topic from a record or feed item.

updateTopic(communityId, topicId, topic)

Update the description or name of a topic or merge up to five secondary topics with a primary topic.

updateTopicsForArticlesInDataCategory(communityId, dataCategoryGroup, dataCategory, articleTopicAssignmentJob)

Assign topics to articles and unassign topics from articles in a data category.

`assignTopic(communityId, recordId, topicId)`

Assign a topic to a record or feed item.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic assignTopic(String communityId, String recordId, String topicId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`recordId`
Type: String

ID for a record or feed item.

`topicId`
Type: String

ID for a topic.

Return Value

Type: `ConnectApi.Topic`

Usage

Only users with the Assign Topics permission can add existing topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

assignTopicByName(communityId, recordId, topicName)

Assign a topic to a record or feed item.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic assignTopicByName(String communityId, String recordId,
String topicName)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

The ID of the record or feed item to which to assign the topic.

topicName
Type: String

The name of a new or existing topic.

Return Value

Type: `ConnectApi.Topic`

Usage

Only users with the Assign Topics permission can add existing topics to records or feed items. Only users with the Create Topics permission can add new topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

createTopic(communityId, name, description)

Create a topic.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic createTopic(String communityId, String name, String
description)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

name
Type: String

The name of the topic.

description
Type: String

The description of the topic.

Return Value

Type: `ConnectApi.Topic`

Usage

Only users with the Create Topics permission can create a topic.

createTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory, topicNames)

Create topic and article assignment rules by data category.

API Version

40.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage createTopicDataCategoryRules(String communityId,
String dataCategoryGroup, String dataCategory, ConnectApi.TopicNamesInput topicNames)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

dataCategoryGroup
Type: String

The data category group used by articles.

dataCategory
Type: String

The data category used by articles.

topicNames
Type: `ConnectApi.TopicNamesInput`

A `ConnectApi.TopicNamesInput` object with the names of topics to assign to articles in a data category.

Return Value

Type: `ConnectApi.TopicPage`

`deleteTopic(communityId, topicId)`

Delete a topic.

API Version

29.0

Requires Chatter

No

Signature

```
public static Void deleteTopic(String communityId, String topicId)
```

Parameters

communityId
Type: String,

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

ID for a topic.

Return Value

Type: Void

Usage

Only users with the Delete Topics or Modify All Data permission can delete topics.

Topic deletion is asynchronous. If a topic is requested before the deletion completes, the response is successful and the `isBeingDeleted` property of `ConnectApi.Topic` is `true` in version 33.0 and later. If a topic is requested after the deletion completes, the response is `ConnectApi.NotFoundException`.

`getGroupsRecentlyTalkingAboutTopic(communityId, topicId)`

Get information about the five groups that most recently contributed to a topic.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupSummaryPage
getGroupsRecentlyTalkingAboutTopic(String communityId, String topicId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`topicId`
Type: String

ID for a topic.

Return Value

Type: `ConnectApi.ChatterGroupSummaryPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetGroupsRecentlyTalkingAboutTopic(communityId, topicId, result)

Apex Developer Guide: Testing ConnectApi Code

`getRecentlyTalkingAboutTopicsForGroup(communityId, groupId)`

Get up to five topics most recently used in a group.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

Signature

```
public static ConnectApi.TopicPage getRecentlyTalkingAboutTopicsForGroup(String communityId, String groupId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

Return Value

Type: `ConnectApi.TopicPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecentlyTalkingAboutTopicsForGroup(communityId, groupId, result)

Apex Developer Guide: Testing ConnectApi Code

`getRecentlyTalkingAboutTopicsForUser(communityId, userId)`

Get up to five topics most recently used by a user.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.TopicPage getRecentlyTalkingAboutTopicsForUser(String
communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.TopicPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecentlyTalkingAboutTopicsForUser(communityId, userId, result)

`getRelatedTopics(communityId, topicId)`

Get up to five topics most closely related to a topic.

Two topics that are assigned to the same feed item at least three times are related.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getRelatedTopics(String communityId, String topicId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

ID for a topic.

Return Value

Type: `ConnectApi.TopicPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRelatedTopics(communityId, topicId, result)

`getTopic(communityId, topicId)`

Get a topic.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic getTopic(String communityId, String topicId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

ID for a topic.

Return Value

Type: `ConnectApi.Topic`

getTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory)

Get topic and article assignment rules by data category.

API Version

40.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopicDataCategoryRules(String communityId, String
dataCategoryGroup, String dataCategory)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

dataCategoryGroup
Type: String

The data category group used by articles.

dataCategory
Type: String

The data category used by articles.

Return Value

Type: ConnectApi.TopicPage

getTopics(communityId, recordId)

Get the first page of topics assigned to a record or feed item.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String recordId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID for a record or feed item.

Return Value

Type: ConnectApi.TopicPage

Usage

Administrators must enable topics for objects before users can add topics to records of that object type.

getTopics(communityId)

Get the first page of topics for the org or Experience Cloud site.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.TopicPage`

`getTopics(communityId, sortParam)`

Get the first page of sorted topics for the org or community.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, ConnectApi.TopicSort
sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

sortParam
Type: `ConnectApi.TopicSort`

Values are:

- `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
- `alphaAsc`—Sorts topics alphabetically.

Return Value

Type: `ConnectApi.TopicPage`

`getTopics(communityId, pageParam, pageSize)`

Get a page of topics.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, Integer pageParam,
Integer pageSize)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`pageParam`
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.TopicPage`

`getTopics(communityId, pageParam, pageSize, sortParam)`

Get a page of sorted topics.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, Integer pageParam,
Integer pageSize, ConnectApi.TopicSort sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.TopicSort`

Values are:

- `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
- `alphaAsc`—Sorts topics alphabetically.

Return Value

Type: `ConnectApi.TopicPage`

`getTopics(communityId, q, sortParam)`

Get the sorted topics that match the search criteria.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String q,
ConnectApi.TopicSort sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The string must contain at least two characters, not including wildcards.

sortParam
Type: `ConnectApi.TopicSort`

Values are:

- `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
- `alphaAsc`—Sorts topics alphabetically.

Return Value

Type: `ConnectApi.TopicPage`

`getTopics(communityId, q, pageParam, pageSize)`

Get a page of topics that match the search criteria.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String q, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The string must contain at least two characters, not including wildcards.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.TopicPage`

`getTopics(communityId, q, pageParam, pageSize, sortParam)`

Get a page of sorted topics that match the search criteria.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String q, Integer pageParam, Integer pageSize, ConnectApi.TopicSort sortParam)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The string must contain at least two characters, not including wildcards.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.TopicSort`

Values are:

- `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
- `alphaAsc`—Sorts topics alphabetically.

Return Value

Type: `ConnectApi.TopicPage`

`getTopics(communityId, q, exactMatch)`

Get the topic that matches the exact, case-insensitive name.

API Version

33.0

Available to Guest Users

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String q, Boolean
exactMatch)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The string must contain at least two characters, not including wildcards.

exactMatch
Type: Boolean

Specify `true` to find a topic by its exact, case-insensitive name.

Return Value

Type: `ConnectApi.TopicPage`

getTopicsOrFallBackToRenamedTopics(communityId, q, exactMatch, fallBackToRenamedTopics)

Get the most recent renamed topic match, if there isn't an exact match.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopicsOrFallBackToRenamedTopics(String communityId,
String q, Boolean exactMatch, Boolean fallBackToRenamedTopics)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

q
Type: String

Specifies the string to search. The string must contain at least two characters, not including wildcards.

exactMatch
Type: Boolean

Specify `true` to find a topic by its exact, case-insensitive name or to find the most recent renamed topic match if there isn't an exact match.

fallBackToRenamedTopics
Type: Boolean

Specify `true` and if there isn't an exact match, the most recent renamed topic match is returned. If there are multiple renamed topic matches, only the most recent is returned. If there are no renamed topic matches, an empty collection is returned.

Return Value

Type: `ConnectApi.TopicPage`

`getTopicSuggestions(communityId, recordId, maxResults)`

Get up to a specified number of suggested topics for a record or feed item.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicSuggestionPage getTopicSuggestions(String communityId,
String recordId, Integer maxResults)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`recordId`
Type: String

ID for a record or feed item.

`maxResults`
Type: Integer

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

Return Value

Type: `ConnectApi.TopicSuggestionPage`

Usage

Administrators must enable topics for objects before users can see suggested topics for records of that object type.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTopicSuggestions(communityId, recordId, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`getTopicSuggestions(communityId, recordId)`

Get suggested topics for a record or feed item.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicSuggestionPage getTopicSuggestions(String communityId,
String recordId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`recordId`
Type: String

ID for a record or feed item.

Return Value

Type: `ConnectApi.TopicSuggestionPage`

Usage

Administrators must enable topics for objects before users can see suggested topics for records of that object type.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTopicSuggestions(communityId, recordId, result)

Apex Developer Guide: Testing ConnectApi Code

getTopicSuggestionsForText(communityId, text, maxResults)

Get up to a specified number of suggested topics for a string of text.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicSuggestionPage getTopicSuggestionsForText(String
communityId, String text, Integer maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

text
Type: String

String of text.

maxResults
Type: Integer

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

Return Value

Type: `ConnectApi.TopicSuggestionPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTopicSuggestionsForText(communityId, text, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

getTopicSuggestionsForText(communityId, text)

Get suggested topics for a string of text.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicSuggestionPage getTopicSuggestionsForText(String communityId, String text)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

text
Type: String

String of text.

Return Value

Type: `ConnectApi.TopicSuggestionPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTopicSuggestionsForText(communityId, text, result)

Apex Developer Guide: Testing ConnectApi Code

`getTrendingTopics(communityId)`

Get trending topics for the org or Experience Cloud site.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTrendingTopics(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.TopicPage`

Usage

The more frequently people add a specific topic to their posts and comments and comment on or like posts with the same topic over a short period, the more likely it is to become a trending topic. For example, if your coworkers are attending the upcoming Dreamforce conference and have started discussing it in Chatter, you might see a trending topic for Dreamforce. A trending topic is not solely based on popularity and usually relates to a one-time or infrequent event that has a spike in activity, such as a conference or a project deadline.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTrendingTopics(communityId, result)

Apex Developer Guide: Testing ConnectApi Code

`getTrendingTopics(communityId, maxResults)`

Get up to a specified number of trending topics for the org or Experience Cloud site.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTrendingTopics(String communityId, Integer
maxResults)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

maxResults
Type: Integer

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

Return Value

Type: `ConnectApi.TopicPage`

Usage

The more frequently people add a specific topic to their posts and comments and comment on or like posts with the same topic over a short period, the more likely it is to become a trending topic. For example, if your coworkers are attending the upcoming Dreamforce conference and have started discussing it in Chatter, you might see a trending topic for Dreamforce. A trending topic is not solely based on popularity and usually relates to a one-time or infrequent event that has a spike in activity, such as a conference or a project deadline.

SEE ALSO:

setTestGetTrendingTopics(communityId, maxResults, result)

Apex Developer Guide: Testing ConnectApi Code

`mergeTopics(communityId, topicId, idsToMerge)`

Merge up to five secondary topics with a primary topic.

API Version

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic mergeTopics(String communityId, String topicId,
List<String> idsToMerge)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

The ID for the primary topic for the merge. If this topic is a managed topic, it retains its topic type, topic images, and children topics.

idsToMerge
Type: List<String>

A list of up to five comma-separated secondary topic IDs to merge with the primary topic. If any of the secondary topics are navigational or featured topics, they lose their topic type, topic images, and children topics. Their feed items are reassigned to the primary topic. If you merge a topic with a content topic, the content associations are preserved. If you merge a topic with an inactive endorsee, the endorsement isn't mapped to the primary topic.

Return Value

Type: `ConnectApi.Topic`

Usage

Only users with the Delete Topics or Modify All Data permission can merge topics.

`reassignTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory, topicNames)`

Reassign topic and article assignment rules by data category by deleting the existing rules and creating new rules.

API Version

40.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage reassignTopicDataCategoryRules(String communityId,
String dataCategoryGroup, String dataCategory, ConnectApi.TopicNamesInput topicNames)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

dataCategoryGroup
Type: String

The data category group used by articles.

dataCategory
Type: String

The data category used by articles.

topicNames
Type: ConnectApi.TopicNamesInput

A ConnectApi.TopicNamesInput object with the names of topics to reassign to articles in a data category.

Return Value

Type: ConnectApi.TopicPage

reassignTopicsByName(communityId, recordId, topicNames)

Reassign all the topics on a record or feed item, that is, remove all the assigned topics on a record or feed item and add topics. Optionally, provide a list of suggested topics to assign to a record or feed item to improve future topic suggestions.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage reassignTopicsByName(String communityId, String recordId, ConnectApi.TopicNamesInput topicNames)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, internal, or null.

recordId
Type: String

The ID of the record or feed item to which to assign the topic.

topicNames
Type: ConnectApi.TopicNamesInput

A list of topics to replace the currently assigned topics. Optionally, a list of suggested topics to assign to improve future topic suggestions.

Return Value

Type: ConnectApi.TopicPage

Usage

Only users with the Assign Topics permission can remove topics from records or feed items and add existing topics to records or feed items. Only users with the Create Topics permission can add new topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

unassignTopic(communityId, recordId, topicId)

Remove a topic from a record or feed item.

API Version

29.0

Requires Chatter

No

Signature

```
public static Void unassignTopic(String communityId, String recordId, String topicId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID for a record or feed item.

topicId
Type: String

ID for a topic.

Return Value

Type: Void

Usage

Only users with the Assign Topics permission can remove topics from feed items or records. Administrators must enable topics for objects before users can add topics to records of that object type.

updateTopic(communityId, topicId, topic)

Update the description or name of a topic or merge up to five secondary topics with a primary topic.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic updateTopic(String communityId, String topicId,
ConnectApi.TopicInput topic)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

ID for a topic.

topic
Type: `ConnectApi.TopicInput`

A `ConnectApi.TopicInput` object containing the name and description of the topic or up to five comma-separated secondary topic IDs to merge with the primary topic.

Return Value

Type: `ConnectApi.Topic`

Usage

Only users with the Edit Topics or Modify All Data permission can update topic names and descriptions. Only users with the Delete Topics or Modify All Data permission can merge topics.

updateTopicsForArticlesInDataCategory(communityId, dataCategoryGroup, dataCategory, articleTopicAssignmentJob)

Assign topics to articles and unassign topics from articles in a data category.

API Version

40.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage updateTopicsForArticlesInDataCategory(String communityId, String dataCategoryGroup, String dataCategory, ConnectApi.ArticleTopicAssignmentJobInput articleTopicAssignmentJob)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

dataCategoryGroup
Type: String

The data category group used by articles.

dataCategory
Type: String

The data category used by articles.

articleTopicAssignmentJob
Type: `ConnectApi.ArticleTopicAssignmentJobInput`

A `ConnectApi.ArticleTopicAssignmentJobInput` object that indicates the operation to take on which topics.

Return Value

Type: `ConnectApi.TopicPage`

Topics Test Methods

These test methods are for `Topics`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestGetGroupsRecentlyTalkingAboutTopic(communityId, topicId, result)`

Register a `ConnectApi.ChatterGroupSummaryPage` object to be returned when the matching `ConnectApi.getGroupsRecentlyTalkingAboutTopic` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetGroupsRecentlyTalkingAboutTopic(String communityId, String topicId, ConnectApi.ChatterGroupSummaryPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

ID for a topic.

result
Type: `ConnectApi.ChatterGroupSummaryPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getGroupsRecentlyTalkingAboutTopic(communityId, topicId)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetRecentlyTalkingAboutTopicsForGroup(communityId, groupId, result)`

Register a `ConnectApi.TopicPage` object to be returned when the matching `ConnectApi.getRecentlyTalkingAboutTopicsForGroup` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetRecentlyTalkingAboutTopicsForGroup(String communityId,
String groupId, ConnectApi.TopicPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

groupId
Type: String

ID for a group.

result
Type: `ConnectApi.TopicPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecentlyTalkingAboutTopicsForGroup(communityId, groupId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetRecentlyTalkingAboutTopicsForUser(communityId, userId, result)

Register a `ConnectApi.TopicPage` object to be returned when the matching `ConnectApi.getRecentlyTalkingAboutTopicsForUser` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetRecentlyTalkingAboutTopicsForUser(String communityId,
String userId, ConnectApi.TopicPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

result
Type: `ConnectApi.TopicPage`

Specify the test topics page.

Return Value

Type: Void

SEE ALSO:

getRecentlyTalkingAboutTopicsForUser(communityId, userId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetRelatedTopics(communityId, topicId, result)

Register a `ConnectApi.TopicPage` object to be returned when the matching `ConnectApi.getRelatedTopics` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetRelatedTopics(String communityId, String topicId,
ConnectApi.TopicPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

topicId
Type: String

ID for a topic.

result
Type: `ConnectApi.TopicPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getRelatedTopics(communityId, topicId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetTopicSuggestions(communityId, recordId, maxResults, result)

Register a `ConnectApi.TopicSuggestionPage` object to be returned when the matching `ConnectApi.getTopicSuggestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTopicSuggestions(String communityId, String recordId,
Integer maxResults, ConnectApi.TopicSuggestionPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID for a record or feed item.

maxResults
Type: Integer

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

result
Type: `ConnectApi.TopicSuggestionPage`

Specify the test topic suggestions page.

Return Value

Type: Void

SEE ALSO:

getTopicSuggestions(communityId, recordId, maxResults)

Apex Developer Guide: Testing ConnectApi Code

setTestGetTopicSuggestions(communityId, recordId, result)

Register a `ConnectApi.TopicSuggestionPage` object to be returned when the matching `ConnectApi.getTopicSuggestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTopicSuggestions(String communityId, String recordId,
ConnectApi.TopicSuggestionPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

recordId
Type: String

ID for a record or feed item.

result
Type: `ConnectApi.TopicSuggestionPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getTopicSuggestions(communityId, recordId)

Apex Developer Guide: Testing ConnectApi Code

setTestGetTopicSuggestionsForText(communityId, text, maxResults, result)

Register a `ConnectApi.TopicSuggestionPage` object to be returned when the matching `ConnectApi.getTopicSuggestionsForText` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTopicSuggestionsForText(String communityId, String text,
Integer maxResults, ConnectApi.TopicSuggestionPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

text
Type: String

String of text.

maxResults
Type: Integer

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

result
Type: `ConnectApi.TopicSuggestionPage`

Object containing test data.

Return Value

Type: Void

Apex Developer Guide: Testing ConnectApi Code

setTestGetTopicSuggestionsForText(communityId, text, result)

Register a `ConnectApi.TopicSuggestionPage` object to be returned when the matching `ConnectApi.getTopicSuggestionsForText` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTopicSuggestionsForText(String communityId, String text,
ConnectApi.TopicSuggestionPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

text
Type: String

String of text.

result
Type: `ConnectApi.TopicSuggestionPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getTopicSuggestionsForText(communityId, text)

Apex Developer Guide: Testing ConnectApi Code

setTestGetTrendingTopics(communityId, result)

Register a `ConnectApi.TopicPage` object to be returned when the matching `ConnectApi.getTrendingTopics` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTrendingTopics(String communityId, ConnectApi.TopicPage
result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

result
Type: `ConnectApi.TopicPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getTrendingTopics(communityId)

Apex Developer Guide: Testing ConnectApi Code

`setTestGetTrendingTopics(communityId, maxResults, result)`

Register a `ConnectApi.TopicPage` object to be returned when the matching `ConnectApi.getTrendingTopics` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTrendingTopics(String communityId, Integer maxResults,
ConnectApi.TopicPage result)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

maxResults
Type: Integer

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

result
Type: `ConnectApi.TopicPage`

Object containing test data.

Return Value

Type: Void

SEE ALSO:

getTrendingTopics(communityId, maxResults)

Apex Developer Guide: Testing ConnectApi Code

UserProfiles Class

Access user profile data. The user profile data populates the profile page (also called the Chatter profile page). This data includes user information (such as address, manager, and phone number), some user capabilities (permissions), and a set of subtab apps, which are custom tabs on the profile page.

Namespace

ConnectApi

UserProfiles Methods

These methods are for `UserProfiles`. All methods are static.

All methods in this class require Chatter and are subject to the per user, per namespace, per hour rate limit.

IN THIS SECTION:

deleteBannerPhoto(communityId, userId)
Delete a user's banner photo.

deletePhoto(communityId, userId)
Delete a user's photo.

getBannerPhoto(communityId, userId)
Get a user's banner photo.

getPhoto(communityId, userId)
Get a user's photo.

getUserProfile(communityId, userId)
Get the user profile of the context user.

setBannerPhoto(communityId, userId, fileId, versionNumber)
Set an uploaded file as a user's banner photo.

setBannerPhoto(communityId, userId, fileUpload)
Set a file that hasn't been uploaded as a user's banner photo.

setBannerPhotoWithAttributes(communityId, userId, bannerPhoto)
Set and crop an uploaded file as a user's banner photo.

setBannerPhotoWithAttributes(communityId, userId, bannerPhoto, fileUpload)
Set and crop a file that hasn't been uploaded as a user's banner photo.

setPhoto(communityId, userId, fileId, versionNumber)
Set an uploaded file as a user's photo.

setPhoto(communityId, userId, fileUpload)
Set a file that hasn't been uploaded as a user's photo.

setPhotoWithAttributes(communityId, userId, photo)
Set and crop an uploaded file as a user's photo.

setPhotoWithAttributes(communityId, userId, photo, fileUpload)
Set and crop a file that hasn't been uploaded as a user's photo.

`deleteBannerPhoto(communityId, userId)`

Delete a user's banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void deleteBannerPhoto(String communityId, String userId)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID of the user.

Return Value

Type: Void

deletePhoto(communityId, userId)

Delete a user's photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static Void deletePhoto(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

Return Value

Type: Void

getBannerPhoto(communityId, userId)

Get a user's banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto getBannerPhoto(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.BannerPhoto`

getPhoto(communityId, userId)

Get a user's photo.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo getPhoto(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.Photo`

getUserProfile(communityId, userId)

Get the user profile of the context user.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserProfile getUserProfile(String communityId, String userId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for a user.

Return Value

Type: `ConnectApi.UserProfile`

setBannerPhoto(communityId, userId, fileId, versionNumber)

Set an uploaded file as a user's banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String userId,
String fileId, Integer versionNumber)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

fileId
Type: String

ID of the uploaded file to use as the user banner. The key prefix must be 069, and the image must be smaller than 8 MB.

versionNumber
Type: Integer

Version number of the file. Specify an existing version number or, to get the latest version, specify `null`.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

Photos are processed asynchronously and might not be visible right away.

setBannerPhoto(communityId, userId, fileUpload)

Set a file that hasn't been uploaded as a user's banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String userId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

Photos are processed asynchronously and might not be visible right away.

setBannerPhotoWithAttributes(communityId, userId, bannerPhoto)

Set and crop an uploaded file as a user's banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,
String userId, ConnectApi.BannerPhotoInput bannerPhoto)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

bannerPhoto
Type: `ConnectApi.BannerPhotoInput`

A `ConnectApi.BannerPhotoInput` object that specifies the ID and version of the file, and how to crop the file.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

Photos are processed asynchronously and might not be visible right away.

setBannerPhotoWithAttributes(communityId, userId, bannerPhoto, fileUpload)

Set and crop a file that hasn't been uploaded as a user's banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,
String userId, ConnectApi.BannerPhotoInput bannerPhoto, ConnectApi.BinaryInput
fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID of the user.

bannerPhoto
Type: `ConnectApi.BannerPhotoInput`

A `ConnectApi.BannerPhotoInput` object specifying the cropping parameters.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

Photos are processed asynchronously and might not be visible right away.

setPhoto(communityId, userId, fileId, versionNumber)

Set an uploaded file as a user's photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String userId, String
fileId, Integer versionNumber)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

fileId
Type: String

ID of an uploaded file. The file must be an image, and be smaller than 2 GB.

versionNumber
Type: Integer

Version number of the existing file. Specify either an existing version number, or `null` to get the latest version.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

setPhoto(communityId, userId, fileUpload)

Set a file that hasn't been uploaded as a user's photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String userId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

`fileUpload`
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

`setPhotoWithAttributes(communityId, userId, photo)`

Set and crop an uploaded file as a user's photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`userId`
Type: String

ID for the context user or the keyword `me`.

`photo`
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

`setPhotoWithAttributes(communityId, userId, photo, fileUpload)`

Set and crop a file that hasn't been uploaded as a user's photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

userId
Type: String

ID for the context user or the keyword `me`.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the cropping parameters.

fileUpload
Type: `ConnectApi.BinaryInput`

File to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and might not be visible right away.

Zones Class

Access information about Chatter Answers zones in your organization. Zones organize questions into logical groups, with each zone having its own focus and unique questions.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

Namespace

ConnectApi

Zones Methods

These methods are for `Zones`. All methods are static.

All methods in this class require Chatter and are subject to the per user, per namespace, per hour rate limit.

IN THIS SECTION:

getZone(communityId, zoneId)
Get a zone.

getZones(communityId)
Get a list of zones.

getZones(communityId, pageParam, pageSize)
Get a page of zones.

searchInZone(communityId, zoneId, q, filter)
Search articles or questions in a zone.

searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)
Search a page of articles or questions in a zone.

searchInZone(communityId, zoneId, q, filter, language)
Search articles or questions in a zone, and specify the language of the results.

`getZone(communityId, zoneId)`

Get a zone.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Zone getZone(String communityId, String zoneId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

zoneId
Type: String

The ID of a zone.

Return Value

Type: `ConnectApi.Zone`

getZones(communityId)

Get a list of zones.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ZonePage getZones(String communityId)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

Return Value

Type: `ConnectApi.ZonePage`

getZones(communityId, pageParam, pageSize)

Get a page of zones.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Zone getZones(String communityId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

pageParam
Type: Integer

Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ZonePage`

searchInZone(communityId, zoneId, q, filter)

Search articles or questions in a zone.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version

29.0

Available to Guest Users

37.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ZoneSearchPage searchInZone(String communityId, String zoneId,
String q, ConnectApi.ZoneSearchResultType filter)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

zoneId
Type: String

ID of a zone.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.ZoneSearchResultType`

A `ZoneSearchResultType` enum value. One of the following:

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

Return Value

Type: `ConnectApi.ZoneSearchPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchInZone(communityId, zoneId, q, filter, result)

Apex Developer Guide: Testing ConnectApi Code

`searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)`

Search a page of articles or questions in a zone.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. 37.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ZoneSearchPage searchInZone(String communityId, String zoneId,
String q, ConnectApi.ZoneSearchResultType filter, String pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

zoneId
Type: String

ID of a zone.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.ZoneSearchResultType`

A `ZoneSearchResultType` enum value. One of the following:

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

pageParam
Type: String

Specifies the page token to use to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ZoneSearchPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchInZone(communityId, zoneId, q, filter, pageParam, pageSize, result)

Apex Developer Guide: Testing ConnectApi Code

`searchInZone(communityId, zoneId, q, filter, language)`

Search articles or questions in a zone, and specify the language of the results.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

37.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ZoneSearchPage searchInZone(String communityId, String zoneId,
String q, ConnectApi.ZoneSearchResultType filter, String language)
```

Parameters

`communityId`
Type: String

ID for an Experience Cloud site, `internal`, or `null`.

`zoneId`
Type: String

ID of a zone.

`q`
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`filter`
Type: `ConnectApi.ZoneSearchResultType`

- `Article`—Search results contain only articles.

- `Question`—Search results contain only questions.

`language`
Type: String

The language of the articles or questions. The value must be a Salesforce supported locale code.

Return Value

Type: `ConnectApi.ZoneSearchPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchInZone(communityId, zoneId, q, filter, language, result)

Zones Test Methods

These test methods are for `Zones`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestSearchInZone(communityId, zoneId, q, filter, result)`

Register a `ConnectApi.ZoneSearchPage` object to be returned when `searchInZone(communityId, zoneId, q, filter)` is called in a test context. Use the method with the same parameters or you receive an exception.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version

29.0

Signature

```
public static Void setTestSearchInZone(String communityId, String zoneId, String q,
ConnectApi.ZoneSearchResultType filter, ConnectApi.ZoneSearchPage result)
```

Parameters

`communityId`
Type: String

Use either the ID for an Experience Cloud site, `internal`, or `null`.

`zoneId`
Type: String

The ID of a zone.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.ZoneSearchResultType`

A `ZoneSearchResultType` enum value. One of the following:

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

result
Type: `ConnectApi.ZoneSearchPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchInZone(communityId, zoneId, q, filter)

Apex Developer Guide: Testing ConnectApi Code

`setTestSearchInZone(communityId, zoneId, q, filter, pageParam, pageSize, result)`

Register a `ConnectApi.ZoneSearchPage` object to be returned when `searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)` is called in a test context. Use the method with the same parameters or you receive an exception.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. API Version

29.0

Signature

```
public static Void setTestSearchInZone(String communityId, String zoneId, String q,
ConnectApi.ZoneSearchResultType filter, String pageParam, Integer pageSize,
ConnectApi.ZoneSearchPage result)
```

Parameters

communityId
Type: String

Use either the ID for an Experience Cloud site, `internal`, or `null`.

zoneId
Type: String

The ID of a zone.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.ZoneSearchResultType`

A `ZoneSearchResultType` enum value. One of the following:

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

pageParam
Type: String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.ZoneSearchPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)

Apex Developer Guide: Testing ConnectApi Code

`setTestSearchInZone(communityId, zoneId, q, filter, language, result)`

Register a `ConnectApi.ZoneSearchPage` object to be returned when `searchInZone(communityId, zoneId, q, filter, language)` is called in a test context. Use the method with the same parameters or you receive an exception.

Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.

API Version

36.0

Signature

```
public static Void setTestSearchInZone(String communityId, String zoneId, String q,
ConnectApi.ZoneSearchResultType filter, String language, ConnectApi.ZoneSearchPage
result)
```

Parameters

communityId
Type: String

Use either the ID for an Experience Cloud site, `internal`, or `null`.

zoneId
Type: String

The ID of a zone.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.ZoneSearchResultType`

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

language
Type: String

The language of the articles or questions. The value must be a Salesforce supported locale code. In an `<apex:page>`, the default value is the language of the page. Otherwise, the default value is the user's locale.

result
Type: `ConnectApi.ZoneSearchPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchInZone(communityId, zoneId, q, filter, language)

Apex Developer Guide: Testing ConnectApi Code

`ConnectApi` Input Classes

Some `ConnectApi` methods take arguments that are instances of `ConnectApi` input classes.

Input classes are concrete unless marked abstract in this documentation. Concrete input classes have public constructors that have no parameters.

Some methods have parameters that are typed with an abstract class. You must pass in an instance of a concrete child class for these parameters.

Most input class properties can be set. Read-only properties are noted in this documentation.

ConnectApi.AbstractCheckoutAddressInput

A checkout address.

This class is abstract.

Superclass of:

- `ConnectApi.CartShippingAddressInput`

Property	Type	Description	Required or Optional	Available Version
`city`	String	City of the address.	Optional	53.0
`companyName`	String	Company name of the address.	Optional	59.0
`country`	String	ISO code of the address country. Must match one of the valid ISO codes defined within the org's State-Country picklist.	Required	53.0
`firstName`	String	First name of the contact.	Optional	57.0
`id`	String	ID of the address.	Required	53.0
`lastName`	String	Last name of the contact.	Optional	57.0
`name`	String	Name of the contact.	Required	53.0
`postalCode`	String	ZIP code of the address.	Optional	53.0
`region`	String	ISO code of the address region. Must match one of the valid ISO codes defined within the org's State-Country picklist.	Optional	53.0
`shipToPhoneNumber`	String	Phone number of the contact.	Optional	63.0
`street`	String	Street of the address.	Required	53.0

ConnectApi.AbstractList

Primitive list input.

This class is abstract.

Superclass of:

- ConnectApi.BooleanList
- ConnectApi.DoubleList
- ConnectApi.LongList
- ConnectApi.StringList

No additional properties.

SEE ALSO:

ConnectApi.SearchFilter

ConnectApi.ActionLinkDefinitionInput

The definition of an action link. An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can drive productivity and accelerate innovation.

Usage

You can use context variables in the `actionUrl`, `headers`, and `requestBody` properties. Use context variables to pass information about the user who executed the action link to your server-side code. Salesforce substitutes the value when the action link is executed.

The available context variables are:

Context Variable	Description
`{!actionLinkId}`	The ID of the action link the user executed.
`{!actionLinkGroupId}`	The ID of the action link group containing the action link the user executed.
`{!communityId}`	The ID of the site in which the user executed the action link. The value for your internal org is the empty key `"000000000000000000"`.
`{!communityUrl}`	The URL of the site in which the user executed the action link. The value for your internal org is empty string `""`.
`{!orgId}`	The ID of the org in which the user executed the action link.
`{!userId}`	The ID of the user that executed the action link.

Property	Type	Description	Required or Optional	Available Version
`actionType`	`ConnectApi.ActionLinkType`	Defines the type of action link. Values are: • `Api`—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server. • `ApiAsync`—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus`	Required Can be defined in an action link template.	33.0

Property	Type	Description	Required or Optional	Available Version
		state until a third party makes a request to `/connect/action-links/actionLinkId` to set the status to `SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete. • `Download`—The action link downloads a file from the action URL. • `Ui`—The action link takes the user to a web page at the action URL. Use `Ui` if you need to load a page before the user performs an action, for example, to have the user provide input or view something before the action happens. Note: Invoking `ApiAsync` action links from an app requires a call to set the status. However, there isn't currently a way to set the status of an action link using Apex. To set the status, use Connect REST API. See the Action Link resource in the Connect REST API Developer Guidefor more information.		
`actionUrl`	String	The action link URL. For example, a `Ui` action link URL is a Web page. A `Download` action link URL is a link to the file to download. `Ui` and `Download` action link URLs are provided to clients. An `Api` or `ApiAsync` action link URL is a REST resource. `Api` and `ApiAsync` action link URLs aren't provided to clients. Links to Salesforce can be relative. All other links must be absolute and start with `https://`. Tip: To avoid issues due to upgrades or changing functionality in your API, we recommend using a versioned API for `actionUrl`, for example, `https://www.example.com/api/v1/exampleResource`. If your API isn't versioned, you can use the `expirationDate`	Required Can be defined in an action link template.	33.0

Property	Type	Description	Required or Optional	Available Version
		property of the `ConnectApi.ActionLinkGroupDefinitionInput` class to avoid issues due to upgrades or changing functionality in your API.		
`excludedUserId`	String	ID of a single user to exclude from performing the action. If you specify an `excludedUserId`, you can't specify a `userId`.	Optional Can be defined in an action link template using the `User Visibility` and `Custom User Alias` fields.	33.0
`groupDefault`	Boolean	`true` if this action is the default action link in the action link group; `false` otherwise. There can be only one default action link per action link group. The default action link gets distinct styling in the Salesforce UI.	Optional Can be defined in an action link template.	33.0
`headers`	List<`ConnectApi.RequestHeaderInput`>	The request headers for the `Api` and `ApiAsync` action link types. See Action Links Overview, Authentication, and Security.	Optional Can be defined in an action link template.	33.0
`labelKey`	String	Key for the set of labels to show in the user interface. A set includes labels for these states: NewStatus, PendingStatus, SuccessStatus, FailedStatus. For example, if you use the `Approve` key, you get these labels: Approve, Pending, Approved, Failed. For a complete list of keys and labels, see Action Links Labels. If none of the predefined labels work for your action link, use a custom label. To use a custom label, create an action link template. See Create Action Link Templates.	Required Can be defined in an action link template.	33.0
`method`	`ConnectApi.HttpRequestMethod`	One of these HTTP methods: • `HttpDelete`—Returns HTTP 204 on success. Response body or output class is empty. • `HttpGet`—Returns HTTP 200 on success.	Required Can be defined in an action link template.	33.0

Property	Type	Description	Required or Optional	Available Version
		• `HttpHead`—Returns HTTP 200 on success. Response body or output class is empty. • `HttpPatch`—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty. • `HttpPost`—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success. • `HttpPut`—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty.		
`requestBody`	String	The request body for `Api` action links. Note: Escape quotation mark characters in the `requestBody` value.	Optional Can be defined in an action link template.	33.0
`requires Confirmation`	Boolean	`true` to require the user to confirm the action; `false` otherwise.	Required Can be defined in an action link template.	33.0
`userId`	String	The ID of the user who can execute the action. If not specified or `null`, any user can execute the action. If you specify a `userId`, you can't specify an `excludedUserId`.	Optional Can be defined in an action link template using the `User Visibility` and `Custom User Alias` fields.	33.0

SEE ALSO:

ConnectApi.ActionLinkGroupDefinitionInput

ConnectApi.ActionLinkGroupDefinitionInput

The definition of an action link group. All action links must belong to a group. Action links in a group are mutually exclusive and share some properties. Define standalone actions in their own action group.

Action link definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

Property	Type	Description	Required or Optional	Available Version
`actionLinks`	`List<ConnectApi.ActionLinkDefinitionInput>`	The action links that make up this group. Within an action link group, action links are displayed in the order listed in the `actionLinks` property of the `ConnectApi.ActionLinkGroupDefinitionInput` class. Within a feed item, action link groups are displayed in the order specified in the `actionLinkGroupIds` property of the `ConnectApi.AssociatedActionsCapabilityInput` class. You can create up to three action links in a `Primary` group and up to four in an `Overflow` group.	Required to instantiate this action link group without a template. To instantiate from a template, don't specify a value.	33.0
`category`	`ConnectApi.PlatformActionGroupCategory`	Indicates the priority and relative locations of action links in an associated feed item. Values are: • `Primary`—The action link group is displayed in the body of the feed element. • `Overflow`—The action link group is displayed in the overflow menu of the feed element.	Required to instantiate this action link group without a template. To instantiate from a template, don't specify a value.	33.0
`executionsAllowed`	`ConnectApi.ActionLinkExecutionsAllowed`	Defines the number of times an action link can be executed. Values are: • `Once`—An action link can be executed only one time across all users. • `OncePerUser`—An action link can be executed only one time for each user. • `Unlimited`—An action link can be executed an unlimited number of times by each user. If the action link's `actionType` is `Api` or `ApiAsync`, you can't use this value.	Required to instantiate this action link group without a template. To instantiate from a template, don't specify a value.	33.0
`expirationDate`	`Datetime`	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z, that represents	Required to instantiate this action link group without a template.	33.0

Property	Type	Description	Required or Optional	Available Version
		the date and time this action link group is removed from associated feed items and can no longer be executed. The `expirationDate` must be within one year of the creation date. If the action link group definition includes an OAuth token, it is a good idea to set the expiration date of the action link group to the same value as the expiration date of the OAuth token so that users can't execute the action link and get an OAuth error. To set a date when instantiating from a template, see Set the Action Link Group Expiration Time in Design Action Link Templates.	Optional to instantiate from a template.	
`templateBindings`	[illegible]	A collection of key-value pairs to fill in binding variable values or a custom user alias from an action link template. To instantiate this action link group from an action link template that uses binding variables, you must provide values for all the variables. See Define Binding Variables in Design Action Link Templates.	To instantiate without a template, don't specify a value. Required to instantiate this action link group from a template that uses binding variables.	33.0
`templateId`	`String`	The ID of the action link group template from which to instantiate this action link group.	To instantiate without a template, don't specify a value. Required to instantiate this action link group from a template.	33.0

SEE ALSO:

- Define an Action Link and Post with a Feed Element
- Define an Action Link in a Template and Post with a Feed Element
- createActionLinkGroupDefinition(communityId, actionLinkGroup)

ConnectApi.ActionLinkTemplateBindingInput

A key-value pair to fill in a binding variable value from an action link template.

Property	Type	Description	Required or Optional	Available Version
`key`	String	The name of the binding variable key specified in the action link template in Setup. For example, if the binding variable in the template is `{!Binding.firstName}`, the key is `firstName`	Required	33.0
`value`	String	The value of the binding variable key. For example, if the key is `firstName`, this value could be `Joan`.	Required	33.0

SEE ALSO:

ConnectApi.ActionLinkGroupDefinitionInput

ConnectApi.ActivitySharingInput

Defines who a captured email or event is shared with.

Property	Type	Description	Required or Optional	Available Version
`groupsToShareWith`	List<`String`>	List of IDs for the groups that you share the activity with. Valid only if `sharingType` is `MyGroups`.	Optional	39.0
`sharingType`	`ConnectApi.ActivitySharingType`	Type of sharing operation. Values are: • `Everyone`—The activity is shared with everyone. • `MyGroups`—The activity is shared only with a selection of the context user's groups. • `OnlyMe`—The activity is private.	Required	39.0

ConnectApi.AddressRequest

Address input representation for a payment method or card payment method.

Name	Type	Description	Required or Optional	Available Version
`city`	String	Payment method city.	Optional	51.0
`companyName`	String	Payment method company name.	Optional	51.0
`country`	String	Payment method country.	Optional	51.0

Name	Type	Description	Required or Optional	Available Version
`postalCode`	String	Payment method postal code.	Optional	51.0
`state`	String	Payment method state.	Optional	51.0
`street`	String	Payment method street.	Optional	51.0

ConnectApi.AdjustItemInputRepresentation

A price adjustment to an OrderItemSummary. It only supports discounts, not increases.

Property	Type	Description	Required or Optional	Available Version
`adjustmentType`	String	Describes how the amount is calculated. It can have one of these values: • `AmountWithTax`—Value of amount is the adjustment, including tax. • `AmountWithoutTax`—Value of amount is the adjustment, not including tax. Tax is calculated on the value and added. • `Percentage`—Value of amount is a percentage discount. It is divided by 100, and then multiplied by the TotalPrice and TotalTaxAmount of the OrderItemSummary to determine the adjustment amount.	Required	49.0
`amount`	Double	Value used to calculate the adjustment amount, as described by the adjustmentType. It must be a negative value.	Required	49.0
`description`	String	Description of the adjustment.	Optional	49.0
`orderItemSummaryId`	String	ID of the OrderItemSummary.	Required	49.0
`reason`	String	Reason for the adjustment. The value must match one of the picklist values on the Reason field of the OrderItemSummaryChange object.	Required	49.0

ConnectApi.AdjustOrderItemSummaryInputRepresentation

Price adjustments to order item summaries that together make up a price adjustment to an order, with options for adjusting items in the process of being fulfilled.

Property	Type	Description	Required or Optional	Available Version
`adjustItems`	List<`ConnectApi.AdjustItemInputRepresentation`>	List of price adjustments to order item summaries.	Required	49.0
`allocatedItemsChangeOrderType`	String	Process to use for order item summary quantities that are currently being fulfilled, defined as `QuantityAllocated - QuantityFulfilled`. Values are: • `Disallowed`—When distributing the adjustment, ignore any quantities being fulfilled. If an order item summary's entire quantity is being fulfilled, return an error. This is the default value. • `InFulfillment`—When distributing the adjustment, include quantities being fulfilled. Create a separate change order for the adjustments made to those quantities. • `PreFulfillment`—When distributing the adjustment, include quantities being fulfilled. Include the adjustments made to those quantities in the change order for pre-fulfillment quantity adjustments.	Optional	55.0
individualItemTaxAdjustments	Boolean	Specifies whether to create multiple lines for each tax adjustment or one line with all tax adjustments. The default value is false.	Optional	59.0

ConnectApi.AlternativeInput

Alternative representation for an extension on a feed element.

Property	Type	Description	Required or Optional	Available Version
`textRepresentation`	String	Text representation of the extension.	Required	40.0
`thumbnailUrl`	String	Thumbnail URL to the extension.	Optional	40.0
`title`	String	Title of the extension.	Optional	40.0

ConnectApi.AlternativePaymentMethod

A payment method that doesn't have a defined Salesforce entity such as CardPaymentMethod or DigitalWallet. Common examples of alternative payment methods include CashOnDeliver, Klarna, and Direct Debit. AlternativePaymentMethod functions the same as any other type of payment method for processing transactions in the payment gateway.

Subclass of ConnectApi.BasePaymentMethodRequest

Property	Type	Description	Required or Optional	Available Version
`accountId`	String	Salesforce Payments account to which this payment method is linked.	Required	54.0
`comments`	String	Details about a record added by a user. Maximum of 1,000 characters.	Optional	54.0
`email`	String	Email address of the card holder.	Optional	54.0
`gatewayToken`	String	A unique, alphanumeric ID, called a token, that a payment gateway generates when it first processes a payment. The token replaces the actual payment data so that the data is kept secure. This token is stored as encrypted text, and can be used for recurring payments.	Required	54.0
`gatewayTokenDetails`	String	Detailed information about the gateway token.	Required	54.0
`name`	String	Name that you assign to the payment method object.	Optional	54.0

ConnectApi.AnnouncementInput

An announcement.

Property	Type	Description	Required or Optional	Available
`body`	ConnectApi.MessageBodyInput	Text of the announcement.	Required for creating an announcement if `feedItemId` isn't specified Don't specify for updating an announcement.	31.0

Property	Type	Description	Required or Optional	Available
`expirationDate`	Datetime	The Salesforce UI displays an announcement until 11:59 p.m. on this date unless another announcement is posted first. The Salesforce UI ignores the time value in the `expirationDate`. However, you can use the time value to create your own display logic in your own UI.	Required for creating an announcement Optional for updating an announcement	31.0
`feedItemId`	String	ID of an `AdvancedTextPost` feed item that is the body of the announcement.	Required for creating an announcement if `body` isn't specified Don't specify for updating an announcement.	36.0
`isArchived`	Boolean	Specifies whether the announcement is archived.	Optional	36.0
`parentId`	String	ID of the parent entity for the announcement, that is, a group ID when the announcement appears in a group.	Required for creating an announcement if `feedItemId` isn't specified Don't specify for updating an announcement.	36.0
`sendEmails`	Boolean	Specifies whether the announcement is sent as an email to all group members regardless of their email setting for the group. If Chatter emails aren't enabled for the organization, announcement emails aren't sent. Default value is `false`.	Optional for creating an announcement Don't specify for updating an announcement	36.0

SEE ALSO:

postAnnouncement(communityId, groupId, announcement)

postAnnouncement(communityId, announcement)

ConnectApi.ArticleTopicAssignmentJobInput

An article and topic assignment job.

Property	Type	Description	Required or Optional	Available Version
operation	ConnectApi.ArticleTopicJobType	Type of operation to perform on articles and topics. Values are: • AssignTopicsToArticle—Assign topics to articles in a data category. • UnassignTopicsFromArticle—Unassign topics from articles in a data category.	Required	40.0
topicNames	ConnectApi.TopicNamesInput	List of topic names to assign to or unassign from articles.	Required	40.0

ConnectApi.AssociatedActionsCapabilityInput

A list of action link groups to associate with a feed element. To associate an action link group with a feed element, the call must be made from the Apex namespace that created the action link definition. In addition, the user making the call must have created the definition or have View All Data permission.

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can drive productivity and accelerate innovation.

Property	Type	Description	Required or Optional	Available Version
actionLinkGroupIds	List<String>	The action link group IDs to associate with the feed element. Associate one Primary and up to 10 total action link groups to a feed item. Action link groups are returned in the order specified in this property. An action link group ID is returned from a call to ConnectApi.ActionLinks.createActionLinkGroupDefinition(communityId, actionLinkGroup).	Required	33.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.AssociateRecordsWithRecipientInput

Records associated with the survey invitation.

Property	Type	Description	Required or Optional	Available Version
`associateRecordIds`	List<String>	ID of the associated records.	Required	50.0
`recipientId`	String	Participant ID with whose invitation the record should be associated.	Required	50.0

SEE ALSO:

ConnectApi.SurveyInvitationEmailInput

ConnectApi.AudienceCriteriaInput

Custom recommendation audience criteria type.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass for:

- ConnectApi.CustomListAudienceCriteriaInput
- ConnectApi.NewUserAudienceCriteriaInput

Property	Type	Description	Required or Optional	Available Version
`type`	`ConnectApi.RecommendationAudienceCriteriaType`	Specifies the custom recommendation audience criteria type. One of these values: • `CustomList`—A custom list of users makes up the audience. • `MaxDaysInCommunity`—New members make up the audience.	Optional If not specified, defaults to `CustomList`.	36.0

SEE ALSO:

ConnectApi.RecommendationAudienceInput

ConnectApi.AudienceCriterionInput

Personalization audience criterion.

Property	Type	Description	Required or Optional	Available Version
`criterion`	List<`ConnectApi.AudienceCriterionValueInput`>	List of mappings of audience criteria fields and values.	Required when creating an audience Optional when updating an audience	48.0

Property	Type	Description	Required or Optional	Available Version
`criterionNumber`	Integer	Number associated with the audience criterion in a formula. For example, (1 AND 2) OR 3. If unspecified, criteria are assigned numbers in the order that they're added.	Optional	48.0
`criterionOperator`	`ConnectApi.AudienceCriteriaOperator`	Operator used in the personalization audience criterion. Values are: • `Contains` • `Equal` • `GreaterThan` • `GreaterThanOrEqual` • `Includes` • `LessThan` • `LessThanOrEqual` • `NotEqual` • `NotIncludes` • `StartsWith`	Required when creating an audience Optional when updating an audience	48.0
`criterionType`	`ConnectApi.AudienceCriteriaType`	Type of personalization audience criterion. Values are: • `Audience`—Criterion based on audience. • `Default`—Audience has no criteria. • `Domain`—Criterion based on domain. • `FieldBased`—Criterion based on object fields. • `GeoLocation`—Criterion based on location. • `Permission`—Criterion based on standard or custom permissions. • `Profile`—Criterion based on profile.	Required when creating an audience Optional when updating an audience	48.0

SEE ALSO:

ConnectApi.AudienceInput

ConnectApi.AudienceCriterionValueInput

Audience criterion value.

Property	Type	Description	Required or Optional	Available Version
`audienceId`	String	ID of an audience.	Required if creating or updating an audience with the `Audience` criterion type.	53.0
`city`	String	City of a user.	Optional if creating or updating an audience with the `GeoLocation` criterion type	48.0
`country`	String	Country of a user.	Required if creating or updating an audience with the `GeoLocation` criterion type	48.0
`domainId`	String	Domain ID of a user.	Required if creating or updating an audience with the `Domain` criterion type	48.0
`entityField`	String	Field of an object.	Required if creating or updating an audience with the `FieldBased` criterion type	48.0
`entityType`	String	Type of object.	Required if creating or updating an audience with the `FieldBased` criterion type	48.0
`fieldValue`	String	Value of a field.	Required if creating or updating an audience with the `FieldBased` criterion type	48.0
`isEnabled`	Boolean	Specifies whether the permission is enabled (`true`) or not (`false`) for a user.	Required if creating or updating an audience with the `Permission` criterion type	48.0
`permission`	String	Valid API name of a standard user or custom permission.	Required if creating or updating an	48.0

Property	Type	Description	Required or Optional	Available Version
			audience with the `Permission` criterion type	
`profileId`	String	Profile ID of a user.	Required if creating or updating an audience with the `Profile` criterion type	48.0
`subdivision`	String	Subdivision of a user.	Required if creating or updating an audience with the `GeoLocation` criterion type and using the `city` property	48.0

SEE ALSO:

ConnectApi.AudienceCriterionInput

ConnectApi.AudienceInput

A personalization audience.

Property	Type	Description	Required or Optional	Available Version
`criteria`	List<`ConnectApi.AudienceCriterionInput`>	List of audience criteria to update or add. An audience can have up to 100 criteria.	Required when creating an audience Optional when updating an audience	48.0
`customFormula`	String	Custom formula for the audience criteria. For example, (1 AND 2) OR 3.	Required when creating an audience with the `formulaFilterType` set to `CustomLogicMatches` Optional, otherwise	48.0

Property	Type	Description	Required or Optional	Available Version
formulaFilterType	ConnectApi.FormulaFilterType	Formula filter type for the personalization audience. Values are: • AllCriteriaMatch—All audience criteria are true (AND operation). • AnyCriterionMatches—Any audience criterion is true (OR operation). • CustomLogicMatches—Audience criteria match the custom formula (for example, (1 AND 2) OR 3).	Required when creating an audience Optional when updating an audience	48.0
name	String	Name of the audience.	Required when creating an audience Optional when updating an audience	48.0

ConnectApi.AuditParamsRequest

Audit Parameters input.

This class is abstract.

Superclass of ConnectApi.BaseRequest.

Property	Type	Description	Required or Optional	Available Version
email	String	Email of the client that made the request.	Optional	50.0
ipAddress	String	IP address of the client that made the request.	Optional	50.0
macAddress	String	Mac address of the client that made the request.	Optional	50.0
phone	String	Phone number of the client that made the request.	Optional	50.0

ConnectApi.AuthApiPaymentMethodRequest

Payment method input representation for payment authorizations.

Subclass of ConnectApi.BaseApiPaymentMethodRequest.

Property	Type	Description	Required or Optional	Available Version
`cardPaymentMethod`	`ConnectApi.CardPaymentMethodRequest`	Card payment method information.	Required	51.0

ConnectApi.AuthorizationReversalRequest

Authorization reversal input consumed by authorization reversal service.

Subclass of ConnectApi.BaseRequest.

Property	Type	Description	Required or Optional	Available Version
`accountId`	String	Account for the payment authorization reversal. Must match the payment authorization's account.		51.0
`amount`	Double	Amount of adjustment applied to the payment authorization.		51.0
`comments`	String	Users can add comments to provide additional details about a record. Maximum of 1,000 characters.		51.0
`effectiveDate`	Datetime	Date that the adjustment takes effect on the authorization.		51.0

ConnectApi.AuthorizationRequest

Payment Authorization input consumed by Payment Authorization service.

Subclass of ConnectApi.BaseRequest.

Property	Type	Description	Required or Optional	Available Version
`accountId`	String	Salesforce account that contains the payment transaction being authorized.	Required	51.0
`amount`	Double	Authorization amount.	Required	51.0
`comments`	String	Optional comments for the payment authorization.	Optional	51.0
`currencyIsoCode`	String	Three-letter ISO 4217 currency code associated with the payment group record.	Required	51.0
`effectiveDate`	Datetime	Date that the authorization will be applied to the transaction.	Required	51.0
`paymentGatewayId`	String	Payment gateway that processes the authorization.	Required	51.0

Property	Type	Description	Required or Optional	Available Version
`paymentGroup`	`ConnectApi.PaymentGroupRequest`	Payment group for the authorization. The payload must reference either a `paymentGroup` or a `paymentGroupId`, but not both.	Optional	51.0
`paymentMethod`	`ConnectApi.AuthApiPaymentMethodRequest`	Payment method used in the payment gateway for the authorization transaction.	Required	51.0

ConnectApi.BannerPhotoInput

A banner photo.

Property	Type	Description	Required or Optional	Available Version
`cropHeight`	Integer	Height of the crop rectangle in pixels.	Optional	36.0
`cropWidth`	Integer	Width of the crop rectangle in pixels.	Optional	36.0
`cropX`	Integer	X position of the crop rectangle from the left edge of the image in pixels. Top left is position (0,0).	Optional	36.0
`cropY`	Integer	Y position of the crop rectangle from the top edge of the image in pixels. Top left is position (0,0).	Optional	36.0
`fileId`	String	18 character ID of an existing file. The key prefix must be 069 and the file must be an image and be smaller than 2 GB. Note: Images uploaded on the Group page and on the User page don't have file IDs and therefore can't be used.	Required	36.0
`versionNumber`	Integer	Version number of an existing file. If not provided, the latest version is used.	Optional	36.0

ConnectApi.BaseApiPaymentMethodRequest

Payment method API input representation.

This class is abstract.

Superclass of:

- ConnectApi.AuthApiPaymentMethodRequest
- ConnectApi.PostAuthApiPaymentMethodRequest

- ConnectApi.SaleApiPaymentMethodRequest

Property	Type	Description	Required or Optional	Available Version
address	ConnectApi.AddressRequest	Payment method address.	Required	51.0
id	String	Payment method record ID. Used in payment transactions.	Required	51.0
saveForFuture	Boolean	Shows whether Salesforce saves the payment method for future use.	Required	51.0

ConnectApi.BasePaymentMethodRequest

Base payment method input representation.

This class is abstract.

Superclass of:

- ConnectApi.AlternativePaymentMethod
- ConnectApi.CardPaymentMethodRequest

No additional properties.

ConnectApi.BaseRequest

Base parameters for making a request to the payment gateway.

This class is abstract.

Subclass of ConnectApi.AuditParamsRequest.

Superclass of:

- ConnectApi.AuthorizationRequest
- ConnectApi.AuthorizationReversalRequest
- ConnectApi.CaptureRequest
- ConnectApi.PaymentMethodTokenizationRequest
- ConnectApi.PostAuthRequest
- ConnectApi.RefundRequest
- ConnectApi.SaleRequest

Property	Type	Description	Required or Optional	Available Version
additionalData	Map<String, String>	An optional map of additional parameters to be sent to the payment gateway.	Optional	50.0
idempotencyKey	String	Idempotency key.	Optional	50.0

ConnectApi.BatchInput

Construct a set of inputs to be passed into a method at the same time.

Use this constructor when there isn't a binary input:

```
ConnectApi.BatchInput(Object input)
```

Use this constructor to pass one binary input:

```
ConnectApi.BatchInput(Object input, ConnectApi.BinaryInput binary)
```

Use this constructor to pass multiple binary inputs:

```
ConnectApi.BatchInput(Object input, List<ConnectApi.BinaryInput> binaries)
```

The constructors takes these parameters:

Argument	Type	Description	Available Version
`input`	Object	An individual input object to be used in the batch operation. For example, for `postFeedElementBatch()`, this should be `ConnectApi.FeedElementInput`.	32.0
`binary`	`ConnectApi.BinaryInput`	A binary file to associate with the input object.	32.0
`binaries`	List<`ConnectApi.BinaryInput`>	A list of binary files to associate with the input object.	32.0

SEE ALSO:

- Post a Batch of Feed Elements
- Post a Batch of Feed Elements with a New (Binary) File

ConnectApi.BinaryInput

Create a `ConnectApi.BinaryInput` object to attach files to feed items and comments, to add repository files, to create managed content, and to replace managed content variants.

The constructor is:

```
ConnectApi.BinaryInput(blob, contentType, filename)
```

The constructor takes these arguments:

Argument	Type	Description	Available Version
`blob`	Blob	Contents of the file to be used for input	28.0
`contentType`	String	MIME type description of the content, such as `image/jpg`	28.0

Argument	Type	Description	Available Version
`filename`	String	File name with the file extension, such as UserPhoto.jpg	28.0

SEE ALSO:

- Post a Feed Element with a New File (Binary) Attachment
- Post a Comment with a New File
- ConnectApi.BatchInput

ConnectApi.BookmarksCapabilityInput

Create or update a bookmark on a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`isBookmarkedByCurrentUser`	Boolean	Specifies if the feed element should be bookmarked for the user (`true`) or not (`false`).	No	32.0

SEE ALSO:

- ConnectApi.FeedElementCapabilitiesInput

ConnectApi.BooleanList

List of Boolean values.

Subclass of ConnectApi.AbstractList.

Property	Type	Description	Required or Optional	Available Version
`values`	List<Boolean>	List of Boolean values to filter on, for example, `[true, false]`.	Optional	63.0

ConnectApi.BotVersionActivationInput

Activation status of the bot version.

Property	Type	Description	Required or Optional	Available Version
`status`	`ConnectApi.BotVersionActivationStatus`	Activation status of the bot version. Values are: • `Active`	Optional	50.0

Property	Type	Description	Required or Optional	Available Version
		• `Inactive` Activation status must be specified in the *`status`* or *`postBody`* parameter.		

ConnectApi.CalculateCartInput

Custom fields for a cart calculation.

Property	Type	Description	Required or Optional	Available Version
`customFields`	List<`SObject`>	Array of sObjects and custom fields for the sObjects. Standard fields are ignored. The custom fields must already be defined for the sObject. Currently, the WebCart, CartItem, and CartDeliveryGroup sObjects are supported. Field-level security rules from the shopper profile are applied to the custom fields. The rules are applied for registered shoppers and for the guest shopper profile. See Create a Cart and Cart Item with Custom Fields in a Commerce Store.	Optional	63.0

ConnectApi.CalculateTaxRequest

Request to sent through the tax adapter to the external tax engine. Inputs with a `TaxTransactionType` of Debit represent a tax calculation request. Inputs with a `TaxTransactionType` of Credit represent a tax cancellation request.

Subclass of ConnectApi.TaxTransactionRequest.

Property	Type	Description	Required or Optional	Available Version
`isCommit`	Boolean	Commits the transaction for tax calculation.	Required	55.0
`taxEngineId`	String	ID of the Salesforce tax engine entity used to represent the external tax engine.	Required	55.0
`taxTransactionType`	`ConnectApi.TaxTransactionType`	Type of tax transaction. Values are: • `Credit`—Transaction is a credit transaction. • `Debit`—Transaction is a debit transaction.	Required	55.0

Property	Type	Description	Required or Optional	Available Version
`taxType`	`ConnectApi.CalculateTaxType`	Type of tax calculation. Values are: • `Actual`—Calculated tax represents the final taxed amount for the transaction. • `Estimated`—Calculated tax represents only an estimated value before the transaction is finalized.	Required	55.0

ConnectApi.CancelAllOrderItemsInputRepresentation

Cancellation of all items in an order.

Property	Type	Description	Required or Optional	Available Version
`changeItemFees`	<redacted>	List of input data for fees, including taxes, associated with the order items being canceled.	Optional	63.0
`excludedItems`	List<String>	List of items excluded from cancellation.	Optional	63.0
`orderSummaryId`	String	ID of the order summary.	Required	63.0
`reason`	String	Reason for the cancellation. The value must match one of the picklist values on the Reason field of the Order Product Summary Change object.	Required	63.0
`reasonText`	String	Reason text used for the return insights. The value has a max of 255 characters.	Optional	63.0

ConnectApi.CanvasCapabilityInput

Create or update a canvas app associated with a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`description`	String	A description of the canvas app. The maximum size is 255 characters.	Optional	32.0
`developerName`	String	The API name (developer name) of the connected app.	Required	32.0
`height`	String	The height of the canvas app in pixels.	Optional	32.0

Property	Type	Description	Required or Optional	Available Version
`namespacePrefix`	String	A unique namespace prefix for the canvas app.	Optional	32.0
`parameters`	String	JSON parameters passed to the canvas app.	Optional	32.0
`thumbnailUrl`	String	A thumbnail URL to a preview image. The maximum thumbnail size is 120 pixels by 120 pixels.	Optional	32.0
`title`	String	A title for the canvas link.	Required	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.CapacityRequestInputRepresentation

Request related to a location's fulfillment order capacity.

Property	Type	Description	Required or Optional	Available Version
`actionRequestId`	String	Unique string that identifies the request. Can be a UUID. Use the action request IDs in response data to identify which requests succeeded or failed.	Required	55.0
`locationId`	String	ID of the location associated with the request.	Required	55.0

ConnectApi.CaptureRequest

Payment capture input consumed by the payment capture service.

Subclass of ConnectApi.BaseRequest.

Property	Type	Description	Required or Optional	Available Version
`accountId`	String	ID of the account linked to the capture request.	Optional	50.0
`amount`	Double	Amount captured from the previous authorization.	Required	50.0
`clientContext`	String	Context for payment APIs. Used for a payment caller to re-establish context.	Optional	50.0
`comments`	String	Comments for the payment capture.	Optional	50.0

Property	Type	Description	Required or Optional	Available Version
`effectiveDate`	Datetime	Date when the payment becomes effective.	Optional	50.0
`paymentGroup`	`ConnectApi.PaymentGroupRequest`	Details about the payment group record associated with the payment request.	Optional	50.0

ConnectApi.CardPaymentMethodRequest

Card payment method input representation.

Subclass of ConnectApi.BasePaymentMethodRequest.

Property	Type	Description	Required or Optional	Available Version
`accountId`	String	Salesforce Payments account to which this payment method is linked.	Required	51.0
`autoPay`	Boolean	Indicates whether a token for recurring payments is being requested (`true`) or not (`false`). The token lets the payment method be used for recurring payments.	Optional	55.0
`cardCategory`	`ConnectApi.CardCategory`	Card processing type. Valid values are: • `CreditCard` • `DebitCard`	Required	51.0
`cardHolderFirstName`	String	First name of the card holder.	Required	51.0
`cardHolderLastName`	String	Last name of the card holder.	Required	51.0
`cardHolderName`	String	Full name of the card holder.	Required	51.0
`cardNumber`	String	Card number.	Required	51.0
`cardType`	String	Card network type. Valid values are: • `AmericanExpress` • `DinersClub` • `JCB` • `MasterCard` • `Maestro` • `Visa`	Required	51.0
`comments`	String	Optional comments for the card payment method.	Optional	51.0
`cvv`	String	Card Verification Value.	Optional	51.0

Property	Type	Description	Required or Optional	Available Version
email	String	Email address of the card holder.	Required	51.0
expiryMonth	Integer	Card expiration month.	Required	51.0
expiryYear	Integer	Card expiration year.	Required	51.0
nickName	String	Optional nickname for the card.	Optional	51.0
startMonth	Integer	Month the card becomes active.	Optional	51.0
startYear	Integer	Year the card becomes active.	Optional	51.0

ConnectApi.PromotionCartAdjustmentGroupInput

Cart adjustment group for a promotion.

Property	Type	Description	Required or Optional	Available Version
adjustmentBasisReference	String	ID of the associated coupon, if applicable.	Optional	60.0
adjustmentDescription	String	Description of the price adjustment.	Optional	60.0
adjustmentType	ConnectApi.AdjustmentType	Type of price adjustment. Valid values are: • AdjustmentAmount—The adjustment is a fixed amount. • AdjustmentPercentage—The adjustment is a percentage.	Required	60.0
adjustmentValue	String	Price value of the adjustment.	Optional	60.0
baseAmount	String	Total amount of the adjustment.	Optional	60.0
cartId	String	ID of the cart.	Required	60.0
id	String	ID of the cart adjustment group.	Required	60.0
priceAdjustmentCauseId	String	ID of the related promotion.	Optional	60.0
priority	Integer	Where in the sequence of adjustments this adjustment was applied.	Optional	60.0

ConnectApi.cartCouponInput

Cart coupon input.

Property	Type	Description	Required or Optional	Available Version
couponCode	String	The coupon code.	Required	54.0

ConnectApi.PromotionCartDeliveryGroupInput

Cart delivery group input.

Property	Type	Description	Required or Optional	Available Version
cartDeliveryGroupId	String	ID of the cart delivery group.	Required	57.0
cartDeliveryGroupMethods	List<ConnectApi.PromotionCartDeliveryGroupInput on page 1821>	List of cart delivery group methods.	Optional	60.0
deliveryMethodId	String	ID of the order delivery method.	Optional	57.0—59.0

ConnectApi.CartEvaluateShippingInput

Shipping address and custom fields used to calculate shipping costs for a cart.

Property	Type	Description	Required or Optional	Available Version
customFields	List<SObject>	Array of sObjects and custom fields for the sObjects. Standard fields are ignored. The custom fields must already be defined for the sObject. Currently, the WebCart, CartItem, and CartDeliveryGroup sObjects are supported. Field-level security rules from the shopper profile are applied to the custom fields. The rules are applied for registered shoppers and for the guest shopper profile. See Create a Cart and Cart Item with Custom Fields in a Commerce Store.	Optional	63.0
shippingAddress	[illegible]	Shipping address for a cart.	Required	63.0

ConnectApi.CartEvaluateTaxInput

Shipping address and custom fields used to calculate taxes for a cart.

Property	Type	Description	Required or Optional	Available Version
customFields	List<SObject>	Array of sObjects and custom fields for the sObjects. Standard fields are ignored. The custom fields must already be defined for the sObject. Currently, the WebCart, CartItem, and CartDeliveryGroup sObjects are supported. Field-level security rules from the shopper profile are applied to the custom fields. The rules are applied for registered shoppers and for the guest shopper profile. See Create a Cart and Cart Item with Custom Fields in a Commerce Store.	Optional	63.0
shippingAddress	[illegible]	Shipping address for a cart.	Required	63.0

ConnectApi.CartInventoryReservationInputRepresentation (Pilot)

Input representation to create or update a reservation.

Note: This feature is not generally available and is being piloted with certain Customers subject to additional terms and conditions. It is not part of your purchased Services. This feature is subject to change, may be discontinued with no notice at any time in Salesforce's sole discretion, and Salesforce may never make this feature generally available. Make your purchase decisions only on the basis of generally available products and features. This feature is made available on an AS IS basis and use of this feature is at your sole risk.

Property	Type	Description	Required or Optional	Available Version
durationInSeconds	Integer	Reservation duration in seconds.	Required	58.0

ConnectApi.CartItemInput

An item in a cart.

Property	Type	Description	Required or Optional	Available Version
cartDeliveryGroupId	String	ID of the cart delivery group.	Optional	59.0
customFields	List<SObject>	Array of sObjects and custom fields for the sObjects. Standard fields are ignored. The custom fields must already be defined for the sObject. Currently, only the CartItem sObject is supported. Field-level security rules from the shopper profile are applied to the custom fields. The rules are applied	Optional	61.0

Property	Type	Description	Required or Optional	Available Version
		for registered shoppers and for the guest shopper profile. The custom fields can be of type Checkbox, Currency, Date, Email, LongTextArea, Number, Percent, Phone, Text, TextArea, Url, Address, or Location. The `customFields` property isn't supported in stores built on an Aura template. See Create a Cart and Cart Item with Custom Fields in a Commerce Store.		
`productId`	String	ID of the product.	Required when adding an item to a cart Not supported when updating a cart item	49.0
`productSellingModelId`	String	Reserved for future use.	Optional	59.0
`quantity`	String	Quantity of the cart item. Use a value that can be converted to BigDecimal.	Required	49.0
`subscriptionTerm`	Integer on page 3550	Reserved for future use.	Optional	59.0
`type`	`ConnectApi.CartItemType`	Type of item in a cart. Value is `Product`. • `DeliveryCharge` • `Product`	Required when adding an item to a cart Not supported when updating a cart item	49.0

ConnectApi.CartItemPromotionCollectionInputRepresentation

Promotions for a cart item.

Property	Type	Description	Required or Optional	Available Version
`items`	List<`ConnectApi.CartItemPromotionInputRepresentation`>	List of cart items to get the associated promotions.	Required	52.0

ConnectApi.CartItemPromotionInputRepresentation

ID of a cart item associated with a promotion.

Property	Type	Description	Required or Optional	Available Version
`cartItemId`	String	ID of the item associated with the cart.	Optional	52.0

ConnectApi.CartMessagesVisibilityInput

Set the visibility for cart messages.

Property	Type	Description	Required or Optional	Available Version
`visibility`	Boolean	Specifies whether to set cart messages as visible (`true`) or not (`false`).	Required	50.0

ConnectApi.CartInput

A cart.

Property	Type	Description	Required or Optional	Available Version
`currencyIsoCode`	String	Currency ISO code of the cart.	Optional	57.0
`customFields`	List<`SObject`>	Array of sObjects and custom fields for the sObjects. Standard fields are ignored. The custom fields must already be defined for the sObject. Currently, only the WebCart sObject is supported. Field-level security rules from the shopper profile are applied to the custom fields. The rules are applied for registered shoppers and for the guest shopper profile. See Create a Cart and Cart Item with Custom Fields in a Commerce Store.	Optional	61.0
`effectiveAccountId`	String	ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.	Optional	49.0
`isSecondary`	Boolean	Specifies whether the cart is secondary (`true`) or not (`false`). If unspecified, defaults to `false`.	Optional	53.0
`name`	String	Name of the cart. The name can have up to 250 Unicode characters. If unspecified, defaults to the generated name.	Optional	49.0
`orderOwnerId`	String	ID of the owner of the order.	Optional	58.0

Property	Type	Description	Required or Optional	Available Version
`type`	`ConnectApi.CartType`	Type of cart. Vaues are: • `Cart`—Cart created by a customer. • `PayNowReadOnly`—Clone of a Template cart that the customer can check out with using the Pay Now feature. • `Template`—Cart created by an internal user. If unspecified, defaults to `Cart`.	Optional	49.0
`typeAsString`	String	Type of the cart provided as a string.	Optional	59.0

ConnectApi.CartShippingAddressInput

A cart shipping address.

Subclass of `ConnectApi.AbstractCheckoutAddressInput`

No additional properties.

ConnectApi.CartToWishlistInput

Copy products from a cart to a wishlist.

Property	Type	Description	Required or Optional	Available Version
`wishlistId`	String	ID of the wishlist to copy cart products to.	Required	50.0

ConnectApi.CdpCalculatedInsightInput

Input representation for a calculated insight.

Property	Type	Description	Required or Optional	Available Version
`apiName`	String	API name of the calculated insight with suffix __cio.	Required for creating a calculated insight Optional for updating a calculated insight	57.0
`createdFromPackage`	Boolean	Specifies whether the calculated insight was created from an installed package (`true`) or not (`false`).	Optional	57.0

Property	Type	Description	Required or Optional	Available Version
`dataSpaceName`	String	Name of the data space.	Optional	57.0
`definitionType`	`ConnectApi.CalculatedInsightDefinitionTypeEnum`	Definition type of the calculated insight. Values are: • `CALCULATED_METRIC` • `CALCULATED_METRIC` • `CALCULATED_METRIC`	Required for creating a calculated insight Optional for updating a calculated insight	57.0
`description`	String	Calculated insight description.	Optional	57.0
`displayName`	String	Calculated insight display name.	Required for creating a calculated insight Optional for updating a calculated insight	57.0
`draft`	Boolean	Specifies whether to save the calculated insight as draft (`true`) or not (`false`).	Optional	57.0
`expression`	String	Calculated insight ANSI SQL expression.	Required for creating a calculated insight Optional for updating a calculated insight	57.0
`packagedCalculatedInsightApiName`	String	API name of the packaged calculated insight.	Optional	57.0

ConnectApi.CdpIdentityResolutionConfigInput

Input representation for creating an identity resolution ruleset.

Property	Type	Description	Required or Optional	Available Version
`configurationType`	`ConnectApi.CdpIdentityResolutionConfigurationType`	Source object for an identity resolution ruleset. Values are: • `Account` • `Individual`	Required	57.0
`description`	String	Description of the identity resolution ruleset.	Optional	57.0
`doesRunAutomatically`	Boolean	Specifies whether automatic job run scheduling is enabled for the ruleset (`true`) or not (`false`). If unspecified, defaults to `false`.	Optional	57.0

Property	Type	Description	Required or Optional	Available Version
label	String	User friendly name of the identity resolution ruleset.	Required	57.0
matchRules	List<ConnectApi.CdpIdentityResolutionMatchRule>	List of match rules for the identity resolution ruleset.	Optional	57.0
reconciliationRules	List<ConnectApi.CdpIdentityResolutionReconciliationRule>	List of reconciliation rules for the identity resolution ruleset.	Required	57.0
rulesetId	String	Extended ID of the ruleset used to differentiate between rulesets created for comparison. The ruleset ID must be unique and can't be longer than 4 characters.	Optional	57.0

ConnectApi.CdpIdentityResolutionConfigPatchInput

Input representation for updating an identity resolution ruleset.

Property	Type	Description	Required or Optional	Available Version
description	String	Description of the identity resolution ruleset.	Optional	57.0
doesRunAutomatically	Boolean	Specifies whether automatic job run scheduling is enabled for the ruleset (`true`) or not (`false`). If unspecified, defaults to `false`.	Optional	57.0
label	String	User friendly name of the identity resolution ruleset.	Required	57.0
matchRules	List<ConnectApi.CdpIdentityResolutionMatchRule>	List of match rules for the identity resolution ruleset.	Optional	57.0
reconciliationRules	List<ConnectApi.CdpIdentityResolutionReconciliationRule>	List of reconciliation rules for the identity resolution ruleset.	Required	57.0

ConnectApi.CdpIdentityResolutionMatchCriterion

Input representation for an identity resolution ruleset's match rule criterion.

Property	Type	Description	Required or Optional	Available Version
caseSensitiveMatch	Boolean	Specifies whether the criterion match is case sensitive (true) or not (false). Available only when matching is based on the party identifier.	Optional	58.0
entityName	String	API name of the Data Model Object the match rule applies to.	Required	57.0
fieldName	String	Name of the field the criterion applies to.	Required	57.0
matchMethodType	ConnectApi.CdpIdentityResolutionMatchMethodType	Match method for a match rule criterion. Values are: • Exact—Exact match. • ExactNormalized—Exact normalized match. • Fuzzy—Fuzzy match with medium precision. • FuzzyHigh—Fuzzy match with high precision. • FuzzyLow—Fuzzy match with low precision.	Required	57.0
partyIdentificationInfo	ConnectApi.CdpIdentityResolutionMatchCriterionPartyIdentificationInfo	Party Identifier information.	Optional	57.0
shouldMatchOnBlank	Boolean	Specifies whether blank fields can be used for matching (true) or not (false).	Required	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionMatchRule

ConnectApi.CdpIdentityResolutionMatchCriterionPartyIdentificationInfo

Input representation for information when party identification is used in an identity resolution ruleset's match rule criterion.

Property	Type	Description	Required or Optional	Available Version
partyName	String	Party identification name.	Required if the match rule criterion uses party identification for matching	57.0

Property	Type	Description	Required or Optional	Available Version
`partyType`	String	Party identification type.	Optional	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionMatchCriterion

ConnectApi.CdpIdentityResolutionMatchRule

Input representation for an identity resolution ruleset's match rule.

Property	Type	Description	Required or Optional	Available Version
`criteria`	List<`ConnectApi.CdpIdentityResolutionMatchCriterion`>	Object and field the match rule applies to and the match method applied.	Required	57.0
`label`	String	User friendly name for the identity resolution match rule.	Required	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionConfigInput

ConnectApi.CdpIdentityResolutionConfigPatchInput

ConnectApi.CdpIdentityResolutionReconciliationFieldRule

Input representation for an identity resolution ruleset's reconciliation rule for a field.

Property	Type	Description	Required or Optional	Available Version
`fieldName`	String	The field that this reconciliation rule applies to.	Required	57.0
`ruleType`	`ConnectApi.CdpIdentityResolutionReconciliationRuleType`	Default reconciliation rule applied to fields in the object the reconciliation rule applies to. Values are: • `LastUpdated` • `MostFrequent` • `SourceSequence`	Required	57.0
`shouldIgnoreEmptyValue`	Boolean	Specifies whether to ignore an empty value (`true`) or not (`false`).	Required	57.0

Property	Type	Description	Required or Optional	Available Version
`sources`	List<`ConnectApi.CdpIdentityResolutionReconciliationSource`>	If `ruleType` is `SourceSequence`, a prioritized list of data sources.	Required if `ruleType` is `SourceSequence`	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionReconciliationRule

ConnectApi.CdpIdentityResolutionReconciliationRule

Input representation for an identity resolution ruleset's default reconciliation rule for an object.

Property	Type	Description	Required or Optional	Available Version
`entityName`	String	API name of the Data Model Object the reconciliation rule applies to.	Required	57.0
`fields`	List<`ConnectApi.CdpIdentityResolutionReconciliationFieldRule`>	Field-specific reconciliation rules that override this default rule for the specified field.	Optional	57.0
`ruleType`	`ConnectApi.CdpIdentityResolutionReconciliationRuleType`	Default reconciliation rule applied to fields in the object the reconciliation rule applies to. Values are: • `LastUpdated` • `MostFrequent` • `SourceSequence`	Required	57.0
`shouldIgnoreEmptyValue`	Boolean	Specifies whether to ignore an empty value (`true`) or not (`false`).	Required	57.0
`sources`	List<`ConnectApi.CdpIdentityResolutionReconciliationSource`>	If `ruleType` is `SourceSequence`, a list of data sources in priority order.	Required if `ruleType` is `SourceSequence`	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionConfigInput

ConnectApi.CdpIdentityResolutionConfigPatchInput

ConnectApi.CdpIdentityResolutionReconciliationSource

Input representation for an identity resolution default reconciliation rule or field-specific rule using the `SourceSequence` match method.

Property	Type	Description	Required or Optional	Available Version
`name`	String	If the `ruleType` for a reconciliation rule is `SourceSequence`, API name of a source Data Lake Object.	Required if `ruleType` is `SourceSequence`	57.0

SEE ALSO:

- ConnectApi.CdpIdentityResolutionReconciliationRule
- ConnectApi.CdpIdentityResolutionReconciliationFieldRule
- ConnectApi.CdpIdentityResolutionReconciliationFieldRule

ConnectApi.CdpIdentityResolutionRunNowInput

Input representation for running an identity resolution ruleset job on demand.

Property	Type	Description	Required or Optional	Available Version
`callingApp`	String	Calling application.	Optional	57.0
`callingAppInfo`	String	Calling application information.	Optional	57.0

ConnectApi.CdpQueryInput

Data query input.

Property	Type	Description	Required or Optional	Available Version
`sql`	String	ANSI-standard SQL query.	Required	52.0

ConnectApi.CdpSegmentDbtInput

Segment dbt input.

Property	Type	Description	Required or Optional	Available Version
`models`	List<`ConnectApi.CdpSegmentDbtModelInput`>	List of models. The segment data build tool currently supports a single SQL model.	Required	55.0

SEE ALSO:

- ConnectApi.CdpSegmentInput

ConnectApi.CdpSegmentDbtModelInput

Segment dbt model input.

Property	Type	Description	Required or Optional	Available Version
`name`	String	Dbt model name.	Required	55.0
`sql`	String	Dbt SQL. Dbt SQL date strings must be in ISO 8601 format , for example, 2011-02-25T18:24:31.000Z. For details about supported validations, see Supported Validations for Segment Data Build Tool Model SQL.	Required	55.0

SEE ALSO:

ConnectApi.CdpSegmentDbtInput

ConnectApi.CdpSegmentInput

Segment input.

Property	Type	Description	Required or Optional	Available Version
`additionalMetadata`	Map<String, String>	Map of additional metadata.	Optional for creating a segment Not supported for updating a segment	55.0
`dataSpace`	String	Segment dataspace. In API version 59.0 and later, this property is not available. Use the `dataspace` request parameter instead.	Optional	57.0–58.0
`description`	String	Segment description.	Optional	55.0
`developerName`	String	Segment developer name.	Required for creating a segment Not supported for updating a segment	55.0
`displayName`	String	Segment display name.	Optional	57.0
`includeDbt`	`ConnectApi.CdpSegmentDbtInput`	Segment data build tool.	Required	55.0

Property	Type	Description	Required or Optional	Available Version
`publishSchedule`	`ConnectApi.PublishSchedule`	Publish refresh schedule. Values are: • `One`—Refreshes every hour. Used to rapidly publish UI and DBT-based segments. • `Four`—Refreshes every four hours. Used to rapidly publish UI and DBT-based segments. • `Twelve`—Refreshes every twelve hours. • `TwentyFour`—Refreshes every twenty-four hours.	Optional	55.0
`publishScheduleEndDate`	String	Date indicating the end of the publish schedule.	Optional if `publishSchedule` isn't specified	55.0
`publishScheduleStartDateTime`	String	Datetime indicating the start of the publish schedule.	Optional if `publishSchedule` isn't specified	55.0
`segmentOnApiName`	String	API name of the SegmentOn entity.	Optional	57.0
`segmentType`	`ConnectApi.SegmentType`	Type of segment. Value is: • `Dbt`—Data build tool After a segment is created, the segment type can't be changed.	Required for creating a segment Not supported for updating a segment	55.0

ConnectApi.ChangeInputRepresentation

A list of changes to OrderItemSummaries that make up an order change, such as a cancel or return.

Property	Type	Description	Required or Optional	Available Version
`changeItems`	List<`ConnectApi.ChangeItemInputRepresentation`>	List of changes to OrderItemSummaries.	Required	48.0

SEE ALSO:

previewCancel(orderSummaryId, changeInput)

previewReturn(orderSummaryId, changeInput)

submitCancel(orderSummaryId, changeInput)

submitReturn(orderSummaryId, changeInput)

ConnectApi.ChangeItemFeeInputRepresentation

Input representation for Change Item Fee Input

Property	Type	Description	Required or Optional	Available Version
`amount`	Double	Positive value used to calculate the fee amount, as described by the `amountType`.	Required	57.0
`amountType`	String	Describes how the fee amount is calculated. Valid values are: • `AmountWithTax`—Value of `amount` is the fee amount, including tax. • `AmountWithoutTax`—Value of `amount` is the fee amount, not including tax. Tax is calculated on the value and added. • `Percentage`—Value of `amount` is a percentage. To determine the fee amount, `amount` is divided by 100, and then multiplied by the TotalPrice and TotalTaxAmount of the associated OrderItemSummary, prorated for the quantity being returned. • `PercentageGross`—Value of `amount` is a percentage. To determine the fee amount, `amount` is divided by 100, and then multiplied by the TotalLineAmountWithTax of the associated OrderItemSummary, prorated for the quantity being returned.	Required	57.0
`description`	String	Description of the fee.	Required	57.0
`priceBookEntryId`	String	ID of the price book entry associated with the fee product.	Required unless price books are optional in the org	57.0
`product2Id`	String	ID of the product representing the fee.	Required	57.0

Property	Type	Description	Required or Optional	Available Version
`reason`	String	Reason for the fee. The value must match an entry in the OrderProductSummaryChange object's Reason picklist.	Required	57.0

SEE ALSO:

- ConnectApi.ChangeInputRepresentation
- ConnectApi.ChangeItemInputRepresentation
- previewCancel(orderSummaryId, changeInput)
- previewReturn(orderSummaryId, changeInput)
- submitCancel(orderSummaryId, changeInput)
- submitReturn(orderSummaryId, changeInput)

ConnectApi.ChangeItemFeeTaxInputRepresentation

Input representation of taxes associated with a change item fee.

Property	Type	Description	Required or Optional	Available Version
`amount`	Double	Tax amount of the change item fee.	Required	63.0
`description`	String	Description of the change item fee.	Required	63.0
`rate`	Double	Tax rate for the change item fee.	Required	63.0
`taxEffectiveDate`	String	Effective date for the tax.	Required	63.0
`type`	String	Describes how the fee amount is calculated. Valid values are: • `Actual` • `Estimated`	Required	63.0

ConnectApi.ChangeItemFeeWithTaxInputRepresentation

Input representation of a change item fee with taxes.

Property	Type	Description	Required or Optional	Available Version
`amount`	Double	Positive value used to calculate the fee amount.	Required	63.0
`changeItemFees`	[illegible]	List of taxes associated with the change item fees.	Required	63.0

Property	Type	Description	Required or Optional	Available Version
description	String	Description of the fee.	Required	63.0
orderDeliveryGroupSummaryId	String	ID of the order delivery group summary.	Required	63.0
priceBookEntryId	String	ID of the price book entry associated with the fee product.	Required unless price books are optional in the org	63.0
product2Id	String	ID of the product representing the fee.	Required	63.0
reason	String	Reason for the cancellation. The value must match one of the picklist values on the Reason field of the Order Product Summary Change object.	Required	63.0

ConnectApi.ChangeItemInputRepresentation

Change to an order item summary, such as a return or cancel. You specify whether to prorate the associated shipping charge based on the price change. The order item summary can't be a shipping charge.

Property	Type	Description	Required or Optional	Available Version
changeItemFees	List<ChangeItemFee>	List of input data for fees associated with the order item being returned or canceled.	Optional	57.0
orderItemSummaryId	String	ID of the order item summary.	Required	48.0
quantity	Double	Quantity to change. Use a positive value. For example, a value of 2 means "cancel or return 2 units."	Required	48.0
reason	String	Reason for the change. The value must match one of the picklist values on the Reason field of the OrderItemSummaryChange object.	Required	48.0
reasonForChangeText	String	Reason text used for the return insights. The value has a max of 255 characters.	Optional	59.0

Property	Type	Description	Required or Optional	Available Version
shippingReductionFlag	Boolean	Specifies whether to prorate the shipping charge.	Required	48.0

- submitReturn(orderSummaryId, changeInput)

ConnectApi.ChatterGroupInput

Chatter group input.

Property	Type	Description	Available
`announcement`	String	The 18-character ID of an announcement. An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.	31.0
`canHaveChatterGuests`	Boolean	`true` if this group allows Chatter customers, `false` otherwise. After this property is set to `true`, it cannot be set to `false`.	29.0
`description`	String	The "Description" section of the group.	29.0
`information`	`ConnectApi.GroupInformationInput`	The "Information" section of a group. If the group is private, this section is visible only to members.	28.0
`isArchived`	Boolean	`true` if the group is archived, `false` otherwise. Defaults to `false`.	29.0
`isAutoArchiveDisabled`	Boolean	`true` if automatic archiving is turned off for the group, `false` otherwise. Defaults to `false`.	29.0
`name`	String	The name of the group.	29.0
`owner`	String	The ID of the group owner. This property is available for PATCH requests only.	29.0

Property	Type	Description	Available
`visibility`	`ConnectApi.GroupVisibilityType`	Group visibility type. • `PrivateAccess`—Only members of the group can see posts to this group. • `PublicAccess`—All users within the Experience Cloud site can see posts to this group. • `Unlisted`—Reserved for future use.	29.0

SEE ALSO:

createGroup(communityId, groupInput)

updateGroup(communityId, groupId, groupInput)

ConnectApi.ChatterStreamInput

A Chatter feed stream.

Property	Type	Description	Required or Optional	Available Version
`description`	String	Description of the stream, up to 1,000 characters.	Optional	39.0
`name`	String	Name of the stream, up to 120 characters.	Required when creating a stream Optional when updating a stream	39.0
`subscriptionsToAdd`	List<`ConnectApi.StreamSubscriptionInput`>	List of up to 25 entities whose feeds are included in the stream. Adding an entity that is already added results in no operation. Including the same entity in `subscriptionsToAdd` and `subscriptionsToRemove` results in no operation.	Optional	39.0
`subscriptionsToRemove`	List<`ConnectApi.StreamSubscriptionInput`>	List of entities whose feeds are removed from the stream. Removing an entity that is already removed results in no operation. Including the same entity in `subscriptionsToAdd` and `subscriptionsToRemove` results in no operation.	Optional when updating a stream Not supported when creating a stream	39.0

ConnectApi.CommentCapabilitiesInput

A container for all capabilities that can be included with a comment.

Property	Type	Description	Required or Optional	Available Version
`content`	ConnectApi.ContentCapabilityInput	Content to attach to the comment.	Optional	32.0
`feedEntityShare`	ConnectApi.FeedEntityShareCapabilityInput	Feed entity to share to the comment.	Optional	42.0
`record`	ConnectApi.RecordCapabilityInput	Existing knowledge article to attach to the comment.	Optional	42.0

SEE ALSO:

ConnectApi.CommentInput

ConnectApi.CommentInput

Comment input used to add rich comments, for example, comments that include mentions or file attachments.

Property	Type	Description	Required or Optional	Available Version
`attachment`	`ConnectApi.FeedItemAttachmentInput`	Specifies an attachment for the comment. Valid values are: • `ContentAttachmentInput` • `NewFileAttachmentInput` `LinkAttachmentInput` is not permitted for comments. **Important:** As of version 32.0, use the `capabilities` property.	Optional	28.0–31.0
`body`	`ConnectApi.MessageBodyInput`	Description of message body. The body can contain up to 10,000 characters and 25 mentions. Because the character limit can change, clients should make a `describeSObjects()` call on the FeedItem or FeedComment object and look at the length of the `Body` or `CommentBody` field to determine the maximum number of allowed characters. To edit this property in a comment, use `updateComment(communityId, commentId, comment)`. Editing comments is supported in version 34.0 and later.	Required	28.0

Property	Type	Description	Required or Optional	Available Version
		Rich text and inline images are supported in comment bodies in version 35.0 and later. Entity links are supported in version 43.0 and later.		
`capabilities`	`ConnectApi.CommentCapabilityInput`	Specifies any capabilities for the comment, such as a file attachment.	Optional	32.0
`threadParentId`	String	ID of the parent comment for a threaded comment.	Optional	44.0

SEE ALSO:

- Post a Comment with a Mention
- Post a Comment with a New File
- Post a Comment with an Existing File
- Post a Rich-Text Comment with Inline Image
- Post a Rich-Text Feed Comment with a Code Block
- Edit a Comment
- postCommentToFeedElement(communityId, feedElementId, comment, feedElementFileUpload)

ConnectApi.CommerceAddressFieldInput

Commerce address field input. This is used to reference custom fields for the address.

Property	Type	Description	Required or Optional	Available Version
`dataName`	String	The name of the custom address field.	Required	54.0
`text`	String	The value of the custom address field.	Optional	54.0

ConnectApi.CommerceAddressInput

Commerce address input.

Property	Type	Description	Required or Optional	Available Version
`addressType`	String	Type of address, for example, `Shipping` or `Billing`.	Optional	54.0
`city`	String	The address city.	Optional	54.0

Property	Type	Description	Required or Optional	Available Version
commerceAddressFieldInputList	List<ConnectApi.CommerceAddressFieldInput>	A list of custom address fields, if any.	Optional	54.0
companyName	String	The address company name.	Optional	57.0
country	String	The address country.	Optional	54.0
countryCode	String	Two-character country code.	Optional	54.0–58.0
firstName	String	The address first name.	Optional	57.0
isDefault	Boolean	Indicates whether a contact's address is the preferred method of communication (`true`) or not (`false`). The default value is `false`.	Optional	54.0
lastName	String	The address last name.	Optional	57.0
middleName	String	The address middle name.	Optional	57.0
name	String	Name of the contact.	Required	54.0
phoneNumber	String	The address phone number.	Optional	57.0
postalCode	String	Zip code or postal code for the address.	Optional	54.0
region	String	The address state.	Optional	54.0
regionCode	String	The address state code.	Optional	54.0–58.0
street	String	The address street.	Optional	54.0

ConnectApi.CompositeCommerceProductInputRepresentation

Composite product input.

Property	Type	Description	Required or Optional	Available Version
attributeSetInfo	ConnectApi.[illegible]	Attribute set information for a variation parent product.	Optional	62.0
categoryIds	List<String>	List of category IDs associated with the product.	Optional	61.0
productFields	Map<String, String>	A map of product field names and their values.	Required	61.0
productMedia	ConnectApi.ProductMedia	Media associated with the product.	Optional	61.0

ConnectApi.ConfirmHeldFOCapacityInputRepresentation

Request to confirm held fulfillment order capacity at one or more locations. Can correspond to one action call.

Property	Type	Description	Required or Optional	Available Version
`confirmHeldFOCapacityRequests`	List<ConnectApi.ConfirmHeldFOCapacityRequestInputRepresentation>	List of requests to confirm held fulfillment order capacity at one or more locations.	Required	55.0

ConnectApi.ConfirmHeldFOCapacityRequestInputRepresentation

Request to confirm held fulfillment order capacity at one or more locations.

Property	Type	Description	Required or Optional	Available Version
`allOrNothing`	Boolean	Controls whether a single failed request cancels all other requests in the list (*`true`*) or whether some requests can succeed if others fail (*`false`*). The default value is *`false`*.	Optional	55.0
`capacityRequests`	List<ConnectApi.CapacityRequestInputRepresentation>	List of requests to confirm held fulfillment order capacity. Each request is for one fulfillment order assigned to one location.	Required	55.0

ConnectApi.ContentCapabilityInput

Attach or update a file on a comment. Use this class to attach a new file or update a file that has already been uploaded to Salesforce.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

To attach or remove files from a feed post (instead of a comment) in version 36.0 and later, use ConnectApi.FilesCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`contentDocumentId`	String	ID of the existing content.	Required for existing content	32.0
`description`	String	Description of the file to be uploaded.	Optional	32.0
`sharingOption`	ConnectApi.FileSharingOption	Sharing option of the file. Values are: • `Allowed`—Resharing of the file is allowed. • `Restricted`—Resharing of the file is restricted.	Optional	35.0

Property	Type	Description	Required or Optional	Available Version
`title`	String	Title of the file. This value is used as the file name for new content. For example, if the title is My Title, and the file is a .txt file, the file name is My Title.txt.	Required for new content	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.ContentHubFieldValueInput

Fields of the item type.

Property	Type	Description	Required or Optional	Available Version
`name`	String	Name of the item field. When updating the metadata of a repository file, only the name field can be updated.	Required	39.0
`value`	String	Value of the item field.	Required	39.0

SEE ALSO:

ConnectApi.ContentHubItemInput

ConnectApi.ContentHubItemInput

Item type ID and fields of the item type.

Property	Type	Description	Required or Optional	Available Version
`fields`	List<`ConnectApi.ContentHubFieldValueInput`>	List of fields for the item.	Required to create a SharePoint file in a repository because the file name is required; otherwise optional	39.0
`itemTypeId`	String	ID of the item type.	Required to create a file in a repository	39.0

ConnectApi.ContractInputRepresentation

Input to create and update contract.

Property	Type	Description	Required or Optional	Available Version
isAutoDocgenRequired	Boolean	Specifies whether automatic document generation is required or not.	Required	56.0
recordTypeName	String	Contract record type name.	Optional	56.0
sourceObjectId	String	Source record ID.	Required	56.0
templateName	String	Document template name for document generation.	Optional	56.0

ConnectApi.CouponCodeRedemptionInput

Input representation for coupon code redemption.

Property	Type	Description	Required or Optional	Available Version
buyer	String	ID of the buyer account or email address for a guest user.	Required	60.0
couponCodes	List<String>	List of coupon codes.	Required	58.0
effectiveAccountId	String	ID of the account.	Required	58.0–59.0
transactionId	String	ID of the transaction, which must be a valid cart ID.	Required	58.0

ConnectApi.CreateCreditMemoInputRepresentation

A list of change orders used to create a credit memo.

Property	Type	Description	Required or Optional	Available Version
changeOrderIds	List<String>	List of IDs of the change orders.	Required	48.0

SEE ALSO:

createCreditMemo(orderSummaryId, creditMemoInput)

ConnectApi.CreateInvoiceFromChangeOrdersInputRepresentation

OrderSummary and associated change orders to create Invoices for.

Property	Type	Description	Required or Optional	Available Version
changeOrderIds	List<String>	List of IDs of change orders to create Invoices for.	Required	56.0
orderSummaryId	String	ID of the associated Order Summary.	Required	56.0

SEE ALSO:

createMultipleInvoices(invoicesInput)

ConnectApi.CreateMultipleInvoicesFromChangeOrdersInputRepresentation

ConnectApi.CreateMultipleInvoicesFromChangeOrdersInputRepresentation

Data about the change orders to create Invoices for.

Property	Type	Description	Required or Optional	Available Version
invoicesFromChangeOrders	List<ConnectApi.CreateInvoiceFromChangeOrdersInputRepresentation>	List of OrderSummary IDs with the IDs of the associated change orders to create Invoices for. Each entry in the list generates one invoice, which combines the change orders in that entry.	Required	56.0

SEE ALSO:

createMultipleInvoices(invoicesInput)

ConnectApi.CreateOrderPaymentSummaryInputRepresentation

An OrderSummary for which to create an OrderPaymentSummary, with the payment authorization or payments to include in it.

Property	Type	Description	Required or Optional	Available Version
orderSummaryId	String	ID of the OrderSummary.	Required	48.0
paymentAuthorizationId	String	ID of the payment authorization.	Either a payment authorization or at least one payment is required.	48.0

Property	Type	Description	Required or Optional	Available Version
`paymentIds`	List<String>	List of IDs of the payments.	Either a payment authorization or at least one payment is required.	48.0

SEE ALSO:

createOrderPaymentSummary(orderPaymentSummaryInput)

ConnectApi.CreateServiceAppointmentInput

Contains information to create a service appointment.

Property	Type	Description	Required or Optional	Available Version
`assignedResources`	List<ConnectApi.AssignedResourceInput>	Represents the service resources to be assigned to a service appointment. Note: When creating an appointment, use `extendedFields` to add values to any of the fields, including custom fields, in `assignedResources` as long as you have edit access to those fields.	Optional	53.0
`lead`	ConnectApi.LeadInput	Represents a prospect or lead. Note: Required to create a service appointment for unauthenticated guest users.	Required if `serviceAppointment` isn't provided.	53.0
`schedulingPolicyId`	String	The ID of the `AppointmentSchedulingPolicy` object. If no scheduling policy is passed in the request body, the default configurations are used. The only scheduling policy configuration that is used in determining time slots is the enforcement of account visiting hours.	Optional	53.0
`serviceAppointment`	ConnectApi.ServiceAppointmentInput	Represents the service appointment details to book an appointment. Note: When creating an appointment, use `extendedFields` to add values	Required if `lead` isn't provided.	53.0

Property	Type	Description	Required or Optional	Available Version
		to any of the fields, including custom fields, in `assignedResources` as long as you have edit access to those fields.		

ConnectApi.CredentialCustomHeaderInput

Credential custom header input.

Property	Type	Description	Required or Optional	Available Version
`headerName`	String	Header name.	Required	58.0
`headerValue`	String	Header value.	Required	58.0
`id`	String	Header ID.	Optional	58.0
`sequenceNumber`	Integer	Sequence number.	Required	58.0

SEE ALSO:

ConnectApi.ExternalCredentialInput

ConnectApi.NamedCredentialInput

ConnectApi.CredentialInput

Credential input.

Property	Type	Description	Required or Optional	Available Version
`authentication Protocol`	`ConnectApi. Credential Authentication Protocol`	Authentication protocol of the external credential. Values are: • `AwsSv4` • `Basic` • `Custom` • `Jwt` • `OAuth`	Required	56.0
`authentication ProtocolVariant`	`ConnectApi. Credential Authentication ProtocolVariant`	Authentication protocol variant of the external credential. Values are: • `AwsSv4_STS`—AWS Signature Version 4 with Security Token Service.	Optional	57.0

Property	Type	Description	Required or Optional	Available Version
		• `ClientCredentialsClientSecret`—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's request body. • `ClientCredentialsClientSecretBasic`—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's authorization header, as with Basic authentication. • `ClientCredentialsJwtAssertion`—OAuth 2.0 Client Credentials JSON Web Token assertion. • `JwtBearer`—OAuth 2.0 JSON Web Token bearer flow. • `NoAuthentication`—No authentication. • `RolesAnywhere`—AWS Signature Version 4 with Identity and Access Management (IAM) Roles Anywhere. If specified, the authentication protocol variant must match the actual protocol variant of the external credential.		
`credentials`	Map<String, `ConnectApi.CredentialValueInput`>	Map of protocol-specific credentials. Authentication protocols have credential allowlists and encryption rules. • `AwsSv4`—`awsAccessKeyId` (not encrypted), `awsSecretAccessKey` (encrypted), `awsRoleArn` (not encrypted) • `Custom`—Any credential name is valid (user sets encryption rules)	Required	56.0
`externalCredential`	String	Fully qualified developer name of the external credential.	Required	56.0
`principalName`	String	Name of the external credential named principal.	Required if `principalType` is `NamedPrincipal`	56.0
`principalType`	`ConnectApi.CredentialPrincipalType`	Type of credential principal. Values are: • `AwsStsPrincipal` • `NamedPrincipal`	Required	56.0

Property	Type	Description	Required or Optional	Available Version
		• `PerUserPrincipal`		

ConnectApi.CredentialValueInput

Credential value input.

Authentication protocols have credential allowlists and encryption rules.

- `AwsSv4`—`awsAccessKeyId` (not encrypted), `awsSecretAccessKey` (encrypted), `awsRoleArn` (not encrypted)
- `Custom`—Any credential name is valid (user sets encryption rules)

Property	Type	Description	Required or Optional	Available Version
`encrypted`	Boolean	Specifies whether the value of the credential is encrypted (`true`) or not (`false`).	Required	56.0
`revision`	Integer	Revision number of a short-lived credential, such as OAuthToken. If the provided revision isn't the latest version, the authentication endpoint refreshes the credential.	Optional	58.0
`value`	String	Value of the credential.	Required	56.0

SEE ALSO:

ConnectApi.CredentialInput

ConnectApi.CustomListAudienceCriteriaInput

Criteria for the custom list type of custom recommendation audience.

Subclass of ConnectApi.AudienceCriteriaInput.

Property	Type	Description	Required or Optional	Available Version
`memberOperationType`	`ConnectApi.RecommendationAudienceMemberOperationType`	The operation to carry out on the audience members. Values are: • `Add`—Adds specified members to the audience. • `Remove`—Removes specified members from the audience.	Required to update a recommendation audience Don't use or specify `null` to create a recommendation audience	36.0

Property	Type	Description	Required or Optional	Available Version
`members`	List<String>	A collection of user IDs. When updating an audience, you can include up to 100 members. An audience can have up to 100,000 members, and each Experience Cloud site can have up to 100 audiences.	Required to update a recommendation audience Don't use or specify `null` to create a recommendation audience	36.0

ConnectApi.DeliveryAddressInputRepresentation

Delivery address.

While each field is optional, at least one combination (latitude and longitude, country and postal code, or city, state, and country) must be included. The fields can't be left empty.

Property	Type	Description	Required or Optional	Available Version
`city`	String	City in the state for the delivery address.	Optional	63.0
`country`	String	Country code for the delivery address.	Optional	63.0
`latitude`	Double	Latitude for the delivery address.	Optional	63.0
`longitude`	Double	Longitude for the delivery address.	Optional	63.0
`postalCode`	String	Postal code of the delivery address.	Optional	63.0
`state`	String	State in the country for the delivery address.	Optional	63.0

ConnectApi.DeliveryEstimationProductInputRepresentation

Delivery estimation product information.

Property	Type	Description	Required or Optional	Available Version
`name`	String	Product name.	Optional	63.0
`productId`	String	ID of the product.	Optional	63.0
`quantity`	Double	Product quantity.	Required	63.0
`stockKeepingUnit`	String	Product's stock keeping unit (SKU).	Required	63.0

ConnectApi.DirectMessageCapabilityInput

Create or update the members of a direct message.

Property	Type	Description	Required or Optional	Available Version
`membersToAdd`	List<String>	List of user IDs for members to include in the direct message.	Required when creating a direct message (POST) Optional when updating a direct message (PATCH)	39.0
`membersToRemove`	List<String>	List of user IDs for members to remove from the direct message.	Optional when updating a direct message (PATCH) Not supported when creating a direct message (POST)	40.0
`subject`	String	Subject of the direct message.	Optional when creating a direct message (POST) Not supported when updating a direct message (PATCH)	39.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.DistinctValueRefinementInput

Attribute-based refinement with distinct values for product search.

This class is a subclass of ConnectApi.RefinementInput.

Property	Type	Description	Required or Optional	Available Version
`values`	List<String>	Comma-separated list of attribute values. It considers attribute labels for localization.	Required	52.0

ConnectApi.DoubleList

List of double values.

Subclass of ConnectApi.AbstractList.

Property	Type	Description	Required or Optional	Available Version
`values`	List<Double>	List of Double values to filter on.	Optional	63.0

ConnectApi.EinsteinLlmAdditionalConfigInput

Additional configuration information for the LLM provider.

Property	Type	Description	Required or Optional	Available Version
`additionalParameters`	Map<String, `ConnectApi.WrappedValue`>	Map of parameters and values for the LLM provider.	Optional	60.0
`applicationName`	String	Name of the application.	Required	60.0
`enablePiiMasking`	Boolean	Specifies whether to mask personally identifiable information (PII) (`true`) or not (`false`).	Optional	60.0
`frequencyPenalty`	Double	Use to reduce the repetitiveness of generated tokens. The higher the value, the stronger a penalty is applied to previously present tokens, proportional to how many times they already appeared in the prompt or in prior generations. Minimum value is `0.0`. Maximum value is `1.0`.	Optional	60.0
`maxTokens`	Integer	Maximum number of tokens to generate.	Optional	60.0
`numGenerations`	Integer	Number of generation requests to send to the LLM provider.	Optional	60.0
`presencePenalty`	Double	Use to reduce the repetitiveness of generated tokens. This value is similar to frequency penalty, except that this penalty is applied equally to all tokens that already appeared, regardless of their exact frequencies. Minimum value is `0.0`, and maximum value is `1.0`.	Optional	60.0
`stopSequences`	List<String>	Generated text is cut at the end of the earliest occurrence of a stop sequence.	Optional	60.0
`temperature`	Double	Sampling temperature to use. Higher values mean the model takes more risks. Lower temperatures mean that generations are less random. Minimum value is `0.0`, and maximum value is `1.0`	Optional	60.0

ConnectApi.EinsteinPromptTemplateGenerationsInput

Prompt template input parameters to use for generation.

Property	Type	Description	Required or Optional	Available Version
`additionalConfig`	`ConnectApi.EinsteinLlmAdditionalConfigInput`	Configuration information for the LLM provider.	Required	60.0
`citationMode`	String	Mode of citations for the specified prompt template. Valid values are: • `post_generation`—Citations are generated after the generated response for the specified prompt template. • `off`—Citations aren't generated for the specified prompt template.	Optional	62.0
`inputParams`	Map<String, ConnectApi.WrappedValue>	Parameters and values to resolve the specified prompt template.	Required	60.0
`isPreview`	Boolean	Specifies whether to only resolve the prompt template (`true`) or to resolve the prompt template and generate an LLM response (`false`).	Required	60.0
`outputLanguage`	String	Language code for the language to generate the LLM response in. See Supported Languages in Prompt Template Responses.	Optional	61.0
`tags`	ConnectApi.WrappedValue	Map of wrapped values, such as free-form user feedback, that can be used to resolve a specified prompt template.	Optional	62.0

ConnectApi.EnsureFundsAsyncInputRepresentation

ID of an Invoice to ensure funds for and apply them to.

Property	Type	Description	Required or Optional	Available Version
`invoiceId`	String	ID of the Invoice.	Required	48.0

Property	Type	Description	Required or Optional	Available Version
isConsiderReservedBalanceAmount	Boolean	If true, the reserved balance amount is used for the Order Summary to fund the invoice. If not enough reserved balance amount, any available balance that isn't reserved by another Order Summary is used. If false, any available balance is used.	Optional	59.0

SEE ALSO:

ensureFundsAsync(orderSummaryId, ensureFundsInput)

ConnectApi.EnsureRefundsAsyncInputRepresentation

ID of a credit memo to ensure refunds for, an amount of excess funds to refund, or both. At least one is required. Also includes any invoices for fees that reduce the refund amount, such as return fees. If multiple payment methods are available, you can specify how to distribute the refund.

Property	Type	Description	Required or Optional	Available Version
`creditMemoId`	String	ID of the credit memo that represents a refund amount.	Either `creditMemoId` or `excessFundsAmount` is required	48.0
`excessFundsAmount`	Double	Amount of excess funds to refund.	Either `excessFundsAmount` or `creditMemoId` is required	49.0
`invoicesToPay`	List<`ConnectApi.InvoiceToPayInputRepresentation`>	List of invoices for any fees that reduce the refund, such as return fees.	Optional	56.0
`isAllowPartial`	Boolean	This value controls the behavior when the amounts included in the `sequences` list don't cover the entire refund amount. If this value is false, then the default refund logic is applied to ensure the remaining refund amount. If this value is true, then the unrefunded balance remains on the credit memo. If you don't specify a `sequences` list, this value is ignored and the default refund logic is applied. The default value is false.	Optional	56.0

Property	Type	Description	Required or Optional	Available Version
isReservedBalanceAmountConsidered	Boolean	If true, the refundable amount is used to open the payment balance for the reservedBalanceAmount in the Order Payment Summaries. The remaining refundable amount considers the sequence of order payment summaries, if provided. If false, any reserved balance amount for exchanges is refunded.	Optional	59.0
sequences	List<ConnectApi.SequenceOrderPaymentSummaryInputRepresentation>	Ordered list of refund amounts and OrderPaymentSummaries to apply them to. An OrderPaymentSummary must either belong to the order summary or be a reference to the order summary in the OrderPaymentSummaryReference entity. The process traverses this list in order and stops when it's refunded the full amount.	Optional	56.0

SEE ALSO:

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

ConnectApi.EntityLinkSegmentInput

An entity link segment.

Subclass of ConnectApi.MessageSegmentInput.

Property	Type	Description	Required or Optional	Available Version
entityId	String	ID of the entity to link to. Only users with access to the entity see it. It's hidden for users without access.	Required	43.0

ConnectApi.EstimateDeliveryDateInputRepresentation

Delivery date estimation information.

Property	Type	Description	Required or Optional	Available Version
deliveryAddress	ConnectApi.DeliveryAddressInputRepresentation on page 1850	Delivery address.	Optional	63.0
locations	String	List of location external references.	Optional	63.0

Property	Type	Description	Required or Optional	Available Version
products	ConnectApi.DeliveryProductInputRepresentation on page 1850	List of products included in delivery estimation.	Required	63.0
shippingCarrier	ConnectApi.ShippingCarrierInputRepresentation on page 1937	Shipping carrier used to deliver the order.	Required	63.0

ConnectApi.ExtendedFieldInput

Contains information about the extended field.

Property	Type	Description	Required or Optional	Available Version
name	String	The name of the field, including custom field.	Optional	53.0
value	String	The value of the field.	Optional	53.0

ConnectApi.ExtensionInput

An extension.

Property	Type	Description	Required or Optional	Available Version
alternativeRepresentation	ConnectApi.AlternativeInput	Alternative representation of the extension.	Required	40.0
extensionId	String	ID of the extension.	Required	40.0
payload	String	Payload associated with the extension.	Required	40.0
payloadVersion	String	Payload version that identifies the structure of the payload associated with the extension.	Optional	40.0

SEE ALSO:

ConnectApi.ExtensionsCapabilityInput

ConnectApi.ExtensionsCapabilityInput

Create or update extensions associated with a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`itemsToAdd`	List<`ConnectApi.ExtensionInput`>	List of extensions to associate with the feed element.	Required for creating an extension Optional for updating an extension	40.0
`itemsToRemove`	List<String>	List of attachment IDs to remove from the feed element.	Optional for updating an extension Don't specify for creating an extension	41.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.ExternalAuthIdentityProviderCredentialInput

External auth identity provider credential input.

Property	Type	Description	Required or Optional	Available Version
`credentialName`	String	Name of the external auth identity provider credential.	Required	62.0
`credentialValue`	String	Value of the external auth identity provider credential.	Required	62.0

SEE ALSO:

ConnectApi.ExternalAuthIdentityProviderCredentialsInput

ConnectApi.ExternalAuthIdentityProviderCredentialsInput

External auth identity provider credentials input.

Property	Type	Description	Required or Optional	Available Version
credentials	ConnectApi.ExternalAuthIdentityProviderCredentialInput on page 1857>	List of external auth identity provider credentials to populate.	Required	62.0

SEE ALSO:

createExternalAuthIdentityProviderCredentials(fullName, requestBody)

updateExternalAuthIdentityProviderCredentials(fullName, requestBody)

ConnectApi.ExternalAuthIdentityProviderInput

External auth identity provider input.

Property	Type	Description	Required or Optional	Available Version
authenticationFlow	ConnectApi.IdentityProviderAuthFlow on page 2367	Authentication flow to get tokens to call protected APIs. Values are: • AuthorizationCode	Required	62.0
authenticationProtocol	ConnectApi.IdentityProviderAuthProtocol on page 2367	Authentication protocol required to access the external system. Values are: • OAuth	Required	62.0
authorizeUrl	String	Authorization endpoint URL for the external system.	Required when the authenticationProtocol is OAuth and the authenticationFlow is AuthorizationCode. Otherwise, Optional.	62.0
clientAuthentication	ConnectApi.IdentityProviderClientAuth	Client authentication method that describes how credentials are sent to the authorization server. Values are: • ClientSecretBasic • ClientSecretPost The default value is ClientSecretBasic.	Optional	63.0
description	String	Description of the external auth identity provider.	Optional	62.0

Property	Type	Description	Required or Optional	Available Version
`fullName`	String	Full name of the external auth identity provider. The full name can include a namespace prefix.	Required	62.0
`label`	String	External auth identity provider label.	Required	62.0
`parameters`	List<`ConnectApi.ExternalAuthIdentityProviderParameter`>	List of custom request parameters to customize and extend requests to the identity provider's token endpoint.	Optional	63.0
`standardExternalIdentityProvider`	String	Reference to a standard external auth identity provider.	Optional	63.0
`tokenUrl`	String	Token endpoint URL to retrieve tokens from the external system. Required for all OAuth 2.0 authentication flows.	Required	62.0
`userInfoUrl`	String	User info URL to retrieve user profile information from the external system. Applicable only when the `authenticationProtocol` is `OAuth`.	Optional	62.0

SEE ALSO:

createExternalAuthIdentityProvider(requestBody)

updateExternalAuthIdentityProvider(fullName, requestBody)

ConnectApi.ExternalAuthIdentityProviderParameterInput

External auth identity provider parameter input.

Property	Type	Description	Required or Optional	Available Version
`parameterName`	String	The name of the external auth identity provider parameter.	Required	63.0
`parameterType`	`ConnectApi.ExternalAuthIdentityProviderParameterType`	Parameter type for an external auth identity provider. Values are: • `AuthorizeRequestQueryParameter` • `IdentityProviderOptions` • `RefreshRequestBodyParameter` • `RefreshRequestHttpHeader` • `RefreshRequestQueryParameter`	Required	63.0

Property	Type	Description	Required or Optional	Available Version
		• `TokenRequestBodyParameter` • `TokenRequestHttpHeader` • `TokenRequestQueryParameter`		
`parameterValue`	String	If `parameterType` describes a literal value then the literal value is stored in this property.	Optional	63.0
`sequenceNumber`	Integer	Specifies the order of parameters to apply when an external auth identity provider has more than one parameter. Priority is from lower to higher numbers, for example, `1` is the highest priority.	Optional	63.0

SEE ALSO:

ConnectApi.ExternalAuthIdentityProviderInput

ConnectApi.ExternalCredentialInput

Input used to create or update an external credential.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Property	Type	Description	Required or Optional	Available Version
`authentication Protocol`	`ConnectApi. Credential Authentication Protocol`	Authentication protocol of the external credential. Values are: • `AwsSv4` • `Basic` • `Custom` • `Jwt` • `OAuth`	Required	58.0
`authentication ProtocolVariant`	`ConnectApi. Credential Authentication ProtocolVariant`	Authentication protocol variant of the external credential. Values are: • `AwsSv4_STS`—AWS Signature Version 4 with Security Token Service. • `ClientCredentialsClientSecret`—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's request body.	Optional	58.0

Property	Type	Description	Required or Optional	Available Version
		• `ClientCredentialsClientSecretBasic`—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's authorization header, as with Basic authentication. • `ClientCredentialsJwtAssertion`—OAuth 2.0 Client Credentials JSON Web Token assertion. • `JwtBearer`—OAuth 2.0 JSON Web Token bearer flow. • `NoAuthentication`—No authentication. • `RolesAnywhere`—AWS Signature Version 4 with Identity and Access Management (IAM) Roles Anywhere. If specified, the authentication protocol variant must match the actual protocol variant of the external credential.		
`customHeaders`	List<`ConnectApi.CredentialCustomHeaderInput`>	List of credential custom headers.	Optional	58.0
`developerName`	String	Fully qualified developer name of the external credential.	Required for creating an external credential Optional for updating an external credential	58.0
`masterLabel`	String	External credential label.	Required	58.0
`parameters`	List<`ConnectApi.ExternalCredentialParameterInput`>	List of external credential parameters.	Optional depending on `authenticationProtocol` and `authenticationVariant`	58.0
`principals`	List<`ConnectApi.ExternalCredentialPrincipalInput`>	List of principals the credential has.	Optional	58.0

ConnectApi.ExternalCredentialParameterInput

External credential parameter input.

Property	Type	Description	Required or Optional	Available Version
`id`	String	Parameter ID.	Optional	58.0
`parameterDescription`	String	Parameter description.	Optional	58.0
`parameterName`	String	Parameter name of the external credential.	Required	58.0
`parameterType`	`ConnectApi.ExternalCredentialParameterType`	Parameter type of the external credential. Values are: • `AdditionalRefreshStatusCode` • `AuthParameter` • `AuthProvider` • `AuthProviderUrl` • `AuthProviderUrlQueryParameter` • `JwtBodyClaim` • `JwtHeaderClaim` • `SigningCertificate`	Required	58.0
`parameterValue`	String	Parameter value of the external credential.	Required	58.0

SEE ALSO:

ConnectApi.ExternalCredentialInput

ConnectApi.ExternalCredentialPrincipalInput

ConnectApi.ExternalCredentialPrincipalInput

External credential principal input.

Property	Type	Description	Required or Optional	Available Version
`id`	String	ID of the principal external credential parameter.	Optional	58.0
`parameters`	List<`ConnectApi.ExternalCredentialParameterInput`>	List of external credential parameters.	Optional	58.0
`principalName`	String	Principal name.	Required	58.0
`principalType`	`ConnectApi.CredentialPrincipalType`	Type of credential principal. Values are: • `AwsStsPrincipal` • `NamedPrincipal` • `PerUserPrincipal`	Required	58.0

Property	Type	Description	Required or Optional	Available Version
sequenceNumber	Integer	Sequence number.	Required	58.0

SEE ALSO:

ConnectApi.ExternalCredentialInput

ConnectApi.NamedCredentialInput

ConnectApi.FeedElementCapabilitiesInput

A container for all capabilities that can be included when creating a feed element.

Property	Type	Description	Required or Optional	Available Version
associatedActions	ConnectApi.AssociatedActionsCapabilityInput	Describes actions added to the feed element.	Optional	33.0
bookmarks	ConnectApi.BookmarksCapabilityInput	Describes bookmarks added to the feed element.	Optional	32.0
canvas	ConnectApi.CanvasCapabilityInput	Describes a canvas app added to the feed element.	Optional	32.0
content	ConnectApi.ContentCapabilityInput	Describes content added to the feed element. **Important:** This class isn't available for feed posts in version 36.0 and later. In version 36.0 and later, use ConnectApi.FilesCapabilityInput.	Optional	32.0–35.0
directMessage	ConnectApi.DirectMessageCapabilityInput	Describes the direct message.	Optional	39.0
extensions	ConnectApi.ExtensionsCapabilityInput	Describes the extensions associated with the feed element.	Optional	40.0
feedEntityShare	ConnectApi.FeedEntityShareCapabilityInput	Describes the feed entity shared with the feed element.	Optional	39.0
files	ConnectApi.FilesCapabilityInput	Describes files attached to the feed element.	Optional	36.0

Property	Type	Description	Required or Optional	Available Version
`link`	`ConnectApi.LinkCapabilityInput`	Describes a link added to the feed element.	Optional	32.0
`poll`	`ConnectApi.PollCapabilityInput`	Describes a poll added to the feed element.	Optional	32.0
`questionAndAnswers`	`ConnectApi.QuestionAndAnswersCapabilityInput`	Describes a question and answer capability added to the feed element.	Optional	32.0
`status`	`ConnectApi.StatusCapabilityInput`	Describes the status of the feed element.	Optional	44.0
`topics`	`ConnectApi.TopicsCapabilityInput`	Describes topics assigned to the feed element.	Optional	38.0

SEE ALSO:

ConnectApi.FeedElementInput

ConnectApi.FeedElementCapabilityInput

A feed element capability.

In API version 30.0 and earlier, most feed items can have comments, likes, topics, and so on. In version 31.0 and later, every feed item (and feed element) can have a unique set of *capabilities*. If a capability property exists on a feed element, that capability is available, even if the capability property doesn't have a value. For example, if the `ChatterLikes` capability property exists on a feed element (with or without a value), the context user can like that feed element. If the capability property doesn't exist, it isn't possible to like that feed element. A capability can also contain associated data. For example, the `Moderation` capability contains data about moderation flags.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

This class is a superclass of:

- ConnectApi.AssociatedActionsCapabilityInput
- ConnectApi.BookmarksCapabilityInput
- ConnectApi.CanvasCapabilityInput
- ConnectApi.ContentCapabilityInput
- ConnectApi.DirectMessageCapabilityInput
- ConnectApi.ExtensionsCapabilityInput
- ConnectApi.FeedEntityShareCapabilityInput
- ConnectApi.FilesCapabilityInput
- ConnectApi.LinkCapabilityInput

- ConnectApi.MuteCapabilityInput
- ConnectApi.PollCapabilityInput
- ConnectApi.QuestionAndAnswersCapabilityInput
- ConnectApi.ReadByCapabilityInput
- ConnectApi.RecordCapabilityInput
- ConnectApi.StatusCapabilityInput
- ConnectApi.TopicsCapabilityInput

ConnectApi.FeedElementInput

Feed elements are the top-level items that a feed contains. Feeds are feed element containers.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass of ConnectApi.FeedItemInput.

Property	Type	Description	Required or Optional	Available Version
`capabilities`	`ConnectApi.FeedElementCapabilitiesInput`	The capabilities that define auxiliary information on this feed element.	Optional	31.0
`feedElementType`	`ConnectApi.FeedElementType`	The type of feed element this input represents.	Required when creating a feed element Optional when updating a feed element	31.0

Property	Type	Description	Required or Optional	Available Version
`subjectId`	String	The ID of the parent this feed element is being posted to. This value can be the ID of a user, group, or record, or the string `me` to indicate the context user. In version 45.0 and later, you can move a feed element from one public group to another by setting this property to the ID of the new public group. You can't include or change any other properties when moving a feed element.	Required	31.0

SEE ALSO:

- Post a Feed Element with a Mention
- Post a Feed Element with Existing Content
- Post a Feed Element with a New File (Binary) Attachment
- Define an Action Link and Post with a Feed Element
- Define an Action Link in a Template and Post with a Feed Element
- Share a Feed Element (in Version 39.0 and Later)
- Edit a Feed Element
- Edit a Question Title and Post
- Post a Rich-Text Feed Element with Inline Image

ConnectApi.FeedEntityShareCapabilityInput

Share a feed entity with a feed post or comment.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`feedEntityId`	String	ID of the feed entity to share with the feed post or comment.	Required	39.0

SEE ALSO:

- ConnectApi.FeedElementCapabilitiesInput

ConnectApi.FeedItemInput

Used to create rich feed items, for example, feed items that include @mentions or files.

Subclass of ConnectApi.FeedElementInput as of version 31.0.

Property	Type	Description	Required or Optional	Available Version
`attachment`	`ConnectApi.FeedItemAttachmentInput`	Specifies the attachment for the feed item. The feed item type is inferred based on the provided attachment. **Important:** As of API version 32.0, use the inherited `capabilities` property.	Optional	28.0–31.0
`body`	`ConnectApi.MessageBodyInput`	Message body. The body can contain up to 10,000 characters and 25 mentions. Because the character limit can change, clients should make a `describeSObjects()` call on the FeedItem or FeedComment object and look at the length of the `Body` or `CommentBody` field to determine the maximum number of allowed characters. If you specify `originalFeedElementId` to share a feed item, use the `body` property to add the first comment to the feed item. To edit this property in a feed item, use `updateFeedElement(communityId, feedElementId, feedElement)`. Editing feed posts is supported in version 34.0 and later.	Required unless the feed item has a link capability or a content capability.	28.0
`isBookmarkedByCurrentUser`	Boolean	Specifies if the new feed item should be bookmarked for the user (`true`) or not (`false`). **Important:** As of API version 32.0, use the `capabilities.bookmarks.isBookmarkedByCurrentUser` property.	Optional	28.0–31.0
`originalFeedElementId`	String	To share a feed element, specify its 18-character ID. **Important:** As of API version 39.0, use the `capabilities.feedEntityShare.feedEntityId` property.	Optional	31.0–38.0
`originalFeedItemId`	String	To share a feed item, specify its 18-character ID. **Important:** In API version 32.0–38.0, use the `originalFeedElementId` property. In API version 39.0 and later, use the `capabilities.feedEntityShare.feedEntityId` property.	Optional	28.0–31.0
`visibility`	`ConnectApi.FeedItemVisibilityType` Enum	Type of users who can see a feed item. • `AllUsers`—Visibility is not limited to internal users. • `InternalUsers`—Visibility is limited to internal users.	Optional	28.0

Property	Type	Description	Required or Optional	Available Version
		Default values: • For external users, the default value is `AllUsers`. External users must use this value to see their posts. • For internal users, the default value is `InternalUsers`. Internal users can accept this value or use the value `AllUsers` to allow external users to see their posts. If the parent of the feed item is a user, group, or direct message, the `visibility` of the feed item must be `AllUsers`.		

ConnectApi.FileIdInput

Attach a file that has already been uploaded or remove a file from a feed element.

Property	Type	Description	Required or Optional	Available Version
`id`	String	ID of a file that has already been uploaded.	Required	36.0
`operationType`	`ConnectApi.OperationType`	Operation to carry out on the file. Values are: • `Add`—Adds the file to the feed element. • `Remove`—Removes the file from the feed element. `Remove` operations are processed before `Add` operations. Adding content that is already added and removing content that is already removed result in no operation.	Optional If not specified, defaults to `Add`.	36.0

SEE ALSO:

ConnectApi.FilesCapabilityInput

ConnectApi.FilesCapabilityInput

Attach up to 10 files that have already been uploaded or remove one or more files from a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`items`	List<`ConnectApi.FileIdInput`>	List of file IDs and operations to be carried out on those files.	Required	36.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.SearchFilter

Filter input for object search.

Property	Type	Description	Required or Optional	Available Version
`field`	String	Field to use in the filter.	Optional	63.0
`operator`	`ConnectApi.FilterOperator`	Filter operator. Values are: • `EqOp`—Equal • `ExcludesOp`—Excludes • `GtOp`—Greater than • `GteOp`—Greater than or equal • `InOp`—In • `IncludesOp`—Includes • `LikeOp`—Like • `LtOp`—Less than • `LteOp`—Less than or equal • `NeOp`—Not equal • `NinOp`—Not in	Optional	63.0
`values`	List<`ConnectApi.AbstractList`>	Values of the filter, it can be a List of String, Boolean, Long, or Double. Do not mix data types for filter values, for example, `["A", "B", "C"]` is valid, but `["A", -7, false]` isn't.	Optional	63.0

SEE ALSO:

ConnectApi.SearchRequest

ConnectApi.FindRoutesWithFewestSplitsGroupUsingOCIInputRepresentation

Data used to calculate inventory availability and fulfillment routes for one order involving the fewest number of shipment splits.

Property	Type	Description	Required or Optional	Available Version
excludeLocations	List<String>	List of locations to exclude from the routing calculations.	Optional	55.0
maximumNumberOfSplits	Integer	Maximum allowable number of shipment splits. Routing options that involve more than this number of splits are not returned. Note: Each split represents an additional shipment. Specifying a maximum of 0 returns only locations that can fulfill the entire order in a single shipment. A maximum of 1 returns combinations of locations that can fulfill the order in one or two shipments, and so on.	Required	54.0
orderedItems	[illegible]	Each list element represents a quantity of a product to be routed for fulfillment and the assigned location group or location.	At least one element is required	54.0

SEE ALSO:

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

ConnectApi.FindRoutesWithFewestSplitsUsingOCIInputRepresentation

ConnectApi.FindRoutesWithFewestSplitsInputRepresentation

Data used to calculate order fulfillment routes involving the fewest number of shipment splits.

Property	Type	Description	Required or Optional	Available Version
locationAvailableInventory	List<ConnectApi.LocationAvailabilityInputRepresentation>	Each list element represents the available quantity of a product at an inventory location.	At least one element is required	51.0
maximumNumberOfSplits	Integer	The maximum allowable number of shipment splits. Routing options that involve more than this number of splits are not returned. Note: Each split represents an additional shipment. Specifying a maximum of 0 returns only locations that can fulfill the entire order in a single shipment. A maximum of 1 returns combinations of locations	Required	51.0

Property	Type	Description	Required or Optional	Available Version
		that can fulfill the order in one or two shipments, and so on.		
orderedQuantities	List<ConnectApi.QuantityWithSkuInputRepresentation>	Each list element represents a quantity of a product to be routed for fulfillment.	At least one element is required	51.0

SEE ALSO:

findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)

ConnectApi.FindRoutesWithFewestSplitsUsingOCIInputRepresentation

Data used to calculate order fulfillment routes involving the fewest number of shipment splits, taking into account inventory availability.

Property	Type	Description	Required or Optional	Available Version
[illegible]	[illegible]	Each list element represents a routing request for one order.	At least one element is required	54.0
ociExpandAttributes	Collection	The string value groupEligibilityExclusion excludes specific locations.	Optional	59.0

SEE ALSO:

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

ConnectApi.FindRoutesWithFewestSplitsUsingOCIItemInputRepresentation

A quantity of a product and a location group or location assigned to fulfill it.

Property	Type	Description	Required or Optional	Available Version
locationGroupIdentifier	String	The External Reference of the location group or location assigned to the order item. If you specify a location group, inventory is considered for all locations belonging to that group.	Required	54.0
quantity	Double	Quantity of the product.	Required	54.0

Property	Type	Description	Required or Optional	Available Version
`stockKeepingUnit`	String	SKU of the product.	Required	54.0

SEE ALSO:

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

ConnectApi.FindRoutesWithFewestSplitsUsingOCIInputRepresentation

ConnectApi.FindRoutesWithFewestSplitsGroupUsingOCIInputRepresentation

ConnectApi.FormFieldInput

Marketing integration form field.

Property	Type	Description	Required or Optional	Available Version
`name`	String	Name of the marketing integration form field.	Required	53.0
`type`	`ConnectApi.FormFieldType`	Type of marketing integration form field. Values are: • `Boolean` • `Date` • `EmailAddress` • `Number` • `Text`	Required	53.0

SEE ALSO:

ConnectApi.FormInput

ConnectApi.FormInput

Marketing integration form.

Property	Type	Description	Required or Optional	Available Version
`formFieldsList`	List<`ConnectApi.FormFieldInput`>	Fields for the marketing integration form.	Required	53.0
`formName`	String	Name of the marketing integration form.	Required	53.0
`memberIdentificationCode`	String	The member identification code (MID) of the Marketing Cloud Engagement account associated with the form.	Required	53.0

ConnectApi.FormSubmissionFieldInput

Marketing integration form field submission.

Property	Type	Description	Required or Optional	Available Version
`name`	String	Name of the marketing integration form field.	Required	53.0
`value`	String	Value of the marketing integration form field.	Required	53.0

SEE ALSO:

ConnectApi.FormSubmissionInput

ConnectApi.FormSubmissionInput

Marketing integration form submission.

Property	Type	Description	Required or Optional	Available Version
`formFieldsList`	List<`ConnectApi.FormFieldSubmissionInput`>	Fields for the marketing integration form.	Required	53.0

ConnectApi.FulfillmentGroupInputRepresentation

A list of OrderItemSummaries to be fulfilled together, and the fulfillment location to handle them. The fulfillment type is one of the values defined for the Type field on the FulfillmentOrder object, such as “Warehouse” or “Retail Store.” The specified type is assigned to the FulfillmentOrder for this fulfillment group.

Property	Type	Description	Required or Optional	Available Version
`fulfilledFromLocationId`	String	ID of the fulfillment location.	Required	48.0
`fulfillmentType`	String	Fulfillment type. One of the Type field values defined for FulfillmentOrders.	Required	48.0
`orderItemSummaries`	List<`ConnectApi.OrderItemSummaryInputRepresentation`>	List of OrderItemSummaries.	Required	48.0

Property	Type	Description	Required or Optional	Available Version
`referenceId`	String	Reference to this input for use in troubleshooting failures. This value is only used by the APIs for creating fulfillment orders for multiple order delivery group summaries.	Optional	50.0

SEE ALSO:

ConnectApi.FulfillmentOrderInputRepresentation

createFulfillmentOrders(fulfillmentOrderInput)

ConnectApi.FulfillmentOrderInputRepresentation

An OrderDeliveryGroupSummary that defines a delivery method and recipient, and a list of fulfillment groups to assign to FulfillmentOrders. Each fulfillment group is a set of OrderItemSummaries that match the OrderDeliveryGroupSummary and share the same fulfillment location. The method creates a FulfillmentOrder for each fulfillment group and a FulfillmentOrderLineItem for each OrderItemSummary.

Property	Type	Description	Required or Optional	Available Version
`defaultActivationStatus`	String	Default activation status for a new fulfillment order. If you don't specify a value, the default value is `Allocated`, which belongs to the `Activated` status category. This default can be changed, but the replacement status must also have a status category of `Activated`.	Optional	58.0
`fulfillmentGroups`	List<`ConnectApi.FulfillmentGroupInputRepresentation`>	List of fulfillment groups that specify the OrderItemSummaries and fulfillment locations.	Required	48.0
`orderDeliveryGroupSummaryId`	String	ID of the OrderDeliveryGroupSummary.	Required	48.0
`orderSummaryId`	String	ID of the OrderSummary.	Required	48.0

SEE ALSO:

createFulfillmentOrders(fulfillmentOrderInput)

ConnectApi.FulfillmentOrderInvoiceInputRepresentation

Instantiate and include this object with no properties when creating an invoice.

This input class has no properties.

SEE ALSO:

createInvoice(fulfillmentOrderId, invoiceInput)

ConnectApi.FulfillmentOrderLineItemInputRepresentation

A FulfillmentOrderLineItem and quantity to cancel. You can cancel less than the full quantity, in which case you reallocate the canceled quantity to a different FulfillmentOrder.

Property	Type	Description	Required or Optional	Available Version
`fulfillmentOrderLineItemId`	String	ID of the FulfillmentOrderLineItem.	Required	48.0
`quantity`	Double	Quantity to cancel.	Required	48.0

SEE ALSO:

ConnectApi.FulfillmentOrderLineItemsToCancelInputRepresentation

cancelFulfillmentOrderLineItems(fulfillmentOrderId, cancelFulfillmentOrderLineItemsInput)

ConnectApi.FulfillmentOrderLineItemsToCancelInputRepresentation

A list of FulfillmentOrderLineItems and quantities to cancel.

Property	Type	Description	Required or Optional	Available Version
`fulfillmentOrderLineItemsToCancel`	List<`ConnectApi.FulfillmentOrderLineItemInputRepresentation`>	List of FulfillmentOrderLineItems and quantities.	Required	48.0

SEE ALSO:

cancelFulfillmentOrderLineItems(fulfillmentOrderId, cancelFulfillmentOrderLineItemsInput)

ConnectApi.GetFOCapacityValuesRequestInputRepresentation

Locations to get fulfillment order capacity information for.

Property	Type	Description	Required or Optional	Available Version
`locationIds`	List<String>	List of IDs of the locations to get fulfillment order capacity information for.	Required	55.0

ConnectApi.GroupInformationInput

Chatter group information input.

Property	Type	Description	Available Version
`text`	String	The text in the "Information" section of a group.	28.0
`title`	String	The title of the "Information" section of a group.	28.0

SEE ALSO:

ConnectApi.ChatterGroupInput

ConnectApi.HashtagSegmentInput

Include a hashtag in a feed item or comment.

Subclass of ConnectApi.MessageSegmentInput.

Property	Type	Description	Available Version
`tag`	String	Text of the hash tag without the # (hash tag) prefix Note: Closing square brackets ( ]) are not supported in hash tag text. If the text contains a closing square bracket ( ]), the hash tag ends at the bracket.	28.0

SEE ALSO:

ConnectApi.MessageBodyInput

ConnectApi.HoldFOCapacityInputRepresentation

Request to hold fulfillment order capacity at one or more locations. Can correspond to one action call.

Property	Type	Description	Required or Optional	Available Version
`holdFOCapacityRequests`	List<`ConnectApi.HoldFOCapacityRequestInputRepresentation`>	List of requests to hold fulfillment order capacity at one or more locations.	Required	55.0

ConnectApi.HoldFOCapacityRequestInputRepresentation

Request to hold fulfillment order capacity at one or more locations.

Property	Type	Description	Required or Optional	Available Version
`allOrNothing`	Boolean	Controls whether a single failed request cancels all other requests in the list (`true`) or whether some requests can succeed if others fail (`false`). The default value is `false`.	Optional	55.0
`capacityRequests`	List<`ConnectApi.CapacityRequestInputRepresentation`>	List of requests to hold fulfillment order capacity. Each request is for one fulfillment order at one location.	Required	55.0

ConnectApi.InlineImageSegmentInput

An inline image segment.

Subclass of ConnectApi.MessageSegmentInput.

Property	Type	Description	Required or Optional	Available Version
`altText`	String	Alt text for the inline image.	Optional If not specified, the title of the inline image file is used as the alt text.	35.0
`fileId`	String	ID of the inline image file.	Required	35.0

SEE ALSO:

- Post a Rich-Text Feed Element with Inline Image
- ConnectApi.MessageBodyInput

ConnectApi.InnerEnsureFundsAsyncInputRepresentation

ID of an Invoice and ID of the associated OrderSummary.

Property	Type	Description	Required or Optional	Available Version
`invoiceId`	String	ID of the Invoice to ensure funds for.	Required	56.0
`isConsiderReservedBalanceAmt`	Boolean	If true, the reserved balance amount is used for the Order Summary to fund the invoice. If not enough reserved balance amount, any available balance that isn't reserved by another Order Summary is used. If false, any available balance is used.	Optional	59.0

Property	Type	Description	Required or Optional	Available Version
`orderSummaryId`	String	ID of the OrderSummary associated with the Invoice.	Required	56.0

SEE ALSO:

multipleEnsureFundsAsync(multipleEnsureFundsInput)

ConnectApi.MultipleEnsureFundsAsyncInputRepresentation

ConnectApi.InviteInput

An invitation.

Property	Type	Description	Required or Optional	Available Version
`invitees`	List<`String`>	List of email addresses to send the invitation to.	Required	39.0
`message`	String	Message to include in the invitation.	Optional	39.0

ConnectApi.InvoiceToPayInputRepresentation

Invoice for a fee.

Property	Type	Description	Required or Optional	Available Version
`invoiceId`	String	ID of the invoice for a fee.	Required	56.0

SEE ALSO:

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

ConnectApi.EnsureRefundsAsyncInputRepresentation

ConnectApi.LeadInput

Contains information about a lead or guest user.

Property	Type	Description	Required or Optional	Available Version
`company`	String	The company of the lead.	Optional	53.0
`email`	String	The email address of the lead.	Optional	53.0
`extendedFields`	List<ConnectApi.ExtendedFieldInput>	Use to add values to any of the fields, including custom fields.	Optional	53.0

Property	Type	Description	Required or Optional	Available Version
`firstName`	String	The first name of the lead.	Optional	53.0
`lastName`	String	The last name of the lead.	Optional	53.0
`phone`	String	The phone number of the lead.	Optional	53.0

ConnectApi.LinkCapabilityInput

Create or update a link on a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`url`	String	Link URL. The URL can be to an external site.	Required	32.0
`urlName`	String	Description of the link.	Optional	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.LinkSegmentInput

Include a link segment in a feed item or comment.

Subclass of ConnectApi.MessageSegmentInput.

Property	Type	Description	Available Version
`url`	String	URL to be used for the link	28.0

SEE ALSO:

ConnectApi.MessageBodyInput

ConnectApi.LocationAvailabilityInputRepresentation

The available quantity of a product at an inventory location.

Property	Type	Description	Required or Optional	Available Version
`externalReferenceId`	String	The external reference ID of the inventory location.	Optional	51.0
`quantity`	Double	The available quantity of the product.	Required	51.0
`stockKeepingUnit`	String	The Stock Keeping Unit of the product.	Required	51.0

ConnectApi.LocationInputRepresentation

Inventory location data used to calculate shipping distance.

Property	Type	Description	Required or Optional	Available Version
`countryCode`	String	The country code of the location.	Required	51.0
`locationIdentifier`	String	The identifier of the location.	Required	51.0
`postalCode`	String	The postal code of the location.	Required	51.0

ConnectApi.LongList

List of long values.

Subclass of ConnectApi.AbstractList.

Property	Type	Description	Required or Optional	Available Version
`values`	List<Long>	List of Long values to filter on.	Optional	63.0

ConnectApi.ManagedContentBodyInput

Input representation for the body of a piece of managed content.

Property	Type	Description	Required or Optional	Available Version
`nodeMap`	`Object`	Body of the managed content version. The format must be Map<String, Object> , where map values are either primitive values like String, Integer, Double, Boolean, or another Map<String, Object>.	Required	60.0

SEE ALSO:

- ConnectApi.ManagedContentDocumentInput
- ConnectApi.ManagedContentVariantUpdateInput

ConnectApi.ManagedContentChannelCreateRepresentation

Input class to create a managed content channel.

Property	Type	Description	Required or Optional	Available Version
`cacheControlMaxAge`	Long	Cache control max age value in seconds.	Optional	62.0

Property	Type	Description	Required or Optional	Available Version
`domain`	String	ID or name of the domain assigned to the public channel.	Optional	62.0
`isDedicatedContentDelivery`	Boolean	Specifies whether the channel has off-core dedicated content delivery enabled (`true`) or not (`false`). Orgs hosted on Hyperforce use off-core dedicated content delivery to deliver content in public channels with high performance and low latency.	Optional	63.0
`isDomainLocked`	Boolean	Specifies whether the domain is locked and can't be changed (`true`) or not (`false`).	Optional	62.0
`isSearchable`	Boolean	Specifies whether the text contents of the channel are searchable (`true`) or not (`false`).	Optional	62.0
`mediaCacheControlMaxAge`	Long	Media cache control max age value in seconds.	Optional	62.0
`name`	String	Name of the managed content channel.	Required	62.0
`targetId`	String	ID of the target associated with the managed content channel.	Required for all channel types except `PublicUnauthenticated`	62.0
`type`	`ConnectApi.ManagedContentChannelType`	Type of managed content channel. Values are: • `CloudToCloud`—Cloud-to-Cloud integrated channel. • `Community`—Experience Cloud site channel. • `ConnectedApp`—Channel served by a connected app. • `PublicUnauthenticated`—Public channel. All published content is publicly available. • `UserPermission`—Channel backed by a system permission. All published content is available only to users with the permission.	Required	62.0

SEE ALSO:

postManagedContentChannel(ManagedContentCreateInputParam)

ConnectApi.ManagedContentChannelUpdateRepresentation

Input class to update a managed content channel.

Property	Type	Description	Required or Optional	Available Version
`cacheControlMaxAge`	Long	Cache control max age value in seconds.	Optional	62.0
`domain`	String	ID or name of the domain assigned to the public channel.	Optional	62.0
`isDedicatedContentDelivery`	Boolean	Specifies whether the channel has off-core dedicated content delivery enabled (`true`) or not (`false`). Orgs hosted on Hyperforce use off-core dedicated content delivery to deliver content in public channels with high performance and low latency.	Optional	63.0
`isDomainLocked`	Boolean	Specifies whether the domain is locked and can't be changed (`true`) or not (`false`).	Optional	62.0
`isSearchable`	Boolean	Specifies whether the text contents of the channel are searchable (`true`) or not (`false`).	Optional	62.0
`mediaCacheControlMaxAge`	Long	Media cache control max age value in seconds.	Optional	62.0
`name`	String	Name of the managed content channel.	Required	62.0
`targetId`	String	ID of the target associated with the managed content channel.	Required for all channel types except `Public Unauthenticated`	62.0

SEE ALSO:

patchManagedContentChannel(channelId, ManagedContentChannelInput)

ConnectApi.ManagedContentDocumentCloneInput

Managed content clone input.

Property	Type	Description	Required or Optional	Available Version
`apiName`	String	API name of the cloned content.	Optional	61.0
`contentSpaceOrFolderId`	String	ID of the target folder for the cloned content. If unspecified, defaults to the folder of the source content.	Optional	61.0

Property	Type	Description	Required or Optional	Available Version
`includeVariants`	Boolean	Specifies whether to include variants (`true`) or not (`false`) when cloning the content. If unspecified, default is `false`.	Optional	61.0
`title`	String	Title of the cloned content. If unspecified, "clone of" is appended to the source content's title.	Optional	61.0

SEE ALSO:

cloneManagedContentDocument(contentKeyOrId, ManagedContentCloneInputParam)

ConnectApi.ManagedContentDocumentInput

Input representation for a piece of managed content.

Property	Type	Description	Required or Optional	Available Version
`apiName`	String	API name of the managed content.	Optional	61.0
`contentBody`	`ConnectApi.ManagedContentBodyInput`	Body of the managed content.	Required	60.0
`contentKey`	String	Content key to assign to the managed content. A content key is a universally unique identifier (UUID) such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.	Optional	60.0
`contentSpaceOrFolderId`	String	Content space or folder ID where the content is created.	Required	60.0
`contentType`	String	Fully qualified name of the content type to create. If you're uploading a binary file using a multipart/form-data message, `contentType` must be `sfdc_cms__image` or `sfdc_cms__doc`. You can't create a Form using `sfdc_cms__form`. The `sfdc_cms__form` content type isn't supported.	Required	60.0
`externalId`	String	External ID of the managed content.	Optional	60.0
`title`	String	Title of the managed content.	Required	60.0

Property	Type	Description	Required or Optional	Available Version
`urlName`	String	URL name of the managed content within the org.	Optional	60.0

ConnectApi.ManagedContentPublishInput

Input for publishing content.

Property	Type	Description	Required or Optional	Available Version
`contentIds`	List<String>	IDs of content to publish. All variants of the content are published.	Required if `variantIds` isn't specified	60.0
`contextContentSpaceId`	String	ID of the context workspace. If specified, content from other workspaces is published if it is shared to the specified workspace. If unspecified, the context workspace is derived from the content's origin workspace. All content in the request should belong to the same origin workspace.	Optional	61.0
`description`	String	Description for publish action.	Optional	60.0
`includeContentReferences`	Boolean	Specifies whether to include content references (`true`) or not (`false`).	Optional	60.0
`variantIds`	List<String>	IDs of variants to publish. All variants must be from the same content space.	Required if `contentIds` isn't specified	60.0

ConnectApi.ManagedContentSpaceChannelInputRepresentation

Channel to add or remove from a managed content space.

Property	Type	Description	Required or Optional	Available Version
`channelId`	String	ID of the channel to add or remove from the managed content space.	Required	62.0

Property	Type	Description	Required or Optional	Available Version
`operation`	`ConnectApi.ManagedContentSpaceChannelOperation` on page 2369	Operation to perform on the channel and managed content space. • `Add`—Add a channel to a managed content space. • `Remove`—Remove a channel from a managed content space.	Required	62.0

SEE ALSO:

ConnectApi.ManagedContentSpaceChannelsInputRepresentation

ConnectApi.ManagedContentSpaceChannelsInputRepresentation

Channels to add or remove from the managed content space.

Property	Type	Description	Required or Optional	Available Version
`spaceChannels`	List<`ConnectApi.ManagedContentSpaceChannelInputRepresentation`>	List of channels to add or remove from the managed content space.	Required	62.0

SEE ALSO:

patchManagedContentSpaceChannels(contentSpaceId, spaceChannels)

ConnectApi.ManagedContentUnpublishInput

Input for unpublishing content.

Property	Type	Description	Required or Optional	Available Version
`contentIds`	List<String>	IDs of content to unpublish. All variants of the content are unpublished.	Required if `variantIds` isn't specified	60.0
`contextContentSpaceId`	String	ID of the context workspace. If specified, content from other workspaces is unpublished if it is shared to the specified workspace. If unspecified, the context workspace is derived from the content's origin workspace. All content in the request	Optional	61.0

Property	Type	Description	Required or Optional	Available Version
		should belong to the same origin workspace.		
`description`	String	Description for unpublish action.	Optional	60.0
`variantIds`	List<String>	IDs of variants to unpublish. All variants must be from the same content space.	Required if `contentIds` isn't specified	60.0

ConnectApi.ManagedContentVariantUpdateInput

Input representation for replacing a managed content variant.

Property	Type	Description	Required or Optional	Available Version
`apiName`	String	API name of the managed content variant.	Optional	63.0
`contentBody`	`ConnectApi.ManagedContentBodyInput`	Body of the managed content variant.	Optional	60.0
`title`	String	Title of the managed content variant.	Optional	60.0
`urlName`	String	URL name of the managed content variant within the org.	Optional	60.0

ConnectApi.ManagedTopicPositionCollectionInput

A collection of relative positions of managed topics.

Property	Type	Description	Required or Optional	Available Version
`managedTopicPositions`	List<`ConnectApi.ManagedTopicPositionInput`>	List of relative positions of managed topics. This list can include `Featured` and `Navigational` managed topics and doesn't need to include all managed topics. For more information about reordering managed topics, see the example in reorderManagedTopics(communityId, managedTopicPositionCollection).	Required	32.0

ConnectApi.ManagedTopicPositionInput

Relative position of a managed topic.

Property	Type	Description	Required or Optional	Available Version
`managedTopicId`	String	ID of existing managed topic.	Required	32.0
`position`	Integer	Relative position of the managed topic, indicated by zero-indexed, ascending whole numbers.	Required	32.0

SEE ALSO:

ConnectApi.ManagedTopicPositionCollectionInput

ConnectApi.MarkupBeginSegmentInput

The beginning tag for rich text markup.

Subclass of ConnectApi.MessageSegmentInput.

Property	Type	Description	Required or Optional	Available Version
`altText`	String	Alternative text for the `Hyperlink` segment.	Optional	45.0
`markupType`	`ConnectApi.MarkupType`	Type of rich text markup. • `Bold`—Bold tag. • `Code`—Code tag. • `Hyperlink`—Hyperlink anchor tag. • `Italic`—Italic tag. • `ListItem`—List item tag. • `OrderedList`—Ordered list tag. • `Paragraph`—Paragraph tag. • `Strikethrough`—Strikethrough tag. • `Underline`—Underline tag. • `UnorderedList`—Unordered list tag. Markup segments with a `markupType` of `Code` can include only text segments.	Required	35.0

Property	Type	Description	Required or Optional	Available Version
`url`	String	URL for the `Hyperlink` segment. Supported hyperlink URLs start with `http://` or `https://`.	Required for `Hyperlink`	45.0

SEE ALSO:

Post a Rich-Text Feed Element with Inline Image

ConnectApi.MessageBodyInput

ConnectApi.MarkupEndSegmentInput

The end tag for rich text markup.

Subclass of ConnectApi.MessageSegmentInput

Property	Type	Description	Required or Optional	Available Version
`markupType`	`ConnectApi.MarkupType`	Type of rich text markup. • `Bold`—Bold tag. • `Code`—Code tag. • `Hyperlink`—Hyperlink anchor tag. • `Italic`—Italic tag. • `ListItem`—List item tag. • `OrderedList`—Ordered list tag. • `Paragraph`—Paragraph tag. • `Strikethrough`—Strikethrough tag. • `Underline`—Underline tag. • `UnorderedList`—Unordered list tag.	Required	35.0

SEE ALSO:

Post a Rich-Text Feed Element with Inline Image

ConnectApi.MessageBodyInput

ConnectApi.MCSFolderShareInput

Target to share a managed content space folder with.

Property	Type	Description	Required or Optional	Available Version
`targetId`	String	ID of the target to share the managed content space folder with. Supported target IDs are the root folder IDs of workspaces. To get the root folder ID for a space, use the `getManagedContentSpace(contentSpaceId)` method.	Optional	63.0

SEE ALSO:

ConnectApi.MCSFolderShareCollectionUpdateInput

ConnectApi.MCSFolderShareCollectionUpdateInput

Update the targets that a managed content space folder is shared with.

Property	Type	Description	Required or Optional	Available Version
`shareWith`	List<`ConnectApi.MCSFolderShareInput`>	List of target IDs to share the managed content space folder with. Supported target IDs are the root folder IDs of workspaces. To get the root folder ID for a space, use the `getManagedContentSpace(contentSpaceId)` method.	Required if `unshareWith` isn't specified	63.0
`unshareWith`	List<String>	Comma-separated list of target IDs to unshare the managed content space folder with.	Required if `shareWith` isn't specified	63.0

SEE ALSO:

getMCSFolderShares(folderId)

ConnectApi.MentionSegmentInput

Include an @mention of a user or group in a feed post or comment. When creating a feed post or comment, you can include up to 25 mentions.

Subclass of ConnectApi.MessageSegmentInput.

Property	Type	Description	Available Version
`id`	String	ID of the user or group to mention. To mention a user, use either `id` or `username`. You can't include both. To mention a group, you must use `id`.	28.0 Groups are available in 29.0.
`username`	String	User name of the user to mention. To mention a user, use either `id` or `username`. You can't include both.	38.0

SEE ALSO:

ConnectApi.MessageBodyInput

ConnectApi.MessageBodyInput

Add rich messages to feed items and comments.

Property	Type	Description	Available Version
`messageSegments`	List<`ConnectApi.MessageSegmentInput`>	List of message segments contained in the body	28.0

SEE ALSO:

ConnectApi.FeedItemInput

ConnectApi.CommentInput

ConnectApi.AnnouncementInput

ConnectApi.MessageSegmentInput

Used to add rich message segments to feed items and comments.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass for:

- ConnectApi.EntityLinkSegmentInput
- ConnectApi.HashtagSegmentInput
- ConnectApi.InlineImageSegmentInput
- ConnectApi.LinkSegmentInput
- ConnectApi.MarkupBeginSegmentInput
- ConnectApi.MarkupEndSegmentInput
- ConnectApi.MentionSegmentInput
- ConnectApi.TextSegmentInput

Use the ConnectApiHelper repository on GitHub to simplify many of the tasks accomplished with ConnectApi.MessageSegmentInput, such as posting with inline images, rich text, and mentions.

Property	Type	Description	Required or Optional	Available Version
`type`	`ConnectApi.MessageSegmentType`	The type of message segment. Values are: • `EntityLink` • `FieldChange` • `FieldChangeName` • `FieldChangeValue` • `Hashtag` • `InlineImage` • `Link` • `MarkupBegin` • `MarkupEnd` • `Mention` • `MoreChanges` • `ResourceLink` • `Text`	Required	23.0

SEE ALSO:

- Edit a Comment
- Edit a Feed Element
- Edit a Question Title and Post
- Post a Rich-Text Feed Element with Inline Image
- ConnectApi.MessageBodyInput

ConnectApi.MultipleEnsureFundsAsyncInputRepresentation

List of Invoices and the associated OrderSummaries.

Property	Type	Description	Required or Optional	Available Version
`asyncInputs`	List<`ConnectApi.InnerEnsureFundsAsyncInputRepresentation`>	List of Invoices to ensure funds for and the associated OrderSummaries.	Required	56.0

SEE ALSO:

- multipleEnsureFundsAsync(multipleEnsureFundsInput)

ConnectApi.MultipleFulfillmentOrderInputRepresentation

List of inputs for creating fulfillment orders.

Property	Type	Description	Required or Optional	Available Version
`fulfillmentOrders`	List<`ConnectApi.FulfillmentOrderInputRepresentation`>	Each element contains the data to create one fulfillment order.	Required	50.0

ConnectApi.MultipleFulfillmentOrderInvoicesInputRepresentation

The FulfillmentOrders to create Invoices for.

Property	Type	Description	Required or Optional	Available Version
`fulfillmentOrderIds`	List<String>	List of IDs of FulfillmentOrders to create Invoices for.	At least one ID is required.	52.0

ConnectApi.MuteCapabilityInput

Mute or unmute a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`isMutedByMe`	Boolean	Indicates whether the feed element is muted for the context user. Default value is `false`.	Required	35.0

SEE ALSO:

setIsMutedByMe(communityId, feedElementId, isMutedByMe)

ConnectApi.NamedCredentialCalloutOptionsInput

Named credential callout options input.

Property	Type	Description	Required or Optional	Available Version
`allowMergeFieldsInBody`	Boolean	Specifies whether to allow merge fields in the HTTP body (`true`) or not (`false`).	Required	58.0
`allowMergeFieldsInHeader`	Boolean	Specifies whether to allow merge fields in the HTTP header (`true`) or not (`false`).	Required	58.0

Property	Type	Description	Required or Optional	Available Version
`generateAuthorizationHeader`	Boolean	Specifies whether to generate an authorization header (`true`) or not (`false`).	Required	58.0

SEE ALSO:

ConnectApi.NamedCredentialInput

ConnectApi.NamedCredentialInput

Input used to create or update a named credential.

Property	Type	Description	Required or Optional	Available Version
`calloutOptions`	`ConnectApi.NamedCredentialCalloutOptionsInput`	Callout options.	Required	58.0
`calloutUrl`	String	URL of the named credential in a callout.	Required	58.0
`customHeaders`	List<`ConnectApi.CredentialCustomHeaderInput`>	Custom HTTP headers.	Optional	58.0
`developerName`	String	Named credential developer name.	Required for creating a named credential Optional for updating a named credential	58.0
`externalCredentials`	List<`ConnectApi.ExternalCredentialInput`>	External credentials used by the named credential. In version 58.0 and later only one external credential is supported.	Required	58.0
`masterLabel`	String	Named credential label.	Required	58.0
`networkConnection`	`ConnectApi.NetworkConnectionInput`	PrivateConnect outbound network connection.	Optional depending on `type`	58.0
`parameters`	List<`ConnectApi.NamedCredentialParameterInput`>	Named credential parameters.	Optional	58.0
`type`	`ConnectApi.NamedCredentialType`	Type of named credential. Values are: • `PrivateEndpoint` • `SecuredEndpoint`	Required	58.0

ConnectApi.NamedCredentialParameterInput

Named credential parameter input.

Property	Type	Description	Required or Optional	Available Version
`id`	String	ID of the parameter.	Optional	58.0
`parameterDescription`	String	Description of the parameter.	Optional	58.0
`parameterName`	String	Name of the parameter.	Required	58.0
`parameterType`	`ConnectApi.NamedCredentialParameterType`	Type of named credential parameter. Values are: • `AllowedManagedPackageNamespaces` • `ClientCertificate`	Required	58.0
`parameterValue`	String	Value of the parameter.	Required	58.0

SEE ALSO:

ConnectApi.NamedCredentialInput

ConnectApi.NBAStrategyInput

A recommendation strategy.

Property	Type	Description	Required or Optional	Available Version
`contextRecordId`	String	ID of the context record. For example, if the next best action is on a case detail page, the ID of the case.	Optional	45.0
`maxResults`	Integer	Maximum number of results. Valid values are from 1 to 25. The default is 3.	Optional	45.0
`strategyContext`	Map<String, String>	Variable and value mappings for the strategy.	Optional	45.0
`debugTrace`	Boolean	Specifies whether to return trace and debug information in the response (`true`) or not (`false`). If unspecified, the default is `false`.	Optional	45.0

ConnectApi.NetworkConnectionInput

Network connection input.

Property	Type	Description	Required or Optional	Available Version
`developerName`	String	Developer name of the network connection.	Required	58.0
`namespace`	String	Namespace of the network connection.	Optional	58.0

SEE ALSO:

ConnectApi.NamedCredentialInput

ConnectApi.NewUserAudienceCriteriaInput

Criteria for the new members type of custom recommendation audience.

Subclass of ConnectApi.AudienceCriteriaInput.

Property	Type	Description	Required or Optional	Available Version
`value`	Double	The maximum number of days since a user became a site member. For example, if you specify *30*, anyone who became a site member in the last 30 days is included in the new members audience.	Required	36.0

ConnectApi.OAuthCredentialAuthUrlInput

OAuth authentication flow.

Property	Type	Description	Required or Optional	Available Version
`externalCredential`	String	Fully qualified developer name of the external credential.	Required	56.0
`principalName`	String	Name of the external credential named principal.	Required if `principalType` is `NamedPrincipal`	56.0
`principalType`	`ConnectApi.CredentialPrincipalType`	Type of credential principal. Values are: • `AwsStsPrincipal` • `NamedPrincipal` • `PerUserPrincipal`	Required	56.0
`returnUrl`	String	Return URL to apply to the authentication URL.	Optional	56.0

ConnectApi.OCICreateReservationInputRepresentation

Data to reserve inventory at one or more Omnichannel Inventory locations or location groups.

Property	Type	Description	Required or Optional	Available Version
`actionRequestId`	String	A UUID that identifies the request. Use the action request IDs in response data to identify which requests succeeded or failed. If the `OmnichannelInventoryService` class's `createReservation` method is called, the actionRequestId is used for the reservationId.	Required	51.0
`allowPartialReservations`	Boolean	When true, if the system can't create the entire reservation, then it attempts to create a partial reservation.	Optional	51.0
`createRecords`	List<`ConnectApi.OCICreateReservationSingleInputRepresentation`>	A list of product quantities and locations or location groups. The list can include up to 100 elements.	At least one element is required	51.0
`expirationSeconds`	Integer	A length of time in seconds. If the reservation isn't fulfilled within this amount of time after the `reservationTime`, then it expires. The maximum value is 14400.	Optional	51.0
`externalRefId`	String	External reference ID.	Optional	51.0
`reservationTime`	String	The time at which to record the reservation. Example: 2020-07-24T21:13:00Z	Optional	51.0

ConnectApi.OCICreateReservationSingleInputRepresentation

A quantity of a product and an Omnichannel Inventory location or location group at which to reserve it.

Property	Type	Description	Required or Optional	Available Version
`locationGroupIdentifier`	String	Identifier of the location group at which to reserve inventory.	Either locationGroupIdentifier or locationIdentifier is required, but not both	51.0
`locationIdentifier`	String	Identifier of the location at which to reserve inventory.	Either locationGroupIdentifier or locationIdentifier	51.0

Property	Type	Description	Required or Optional	Available Version
			is required, but not both	
quantity	Double	The quantity of the product to reserve.	Required	51.0
stockKeepingUnit	String	The SKU of the product to reserve.	Required	51.0

ConnectApi.OCIFulfillReservationInputRepresentation

A list of inventory reservations to fulfill.

Property	Type	Description	Required or Optional	Available Version
fulfillmentRecords	List<ConnectApi.OCIFulfillReservationSingleInputRepresentation>	A list of inventory reservations. The list can include up to 100 elements.	At least one element is required.	51.0
reservationId	String	The ID of the inventory reservation.	Optional	58.0

ConnectApi.OCIFulfillReservationSingleInputRepresentation

An inventory reservation to fulfill.

Property	Type	Description	Required or Optional	Available Version
actionRequestId	String	A UUID that identifies the request. Use the action request IDs in response data to identify which requests succeeded or failed.	Required	51.0
externalRefId	String	The external reference ID of the location that's fulfilling the reservation.	Optional	51.0
locationIdentifier	String	The identifier of the location that's fulfilling the reservation.	Required	51.0
quantity	Double	The quantity being fulfilled.	Required	51.0
reservationId	String	The ID of the inventory reservation.	Optional	58.0
stockKeepingUnit	String	The SKU of the product being fulfilled.	Required	51.0

ConnectApi.OCIGetInventoryAvailabilityInputRepresentation

Details of a request to retrieve inventory availability.

Property	Type	Description	Required or Optional	Available Version
`locationGroupIdentifier`	String	The External Reference of a location group to retrieve inventory availability data for. Specifying this value retrieves inventory data for all locations belonging to this group.	Optional; can't combine with `locationGroupIdentifiers` or `locationIdentifiers`	51.0
`locationGroupIdentifiers`	List<String>	A list of up to 100 External References of location groups to retrieve inventory availability data for.	Optional; can't combine with `locationGroupIdentifier` or `locationIdentifiers`	51.0
`locationIdentifiers`	List<String>	A list of up to 100 External References of locations to retrieve inventory availability data for.	Optional; can't combine with `locationGroupIdentifier` or `locationGroupIdentifiers`	51.0
`stockKeepingUnit`	String	The SKU of a product to retrieve inventory availability data for. Specifying a SKU with no locations or location groups returns availability data for that SKU at all inventory locations that aren't assigned to location groups.	Optional; can't combine with `stockKeepingUnits`	51.0
`stockKeepingUnits`	List<String>	A list of up to 100 SKUs of products to retrieve inventory availability data for.	Optional; can't combine with `stockKeepingUnit`	51.0
`useCache`	Boolean	Whether to fetch the inventory data from the cache. The default value is True..	Optional	51.0

ConnectApi.OCIReleaseReservationInputRepresentation

Details of one or more inventory reservations to release.

Property	Type	Description	Required or Optional	Available Version
`releaseRecords`	List<`ConnectApi.OCIReleaseReservationSingleInputRepresentation`>	List of inventory reservations to release. The list can include up to 100 elements.	At least one element is required.	51.0
`reservationId`	String	The ID of the inventory reservation.	Optional	58.0

ConnectApi.OCIReleaseReservationSingleInputRepresentation

A single inventory reservation to release.

Property	Type	Description	Required or Optional	Available Version
`actionRequestId`	String	A UUID that identifies the request. Use the action request IDs in response data to identify which requests succeeded or failed.	Required	51.0
`externalRefId`	String	The external reference ID of the location or location group that has the reservation.	Optional	51.0
`locationGroupIdentifier`	String	The identifier of the location group that has the reservation.	The identifier for a location or location group, but not both, is required.	51.0
`locationIdentifier`	String	The identifier of the location that has the reservation.	The identifier for a location or location group, but not both, is required.	51.0
`quantity`	Double	The quantity of reserved inventory to release.	Required	51.0
`reservationId`	String	The ID of the inventory reservation.	Optional	58.0
`stockKeepingUnit`	String	The SKU of the product to release.	Required	51.0

ConnectApi.OCITransferReservationInputRepresentation

A list of inventory reservation transfers and specifies whether a single failure cancels the entire list.

Property	Type	Description	Required or Optional	Available Version
`allOrNothing TransferId`	String	Controls whether a single failed transfer cancels all other transfers in the `transferRecords` list. • To allow some transfers in the `transferRecords` list to succeed when others fail, don't include this property. • To cancel all the transfers in the `transferRecords` list when any of them fail, set this property to a UUID. The ID must be unique, but isn't otherwise used in this version.	Optional	51.0
`reservationId`	String	The ID of the inventory reservation.	Optional	58.0

Property	Type	Description	Required or Optional	Available Version
transferRecords	List<ConnectApi.OCITransferReservationSingleInputRepresentation>	A list of inventory reservation transfers. The list can include up to 100 elements.	At least one element is required.	51.0

ConnectApi.OCITransferReservationSingleInputRepresentation

An inventory reservation transfer.

Property	Type	Description	Required or Optional	Available Version
actionRequestId	String	A UUID that identifies the request. Use the action request IDs in response data to identify which requests succeeded or failed.	Required	51.0
externalRefId	String	The external reference ID of the location receiving the transfer.	Optional	51.0
fromLocationGroupIdentifier	String	The identifier of the location group sending the reservation.	The identifier for a sending location or location group, but not both, is required	51.0
fromLocationIdentifier	String	The identifier of the location sending the reservation.	The identifier for a sending location or location group, but not both, is required	51.0
ignoreAvailabilityCheck	Boolean	If true, force the transfer even if the receiving location doesn't have sufficient available inventory. The default value is false.	Optional	52.0
quantity	Double	The quantity of inventory being transferred.	Required	51.0
reservationId	String	The ID of the inventory reservation.	Optional	58.0
stockKeepingUnit	String	The SKU of the product being transferred.	Required	51.0
toLocationGroupIdentifier	String	The identifier of the location group receiving the reservation.	The identifier for a receiving location or location group, but not both, is required	51.0
toLocationIdentifier	String	The identifier of the location receiving the reservation.	The identifier for a receiving location or location group, but not both, is required	51.0

ConnectApi.OCIUpdateReservationInputRepresentation

Data to update one or more Omnichannel Inventory item reservations.

Property	Type	Description	Required or Optional	Available Version
actionRequestId	String	Unique and idempotent action request ID. Use in response data to identify which requests succeeded or failed.	Required	61.0
allowPartialReservations	Boolean	When true, if the system can't update the entire reservation, then it attempts to update a partial reservation.	Optional	61.0
externalRefId	String	External reference ID.	Optional	61.0
reservationId	String	The ID of the inventory reservation.	Optional	61.0
reservationTime	String	The time the reservation was updated. Example: 2020-07-24T21:13:00Z.	Optional	61.0
updateAllOrNothingRecords	List	Controls whether a single failed request updates all other requests in the list (true) or whether some requests can succeed if others fail (false). The default value is false.	Optional	61.0
updateRecords	List<ConnectApi.OCIUpdateReservationSingleInputRepresentation> on page 1901 []	A list of product quantities and locations or location groups. The list can have up to 100 elements.	At least one element is required	61.0

ConnectApi.OCIUpdateReservationSingleInputRepresentation

Data to update one Omnichannel Inventory reservation item.

Property	Type	Description	Required or Optional	Available Version
locationGroupIdentifier	String	Identifier of the location group where the inventory is reserved.	Either locationGroupIdentifier or locationIdentifier are required, but not both	61.0
locationIdentifier	String	Identifier of the location where the inventory is reserved.	Either locationGroupIdentifier or locationIdentifier are required, but not both	61.0
quantity	Double	The quantity of the product to update.	Required	61.0
stockKeepingUnit	String	The SKU of the product to update.	Required	61.0

ConnectApi.SearchOrderBy

Order by parameter for object search.

Property	Type	Description	Required or Optional	Available Version
`field`	String	Field to sort the results by.	Optional	63.0
`order`	`ConnectApi.OrderDirection`	Order direction. Values are: • `Ascending` • `Descending`	Optional	63.0
`orderNulls`	`ConnectApi.OrderNulls`	Null value order. Values are: • `Firsts`—Null values are sorted first. • `Lasts`—Null values are sorted last.	Optional	63.0

SEE ALSO:

ConnectApi.SearchRequest

ConnectApi.OrderItemSummaryInputRepresentation

An OrderItemSummary and quantity.

Property	Type	Description	Required or Optional	Available Version
`orderItemSummaryId`	String	ID of the OrderItemSummary.	Required	48.0
`quantity`	Double	Quantity to include. Can't contain a fraction or a decimal.	Required	48.0

SEE ALSO:

ConnectApi.FulfillmentGroupInputRepresentation

ConnectApi.FulfillmentOrderInputRepresentation

createFulfillmentOrders(fulfillmentOrderInput)

ConnectApi.OrderItemSummaryAdjustmentCollectionInput

Collection of order item summaries.

Property	Type	Description	Required or Optional	Available Version
`orderItemSummaries`	List<`ConnectApi.OrderItemSummaryAdjustmentInput`>	List of order item summaries.	Required	53.0

ConnectApi.OrderItemSummaryAdjustmentInput

Order item summary.

Property	Type	Description	Required or Optional	Available Version
`orderItemSummaryId`	String	ID of the order item summary.	Required	53.0

SEE ALSO:

ConnectApi.OrderItemSummaryAdjustmentCollectionInput

ConnectApi.OrderSummaryAdjustmentAggregatesAsyncInput

Order summary IDs for calculating adjustment aggregates.

Property	Type	Description	Required or Optional	Available Version
`orderSummaryIds`	List< String>	List of order summary IDs.	Required	55.0

ConnectApi.OrderSummaryInputRepresentation

An order from which to create an OrderSummary. Optionally, you can specify OrderSummary-specific information such as its Status and whether it is managed in Salesforce Order Management.

Property	Type	Description	Required or Optional	Available Version
`businessModel`	String	The order's business model. It can have one of these values: • B2B • B2C	Optional	53.0
`externalReferenceIdentifier`	String	Used internally to prevent duplicate records. This value is case-sensitive.	Optional	56.0
`name`	String	Specifies an OrderNumber to assign to the order summary.	Optional	50.0

Property	Type	Description	Required or Optional	Available Version
`orderId`	String	ID of the original order.	Required	48.0
`orderLifeCycleType`	String	Specifies whether the order is managed in Salesforce Order Management or by an external system. It can have one of these values: • `MANAGED`—Managed in Salesforce Order Management. • `UNMANAGED`—Managed by an external system. If no value is specified, the default is `MANAGED`.	Optional	49.0
`sourceProcess`	String	Describes the order process creating the OrderSummary. It can have one of these values: • `Exchange`—An Exchange process. • `OrderOnBehalf`—An Order on Behalf Of process. • `Standard`—Any process other than Exchange or Order on Behalf Of. If no value is specified, the default is `Standard`.	Optional	57.0
`status`	String	Specifies a status to assign to the order summary. The value must match one of the picklist values on the Status field of the OrderSummary object.	Optional	50.0

SEE ALSO:

createOrderSummary(orderSummaryInput)

ConnectApi.OrderSummaryLookupInput

Order summary lookup input.

Property	Type	Description	Required or Optional	Available Version
`orderSummaryIdOrRefNumber`	String	Either the order summary ID or reference number value.	Required	58.0

Property	Type	Description	Required or Optional	Available Version
`verification`	`ConnectApi.OrderSummaryVerificationInput`	Verification attributes for guest shoppers.	Optional	58.0

ConnectApi.OrderSummaryVerificationInput

Order summary verification input.

Property	Type	Description	Required or Optional	Available Version
`email`	String	Guest shopper or registered buyer's email address.	Optional	58.0
`lastName`	String	Guest shopper or registered buyer's last name.	Optional	58.0
`phoneNumber`	String	Guest shopper or registered buyer's phone number.	Optional	58.0

ConnectApi.OrderToCartInput

Input for action adding an order to a cart.

Property	Type	Description	Required or Optional	Available Version
`cartStateOrId`	String	Cart state (`active` or `current`) or the ID of the cart to which the products from an order are to be copied.	Required	57.0

ConnectApi.PaymentGroupRequest

Payment group input consumed by a payment group service.

Property	Type	Description	Required or Optional	Available Version
`createPaymentGroup`	Boolean	Specifies whether Salesforce needs to create a payment group (`true`) or not (`false`).	Optional	50.0
`currencyIsoCode`	String	Three-letter ISO 4217 currency code associated with the payment group record.	Optional	50.0
`id`	String	ID of the payment group record.	Optional	50.0
`sourceObjectId`	String	Source object ID of the payment group record. Supports only OrderId.	Optional	50.0

ConnectApi.PaymentInfoInputRepresentation

Payment information about additional funds required for an order.

Property	Type	Description	Required or Optional	Available Version
lastPaymentGatewayLogId	String	Last payment gateway log ID for the new order payment summary.	Optional	60.0
name	String	Overrides the default name of the order payment summary created.	Optional	60.0
paymentAuthorizationId	String	Payment authorization ID to be used if needed to fund the exchange order.	Optional	60.0
paymentIds	List<String>	Payment IDs for the new order payment summary.	Optional	60.0
paymentMethodId	String	Payment method ID for the new order payment summary.	Optional	60.0

ConnectApi.PaymentMethodTokenizationRequest

Payment method tokenization input consumed by the payment tokenization service.

Subclass of ConnectApi.BaseRequest.

Property	Type	Description	Required or Optional	Available Version
address	ConnectApi.AddressRequest	Address of the payment method.	Required	52.0
cardPaymentMethod	ConnectApi.CardPaymentMethodRequest	Object representation of the card payment method.	Required	52.0
paymentGatewayId	String	ID of the card payment method's payment gateway.	Required	52.0

ConnectApi.PhotoInput

Specify how to crop a photo that has already been uploaded.

Property	Type	Description	Available version
cropSize	Integer	The length, in pixels, of any edge of the crop square.	29.0
cropX	Integer	The position X, in pixels, from the left edge of the image to the start of the crop square. Top left is position (0,0).	29.0
cropY	Integer	The position Y, in pixels, from the top edge of the image to the start of the crop square. Top left is position (0,0).	29.0

Property	Type	Description	Available version
`fileId`	String	18 character ID of an existing file. The key prefix must be 069 and the file must be an image and be smaller than 2 GB. Note: Images uploaded on the Group page and on the User page don't have file IDs and therefore can't be used.	25.0
`versionNumber`	Integer	Version number of the existing content. If not provided, the latest version is used.	25.0

- setPhotoWithAttributes(communityId, userId, photo, fileUpload)

ConnectApi.PinCapabilityInput

Pin or unpin a feed element to a feed.

Property	Type	Description	Required or Optional	Available Version
`entityId`	String	ID of the entity to pin or unpin. In version 41.0 and later, `entityId` must be a feed item ID. In version 41.0–42.0, only one feed item can be pinned per feed. In version 43.0 and later, three feed items can be pinned per feed.	Required	41.0
`isPinned`	Boolean	Specifies whether to pin (`true`) or unpin (`false`) the entity.	Required	41.0

ConnectApi.PollCapabilityInput

Create, update, or vote on a poll on a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`choices`	List<String>	The choices used to create a new poll. You must specify 2–10 poll choices for each poll.	Required for creating a poll	32.0

Property	Type	Description	Required or Optional	Available Version
myChoiceId	String	ID of an existing choice on the feed poll. Used to vote on an existing poll.	Required for voting on a poll	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.PostAuthApiPaymentMethodRequest

Payment method input for post authorization.

Subclass of ConnectApi.BaseApiPaymentMethodRequest.

Property	Type	Description	Required or Optional	Available Version
alternativePaymentMethod	ConnectApi.AlternativePaymentMethod	Alternative payment method.	Required	54.0
cardPaymentMethod	ConnectApi.CardPaymentMethodRequest	Card payment method.	Required	54.0

ConnectApi.PostAuthRequest

Payment post authorization input consumed by the payment post authorization service.

Subclass of ConnectApi.BaseRequest.

Property	Type	Description	Required or Optional	Available Version
accountId	String	ID of the account of the customer for the authorized payment.	Required	54.0
amount	Double	Amount of the post authorization.	Required	54.0
comments	String	Comments for payment post authorization. Maximum of 1000 characters.	Optional	54.0
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the payment group record.	Optional	54.0
effectiveDate	Datetime	Date that the payment post authorization occurs.	Required	54.0
paymentGatewayId	String	Payment gateway that evaluates the post authorization.	Required	54.0

Property	Type	Description	Required or Optional	Available Version
paymentGroup	ConnectApi.PaymentGroupRequest	Payment group associated with or to be created for the request. Request must contain either a paymentGroupId or paymentGroup, but not both.	Optional	54.0
paymentMethod	ConnectApi.PostAuthApiPaymentMethodRequest	Payment method sent for the post authorization.	Required.	54.0

ConnectApi.PreviewCartToExchangeOrderInputRepresentation

Information required to preview a cart to exchange order.

Property	Type	Description	Required or Optional	Available Version
exchangeCartId	String	ID of the cart used for adding items to the exchange order.	Required	60.0
orderSummaryId	String	Order summary ID.	Required	60.0
referenceId	String	Return order ID.	Required	60.0
reservationType	String	The type of the reservation.	Optional	61.0

ConnectApi.PricingInput

Pricing for multiple products.

Property	Type	Description	Required or Optional	Available Version
pricingLineItems	List<ConnectApi.PricingLineItemInput>	Up to 500 line items for pricing.	Required	49.0

ConnectApi.PricingLineItemInput

Pricing line item.

Property	Type	Description	Required or Optional	Available Version
productId	String	ID of the product to price.	Required	49.0

SEE ALSO:

ConnectApi.PricingInput

ConnectApi.ProductSearchGroupingInput

Grouping information for product search results.

Property	Type	Description	Required or Optional	Available Version
`groupingOption`	`ConnectApi.CommerceSearchGroupingOption`	Grouping option for search results. Values are: • `BestMatch`—Search results are grouped by the best-match product of the variation group. • `NoGrouping`—Search results aren't grouped. • `VariationParent`—Search results are grouped by the variation parent.	Required	52.0
`topProductType`	`ConnectApi.CommerceSearchTopProductType`	Type of the top product to return for each product group in search results. Value is: • `VariationParent` If `NoGrouping` is specified for `groupingOption`, `topProductType` is ignored.	Optional	52.0—62.0

ConnectApi.ProductSearchInput

Product search.

Property	Type	Description	Required or Optional	Available Version
`categoryId`	String	Category ID returns results for products in this category or its subcategories. If you omit `categoryId` from the request, all categories are searched. If you specify `categoryId` and `searchTerm`, only products in the specified category are searched.	Required if `searchTerm` isn't specified	52.0
`fields`	List<String>	Product fields to return in search results. Search results include fields you have access to. If unspecified, returns the `Name`, `Description`, `StockKeepingUnit`, `ProductCode`, and `Family` fields.	Optional	52.0
`grouping`	`ConnectApi.ProductSearchGroupingInput`	Specifies whether to group products in search results and how to group them. If unspecified, the default is the value	Optional	52.0

Property	Type	Description	Required or Optional	Available Version
		specified in **Search** > **Results Display Settings** > **Results Grouping**.		
`includePrices`	Boolean	Specifies whether to include prices for products in search results (`true`) or not (`false`). If unspecified, defaults to `false`.	Optional	52.0
`includeQuantityRule`	Boolean	Specifies whether to include purchase quantity rule information for products in search results (`true`) or not (`false`). If unspecified, defaults to `false`.	Optional	52.0
`page`	Integer	Number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.	Optional	52.0
`pageSize`	Integer	Specifies the number of items per page. Valid values are from 1 through 200. If unspecified, the default is the value specified in Results per Page in **Search** > **Results Display Settings**.	Optional	52.0
`refinements`	List<`ConnectApi.RefinementInput`>	List up to nine refinements (facets) for search results. Buyers or shoppers can select up to 20 values for each refinement.	Optional	52.0
`searchTerm`	String	List of up to 32 space-separated search terms.	Required if `categoryId` isn't specified	52.0
`sortRuleId`	String	ID of the sort rule that specifies the order of products in the search results.	Optional	52.0

ConnectApi.ProductVariationInputRepresentation

Variation product input.

Property	Type	Description	Required or Optional	Available Version
`variationAttributes`	Map<String, String>	Mapping of variation attributes (API name and value) associated with the product.	Required	62.0

ConnectApi.PromotionCartDeliveryGroupInput

IDs of the cart delivery group and its delivery method.

Property	Type	Description	Required or Optional	Available Version
`cartDeliveryGroupId`	String	ID of the cart delivery group.	Required	57.0
`deliveryMethodId`	String	ID of the order delivery method.	Required	57.0

SEE ALSO:

ConnectApi.PromotionEvaluateInput

evaluate(salesTransaction)

ConnectApi.PromotionCartInput

Cart during promotion evaluation.

Property	Type	Description	Required or Optional	Available Version
`cartAdjustmentGroups`	ConnectApi.PromotionCartAdjustmentGroupInput[]	Collection of cart adjustment groups associated with the items in the cart.	Optional	60.0
`cartDeliveryGroups`	ConnectApi.PromotionCartDeliveryGroupInput[]	Collection of cart delivery groups associated with the items in the cart. Available if shipping promotions are enabled.	Required when evaluating shipping promotions	60.0
`cartItems`	List<`ConnectApi.PromotionCartItemInput`>	A collection of items in the cart.	Required	57.0
`currencyIsoCode`	String	Three-letter ISO 4217 currency code associated with the cart.	Required for multi-currency orgs	57.0
`id`	String	ID of the cart.	Optional	57.0

SEE ALSO:

ConnectApi.PromotionEvaluateInput

evaluate(salesTransaction)

ConnectApi.PromotionCartItemInput

Item in a cart during promotion evaluation.

Property	Type	Description	Required or Optional	Available Version
`cartDeliveryGroupId`	String	ID of the cart delivery group.	Required when evaluating shipping promotions	57.0
`cartId`	String	ID of the cart.	Optional	57.0
`id`	String	ID of the cart item. Must be unique across all items in the cart.	Required	57.0
`itemDescription`	String	Description of the cart item.	Optional	57.0
`itemName`	String	Name of the cart item.	Optional	57.0
`listPrice`	String	List price of the cart item.	Optional	57.0
`product2Id`	String	Product ID of the cart item.	Required if `sku` isn't specified	57.0
`quantity`	String	Number of items in the cart.	Required	57.0
`salesPrice`	String	Sales price of the cart item. This is the price per quantity and the value used to compute the discount. If `salesPrice` and `totalLineBaseAmount` are specified, `totalLineBaseAmount` is used.	Required if `totalLineBaseAmount` isn't specified	57.0
`sku`	String	Stock keeping unit (SKU) of the cart item.	Required if `product2Id` isn't specified	57.0
`totalLineBaseAmount`	String	Total amount for the cart item, equal to sales price multiplied by quantity. This value is used to compute the discount. If `salesPrice` and `totalLineBaseAmount` are specified, `totalLineBaseAmount` is used.	Required if `salesPrice` isn't specified	57.0
`totalListBaseAmount`	String	Total amount for the cart item based on list price and quantity.	Optional	57.0
`type`	`ConnectApi.CartItemType`	Type of item in a cart. Values are: • `DeliveryCharge` • `Product`	Required when evaluating shipping promotions	57.0

SEE ALSO:

ConnectApi.PromotionCartInput
ConnectApi.PromotionEvaluateInput
evaluate(salesTransaction)

ConnectApi.PromotionEvaluateInput

Find promotions that the customer is eligible for and compute their discounts.

Property	Type	Description	Required or Optional	Available Version
`cart`	ConnectApi.PromotionCartInput	Cart and its items.	Required	57.0
`cartDeliveryGroups`	[illegible]	List of cart delivery groups associated with the items in the cart. Available if shipping promotions are enabled.	Required when evaluating shipping promotions	57.0
`couponCodes`	List<String>	Collection of coupon codes to enable promotions. A customer can apply a maximum of two coupons per cart.	Optional	57.0
`effectiveAccountId`	String	ID of the account for which the request is made.	Required if `segments` isn't specified	57.0
`isItemizeHeaderAdjustments`	Boolean	Specifies whether order-level adjustments are itemized (`true`) or not (`false`). If unspecified, the default value is `false`.	Optional	57.0
`parentProducts`	List<ConnectApi.PromotionParentProductsInput>	Collection of parent product IDs mapped to their variation product IDs.	Optional	57.0
`productCategories`	List<ConnectApi.PromotionProductCategoriesInput>	Collection of product IDs mapped to their associated category IDs.	Optional	57.0
`segments`	List<String>	All promotions associated with promotion segments specified in this collection are active and can be evaluated against the cart. Additionally, any segments associated with a store or buyer group are also still evaluated against the cart. If this field is not present, only the promotions associated with a store or buyer group are evaluated.	Optional	57.0
`webStoreId`	String	ID of the store for which the request is made. If unspecified, defined segments must be used instead.	Optional	57.0

SEE ALSO:

evaluate(salesTransaction)

ConnectApi.PromotionParentProductsInput

IDs of a parent product and variation product.

Property	Type	Description	Required or Optional	Available Version
`childProductId`	String	ID of the variation product.	Required	57.0
`parentProductId`	String	ID of the parent product.	Required	57.0

SEE ALSO:

ConnectApi.PromotionEvaluateInput

evaluate(salesTransaction)

ConnectApi.PromotionProductCategoriesInput

IDs of a product and associated category.

Property	Type	Description	Required or Optional	Available Version
`categoryId`	String	ID of the category.	Required	57.0
`productId`	String	ID of the product.	Required	57.0

SEE ALSO:

ConnectApi.PromotionEvaluateInput

evaluate(salesTransaction)

ConnectApi.QuantityWithSkuInputRepresentation

A quantity of a product.

Property	Type	Description	Required or Optional	Available Version
`quantity`	Double	Quantity of the product.	Required	51.0
`stockKeepingUnit`	String	SKU of the product.	Required	51.0

ConnectApi.QuestionAndAnswersCapabilityInput

Create or edit a question feed element or set the best answer of the existing question feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`bestAnswerId`	String	A comment ID to use as a best answer for a question feed element. The best answer comment must already exist on the question feed element.	Required to update a feed element. Not supported when posting a feed element.	32.0
`questionTitle`	String	Title for a question feed element. To edit the title of a question, use `updateFeedElement(communityId, feedElementId, feedElement)`. Editing question titles is supported in version 34.0 and later.	Required to post a feed element. Not supported when updating a feed element.	32.0

SEE ALSO:

- Edit a Question Title and Post
- ConnectApi.FeedElementCapabilitiesInput

ConnectApi.RankAverageDistanceInputRepresentation

An order recipient's geographic location and information about sets of inventory locations that can fulfill the order.

Property	Type	Description	Required or Optional	Available Version
`deliveryCountryCode`	String	The country code of the order recipient.	Required	51.0
`deliveryPostalCode`	String	The postal code of the order recipient.	Required	51.0
`distanceUnit`	String	Specify *`mi`* or *`km`* to return average distances in miles or kilometers, respectively.		51.0
`sortResult`	String	Specify *`ASC`* or *`DESC`* to rank the results by average shipping distance in ascending or descending order, respectively.		51.0
`targetLocations`	List<ConnectApi.TargetLocationInputRepresentation>	Each element is a set of inventory locations that can combine to fulfill the order.	At least one element is required	51.0

ConnectApi.ReadByCapabilityInput

Mark feed elements as read by the context user.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`isReadByMe`	Boolean	Specifies to mark the feed element as read (`true`) for the context user.	Required	40.0
`lastReadDateByMe`	Datetime	Specifies the last date, in ISO 8601 format, when the feed element is marked as read for the context user. If you don't specify a date or you specify a future date, the current system date is used.	Optional	40.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.SequenceOrderPaymentSummaryInputRepresentation

Amount to apply to specified OrderPaymentSummary as part of a payment or refund.

Property	Type	Description	Required or Optional	Available Version
`amount`	Double	Amount to apply to the OrderPaymentSummary.	Optional	56.0
`orderPaymentSummaryId`	String	ID of the OrderPaymentSummary to apply the Amount to.	Required	56.0

SEE ALSO:

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

ConnectApi.EnsureRefundsAsyncInputRepresentation

ConnectApi.sharedOrderPaymentSummarySequenceInputRepresentation

Shared order payment summary sequence.

Property	Type	Description	Required or Optional	Available Version
`orderPaymentSummaryId`	String	Shared order payment summary ID.	Required	60.0
`reservedBalanceAmount`	Double	Balance amount to be reserved.	Required	60.0

ConnectApi.SubmitCartToExchangeOrderInputRepresentation

Information required for a submit cart to exchange order action.

Property	Type	Description	Required or Optional	Available Version
exchangeCartId	String	ID of the cart used for adding items to the exchange order.	Required	60.0
orderNumber	String	Order number.	Optional	60.0
orderSummaryId	String	Order summary ID.	Required	60.0
paymentInfoList	[illegible] on page 1906>	List of payment information when additional funds are needed for the newly created exchange order.	Optional	60.0
referenceId	String	Return order ID.	Optional	60.0
reservationType	String	The reservation that's created by the submit API. The possible values are Full, which means there's a reservation against the exchange cart, or None if there's no reservation.	Optional	61.0
sequences	[illegible] on page 1917>	Ordered list of order payment summaries and reserved balance amounts to apply them to.	Optional	60.0

ConnectApi.RecipientEngagementContextInput

Context based on which the survey invitation is sent to a participant.

Property	Type	Description	Required or Optional	Available Version
recipientEngagementContext	Map<String, String>	Map each recipient with the context based on which the survey invitation is emailed.	Required	50.0
recipientId	String	Participant ID with whom the engagement context should be associated.	Required	50.0

SEE ALSO:

ConnectApi.SurveyInvitationEmailInput

ConnectApi.RecommendationAudienceInput

A custom recommendation audience.

Property	Type	Description	Required or Optional	Available Version
`criteria`	ConnectApi.AudienceCriteriaInput	The criteria for the custom recommendation audience type.	Optional If not specified when creating a recommendation audience, the audience criteria type defaults to custom list.	36.0
`memberOperationType`	`ConnectApi.RecommendationAudienceMemberOperationType`	**Important:** This property is available only in version 35.0. In version 36.0 and later, use ConnectApi.CustomListAudienceCriteriaInput. The operation to carry out on the audience members. • `Add`—Adds specified members to the audience. • `Remove`—Removes specified members from the audience.	Required to update a recommendation audience Don't use or specify `null` to create a recommendation audience	35.0 only
`members`	List<String>	**Important:** This property is available only in version 35.0. In version 36.0 and later, use ConnectApi.CustomListAudienceCriteriaInput. A collection of user IDs. When updating an audience, you can include up to 100 members. An audience can have up to 100,000 members, and each Experience Cloud site can have up to 100 audiences.	Required to update a recommendation audience Don't use or specify `null` to create a recommendation audience	35.0 only
`name`	String	The unique name of the custom recommendation audience.	Optional to update a recommendation audience Required to create a recommendation audience	35.0

SEE ALSO:

createRecommendationAudience(communityId, recommendationAudience)

ConnectApi.RecommendationDefinitionInput

A custom recommendation definition.

Property	Type	Description	Required or Optional	Available Version
`actionUrl`	String	URL for acting on the custom recommendation, for example, the URL to join a group.	Required to create a recommendation definition Optional to update a recommendation definition	35.0
`actionUrlName`	String	Text label for the action URL in the user interface, for example, "Launch."	Required to create a recommendation definition Optional to update a recommendation definition	35.0
`explanation`	String	Explanation, or body, of the custom recommendation.	Required to create a recommendation definition Optional to update a recommendation definition	35.0
`name`	String	Name of the custom recommendation definition. The name is displayed in Setup.	Required to create a recommendation definition Optional to update a recommendation definition	35.0
`title`	String	Title of the custom recommendation definition.	Optional	35.0

SEE ALSO:

createRecommendationDefinition(communityId, recommendationDefinition)

ConnectApi.RecommendationReactionInput

A reaction to a recommendation produced by a recommendation strategy.

Property	Type	Description	Required or Optional	Available Version
`aiModel`	String	Reserved for future use.	Optional	47.0
`contextRecordId`	String	ID of the context record. For example, if the next best action is on a case detail page, the ID of the case.	Optional	45.0
`executionId`	String	ID of the original recommendation strategy execution.	Optional	45.0
`externalId`	String	External ID of the recommendation. This ID doesn't need to be a Salesforce 18-character ID. For example, it can be a product number from an external system.	Optional	46.0
`onBehalfOfId`	String	ID of the user or entity for which the reaction took place.	Optional	45.0
`reactionType`	`ConnectApi.RecommendationReactionType`	Type of reaction to a recommendation. Values are: • `Accepted` • `Rejected`	Required	45.0
`recommendationMode`	String	Reserved for future use.	Optional	46.0
`recommendationScore`	Double	Reserved for future use.	Optional	46.0
`strategyName`	String	Name of the recommendation strategy.	Required	45.0
`targetActionId`	String	ID of the target action.	Optional	45.0
`targetActionName`	String	Name of the target action.	Required	45.0
`targetId`	String	ID of the recommendation that is being reacted to.	Required	45.0

ConnectApi.RecordCapabilityInput

Attach an existing knowledge article to a comment.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`recordId`	String	ID of the existing knowledge article to attach.	Required	42.0

ConnectApi.RecordsetFilterCriteriaInput

A set of recordset filter criteria applied to records, such as service appointment records.

Property	Type	Description	Required or Optional	Available Version
`criteriaIds`	List<String>	Recordset filter criteria IDs.	Required	53.0
`enforceSharing`	Boolean	Determines whether record sharing checks are enforced (`true`) or not (`false`) during the execution of this call.	Optional	53.0
`filteredObjectName`	String	Object that the filter is applied to.	Required	53.0
`recordIds`	List<String>	List of record IDs of the filtered object.	Required	53.0

ConnectApi.ReferencedRefundRequest

Referenced refund input.

Subclass of ConnectApi.RefundRequest.

Property	Type	Description	Required or Optional	Available Version
`accountId`	String	ID of the account linked to the referenced refund request.	Optional	50.0
`amount`	Double	Amount refunded.	Required	50.0
`clientContext`	String	Context for payment APIs. Used for a payment caller to re-establish context.	Optional	50.0
`comments`	String	Optional comments for the refund.	Optional	50.0
`effectiveDate`	Datetime	Date when the refund becomes effective.	Optional	50.0
`paymentGroup`	`ConnectApi.PaymentGroupRequest`	Payment group details associated with the refund request.	Optional	50.0

ConnectApi.RefinementInput

Attribute-based refinement input for product search.

This class is abstract and is a superclass of ConnectApi.DistinctValueRefinementInput.

Property	Type	Description	Required or Optional	Available Version
`attributeType`	`ConnectApi.CommerceSearchAttributeType`	Search attribute type. • `Custom` • `ProductAttribute`	Required	52.0

Property	Type	Description	Required or Optional	Available Version
		• `Standard`		
`nameOrId`	String	Developer name of the attribute. In version 52.0 and later, the ID of the attribute isn't supported.	Required	52.0
`type`	`ConnectApi.CommerceSearchFacetType`	Search facet type. Value is: • `DistinctValue`	Required	52.0

ConnectApi.RefundRequest

Refund input.

This class is abstract.

Subclass of ConnectApi.BaseRequest.

No additional properties.

Superclass of ConnectApi.ReferencedRefundRequest.

ConnectApi.ReleaseHeldFOCapacityInputRepresentation

Request to release held fulfillment order capacity at one or more locations. Can correspond to one action call.

Property	Type	Description	Required or Optional	Available Version
`releaseHeldFOCapacityRequests`	List<`ConnectApi.ReleaseHeldFOCapacityRequestInputRepresentation`>	List of requests to release held fulfillment order capacity at one or more locations.	Required	55.0

ConnectApi.ReleaseHeldFOCapacityRequestInputRepresentation

Request to release held fulfillment order capacity at one or more locations.

Property	Type	Description	Required or Optional	Available Version
`allOrNothing`	Boolean	Controls whether a single failed request cancels all other requests in the list (*`true`*) or whether some requests can succeed if others fail (*`false`*). The default value is *`false`*.	Optional	55.0

Property	Type	Description	Required or Optional	Available Version
capacityRequests	List<ConnectApi.CapacityRequestInputRepresentation>	List of requests to release held fulfillment order capacity. Each request is for capacity for one fulfillment order held at one location.	Required	55.0

ConnectApi.RequestHeaderInput

An HTTP request header name and value pair.

Property	Type	Description	Required or Optional	Available Version
name	String	The name of the request header.	Required	33.0
value	String	The value of the request header.	Required	33.0

SEE ALSO:

Define an Action Link and Post with a Feed Element

ConnectApi.ReturnItemsInputRepresentation

Data about products and delivery charges to return, as well as associated return fees.

Property	Type	Description	Required or Optional	Available Version
returnOrderItemDeliveryCharges	List<ConnectApi.ReturnOrderItemDeliveryChargeInputRepresentation>	List of ReturnOrderLineItems to return that represent delivery charges.	Optional	52.0
returnOrderItemFees	List<ConnectApi.ReturnOrderItemFeeInputRepresentation>	List of ReturnOrderLineItems to process that represent return fees.	Optional	56.0
returnOrderItems	List<ConnectApi.ReturnOrderItemInputRepresentation>	List of ReturnOrderLineItems to process that represent products, along with data about how to process them.	Required	52.0

SEE ALSO:

returnItems(returnOrderId, returnItemsInput)

ConnectApi.ReturnOrderInputRepresentation

Data for creating a ReturnOrder and ReturnOrderLineItems.

Property	Type	Description	Required or Optional	Available Version
`orderSummaryId`	String	ID of the OrderSummary containing the items to be returned. The OrderSummary's OrderLifeCycleType must be Managed.	Required	50.0
`returnOrder LifeCycleType`	String	The LifeCycleType of the ReturnOrder. Possible values are: • Managed—Process the ReturnOrder using the APIs and actions. It can generate change orders and affects financial fields and rollup calculations. • Unmanaged—The ReturnOrder is for tracking purposes only. It isn't involved in any financial calculations and doesn't generate any change orders. The system doesn't prevent the creation of duplicate ReturnOrderLineItems in an unmanaged ReturnOrder for the same OrderItem.	Required	51.0
`returnOrderLineItems`	List<`ConnectApi.ReturnOrderLineItemInputRepresentation`>	List of data for creating ReturnOrderLineItems.	At least one element is required	50.0
`status`	String	Status to assign the ReturnOrder. This value must match an entry in the ReturnOrder object's Status picklist.	Required	51.0

SEE ALSO:

createReturnOrder(returnOrderInput)

ConnectApi.ReturnOrderItemDeliveryChargeInputRepresentation

ID of a ReturnOrderLineItem representing a delivery charge.

Property	Type	Description	Required or Optional	Available Version
`returnOrder LineItemId`	String	ID of a ReturnOrderLineItem to return.	Required	52.0

SEE ALSO:

ConnectApi.ReturnItemsInputRepresentation

returnItems(returnOrderId, returnItemsInput)

ConnectApi.ReturnOrderItemFeeInputRepresentation

ID of a ReturnOrderLineItem representing a return fee, and instructions for updating it. After the update, the ReturnOrderLineItem is read-only. Any remaining quantity of the fee to be processed is added to a new ReturnOrderLineItem.

Property	Type	Description	Required or Optional	Available Version
`quantityReturned`	Double	Quantity of the ReturnOrderLineItem to process. When the fee is a fixed amount, the charge is determined by multiplying the total fee amount by this value divided by the expected quantity. For example, if the fee amount is $10 and the expected quantity is 2, then if the `quantityReturned` is 1, $5 is charged. This value normally equals the quantity returned of the ReturnOrderLineItem for the returned item that the fee applies to. The value must be greater than zero. If this value plus `quantityToCancel` is less than the expected quantity, then the remaining quantity to be returned is added to a new ReturnOrderLineItem.	Required	56.0
`quantityToCancel`	Double	Quantity of the ReturnOrderLineItem to remove. This value normally equals the quantity canceled of the ReturnOrderLineItem for the returned item that the fee applies to. This value can also be used to cancel a portion of the fee. The value must be zero or greater. If this value plus `quantityReturned` is less than the expected quantity, then the remaining quantity to be returned is added to a new ReturnOrderLineItem.	Required	56.0
`returnOrderLineItemId`	String	ID of the ReturnOrderLineItem representing the return fee.	Required	56.0

SEE ALSO:

ConnectApi.ReturnItemsInputRepresentation

returnItems(returnOrderId, returnItemsInput)

ConnectApi.ReturnOrderItemInputRepresentation

ID of a ReturnOrderLineItem and instructions for updating it. After the update, the ReturnOrderLineItem is read-only. Any remaining quantity to be returned is added to a new ReturnOrderLineItem.

Property	Type	Description	Required or Optional	Available Version
quantityReceived	Double	The quantity of the ReturnOrderLineItem that has been received. The value must be zero or greater. This value isn't used by any standard features, but is provided for use in customizations.	Required	52.0
quantityRejected	Double	The quantity of the ReturnOrderLineItem that has been rejected for return. The value must be zero or greater. This value isn't used by any standard features, but is provided for use in customizations.	Required	52.0
quantityReturned	Double	The quantity of the ReturnOrderLineItem that has been returned. The value must be greater than zero. If this value plus quantityToCancel is less than the expected return quantity, then the remaining quantity to be returned is added to a new ReturnOrderLineItem.	Required	52.0
quantityToCancel	Double	The quantity of the ReturnOrderLineItem to remove because it's not being returned. The value must be zero or greater. If this value plus quantityReturned is less than the expected return quantity, then the remaining quantity to be returned is added to a new ReturnOrderLineItem.	Required	52.0
reasonForRejection	String	The reason why the rejected quantity, if any, was rejected. This value isn't used by any standard features, but is provided for use in customizations.	Optional	52.0
returnOrderLineItemId	String	The ID of the ReturnOrderLineItem.	Required	52.0

SEE ALSO:

ConnectApi.ReturnItemsInputRepresentation

returnItems(returnOrderId, returnItemsInput)

ConnectApi.ReturnOrderLineItemInputRepresentation

Data for creating a ReturnOrderLineItem for an order item being returned, including data to create ReturnOrderLineItems representing any return fees associated with it.

Property	Type	Description	Required or Optional	Available Version
canReduceShipping	Boolean	Whether to refund any associated shipping charge.	Required	50.0
orderItemSummaryId	String	ID of the associated OrderItemSummary. If the OrderItemSummary already has an associated ReturnOrderLineItem, then you must specify a different reasonForReturn. Duplicating the reason breaks the financial calculations.	Required	50.0
quantityExpected	Double	Quantity expected to be returned. This value also applies to any fees specified in returnOrderLineItemFees.	Required	50.0
quantityReceived	Double	Quantity already physically returned.	Optional	50.0
reasonForReturn	String	Reason for the return. The value must match an entry in both the OrderSummaryChange Reason field and the ReturnOrderLineItem object's ReasonForReturn picklist.	Required if the returnOrder LifeCycleType is MANAGED.	50.0
returnOrder LineItemFees	List<ConnectApi. ReturnOrder LineItemFee InputRepresentation>	List of input data for return fees associated with the order item being returned. A ReturnOrderLineItem of Type Fee is created to represent each fee.	Optional	56.0

SEE ALSO:

ConnectApi.ReturnOrderInputRepresentation

createReturnOrder(returnOrderInput)

ConnectApi.ReturnOrderLineItemFeeInputRepresentation

Data for creating a ReturnOrderLineItem that represents a return fee.

Property	Type	Description	Required or Optional	Available Version
amount	Double	Value used to calculate the fee amount, as described by the amountType. It must be a positive value.	Required	56.0
amountType	String	Describes how the fee amount is calculated. It can have one of these values: • AmountWithTax—Value of amount is the fee amount, including tax.	Required	56.0

Property	Type	Description	Required or Optional	Available Version
		• `AmountWithoutTax`—Value of `amount` is the fee amount, not including tax. Tax is calculated on the value and added. • `Percentage`—Value of `amount` is a percentage. To determine the fee amount, `amount` is divided by 100, and then multiplied by the TotalPrice and TotalTaxAmount of the associated OrderItemSummary, prorated for the quantity being returned. • `PercentageGross`—Value of `amount` is a percentage. To determine the fee amount, `amount` is divided by 100, and then multiplied by the TotalLineAmountWithTax of the associated OrderItemSummary, prorated for the quantity being returned.		
`description`	String	Description of the fee.	Required	56.0
`product2Id`	String	ID of the product representing the fee.	Required	56.0
`reason`	String	Reason for the fee. The value must match an entry in the ReturnOrderLineItem object's ReasonForReturn picklist.	Required	56.0

SEE ALSO:

ConnectApi.ReturnOrderInputRepresentation

createReturnOrder(returnOrderInput)

ConnectApi.ReturnOrderLineItemInputRepresentation

ConnectApi.SaleApiPaymentMethodRequest

Payment method request for sale.

Subclass of ConnectApi.BaseApiPaymentMethodRequest.

Property	Type	Description	Required or Optional	Available Version
`cardPaymentMethod`	ConnectApi.CardPaymentMethodRequest	Payment method used in a sale request.	Required	54.0

ConnectApi.SaleRequest

Payment sale input consumed by the payment sale service.

Subclass of ConnectApi.BaseRequest.

Property	Type	Description	Required or Optional	Available Version
`accountId`	String	Reference to account.	Required	54.0
`amount`	Double	The amount of the sale request.	Required	54.0
`comments`	String	Optional comment for the sale request.	Optional	54.0
`currencyIsoCode`	String	Three-letter ISO 4217 currency code associated with the payment output.	Required	54.0
`effectiveDate`	Datetime	Date that the sale request takes effect.	Required	54.0
`paymentGatewayId`	String	The payment gateway that receives the sale request.	Required	54.0
`paymentGroup`	ConnectApi.PaymentGroupRequest	Payment group information for the sale request.	Optional	54.0
`paymentMethod`	ConnectApi.SalePaymentMethodRequest	Payment method used within the sale request.	Reqiured	54.0

ConnectApi.ScheduledRecommendationInput

A scheduled custom recommendation.

Property	Type	Description	Required or Optional	Available Version
`channel`	`ConnectApi.RecommendationChannel`	A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are: • `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear. • `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.	Optional for creating a scheduled recommendation If not specified, defaults to `DefaultChannel`. Don't use when updating a scheduled recommendation	36.0

Property	Type	Description	Required or Optional	Available Version
		• `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder. Use these channel values; you can't rename or create other channels.		
`enabled`	Boolean	Indicates whether scheduling is enabled. If `true`, the custom recommendation is enabled and appears in Experience Cloud sites. If `false`, custom recommendations in feeds in Salesforce mobile web aren't removed, but no new custom recommendations appear. In Customer Service and Partner Central sites, disabled custom recommendations no longer appear.	Optional	35.0
`rank`	Integer	Relative rank of the scheduled custom recommendation indicated by ascending whole numbers starting with 1. Setting the rank is comparable to an insertion into an ordered list. The scheduled custom recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled custom recommendations after it is pushed down.	Optional	35.0

Property	Type	Description	Required or Optional	Available Version
		See Ranking scheduled custom recommendations example. If the specified `rank` is larger than the size of the list, the scheduled custom recommendation is put at the end of the list. The `rank` of the scheduled custom recommendation is the size of the list, instead of the one specified. If a `rank` is not specified, the scheduled custom recommendation is put at the end of the list.		
`recommendationAudienceId`	String	ID of the audience for this scheduled custom recommendation.When updating a scheduled custom recommendation, specify `ALL` to remove the association between a custom recommendation audience and a scheduled custom recommendation.	Optional	35.0
`recommendationDefinitionId`	String	ID of the custom recommendation definition that this scheduled recommendation schedules.	Required to create a scheduled recommendation You can't specify a `recommendationDefinitionId` when updating a scheduled recommendation.	35.0

Ranking scheduled custom recommendations example

If you have these scheduled custom recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Custom Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

SEE ALSO:

createScheduledRecommendation(communityId, scheduledRecommendation)

ConnectApi.SearchDataCategory

Data category input for object search.

Property	Type	Description	Required or Optional	Available Version
`categories`	List<String>	List of data category names to filter.	Optional	63.0
`groupName`	String	Name of the data category group to filter.	Optional	63.0
`operator`	`ConnectApi.DataCategoryOperator`	Data category operator. • `Above`—Queries the data category and all of its parent categories. • `AboveOrBelow`—Queries the data category, all of its parent categories, and all of its subcategories. • `At`—Queries the data category. • `Below`—Queries the data category and all of its subcategories.	Optional	63.0

SEE ALSO:

ConnectApi.SearchRequest

ConnectApi.SearchRequest

Search request input for searching an object.

Property	Type	Description	Required or Optional	Available Version
`q`	String	Query term to search on. Query term must be two or more characters.	Required	63.0

Property	Type	Description	Required or Optional	Available Version
configurationName	String	Name of the search configuration to apply. Look up search configuration names from Search Manager.	Optional	63.0
dataCategories	List<ConnectApi.SearchDataCategory>	List of data categories to filter.	Optional	63.0
displayFields	List<String>	List of fields to display and return in the search results. By default, the fields displayed are defined by the search layout.	Optional	63.0
filters	List<ConnectApi.SearchFilter>	List of filters to apply.	Optional	63.0
highlights	Boolean	Specifies whether search generates a text highlight (`true`) or not (`false`). The default value is `false`.	Optional	63.0
offset	Integer	Search page offset position. Default value is `0`, which indicates displaying results from the beginning without skipping any entries.	Optional	63.0
orderBy	List<ConnectApi.SearchOrderBy>	Order by input for object search.	Optional	63.0
pageSize	Integer	Number of results in a page. Valid values are from 1 through 1999. If unspecified the default value is `20`.	Optional	63.0
spellcheck	Boolean	Specifies whether search should apply spellcheck (`true`) or not (`false`). The default value is `true`.	Optional	63.0

SEE ALSO:

find(objectApiName, request)

ConnectApi.SellerDetailsRequest

Seller details for the tax calculation

Property	Type	Description	Required or Optional	Available Version
code	String	Code used to identify the seller of the taxed items.		55.0

ConnectApi.ServiceAppointmentInput

Contains information about the service appointment.

Property	Type	Description	Required or Optional	Available Version
additionalInformation	String	Additional details about the service appointment.	Optional	53.0
appointmentMode	ConnectApiSvcApptModeEnum	Mode of the service appointment. • `Group`— Service appointment mode is Group. • `Regular`— Default mode of service appointment.	Optional	60.0
appointmentType	String	Type of the appointment.	Optional	53.0
attendeeLimit	Integer	Maximum number of customers that's allowed to attend the service appointment.	Required if the appointment mode is Group.	60.0
city	String	Name of the city.	Optional	53.0
comments	String	Comments about the appointment.	Optional	53.0
contactId	String	ID of the contact associated with the parent record.	Optional	53.0
country	String	Name of the country.	Optional	53.0
description	String	Description of the appointment.	Optional	53.0
engagementChannelTypeId	String	ID of the engagement channel type to associate with the appointment. You can use engagement channel type only if: • **Schedule Appointments Using Engagement Channels** is enabled in Salesforce Scheduler Settings in your Salesforce org. • Shifts are defined in the scheduling policy. For more information on setting up shifts in the scheduling policy, see Define Shift Rules in Scheduling Policy. Note: Engagement channel types are not supported with operating hours rules in the scheduling policy.	Optional	56.0

Property	Type	Description	Required or Optional	Available Version
extendedFields	List<ConnectApi.ExtendedFieldInput>	Values to add to any of the fields, including custom fields.	Optional	53.0
parentRecordId	String	ID of the parent record associated with the account.	Required if `lead` isn't provided.	53.0
postalCode	String	Postal code of the city.	Optional	53.0
schedEndTime	Datetime	Time at which the appointment is scheduled to end.	Optional	53.0
schedStartTime	Datetime	Time at which the appointment is scheduled to start.	Optional	53.0
serviceTerritoryId	String	ID of the service territory associated with the service appointment.	Optional	53.0
state	String	Name of the state.	Optional	53.0
street	String	Name of the street.	Optional	53.0
subject	String	Short phrase describing the appointment.	Optional	53.0
workTypeId	String	ID of the work type associated with the service appointment. If specified, it is added to the service appointment record.	Optional	53.0

ConnectApi.ShiftsFromPatternInput

Shifts from a pattern.

Property	Type	Description	Required or Optional	Available Version
schedulingEndDate	String	Scheduling end date in YYYY-MM-DD format. Provide `schedulingEndDate` or `schedulingOccurrences`. Don't provide both.	Required if `schedulingOccurrences` isn't provided	51.0
schedulingOccurrences	Integer	Number of scheduling occurrences. Provide `schedulingEndDate` or `schedulingOccurrences`. Don't provide both.	Required if `schedulingEndDate` isn't provided	51.0
schedulingStartDate	String	Scheduling start date in YYYY-MM-DD format.	Required	51.0

Property	Type	Description	Required or Optional	Available Version
`serviceResourceId`	String	ID of the service resource to assign shifts to. In version 53.0 and later, use `serviceResourceIdList`.	Optional	51.0–52.0
`serviceResourceIdList`	List<String>	List of service resource IDs to assign shifts to.	Optional	53.0
`serviceTerritoryId`	String	ID of the service territory to assign shifts to.	Optional	51.0
`shiftStatus`	String	Status of the shifts. Default values are: • `Confirmed` • `Published` • `Tentative` Additional status values can be created.	Optional	52.0

ConnectApi.ShippingCarrierInputRepresentation

Shipping carrier.

Property	Type	Description	Required or Optional	Available Version
`externalReference`	String	Unique code, reference, or identifier for the shipping carrier used by external systems.	Optional	63.0
`shippingCarrierMethods`	[illegible] on page 1937	List of shipping carrier methods.	Required	63.0

ConnectApi.ShippingCarrierMethodInputRepresentation

Shipping carrier method external references.

Property	Type	Description	Required or Optional	Available Version
`externalReference`	String	Unique code, reference, or identifier for the shipping carrier method used by external systems.	Required	63.0

ConnectApi.SocialPostMassApprovalInput

List of social post ids and the action to approve or reject publishing them.

Property	Type	Description	Required or Optional	Available Version
`isApproved`	Boolean	Specifies whether to approve (`true`) or reject (`false`) publishing the social posts. If unspecified, defaults to `false`.	Optional	46.0
`socialPostIdList`	List<String>	A list of up to 200 social post IDs.	Required	46.0

ConnectApi.StatusCapabilityInput

Change the status of a feed post or comment.

This class is a subclass of ConnectApi.FeedElementCapabilityInput.

Property	Type	Description	Required or Optional	Available Version
`feedEntityStatus`	`ConnectApi.FeedEntityStatus`	Status of the feed post or comment. Values are: • `Draft`—The feed post isn't published but is visible to the author and users with Modify All Data or View All Data permission. Comments can't be drafts. • `Isolated`—The feed post or comment is isolated, and only admins can see it. • `PendingReview`—The feed post or comment isn't approved yet and therefore isn't published or visible. • `Published`—The feed post or comment is approved and visible. Posts that have a status of `PendingReview` or `Published` can't be changed to a status of `Draft` and vice versa. Only admins can change the status of a post or comment to or from `Isolated` status.	Required	37.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.StreamSubscriptionInput

An entity to subscribe to for a Chatter feed stream.

Property	Type	Description	Required or Optional	Available Version
`entityId`	String	The ID of any feed-enabled entity, such as a group, record, or user, that the context user can access. When subscribed, the entity's feed is included in the feed stream.	Required	39.0

SEE ALSO:

ConnectApi.ChatterStreamInput

ConnectApi.StringList

List of string values.

Subclass of ConnectApi.AbstractList.

Property	Type	Description	Required or Optional	Available Version
`values`	List<String>	List of string values to filter on, for example, `["A", "B", "C"]`.	Optional	63.0

ConnectApi.SurveyInvitationEmailInput

Survey invitation email.

Property	Type	Description	Required or Optional	Available Version
`allowGuestUserResponse`	Boolean	Specifies whether participants who don't have a Salesforce account can respond (`true`) or not (`false`).	Required	50.0
`allowParticipantsAccessTheirResponse`	Boolean	Specifies whether participants can see their responses (`true`) or not (`false`).	Required	50.0
`associateRecordsWithRecipients`	List<`ConnectApi.AssociateRecordsWithRecipientInput`>	Maps each recipient with another record that must be associated with the recipient's survey invitation.	Optional	50.0
`body`	String	Content of the email. Specify the email body in case you don't specify an email template. The email body must contain one of the following merge fields: • To embed a link to launch the survey: [[SURVEY_INVITATION_URL]]	Optional	50.0

Property	Type	Description	Required or Optional	Available Version
		• To embed a survey question: {{{SurveyQuestion.QuestionName}}} and {{{SurveyQuestion.QuestionHtmlContent}}}		
`collectAnonymousResponse`	Boolean	Specifies whether participants can respond anonymously (`true`) or not (`false`).	Required	50.0
`communityId`	String	ID of the site that's used to open the survey for users outside your org.	Optional	50.0
`emailTemplateId`	String	ID of the Lightning email template that's used to send the survey invitation. The template must contain the required merge fields that embed either the survey link or a question in the email. Only Lightning email templates are used to send survey invitations.	Optional	50.0
`fromEmailAddress`	String	Email ID of the user or the org-wide email address associated with the user's profile.	Required	50.0
`invitationExpirationDate`	Datetime	Date on which the survey invitation expires.	Optional	50.0
`invitationOwner`	String	ID of the owner of the survey invitation records.	Optional	50.0
`isPersonalInvitation`	Boolean	Specifies whether an unique invitation is created for each participant (`true`) or not (`false`). When a participant responds using a personal invitation, the response record is associated with the participant's Salesforce record.	Required	50.0
`recipientEngagementContexts`	List<`ConnectApi.RecipientEngagementContextInput`>	Maps each recipient with the context based on which the survey invitation is emailed.	Optional	50.0
`recipients`	List<String>	List of up to 300 IDs of leads, contacts, or users to whom the survey invitation is emailed.	Required	50.0
`shareInvitationsWith`	List<String>	IDs of the users with whom the survey invitation records must be shared. The invitation records are shared with Read access.	Optional	50.0
`subject`	String	Subject of the email. Specify the subject in case you don't specify an email template.	Optional	50.0

Property	Type	Description	Required or Optional	Available Version
`surveyQuestionIds`	List<String>	IDs of the questions that are embedded in the email. You can send an email invitation for questions of the following types: Net Promoter Score (NPS), rating, and score.	Optional	50.0

ConnectApi.TargetCollectionInput

Collection of targets to create.

Property	Type	Description	Required or Optional	Available Version
`targets`	List<`ConnectApi.TargetInput`>	List of targets to create.	Required	48.0

ConnectApi.TargetCollectionUpdateInput

Collection of targets to update.

Property	Type	Description	Required or Optional	Available Version
`targets`	List<`ConnectApi.TargetUpdateInput`>	List of targets to update.	Required	48.0

ConnectApi.TargetInput

Target to create.

Property	Type	Description	Required or Optional	Available Version
`audienceId`	String	ID of the audience to assign to the target.	Required	48.0
`groupName`	String	Group name of the target. Groups bundle related target and audience pairs. You can have up to 2,000 groups and 500 targets per group. To determine the group name for targets of type `ExperienceVariation`, see Personalization Target Developer and Group Names in the *Experience Cloud Developer Guide*.	Required	48.0

Property	Type	Description	Required or Optional	Available Version
`priority`	Integer	Priority of the target. Within a group, priority determines which target is returned if the user matches more than one audience.	Optional	48.0
`publishStatus`	`ConnectApi.PublishStatus`	The publish status of the target. Values are: • `Draft` • `Live` We recommend setting the publish status to `Draft`. If you specify `Live`, your changes revert after you publish the site.	Optional	48.0
`targetType`	String	Type of target, indicating the nature of the data being targeted. Supported values include: • `ExperienceVariation` (version 48.0 and later) • Custom object API names, such as ***`CustomObjectName`*`__c`** (version 48.0 and later) • `NavigationLinkSet` (version 49.0 and later) • `Topic` (version 49.0 and later) • `CollaborationGroup` (version 49.0 and later) • `KnowledgeArticle` (version 49.0 and later) • `ContentDocument` (version 49.0 and later) • `ManagedContent` (version 49.0 and later) • `Report` (version 49.0 and later) • `Dashboard` (version 49.0 and later) You can have up to 2,500 `ExperienceVariation` targets and 25,000 record targets.	Required	48.0

Property	Type	Description	Required or Optional	Available Version
`targetValue`	String	Value of the target. If `targetType` is `ExperienceVariation`, `targetValue` is the developer name of the experience variation. If `targetType` is ***`CustomObjectName`*****`__c`**, `targetValue` is the ID of the custom object. To determine the developer name for targets of type `ExperienceVariation`, see Personalization Target Developer and Group Names in the *Experience Cloud Developer Guide*.	Required	48.0

SEE ALSO:

ConnectApi.TargetCollectionInput

ConnectApi.TargetLocationInputRepresentation

A set of inventory locations that together can fulfill an order.

Property	Type	Description	Required or Optional	Available Version
`locations`	List<`ConnectApi.LocationInputRepresentation`>	A list of locations with information about their country and postal codes.	Required	51.0

ConnectApi.TargetUpdateInput

Target to update.

Property	Type	Description	Required or Optional	Available Version
`audienceId`	String	ID of the audience to assign to the target.	Required if `priority` isn't specified. Otherwise, Optional	48.0
`priority`	Integer	Priority of the target. Within a group, priority determines which target is returned if the user matches more than one audience.	Required if `audienceId` isn't specified. Otherwise, Optional	48.0

Property	Type	Description	Required or Optional	Available Version
`targetId`	String	ID of the target to update.	Required	48.0

SEE ALSO:

ConnectApi.TargetCollectionUpdateInput

ConnectApi.TaxAddressRequest

Address input representation for tax calculation.

Name	Type	Description	Required or Optional	Available Version
`city`	String	City.	Optional	55.0
`country`	String	Country.	Optional	55.0
`latitude`	Double	Latitude.	Optional	55.0
`locationCode`	String	Location code.	Optional	55.0
`longitude`	Double	Longitude.	Optional	55.0
`postalCode`	String	Postal code.	Optional	55.0
`state`	String	State.	Optional	55.0
`street`	String	Street.	Optional	55.0

ConnectApi.TaxAddressesRequest

Addresses, including the Bill To address, Ship From address, Ship to address, and Sold To address.

Name	Type	Description	Required or Optional	Available Version
`billTo`	`ConnectApi.TaxAddressRequest`	Bill To address.	Optional	55.0
`shipFrom`	`ConnectApi.TaxAddressRequest`	Ship From address.	Optional	55.0
`shipTo`	`ConnectApi.TaxAddressRequest`	Ship To address.	Optional	55.0

Name	Type	Description	Required or Optional	Available Version
soldTo	ConnectApi.TaxAddressRequest	Sold To address.	Optional	55.0

ConnectApi.TaxCustomerDetailsRequest

Customer details for the tax calculation.

Property	Type	Description	Required or Optional	Available Version
accountId	String	ID of the customer's account.	Optional	55.0
code	String	Customer code.	Optional	55.0
exemptionNo	String	Tax exemption number.	Optional	55.0
exemptionReason	String	Tax exemption reason.	Optional	55.0

ConnectApi.TaxLineItemRequest

A list of line items passed to the tax engine for tax calculation.

Property	Type	Description	Required or Optional	Available Version
addresses	ConnectApi.TaxAddressesRequest	Addresses, including the Bill To address, Ship From address, Ship To address, and Sold To address.	Optional	55.0
amount	Double	Amount of the line item.	Optional	55.0
description	String	Description of the line item.	Optional	55.0
effectiveDate	Datetime	Date to apply the tax calculation to the line item.	Optional	55.0
lineNumber	String	Line number of the line item.	Optional	55.0
productCode	String	Product code of the line item.	Optional	55.0
quantity	Double	Quantity of the line item.	Optional	55.0
taxCode	String	Tax code for the line item.	Optional	55.0

ConnectApi.TaxTransactionRequest

Information about the tax transaction sent to the tax adapter as part of a tax calculation request.

This class is abstract.

Superclass of ConnectApi.CalculateTaxRequest.

Property	Type	Description	Required or Optional	Available Version
addresses	ConnectApi.TaxAddressesRequest	Addresses, including the Bill To address, Ship From address, Ship to address, and Sold To address.	Optional	55.0
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the payment group record.	Optional	55.0
customerDetails	ConnectApi.TaxCustomerDetailsRequest	Customer details for the tax calculation.	Optional	55.0
description	String	Information about whether the tax transaction failed or was successful.	Optional	55.0
documentCode	String	Document code.	Optional	55.0
effectiveDate	Datetime	The date that tax is applied to the taxed entity.	Required	55.0
lineItems	List<ConnectApi.TaxLineItemRequest>	The line items on which tax was calculated.	Required	55.0
referenceDocumentCode	String	The original document code. Used in case of subsequent transactions such as credit tax.	Optional	55.0
referenceEntityId	String	ID of the reference entity used during tax calculation.	Optional	55.0
transactionDate	Datetime	The date that the tax transaction occurred.	Optional	53.0

ConnectApi.TextClassificationsInputRepresentation

Text classification information associating classifiers and text to be classified.

Property	Type	Description	Required or Optional	Available Version
classifiers	List<String>	List of classifiers according to which text has to be classified.	Required	59.0
textList	List<String>	List of text to be classified.	Required	59.0

ConnectApi.TextSegmentInput

Include a text segment in a feed item or comment.

Subclass of ConnectApi.MessageSegmentInput.

Property	Type	Description	Available Version
`text`	String	Plain text for this segment. If hashtags or links are detected in *`text`*, they're included in the comment as hashtag and link segments. Mentions aren't detected in *`text`* and aren't separated out of the text. Mentions require `ConnectApi.MentionSegmentInput`.	28.0

SEE ALSO:

- Edit a Comment
- Edit a Feed Element
- Edit a Question Title and Post
- Post a Rich-Text Feed Element with Inline Image
- ConnectApi.MessageBodyInput

ConnectApi.TopicInput

Update a topic's name or description or merge topics.

Property	Type	Description	Available Version
`description`	String	Description of the topic	29.0
`idsToMerge`	List<String>	List of up to five secondary topic IDs to merge with the primary topic If any of the secondary topics are navigational or featured topics, they lose their topic type, topic images, and children topics. Their feed items are reassigned to the primary topic. If you merge a topic with a content topic, the content associations are preserved. If you merge a topic with an inactive endorsee, the endorsement isn't mapped to the primary topic.	33.0
`name`	String	Name of the topic Use this property to change only the capitalization and spacing of the topic name.	29.0

SEE ALSO:

- updateTopic(communityId, topicId, topic)

ConnectApi.TopicNamesInput

A list of topic names to replace currently assigned topics. Also a list of suggested topics to assign.

Property	Type	Description	Required or Optional	Available Version
`topicNames`	List<String>	A list of up to 10 topic names for a feed item or 100 topic names for a record.	Required	35.0

Property	Type	Description	Required or Optional	Available Version
topicSuggestions	List<String>	A list of suggested topics to assign to a record or feed item to improve future topic suggestions.	Optional	37.0

SEE ALSO:

reassignTopicsByName(communityId, recordId, topicNames)

ConnectApi.ArticleTopicAssignmentJobInput

ConnectApi.TopicsCapabilityInput

Assign topics to a feed element.

Property	Type	Description	Required or Optional	Available Version
contextTopicName	String	Name of the parent topic in the site to which the feed element belongs.	Optional	38.0
topics	List<String>	List of topics to assign to the feed element.	Required	38.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.UpdateServiceAppointmentInput

Contains information to update a service appointment.

Property	Type	Description	Required or Optional	Available Version
serviceAppointmentId	String	The ID of the service appointment to be modified.	Required	53.0
assignedResources	List<ConnectApi.AssignedResourceInput>	Represents the service resources who are assigned to a service appointment. When updating an appointment, pass the complete list of required resources. If you don't pass a resource who is already assigned to the appointment, the API deletes that assigned resource. For example, suppose that an existing service appointment has assigned resources: A and B and you pass B and C in assigned resources in the PATCH request. The API checks the resource availability of B and C	Optional	53.0

Property	Type	Description	Required or Optional	Available Version
		for existing work type and service territory, and if both are available, the service appointment gets updated with: • Resource A—Deleted • ResourceB—Updated • ResourceC—Created However, if you don't pass any of the assigned resources, the API assumes there's no change. Note: When creating an appointment, use `extendedFields` to add values to any of the fields, including custom fields, in `assignedResources` as long as you have edit access to those fields.		
`lead`	ConnectApi.LeadInput	Represents a prospect or lead. Note: Required to create a service appointment for unauthenticated guest users.	Required if `serviceAppointment` isn't provided.	53.0
`schedulingPolicyId`	String	The ID of the `AppointmentSchedulingPolicy` object. If no scheduling policy is passed in the request body, the default configurations are used. The only scheduling policy configuration that is used in determining time slots is the enforcement of account visiting hours.	Optional	53.0
`serviceAppointment`	ConnectApi.ServiceAppointmentInput	Represents the service appointment details to book an appointment. When updating an appointment, pass only the fields that must be updated. Note: When creating an appointment, use `extendedFields` to add values to any of the fields, including custom fields, in `assignedResources` as long as you have edit access to those fields.	Required if `lead` isn't provided.	53.0

ConnectApi.UpDownVoteCapabilityInput

Upvote or downvote a feed element or a comment.

Property	Type	Description	Required or Optional	Available Version
`vote`	`ConnectApi.UpDownVoteValue`	Type of vote for a feed element or comment. Values are: • `Down` • `None` • `Up`	Required	41.0

ConnectApi.UserInput

Update a user's About Me information.

Property	Type	Description	Available Version
`aboutMe`	String	The `aboutMe` property of a `ConnectApi.UserDetail` output object. This property populates the About Me section of the user profile, which is visible to all members of an Experience Cloud site or org.	29.0

SEE ALSO:

updateUser(communityId, userId, userInput)

ConnectApi.WishlistInput

Create a wishlist.

Property	Type	Description	Required or Optional	Available Version
`name`	String	Name of the wishlist.	Required	49.0
`products`	List<`ConnectApi.WishlistItemInput`>	List of products to add to the wishlist.	Optional	49.0

ConnectApi.WishlistItemInput

Item to update or add to a wishlist.

Property	Type	Description	Required or Optional	Available Version
`productId`	String	ID of the product to update or add to the wishlist.	Required	49.0

SEE ALSO:

ConnectApi.WishlistInput

ConnectApi.WishlistUpdateInput

Update a wishlist name.

Property	Type	Description	Required or Optional	Available Version
`name`	String	Wishlist name to update.	Required	50.0

ConnectApi.WrappedValue

Value wrapped for use as an object.

Property	Type	Description	Required or Optional	Available Version
`value`	`Object`	Value to wrap.	Required	60.0

Retired `ConnectApi` Input Classes

These `ConnectApi` input classes are retired.

IN THIS SECTION:

ConnectApi.CanvasAttachmentInput

Used to attach a canvas app to a feed item.

ConnectApi.ContentAttachmentInput

Used to attach existing content to a comment or feed item.

ConnectApi.DatacloudOrderInput

Input representation for a Datacloud order to purchase contacts or companies and retrieve purchase information.

ConnectApi.FeedItemAttachmentInput

Used to attach a file to a feed item.

ConnectApi.LinkAttachmentInput

Add links to a feed item.

ConnectApi.NewFileAttachmentInput

Attach a new file to a feed item.

ConnectApi.PollAttachmentInput

Attach a poll to a feed item.

ConnectApi.CanvasAttachmentInput

Used to attach a canvas app to a feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.CanvasCapabilityInput.

Subclass of Connectapi.FeedItemAttachmentInput.

Property	Type	Description	Available Version
`description`	String	Optional. The description of the canvas app.	29.0–31.0
`developerName`	String	The developer name (API name) of the canvas app	29.0–31.0
`height`	String	Optional. The height of the canvas app in pixels. Default height is 200 pixels.	29.0–31.0
`namespacePrefix`	String	Optional. The namespace prefix of the Developer Edition organization in which the canvas app was created.	29.0–31.0
`parameters`	String	Optional. Parameters passed to the canvas app in JSON format. Example: `{'isUpdated'='true'}`	29.0–31.0
`thumbnailUrl`	String	Optional. A URL to a thumbnail image for the canvas app. Maximum dimensions are 120x120 pixels.	29.0–31.0
`title`	String	The title of the link used to call the canvas app.	29.0–31.0

ConnectApi.ContentAttachmentInput

Used to attach existing content to a comment or feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.ContentCapabilityInput.

Subclass of ConnectApi.FeedItemAttachmentInput.

Property	Type	Description	Available Version
`contentDocumentId`	String	ID of the existing content.	28.0–31.0

ConnectApi.DataCloudOrderInput

Input representation for a Datacloud order to purchase contacts or companies and retrieve purchase information.

Property	Type	Description	Required or Optional	Available Version
`companyIds`	String	A comma-separated list of identification numbers for the companies to be purchased. You can't include any contact IDs or your purchase fails.	Required to purchase companies	32.0
`contactIds`	String	A comma-separated list of identification numbers for the contacts to be purchased. You can't include any company IDs or your purchase fails.	Required to purchase contacts	32.0
`userType`	ConnectDatacloudUserTypeEnum	Indicates the Data.com user type to be used. There are two user types. • `Monthly` (default) • `Listpool`	Optional	32.0

SEE ALSO:

postOrder(orderInput)

ConnectApi.FeedItemAttachmentInput

Used to attach a file to a feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.FeedElementCapabilityInput.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass for:

- ConnectApi.CanvasAttachmentInput
- ConnectApi.ContentAttachmentInput
- ConnectApi.LinkAttachmentInput
- ConnectApi.NewFileAttachmentInput
- ConnectApi.PollAttachmentInput

ConnectApi.LinkAttachmentInput

Add links to a feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.LinkCapabilityInput.

Subclass of ConnectApi.FeedItemAttachmentInput.

Property	Type	Description	Available Version
`url`	String	URL to be used for the link	28.0–31.0
`urlName`	String	Title of the link	28.0–31.0

ConnectApi.NewFileAttachmentInput

Attach a new file to a feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.ContentCapabilityInput.

The actual binary file, that is the attachment, is provided as part of the BinaryInput in the method that takes this attachment input, such as `postFeedItem` or `postComment`.

Subclass of ConnectApi.FeedItemAttachmentInput.

Property	Type	Description	Available Version
`description`	String	Description of the file to be uploaded.	28.0–31.0
`title`	String	The title of the file. This value is required and is also used as the file name. For example, if the title is My Title, and the file is a .txt file, the file name is My Title.txt.	28.0–31.0

ConnectApi.PollAttachmentInput

Attach a poll to a feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.PollCapabilityInput.

Subclass of ConnectApi.FeedItemAttachmentInput.

Property	Type	Description	Available Version
`pollChoices`	List<String>	The text labels for the poll items. Polls must contain between 2 to 10 poll choices.	28.0–31.0

`ConnectApi` Output Classes

Most `ConnectApi` methods return instances of `ConnectApi` output classes.

All properties are read-only, except for instances of output classes created within test code.

All output classes are concrete unless marked abstract in this documentation.

All concrete output classes have no-argument constructors that you can invoke only from test code. See Testing ConnectApi Code.

ConnectApi.AbstractCartItem

A cart item.

This class is abstract.

Superclass of:

- ConnectApi.CartItem
- ConnectApi.CartItemWithoutPrice

Property Name	Type	Description	Available Version
billingFrequency	ConnectApi.BillingFrequency	Reserved for future use.	59.0
cartDeliveryGroupId	String	ID of the cart delivery group.	60.0
cartId	String	ID of the cart.	49.0
cartItemId	String	ID of the item.	49.0
childProductCount	Integer on page 3550	Number of child products in the cart that are associated with the item. A cart item can have child products if the `productClass` of the item is `Bundle`. For nested bundles, which include a child product that's also a bundle, `childProductCount` includes all child products.	62.0
customFields	List<SObject>	Array of sObjects and viewable custom fields for the sObjects. Standard fields are ignored. Currently, only the CartItem sObject is supported. Field-level security rules from the shopper profile are applied to the custom fields. The rules are applied for registered shoppers and for the guest shopper profile.	61.0
messagesSummary	ConnectApi.CartMessagesSummary	Messages summary for the item.	49.0
name	String	Name of the item.	49.0
parentCartItemId	String	ID of the item's parent cart item. The value is empty if the item is a top-level cart item.	62.0
productDetails	ConnectApi.CartItemProduct	Summary of the product details.	49.0
productId	String	ID of the product.	49.0
productSellingModelId	String	Reserved for future use.	59.0
quantity	String	Quantity of the item.	49.0
sellingModelType	ConnectApi.SellingModelType	Reserved for future use.	60.0
subscriptionTerm	Integer on page 3550	Reserved for future use.	59.0

Property Name	Type	Description	Available Version
`type`	`ConnectApi.CartItemType`	Type of item in a cart. Values are: • `DeliveryCharge` • `Product`	49.0

SEE ALSO:

ConnectApi.CartItemResult

ConnectApi.AbstractContentHubItemType

An item type associated with a repository folder.

This class is abstract.

Superclass of:

- ConnectApi.ContentHubItemTypeDetail
- ConnectApi.ContentHubItemTypeSummary

Property Name	Type	Description	Available Version
`contentStreamSupport`	`ConnectApi.ContentHubStreamSupport`	Support for content streaming. Values are: • `ContentStreamAllowed` • `ContentStreamNotAllowed` • `ContentStreamRequired`	39.0
`description`	String	Description of the item type.	39.0
`displayName`	String	Display name of the item type.	39.0
`id`	String	ID of the item type.	39.0
`isVersionable`	Boolean	Indicates whether the item type can have versions.	39.0
`url`	String	URL to the detailed information of the item type.	39.0

ConnectApi.AbstractDirectoryEntrySummary

A directory entry with summary information.

This class is abstract.

Superclass of:

- ConnectApi.RepositoryGroupSummary
- ConnectApi.RepositoryUserSummary

Property Name	Type	Description	Available Version
`domain`	String	Domain of the directory entry.	39.0

Property Name	Type	Description	Available Version
email	String	Email of the directory entry.	39.0
id	String	ID of the directory entry.	39.0
type	ConnectApi.ContentHubDirectoryEntryType	Type of directory entry. Values are: • GroupEntry • UserEntry	39.0

ConnectApi.AbstractExtensionInformation

Extension information.

This class is abstract.

Superclass of ConnectApi.LightningExtensionInformation.

Property Name	Type	Description	Available Version
extensionInformationType	ConnectApi.ExtensionInformationType	Information type of the extension. Values are: • Lightning	40.0

ConnectApi.AbstractGatewayCommonResponse

Payment gateway response fields commonly used in payment services.

This class is abstract.

Superclass of ConnectApi.AbstractGatewayResponse.

Property Name	Type	Description	Available Version
gatewayAvsCode	String	Used to verify the address mapped to a payment method when the payments platform requests tokenization from the payment gateway.	50.0
gatewayDate	Datetime	Date when the notification occurred. Some gateways don't send this value.	50.0
gatewayMessage	String	Error messages that the gateway returned for the notification request. Maximum length of 255 characters.	50.0
gatewayResultCode	String	Gateway-specific result code. You can map the result code to a Salesforce-specific result code. Maximum length of 64 characters.	50.0
gatewayResultCodeDescription	String	A description of the gateway-specific result code that a payment gateway returned. Maximum length of 1,000 characters.	50.0

Property Name	Type	Description	Available Version
`salesforceResultCode`	String	The Salesforce result code for the gateway result code.	50.0

ConnectApi.AbstractGatewayResponse

Payment gateway response fields used in sale, authorization, and capture services.

This class is abstract.

Subclass of ConnectApi.AbstractGatewayCommonResponse.

Super class of:

- ConnectApi.AuthReversalGatewayResponse
- ConnectApi.AuthorizationGatewayResponse
- ConnectApi.AuthorizationReversalResponse
- ConnectApi.CaptureGatewayResponse
- ConnectApi.PaymentMethodTokenizationGatewayResponse
- ConnectApi.PostAuthGatewayResponse
- ConnectApi.RefundGatewayResponse
- ConnectApi.SaleGatewayResponse

Property Name	Type	Description	Available Version
`gatewayReferenceDetails`	String	Provides information about the gateway communication.	50.0
`gatewayReferenceNumber`	String	Unique transaction ID created by the payment gateway.	50.0

ConnectApi.AbstractManagedContentChannelRepresentation

Managed content channel.

This class is abstract.

Super class of:

- ConnectApi.ManagedContentChannel
- ConnectApi.ManagedContentChannelSummary

No additional properties.

SEE ALSO:

ConnectApi.ManagedContentChannelsRepresentation

ConnectApi.AbstractManagedContentDeliveryDocument

Managed content delivery document.

This class is abstract.

Superclass of:

- ConnectApi.ManagedContentDeliveryDocument
- ConnectApi.ManagedContentDeliveryDocumentSummary

Property Name	Type	Description	Available Version
`contentKey`	String	Globally unique identifier (GUID) for the managed content.	55.0
`contentType`	`ConnectApi.ManagedContentTypeSummary`	Type of managed content.	55.0
`language`	String	Language locale of the managed content.	55.0
`managedContentId`	String	ID of the managed content.	55.0
`publishedDate`	Datetime	Most recent publish date of the managed content.	55.0
`resourceUrl`	String	URL to the single content delivery resource.	55.0
`title`	String	Title of the managed content.	55.0
`unauthenticatedUrl`	String	Public URL for the managed content.	55.0
`urlName`	String	URL name of the managed content.	55.0

SEE ALSO:

ConnectApi.ManagedContentDeliveryDocumentCollection

ConnectApi.AbstractManagedContentReference

Managed content reference.

This class is abstract.

Superclass of:

- ConnectApi.ManagedContentReference
- ConnectApi.ManagedContentReferenceSummary

Property Name	Type	Description	Available Version
`contentKey`	String	Unique identifier for the managed content reference.	54.0
`managedContentId`	String	ID of the managed content reference.	54.0
`resourceUrl`	String	URL to the single content delivery resource.	55.0

SEE ALSO:

ConnectApi.ManagedContentDeliveryDocumentCollection

ConnectApi.AbstractMessageBody

Abstract message body.

This class is abstract.

Superclass of:

- ConnectApi.FeedBody
- ConnectApi.MessageBody

Name	Type	Description	Available Version
`isRichText`	Boolean	Indicates whether the body is rich text.	35.0
`messageSegments`	List<`ConnectApi.MessageSegment`>	List of message segments	28.0
`text`	String	Display-ready text. Use this text if you don't want to process the message segments.	28.0

ConnectApi.AbstractNBAAction

A recommended action of recommendation strategy.

This class is abstract.

Superclass of ConnectApi.NBAFlowAction.

Property Name	Type	Description	Available Version
`parameters`	List<`ConnectApi.NBAActionParameter`>	List of parameters to pass to the action.	45.0
`type`	`ConnectApi.NBAActionType`	Type of action. Values are: • `Flow`—Automated process tool with multiple subtypes.	45.0

SEE ALSO:

ConnectApi.NBARecommendation

ConnectApi.AbstractNBATarget

A recommendation target of a recommendation strategy.

This class is abstract.

Superclass of ConnectApi.NBANativeRecommendation.

Property Name	Type	Description	Available Version
type	ConnectApi.NBATargetType	Type of target. Values are: • Recommendation	45.0

SEE ALSO:

ConnectApi.NBARecommendation

ConnectApi.AbstractRecommendation

A Chatter, custom, or static recommendation.

This class is abstract.

Superclass of:

- ConnectApi.EntityRecommendation
- ConnectApi.NonEntityRecommendation

  ConnectApi.NonEntityRecommendation isn't used in version 34.0 and later. In version 34.0 and later, ConnectApi.EntityRecommendation is used for all recommendations.

Property Name	Type	Description	Available Version
explanation	ConnectApi.RecommendationExplanation	The Chatter, custom, or static recommendation explanation.	32.0
platformActionGroup	ConnectApi.PlatformActionGroup	A platform action group instance with state appropriate for the context user.	34.0
recommendationType	ConnectApi.RecommendationType	Specifies the type of record being recommended.	32.0
url	String	URL for the Chatter, custom, or static recommendation.	34.0

SEE ALSO:

ConnectApi.RecommendationsCapability

ConnectApi.RecommendationCollection

ConnectApi.AbstractRecommendationExplanation

Explanation for a Chatter recommendation.

This class is abstract.

Superclass of ConnectApi.RecommendationExplanation.

Property Name	Type	Description	Available Version
`summary`	String	Summary explanation for the Chatter recommendation.	32.0
`type`	`ConnectApi.RecommendationExplanationType`	Indicates the reason for the Chatter recommendation. • `ArticleHasRelatedContent`—Articles with related content to a context article. • `ArticleViewedTogether`—Articles often viewed together with the article that the context user just viewed. • `ArticleViewedTogetherWithViewers`—Articles often viewed together with other records that the context user views. • `Custom`—Custom recommendations. • `FilePopular`—Files with many followers or views. • `FileViewedTogether`—Files often viewed at the same time as other files that the context user views. • `FollowedTogetherWithFollowees`—Users often followed together with other records that the context user follows. • `GroupMembersFollowed`—Groups with members that the context user follows. • `GroupNew`—Recently created groups. • `GroupPopular`—Groups with many active members. • `ItemViewedTogether`—Records often viewed at the same time as other records that the context user views. • `PopularApp`—Applications that are popular. • `RecordOwned`—Records that the context user owns. • `RecordParentOfFollowed`—Parent records of records that the context user follows. • `RecordViewed`—Records that the context user recently viewed. • `TopicFollowedTogether`—Topics often followed together with the record that the context user just followed. • `TopicFollowedTogetherWithFollowees`—Topics often followed together with other records that the context user follows.	32.0

Property Name	Type	Description	Available Version
		• `TopicPopularFollowed`—Topics with many followers. • `TopicPopularLiked`—Topics on posts that have many likes. • `UserDirectReport`—Users who report to the context user. • `UserFollowedTogether`—Users often followed together with the record that the context user followed . • `UserFollowsSameUsers`—Users who follow the same users as the context user. • `UserManager`—The context user's manager. • `UserNew`—Recently created users. • `UserPeer`—Users who report to the same manager as the context user. • `UserPopular`—Users with many followers. • `UserViewingSameRecords`—Users who view the same records as the context user.	

ConnectApi.AbstractRecordField

A field on a record.

This class is abstract.

Superclass of:

- ConnectApi.BlankRecordField
- ConnectApi.LabeledRecordField

Message segments in a feed item are typed as `ConnectApi.MessageSegment`. Feed item capabilities are typed as `ConnectApi.FeedItemCapability`. Record fields are typed as `ConnectApi.AbstractRecordField`. These classes are all abstract and have several concrete subclasses. At runtime you can use `instanceof` to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

Important: The composition of a feed can change between releases. Write your code to handle instances of unknown subclasses.

Name	Type	Description	Available Version
`type`	String	Type of the field. One of these values: • `Address` • `Blank` • `Boolean` • `Compound` • `CreatedBy` • `Date` • `DateTime` • `Email` • `LastModifiedBy` • `Location` • `Name` • `Number` • `Percent` • `Phone` • `Picklist` • `Reference` • `Text` • `Time`	29.0

SEE ALSO:

ConnectApi.RecordViewSection

ConnectApi.AbstractRecordView

A view of any record in the org, including a custom object record. This object is used if a specialized object, such as User or ChatterGroup, isn't available for the record type.

This class is abstract.

Subclass of ConnectApi.ActorWithId.

Superclass of:

- ConnectApi.RecordSummary
- ConnectApi.RecordView

Name	Type	Description	Available Version
`name`	String	The localized name of the record.	29.0

ConnectApi.AbstractRepositoryFile

A repository file.

This class is abstract.

Subclass of ConnectApi.AbstractRepositoryItem.

Superclass of:

- ConnectApi.RepositoryFileDetail
- ConnectApi.RepositoryFileSummary

Property Name	Type	Description	Available Version
`checkinComment`	String	Checkin comment of the file.	39.0
`contentBody`	String	Text of the file's content if available, otherwise `null`.	43.0
`contentSize`	Integer	Length in bytes of the content of the file.	39.0
`downloadUrl`	String	URL to the repository file content.	39.0
`external ContentUrl`	String	URL of this file's content in the external system.	39.0
`external DocumentUrl`	String	URL of this file in the external system.	39.0
`external FilePermission Information`	`ConnectApi. ExternalFile PermissionInformation`	External file permission information, such as available groups, available permission types, and current sharing status, or `null` if `includeExternalFilePermissionsInfo` is `false`.	39.0
`mimeType`	String	Mime type of the file.	39.0
`previewUrl Thumbnail`	String	URL to the thumbnail preview (240 x 180 PNG).	39.0
`previewUrl ThumbnailBig`	String	URL to the big thumbnail preview (720 x 480 PNG).	39.0
`previewUrl ThumbnailTiny`	String	URL to the tiny thumbnail preview (120 x 90 PNG).	39.0
`previewsUrl`	String	URL to the previews.	39.0
`title`	String	Title of the file.	39.0
`versionId`	String	ID of the file version in the external system.	39.0

ConnectApi.AbstractRepositoryFolder

A repository folder.

This class is abstract.

Subclass of ConnectApi.AbstractRepositoryItem.

Superclass of:

- ConnectApi.RepositoryFolderDetail
- ConnectApi.RepositoryFolderSummary

Property Name	Type	Description	Available Version
`externalFolderUrl`	String	URL of this folder in the external system.	39.0
`folderItemsUrl`	String	URL that lists the files and folders in this folder.	39.0
`path`	String	Absolute path of the folder in the external system.	39.0

ConnectApi.AbstractRepositoryItem

A repository item.

This class is abstract.

Superclass of:

- ConnectApi.AbstractRepositoryFile
- ConnectApi.AbstractRepositoryFolder

Property Name	Type	Description	Available Version
`createdBy`	String	Name of the user who created the item.	39.0
`createdDate`	Datetime	Date the item was created.	39.0
`description`	String	Description of the Item.	39.0
`id`	String	ID of the item.	39.0
`itemTypeUrl`	String	URL to the item type information.	39.0
`modifiedBy`	String	Name of the user who last modified the item.	39.0
`modifiedDate`	Datetime	Date the item was last modified.	39.0
`motif`	`ConnectApi.Motif`	Motif of the item.	39.0
`name`	String	Name of the item.	39.0
`repository`	`ConnectApi.Reference`	Item external repository.	39.0
`type`	String	Item type, `file` or `folder`.	39.0
`url`	String	The URL to the item.	39.0

ConnectApi.AbstractUserMissionActivity

User activity associated with missions.

This class is abstract.

Superclass of:

- ConnectApi.UserMission
- ConnectApi.UserMissionActivity

Property Name	Type	Description	Available Version
`activityCount`	Integer	Number of mission activities of the specified type for the user.	45.0
`activityType`	String	Type of mission activity for a user. Values are: • `FeedItemAnswerAQuestion`—User answered a question. • `FeedItemLikeSomething`—User liked a post or comment. • `FeedItemMarkAnswerAsBest`—User marked an answer as the best answer. • `FeedItemPostQuestion`—User posted a question. • `FeedItemReceiveAComment`—User received a comment on a post. • `FeedItemReceiveALike`—User received a like on a post or comment. • `FeedItemReceiveAnAnswer`—User received an answer to a question. • `FeedItemWriteAComment`—User commented on a post. • `FeedItemWriteAPost`—User made a post. • `FeedItemYourAnswerMarkedBest`—User's answer was marked as the best answer.	45.0

SEE ALSO:

ConnectApi.UserMissionActivityCollection

ConnectApi.ActionLinkDefinition

The definition of an action link. Action link definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

Property Name	Type	Description	Available Version
`actionUrl`	String	The action link URL. For example, a `Ui` action link URL is a Web page. A `Download` action link URL is a link to the file to download. `Ui` and `Download` action link URLs are provided to clients. An `Api` or	33.0

Property Name	Type	Description	Available Version
		`ApiAsync` action link URL is a REST resource. `Api` and `ApiAsync` action link URLs aren't provided to clients. Links to Salesforce can be relative. All other links must be absolute and start with `https://`.	
`createdDate`	Datetime	ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	33.0
`excludedUserId`	String	ID of a single user to exclude from performing the action. If you specify an `excludedUserId`, you can't specify a `userId`.	33.0
`groupDefault`	Boolean	`true` if this action is the default action link in the action link group; `false` otherwise. There can be only one default action link per action link group. The default action link gets distinct styling in the Salesforce UI.	33.0
`headers`	List<`ConnectApi.RequestHeader`>	The request headers for the `Api` and `ApiAsync` action link types.	33.0
`id`	String	The 18-character ID for the action link definition.	33.0
`label`	String	A custom label to display on the action link button. A `label` value can be set only in an action link template. Action links have four statuses: NewStatus, PendingStatus, SuccessStatus, and FailedStatus. These strings are appended to the label for each status: • *label* • *label* Pending • *label* Success • *label* Failed For example, if the value of `label` is "See Example," the values of the four action link states are: See Example, See Example Pending, See Example Success, and See Example Failed. An action link can use either `label` or `labelKey` to generate label names, it can't use both. If `label` has a value, the value of `labelKey` is `None`. If `labelKey` has a value other than `None`, the value of `label` is `null`.	34.0
`labelKey`	String	Key for the set of labels to show in the user interface. A set includes labels for these states: NewStatus, PendingStatus, SuccessStatus, FailedStatus. For example, if you use the `Approve` key, you get these labels: Approve, Pending, Approved, Failed.	33.0

Property Name	Type	Description	Available Version
		For a complete list of label keys, see Action Links Labels in the *Connect REST API Developer Guide*.	
`method`	`ConnectApi.HttpRequestMethod`	The HTTP method. One of these values: • `HttpDelete`—Returns HTTP 204 on success. Response body or output class is empty. • `HttpGet`—Returns HTTP 200 on success. • `HttpHead`—Returns HTTP 200 on success. Response body or output class is empty. • `HttpPatch`—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty. • `HttpPost`—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success. • `HttpPut`—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty.	33.0
`modifiedDate`	Datetime	ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	33.0
`requestBody`	String	The request body for `Api` and `ApiAsync` action link types. Note: Escape quotation mark characters in the `requestBody` value.	33.0
`requires Confirmation`	Boolean	`true` to require the user to confirm the action; `false` otherwise.	33.0
`templateId`	String	The ID of the action link template from which to instantiate this action link. If the action link isn't associated with a template, the value is `null`.	33.0
`type`	`ConnectApi.ActionLinkType`	Defines the type of action link. Values are: • `Api`—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server. • `ApiAsync`—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to	33.0

Property Name	Type	Description	Available Version
		`/connect/action-links/`***`actionLinkId`*** to set the status to `SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete. • `Download`—The action link downloads a file from the action URL. • `Ui`—The action link takes the user to a web page at the action URL. Note: Invoking `ApiAsync` action links from an app requires a call to set the status. However, there isn't currently a way to set the status of an action link using Apex. To set the status, use Connect REST API. See the Action Link resource in the Connect REST API Developer Guidefor more information.	
`userId`	String	The ID of the user who can execute the action. If not specified or `null`, any user can execute the action. If you specify a `userId`, you can't specify an `excludedUserId`.	33.0

SEE ALSO:

ConnectApi.ActionLinkGroupDefinition

ConnectApi.ActionLinkDiagnosticInfo

Any diagnostic information that may exist for an executed action link. Diagnostic info is provided only for users who can access the action link.

Property Name	Type	Description	Available Version
`diagnosticInfo`	String	Any diagnostic information returned when an action link is executed. Diagnostic information is provided only for users who can access the action link.	33.0
`url`	String	The URL for this action link diagnostic information.	33.0

ConnectApi.ActionLinkGroupDefinition

The definition of an action link group. Information in the action link group definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link group definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

Property Name	Type	Description	Available Version
actionLinks	List<ConnectApi.ActionLinkDefinition>	A collection of action link definitions that make up the action link group. Within an action link group, action links are displayed in the order listed in the actionLinks property of the ConnectApi.ActionLinkGroupDefinitionInput class. Within a feed item, action link groups are displayed in the order specified in the actionLinkGroupIds property of the ConnectApi.AssociatedActionsCapabilityInput class.	33.0
category	ConnectApi.PlatformActionGroupCategory	Indicates the priority and location of the action links. Values are: • Primary—The action link group is displayed in the body of the feed element. • Overflow—The action link group is displayed in the overflow menu of the feed element.	33.0
createdDate	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	33.0
executionsAllowed	ConnectApi.ActionLinkExecutionsAllowed	Defines the number of times an action link can be executed. Values are: • Once—An action link can be executed only one time across all users. • OncePerUser—An action link can be executed only one time for each user. • Unlimited—An action link can be executed an unlimited number of times by each user. If the action link's actionType is Api or ApiAsync, you can't use this value.	33.0
expirationDate	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z, that represents the date and time this action group expires and can no longer be executed. If the value is null, there isn't an expiration date.	33.0
id	String	18-character ID of the action link group definition.	33.0
modifiedDate	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	33.0
templateId	String	The ID of the action link group template from which to instantiate this action link group, or null if this group isn't associated with a template.	33.0
url	String	The URL for this action link group definition.	33.0

ConnectApi.ActivitySharingResult

The results of sharing a captured email or event.

Property Name	Type	Description	Available Version
`success`	Boolean	Whether the share operation succeeded or not.	39.0

ConnectApi.Actor

Actor.

This class is abstract.

Superclass of:

- ConnectApi.ActorWithId
- ConnectApi.RecommendedObject
- ConnectApi.UnauthenticatedUser

Name	Type	Description	Available Version
`name`	String	Name of the actor, such as the group name.	28.0
`type`	String	One of the following: • `file` • `group` • `recommendedObject` (version 34.0 and later) • `unauthenticateduser` • `user` • *`record type name`*—the name of the record type, such as `myCustomObject__c` or Account	28.0

SEE ALSO:

ConnectApi.CaseCommentCapability
ConnectApi.EntityRecommendation
ConnectApi.EditCapability
ConnectApi.FeedEntitySummary
ConnectApi.FeedItem
ConnectApi.FeedItemSummary
ConnectApi.Subscription

ConnectApi.ActorWithId

Actor with ID.

This class is abstract.

Subclass of ConnectApi.Actor.

Superclass of:

- ConnectApi.AbstractRecordView
- ConnectApi.ArticleSummary
- ConnectApi.ChatterGroup
- ConnectApi.ContentHubRepository
- ConnectApi.File
- ConnectApi.RelatedFeedPost
- ConnectApi.User

Name	Type	Description	Available Version
`id`	String	Actor's 18-character ID	28.0
`motif`	`ConnectApi.Motif`	An icon that identifies the actor as a user, group, file, or custom object. The icon isn't the user or group photo, and it isn't a preview of the file. The motif can also contain the object's base color.	28.0
`mySubscription`	`ConnectApi.Reference`	If the context user is following the item, this contains information about the subscription, else returns `null`.	28.0
`url`	String	Connect REST API URL for the resource	28.0

SEE ALSO:

ConnectApi.FeedElement
ConnectApi.FeedEntitySummary
ConnectApi.GroupRecord
ConnectApi.MentionSegment
ConnectApi.RecordSummaryList

ConnectApi.Address

Address.

Name	Type	Description	Available Version
`city`	String	Name of the city	28.0
`country`	String	Name of the country	28.0
`formattedAddress`	String	Formatted address per the locale of the context user	28.0
`state`	String	Name of the state, province, or so on	28.0
`street`	String	Street number	28.0

Name	Type	Description	Available Version
`zip`	String	Zip or postal code	28.0

SEE ALSO:

- ConnectApi.DatacloudCompany
- ConnectApi.DatacloudContact
- ConnectApi.UserDetail

ConnectApi.AdjustOrderSummaryOutputRepresentation

Output representation of the financial changes for an adjust items action. For a preview action, these values are the expected output. For a submit action, these values are the actual output.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`changeBalances`	`ConnectApi.ChangeItemOutputRepresentation`	Expected (for preview) or actual (for submit) financial values for the price adjustment action. Most of the values match the change order values. If two change orders are returned, then these values combine them. The sign of a value in this output is the opposite of the corresponding value on a change order record. For example, a discount is a positive value in `changeBalances` and a negative value on a change order record.	49.0
`inFulfillmentChangeOrderId`	String	ID of the change Order that holds the financial changes applicable to OrderItemSummary quantities that are in the process of being fulfilled. This change Order is only created for a request that specified an `allocatedItemsChangeOrderType` of InFulfillment. For an adjustPreview call, this value is always null.	55.0
`orderSummaryId`	String	ID of the OrderSummary.	49.0
`postFulfillmentChangeOrderId`	String	ID of the change Order that holds the financial changes applicable to OrderItemSummary quantities that have been fulfilled. For an adjustPreview call, this value is always null.	49.0
`preFulfillmentChangeOrderId`	String	ID of the change Order that holds the financial changes applicable to OrderItemSummary quantities that have not been fulfilled. If the request specified an `allocatedItemsChangeOrderType` of PreFulfillment, this change Order also includes the changes applicable to OrderItemSummary quantities	49.0

Property Name	Type	Description	Available Version
		that are in the process of being fulfilled. For an adjustPreview call, this value is always null.	

ConnectApi.Alternative

Alternative representation for an extension on a feed element.

Property Name	Type	Description	Available Version
`textRepresentation`	String	Text representation of the extension.	40.0
`thumbnailUrl`	String	Thumbnail URL to the extension.	40.0
`title`	String	Title of the extension.	40.0

ConnectApi.AlternativePaymentMethodOutput

Alternative payment method details output.

Property Name	Type	Description	Available Version
`accountId`	String	Salesforce Payments account to which this payment method is linked.	56.0
`comments`	String	Details about a record added by a user. Maximum of 1,000 characters.	56.0
`email`	String	Email address of the card holder.	56.0
`gatewayToken`	String	A unique, alphanumeric ID, called a token, that a payment gateway generates when it first processes a payment. The token replaces the actual payment data so that the data is kept secure. This token is stored as encrypted text, and can be used for recurring payments.	56.0
`gatewayTokenDetails`	String	Detailed information about the gateway token.	56.0
`name`	String	Name that you assign to the payment method object.	56.0

ConnectApi.Announcement

An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.

Name	Type	Description	Available Version
`expirationDate`	Datetime	The Salesforce UI displays an announcement until 11:59 p.m. on this date unless another announcement is posted first. The Salesforce UI ignores the time value in the `expirationDate`. However, you can use the time value to create your own display logic in your own UI.	31.0
`feedElement`	`ConnectApi.FeedElement`	The feed element that contains the body of the announcement and its associated comments, likes, and so on.	31.0
`id`	String	18-character ID of the announcement.	31.0
`isArchived`	Boolean	Specifies whether the announcement is archived.	36.0
`sendEmails`	Boolean	Specifies whether the announcement is sent as an email to all group members.	36.0
`url`	String	The URL to the announcement.	33.0

SEE ALSO:

ConnectApi.AnnouncementPage

ConnectApi.ChatterGroup

ConnectApi.AnnouncementPage

A collection of announcements.

Name	Type	Description	Available Version
`announcements`	`List<ConnectApi.Announcement>`	A collection of `ConnectApi.Announcement` objects.	31.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	31.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	31.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	31.0

ConnectApi.SearchAppliedOrderBy

The applied order for object search.

Property Name	Type	Description	Available Version
`field`	String	Field used to sort the results.	63.0

Property Name	Type	Description	Available Version
`order`	`ConnectApi.OrderDirection`	Order direction. Values are: • `Ascending` • `Descending`	63.0
`orderNulls`	`ConnectApi.OrderNulls`	Null value order. Values are: • `Firsts`—Null values are sorted first. • `Lasts`—Null values are sorted last.	63.0

SEE ALSO:

ConnectApi.SearchObject

ConnectApi.ApprovalCapability

If a feed element has this capability, it includes information about an approval.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`id`	String	The work item ID. The work item ID is `null` if there isn't a pending work item associated with the approval record.	32.0
`postTemplateFields`	List<`ConnectApi.ApprovalPostTemplateField`>	The details of the approval post template field.	32.0
`processInstanceStepId`	String	The process instance step ID. The associated record represents one step in an approval process.	32.0
`status`	`ConnectApi.WorkflowProcessStatus`	The status of the approval.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.ApprovalIntent

Approval intent for a social post.

Property Name	Type	Description	Available Version
`isRecallable`	Boolean	Specifies whether the social post can be recalled (`true`) or not (`false`).	45.0

SEE ALSO:

ConnectApi.SocialPostIntents

ConnectApi.ApprovalPostTemplateField

Approval post template field.

Name	Type	Description	Available Version
`displayName`	String	The field name.	28.0
`displayValue`	String	The field value or `null` if the field is set to `null`.	28.0
`record`	`ConnectApi.Reference`	A record ID. If no record exists or if the reference is `null`, this value is `null`.	28.0

SEE ALSO:

ConnectApi.ApprovalCapability

ConnectApi.ArticleItem

Article item in question and answers suggestions.

Property Name	Type	Description	Available Version
`id`	String	Id of the article.	32.0
`rating`	Double	The rating of the article.	32.0
`title`	String	Title of the article.	32.0
`urlLink`	String	Link URL of the article.	32.0
`viewCount`	Integer	Number of votes given to the article.	32.0

SEE ALSO:

ConnectApi.QuestionAndAnswersSuggestions

ConnectApi.ArticleSummary

A knowledge article summary.

Subclass of ConnectApi.ActorWithId.

Property Name	Type	Description	Available Version
`articleType`	String	Type of the knowledge article.	37.0
`knowledgeArticleVersionId`	String	ID of the knowledge article version.	39.0
`lastPublishedDate`	Datetime	Last published date of the knowledge article.	37.0
`rating`	Double	The rating of the article.	37.0
`summary`	String	Summary of the knowledge article contents.	37.0
`title`	String	Title of the knowledge article.	37.0
`urlName`	String	URL name of the knowledge article.	37.0
`viewCount`	Integer	Number of times the knowledge article has been viewed.	38.0

ConnectApi.AssociatedActionsCapability

If a feed element has this capability, it has platform actions associated with it.

Property Name	Type	Description	Available Version
`platformActionGroups`	List<`ConnectApi.PlatformActionGroup`>	The platform action groups associated with a feed element. Platform action groups are returned in the order specified in the `ConnectApi.AssociatedActionsCapabilityInput` class.	33.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.AsyncOutputRepresentation

Output representation of the async operation.

Subclass of ConnectApi.BaseAsyncOutputRepresentation.

No additional properties.

SEE ALSO:

multipleEnsureFundsAsync(multipleEnsureFundsInput)

ConnectApi.MultipleAsyncOutputRepresentation

ConnectApi.Audience

A personalization audience.

Property Name	Type	Description	Available Version
`criteria`	List<`ConnectApi.AudienceCriteriaDetail`>	Criteria details for the audience.	48.0
`customFormula`	String	Custom formula for the audience criteria. For example, (1 AND 2) OR 3.	48.0
`formulaFilterType`	`ConnectApi.FormulaFilterType`	Formula filter type for the personalization audience. Values are: • `AllCriteriaMatch`—All audience criteria are true (AND operation). • `AnyCriterionMatches`—Any audience criterion is true (OR operation). • `CustomLogicMatches`—Audience criteria match the custom formula (for example, (1 AND 2) OR 3).	48.0
`id`	String	ID of the audience.	48.0
`name`	String	Name of the audience.	48.0
`targets`	List<`ConnectApi.AudienceTargetAssignment`>	Target assignments for the audience.	48.0
`url`	String	URL to this audience.	48.0

SEE ALSO:

ConnectApi.AudienceCollection

ConnectApi.AudienceCollection

Collection of personalization audiences.

Property Name	Type	Description	Available Version
`audiences`	List<`ConnectApi.Audience`>	Collection of audiences.	48.0

ConnectApi.AudienceCriteria

Custom recommendation audience criteria.

This class is abstract.

This class is a superclass of:

- ConnectApi.CustomListAudienceCriteria
- ConnectApi.NewUserAudienceCriteria

Property Name	Type	Description	Available Version
type	ConnectApi.RecommendationAudienceCriteriaType	Specifies the custom recommendation audience criteria type. One of these values: • CustomList—A custom list of users makes up the audience. • MaxDaysInCommunity—New members make up the audience.	36.0

SEE ALSO:

ConnectApi.RecommendationAudience

ConnectApi.AudienceCriteriaDetail

Personalization audience criteria.

Property Name	Type	Description	Available Version
criterion	List<ConnectApi.AudienceCriterionDetail>	List of mappings of audience criteria fields and values.	48.0
criterionNumber	Integer	Number associated with the audience criterion in a formula. For example, (1 AND 2) OR 3. If unspecified, criteria are assigned numbers in the order that they're added.	48.0
criterionOperator	ConnectApi.AudienceCriteriaOperator	Operator used in the personalization audience criterion. Values are: • Contains • Equal • GreaterThan • GreaterThanOrEqual • Includes • LessThan • LessThanOrEqual • NotEqual • NotIncludes • StartsWith	48.0

Property Name	Type	Description	Available Version
`criterionType`	`ConnectApi.AudienceCriteriaType`	Type of personalization audience criterion. Values are: • `Audience`—Criterion based on audience. • `Default`—Audience has no criteria. • `Domain`—Criterion based on domain. • `FieldBased`—Criterion based on object fields. • `GeoLocation`—Criterion based on location. • `Permission`—Criterion based on standard or custom permissions. • `Profile`—Criterion based on profile.	48.0

SEE ALSO:

ConnectApi.Audience

ConnectApi.AudienceCriterionDetail

Audience criterion information.

Property Name	Type	Description	Available Version
`value`	Map<String, String>	Mapping of an audience criterion value and field.	48.0

SEE ALSO:

ConnectApi.AudienceCriteriaDetail

ConnectApi.AudienceTarget

Personalization audience assigned to a target.

Property Name	Type	Description	Available Version
`audienceName`	String	Name of the audience assigned to the target.	48.0
`id`	String	ID of the audience assigned to the target.	48.0
`url`	String	URL to the audience assigned to the target.	48.0

SEE ALSO:

ConnectApi.Target

ConnectApi.AudienceTargetAssignment

Target assignments for a personalization audience.

Property Name	Type	Description	Available Version
`formulaScope`	`ConnectApi.FormulaScope`	Formula scope of the target.	51.0
`groupName`	String	Group name of the target. Groups bundle related target and audience pairs.	48.0
`id`	String	ID of the target.	48.0
`isMatch`	Boolean	Specifies whether the target matches the current context (`true`) or doesn't (`false`).	48.0
`priority`	Integer	Priority of the target. Within a group, priority determines which target is returned if the user matches more than one audience.	48.0
`publishStatus`	`ConnectApi.PublishStatus`	Publish status of the target. Values are: • `Draft` • `Live`	48.0
`targetType`	String	Type of target, indicating the nature of the data being targeted.	48.0
`targetValue`	String	Value of the target.	48.0
`url`	String	URL to the target.	48.0

SEE ALSO:

ConnectApi.Audience

ConnectApi.AuthReversalGatewayResponse

Authorization Reversal Gateway Response Representation.

Subclass of ConnectApi.AbstractGatewayResponse.

No additional properties.

ConnectApi.AuthorizationGatewayResponse

Payment gateway authorization response representation.

Subclass of ConnectApi.AbstractGatewayResponse.

Property Name	Type	Description	Available Version
`gatewayAuthorizationCode`	String	Gateway authorization code.	51.0

ConnectApi.AuthorizationResponse

Payment Authorization output representation.

Property Name	Type	Description	Available Version
error	ConnectApi.ErrorResponse	Error representation for the payment authorization.	51.0
gatewayResponse	ConnectApi.AuthorizationGatewayResponse	Gateway response representation for the payment authorization.	51.0
paymentAuthorization	ConnectApi.PaymentAuthorizationResponse	Payment authorization representation.	51.0
paymentGatewayLogs	List<ConnectApi.GatewayLogResponse>	Gateway log list representation for the payment authorization.	51.0
paymentGroup	ConnectApi.PaymentGroupResponse	Payment group representation for the payment authorization.	51.0
paymentMethod	ConnectApi.PaymentMethodResponse	Payment method representation for the payment authorization.	51.0

ConnectApi.AuthorizationReversalResponse

Authorization Reversal output representation.

Property Name	Type	Description	Available Version
error	ConnectApi.ErrorResponse	Error response representation for the authorization reversal.	51.0
gatewayResponse	ConnectApi.AuthReversalGatewayResponse	Gateway response representation for authorization reversal.	51.0
paymentAuthAdjustment	ConnectApi.PaymentAuthAdjustmentResponse	Payment authorization adjustment response representation for the authorization reversal.	51.0
paymentGatewayLogs	List<ConnectApi.GatewayLogResponse>	Gateway log collection representation for the authorization reversal.	51.0

ConnectApi.AvailableLocationOutputRepresentation

A set of inventory locations that can combine to fulfill an order.

Property Name	Type	Description	Available Version
locations	List<String>	A list of inventory locations.	51.0

SEE ALSO:

findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

ConnectApi.FindRoutesWithFewestSplitsOutputRepresentation

ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation

ConnectApi.AverageDistanceResultOutputRepresentation

Wraps inventory location shipping distance calculation results.

Property Name	Type	Description	Available Version
distanceCalculation	ConnectApi.DistanceCalculationOutputRepresentation	Results of the shipping distance calculations.	51.0

ConnectApi.BalanceStatePreviewOutputRepresentation

The generated preview of all balances for an order or a cart, including totals, adjustments, and taxes.

Property Name	Type	Description	Available Version
grandTotalAmount	Double	The grand total of the exchanges, including adjustments, fees, delivery cost, and taxes.	61.0
totalAdjustmentAmount	Double	The total amount the order was adjusted by, not including tax.	61.0
totalAdjustmentAmountWithTax	Double	The total amount the order was adjusted by, including tax.	61.0
totalAmount	Double	The total amount being return, not including tax.	61.0
totalAmountWithTax	Double	The total amount being return, including tax.	61.0
totalDeliveryAmount	Double	The total cost for delivery, not including tax.	61.0
totalDeliveryAmountWithTax	Double	The total cost for delivery, including tax.	61.0
totalFeeAmount	Double	The combined total of all fees charged, not including tax.	61.0
totalFeeAmountWithTax	Double	The combined total of all fees charged, including tax.	61.0
totalTaxAmount	Double	The combined total of all taxes.	61.0

ConnectApi.BannerCapability

If a feed element has this capability, it has a banner motif and style.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`motif`	`ConnectApi.Motif`	A banner motif.	31.0
`style`	`ConnectApi.BannerStyle`	Decorates a feed item with a color and set of icons. Possible value: • `Announcement`—An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.	31.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.BannerPhoto

A banner photo.

Property Name	Type	Description	Available Version
`bannerPhotoUrl`	String	URL to the banner photo in a large format. This URL is available only to authenticated users.	36.0
`bannerPhoto VersionId`	String	18-character version ID of the banner photo.	36.0
`url`	String	URL to the banner photo.	36.0

SEE ALSO:

ConnectApi.ChatterGroup

ConnectApi.UserDetail

ConnectApi.BaseAsyncOutputRepresentation

Base Order Management async output class.

This class is abstract.

Subclass of ConnectApi.BaseOutputRepresentation.

Superclass of:

- ConnectApi.AsyncOutputRepresentation
- ConnectApi.EnsureFundsAsyncOutputRepresentation
- ConnectApi.EnsureRefundsAsyncOutputRepresentation

Property Name	Type	Description	Available Version
`backgroundOperationId`	String	ID of the background operation.	48.0

ConnectApi.BaseInvoiceOutputRepresentation

Base Order Management Invoice output class.

This class is abstract.

Subclass of ConnectApi.BaseOutputRepresentation.

Superclass of ConnectApi.ChangeOrdersInvoiceOutputRepresentation.

Property Name	Type	Description	Available Version
`invoiceId`	String	ID of the created invoice.	56.0

ConnectApi.BaseManagedSocialAccount

Base information describing a managed social account or fan page of a social network.

This class is abstract.

Superclass of ConnectApi.ManagedSocialAccount.

Property Name	Type	Description	Available Version
`defaultResponseAccountId`	String	Default response account to use when replying to posts sent to this account.	44.0
`displayName`	String	Real name (or user name if real name not available) for this account on the social network.	44.0
`externalPictureUrl`	String	URL to the account's avatar image.	44.0
`id`	String	Internal SFDC ID for this managed social account.	44.0
`label`	String	Label for the social account.	44.0
`profileUrl`	String	URL to the account's profile.	44.0
`socialNetwork`	`ConnectApi.SocialNetworkProvider`	Social network that this account belongs to. Values are: • `Facebook` • `GooglePlus` • `Instagram` • `InstagramBusiness` • `KakaoTalk` • `Kik` • `Line`	44.0

Property Name	Type	Description	Available Version
		• LinkedIn • Messenger • Other • Pinterest • QQ • Rypple • SinaWeibo • SMS • Snapchat • Telegram • Twitter • VKontakte • WeChat • WhatsApp • YouTube	
uniqueName	String	Unique name used for distinguishing same name fan pages; acts like a user name for a fan page.	44.0
username	String	Unique user name or handle for this account on the social network.	44.0

ConnectApi.BaseOutputRepresentation

Base Order Management output class.

This class is abstract.

Superclass of:

- ConnectApi.AdjustOrderSummaryOutputRepresentation
- ConnectApi.BaseAsyncOutputRepresentation
- ConnectApi.BaseInvoiceOutputRepresentation
- ConnectApi.ConfirmHeldFOCapacityOutputRepresentation
- ConnectApi.CreateCreditMemoOutputRepresentation
- ConnectApi.CreateMultipleInvoicesFromChangeOrdersOutputRepresentation
- ConnectApi.CreateOrderPaymentSummaryOutputRepresentation

Property Name	Type	Description	Available Version
`errors`	List<`ConnectApi.ErrorResponse`>	Any errors that were returned.	48.0
`success`	Boolean	Indicates whether the transaction was successful.	48.0

ConnectApi.BatchResult

The result of an operation returned by a batch method.

Usage

Calls to batch methods return a list of `BatchResult` objects. Each element in the `BatchResult` list corresponds to the strings in the list parameter passed to the batch method. The first element in the `BatchResult` list matches the first string passed in the list parameter, the second element corresponds with the second string, and so on. If only one string is passed, the `BatchResult` list contains a single element.

Example

The following example shows how to obtain and iterate through the returned `ConnectApi.BatchResult` objects. The code adds two group IDs to a list. One of group IDs is incorrect, which causes a failure when the code calls the batch method. After it calls the batch method, it iterates through the results to determine whether the operation was successful or not for each group ID in the list. The

code writes the ID of every group that was processed successfully to the debug log. The code writes an error message for every failed group.

This example generates one successful operation and one failure.

```
List<String> myList = new List<String>();
// Add one correct group ID.
myList.add('0F9D00000000oOT');
// Add one incorrect group ID.
myList.add('0F9D00000000izf');

ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterGroups.getGroupBatch(null,
myList);

// Iterate through each returned result.
for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the group ID.
        ConnectApi.ChatterGroupSummary groupSummary;
        if(batchResult.getResult() instanceof ConnectApi.ChatterGroupSummary) {
           groupSummary = (ConnectApi.ChatterGroupSummary) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(groupSummary.id);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

IN THIS SECTION:

BatchResult Methods

These are instance methods for `BatchResult`.

BatchResult Methods

These are instance methods for `BatchResult`.

IN THIS SECTION:

getError()

If an error occurred, returns a `ConnectApi.ConnectApiException` object providing the error code and description.

getErrorMessage()

Returns a String that contains an error message.

getErrorTypeName()

Returns a String that contains the name of the error type.

getResult()

Returns an object that contains the results of the batch operation. The object is typed according to the batch method. For example, if you call `getMembershipBatch()`, a successful call to BatchResult `getResult()` returns a `ConnectApi.GroupMembership` object.

isSuccess()

Returns a Boolean that is set to `true` if the batch operation was successful for this object, `false` otherwise.

getError()

If an error occurred, returns a `ConnectApi.ConnectApiException` object providing the error code and description.

Signature

```
public ConnectApi.ConnectApiException getError()
```

Return Value

Type: `ConnectApi.ConnectApiException`

getErrorMessage()

Returns a String that contains an error message.

Signature

```
public String getErrorMessage()
```

Return Value

Type: String

Usage

The error message doesn't make a round trip through a Visualforce view state, because exceptions can't be serialized.

getErrorTypeName()

Returns a String that contains the name of the error type.

Signature

```
public String getErrorTypeName()
```

Return Value

Type: String

getResult()

Returns an object that contains the results of the batch operation. The object is typed according to the batch method. For example, if you call `getMembershipBatch()`, a successful call to BatchResult `getResult()` returns a `ConnectApi.GroupMembership` object.

Signature

```
public Object getResult()
```

Return Value

Type: Object

isSuccess()

Returns a Boolean that is set to `true` if the batch operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

ConnectApi.BlankRecordField

Record field displayed as a place holder in a grid of fields.

Subclass of ConnectApi.AbstractRecordField.

ConnectApi.PromotionBonusProduct

Bonus product for a promotion.

Property Name	Type	Description	Available Version
`adjustmentBasisReference`	String	ID of the associated coupon, if applicable.	58.0
`bonusProductId`	String	ID of the bonus product.	58.0
`causeId`	String	ID of the related promotion.	58.0
`qualifyingItems`	List<`ConnectApi.PromotionCartItemKey` on page 2004>	List of qualifying cart items and their related quantity.	58.0

ConnectApi.BookmarksCapability

If a feed element has this capability, the context user can bookmark it.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`isBookmarkedByCurrentUser`	Boolean	Indicates whether the feed element has been bookmarked by the context user (`true`) or not (`false`).	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.BookmarkSummary

Summary of a bookmark.

Subclass of ConnectApi.UserFeedEntityActivitySummary.

No additional properties.

ConnectApi.BotInfoRepresentation

Information about the bot associated with the conversation application.

Property Name	Type	Description	Available Version
`botId`	String	ID of the bot.	54.0
`botName`	String	Name of the bot.	54.0
`lastModifiedDate`	Datetime	Last modified date of the bot definition.	54.0

ConnectApi.BotVersionActivationInfo

Success or failure information of the bot version activation.

Property Name	Type	Description	Available Version
`isActivated`	Boolean	Indicates whether the bot is active or not.	51.0
`messages`	List<String>	Failure messages.	50.0
`success`	Boolean	Indicates whether the activation was successful or not.	50.0

ConnectApi.BundleCapability

If a feed element has this capability, it has a container of feed elements called a *bundle*.

This class is abstract.

Subclass of ConnectApi.FeedElementCapability.

Superclass of:

- ConnectApi.GenericBundleCapability
- ConnectApi.TrackedChangeBundleCapability

Property Name	Type	Description	Available Version
`bundleType`	`ConnectApi.BundleType`	Defines this feed element's bundle type. The bundle type determines what additional information appears in the bundle.	31.0
`page`	`ConnectApi.FeedElementPage`	A collection of feed elements.	31.0
`totalElements`	Integer	The total number of feed elements that this bundle aggregates.	31.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.CalculateCartResult

Result of a cart calculate request. Includes a cart summary with calculated cart values.

Subclass of ConnectApi.CommerceResultRepresentationBase

Property Name	Type	Description	Available Version
`data`	ConnectApi.CartSummary	A cart summary with calculated cart values.	62.0

ConnectApi.CalculateTaxResponse

Shows the results of a tax calculation request.

Subclass of ConnectApi.TaxTransactionResponse.

Property Name	Type	Description	Available Version
`adapterError`	`ConnectApi.ErrorResponse`	Adapter error.	55.0
`status`	`ConnectApi.TaxTransactionStatus`	Status of a tax transaction. Values are: • `Committed`—Tax has been committed to the transaction. • `Uncommitted`—Tax hasn't been committed to the transaction.	55.0

Property Name	Type	Description	Available Version
taxEngineLogs	List<ConnectApi.TaxEngineLogResponse>	Tax engine logs.	55.0
taxTransactionType	ConnectApi.TaxTransactionType	Type of tax transaction. Values are: • Credit—Transaction is a credit transaction. • Debit—Transaction is a debit transaction.	55.0
taxType	ConnectApi.CalculateTaxType	Type of tax calculation. Values are: • Actual—Calculated tax represents the final taxed amount for the transaction. • Estimated—Calculated tax represents only an estimated value before the transaction is finalized.	55.0

ConnectApi.CallCollaborationCapability

If a feed element has this capability, it has a recording comment.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
commentEndTime	Integer	End time of the comment on the media player, in seconds.	51.0
commentStartTime	Integer	Start time of the comment on the media player, in seconds.	51.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.CancelAllOrderItemsAsyncOutputRepresentation

ID of the asynchronous background operation.

Subclass of ConnectApi.BaseAsyncOutputRepresentation on page 1986.

Property Name	Type	Description	Available Version
asyncOperationLogId	String	ID of the background operation.	63.0

ConnectApi.CandidateAnswersStatus

The status of candidate answers on a feed element.

Property Name	Type	Description	Available Version
`hasCandidateAnswers`	Boolean	Indicates whether candidate answers are available for a question.	41.0
`hasCandidateAnswersPublished`	Boolean	Indicates whether any candidate answers are published.	41.0
`hasCandidateAnswersRated`	Boolean	Indicates whether any candidate answers are rated.	41.0

SEE ALSO:

ConnectApi.QuestionAndAnswersCapability

ConnectApi.CanvasCapability

If a feed element has this capability, it renders a canvas app.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`description`	String	A description of the canvas app. The maximum size is 255 characters.	32.0
`developerName`	String	The API name (developer name) of the connected app.	32.0
`height`	String	The height of the canvas app in pixels.	32.0
`icon`	`ConnectApi.Icon`	The icon for the canvas app.	32.0
`namespacePrefix`	String	A unique namespace prefix for the canvas app.	32.0
`parameters`	String	JSON parameters passed to the canvas app.	32.0
`thumbnailUrl`	String	A thumbnail URL to a preview image. The maximum thumbnail size is 120 pixels by 120 pixels.	32.0
`title`	String	A title for the canvas link.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.CapacityResponseOutputRepresentation

Response to a request related to a location's fulfillment capacity.

Property Name	Type	Description	Available Version
`actionRequestId`	String	Unique string that identifies the original capacity request.	55.0

Property Name	Type	Description	Available Version
`error`	`ConnectApi.ErrorResponse`	Error returned by the request, if any.	55.0
`success`	Boolean	Indicates whether the request was successful.	55.0

ConnectApi.CaptureGatewayResponse

Gateway capture response.

Subclass of ConnectApi.AbstractGatewayResponse.

No additional properties.

ConnectApi.CaptureResponse

Capture output.

Property Name	Type	Description	Available Version
`error`	`ConnectApi.ErrorResponse`	Error response representation for an authorization capture.	50.0
`gatewayResponse`	`ConnectApi.CaptureGatewayResponse`	Gateway log response containing details about gateway logs created during the process of the capture request.	50.0
`payment`	`ConnectApi.PaymentResponse`	Payment response object for the capture request. Contains the information related to a payment object created during request processing.	50.0
`paymentGatewayLogs`	List<`ConnectApi.GatewayLogResponse`>	Gateway log collection for an authorization capture.	50.0
`paymentGroup`	`ConnectApi.PaymentGroupResponse`	Payment group associated with the capture request.	50.0

ConnectApi.CardPaymentMethodOutput

Card payment method details output.

Property Name	Type	Description	Available Version
`accountId`	String	Salesforce Payments account to which this payment method is linked.	56.0
`autoPay`	Boolean	Indicates whether a token for recurring payments is being requested (`true`) or not (`false`). The token lets the payment method be used for recurring payments.	56.0

Property Name	Type	Description	Available Version
`cardBin`	String	Bank Identification Number (BIN). The BIN is the first 4-6 numbers on a payment card that identifies the card issuer.	56.0
`cardCategory`	ConnectApi.CardCategory	• `CreditCard` • `DebitCard`	56.0
`cardHolderFirstName`	String	First name of the card holder	56.0
`cardHolderLastName`	String	Last name of the card holder	56.0
`cardHolderName`	String	Full name of card holder	56.0
`cardLastFour`	String	Last four digits on a card.	56.0
`cardType`	ConnectApi.CardType	Credit card issuer. • `AmericanExpress` • `DinersClub` • `JCB` • `Maestro` • `MasterCard` • `Visa`	56.0
`comments`	String	Details about a record added by a user. Maximum of 1,000 characters.	56.0
`displayCardNumber`	String	Card displayed number	56.0
`email`	String	Email address of the card holder.	56.0
`expiryMonth`	Integer	Card expiration month	56.0
`expiryYear`	Integer	Card expiration year	56.0
`nickName`	String	Optional card nickname	56.0
`startMonth`	Integer	Month when card becomes active	56.0
`startYear`	Integer	Year when card becomes active	56.0

ConnectApi.CartCoupon

Cart Coupon representation.

Property Name	Type	Description	Available Version
`cartCouponId`	String	ID of the cart coupon code.	54.0
`couponCode`	String	The coupon code a buyer can use to manually apply a promotion to the cart.	54.0

ConnectApi.CartCouponCollection

Collection of coupons related to a cart.

Property Name	Type	Description	Available Version
`cartCoupons`	ConnectApi.CartCouponList	Collection of coupons.	54.0
`cartId`	String	ID of the cart.	54.0
`cartStatus`	`ConnectApi.CartStatus`	Status of the cart. Values are: • `Active`—Cart is created and available for modifications, like adding or removing products or promotions. • `Checkout`—Cart is in checkout. If the customer modifies the cart, the current checkout session is canceled. • `Closed`—Checkout is complete and an order was created. The cart cannot be modified. • `PendingClosed`—Cart is marked to be closed, but the request isn't completed yet. The cart can't be modified. This value is available in API version 57.0 and later. • `PendingDelete`—Cart is marked for delete, but the request isn't completed yet. The cart can't be modified. • `Processing`—Cart is processing. For example, taxes are being calculated. The cart can't be modified.	54.0
`ownerId`	String	ID of the user who owns the cart.	54.0

ConnectApi.CartCouponList

List of coupons for a cart.

Property Name	Type	Description	Available Version
`coupons`	List<ConnectApi.CartCoupon>	List of coupons associated with a cart.	54.0

ConnectApi.PromotionCartDeliveryGroupMethod

Cart delivery group method for a promotion.

Property Name	Type	Description	Available Version
`cartDeliveryMethodAdjustments`	List<`ConnectApi.PromotionCart`	List of cart delivery method adjustments.	60.0

Property Name	Type	Description	Available Version
	DeliveryMethodAdjustment on page 2259>		
cartDeliveryMethodId	String	ID of the cart delivery method.	60.0
price	String	Price	60.0
shippingRateId	String	ID of the shipping rate.	62.0
totalAdjustmentBaseAmount	String	Total amount of the adjustment.	60.0
totalNetAmount	String	Final price of the cart item after all adjustments.	60.0

ConnectApi.PromotionCartDeliveryGroup

Cart delivery group for a promotion.

Property Name	Type	Description	Available Version
cartDeliveryGroupId	String	ID of the cart delivery group.	60.0
cartDeliveryGroupMethods	List<ConnectApi.PromotionCartDeliveryGroupMethod on page 1999>	List of methods for the delivery group.	60.0
id	String	ID of the cart.	60.0

ConnectApi.CartInventoryItemReservationOutputRepresentation (Pilot)

Inventory item reservation.

Note: This feature is not generally available and is being piloted with certain Customers subject to additional terms and conditions. It is not part of your purchased Services. This feature is subject to change, may be discontinued with no notice at any time in Salesforce's sole discretion, and Salesforce may never make this feature generally available. Make your purchase decisions only on the basis of generally available products and features. This feature is made available on an AS IS basis and use of this feature is at your sole risk.

Property Name	Type	Description	Available Version
errorCode	String	Error code for this reservation item.	58.0
errorMessage	String	Error message for this reservation item.	58.0
id	String	ID for this reservation item.	58.0
itemReservationSourceId	String	Item reservation source ID for this reservation item.	58.0

Property Name	Type	Description	Available Version
`productId`	String	Product ID for this reservation item.	58.0
`quantity`	Double	Quantity for this reservation item.	58.0
`reservedAtLocationId`	String	Reserved at location or group ID for this reservation item.	58.0

ConnectApi.CartInventoryReservationOutputRepresentation (Pilot)

Inventory Reservation

Note: This feature is not generally available and is being piloted with certain Customers subject to additional terms and conditions. It is not part of your purchased Services. This feature is subject to change, may be discontinued with no notice at any time in Salesforce's sole discretion, and Salesforce may never make this feature generally available. Make your purchase decisions only on the basis of generally available products and features. This feature is made available on an AS IS basis and use of this feature is at your sole risk.

Property Name	Type	Description	Available Version
`errorCode`	String	Error code for this reservation.	58.0
`errorMessage`	String	Error message for this reservation.	58.0
`inventoryItemReservations`	List<`ConnectApi.CartInventoryItemReservationOutputRepresentation`>	Collection of inventory item reservations.	58.0
`reservationIdentifier`	String	Reservation identifier.	58.0
`success`	Boolean	Indicates whether the transaction was successful.	58.0

ConnectApi.CartItem

An item in a cart.

Subclass of ConnectApi.AbstractCartItem.

Property Name	Type	Description	Available Version
`currencyIsoCode`	String	Currency ISO code of the cart.	57.0
`firstPymtTotalAmount`	String	For subscription items, the first payment amount after adjustments and taxes. For non-subscription products, the value is the same as `totalAmount`.	60.0
`firstPymtTotalListPrice`	String	For subscription items, the total list price of the first payment. For non-subscription items, the value is the same as `totalListPrice`.	63.0

Property Name	Type	Description	Available Version
`firstPymtTotalPrice`	String	For subscription items, the first term price, including adjustments but excluding taxes. For non-subscription items, the total price, including adjustments but excluding taxes.	60.0
`firstPymtTotalTax`	String	For subscription items, the tax amount on the first payment. For non-subscription products, the value is the same as `totalTax`.	60.0
`itemizedAdjustmentAmount`	String	Total itemized adjustment amount for the item, including promotions and excluding taxes.	52.0
`listPrice`	String	List price for the item.	49.0
`productClass`	`ConnectApi.ProductClass`	Class of product. Values are: • `Bundle` • `Set` • `Simple` • `Variation` • `VariationParent`	62.0
`salesPrice`	String	Sales price for the item.	49.0
`totalAdjustmentAmount`	String	Total adjustment amount for the item.	50.0
`totalAmount`	String	Total amount for the item.	49.0
`totalListPrice`	String	Total list price for the item.	49.0
`totalPrice`	String	Total price for the item including adjustments but excluding taxes.	49.0
`totalTax`	String	Total tax for the item.	49.0
`unitAdjustedPrice`	String	Unit price, including tier level discounts, for the item. This value is informational only and isn't used in pricing calculations.	50.0
`unitAdjustedPriceWithItemAdj`	String	Unit price, including both tier and item level discounts, for the item. This value is informational only and isn't used in pricing calculations.	61.0
`unitAdjustmentAmount`	String	Tier level adjustments made to the unit price for the item. This value is informational only and isn't used in pricing calculations.	50.0
`unitItemAdjustmentAmount`	String	Item level adjustments made to the unit price for the item. This value is informational only and isn't used in pricing calculations.	61.0

ConnectApi.CartItemBasic

Represents limited details about a cart item.

Property Name	Type	Description	Available Version
`cartItemId`	String	ID of the cart item.	60.0
`name`	String	Name of the cart item.	60.0
`productId`	String	ID of the product associated with the cart item.	60.0
`quantity`	String	Quantity of the cart item.	60.0
`type`	`ConnectApi.CartItemType`	Type of item in a cart. Value is Product.	60.0

ConnectApi.CartItemBasicResult

Represents the result of a cart request.

Property Name	Type	Description	Available Version
`cartItem`	ConnectApi.CartItemBasic on page 2003	Item in a cart.	60.0
`message`	String	Error message when the request is not successful.	60.0
`status`	String	Status of the request.	60.0

ConnectApi.CartItemCollection

A collection of items in a cart.

Property Name	Type	Description	Available Version
`cartCoupons`	`ConnectApi.CartCouponCollection`	Collection of coupons in the cart.	59.0
`cartItems`	List<`ConnectApi.CartItemResult`>	Collection of cart item results.	49.0
`cartPromotions`	`ConnectApi.CartPromotionCollection`	Collection of promotions in the cart.	59.0
`cartSummary`	`ConnectApi.CartSummary`	Summary of the cart.	49.0
`currentPage`	Integer	Current page of cart items. The value matches the requested page number, unless the requested page number exceeds the total number of pages. In this scenario, the current page is the highest available page number.	60.0

Property Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	49.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	49.0
`hasErrors`	Boolean	Specifies whether at least one of the results contains an error.	49.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	49.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	49.0
`previousPageToken`	String	Token identifying the previous page, or `null` if there isn't a previous page.	49.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	49.0
`totalItemCount`	Integer	Total number of unique products in the cart.	60.0
`totalNumberOfPages`	Integer	Total number of pages for the given page size.	60.0

ConnectApi.PromotionCartItemKey

Cart item key for a bonus product in a promotion.

Property Name	Type	Description	Available Version
`cartItemId`	String	ID of the cart item.	58.0
`cartItem QuantityIdentifier`	String	Quantity ID of the cart item.	58.0

ConnectApi.CartItemProduct

Product summary for a cart item.

Property Name	Type	Description	Available Version
`fields`	Map<String, String>	Map of product fields and values.	49.0
`name`	String	Name of the product.	49.0
`productId`	String	ID of the product.	49.0
`productSubscriptionInformation`		Reserved for future use.	59.0
`purchaseQuantityRule`	`ConnectApi.PurchaseQuantityRule`	If one exists, purchase quantity rule for the product.	52.0

Property Name	Type	Description	Available Version
`sku`	String	SKU of the product.	49.0
`thumbnailImage`	`ConnectApi.ProductMedia`	Thumbnail image of the product.	49.0
`variationAttributes`	Map<String, `ConnectApi.CartProductAttribute`>	Variation attributes associated with the product.	50.0

SEE ALSO:

ConnectApi.AbstractCartItem

ConnectApi.WishlistItem

ConnectApi.CartItemPromotionCollectionOutputRepresentation

Promotions for the items in a cart.

Property Name	Type	Description	Available Version
`currencyIsoCode`	String	Currency code associated with the cart.	53.0
`items`	Map<String, `ConnectApi.CartPromotionListRepresentation`>	Collection of promotions.	52.0

ConnectApi.CartItemResult

Result after requesting a cart item.

Property Name	Type	Description	Available Version
`cartItem`	`ConnectApi.AbstractCartItem`	Cart item.	49.0
`message`	String	Message when the request isn't successful.	49.0
`status`	String	Status for the request.	49.0

SEE ALSO:

ConnectApi.CartItemCollection

ConnectApi.WishlistToCartResult

ConnectApi.CartItemWithoutPrice

An item without price information in a cart.

Subclass of ConnectApi.AbstractCartItem.

No additional properties.

ConnectApi.CartMessage

Cart message.

Property Name	Type	Description	Available Version
`message`	String	Cart message.	49.0
`messageId`	String	ID of the object supplying the message.	49.0
`relatedEntityId`	String	ID of the entity, for example, cart, cart item, or cart tax, associated with the message.	49.0
`severity`	`ConnectApi.CartMessageSeverity`	Severity of cart message. Values are: • `Error` • `Info` • `Warning`	49.0
`type`	String	Type of message. Standard values include `Inventory`, `Taxes`, `Pricing`, `Shipping`, `Entitlement`, `SystemError`, and `Other`.	49.0
`visible`	Boolean	Specifies whether the message is visible (`true`) or dismissed (`false`).	49.0

SEE ALSO:

ConnectApi.CartMessagesSummary

ConnectApi.CartMessagesSummary

Cart messages summary.

Property Name	Type	Description	Available Version
`errorCount`	Integer	In `ConnectApi.CartItemResult`, the count of messages with the `Error` severity level.	49.0
`hasErrors`	Boolean	Specifies whether there are messages related to the entity (`true`) or not (`false`).	49.0
`limitedMessages`	List<`ConnectApi.CartMessage`>	In `ConnectApi.CartItemResult`, a limited list of messages related to the cart item. In `ConnectApi.CartSummary`, each message	49.0

Property Name	Type	Description	Available Version
		can be related to the cart or to another cart-related entity.	
`relatedEntityId`	String	In `ConnectApi.CartItemResult`, the ID of the related cart item. In `ConnectApi.CartSummary`, each message can be related to the cart or to another cart-related entity.	49.0
`totalLineItemsWithErrors`	Integer	In `ConnectApi.CartItemResult`, either `null` if the cart item has no errors or `1` if the cart item has errors. In `ConnectApi.CartSummary`, the total number of product line items that contain errors.	50.0

SEE ALSO:

ConnectApi.AbstractCartItem

ConnectApi.CartMessagesVisibilityResult

Result of setting the visibility for cart messages.

Property Name	Type	Description	Available Version
`visibility`	Boolean	Specifies whether cart messages are set to visible (`true`) or not (`false`).	50.0

ConnectApi.CartProductAttribute

Product attribute for a cart item.

Property Name	Type	Description	Available Version
`label`	String	Label or display name of the attribute.	50.0
`sequence`	Integer	Sequence of the attribute within the attribute set.	50.0
`value`	String	Display value of the attribute.	50.0

SEE ALSO:

ConnectApi.CartItemProduct

ConnectApi.CartPromotionCollection

All the promotions associated with the cart.

Property Name	Type	Description	Available Version
`cartId`	String	ID of the cart.	53.0
`cartStatus`	`ConnectApi.CartStatus`	Status of the cart. Values are: • `Active`—Cart is created and available for modifications, like adding or removing products or promotions. • `Checkout`—Cart is in checkout. If the customer modifies the cart, the current checkout session is canceled. • `Closed`—Checkout is complete and an order was created. The cart cannot be modified. • `PendingClosed`—Cart is marked to be closed, but the request isn't completed yet. The cart can't be modified. This value is available in API version 57.0 and later. • `PendingDelete`—Cart is marked for delete, but the request isn't completed yet. The cart can't be modified. • `Processing`—Cart is processing. For example, taxes are being calculated. The cart can't be modified.	53.0
`currencyIsoCode`	String	Currency ISO code of the cart.	53.0
`promotions`	List<`ConnectApi.CartPromotionList`>	Collection of promotions.	53.0

ConnectApi.CartPromotionList

A list of promotions for a cart.

Property Name	Type	Description	Available Version
`promotions`	List<`ConnectApi.CartPromotionOutputRepresentation`>	Promotions associated with a cart.	54.0

ConnectApi.CartPromotionOutputRepresentation

A promotion associated with a cart.

Property Name	Type	Description	Available Version
`adjustmentAmount`	String	Adjustment amount out of the promotion.	53.0

Property Name	Type	Description	Available Version
couponCode	String	Coupon code for a promotion. A coupon code is available only for manual promotions, not for automatic promotions.	54.0
currencyIsoCode	String	Currency ISO code associated with the cart.	57.0
displayName	String	Localized display name of the promotion.	52.0
promotionId	String	ID of the promotion.	53.0
targetType	ConnectApi.CartPromotionType	Promotion target type. Values are: • Cart—Promotion targets a cart. • Item—Promotion targets an item in a cart.	53.0
termsAndConditions	String	Localized terms and conditions for the promotion.	53.0

ConnectApi.CartSummary

A cart summary.

Property Name	Type	Description	Available Version
accountId	String	ID of the account for the cart.	49.0
asyncOperationStatus	String	Asynchronous processing status of the cart, if asynchronous processing is enabled for the store. This property returns Completed in Apex, because Apex operations always run synchronously.	59.0
cartId	String	ID of the cart.	49.0
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the cart.	49.0
customFields	List<SObject>	Array of sObjects and viewable custom fields for the sObjects. Field-level security rules from the shopper profile are applied to the custom fields. The rules are applied for registered shoppers and for the guest shopper profile. If no custom fields were specified, returns an empty collection.	61.0
firstPymtGrandTotalAmount	String	First payment amount for subscription products, plus the total payment amount for non-subscription products. Includes taxes.	60.0
firstPymtTotalAmount	String	The total amount on the first payment of the cart.	63.0
firstPymtTotalListPrice	String	The total list price on the first payment of the cart.	63.0

Property Name	Type	Description	Available Version
`firstPymtTotalTaxAmount`	String	Tax amount on the first payment for any subscription products, plus the total tax amount on non-subscription products.	60.0
`grandTotalAmount`	String	Grand total amount including shipping and tax for items in the cart, in the currency of the cart.	49.0
`isSecondary`	Boolean	Specifies whether the cart is secondary (`true`) or not (`false`).	53.0
`name`	String	Name of the cart.	49.0
`ownerId`	String	ID of the owner of the cart.	49.0
`ownerOrderId`	String	ID of the owner of the order.	58.0
`purchaseOrderNumber`	String	Purchase order for the cart.	50.0
`status`	`ConnectApi.CartStatus`	Status of the cart. Values are: • `Active`—Cart is created and available for modifications, like adding or removing products or promotions. • `Checkout`—Cart is in checkout. If the customer modifies the cart, the current checkout session is canceled. • `Closed`—Checkout is complete and an order was created. The cart cannot be modified. • `PendingClosed`—Cart is marked to be closed, but the request isn't completed yet. The cart can't be modified. This value is available in API version 57.0 and later. • `PendingDelete`—Cart is marked for delete, but the request isn't completed yet. The cart can't be modified. • `Processing`—Cart is processing. For example, taxes are being calculated. The cart can't be modified.	49.0
`taxType`	String	Tax type of the cart. • `Automatic`—Automatic taxation policy. • `Gross`—Gross taxation policy. • `Net`—Net taxation policy.	55.0
`totalAmountWithItemAdjustment`	String	Total amount, including both tier and item level discounts but excluding cart level discounts, for all items in the cart.	61.0

Property Name	Type	Description	Available Version
`totalCartLevelAdjustmentAmount`	String	Total cart level discount amount for the cart.	61.0
`totalChargeAmount`	String	Total amount for shipping and other charges in the currency of the cart. Includes adjustments from shipping promotions.	49.0
`totalListPrice`	String	Total list price for all cart items plus shipping adjustments.	49.0
`totalProductAmount`	String	Total amount including discounts, but excluding shipping and tax, for product items in the cart.	49.0
`totalProductAmountAfterAdjustments`	String	Total product amount, including promotions.	52.0
`totalProductCount`	String	Total count of items in the cart. This field may not be accurate when faster add-to-cart is turned on and quantity rules are enabled for products in the cart.	49.0
`totalProductLineItemCount`	Integer	Total count of line items, of the type Product, in the cart.	60.0
`totalProductListAmount`	String	Total list price for all products in the cart without any adjustments.	59.0
`totalPromotionalAdjustmentAmount`	String	Total promotional adjustment amount for items in the cart.	52.0
`totalSubProductCount`	String	Total quantity of all cart items with the selling model type Evergreen or Term-Defined.	60.0
`totalTaxAmount`	String	Total tax amount for the cart, including tax on shipping, if applicable.	49.0
`type`	`ConnectApi.CartType`	Type of cart. Values are: • `Cart`—Cart created by a customer. • `PayNowReadOnly`—Clone of a Template cart that the customer can check out with using the Pay Now feature. • `Template`—Cart created by an internal user.	49.0
`uniqueProductCount`	Integer	Total count of unique items, or SKUs, in the cart. This field is supported when faster add-to-cart is turned off.	49.0
`webstoreId`	String	ID of the webstore of the cart.	49.0

SEE ALSO:

ConnectApi.CartItemCollection

ConnectApi.CartToWishlistResult

Result of copying products from a cart to a wishlist.

Property Name	Type	Description	Available Version
`productsAddedCount`	Integer	Number of products copied from the cart to the wishlist.	50.0
`wishlistId`	String	ID of the wishlist that cart products were copied to.	50.0

ConnectApi.CaseCommentCapability

If a feed element has this capability, it has a case comment on the case feed.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`actorType`	`ConnectApi.CaseActorType`	Specifies the type of user who made the comment.	32.0
`createdBy`	`ConnectApi.Actor`	Information about the user who created the comment.	32.0
`createdDate`	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	32.0
`eventType`	`ConnectApi.CaseCommentEventType`	Specifies an event type for a comment in the case feed.	32.0
`id`	String	18-character ID of case comment.	32.0
`published`	Boolean	Specifies whether the comment has been published.	32.0
`text`	String	Text of the case comment.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.CdpActionResponse

Customer Data Platform action response.

This class is abstract.

Superclass of:

- ConnectApi.CdpCalculatedInsightStandardActionResponseRepresentation
- ConnectApi.CdpSegmentActionOutput in API version 59.0 and later.

Property Name	Type	Description	Available Version
errors	List<ConnectApi.CdpErrorResponse>	List of errors that resulted from the action.	57.0
success	Boolean	Indicates whether the call was successful (true) or not (false).	57.0

ConnectApi.CdpCalculatedInsightDataSource

Calculated insight data source.

Property Name	Type	Description	Available Version
sourceApiName	String	Data source API name.	57.0
type	String	Data source type.	57.0

SEE ALSO:

- ConnectApi.CdpCalculatedInsightDimension
- ConnectApi.CdpCalculatedInsightMeasure

ConnectApi.CdpCalculatedInsightDimension

Calculated insight dimension.

Property Name	Type	Description	Available Version
apiName	String	API name of the dimension.	57.0
creationType	String	Creation type of the dimension.	57.0
dataSource	ConnectApi.CdpCalculatedInsightDataSource	Data source of the dimension.	57.0
dataType	String	Data type of the dimension.	57.0
dateGranularity	String	Date granularity of the dimension.	57.0
displayName	String	Display name of the dimension.	57.0
fieldRole	String	Field role of the dimension.	57.0
formula	String	Formula of the dimension.	57.0

SEE ALSO:

- ConnectApi.CdpCalculatedInsightOutput

ConnectApi.CdpCalculatedInsightMeasure

Calculated insight measure.

Property Name	Type	Description	Available Version
`apiName`	String	API name of the measure.	57.0
`creationType`	String	Creation type of the measure.	57.0
`dataSource`	`ConnectApi.CdpCalculatedInsightDataSource`	Data source of the measure.	57.0
`dataType`	String	Data type of the measure.	57.0
`displayName`	String	Display name of the measure.	57.0
`fieldAggregationType`	String	Field aggregation type of the measure.	57.0
`fieldRole`	String	Field role of the measure.	57.0
`formula`	String	Formula of the measure.	57.0

SEE ALSO:

ConnectApi.CdpCalculatedInsightOutput

ConnectApi.CdpCalculatedInsightOutput

Calculated insight.

Property Name	Type	Description	Available Version
`apiName`	String	API name of the calculated insight.	57.0
`calculatedInsightStatus`	String	Status of the calculated insight.	57.0
`creationType`	String	Creation type of the calculated insight.	57.0
`dataSpace`	String	Data space of the calculated insight.	57.0
`definitionStatus`	String	Definition status of the calculated insight.	57.0
`definitionType`	String	Definition type of the calculated insight.	57.0
`description`	String	Description of the calculated insight.	57.0
`dimensions`	List<`ConnectApi.CdpCalculatedInsightDimension`>	Dimensions of the calculated insight.	57.0
`displayName`	String	Display name of the calculated insight.	57.0
`expression`	String	Expression of the calculated insight.	57.0

Property Name	Type	Description	Available Version
`isEnabled`	Boolean	Specifies whether the calculated insight is enabled (`true`) or not (`false`).	57.0
`lastCalcInsightStatusDateTime`	String	Last calculated insight status date and time.	57.0
`lastCalcInsightStatusErrorCode`	String	Last calculated insight status error code.	57.0
`lastRunDateTime`	String	Last run date and time of the calculated insight.	57.0
`lastRunStatus`	String	Last run status of the calculated insight.	57.0
`lastRunStatusDateTime`	String	Last run status date and time of the calculated insight.	57.0
`lastRunStatusErrorCode`	String	Last run status error code of the calculated insight.	57.0
`measures`	List<`ConnectApi.CdpCalculatedInsightMeasure`>	Measures of the calculated insight.	57.0

SEE ALSO:

ConnectApi.CdpCalculatedInsightPageData

ConnectApi.CdpCalculatedInsightPage

Collection of calculated insights.

Property Name	Type	Description	Available Version
`collection`	`ConnectApi.CdpCalculatedInsightPageData`	Collection of calculated insights.	57.0

ConnectApi.CdpCalculatedInsightPageData

Calculated insight collection data.

Property Name	Type	Description	Available Version
`count`	Integer	Number of results returned in the page.	57.0
`currentPageToken`	String	Token identifying the current page.	57.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	57.0

Property Name	Type	Description	Available Version
`items`	List<`ConnectApi.CdpCalculatedInsightOutput`>	List of calculated insights.	57.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	57.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	57.0
`previousPageToken`	String	Token identifying the previous page, or `null` if there isn't a previous page.	57.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	57.0
`total`	Integer	Total row count of calculated insights.	57.0

SEE ALSO:

ConnectApi.CdpCalculatedInsightPage

ConnectApi.CdpCalculatedInsightStandardActionResponseRepresentation

Response of the calculated insight run action.

Subclass of ConnectApi.CdpActionResponse.

No additional properties.

ConnectApi.CdpErrorResponse

Error response.

Property Name	Type	Description	Available Version
`errorCode`	String	Error code.	57.0
`message`	String	Message stating the reason for the error, if any.	57.0

SEE ALSO:

ConnectApi.CdpActionResponse

ConnectApi.CdpIdentityResolutionMatchCriterionOutput

Identity resolution ruleset's match rule criterion.

Property Name	Type	Description	Available Version
caseSensitiveMatch	Boolean	Specifies whether the criterion match is case sensitive (true) or not (false). Available only when matching is based on the party identifier.	58.0
entityName	String	API name of the Data Model Object the match rule applies to.	57.0
fieldName	String	Name of the field the criterion applies to.	57.0
matchMethodType	ConnectApi.CdpIdentityResolutionMatchMethodType	Match method for a match rule criterion. Values are: • Exact—Exact match. • ExactNormalized—Exact normalized match. • Fuzzy—Fuzzy match with medium precision. • FuzzyHigh—Fuzzy match with high precision. • FuzzyLow—Fuzzy match with low precision.	57.0
partyIdentificationInfo	ConnectApi.CdpIdentityResolutionMatchCriterionPartyIdentificationInfoOutput	Party Identifier information.	57.0
shouldMatchOnBlank	Boolean	Specifies whether blank fields can be used for matching (true) or not (false).	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionMatchRuleOutput

ConnectApi.CdpIdentityResolutionMatchCriterionPartyIdentificationInfoOutput

Information when party identification is used in an identity resolution ruleset's match rule criterion.

Property Name	Type	Description	Available Version
partyName	String	Party identification name.	57.0
partyType	String	Party identification type.	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionMatchCriterionOutput

ConnectApi.CdpIdentityResolutionMatchRuleOutput

Identity resolution ruleset's match rule.

Property Name	Type	Description	Available Version
criteria	List<ConnectApi.CdpIdentityResolutionMatchCriterionOutput>	Object and field the match rule applies to and the match method applied.	57.0
label	String	User friendly name for the identity resolution match rule.	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionOutput

ConnectApi.CdpIdentityResolutionOutput

Identity resolution ruleset.

Property Name	Type	Description	Available Version
anonymousUnifiedProfiles	Long	Count of anonymous unified profiles created by running the identity resolution ruleset.	57.0
configurationType	ConnectApi.CdpIdentityResolutionConfigurationType	Source object for an identity resolution ruleset. Values are: • Account • Individual	57.0
consolidationRate	Double	Consolidation rate resulting from the run of an identity resolution ruleset.	57.0
dataSpaceName	String	Data space used as source data for an identity resolution ruleset.	57.0
description	String	Description of the identity resolution ruleset.	57.0
doesRunAutomatically	Boolean	Specifies whether automatic job run scheduling is enabled for the ruleset (true) or not (false). If unspecified, defaults to false.	57.0
id	String	Identity resolution ruleset's ID. This is not the identity resolution's extended ruleset ID (rulesetId).	57.0
knownUnifiedProfiles	Long	Count of known unified profiles created by running the identity resolution ruleset.	57.0
label	String	User friendly name of the identity resolution ruleset.	57.0
lastJobCompleted	Datetime	Date and time the last job completed.	57.0
lastJobStatus	String	Last job's status. Possible values are: • SUCCESS • IN_PROGRESS	57.0

Property Name	Type	Description	Available Version
		• FAIL • SCHEDULED • SKIPPED	
matchRules	List<ConnectApi.CdpIdentityResolutionMatchRuleOutput>	List of match rules.	57.0
matchedSourceProfiles	Long	Count of matched source profiles identified by running the identity resolution ruleset.	57.0
objectApiName	String	Object name of the identity resolution ruleset.	57.0
reconciliationRules	List<ConnectApi.CdpIdentityResolutionReconciliationRuleOutput>	List of reconciliation rules.	57.0
rulesetId	String	Extension ID of a ruleset. The ruleset ID must be unique and no longer than 4 characters. This ID is not the identifying ID for the ruleset.	57.0
rulesetStatus	String	Status of a ruleset job. Possible values are: • NEW • PUBLISHING • PUBLISHED • ERROR • DELETING • DELETE_FAILED	57.0
sourceProfiles	Long	Count of source profiles that were processed by a ruleset job.	57.0
totalUnifiedProfiles	Long	Count of unified profiles created by running the identity resolution ruleset.	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionsOutput

ConnectApi.CdpIdentityResolutionReconciliationFieldRuleOutput

Identity resolution ruleset's reconciliation rule for a field.

Property Name	Type	Description	Available Version
fieldName	String	The field that this reconciliation rule applies to.	57.0

Property Name	Type	Description	Available Version
ruleType	ConnectApi.CdpIdentityResolutionReconciliationRuleType	Default reconciliation rule applied to fields in the object the reconciliation rule applies to. Values are: • LastUpdated • MostFrequent • SourceSequence	57.0
shouldIgnoreEmptyValue	Boolean	Specifies whether to ignore an empty value (true) or not (false).	57.0
sources	List<ConnectApi.CdpIdentityResolutionReconciliationSourceOutput>	If ruleType is SourceSequence, a prioritized list of data sources.	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionReconciliationRuleOutput

ConnectApi.CdpIdentityResolutionReconciliationRuleOutput

Identity resolution ruleset's reconciliation rule for an object.

Property Name	Type	Description	Available Version
entityName	String	API name of the Data Model Object the reconciliation rule applies to.	57.0
fields	List<ConnectApi.CdpIdentityResolutionReconciliationFieldRuleOutput>	Field-specific reconciliation rules that override this default rule for the specified field.	57.0
linkDmoName	String	API name of the unified link object created by the identity resolution process.	57.0
ruleType	ConnectApi.CdpIdentityResolutionReconciliationRuleType	Default reconciliation rule applied to fields in the object the reconciliation rule applies to. Values are: • LastUpdated • MostFrequent • SourceSequence	57.0
shouldIgnoreEmptyValue	Boolean	Specifies whether to ignore an empty value (true) or not (false).	57.0
sources	List<ConnectApi.CdpIdentityResolutionReconciliationSourceOutput>	If ruleType is SourceSequence, a list of data sources in priority order.	57.0

Property Name	Type	Description	Available Version
`unifiedDmoName`	String	API name of the unified data model object created by the identity resolution process.	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionOutput

ConnectApi.CdpIdentityResolutionReconciliationSourceOutput

Source for an identity resolution default reconciliation rule or field-specific rule using the `SourceSequence` match method.

Property Name	Type	Description	Available Version
`name`	String	If the `ruleType` for a reconciliation rule is `SourceSequence`, API name of a source Data Lake Object.	57.0

SEE ALSO:

ConnectApi.CdpIdentityResolutionReconciliationRuleOutput

ConnectApi.CdpIdentityResolutionReconciliationFieldRuleOutput

ConnectApi.CdpIdentityResolutionRunNowOutput

Identity resolution ruleset run now output.

Property Name	Type	Description	Available Version
`resultCode`	`ConnectApi.CdpIdentityResolutionRunNowResultCode`	Result of an identity resolution ruleset job run. Values are: • `ExceededMaximumNumberOfSuccessfulRunsAllowedIn24Hours` • `IdentityResolutionJobIsAlreadyRunning` • `NoPendingChangesJobRunSkipped` • `SuccessfullySubmittedIdentityResolutionJobRunRequest`	57.0

ConnectApi.CdpIdentityResolutionsOutput

Identity resolution rulesets.

Property Name	Type	Description	Available Version
identityResolutions	List<ConnectApi.CdpIdentityResolutionOutput>	List of identity resolution rulesets.	57.0

ConnectApi.CdpQueryDataOutput

Query data output.

Property Name	Type	Description	Available Version
data	List<Object>	Result data set.	54.0

ConnectApi.CdpQueryMetadataItem

Metadata item.

Property Name	Type	Description	Available Version
placeInOrder	Integer	Attribute place order in the result.	55.0
type	String	Metadata type for column.	55.0
typeCode	Integer	Metadata type code.	55.0

SEE ALSO:

ConnectApi.CdpQueryOutputV2

ConnectApi.CdpQueryMetadataOutput

Query metadata result.

Property Name	Type	Description	Available Version
metadata	List<Object>	Metadata set.	52.0

ConnectApi.CdpQueryOutput

Query result.

Property Name	Type	Description	Available Version
data	List<Object>	Result data set.	52.0
done	Boolean	Specifies whether the query is done (true) or not (false).	52.0
endTime	String	Query end time.	52.0

Property Name	Type	Description	Available Version
`metadata`	Map<String, Object>	Result metadata set.	52.0
`queryId`	String	Query ID.	52.0
`rowCount`	Integer	Number of rows in the result data set.	52.0
`startTime`	String	Query start time.	52.0

ConnectApi.CdpQueryOutputV2

Query output for the V2 API.

Property Name	Type	Description	Available Version
`data`	List<`ConnectApi.CdpQueryV2Row`> (in version 55.0 and later) List<Object> (version 54.0 only)	Result data set.	54.0
`done`	Boolean	Specifies whether the query is done (`true`) or not (`false`).	54.0
`endTime`	String	Query end time.	54.0
`metadata`	Map<String, `ConnectApi.CdpQueryMetadataItem`> (version 55.0 and later) Map<String, Object> (version 54.0 only)	Result metadata set.	54.0
`nextBatchId`	String	Next batch ID. Use this property as the *`nextBatchId`* parameter in the `nextBatchAnsiSqlV2(nextBatchId)` method to get the next batch of data.	54.0
`queryId`	String	Query ID.	54.0
`rowCount`	Integer	Number of rows in the result data set.	54.0
`startTime`	String	Query start time.	54.0

ConnectApi.CdpQueryV2Row

Row in the query output for the V2 API.

Property Name	Type	Description	Available Version
`rowData`	List<Object>	Row values.	55.0

SEE ALSO:

ConnectApi.CdpQueryOutputV2

ConnectApi.CdpSegmentActionOutput

Segment action.

Subclass of ConnectApi.CdpActionResponse in API version 59.0 and later.

Property Name	Type	Description	Available Version
`errorCode`	String	Error code associated with the action, if any.	57.0
`errorMessage`	String	Error message associated with the action, if any.	57.0
`jobId`	String	Job ID for the publish job.	56.0
`partitionId`	String	ID of the partition.	56.0
`publishStatus`	String	Publish status of the segment.	57.0
`segmentApiName`	String	API name of the segment.	59.0
`segmentId`	String	ID of the segment.	56.0

ConnectApi.CdpSegmentContainerOutput

Segment container.

Property Name	Type	Description	Available Version
`batchSize`	Integer	Number of items returned.	56.0
`offset`	Integer	Number of rows skipped before returning results.	56.0
`orderByExpression`	String	Expression indicating how results are ordered.	56.0
`segments`	List<`ConnectApi.CdpSegmentOutput`>	List of segments.	55.0

ConnectApi.CdpSegmentDbtModel

Segment dbt model.

Property Name	Type	Description	Available Version
`name`	String	Dbt model name.	55.0

Property Name	Type	Description	Available Version
sql	String	Dbt model SQL.	55.0

SEE ALSO:

ConnectApi.CdpSegmentDbtPipeline

ConnectApi.CdpSegmentDbtPipeline

Segment dbt pipeline.

Property Name	Type	Description	Available Version
models	List<ConnectApi.CdpSegmentDbtModel>	Dbt models.	55.0

SEE ALSO:

ConnectApi.CdpSegmentOutput

ConnectApi.CdpSegmentMemberOutput

Data Cloud segment member output.

Property Name	Type	Description	Available Version
data	List<ConnectApi.CdpSegmentMemberRowOutput>	Result data set.	58.0
endTime	Datetime	Query end time.	58.0
filter	String	Filter information for the query.	58.0
limit	Integer	Batch size information.	58.0
nextPageUrl	String	URL for the next page.	58.0
offSet	Integer	Offset information.	58.0
orderBy	String	Order by information.	58.0
rowCount	Integer	Total row count.	58.0
startTime	Datetime	Query start time.	58.0
totalCount	Integer	Total count of records.	58.0

ConnectApi.CdpSegmentMemberRowOutput

Data Cloud segment member row output.

Property Name	Type	Description	Available Version
`deltaType`	String	Delta type, for example, `new`, `existing`, or `removed`.	58.0
`id`	String	Segment member ID.	58.0
`kqId`	String	Fully qualified key ID.	58.0
`snapshotType`	String	Type of snapshot, for example, `full` or `incremental`.	58.0
`timestamp`	String	Timestamp.	58.0
`versionStamp`	String	Version timestamp.	58.0

SEE ALSO:

ConnectApi.CdpSegmentMemberOutput

ConnectApi.CdpSegmentMembershipTableOutput

Data Cloud segment membership table.

Property Name	Type	Description	Available Version
`historyTable`	String	Segment membership history table.	58.0
`latestTable`	String	Segment membership latest table.	58.0
`profileTable`	String	Segment membership profile table.	58.0

SEE ALSO:

ConnectApi.CdpSegmentOutput

ConnectApi.CdpSegmentOutput

Segment.

Property Name	Type	Description	Available Version
`apiName`	String	API name of the segment.	56.0
`dataSpace`	String	Data space of the segment.	57.0
`description`	String	Segment description.	55.0
`developerName`	String	Segment developer name.	55.0

Property Name	Type	Description	Available Version
displayName	String	Segment display name.	57.0
excludeCriteria	String	Segment exclude criteria.	57.0
includeCriteria	String	Segment include criteria.	57.0
includeDbt	ConnectApi.CdpSegmentDbtPipeline	Segment dbt pipeline.	55.0
lookalikeCriteria		Reserved for future use.	56.0
marketSegmentDefinitionId	String	ID of the market segment definition.	55.0
marketSegmentId	String	ID of the market segment.	56.0
nextPublishDateTime	String	Date and time of the next segment publish.	57.0
publishInterval	String	Segment publish interval.	55.0
publishScheduleEndDate	String	Publish schedule end date.	55.0
publishScheduleStartDateTime	String	Publish schedule start date time.	55.0
publishStatus	String	Segment publish status.	55.0
segmentMembershipDmo	ConnectApi.CdpSegmentMembershipTableOutput	Segment membership tables.	58.0
segmentMembershipTable	String	Name of the segment membership table.	56.0
segmentOnApiName	String	API name of the SegmentOn entity.	56.0
segmentOnId	String	ID of the DMO segment.	55.0
segmentStatus	String	Segment status.	55.0
segmentType	String	Type of segment.	56.0

SEE ALSO:

ConnectApi.CdpSegmentContainerOutput

ConnectApi.ChangeItemOutputRepresentation

The financial changes resulting from a change to one or more OrderItemSummaries. Most of the values represent the deltas of the values on the associated OrderSummary. The sign of each value is the opposite of the corresponding value on a change order record. For example, a discount is a positive value here and a negative value on a change order record.

Property Name	Type	Description	Available Version
grandTotalAmount	Double	Change to the GrandTotalAmount field.	48.0
totalAdjDeliveryAmtWithTax	Double	Change to the TotalAdjDeliveryAmtWithTax field.	49.0
totalAdjDistAmountWithTax	Double	Change to the TotalAdjDistAmountWithTax field.	49.0
totalAdjProductAmtWithTax	Double	Change to the TotalAdjProductAmtWithTax field.	49.0
totalAdjustedDeliveryAmount	Double	Change to the TotalAdjustedDeliveryAmount field.	48.0
totalAdjustedDeliveryTaxAmount	Double	Change to the TotalAdjustedDeliveryTaxAmount field.	48.0
totalAdjustedProductAmount	Double	Change to the TotalAdjustedProductAmount field.	48.0
totalAdjustedProductTaxAmount	Double	Change to the TotalAdjustedProductTaxAmount field.	48.0
totalAdjustmentDistributedAmount	Double	Change to the TotalAdjustmentDistributedAmount field.	48.0
totalAdjustmentDistributedTaxAmount	Double	Change to the TotalAdjustmentDistributedTaxAmount field.	48.0
totalAmount	Double	Change to the TotalAmount field.	48.0
totalExcessFundsAmount	Double	Amount of excess funds available on the OrderPaymentSummaries related to the OrderSummary. It is equal to the captured amount that is owed as a refund but is not associated with an invoice or credit memo. Excess funds normally occur when order items are canceled before fulfillment but after payment has been captured. This situation is not common in the US, where funds are normally authorized but not captured until the fulfillment process begins. This value includes all current excess funds related to the OrderSummary, not only the funds related to the current change.	48.0
totalFeeAmount	Double	Total amount of the fees charged for the change.	57.0
totalFeeTaxAmount	Double	Total amount of tax on the fees charged for the change.	57.0
totalRefundableAmount	Double	Total amount available to be refunded. It is the sum of the excess funds and any outstanding change order grand total amounts that apply to post-fulfillment changes. This value includes all	48.0

Property Name	Type	Description	Available Version
		current refundable amounts related to the OrderSummary, not only the amount related to the current change.	
`totalRequiredFundsAmount`	Double	The required funds associated with added order items.	54.0
`totalTaxAmount`	Double	Change to the TotalTaxAmount field.	48.0

ConnectApi.ChatterActivity

Chatter activity.

Name	Type	Description	Available Version
`commentCount`	Integer	Total number of comments in the org or site made by the user.	28.0
`commentReceivedCount`	Integer	Total number of comments in the org or site received by the user.	28.0
`likeReceivedCount`	Integer	Total number of likes and upvotes (in version 45.0 and later) on posts and comments in the org or site received by the user.	28.0
`postCount`	Integer	Total number of posts in the org or site made by the user.	28.0

SEE ALSO:

- ConnectApi.UserDetail

ConnectApi.ChatterActivitySummary

Summary of Chatter activity.

Subclass of ConnectApi.UserFeedEntityActivitySummary.

Property Name	Type	Description	Available Version
`commentCount`	Integer	Total number of comments in the org or site made by the user.	42.0
`commentReceivedCount`	Integer	Total number of comments in the org or site received by the user.	42.0
`likeReceivedCount`	Integer	Total number of likes and upvotes (in version 45.0 and later) on posts and comments in the org or site received by the user.	42.0
`postCount`	Integer	Total number of posts in the org or site made by the user.	42.0

ConnectApi.ChatterConversation

Chatter conversation.

Name	Type	Description	Available Version
`conversationId`	String	ID for the conversation.	29.0
`conversationUrl`	String	Connect REST API URL identifying the conversation.	29.0
`members`	`List<ConnectApi.UserSummary>`	List of users in the conversation.	29.0
`messages`	`ConnectApi.ChatterMessagePage`	Content of the conversation.	29.0
`read`	Boolean	Specifies if the conversation is read (`true`) or not read (`false`).	29.0

ConnectApi.ChatterConversationPage

Chatter conversation page.

Name	Type	Description	Available Version
`conversations`	`List<ConnectApi.ChatterConversationSummary>`	List of conversations on the page.	29.0
`currentPageToken`	String	Token identifying the current page.	29.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	29.0

Name	Type	Description	Available Version
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	29.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	29.0

ConnectApi.ChatterConversationSummary

Chatter conversation summary.

Name	Type	Description	Available Version
`id`	String	ID for the conversation summary.	29.0
`latestMessage`	`ConnectApi.ChatterMessage`	Contents of the latest message.	29.0
`members`	`List<ConnectApi.UserSummary>`	List of members in the conversation.	29.0
`read`	Boolean	Specifies if the conversation is read (`true`) or not read (`false`).	29.0
`url`	String	Connect REST API URL to the conversation summary.	29.0

SEE ALSO:

ConnectApi.ChatterConversationPage

ConnectApi.ChatterGroup

Chatter group.

This class is abstract.

Subclass of ConnectApi.ActorWithId.

Superclass of:

- ConnectApi.ChatterGroupDetail
- ConnectApi.ChatterGroupSummary

Name	Type	Description	Available Version
`additionalLabel`	String	An extra label for the group, for example, "Archived," "Private," or "Private With Customers." If there isn't an extra label, the value is `null`.	30.0
`announcement`	`ConnectApi.Announcement`	The current announcement for this group. An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.	31.0

Name	Type	Description	Available Version
bannerPhoto	ConnectApi.BannerPhoto	The banner photo for the group.	36.0
canHaveChatterGuests	Boolean	true if this group allows Chatter guests.	28.0
community	ConnectApi.Reference	Information about the Experience Cloud site the group is in.	28.0
description	String	Group's description.	28.0
emailToChatterAddress	String	Group's email address for posting to this group by email. Returns null if Chatter emails and posting to Chatter by email aren't both enabled in your organization.	30.0
isArchived	Boolean	Specifies whether the group is archived (true) or not (false).	29.0
isAutoArchiveDisabled	Boolean	Specifies whether automatic archiving is disabled for the group (true) or not (false).	29.0
isBroadcast	Boolean	Specifies whether the group is a broadcast group (true) or not (false). In a broadcast group, only group owners and managers can post to the group.	36.0
lastFeedElementPostDate	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z, of the most recent feed element posted to the group.	31.0
lastFeedItemPostDate	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z, of the most recent feed item posted to the group. Use lastFeedElementPosted.	28.0–30.0
memberCount	Integer	Total number of group members.	28.0
myRole	ConnectApi.GroupMembershipType	Type of membership the user has with the group. • GroupOwner • GroupManager • NotAMember • NotAMemberPrivateRequested • StandardMember	28.0
mySubscription	ConnectApi.Reference	If the context user is a member of this group, contains information about that subscription; otherwise, returns null.	28.0
name	String	Name of the group.	28.0
owner	ConnectApi.UserSummary	Information about the owner of the group.	28.0
photo	ConnectApi.Photo	Information about the group photo.	28.0

Name	Type	Description	Available Version
`visibility`	`Connectapi.GroupVisibilityType`	Group visibility type. Valid values are: • `PrivateAccess`—Only members of the group can see posts to this group. • `PublicAccess`—All users within the Experience Cloud site can see posts to this group. • `Unlisted`—Reserved for future use.	28.0

ConnectApi.ChatterGroupDetail

Chatter group details.

Subclass of ConnectApi.ChatterGroup.

Name	Type	Description	Available Version
`fileCount`	Integer	The number of files posted to the group.	28.0
`information`	`ConnectApi.GroupInformation`	Describes the Information section of the group. If the group is private, this section is visible only to members. If the context user is not a member of the group or does not have Modify All Data or View All Data permission, this value is `null`.	28.0
`pendingRequests`	Integer	The number of requests to join a group that are in a pending state.	29.0

SEE ALSO:

ConnectApi.ChatterGroupPage

ConnectApi.UserGroupDetailPage

ConnectApi.ChatterGroupPage

Page of groups.

Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	28.0
`groups`	`List<ConnectApi.ChatterGroupDetail>`	List of group details.	28.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	28.0

Name	Type	Description	Available Version
previousPageUrl	String	Connect REST API URL identifying the previous page, or null if there isn't a previous page.	28.0

ConnectApi.ChatterGroupSummary

Chatter group summary.

Subclass of ConnectApi.ChatterGroup.

Name	Type	Description	Available Version
fileCount	Integer	The number of files posted to the group.	28.0

SEE ALSO:

- ConnectApi.ChatterGroupSummaryPage
- ConnectApi.UserGroupPage

ConnectApi.ChatterGroupSummaryPage

Page of group summaries.

Name	Type	Description	Available Version
currentPageUrl	String	Connect REST API URL identifying the current page.	29.0
groups	List<ConnectApi.ChatterGroupSummary>	List of group summary objects.	29.0
nextPageUrl	String	Connect REST API URL identifying the next page, or null if there isn't a next page.	29.0
previousPageUrl	String	Connect REST API URL identifying the previous page, or null if there isn't a previous page.	29.0

ConnectApi.ChatterLike

Chatter like information.

Name	Type	Description	Available Version
id	String	Like's 18-character ID	28.0

Name	Type	Description	Available Version
`likedItem`	`ConnectApi.Reference`	A reference to the liked comment or feed element.	28.0
`url`	String	Like's Connect REST API URL	28.0
`user`	`ConnectApi.UserSummary`	Like's creator	28.0

SEE ALSO:

ConnectApi.ChatterLikePage

ConnectApi.ChatterLikePage

Page of Chatter likes.

Name	Type	Description	Available Version
`currentPageToken`	Integer	Token identifying the current page.	28.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	28.0
`items`	`List<ConnectApi.ChatterLike>`	List of likes.	32.0
`likes`	`List<ConnectApi.ChatterLike>`	List of likes. **Important:** As of API version 32.0, use the `items` property.	28.0–31.0
`nextPageToken`	Integer	Token identifying the next page, or `null` if there isn't a next page.	28.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	28.0
`previousPageToken`	Integer	Token identifying the previous page, or `null` if there isn't a previous page.	28.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	28.0
`total`	Integer	Total number of likes across all pages.	28.0

SEE ALSO:

ConnectApi.ChatterLikesCapability

ConnectApi.Comment

ConnectApi.ChatterLikesCapability

If a feed element has this capability, the context user can like it. Exposes information about existing likes.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`isLikedBy CurrentUser`	Boolean	Indicates whether the feed element is liked by the context user (`true`) or not (`false`).	32.0
`page`	`ConnectApi. ChatterLikePage`	Likes information for this feed element.	32.0
`likesMessage`	`ConnectApi. MessageBody`	A message body that describes who likes the feed element.	32.0
`myLike`	`ConnectApi. Reference`	If the context user has liked the feed element, this property is a reference to the specific like, `null` otherwise.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.ChatterMessage

Chatter message.

Name	Type	Description	Available Version
`body`	`ConnectApi.MessageBody`	Contents of the message.	29.0
`conversationId`	String	ID for the conversation.	29.0
`conversationUrl`	String	Connect REST API URL identifying the conversation.	29.0
`id`	String	ID of the message.	29.0
`recipients`	`List<ConnectApi.UserSummary>`	List of the recipients of the message.	29.0
`sender`	`ConnectApi.UserSummary`	Sender of the message.	29.0
`sendingCommunity`	`ConnectApi.Reference`	Information about the Experience Cloud site from which the message was sent. Returns `null` for the default site or if digital experiences isn't enabled.	32.0
`sentDate`	Datetime	The date and time the message was sent.	29.0

Name	Type	Description	Available Version
`url`	String	Connect REST API URL identifying the current page of the conversation.	29.0

SEE ALSO:

ConnectApi.ChatterConversationSummary

ConnectApi.ChatterMessagePage

ConnectApi.ChatterMessagePage

Chatter message page.

Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	29.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	29.0
`messages`	`List<ConnectApi.ChatterMessage>`	Messages on the current page.	29.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	29.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	29.0

SEE ALSO:

ConnectApi.ChatterConversation

ConnectApi.ChatterStream

A Chatter feed stream.

Property Name	Type	Description	Available Version
`community`	ConnectApi.CommunitySummary	Experience Cloud site where the stream is.	41.0
`createdDate`	Datetime	Date the stream was created.	39.0
`description`	String	Description of the stream.	39.0
`id`	String	18-character ID of the stream.	39.0
`name`	String	Name of the stream.	39.0
`subscriptions`	List<ConnectApi.FeedEntity>	List of entities whose feeds are included in the stream.	39.0

Property Name	Type	Description	Available Version
`url`	String	URL to the stream.	39.0

SEE ALSO:

ConnectApi.ChatterStreamPage

ConnectApi.ChatterStreamPage

A collection of Chatter feed streams.

Property Name	Type	Description	Available Version
`currentPageUrl`	String	URL to the current page of streams.	39.0
`items`	List<`ConnectApi.ChatterStream`>	List of streams.	39.0
`nextPageUrl`	String	URL to the next page of streams. In version 39.0, all streams are included in `currentPageUrl` and `nextPageUrl` is `null`.	39.0
`total`	Integer	Total number of streams in the collection.	39.0

ConnectApi.ClientInfo

Client information.

Name	Type	Description	Available Version
`applicationName`	String	Name of the connected app used for authentication.	28.0
`applicationUrl`	String	Value from the `Info URL` field of the connected app used for authentication.	28.0

SEE ALSO:

ConnectApi.Comment

ConnectApi.FeedItem

ConnectApi.CloseCapability

If a feed element has this capability, users with permission can close it.

Users can't edit (specifically the feed item body or title), comment on, or delete a closed feed element. If the closed feed element is a poll, users can't vote on it. Users can't edit (specifically the comment body) or delete a comment on a closed feed element or select or remove it as best answer.

Admins and moderators can edit and delete closed feed elements and comments on closed feed elements. Admins and moderators can select or remove the best answer status on comments on closed feed elements.

Property Name	Type	Description	Available Version
`canContextUserUpdateIsClosed`	Boolean	Specifies whether the context user has permission to set the feed element to closed (`true`) or not (`false`).	43.0
`isClosed`	Boolean	Specifies whether the feed element is closed (`true`) or not (`false`).	43.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.Comment

A comment.

Name	Type	Description	Available Version
`attachment`	`ConnectApi.FeedItemAttachment`	If the comment contains an attachment, property value is `ContentAttachment`. If the comment does not contain an attachment, it is `null`. **Important:** As of version 32.0, use the `capabilities` property.	28.0–31.0
`body`	`ConnectApi.FeedBody`	Body of the comment.	28.0
`capabilities`	`ConnectApi.CommentCapabilities`	Capabilities associated with the comment, such as any file attachments.	32.0
`clientInfo`	`ConnectApi.ClientInfo`	Information about the connected app used to authenticate the connection.	28.0
`createdDate`	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	28.0
`feedElement`	`ConnectApi.Reference`	Feed element on which the comment is posted.	
`feedItem`	`ConnectApi.Reference`	Feed item on which the comment is posted. **Important:** As of version 32.0, use the `feedElement` property.	28.0–31.0
`id`	String	Comment's 18–character ID.	28.0
`isDeleteRestricted`	Boolean	If this property is `true`, the context user can't delete the comment. If this property is `false`, the context user might be able to delete the comment.	28.0

Name	Type	Description	Available Version
`likes`	`ConnectApi.ChatterLikePage`	The first page of likes for the comment. This property has no information for comments on direct messages.	28.0
`likesMessage`	`ConnectApi.MessageBody`	A message body that describes who likes the comment. This property is `null` for comments on direct messages.	28.0
`moderationFlags`	`ConnectApi.ModerationFlags`	Information about the moderation flags on a comment. If `ConnectApi.Features.communityModeration` is `false`, this property is `null`.	29.0
`myLike`	`ConnectApi.Reference`	If the context user liked the comment, this property is a reference to the specific like, `null` otherwise. This property is `null` for comments on direct messages.	28.0
`parent`	`ConnectApi.Reference`	Information about the parent feed-item for this comment.	28.0
`relativeCreatedDate`	String	The created date formatted as a relative, localized string, for example, "17m ago" or "Yesterday."	28.0
`threadLevel`	Integer	Level of nesting for a comment. 0 indicates a standard comment with a parent post. 1 indicates a threaded comment with a parent comment and a parent post. 2 indicates a threaded comment with two parent comments and a parent post. The UI is limited to these three levels.	44.0
`threadParentId`	String	ID of the parent comment for a threaded comment.	44.0
`type`	`ConnectApi.CommentType`	Type of comment. • `ContentComment`—Comment holds a content capability. • `TextComment`—Comment contains only text.	28.0
`url`	String	Connect REST API URL to this comment.	28.0
`user`	`ConnectApi.UserSummary`	Information about the comment author.	28.0

SEE ALSO:

ConnectApi.CommentPage

ConnectApi.QuestionAndAnswersCapability

ConnectApi.CommentCapabilities

A set of capabilities on a comment.

Property Name	Type	Description	Available Version
comments	ConnectApi.CommentsCapability	If a comment has this capability, it has threaded comments.	44.0
content	ConnectApi.ContentCapability	If a comment has this capability, it has a file attachment. Most ConnectApi.ContentCapability properties are null if the content has been deleted from the feed element or if the access has changed to private.	32.0
edit	ConnectApi.EditCapability	If a comment has this capability, users who have permission can edit it.	34.0
feedEntityShare	ConnectApi.FeedEntityShareCapability	If a comment has this capability, a feed entity is shared with it.	42.0
record	ConnectApi.RecordCapability	If a comment has this capability, it has a record attachment.	42.0
status	ConnectApi.StatusCapability	If a comment has this capability, it has a status that determines its visibility.	38.0
upDownVote	ConnectApi.UpDownVoteCapability	If a comment has this capability, users can upvote or downvote it.	41.0
verified	ConnectApi.VerifiedCapability	If a comment has this capability, users with permission can mark it as verified or unverified.	41.0

SEE ALSO:

ConnectApi.Comment

ConnectApi.CommentPage

A page of comments.

Name	Type	Description	Available Version
comments	List<ConnectApi.Comment>	Collection of comments. **Important:** As of version 32.0, use the items property.	28.0–31.0
currentPageToken	String	Token identifying the current page.	28.0
currentPageUrl	String	Connect REST API URL identifying the current page.	28.0
items	List<ConnectApi.Comment>	Collection of comments for this feed element.	32.0

Name	Type	Description	Available Version
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page. If you want to read more of the comments in search results, all the comments in the thread are refreshed, not just the ones that match the search term. Avoid using `nextPageToken` until the comments are refreshed.	28.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page. If you want to read more of the comments in search results, all the comments in the thread are refreshed, not just the ones that match the search term. Avoid using `nextPageUrl` until the comments are refreshed.	28.0
`previousPageToken`	String	Token identifying the previous page, or `null` if there isn't a previous page.	44.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	44.0
`total`	Integer	Total number of published comments for the parent feed element.	28.0

SEE ALSO:

ConnectApi.CommentsCapability

ConnectApi.CommentSummary

Summary of the comment.

Subclass of ConnectApi.UserActivitySummary.

Property Name	Type	Description	Available Version
`commentId`	String	ID of the comment.	42.0

ConnectApi.CommentsCapability

If a feed element or comment has this capability, the context user can add a comment to it.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
page	ConnectApi.CommentPage	The comments information for this feed element or comment. Threaded comments are supported in version 44.0 and later.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.CommerceActionResult

Result of executing a commerce action.

Property Name	Type	Description	Available Version
isSuccess	Boolean	Specifies whether the action is a success (`true`) or not (`false`).	53.0
message	String	Action result message.	53.0

ConnectApi.CommerceAddressCollection

A collection of Commerce addresses.

Property Name	Type	Description	Available Version
count	Integer	Count of addresses.	54.0
currentPageToken	String	Token to the current page of addresses.	54.0
currentPageUrl	String	URL to the current page of addresses.	54.0
items	List<ConnectApi.CommerceAddressOutput>	Address Details	54.0
nextPageToken	String	Token to the next page of addresses.	54.0
nextPageUrl	String	URL to the next page of addresses.	54.0
pageSize	Integer	Page size for addresses.	54.0
previousPageToken	String	Token to previous page of addresses.	54.0
previousPageUrl	String	URL to the previous page of addresses.	54.0
sortOrder	ConnectApi.CommerceAddressSort	Sort order for Commerce addresses. • `CreatedDateAsc`—Sort in ascending order of created date. • `CreatedDateDesc`—Sort in descending order of created date. • `NameAsc`—Sort in ascending order of name.	54.0

Property Name	Type	Description	Available Version
		• `NameDesc`—Sort in descending order of name.	

ConnectApi.CommerceAddressOutput

Address for a Commerce account.

Property Name	Type	Description	Available Version
`addressId`	String	ID of the address.	54.0
`addressType`	String	Type of address (for example, "Shipping" or "Billing").	54.0
`city`	String	The address city.	54.0
`companyName`	String	The address company name.	57.0
`country`	String	The address country.	54.0
`countryCode`	String	Two-character country code.	54.0–58.0
`fields`	Map<String, Record Field>	A list of custom address fields, if any.	54.0
`firstName`	String	The address first name.	57.0
`isDefault`	Boolean	Indicates whether a contact's address is the preferred method of communication (`true`) or not (`false`). The default value is `false`.	54.0
`lastName`	String	The address last name.	57.0
`middleName`	String	The address middle name.	57.0
`name`	String	Name of the contact.	54.0
`phoneNumber`	String	The address phone number.	57.0
`postalCode`	String	Zip code or postal code for the address.	54.0
`region`	String	The address state.	54.0
`regionCode`	String	The address state code.	54.0–58.0
`street`	String	The address street.	54.0

ConnectApi.CommerceProductSearchResults

Product search results information.

Property Name	Type	Description	Available Version
`categories`	`ConnectApi.SearchCategory`	Categories from the search results.	52.0

Property Name	Type	Description	Available Version
correlationId	String	Reserved for future use.	55.0
facets	List<ConnectApi.SearchFacet>	Facets from the search results.	52.0
locale	String	Locale of the search results.	52.0
productsPage	ConnectApi.ProductSummaryPage	Page of products from the search results.	52.0

ConnectApi.CommerceProductSellingModel

Product selling model information.

Property Name	Type	Description	Available Version
isSubscriptionProduct	Boolean	Indicates whether the product selling model is a subscription product or not.	59.0

ConnectApi.CommerceProductSummary

Summary of a product in product search results.

Property Name	Type	Description	Available Version
defaultImage	ConnectApi.ProductMedia	Default image of the product.	55.0
fields	Map<String, ConnectApi.FieldValue>	Map of fields belonging to the product.	55.0
id	String	ID of the product.	55.0
name	String	Name of the product.	55.0
prices	ConnectApi.PricingResultLineItem	Prices of the product.	55.0
productClass	ConnectApi.ProductClass	Class of product. Values are: • Bundle • Set • Simple • Variation • VariationParent	55.0

Property Name	Type	Description	Available Version
`productSellingModelInformation`	`ConnectApi.CommerceProductSellingModel`	Product selling model information.	59.0
`productVariationInfo`	ConnectApiProductVariationInfo on page 2257	Product variation attributes, metadata, and mappings of attribute combinations to variation product IDs. This field isn't available in stores with displayable fields enabled.	63.0
`purchaseQuantityRule`	`ConnectApi.PurchaseQuantityRule`	If one exists, purchase quantity rule for the product.	58.0
`urlName`	String	SEO-friendly URL name for the product.	59.0
`variationAttributeSet`	`ConnectApi.ProductAttributeSetSummary`	Variation attribute set that's associated with the product.	55.0

ConnectApi.CommerceProductSummaryPage

Collection of product summary representations in product search results.

Property Name	Type	Description	Available Version
`pageSize`	Integer	Number of products per page in search results.	55.0
`products`	List<ConnectApi.CommerceProductSummary>	Collection of product summaries.	55.0
`total`	Long	Number of products in search results across all pages.	55.0

ConnectApi.CommerceResultRepresentationBase

Base cart calculate output class.

This class is abstract.

Superclass of:

- ConnectApi.CalculateCartResult

Property Name	Type	Description	Available Version
`message`	String	Message related to the request.	62.0
`status`	String	Asynchronous processing status of the cart, if asynchronous processing is enabled for the store. This property returns `Completed` in Apex, because Apex operations always run synchronously.	62.0

ConnectApi.CommerceSearchIndex

Index information.

Property Name	Type	Description	Available Version
`completionDate`	Datetime	Completion date and time of the index.	52.0
`createdDate`	Datetime	Creation date of the index.	52.0
`creationType`	`ConnectApi.CommerceSearchIndexCreationType`	Creation type of the index. Values are: • `Manual` • `Scheduled`	52.0
`id`	String	ID of the index.	52.0
`indexBuildType`	`ConnectApi.CommerceSearchIndexBuildType`	Build type of the index. Values are: • `Full` • `Incremental`	57.0
`indexStatus`	`ConnectApi.CommerceSearchIndexStatus`	Status of the index. Values are: • `Completed` • `Failed` • `InProgress`	52.0
`indexUsage`	`ConnectApi.CommerceSearchIndexUsage`	Usage of the index. Values are: • `Live` • `OutOfUse`	52.0
`isIncrementable`	Boolean	Specifies whether the index allows incremental indexing (`true`) or not (`false`).	57.0
`lastCatalogSnapshotTime`	Datetime	Catalog snapshot time of the index.	57.0
`message`	String	Detailed message for the index status.	52.0

SEE ALSO:

ConnectApi.CommerceSearchIndexCollection

ConnectApi.CommerceSearchIndexCollection

Collection of indexes.

Property Name	Type	Description	Available Version
`indexes`	List<`ConnectApi.CommerceSearchIndex`>	List of up to two indexes. Returns the completed, live index and either the in-progress, out-of-use index or the most-recently-failed, out-of-use index.	52.0

ConnectApi.CommerceSearchIndexLog

Search index log information.

Property Name	Type	Description	Available Version
`catalogSnapshotTime`	Datetime	Catalog snapshot time of the index build.	57.0
`completionDate`	Datetime	Completion date of the index build.	57.0
`createdById`	String	ID of the user who initiated the index build.	57.0
`indexBuildStatus`	`ConnectApi.CommerceSearchIndexStatus`	Status of the index. Values are: • `Completed` • `Failed` • `InProgress`	57.0
`indexBuildType`	`ConnectApi.CommerceSearchIndexBuildType`	Build type of the index. Values are: • `Full` • `Incremental`	57.0
`indexId`	String	ID of the index build.	57.0
`message`	String	Detailed message for the index build status.	57.0
`numberOfProducts`	Integer	Number of new or changed products in the index build.	57.0

ConnectApi.CommerceSearchIndexLogCollection

Collection of search index logs for a webstore.

Property Name	Type	Description	Available Version
`indexLogs`	List<`ConnectApi.CommerceSearchIndexLog`>	List of up to 100 index logs sorted by most recent catalog snapshot time of the index.	57.0

ConnectApi.Community

Experience Cloud site.

Name	Type	Description	Available Version
`allowChatterAccessWithoutLogin`	Boolean	Specifies if guest users can access public groups without logging in.	31.0

Name	Type	Description	Available Version
`allowMembersToFlag`	Boolean	Specifies if members can flag content.	30.0
`builderBasedSnaEnabled`	Boolean	Specifies whether the Service Not Available page is an auto-generated Experience Builder-based page (`true`) or a static resource page that's set in **Workspaces** > **Administration** > **Pages** (`false`).	52.0
`builderUrl`	String	Experience Builder URL for the site.	56.0
`contentSpaceId`	String	ID of the managed content space associated with the enhanced site.	62.0
`description`	String	Site description.	28.0
`guestMemberVisibilityEnabled`	Boolean	Specifies whether guest members can see other members (`true`) or not (`false`).	47.0
`id`	String	Site ID.	28.0
`imageOptimizationCDNEnabled`	Boolean	Specifies whether images are optimized for guest users on all devices for sites using Salesforce's CDN for Digital Experiences (`true`) or not (`false`).	56.0
`invitationsEnabled`	Boolean	Specifies whether users can invite other external users.	28.0
`knowledgeableEnabled`	Boolean	Specifies whether knowledgeable people and endorsements are available for topics (`true`), or not (`false`).	30.0
`loginUrl`	String	Login URL for the site.	36.0
`memberVisibilityEnabled`	Boolean	Specifies whether members can see other members (`true`) or not (`false`).	45.0
`name`	String	Site name.	28.0
`nicknameDisplayEnabled`	Boolean	Specifies whether nicknames are displayed.	32.0
`privateMessagesEnabled`	Boolean	Specifies whether members can send and receive private messages to and from other members (`true`) or not (`false`).	30.0
`reputationEnabled`	Boolean	Specifies whether reputation is calculated and displayed for members.	31.0
`sendWelcomeEmail`	Boolean	Specifies whether emails are sent to all new users when they join.	28.0
`siteAsContainerEnabled`	Boolean	Specifies whether the site is an Experience Builder site (`true`) or a Salesforce Tabs + Visualforce site (`false`).	41.0
`siteUrl`	String	URL for the site, which is your Experience Cloud sites domain plus a URL prefix. For example, *`MyDomainName`*`.my.site.com/customers`.	30.0
`status`	`ConnectApi.CommunityStatus` Enum	Status of the Experience Cloud site. • `Live` • `Inactive`	28.0

Name	Type	Description	Available Version
		• `UnderConstruction`	
`templateName`	String	Name of the Experience Builder template.	46.0
`url`	String	Connect REST API URL to the site.	28.0
`urlPathPrefix`	String	Site-specific URL prefix. For example, in the site URL *`MyDomainName`*`.my.site.com/customers`, `customers` is the `UrlPathPrefix`.	28.0

SEE ALSO:

ConnectApi.CommunityPage

ConnectApi.CommunityPage

Page of Experience Cloud sites.

Name	Type	Description	Available Version
`communities`	`List<ConnectApi.Community>`	List of Experience Cloud sites the context user has access to.	28.0
`total`	Integer	Total number of Experience Cloud sites.	28.0

ConnectApi.CommunitySummary

Summary of an Experience Cloud site.

Property Name	Type	Description	Available Version
`id`	String	18-character ID of the site.	41.0
`name`	String	Localized name of the site.	41.0

SEE ALSO:

ConnectApi.UserActivitySummary

ConnectApi.CompanyVerifySummary

Company verify summary.

Subclass of ConnectApi.UserFeedEntityActivitySummary.

No additional properties.

ConnectApi.ComplexSegment

Complex segments of field changes.

This class is abstract.

Subclass of ConnectApi.MessageSegment.

Superclass of ConnectApi.FieldChangeSegment.

Name	Type	Description	Available Version
`segments`	`List<ConnectApi.MessageSegment>`	List of message segments.	28.0

ConnectApi.CompositeCommerceProductOutputRepresentation

Details of a composite product.

Property Name	Type	Description	Available Version
`errors`	List<`ConnectApi.ErrorResponse`>	List of any errors that were returned, including the error code and error message.	61.0
`productId`	String	ID of the product record created.	61.0
`success`	Boolean	Indicates whether the product was successfully created (`true`) or not (`false`).	61.0

ConnectApi.CompositeCommerceVariationOutputRepresentation

Details of composite product variations.

Property Name	Type	Description	Available Version
`errors`	List<`ConnectApi.ErrorResponse`>	List of any errors that were returned, including the error code and error message.	62.0
`productIds`	List<String>	IDs of the created product variations.	62.0
`success`	Boolean	Indicates whether the product variations were successfully created (`true`) or not (`false`).	62.0

ConnectApi.CompoundRecordField

Record field that is a composite of subfields.

Subclass of ConnectApi.LabeledRecordField.

Name	Type	Description	Available Version
fields	List<ConnectApi.AbstractRecordField>	Collection of subfields that make up the compound field.	29.0

ConnectApi.ConfirmHeldFOCapacityOutputRepresentation

Response to a request to confirm held fulfillment order capacity at one or more locations. Can correspond to one action call.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
confirmHeldFOCapacityResponses	List<ConnectApi.ConfirmHeldFOCapacityResponseOutputRepresentation>	List of responses to the requests to confirm held fulfillment order capacity at one or more locations.	55.0

ConnectApi.ConfirmHeldFOCapacityResponseOutputRepresentation

Response to a request to confirm held fulfillment order capacity at one or more locations.

Property Name	Type	Description	Available Version
capacityResponses	List<ConnectApi.CapacityResponseOutputRepresentation>	List of responses to the requests to confirm held fulfillment order capacity at individual locations.	55.0

ConnectApi.Content

A file attached to a feed item.

Property Name	Type	Description	Available Version
checksum	String	MD5 checksum for the file.	36.0
contentUrl	String	URL of the content for links.	36.0
description	String	Description of the attachment.	36.0
downloadUrl	String	URL to the content.	36.0
fileExtension	String	Extension of the file.	36.0
fileSize	String	Size of the file in bytes. If size can't be determined, returns `unknown`.	36.0
fileType	String	Type of file, such as PDF.	36.0
hasPdfPreview	Boolean	`true` if the file has a PDF preview available; `false` otherwise.	36.0

Property Name	Type	Description	Available Version
`id`	String	18-character ID of the content.	36.0
`imageDetails`	ConnectApi.ContentImageFileDetails	Image details, or `null` if the file isn't an image.	40.0
`isInMyFileSync`	Boolean	`true` if the file is synced with Salesforce Files Sync. Note: Salesforce Files Sync was retired on May 25, 2018.	36.0
`mimeType`	String	MIME type of the file.	36.0
`renditionUrl`	String	URL to the rendition resource for the file. For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	36.0
`renditionUrl 240By180`	String	URL to the 240 x 180 pixel rendition resource for the file. For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	36.0
`renditionUrl 720By480`	String	URL to the 720 x 480 pixel rendition resource for the file. For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	36.0
`sharingOption`	`ConnectApi. FileSharingOption`	Sharing option of the file. Values are: • `Allowed`—Resharing of the file is allowed. • `Restricted`—Resharing of the file is restricted.	36.0
`textPreview`	String	Text preview of the file if available; `null` otherwise.	36.0
`thumb120By90 RenditionStatus`	String	Specifies the rendering status of the 120 x 90 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	36.0
`thumb240By180 RenditionStatus`	String	Specifies the rendering status of the 240 x 180 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed.	36.0

Property Name	Type	Description	Available Version
		• `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	
`thumb720By480RenditionStatus`	String	Specifies the rendering status of the 720 x 480 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	36.0
`title`	String	Title of the file.	36.0
`versionId`	String	Version ID of the file.	36.0

SEE ALSO:

ConnectApi.FilesCapability

ConnectApi.ContentCapability

If a comment has this capability, it has a file attachment.

Subclass of ConnectApi.FeedElementCapability.

For files attached to a feed post (instead of a comment) in version 36.0 and later, use `ConnectApi.FilesCapability`.

If content is deleted from a feed element after it's posted or if the access to the content is changed to private, the `ConnectApi.ContentCapability` exists, however most of its properties are null.

Property Name	Type	Description	Available Version
`checksum`	String	MD5 checksum for the file.	32.0
`contentUrl`	String	URL of the content for links and Google docs.	32.0
`description`	String	Description of the attachment.	32.0
`downloadUrl`	String	URL to the content.	32.0
`fileExtension`	String	Extension of the file.	32.0
`fileSize`	String	Size of the file in bytes. If size cannot be determined, returns `Unknown`.	32.0
`fileType`	String	Type of file.	32.0
`hasPdfPreview`	Boolean	`true` if the file has a PDF preview available, `false` otherwise.	32.0
`id`	String	18-character ID of the content.	32.0

Property Name	Type	Description	Available Version
`isInMyFileSync`	Boolean	`true` if the file is synced with Salesforce Files Sync; `false` otherwise. Note: Salesforce Files Sync was retired on May 25, 2018.	32.0
`mimeType`	String	MIME type of the file.	32.0
`renditionUrl`	String	URL to the rendition resource for the file. Renditions are processed asynchronously and may not be available immediately after the file has been uploaded.	32.0
`renditionUrl240By180`	String	URL to the 240x180 size rendition resource for the file. Renditions are processed asynchronously and may not be available immediately after the file has been uploaded.	32.0
`renditionUrl720By480`	String	URL to the 720x480 size rendition resource for the file. Renditions are processed asynchronously and may not be available immediately after the file has been uploaded.	32.0
`sharingOption`	`ConnectApi.FileSharingOption`	Sharing option of the file. Values are: • `Allowed`—Resharing of the file is allowed. • `Restricted`—Resharing of the file is restricted.	35.0
`textPreview`	String	Text preview of the file if available, `null` otherwise. The maximum number of characters is 200.	32.0
`thumb120By90RenditionStatus`	String	The status of the rendering of the 120x90 pixel sized preview image of the file. Should be either Processing, Failed, Success, or Na if unavailable.	32.0
`thumb240By180RenditionStatus`	String	The status of the rendering of the 240x180 pixel sized preview image of the file. Should be either Processing, Failed, Success, or Na if unavailable.	32.0
`thumb720By480RenditionStatus`	String	The status of the rendering of the 720x480 pixel sized preview image of the file. Should be either Processing, Failed, Success, or Na if unavailable.	32.0
`title`	String	Title of the file.	32.0
`versionId`	String	Version ID of the file.	32.0

SEE ALSO:

ConnectApi.CommentCapabilities

ConnectApi.ContentHubAllowedItemTypeCollection

The item types that the context user is allowed to create in a repository folder.

Property Name	Type	Description	Available Version
`allowedItemTypes`	List<`ConnectApi.ContentHubItemTypeSummary`>	A collection of item types that the context user is allowed to create in a repository folder.	39.0

ConnectApi.ContentHubFieldDefinition

A field definition.

Property Name	Type	Description	Available Version
`displayName`	String	Label or caption of this field.	39.0
`isMandatory`	Boolean	Specifies whether this field is mandatory for the item type.	39.0
`maxLength`	Integer	Maximum length of the value of this field.	39.0
`name`	String	Name of the field.	39.0
`type`	`ConnectApi.ContentHubVariableType`	Data type of the value of the field. Values are: • `BooleanType` • `DateTimeType` • `DecimalType` • `HtmlType` • `IdType` • `IntegerType` • `StringType` • `UriType` • `XmlType`	39.0

SEE ALSO:

ConnectApi.ContentHubItemTypeDetail

ConnectApi.ContentHubItemTypeDetail

The details of an item type associated with a repository folder.

Subclass of ConnectApi.AbstractContentHubItemType.

Property Name	Type	Description	Available Version
`fields`	List<`ConnectApi.ContentHubFieldDefinition`>	A list of fields that the context user is allowed to set in the metadata of this item type.	39.0

ConnectApi.ContentHubItemTypeSummary

The summary of an item type associated with a repository folder.

Subclass of ConnectApi.AbstractContentHubItemType.

No additional properties.

SEE ALSO:

ConnectApi.ContentHubAllowedItemTypeCollection

ConnectApi.ContentHubPermissionType

A permission type.

Property Name	Type	Description	Available Version
`id`	String	Internal ID of the permission type in the repository.	39.0
`label`	String	Label as returned by the repository.	39.0

SEE ALSO:

ConnectApi.ExternalFilePermissionInformation

ConnectApi.ContentHubProviderType

The type of repository.

Property Name	Type	Description	Available Version
`label`	String	Localized label of the provider type.	39.0

Property Name	Type	Description	Available Version
`type`	String	Provider type. One of these values: • `ContentHubBox` • `ContentHubGDrive` • `ContentHubSharepoint` • `ContentHubSharepointOffice365` • `ContentHubSharepointOneDrive` • `SimpleUrl`	39.0

SEE ALSO:

ConnectApi.ContentHubRepository

ConnectApi.ContentHubRepository

A repository.

Subclass of ConnectApi.ActorWithId.

Property Name	Type	Description	Available Version
`authentication`	ConnectApi.ContentHubRepositoryAuthentication	Repository authentication information.	40.0
`features`	`ConnectApi.ContentHubRepositoryFeatures`	Repository features.	39.0
`label`	String	Repository label.	39.0
`name`	String	Repository name.	39.0
`providerType`	`ConnectApi.ContentHubProviderType`	Repository provider type.	39.0
`rootFolderItemsUrl`	String	URL to the list of items in the repository root folder.	39.0

SEE ALSO:

ConnectApi.ContentHubRepositoryCollection

ConnectApi.ContentHubRepositoryAuthentication

Authentication information for a repository.

Property Name	Type	Description	Available Version
`authFlowUrl`	String	Depends on the `authProtocol`. • `NoAuthentication`—`null`. • `Oauth`—URL to start the OAuth flow. • `Password`—URL to the authentication settings for external systems.	40.0
`authProtocol`	ConnectApi.ContentHubAuthenticationProtocol	Authentication protocol used for the repository. Values are: • `NoAuthentication`—Repository doesn't require authentication. • `Oauth`—Repository uses OAuth authentication protocol. • `Password`—Repository uses user name and password authentication protocol.	40.0
`userHasAuthSettings`	Boolean	Specifies whether the user has credentials or the administrator configured the external data source to use the same set of credentials for every user (`true`). Otherwise, `false`.	40.0

SEE ALSO:

ConnectApi.ContentHubRepository

ConnectApi.ContentHubRepositoryCollection

A collection of repositories.

Property Name	Type	Description	Available Version
`currentPageUrl`	String	URL to the current page of repositories.	39.0
`nextPageUrl`	String	URL to the next page of repositories, or `null` if there isn't a next page.	39.0
`previousPageUrl`	String	URL to the previous page of repositories, or `null` if there isn't a previous page.	39.0
`repositories`	List<`ConnectApi.ContentHubRepository`>	Collection of repositories.	39.0

ConnectApi.ContentHubRepositoryFeatures

The features of a repository.

Property Name	Type	Description	Available Version
`canBrowse`	Boolean	Specifies whether the repository's folder hierarchy can be browsed (`true`) or not (`false`).	39.0
`canSearch`	Boolean	Specifies whether the repository can be searched (`true`) or not (`false`).	39.0

SEE ALSO:

ConnectApi.ContentHubRepository

ConnectApi.ContentImageFileDetails

Image file details.

Property Name	Type	Description	Available Version
`height`	Integer	Image's height in pixels.	40.0
`imageFormat`	String	Image's format.	40.0
`orientation`	String	Image's EXIF orientation value, if present.	40.0
`width`	Integer	Image's width in pixels.	40.0

SEE ALSO:

ConnectApi.InlineImageSegment

ConnectApi.ContractOutputRepresentation

Contract list.

Property Name	Type	Description	Available Version
`data`	List<`String`>	Record IDs of the contacts.	56.0

ConnectApi.ConversationApplicationDefinitionDetailRespresentation

Information about the conversation application definition.

Property Name	Type	Description	Available Version
`botInfo`	`ConnectApi.BotInfoRepresentation`	Basic information of the bot associated with this conversation application.	54.0
`errorMessage`	String	Error message for the failed get operation.	54.0

Property Name	Type	Description	Available Version
integrationApplication	ConnectApi.ConversationApplicationIntegrationType	Conversation application integration types. Values are: • Api • Slack	54.0
integrationName	String	Name of the conversation application.	54.0
isSuccess	Boolean	Success indicator of the get operation.	54.0
runtimeUrl	String	Base URL of the bot runtime API.	54.0

ConnectApi.CouponCodeRedemptionCollection

Collection of coupon code redemption results.

Property Name	Type	Description	Available Version
couponCodeRedemptionResults	List<ConnectApi.CouponCodeRedemptionResult>	List of coupon code redemption results.	58.0

ConnectApi.CouponCodeRedemptionResult

Coupon code redemption result.

Property Name	Type	Description	Available Version
availableRedemptions	Integer	Number of coupon code redemptions available.	58.0
couponCode	String	Coupon code.	58.0
errorMsg	String	Error message when coupon code redemption isn't successful.	58.0
isSuccess	Boolean	Specifies whether increasing or decreasing the coupon code redemption is successful (true) or not (false).	58.0
redemptionLimit	Integer	Number of coupon code redemptions allowed.	58.0

ConnectApi.CreateCreditMemoOutputRepresentation

ID of a created Credit Memo.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
creditMemoId	String	ID of the created Credit Memo.	48.0

ConnectApi.CreateMultipleInvoicesFromChangeOrdersOutputRepresentation

List of lists of invoices created from change orders for fees.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`invoices`	List<`ConnectApi.ChangeOrdersInvoiceOutputRepresentation`>	List of IDs of invoices created from change orders for fees. Include these invoice IDs when calling Ensure Refunds for the return that the fees applied to.	56.0

SEE ALSO:

createMultipleInvoices(invoicesInput)

ConnectApi.CreateOrderPaymentSummaryOutputRepresentation

ID of the created Order Payment Summary.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`orderPaymentSummaryId`	String	ID of the Order Payment Summary.	48.0

ConnectApi.Credential

Credential.

Property Name	Type	Description	Available Version
`authenticationProtocol`	`ConnectApi.CredentialAuthenticationProtocol`	Authentication protocol of the external credential. Values are: • `AwsSv4` • `Basic` • `Custom` • `Jwt` • `OAuth`	56.0
`authenticationProtocolVariant`	`ConnectApi.CredentialAuthenticationProtocolVariant`	Authentication protocol variant of the external credential. Values are: • `AwsSv4_STS`—AWS Signature Version 4 with Security Token Service. • `ClientCredentialsClientSecret`—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's request body.	57.0

Property Name	Type	Description	Available Version
		• `ClientCredentialsClientSecretBasic`—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's authorization header, as with Basic authentication. • `ClientCredentialsJwtAssertion`—OAuth 2.0 Client Credentials JSON Web Token assertion. • `JwtBearer`—OAuth 2.0 JSON Web Token bearer flow. • `NoAuthentication`—No authentication. • `RolesAnywhere`—AWS Signature Version 4 with Identity and Access Management (IAM) Roles Anywhere.	
`authenticationStatus`	`ConnectApi.CredentialAuthenticationStatus`	Status of the credential authentication. Values are: • `Configured`—Credential has all required credentials for at least one principal. • `NotConfigured`—Credential isn't configured. • `Unknown`—Credential status can't be determined because the authentication protocol is custom.	56.0
`credentials`	Map<String, `ConnectApi.CredentialValue`>	Map of protocol-specific credentials.	56.0
`externalCredential`	String	Fully qualified developer name of the external credential.	56.0
`principalName`	String	Name of the external credential named principal.	56.0
`principalType`	`ConnectApi.CredentialPrincipalType`	Type of credential principal. Values are: • `AwsStsPrincipal` • `NamedPrincipal` • `PerUserPrincipal`	56.0

ConnectApi.CredentialCustomHeader

Credential custom header.

Property Name	Type	Description	Available Version
`headerName`	String	Header name.	57.0
`headerValue`	String	Header value that can contain formulas.	57.0

Property Name	Type	Description	Available Version
`id`	String	ID of the customer header parameter.	58.0
`sequenceNumber`	Integer	Sequence number of the header. The sequence number determines the order of the header.	57.0

SEE ALSO:

ConnectApi.ExternalCredential

ConnectApi.NamedCredential

ConnectApi.CredentialValue

Credential value.

Property Name	Type	Description	Available Version
`encrypted`	Boolean	Specifies whether the credential value is encrypted (`true`) or not (`false`).	56.0
`revision`	Integer	Revision number of a short-lived credential.	58.0
`value`	String	Value of the credential.	56.0

SEE ALSO:

ConnectApi.Credential

ConnectApi.CurrencyRecordField

Record field containing a currency value.

Subclass of ConnectApi.LabeledRecordField.

ConnectApi.CustomListAudienceCriteria

Criteria for the custom list type of custom recommendation audience.

Subclass of ConnectApi.AudienceCriteria.

Property Name	Type	Description	Available Version
`memberCount`	Integer	Total number of members in the custom recommendation audience.	36.0
`members`	ConnectApi.UserReferencePage	Members of the custom recommendation audience.	36.0

ConnectApi.DashboardComponentSnapshot

Represents both dashboard component snapshots and alerts you receive when a dashboard component value crosses a threshold.

Property Name	Type	Description	Available Version
componentId	String	18-character ID of the dashboard component.	32.0
componentName	String	The dashboard component name.	32.0
dashboardBodyText	String	Display this text next to the actor in the feed element.Use this text in place of the default body text.	32.0
dashboardId	String	18-character ID of the dashboard.	32.0
dashboardName	String	The name of the dashboard.	32.0
fullSizeImageUrl	String	The source URL to retrieve the full-size image of a snapshot. Access this URL with OAuth credentials.	32.0
lastRefreshDate	Datetime	ISO 8601 date specifying when this dashboard component was last refreshed.	32.0
lastRefreshDateDisplayText	String	Display text for the last refresh date, for example, "Last Refreshed on October 31, 2013."	32.0
runningUser	ConnectApi.UserSummary	The running user of the dashboard at the time the snapshot was posted. This value may be null. Each dashboard has a running user, whose security settings determine which data to display in a dashboard.	32.0
thumbnailUrl	String	The source URL to retrieve the thumbnail image of a snapshot. Access this URL with OAuth credentials.	32.0

SEE ALSO:

ConnectApi.DashboardComponentSnapshotCapability

ConnectApi.DatacloudCompanies

ConnectApi.DashboardComponentSnapshotCapability

If a feed element has this capability, it has a dashboard component snapshot. A snapshot is a static image of a dashboard component at a specific point in time.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
dashboardComponentSnapshot	ConnectApi.DashboardComponentSnapshot	The dashboard component snapshot.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.DataCategoryMetadata

Data category metadata for the object.

Property Name	Type	Description	Available Version
`groupName`	String	Group name of the data category.	63.0
`label`	String	Label of the data category.	63.0
`values`	Map<String, `ConnectApi.DataCategoryValueMetadata`>	Map of values for the current data category.	63.0

SEE ALSO:

ConnectApi.ObjectMetadata

ConnectApi.DataCategoryValueMetadata

Data category values for the object's data category.

Property Name	Type	Description	Available Version
`label`	String	Label of the data category group.	63.0
`valueName`	String	Name of the data category group.	63.0

SEE ALSO:

ConnectApi.ObjectMetadata

ConnectApi.DateEstimationOutputRepresentation

Date estimation for product delivery.

Property Name	Type	Description	Available Version
`max`	String	Maximum estimated date for delivery.	63.0
`min`	String	Minimum estimated date for delivery.	63.0
`type`	String	Estimation type.	63.0

ConnectApi.DateRecordField

Record field containing a date.

Subclass of ConnectApi.LabeledRecordField.

Name	Type	Description	Available Version
`dateValue`	Datetime	Date that a machine can read. Ignore the trailing `00:00:00.000Z` characters.	29.0

ConnectApi.DeleteIntent

Delete intent for a social post.

Property Name	Type	Description	Available Version
`managedSocialAccount`	`ConnectApi.ManagedSocialAccount`	Managed social account that deletes the social post.	45.0

SEE ALSO:

ConnectApi.DeleteIntents

ConnectApi.DeleteIntents

List of delete intents for a social post.

Property Name	Type	Description	Available Version
`deletes`	List<`ConnectApi.DeleteIntent`>	List of delete intents for the social post.	45.0

SEE ALSO:

ConnectApi.SocialPostIntents

ConnectApi.DeleteSocialPostIntent

Delete intent for the social post.

Property Name	Type	Description	Available Version
`socialAccountId`	String	ID of the social account that deletes the social post.	46.0
`socialPostId`	String	ID of the social post to delete.	46.0

ConnectApi.DeliveryEstimateOutputRepresentation

Delivery estimation information for products.

Property Name	Type	Description	Available Version
error	ConnectApi.DeliveryEstimationErrorOutputRepresentation on page 2068	Any error that was returned, including the error code and error message.	63.0
location	String	Location external reference.	63.0
productDeliveryEstimations	List<ConnectApi.ProductDeliveryEstimationOutputRepresentation> on page 2244	List of product delivery estimations.	63.0
shippingCarrierMethodExternalReference	String	Shipping carrier method external reference.	63.0

ConnectApi.DeliveryEstimationErrorOutputRepresentation

Delivery estimation error.

Property Name	Type	Description	Available Version
code	String	Error code.	63.0
message	String	Error message, if any.	63.0

ConnectApi.DigestJob

Represents a successfully enqueued API digest job request.

Property Name	Type	Description	Available Version
period	ConnectApi.DigestPeriod	Time period that's included in a Chatter email digest. Values are: • DailyDigest—The email includes up to the 50 latest posts from the previous day. • WeeklyDigest—The email includes up to the 50 latest posts from the previous week.	37.0

ConnectApi.DirectMessageCapability

If a feed element has this capability, it's a direct message.

Property Name	Type	Description	Available Version
memberChanges	ConnectApi.DirectMessageMemberActivityPage	Member activities of the direct message, with the most recent activity first.	40.0
members	ConnectApi.DirectMessageMemberPage	Members included in the direct message.	39.0

Property Name	Type	Description	Available Version
originalMembers	ConnectApi.DirectMessageMemberPage	Original members of the direct message.	40.0
subject	String	Subject of the direct message.	39.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.DirectMessageMemberActivity

Direct message member activity.

Property Name	Type	Description	Available Version
activityDate	Datetime	Direct message member activity date.	40.0
actor	ConnectApi.UserSummary	User who changed the direct message membership.	40.0
membersAdded	ConnectApi.DirectMessageMemberPage	Members added to the direct message as part of the activity.	40.0
membersRemoved	ConnectApi.DirectMessageMemberPage	Members removed from the direct message as part of the activity.	40.0

SEE ALSO:

ConnectApi.DirectMessageMemberActivityPage

ConnectApi.DirectMessageMemberActivityPage

A page of direct message member activities.

Property Name	Type	Description	Available Version
activities	List<ConnectApi.DirectMessageMemberActivity>	Collection of direct message member activities.	40.0
currentPageToken	String	Token identifying the current page.	40.0
currentPageUrl	String	Connect REST API URL identifying the current page.	40.0
nextPageToken	String	Token identifying the next page, or `null` if there isn't a next page.	40.0

Property Name	Type	Description	Available Version
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	40.0

SEE ALSO:

ConnectApi.DirectMessageCapability

ConnectApi.DirectMessageMemberPage

A collection of direct message members.

Property Name	Type	Description	Available Version
`currentPageToken`	String	Page token to access the current page of direct message members.	39.0
`currentPageUrl`	String	URL to the current page of direct message members.	39.0
`nextPageToken`	String	Page token to access the next page of direct message members.	39.0
`nextPageUrl`	String	URL to the next page of direct message members.	39.0
`users`	List<`ConnectApi.UserSummary`>	Collection of direct message members.	39.0

SEE ALSO:

ConnectApi.DirectMessageCapability

ConnectApi.DirectMessageCapability

ConnectApi.DirectMessageMemberActivity

ConnectApi.DistanceCalculationOutputRepresentation

Shipping distance data for a set of inventory locations.

Property Name	Type	Description	Available Version
`averageDistance`	Double	The average distance from the locations to the order recipient.	51.0
`locations`	List<`ConnectApi.LocationOutputRepresentation`>	The list of locations and their distances to the order recipient.	51.0
`rank`	Integer	This result's rank among all results by average distance to the order recipient.	51.0

ConnectApi.DistinctFacetValue

Distinct facet value.

This class is a subclass of ConnectApi.FacetValue.

Property Name	Type	Description	Available Version
`displayName`	String	Display name of the facet value.	52.0
`nameOrId`	String	Developer name of the attribute.	52.0
`productCount`	Long	Number of products in the search result that match the facet value.	52.0

SEE ALSO:

ConnectApi.DistinctValueSearchFacet

ConnectApi.DistinctValueSearchFacet

Facet with distinct values in product search results.

This class is a subclass of ConnectApi.SearchFacet.

Property Name	Type	Description	Available Version
`values`	List<`ConnectApi.DistinctFacetValue`>	Values of the facet found in the search result. Sorted by display name in alphabetical order.	52.0

ConnectApi.DownVoteSummary

Summary of a downvote.

Subclass of ConnectApi.UserFeedEntityActivitySummary.

No additional properties.

ConnectApi.EditCapability

If a feed element or comment has this capability, users who have permission can edit it.

Property Name	Type	Description	Available Version
`isEditRestricted`	Boolean	Specifies whether editing this feed element or comment is restricted. If `true`, the context user can't edit this feed element or comment. If `false`, the context user may or may not have permission to edit this feed element or comment. To determine if the context user can edit a feed element or comment, use the `isFeedElementEditableByMe(communityId, feedElementId)` or	34.0

Property Name	Type	Description	Available Version
		`isCommentEditableByMe(communityId, commentId)` method.	
`isEditableByMeUrl`	String	The URL to check if the context user is able to edit this feed element or comment.	34.0
`lastEditedBy`	`ConnectApi.Actor`	Who last edited this feed element or comment.	34.0
`lastEditedDate`	Datetime	The most recent edit date of this feed element or comment.	34.0
`latestRevision`	Integer	The most recent revision of this feed element or comment.	34.0
`relativeLastEditedDate`	String	Relative last edited date, for example, "2h ago."	34.0

SEE ALSO:

- ConnectApi.CommentCapabilities
- ConnectApi.FeedElementCapabilities

ConnectApi.EinsteinLlmGenAiSourceReference

Source from a data provider.

Property Name	Type	Description	Available Version
`contents`	List<`ConnectApi.EinsteinLlmGenerationGenAiSourceContentInfo`>	List of values from the source that are used for grounding a generated response.	62.0
`metadata`	List<`ConnectApi.EinsteinLlmGenerationGenAiSourceReferenceInfo`>	List of metadata for the source, such as URLs or record IDs.	62.0

ConnectApi.EinsteinLlmGenerationCitationOutput

Source information associated with a generated response.

Property Name	Type	Description	Available Version
`citedReferences`	List<`ConnectApi.EinsteinLlmGenerationGenAiCitedReference`>	List of metadata for the sources that are cited in the generated response.	62.0

Property Name	Type	Description	Available Version
sourceReferences	List<ConnectApi.EinsteinLlmGenAiSourceReference>	List of sources from one or more data providers.	62.0

ConnectApi.EinsteinLlmGenerationContentQualityOutput

Quality information about the generated response.

Property Name	Type	Description	Available Version
isToxicityDetected	Boolean	Specifies whether the generated response contains toxic language (true) or not (false).	61.0

ConnectApi.EinsteinLlmGenerationGenAiCitedReference

Metadata from an input source that is cited in a generated response.

Property Name	Type	Description	Available Version
link	String	URL for the source that is cited in a generated response.	62.0
sourceObjectApiName	String	API name of the source record that is cited in a generated response.	62.0
sourceObjectRecordId	String	ID of the source record that is cited in a generated response.	62.0

ConnectApi.EinsteinLlmGenerationGenAiSourceContentInfo

Values from a source that is cited in a generated response.

Property Name	Type	Description	Available Version
content	String	Text from the source that is cited in the generated response.	62.0
fieldName	String	API name of the field that is cited in the generated response, such as Opportunity.Amount.	62.0
objectName	String	API name of the object that is cited in the generated response, such as Opportunity.	62.0

ConnectApi.EinsteinLlmGenerationGenAiSourceReferenceInfo

Metadata from a source from a data provider.

Property Name	Type	Description	Available Version
`link`	String	URL for the source from the data provider.	62.0
`sourceObjectApiName`	String	API name of the source record.	62.0
`sourceObjectRecordId`	String	ID of the source record.	62.0

ConnectApi.EinsteinLLMGenerationItemOutput

Generated response from the LLM provider.

Property Name	Type	Description	Available Version
`contentQualityRepresentation`	`ConnectApi.EinsteinLlmGenerationsContentQuality`	Specifies whether the generated response contains toxic language `(true)` or not `(false)`.	61.0
`parameters`	String	Parameter values for the LLM provider.	60.0
`responseId`	String	ID of the generated response.	60.0
`safetyScoreRepresentation`	`ConnectApi.EinsteinLlmGenerationSafetyScoreOutput`	Safety score information related to the generated response.	60.0
`text`	String	Text of generated response.	60.0

ConnectApi.EinsteinLlmGenerationSafetyScoreOutput

Safety score information related to the LLM response.

Property Name	Type	Description	Available Version
`hateScore`	Double	A higher value means the generated response is more likely to contain text that expresses, incites, or promotes hatred, violence, or severe harm towards the targeted group. Minimum value of `0.0`. Maximum value of `1.0`.	60.0
`physicalScore`	Double	A higher value means the generated response is more likely to contain text with unsafe advice that may harm the user or others physically, or text that promotes, encourages, or depicts acts of self-harm. Minimum value of `0.0`. Maximum value of `1.0`.	60.0

Property Name	Type	Description	Available Version
`profanityScore`	Double	A higher value means the generated response is more likely to contain swear words, curse words, or obscene or profane language. Minimum value of `0.0`. Maximum value of `1.0`.	60.0
`safetyScore`	Double	Overall safety score based on the `hateScore`, `physicalScore`, `profanityScore`, `sexualScore`, `toxicityScore`, and `violenceScore`. A higher value means the generated response is more likely to be safe. Minimum value of `0.0`. Maximum value of `1.0`.	60.0
`sexualScore`	Double	A higher value means the generated response is more likely to contain text meant to arouse sexual excitement or promote sexual services. Minimum value of `0.0`. Maximum value of `1.0`.	60.0
`toxicityScore`	Double	A higher value means the generated response is more likely to contain text that is rude, disrespectful, or unreasonable. Minimum value of `0.0`. Maximum value of `1.0`.	60.0
`violenceScore`	Double	A higher value means the generated response is more likely to contain text that promotes or glorifies violence or celebrates the suffering or humiliation of others. Minimum value of `0.0`. Maximum value of `1.0`.	60.0

ConnectApi.EinsteinPromptRecordCollectionOutputRepresentation

List of prompt template records.

Property Name	Type	Description	Available Version
`hasMoreRecords`	Boolean	Specifies whether the query returned more prompt template records `(true)` or not `(false)`.	62.0
`promptRecords`	List<`ConnectApi.EinsteinPromptRecordRepresentation`>	List of prompt template records returned.	62.0
`totalPromptRecords`	Integer	Number of prompt template records returned.	62.0

ConnectApi.EinsteinPromptRecordFieldRepresentation

Field values for a prompt template record field.

Property Name	Type	Description	Available Version
`displayValue`	String	Visible value of a prompt template record field.	62.0
`value`	Object	Raw data value of a prompt template record field.	62.0

ConnectApi.EinsteinPromptRecordRepresentation

Prompt template record.

Property Name	Type	Description	Available Version
`apiName`	String	API name of the prompt template record.	62.0
`childRelationships`	Map<String, `ConnectApi.EinsteinPromptRecordRepresentation`>	Map of prompt template name and prompt template records that are versions of the prompt template.	62.0
`fields`	Map<String, `ConnectApi.EinsteinPromptRecordFieldRepresentation`>	Map of field name and prompt template record fields.	62.0
`id`	String	ID of the prompt template record.	62.0
`isStandard`	Boolean	Specifies whether the prompt template record is a standard prompt template `(true)` or user-created prompt template `(false)`.	62.0

ConnectApi.EinsteinPromptTemplateAttachment

Data for file attachments to prompts.

Property Name	Type	Description	Available Version
`fileExtension`	String	Extension of the file attachment.	63.0
`id`	String	Content document ID of the file attachment.	63.0
`latestPublishedVersion`	String	Content version ID of the file attachment.	63.0
`title`	String	Title of the file attachment.	63.0

ConnectApi.EinsteinPromptTemplateGenerationsError

Error response to a prompt template generation request.

Property Name	Type	Description	Available Version
errorMessage	String	Message stating the reason for the error, if any.	60.0
httpErrorCode	String	HTTP status code, if any.	60.0
localized ErrorMessage	String	Translated error message, if available.	60.0
messageCode	String	Message code associated with the error message, if any.	60.0

ConnectApi.EinsteinPromptTemplateGenerationsRepresentation

Generated response from the LLM provider and resolved prompt template text.

Property Name	Type	Description	Available Version
citations	ConnectApi. EinsteinLlmGeneration CitationOutput	Source information associated with the generated responses.	62.0
fileData	List<ConnectApi. EinsteinPrompt TemplateAttachment>	File data of the input files used in generation.	63.0
generationErrors	List<ConnectApi. EinsteinPrompt Template GenerationsError>	List of errors associated with the generated responses, if any.	60.0
generations	List< ConnectApi. EinsteinLlm GenerationItem Output>	List of generated responses from the LLM provider.	60.0
isSummarized	Boolean	Specifies whether the generated response contains summarized text (true) or not (false).	61.0
parameters	ConnectApi. WrappedMapObject	Map of parameters and values for the LLM provider parameters.	60.0
prompt	String	Prompt template text with resolved inputs.	60.0
promptTemplate DevName	String	Developer name or ID of the prompt template record.	60.0
requestId	String	ID of the generation request sent to the LLM provider.	60.0
requestMessages	List<ConnectApi. EinsteinPrompt TemplateMask Content>	List of resolved prompt templates with masked data and masking information.	61.0

Property Name	Type	Description	Available Version
responseMessages	List<ConnectApi.EinsteinPromptTemplateMaskContent>	List of generated responses with masked data and masking information for the specified prompt template.	61.0
slotsMaskingInformation	List<ConnectApi.EinsteinPromptTemplateMaskData>	List of original and placeholder values of the masked data.	61.0

ConnectApi.EinsteinPromptTemplateMaskContentRepresentation

Generated response with masked data and masking information for a prompt template.

Property Name	Type	Description	Available Version
content	String	Text of generated response or resolved prompt template with masked data.	61.0
moderationSettings	ConnectApi.EinsteinPromptTemplateMaskSettingsRepresentation	Data masking settings for the specified prompt template.	61.0
role	String	Role in the Salesforce role hierarchy of the user executing the prompt template.	61.0

ConnectApi.EinsteinPromptTemplateMaskDataRepresentation

Information about masked data for a prompt template.

Property Name	Type	Description	Available Version
originalValue	String	Original value of the masked data.	61.0
placeHolder	String	Placeholder value of the masked data.	61.0
recognizers	List<String>	Reserved for internal use.	61.0

ConnectApi.EinsteinPromptTemplateMaskSettingsRepresentation

Data masking settings for a prompt template.

Property Name	Type	Description	Available Version
enableModeration	Boolean	Specifies whether data masking is enabled (true) or not (false).	61.0

ConnectApi.EmailAddress

Email address.

Name	Type	Description	Available Version
`displayName`	String	The display name for the email address.	29.0
`emailAddress`	String	The email address.	29.0
`relatedRecord`	ConnectApi.RecordSummary	The summary of a related record, for example, a contact or user summary.	36.0

SEE ALSO:

ConnectApi.EmailMessageCapability

ConnectApi.EmailAttachment

An email attachment in an email message.

Property Name	Type	Description	Available Version
`attachment`	`ConnectApi.RecordSummary`	Record summary of the attachment.	36.0
`contentType`	String	Type of attachment.	36.0
`fileName`	String	Name of the attachment.	36.0

SEE ALSO:

ConnectApi.EmailMessageCapability

ConnectApi.EmailMergeFieldCollectionInfo

The merge fields for an object.

Property Name	Type	Description	Available Version
`mergeFields`	List<String>	List of merge fields for a single object.	39.0

SEE ALSO:

ConnectApi.EmailMergeFieldInfo

ConnectApi.EmailMergeFieldInfo

The map for objects and their merge fields.

Property Name	Type	Description	Available Version
entityToMergeFieldsMap	Map<String, ConnectApi.EmailMergeFieldCollectionInfo>	Map for multiple objects and their merge field collections.	39.0

ConnectApi.EmailMessageCapability

If a feed element has this capability, it has an email message from a case.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
attachments	List<ConnectApi.EmailAttachment>	Attachments in the email message.	36.0
automationType	String	Automation type of the email message. • aiAssisted—The email message was created with the assistance of AI. • aiAutomated—The email message was created automatically by AI.	63.0
bccAddresses	List<ConnectApi.EmailAddress>	BCC addresses for the email message.	36.0
body	String	Body of the email message.	36.0
ccAddresses	List<ConnectApi.EmailAddress>	CC addresses for the email message.	36.0
direction	ConnectApi.EmailMessageDirection	Direction of the email message. Values are: • Inbound—An inbound message (sent by a customer). • Outbound—An outbound message (sent to a customer by a support agent).	32.0
emailMessageId	String	ID of the email message.	32.0
fromAddress	ConnectApi.EmailAddress	From address for the email message.	36.0
htmlExpandEmailThread	Integer	Start location of previous email thread.	47.0
isRichText	Boolean	Indicates whether the body of the email message is in rich text format.	36.0
status	ConnectApi.EmailMessageStatus	Status of an email message on a case. Values are: • DraftStatus • ForwardedStatus	47.0

Property Name	Type	Description	Available Version
		• `NewStatus` • `ReadStatus` • `RepliedStatus` • `SentStatus`	
`subject`	String	Subject of the email message.	32.0
`textBody`	String	Body of the email message. **Important:** In version 36.0 and later, use the `body` property.	32.0–35.0
`toAddresses`	List<`ConnectApi.EmailAddress`>	To addresses of the email message.	32.0
`totalAttachments`	Integer	Total number of attachments in the email message.	38.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.Emoji

An emoji.

Property Name	Type	Description	Available Version
`category`	String	Emoji category.	39.0
`shortcut`	String	Emoji shortcut.	39.0
`unicodeCharacter`	String	Emoji's unicode character.	39.0

SEE ALSO:

ConnectApi.EmojiCollection

ConnectApi.EmojiCollection

A collection of emoji.

Property Name	Type	Description	Available Version
`emojis`	List<`ConnectApi.Emoji`>	A collection of emoji.	39.0

SEE ALSO:

ConnectApi.SupportedEmojis

ConnectApi.EnhancedLinkCapability

If a feed element has this capability, it has a link that may contain supplemental information like an icon, a title, and a description.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`description`	String	A description with a 500 character limit.	32.0
`icon`	`ConnectApi.Icon`	A icon.	32.0
`linkRecordId`	String	A ID associated with the link if the link URL refers to a Salesforce record.	32.0
`linkUrl`	String	A link URL to a detail page if available content can't display inline.	32.0
`title`	String	A title to a detail page.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.EnsureFundsAsyncOutputRepresentation

ID of the asynchronous background operation. This output only includes the operation ID, regardless of whether a call is made to an external payment gateway. It doesn't include any errors from the operation.

Subclass of ConnectApi.BaseAsyncOutputRepresentation.

No additional properties.

SEE ALSO:

ensureFundsAsync(orderSummaryId, ensureFundsInput)

ConnectApi.EnsureRefundsAsyncOutputRepresentation

ID of the asynchronous background operation. This output only includes the operation ID, regardless of whether a call is made to an external payment gateway. It doesn't include any errors from the operation.

Subclass of ConnectApi.BaseAsyncOutputRepresentation.

No additional properties.

SEE ALSO:

ensureRefundsAsync(orderSummaryId, ensureRefundsInput)

ConnectApi.EntityLabel

An entity's label.

Property Name	Type	Description	Available Version
`label`	String	Localized singular label of the entity.	40.0
`labelPlural`	String	Localized plural label of the entity.	40.0

SEE ALSO:

ConnectApi.RecordSummary

ConnectApi.EntityLinkSegment

Entity link segment.

Subclass of ConnectApi.MessageSegment.

Name	Type	Description	Available Version
`motif`	`ConnectApi.MotifClass`	A set of small, medium, and large icons that indicate whether the entity is a file, group, record, or user. The motif can also contain the object's base color.	28.0
`reference`	`ConnectApi.Reference`	A reference to the link object if applicable, otherwise, `null`.	28.0

ConnectApi.EntityRecommendation

A Chatter, custom, or static recommendation.

Subclass of ConnectApi.AbstractRecommendation.

Property Name	Type	Description	Available Version
`actOnUrl`	String	For user, file, group, topic, and record `entity` types, use this Connect REST URL with a POST request to take action on the recommendation. For `ConnectApi.RecommendedObject` `entity` types, such as custom recommendations, use the `actionUrl` property of the ConnectApi.PlatformAction to take action on the recommendation.	32.0
`action`	`ConnectApi.RecommendationActionType`	Specifies the action to take on a recommendation. • `follow`—Follow a file, record, topic, or user. • `join`—Join a group. • `view`—View a file, group, article, record, user, custom, or static recommendation.	32.0

Property Name	Type	Description	Available Version
entity	ConnectApi.Actor	The entity with which the receiver is recommended to take action.	32.0

ConnectApi.ErrorResponse

Base error response.

Property Name	Type	Description	Available Version
errorCode	String	Error code.	48.0
message	String	More error detail, if available.	48.0

SEE ALSO:

ConnectApi.BaseOutputRepresentation

ConnectApi.EstimateDeliveryDateOutputRepresentation

Estimated delivery dates.

Property Name	Type	Description	Available Version
deliveryEstimates	List<ConnectApi.DeliveryEstimateOutputRepresentation> on page 2067	List of delivery estimations.	63.0
estimatedDeliveryReference	String	Unique code, reference, or identifier for the estimated delivery used by external systems.	63.0

ConnectApi.Extension

An extension.

Property Name	Type	Description	Available Version
alternativeRepresentation	ConnectApi.Alternative	Alternative representation of the extension.	40.0
attachmentId	String	Attachment ID of the extension.	41.0
extensionId	String	ID of the extension.	40.0
payload	String	Payload associated with the extension.	40.0

Property Name	Type	Description	Available Version
payloadVersion	String	Payload version that identifies the structure of the payload associated with the extension.	40.0

SEE ALSO:

ConnectApi.ExtensionsCapability

ConnectApi.ExtensionDefinition

An extension's definition.

Property Name	Type	Description	Available Version
canAccess	Boolean	Indicates whether users can access the extension when it's associated with a feed element.	40.0
canCreate	Boolean	Indicates whether users can create a feed element with the extension in the org.	40.0
createdDate	Datetime	Date when the extension was created.	40.0
description	String	Description of the extension.	40.0
iconUrl	String	URL to the icon for the extension.	40.0
id	String	ID of the extension.	40.0
informationCollection	List<ConnectApi.AbstractExtensionInformation>	Collection of extension information.	40.0
isEnabledInCommunity	Boolean	Indicates whether the extension is enabled in the site.	40.0 only
isEnabledInLightningPublisher	Boolean	Indicates whether the extension is enabled in the Lightning publisher.	40.0 only
name	String	Name of the extension.	40.0
position	Integer	Position in which the extension is displayed in the publisher.	41.0

SEE ALSO:

ConnectApi.ExtensionDefinitions

ConnectApi.ExtensionDefinitions

A collection of extension definitions.

Property Name	Type	Description	Available Version
currentPageToken	String	Token identifying the current page.	40.0
currentPageUrl	String	Connect REST API URL identifying the current page.	40.0
extensionDefinitions	List<ConnectApi.ExtensionDefinition>	Collection of extension definitions.	40.0
nextPageToken	String	Token identifying the next page, or null if there isn't a next page.	40.0
nextPageUrl	String	Connect REST API URL identifying the next page, or null if there isn't a next page.	40.0
total	Integer	Total number of extensions returned.	40.0

ConnectApi.ExtensionsCapability

If a feed element has this capability, it has one or more extension attachments.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
items	List<ConnectApi.Extension>	List of extensions associated with the feed element.	40.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.ExternalAuthIdentityProvider

External auth identity provider.

Property Name	Type	Description	Available Version
authenticationFlow	ConnectApi.IdentityProviderAuthFlow	Authentication flow to get tokens to call protected APIs. Values are: • AuthorizationCode	62.0
authenticationProtocol	ConnectApi.IdentityProviderAuthProtocol	Authentication protocol required to access the external system. Values are: • OAuth	62.0
authorizeUrl	String	Authorization endpoint URL for the external system.	62.0
callbackUrl	String	For the Authorization Code authentication flow, the callback URL that's used by the external system after authorization.	62.0

Property Name	Type	Description	Available Version
clientAuthentication	ConnectApi.IdentityProviderClientAuth	Client authentication method that describes how credentials are sent to the authorization server. Values are: • ClientSecretBasic • ClientSecretPost	63.0
createdByNamespace	String	Namespace of the package that created the external auth identity provider.	62.0
credentials	List<ConnectApi.ExternalAuthIdentityProviderCredential>	List of the external auth identity provider credentials.	62.0
description	String	Description of the external auth identity provider.	62.0
fullName	String	Full name of the external auth identity provider. The full name can include a namespace prefix.	62.0
id	String	External auth identity provider ID.	62.0
label	String	External auth identity provider label.	62.0
parameters	List<ConnectApi.ExternalAuthIdentityProviderParameter>	List of custom request parameters.	63.0
standardExternalIdentityProvider	String	Reference to a standard external auth identity provider.	63.0
tokenUrl	String	Token endpoint URL to retrieve tokens from the external system. Required for all OAuth 2.0 authentication flows.	62.0
url	String	Connect REST API URL for the external auth identity provider.	62.0
userInfoUrl	String	User info URL to retrieve user profile information from the external system.	62.0

SEE ALSO:

ConnectApi.ExternalAuthIdentityProviderList

createExternalAuthIdentityProvider(requestBody)

getExternalAuthIdentityProvider(fullName)

updateExternalAuthIdentityProvider(fullName, requestBody)

ConnectApi.ExternalAuthIdentityProviderCredential

External auth identity provider credential.

Property Name	Type	Description	Available Version
`credentialName`	String	Name of the external auth identity provider credential.	62.0
`credentialValue`	String	Value of the external auth identity provider credential.	62.0
`encrypted`	Boolean	Indicates whether the external auth identity provider credential is encrypted (`true`) or not (`false`).	62.0

SEE ALSO:

ConnectApi.ExternalAuthIdentityProviderCredentials

ConnectApi.ExternalAuthIdentityProviderCredentials

List of an external auth identity provider's credentials.

Property Name	Type	Description	Available Version
`credentials`	[ConnectApi.ExternalAuthIdentityProviderCredential on page 2088]>	List of external auth identity provider credentials.	62.0

SEE ALSO:

getExternalAuthIdentityProviderCredentials(fullName)

createExternalAuthIdentityProviderCredentials(fullName, requestBody)

updateExternalAuthIdentityProviderCredentials(fullName, requestBody)

ConnectApi.ExternalAuthIdentityProviderList

List of external auth identity providers in the org.

Property Name	Type	Description	Available Version
`externalAuthIdentityProviders`	[ConnectApi.ExternalAuthIdentityProvider on page 2086]>	List of external auth identity providers.	62.0

SEE ALSO:

getExternalAuthIdentityProviders()

ConnectApi.ExternalAuthIdentityProviderParameter

External auth identity provider parameter.

Property Name	Type	Description	Available Version
parameterName	String	The name of the external auth identity provider parameter.	63.0
parameterType	ConnectApi.ExternalAuthIdentityProviderParameterType	Parameter type for an external auth identity provider. Values are: • AuthorizeRequestQueryParameter • IdentityProviderOptions • RefreshRequestBodyParameter • RefreshRequestHttpHeader • RefreshRequestQueryParameter • TokenRequestBodyParameter • TokenRequestHttpHeader • TokenRequestQueryParameter	63.0
parameterValue	String	If parameterType describes a literal value then the literal value is stored in this property.	63.0
sequenceNumber	Integer	Specifies the order of parameters to apply when an external auth identity provider has more than one parameter. Priority is from lower to higher numbers, for example, 1 is the highest priority.	63.0

SEE ALSO:

ConnectApi.ExternalAuthIdentityProvider

ConnectApi.ExternalCredential

External credential, including the named credentials and principals associated with it and the type and status of each principal.

If you don't have the View Setup and Configuration permission, some properties are empty or show limited information.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Property Name	Type	Description	Available Version
authenticationProtocol	ConnectApi.CredentialAuthenticationProtocol	Authentication protocol of the external credential. Values are: • AwsSv4 • Basic • Custom • Jwt • OAuth	56.0

Property Name	Type	Description	Available Version
authenticationProtocolVariant	ConnectApi.CredentialAuthenticationProtocolVariant	Authentication protocol variant of the external credential. Values are: • AwsSv4_STS—AWS Signature Version 4 with Security Token Service. • ClientCredentialsClientSecret—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's request body. • ClientCredentialsClientSecretBasic—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's authorization header, as with Basic authentication. • ClientCredentialsJwtAssertion—OAuth 2.0 Client Credentials JSON Web Token assertion. • JwtBearer—OAuth 2.0 JSON Web Token bearer flow. • NoAuthentication—No authentication. • RolesAnywhere—AWS Signature Version 4 with Identity and Access Management (IAM) Roles Anywhere.	57.0
authenticationStatus	ConnectApi.CredentialAuthenticationStatus	Status of the credential authentication. Values are: • Configured—Credential has all required credentials for at least one principal. • NotConfigured—Credential isn't configured. • Unknown—Credential status can't be determined because the authentication protocol is custom.	56.0
createdByNamespace	String	Namespace of the package that created the external credential.	59.0
customHeaders	List<ConnectApi.CredentialCustomHeader>	List of custom headers.	57.0
developerName	String	Fully qualified developer name of the external credential.	56.0
id	String	External credential ID.	58.0
masterLabel	String	External credential label.	56.0
parameters	List<ConnectApi.ExternalCredentialParameter>	List of parameters of the external credential.	57.0

Property Name	Type	Description	Available Version
`principals`	List<`ConnectApi.ExternalCredentialPrincipal`>	List of principals the credential has.	56.0
`relatedNamedCredentials`	List<`ConnectApi.NamedCredential`>	List of named credentials associated to the external credential.	56.0
`url`	String	Connect REST API URL for the external credential.	58.0

SEE ALSO:

ConnectApi.ExternalCredentialList

ConnectApi.NamedCredential

ConnectApi.ExternalCredentialList

List of external credentials.

Property Name	Type	Description	Available Version
`externalCredentials`	List<`ConnectApi.ExternalCredential`>	List of external credentials.	56.0

ConnectApi.ExternalCredentialParameter

External credential parameter.

Property Name	Type	Description	Available Version
`id`	String	Parameter ID.	58.0
`parameterDescription`	String	Parameter description.	58.0
`parameterName`	String	Parameter name. If the `parameterType` is `AuthParameter`, valid values are: • `AwsAccountId`—Valid for AwsSv4. • `AwsProfileArn`—Valid for AwsSv4 with RolesAnywhere. • `AwsRegion`—Valid for AwsSv4. • `AwsService`—Valid for AwsSv4. • `AwsStsDuration`—Valid for AwsSv4 with STS or RolesAnywhere. • `AwsStsExternalId`—Valid for AwsSv4 with STS. • `AwsTrustAnchorArn`—Valid for AwsSv4 with RolesAnywhere.	57.0

Property Name	Type	Description	Available Version
		• `Scope`—Valid for OAuth. Other parameter types can be any value.	
`parameterType`	`ConnectApi.ExternalCredentialParameterType`	Parameter type of the external credential. Values are: • `AdditionalRefreshStatusCode` • `AuthParameter` • `AuthProvider` • `AuthProviderUrl` • `AuthProviderUrlQueryParameter` • `JwtBodyClaim` • `JwtHeaderClaim` • `SigningCertificate`	57.0
`parameterValue`	String	Parameter value. If the `parameterType` is `JwtBodyClaim` or `JwtHeaderClaim`, the parameter value can contain formulas. If the `parameterType` is `AuthProvider` or `SigningCertificate`, the parameter value is the fully qualified entity name of the corresponding entity.	57.0

SEE ALSO:

ConnectApi.ExternalCredential

ConnectApi.ExternalCredentialPrincipal

External credential principal.

If you don't have the View Setup and Configuration permission, some properties are empty or show limited information.

Property Name	Type	Description	Available Version
`authenticationStatus`	`ConnectApi.CredentialAuthenticationStatus`	Status of the credential authentication. Values are: • `Configured`—Credential has all required credentials for at least one principal. • `NotConfigured`—Credential isn't configured. • `Unknown`—Credential status can't be determined because the authentication protocol is custom.	56.0
`id`	String	ID of the external credential principal.	58.0

Property Name	Type	Description	Available Version
`parameters`	List<`ConnectApi.ExternalCredentialParameter`>	List of external credential parameters.	58.0
`principalAccess`	List<`ConnectApi.ExternalCredentialPrincipalAccess`>	List of access entities associated with the external credential principal.	58.0
`principalName`	String	Name of the external credential named principal.	56.0
`principalType`	`ConnectApi.CredentialPrincipalType`	Type of credential principal. Values are: • `AwsStsPrincipal` • `NamedPrincipal` • `PerUserPrincipal`	56.0
`sequenceNumber`	Integer	Sequence number of the external credential principal.	58.0

SEE ALSO:

ConnectApi.ExternalCredential

ConnectApi.ExternalCredentialPrincipalAccess

External credential principal access.

Property Name	Type	Description	Available Version
`developerName`	String	Developer name of the associated access entity.	58.0
`id`	String	ID of the associated access entity.	58.0
`type`	`ConnectApi.ExternalCredentialPrincipalAccessType`	Access type of the external credential principal. Values are: • `PermissionSet` • `PermissionSetGroup` • `Profile`	58.0

SEE ALSO:

ConnectApi.ExternalCredentialPrincipal

ConnectApi.ExternalFilePermissionInformation

External file permission information.

Property Name	Type	Description	Available Version
externalFilePermissionTypes	List<ConnectApi.ContentHubPermissionType>	Available permission types for the parent folder of the external file, or null for non-external files or when includeExternalFilePermissionsInfo is false.	39.0
externalFilePermissionsFailure	Boolean	true if the retrieval of external file information failed or if includeExternalFilePermissionsInfo is false; false otherwise.	39.0
externalFilePermissionsInfoFailureReason	String	Explanation of the failure if a failure occurred and includeExternalFilePermissionsInfo is true; null otherwise.	39.0
externalFileSharingStatus	ConnectApi.ContentHubExternalItemSharingType	Sharing status for the external file. Values are: • DomainSharing—File is shared with the domain. • PrivateSharing—File is private or shared only with individuals. • PublicSharing—File is publicly shared. Value is null for non-external files or when includeExternalFilePermissionsInfo is false.	39.0
repositoryPublicGroups	List<ConnectApi.RepositoryGroupSummary>	Available public groups in the external repository or null for non-external files or when includeExternalFilePermissionsInfo is false.	39.0

SEE ALSO:

ConnectApi.AbstractRepositoryFile

ConnectApi.ExternalManagedAccountAddressOutput

Default shipping address for an externally managed account.

Property Name	Type	Description	Available Version
city	String	City of the external managed account record.	53.0
country	String	Country of the external managed account record.	53.0
geolocationAccuracy	String	Geolocation accuracy of the external managed account record.	53.0
latitude	String	Latitude of the external managed account record.	53.0

Property Name	Type	Description	Available Version
`longitude`	String	Longitude of the external managed account record.	53.0
`state`	String	State of the external managed account record.	53.0
`street`	String	Street of the external managed account record.	53.0
`zip`	String	Postal code of the external managed account record.	53.0

SEE ALSO:

ConnectApi.ExternalManagedAccountOutput

ConnectApi.ExternalManagedAccountCollectionOutput

Collection of externally managed accounts.

Property Name	Type	Description	Available Version
`externalManagedAccounts`	List<`ConnectApi.ExternalManagedAccountOutput`>	Collection of externally managed accounts.	49.0
`totalExternalManagedAccounts`	Integer	Total number of externally managed accounts.	49.0

ConnectApi.ExternalManagedAccountOutput

Externally managed account.

Property Name	Type	Description	Available Version
`accountId`	String	ID of the account managed by another account.	49.0
`accountName`	String	Name of the external managed account record.	53.0
`address`	`ConnectApi.ExternalManagedAccountAddressOutput`	Default shipping address of the external managed account.	53.0
`externalManagedAccountId`	String	ID of the external managed account record.	49.0
`isMyAccount`	Boolean	Specifies whether the account is the context user's account (`true`) or not (`false`).	53.0

SEE ALSO:

ConnectApi.ExternalManagedAccountCollectionOutput

ConnectApi.FacetValue

Facet value.

This class is abstract and is a superclass of ConnectApi.DistinctFacetValue.

Property Name	Type	Description	Available Version
`type`	`ConnectApi.CommerceSearchFacetType`	Search facet type. Value is: • `DistinctValue`	52.0

ConnectApi.Features

Features available to the context user in the org.

Property	Type	Description	Available Version
`activityReminderNotificationsEnabled`	Boolean	Reserved for future use.	37.0
`chatter`	Boolean	Specifies whether Chatter is enabled.	28.0
`chatterActivity`	Boolean	Specifies whether user details include information about Chatter activity.	28.0
`chatterAnswers`	Boolean	Specifies whether Chatter Answers is enabled. Note: With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see End of Support for Chatter Answers in Spring '18.	29.0
`chatterGlobalInfluence`	Boolean	Specifies whether user details include global Chatter activity.	28.0
`chatterGroupRecords`	Boolean	Specifies whether Chatter groups can have records associated with them.	30.0
`chatterGroupRecordSharing`	Boolean	Specifies whether Chatter records are implicitly shared among group members when records are added to groups.	30.0
`chatterMessages`	Boolean	Specifies whether Chatter messages are enabled.	28.0
`chatterTopics`	Boolean	Specifies whether topics are enabled.	28.0
`communitiesEnabled`	Boolean	Specifies whether digital experiences is enabled.	31.0

Property	Type	Description	Available Version
`communityModeration`	Boolean	Specifies whether moderation is enabled.	29.0
`communityReputation`	Boolean	Specifies whether reputation is enabled.	32.0
`customFiscalCalendarEnabled`	Boolean	Specifies whether custom fiscal calendar is enabled.	63.0
`dashboardComponentSnapshots`	Boolean	Specifies whether the user can post dashboard component snapshots.	28.0
`defaultCurrencyIsoCode`	String	ISO code of the default currency. Applicable only when `multiCurrency` is `false`.	28.0
`defaultLocale`	String	Specifies the Default locale.	63.0
`einsteinVoiceEnabled`	Boolean	Reserved for future use.	46.0
`einsteinVoiceInPilotEnabled`	Boolean	Reserved for future use.	46.0
`einsteinVoiceLoggingEnabled`	Boolean	Reserved for future use.	46.0
`einsteinVoiceProviderId`	Integer	Reserved for future use.	46.0
`favoritesEnabled`	Boolean	Specifies whether favorites in Lightning are enabled.	41.0
`feedPolling`	Boolean	Reserved for future use.	28.0
`feedStreamEnabled`	Boolean	Specifies whether Chatter feed streams are enabled.	39.0
`files`	Boolean	Specifies whether files can act as resources for Connect REST API.	28.0
`filesOnComments`	Boolean	Specifies whether files can be attached to comments.	28.0
`fiscalYearStartMonth`	Integer	Specifies the number that corresponds to the month that starts the fiscal year for the org. For example, if the org's fiscal year starts in February, the value is 2.	63.0
`forecasting3AggregatedEnabled`	Boolean	Specifies whether aggregated forecasting is enabled for mobile clients.	38.0

Property	Type	Description	Available Version
`forecastingEnabled`	Boolean	Specifies whether forecasting is enabled.	38.0
`forecastingPeriodRange`	Integer	Range of the forecasting period.	38.0
`forecastingPeriodStart`	Integer	Start index for the forecasting period.	38.0
`forecastingPeriodType`	`ConnectApi.PeriodType`	Time period used for forecasting. Values are: • `Month` • `Quarter` • `Week` • `Year`	38.0
`groupsCanFollow`	Boolean	Reserved for future use.	28.0–29.0
`ideas`	Boolean	Specifies whether Ideas is enabled.	29.0
`liveAgentHostName`	String	Live Agent host name configured for the org.	41.0
`managedTopicsEnabled`	Boolean	Specifies whether managed topics are enabled.	32.0
`maxEntitySubscriptionsPerStream`	Integer	Specifies the maximum number of feed-enabled entities that can be subscribed to in a Chatter stream.	39.0
`maxFilesPerFeedItem`	Integer	Specifies the maximum number of files that can be added to a feed item.	36.0
`maxStreamsPerPerson`	Integer	Specifies the maximum number of Chatter streams that a user can have.	39.0
`mobileNotificationsEnabled`	Boolean	Reserved for future use.	29.0
`multiCurrency`	Boolean	Specifies whether the org uses multiple currencies (`true`) or not (`false`). When `false`, the `defaultCurrencyIsoCode` indicates the ISO code of the default currency.	28.0
`offlineEditEnabled`	Boolean	Specifies whether the offline object permissions are enabled for Salesforce for Android and Salesforce for iOS mobile clients.	37.0
`publisherActions`	Boolean	Specifies whether actions in the publisher are enabled.	28.0
`storeDataOnDevicesEnabled`	Boolean	Specifies whether the Salesforce for Android and Salesforce for iOS can use secure, persistent storage on mobile devices to cache data.	30.0

Property	Type	Description	Available Version
`thanksAllowed`	Boolean	Reserved for future use.	28.0
`trendingTopics`	Boolean	Specifies whether trending topics are enabled.	28.0
`userNavItemsEnabled`	Boolean	Specifies whether users can customize the navigation bar in Lightning.	41.0
`usesStartDateAsFiscalYearName`	Boolean	Specifies whether the calendar year when the fiscal year begins is referred to as the year of the company's fiscal year. For example, if the fiscal year begins in November 2025, but is referred to as fiscal year 2026, the value is `false`.	63.0
`viralInvitesAllowed`	Boolean	Specifies whether existing Chatter users can invite people in their company to use Chatter.	28.0
`wave`	Boolean	Specifies whether CRM Analytics is enabled.	36.0

SEE ALSO:

getSettings()

ConnectApi.OrganizationSettings

ConnectApi.Feed

Chatter feed.

Name	Type	Description	Available Version
`feedElementPostUrl`	String	Connect REST API URL to post feed elements to this subject.	31.0
`feedElements`	ConnectApi.FeedElementPage	Page of feed elements for the feed specified in `redirectedFeedType`. Otherwise, `null`.	40.0
`feedElementsUrl`	String	Connect REST API URL to feed elements.	31.0
`feedItemsUrl`	String	Connect REST API URL to feed items.	28.0–31.0
`isModifedUrl`	String	Connect REST API URL with a *`since`* request parameter that contains an opaque token that describes when the feed was last modified. Returns `null` if the feed isn't a news feed. Use this URL to poll a news feed for updates. **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	28.0
`pinnedFeedElementsUrl`	String	URL to pinned feed items.	41.0

Name	Type	Description	Available Version
`redirectedFeedFilter`	`ConnectApi.FeedFilter`	Filter for the feed specified in `redirectedFeedType`. Otherwise, `null`.	42.0
`redirectedFeedSort`	`ConnectApi.FeedSortOrder`	Sort order for the feed specified in `redirectedFeedType`. Otherwise, `null`.	42.0
`redirectedFeedType`	`ConnectApi.FeedType`	Specifies which feed is returned if `pageSize` is specified. Otherwise, `null`.	40.0
`respectsMute`	Boolean	Indicates whether the feed respects the mute feature. If `true`, the feed shows the ability to mute or unmute each element, depending on the value of `isMutedByMe`; `null` if the mute feature is disabled for the organization.	35.0

ConnectApi.FeedBody

Feed body.

Subclass of ConnectApi.AbstractMessageBody.

No additional properties.

SEE ALSO:

- ConnectApi.Comment
- ConnectApi.FeedElement
- ConnectApi.FeedEntitySummary

ConnectApi.FeedDirectory

Directory of feeds and favorites.

Name	Type	Description	Available Version
`favorites`	`List<ConnectApi.FeedFavorite>`	A list of feed favorites	30.0
`feeds`	`List<ConnectApi.FeedDirectoryItem>`	A list of feeds	30.0

ConnectApi.FeedDirectoryItem

Definition of a feed.

Name	Type	Description	Available Version
`feedElementsUrl`	String	Connect REST API resource URL for the feed elements.	
`feedItemsUrl`	String	Connect REST API resource URL for the feed items of a specific feed.	30.0–31.0
`feedType`	`ConnectApi.FeedType` Enum	The feed type. One of these values: • `Bookmarks`—Contains all feed items saved as bookmarks by the context user. • `Company`—Contains all feed items except feed items of type `TrackedChange`. To see the feed item, the user must have sharing access to its parent. • `DirectMessageModeration`—Contains all direct messages that are flagged for moderation. The Direct Message Moderation feed is available only to users with Moderate Experiences Chatter Messages permissions. • `DirectMessages`—Contains all feed items of the context user's direct messages. • `Draft`—Contains all the feed items that the context user drafted. • `Files`—Contains all feed items that contain files posted by people or groups that the context user follows. • `Filter`—Contains the news feed filtered to contain feed items whose parent is a specified object type. • `Groups`—Contains all feed items from all groups the context user either owns or is a member of. • `Home`—Contains all feed items associated with any managed topic in an Experience Cloud site. • `Isolated`—Contains all the feed items and comments that are isolated. • `Landing`—Contains all feed items that best drive user engagement when the feed is requested. Allows clients to avoid an empty feed when there aren't many personalized feed items. • `Moderation`—Contains all feed items that are flagged for moderation, except direct messages. The moderation feed is available only to users with Moderate Experiences Feeds permissions. • `Mute`—Contains all feed items that the context user muted. • `News`—Contains all updates for people the context user follows, groups the user is a member of, and files and records the user is following. Contains all updates for records whose parent is the context user. • `PendingReview`—Contains all feed items and comments that are pending review. • `People`—Contains all feed items posted by all people the context user follows.	30.0

Name	Type	Description	Available Version
		• `Record`—Contains all feed items whose parent is a specified record, which could be a group, user, object, file, or any other standard or custom object. When the record is a group, the feed also contains feed items that mention the group. When the record is a user, the feed contains only feed items on that user. You can get another user's record feed. • `Streams`—Contains all feed items for any combination of up to 25 feed-enabled entities that the context user subscribes to in a stream. Examples of feed-enabled entities include people, groups, and records, • `To`—Contains all feed items with mentions of the context user. Contains feed items the context user commented on and feed items created by the context user that are commented on. • `Topics`—Contains all feed items that include the specified topic. • `UserProfile`—Contains feed items created when a user changes records that can be tracked in a feed. Contains feed items whose parent is the user and feed items that @mention the user. This feed is different than the news feed, which returns more feed items, including group updates. You can get another user's user profile feed.	
`feedUrl`	String	Connect REST API resource URL for a specific feed	30.0
`keyPrefix`	String	A *key prefix* is the first three characters of a record ID, which specifies the object type. For filter feeds, this value is the key prefix associated with the object type used to filter this feed. All feed items in this feed have a parent whose object type matches this key prefix value. For non-filter feeds, this value is `null`.	30.0
`label`	String	Localized label of the feed	30.0

SEE ALSO:

ConnectApi.FeedDirectory

ConnectApi.FeedElement

Feed elements are the top-level items that a feed contains. Feeds are feed element containers.

This class is abstract.

Superclass of:

- ConnectApi.FeedItem
- ConnectApi.GenericFeedElement

Property Name	Type	Description	Available Version
`body`	`ConnectApi.FeedBody`	Information about the feed element. **Important:** Use the `header.text` property as the default value for rendering text because the `body.text` property can be `null`.	22.0
`capabilities`	`ConnectApi.FeedElementCapabilities`	A container for all capabilities that can be included with a feed element.	31.0
`createdDate`	Datetime	ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	31.0
`feedElementType`	`ConnectApi.FeedElementType`	Feed elements are the top-level objects that a feed contains. The feed element type describes the characteristics of that feed element. One of these values: • `Bundle`—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values. • `FeedItem`—A feed item has a single parent and is scoped to oneExperience Cloud site or across all Experience Cloud sites. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values. • `Recommendation`—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user.	31.0
`header`	`ConnectApi.MessageBody`	The header is the title of the post. This property contains renderable plain text for all the segments of the message. If a client doesn't know how to render a feed element type, it should render this text.	31.0
`id`	String	18-character ID of the feed element.	22.0
`modifiedDate`	Datetime	ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	31.0
`parent`	`ConnectApi.ActorWithId`	Feed element's parent	28.0

Property Name	Type	Description	Available Version
relativeCreatedDate	String	The created date formatted as a relative, localized string, for example, "17m ago" or "Yesterday."	31.0
url	String	Connect REST API URL to this feed element.	22.0

SEE ALSO:

- ConnectApi.Announcement
- ConnectApi.FeedElementPage
- ConnectApi.PinnedFeedElements
- ConnectApi.QuestionAndAnswersSuggestions

ConnectApi.FeedElementCapabilities

A container for all capabilities that can be included with a feed element.

Property Name	Type	Description	Available Version
approval	ConnectApi.ApprovalCapability	If a feed element has this capability, it includes information about an approval.	32.0
associatedActions	ConnectApi.AssociatedActionsCapability	If a feed element has this capability, it has platform actions associated with it.	33.0
banner	ConnectApi.BannerCapability	If a feed element has this capability, it has a banner motif and style.	31.0
bookmarks	ConnectApi.BookmarksCapability	If a feed element has this capability, the context user can bookmark it.	31.0
bundle	ConnectApi.BundleCapability	If a feed element has this capability, it has a container of feed elements called a *bundle*.	31.0
callCollaboration	ConnectApi.CallCollaborationCapability	If a feed element has this capability, it has a recording comment.	51.0
canvas	ConnectApi.CanvasCapability	If a feed element has this capability, it renders a canvas app.	32.0
caseComment	ConnectApi.CaseCommentCapability	If a feed element has this capability, it has a case comment on the case feed.	32.0
chatterLikes	ConnectApi.ChatterLikesCapability	If a feed element has this capability, the context user can like it. Exposes information about existing likes.	31.0
close	ConnectApi.CloseCapability	If a feed element has this capability, users with permission can close it.	43.0

Property Name	Type	Description	Available Version
comments	ConnectApi.CommentsCapability	If a feed element or comment has this capability, the context user can add a comment to it.	31.0
content	ConnectApi.ContentCapability	If a comment has this capability, it has a file attachment. Most ConnectApi.ContentCapability properties are null if the content has been deleted from the feed element or if the access has changed to private. **Important:** In version 36.0 and later, use the files property.	32.0–35.0
dashboardComponentSnapshot	ConnectApi.DashboardComponentSnapshotCapability	If a feed element has this capability, it has a dashboard component snapshot. A snapshot is a static image of a dashboard component at a specific point in time.	32.0
directMessage	ConnectApi.DirectMessageCapability	If a feed element has this capability, it's a direct message.	39.0
edit	ConnectApi.EditCapability	If a feed element has this capability, users who have permission can edit it.	34.0
emailMessage	ConnectApi.EmailMessageCapability	If a feed element has this capability, it has an email message from a case.	32.0
enhancedLink	ConnectApi.EnhancedLinkCapability	If a feed element has this capability, it has a link that may contain supplemental information like an icon, a title, and a description.	32.0
extensions	ConnectApi.ExtensionsCapability	If a feed element has this capability, it has one or more extension attachments.	40.0
feedEntityShare	ConnectApi.FeedShareCapability	If a feed element or comment has this capability, a feed entity is shared with it.	39.0
files	ConnectApi.FilesCapability	If a feed element has this capability, it has one or more file attachments.	36.0
interactions	ConnectApi.InteractionsCapability	If a feed element has this capability, it has information about user interactions.	37.0
link	ConnectApi.LinkCapability	If a feed element has this capability, it has a link.	32.0
mediaReferences	ConnectApi.MediaReferenceCapability	If a feed element has this capability, it has one or more media references.	41.0

Property Name	Type	Description	Available Version
moderation	ConnectApi.ModerationCapability	If a feed element has this capability, users in an Experience Cloud site can flag it for moderation.	31.0
mute	ConnectApi.MuteCapability	If a feed element has this capability, users can mute it.	35.0
origin	ConnectApi.OriginCapability	If a feed element has this capability, it was created by a feed action.	33.0
pin	ConnectApi.PinCapability	If a feed element has this capability, users who have permission can pin it to a feed.	41.0
poll	ConnectApi.PollCapability	If a feed element has this capability, it includes a poll.	31.0
questionAndAnswers	ConnectApi.QuestionAndAnswersCapability	If a feed element has this capability, it has a question and comments on the feed element are answers to the question.	31.0
readBy	ConnectApi.ReadByCapability	If a feed element has this capability, the context user can mark it as read.	40.0
recommendations	ConnectApi.RecommendationsCapability	If a feed element has this capability, it has a recommendation.	32.0
recordSnaphot	ConnectApi.RecordSnapshotCapability	If a feed element has this capability, it contains all the snapshotted fields of a record for a single create record event.	32.0
socialPost	ConnectApi.SocialPostCapability	If a feed element has this capability, it can interact with a social post on a social network.	36.0
status	ConnectApi.StatusCapability	If a feed post or comment has this capability, it has a status that determines its visibility.	37.0
topics	ConnectApi.TopicsCapability	If a feed element has this capability, the context user can add topics to it. Topics help users organize and discover conversations.	31.0
trackedChanges	ConnectApi.TrackedChangesCapability	If a feed element has this capability, it contains all changes to a record for a single tracked change event.	32.0

Property Name	Type	Description	Available Version
`upDownVote`	`ConnectApi.UpDownVoteCapability`	If a feed post or comment has this capability, users can upvote or downvote it.	41.0

SEE ALSO:

- ConnectApi.FeedElement
- ConnectApi.FeedItemSummary

ConnectApi.FeedElementCapability

A feed element capability, which defines the characteristics of a feed element.

In API version 30.0 and earlier, most feed items can have comments, likes, topics, and so on. In version 31.0 and later, every feed item (and feed element) can have a unique set of *capabilities*. If a capability property exists on a feed element, that capability is available, even if the capability property doesn't have a value. For example, if the `ChatterLikes` capability property exists on a feed element (with or without a value), the context user can like that feed element. If the capability property doesn't exist, it isn't possible to like that feed element. A capability can also contain associated data. For example, the `Moderation` capability contains data about moderation flags.

This class is abstract.

This class is a superclass of:

- ConnectApi.AssociatedActionsCapability
- ConnectApi.ApprovalCapability
- ConnectApi.BannerCapability
- ConnectApi.BookmarksCapability
- ConnectApi.BundleCapability
- ConnectApi.CallCollaborationCapability
- ConnectApi.CanvasCapability
- ConnectApi.CaseCommentCapability
- ConnectApi.ChatterLikesCapability
- ConnectApi.CloseCapability
- ConnectApi.CommentsCapability
- ConnectApi.ContentCapability
- ConnectApi.DashboardComponentSnapshotCapability
- ConnectApi.DirectMessageCapability
- ConnectApi.EmailMessageCapability
- ConnectApi.EnhancedLinkCapability
- ConnectApi.ExtensionsCapability
- ConnectApi.FeedEntityShareCapability
- ConnectApi.FilesCapability
- ConnectApi.InteractionsCapability
- ConnectApi.LinkCapability

- ConnectApi.MediaReferenceCapability
- ConnectApi.ModerationCapability
- ConnectApi.MuteCapability
- ConnectApi.OriginCapability
- ConnectApi.PinCapability
- ConnectApi.PollCapability
- ConnectApi.QuestionAndAnswersCapability
- ConnectApi.ReadByCapability
- ConnectApi.RecommendationsCapability
- ConnectApi.RecordCapability
- ConnectApi.RecordSnapshotCapability
- ConnectApi.SocialPostCapability
- ConnectApi.StatusCapability
- ConnectApi.TopicsCapability
- ConnectApi.TrackedChangesCapability
- ConnectApi.UpDownVoteCapability
- ConnectApi.VerifiedCapability

This class doesn't have any properties.

ConnectApi.FeedElementPage

A paged collection of `ConnectApi.FeedElement` objects.

Property Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	31.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	31.0
`elements`	List<`ConnectApi.FeedElement`>	Collection of feed elements.	31.0
`isModifiedToken`	String	Opaque polling token to use in the *`since`* parameter of the `ChatterFeeds.isModified` method. The token describes when the feed was last modified. **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	31.0
`isModifiedUrl`	String	Connect REST API URL with a *`since`* request parameter that contains an opaque token that describes when the feed was last modified. Returns `null` if the feed isn't a news feed. Use this URL to poll a news feed for updates.	31.0

Property Name	Type	Description	Available Version
		Important: This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	31.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	31.0
`updatesToken`	String	A token to use in a request to the `ConnectApi.ChatterFeeds.getFeedElementsUpdatedSince` method.	31.0
`updatesUrl`	String	Connect REST API feed resource containing the feed elements that have been updated since the feed was refreshed. If the feed doesn't support this feature, the value is `null`.	31.0

SEE ALSO:

ConnectApi.BundleCapability

ConnectApi.Feed

ConnectApi.FeedEnabledEntity

An entity that can have feeds associated with it.

Property Name	Type	Description	Available Version
`id`	String	The 18-character ID of the record.	39.0
`motif`	`ConnectApi.Motif`	Small, medium, and large icons indicating the record's type.	39.0
`name`	String	The localized name of the record.	39.0
`type`	String	The type of the record.	39.0
`url`	String	URL to the record.	39.0

SEE ALSO:

ConnectApi.ChatterStream

ConnectApi.FeedEntityIsEditable

Indicates if the context user can edit a feed element or comment.

Property Name	Type	Description	Available Version
`areAttachmentsEditableByMe`	Boolean	`true` if the context user can add and remove attachments on the feed element or comment, `false` otherwise.	36.0
`feedEntityUrl`	String	URL of the feed element or comment.	34.0
`isEditableByMe`	Boolean	`true` if the context user can edit the feed element or comment, `false` otherwise.	34.0

ConnectApi.FeedEntityNotAvailableSummary

A summary when the feed entity isn't available.

Subclass of ConnectApi.FeedEntitySummary.

No additional properties.

ConnectApi.FeedEntityReadSummary

Summary of the feed post or comment that was read.

Subclass of ConnectApi.UserFeedEntityActivitySummary.

No additional properties.

ConnectApi.FeedEntityShareCapability

If a feed element or comment has this capability, a feed entity is shared with it.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`feedEntity`	`ConnectApi.FeedEntitySummary`	The summary of the feed entity that is shared with the feed element or comment.	39.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.FeedEntitySummary

The summary of a feed entity that is shared with a feed element.

This class is abstract.

Superclass of:

- ConnectApi.FeedItemSummary
- ConnectApi.FeedEntityNotAvailableSummary

Property Name	Type	Description	Available Version
`actor`	`ConnectApi.Actor`	Entity that created the feed entity.	39.0
`body`	`ConnectApi.FeedBody`	Information about the feed entity.	39.0
`createdDate`	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z, when the entity was created.	39.0
`feedElementType`	`ConnectApi.FeedElementType`	Type of feed entity. • `Bundle`—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values. • `FeedItem`—A feed item has a single parent and is scoped to oneExperience Cloud site or across all Experience Cloud sites. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values. • `Recommendation`—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user.	39.0
`id`	String	18-character ID of the feed entity.	39.0
`isEntityAvailable`	Boolean	Specifies whether the entity is available. If `false`, either the user doesn't have access to the entity or the entity was deleted.	39.0
`parent`	`ConnectApi.ActorWithId`	Parent of the feed entity.	39.0
`relativeCreatedDate`	String	Relative created date, for example, "2h ago."	39.0
`url`	String	URL to the feed entity.	39.0

SEE ALSO:

ConnectApi.FeedEntityShareCapability

ConnectApi.FeedFavorite

Feed favorite.

Name	Type	Description	Available Version
`community`	`ConnectApi.Reference`	Information about the Experience Cloud site that contains the favorite.	28.0
`createdBy`	`ConnectApi.UserSummary`	Favorite's creator.	28.0
`feedUrl`	String	Connect REST API URL identifying the feed item for this favorite.	28.0
`id`	String	Favorite's 18–character ID.	28.0
`lastViewDate`	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	28.0
`name`	String	Favorite's name.	28.0
`searchText`	String	If the favorite is from a search, contains the search text, otherwise, an empty string.	28.0
`target`	`ConnectApi.Reference`	A reference to the topic if applicable, `null` otherwise.	28.0
`type`	`ConnectApi.FeedFavoriteType` Enum	An empty string or one of the following values: • `ListView` • `Search` • `Topic`	28.0
`url`	String	Connect REST API URL to this favorite.	28.0
`user`	`ConnectApi.UserSummary`	Information about the user who saved this favorite.	28.0

SEE ALSO:

ConnectApi.FeedDirectory

ConnectApi.FeedFavorites

ConnectApi.FeedFavorites

Feed favorites.

Name	Type	Description	Available Version
`favorites`	`List<ConnectApi.FeedFavorite>`	Complete list of favorites.	28.0
`total`	Integer	Total number of favorites.	28.0

ConnectApi.FeedItem

Feed item.

Subclass of ConnectApi.FeedElement Class as of version 31.0.

Name	Type	Description	Available Version
`actor`	`ConnectApi.Actor`	The entity that created the feed item.	28.0
`attachment`	`ConnectApi.FeedItemAttachment`	Information about the attachment. If there is no attachment, returns `null`. **Important:** As of version 32.0, use the inherited `capabilities` property.	28.0–31.0
`canShare`	Boolean	Indicates whether the feed item can be shared. If a feed item has multiple file attachments and at least one attachment has been deleted or is inaccessible, the feed item can't be shared. The `canShare` value is incorrectly set to `true` in these cases. **Important:** As of version 39.0, use the `isSharable` property.	28.0–38.0
`clientInfo`	`ConnectApi.ClientInfo`	Information about the connected app used to authenticate the connection.	28.0
`comments`	`ConnectApi.CommentPage`	First page of comments for this feed item. **Important:** As of version 32.0, use the inherited `capabilities.comments.page` property.	28.0–31.0
`event`	Boolean	`true` if feed item is created due to an event change, `false` otherwise.	22.0
`hasVerifiedComment`	Boolean	`true` if the feed item has a verified comment, otherwise `false`.	41.0
`isBookmarkedByCurrentUser`	Boolean	`true` if the context user has bookmarked this feed item, otherwise, `false`. **Important:** As of version 32.0, use the inherited `capabilities.bookmarks.isBookmarkedByCurrentUser` property.	28.0–31.0
`isDeleteRestricted`	Boolean	If this property is `true` the comment cannot be deleted by the context user. If it is `false`, it might be possible for the context user to delete the comment, but it is not guaranteed.	28.0

Name	Type	Description	Available Version
`isLikedBy CurrentUser`	Boolean	`true` if the context user has liked this feed item, otherwise, `false`. **Important:** As of version 32.0, use the inherited `capabilities.chatterLikes.isLikedByCurrentUser` property.	28.0–31.0
`isSharable`	Boolean	Indicates whether the feed item can be shared.	39.0
`likes`	`ConnectApi.ChatterLikePage`	First page of likes for this feed item. **Important:** As of version 32.0, use the inherited `capabilities.chatterLikes.page` property.	28.0–31.0
`likesMessage`	`ConnectApi.MessageBody`	A message body the describes who likes the feed item. **Important:** As of version 32.0, use the inherited `capabilities.chatterLikes.likesMessage` property.	28.0–31.0
`moderationFlags`	`ConnectApi.ModerationFlags`	Information about the moderation flags on a feed item. If `ConnectApi.Features.communityModeration` is `false`, this property is `null`. **Important:** As of version 31.0, use the inherited `capabilities.moderation.moderationFlags` property.	29.0–30.0
`myLike`	`ConnectApi.Reference`	If the context user has liked the feed item, this property is a reference to the specific like, otherwise, `null`. **Important:** As of version 32.0, use the inherited `capabilities.chatterLikes.myLike` property.	28.0–31.0
`originalFeedItem`	`ConnectApi.Reference`	A reference to the original feed item if this feed item is a shared feed item, otherwise, `null`.	28.0
`originalFeed ItemActor`	`ConnectApi.Actor`	If this feed item is a shared feed item, returns information about the original poster of the feed item, otherwise, returns `null`.	28.0

Name	Type	Description	Available Version
`photoUrl`	String	URL of the photo associated with the feed item	28.0
`preamble`	`ConnectApi.MessageBody`	A collection of message segments, including the unformatted text of the message that you can use as the title of a feed item. Message segments include name, link, and motif icon information for the actor that created the feed item. **Important:** For API versions 29.0 and 30.0, use the `ConnectApi.FeedItem.preamble.text` property as the default case to render text. For API versions 31.0 and later, use the `ConnectApi.FeedElement.header.text` property as the default case to render text.	28.0-30.0
`topics`	`ConnectApi.FeedItemTopicPage`	Topics for this feed item. **Important:** As of version 31.0, use the inherited `capabilities.topics.items` property.	28.0–31.0
`type`	`ConnectApi.FeedItemType`	Type of feed item. **Important:** As of API version 32.0, use the `capabilities` property to determine what can be done with a feed item. See Working with Feeds and Feed Elements. One of these values: • `ActivityEvent`—Feed item generated in Case Feed when an event or task associated with a parent record with a feed enabled is created or updated. • `AdvancedTextPost`—A feed item with advanced text formatting, such as a group announcement post. • `ApprovalPost`—Feed item with an approval capability. Approvers can act on the feed item parent. • `AttachArticleEvent`—Feed item generated when an article is attached to a case in Case Feed. • `BasicTemplateFeedItem`—Feed item with an enhanced link capability.	28.0

Name	Type	Description	Available Version
		• `CallLogPost`—Feed item generated when a call log is saved to a case in Case Feed. • `CanvasPost`—Feed item generated by a canvas app in the publisher or from Connect REST API or Connect in Apex. The post itself is a link to a canvas app. • `CaseCommentPost`—Feed item generated when a case comment is saved in Case Feed. • `ChangeStatusPost`—Feed item generated when the status of a case is changed in Case Feed. • `ChatTranscriptionPost`—Feed item generated in Case Feed when a Live Agent chat transcript is saved to a case. • `CollaborationGroupCreated`—Feed item generated when a new public group is created. Contains a link to the new group. • ~~`CollaborationGroupUnarchived`—Deprecated.~~ Feed item generated when an archived group is activated. • `ContentPost`—Feed item with a content capability. • `CreateRecordEvent`—Feed item that describes a record created in the publisher. • `DashboardComponentAlert`—Feed item with a dashboard alert. • `DashboardComponentSnapshot`—Feed item with a dashboard component snapshot capability. • `EmailMessageEvent`—Feed item generated when an email is sent from a case in Case Feed. • `FacebookPost`—Deprecated. Feed item generated when a Facebook post is created from a case in Case Feed. • `LinkPost`—Feed item with a link capability. • `MilestoneEvent`—Feed item generated when a case milestone is either completed or reaches a violation status. Contains a link to the case milestone. • `PollPost`—Feed item with a poll capability. Viewers of the feed item are allowed to vote on the options in the poll.	

Name	Type	Description	Available Version
		• `ProfileSkillPost`—Feed item generated when a skill is added to a user's profile. • `QuestionPost`—Feed item generated when a question is asked. As of API version 33.0, a feed item of this type can have a content capability and a link capability. • `ReplyPost`—Feed item generated by a Chatter Answers reply. • `RypplePost`—Feed item generated when a user posts thanks. • `SocialPost`—Feed item generated when a social post is created from a case in Case Feed. • `TextPost`—Feed item containing text only. • `TrackedChange`—Feed item created when one or more fields on a record have been changed. • `UserStatus`—Deprecated. A user's post to their own profile.	
`visibility`	`ConnectApi.FeedItemVisibilityType`	Type of users who can see a feed item. • `AllUsers`—Visibility is not limited to internal users. • `InternalUsers`—Visibility is limited to internal users.	28.0

ConnectApi.FeedItemSummary

A feed item summary.

Subclass of ConnectApi.FeedEntitySummary.

Property Name	Type	Description	Available Version
`capabilities`	`ConnectApi.FeedElementCapabilities`	Container for all capabilities that can be included with a feed item.	39.0
`header`	`ConnectApi.MessageBody`	Title of the post. This property contains renderable plain text for all the message segments. If a client doesn't know how to render a feed element type, it should render this text.	39.0

Property Name	Type	Description	Available Version
`modifiedDate`	Datetime	When the feed item was modified in the form of an ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	39.0
`originalFeedItem`	`ConnectApi.Reference`	Reference to the original feed item if this feed item is a shared feed item; otherwise, `null`.	39.0
`originalFeedItemActor`	`ConnectApi.Actor`	If this feed item is a shared feed item, information about the original poster of the feed item; otherwise, `null`.	39.0
`photoUrl`	String	URL of the photo associated with the feed item.	39.0
`visibility`	`ConnectApi.FeedItemVisibility`	Specifies who can see a feed item. • `AllUsers`—Visibility is not limited to internal users. • `InternalUsers`—Visibility is limited to internal users.	39.0

ConnectApi.FeedModifiedInfo

Feed modified information.

Important: This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.

Name	Type	Description	Available Version
`isModified`	Boolean	`true` if the news feed has been modified since the last time it was polled; `false` otherwise. Returns `null` if the feed is not a news feed.	28.0
`isModifiedToken`	String	Opaque polling token to use in the *`since`* parameter of the `ChatterFeeds.isModified` method. The token describes when the feed was last modified.	28.0
`nextPollUrl`	String	Connect REST API URL with a *`since`* request parameter that contains an opaque token that describes when the feed was last modified. Returns `null` if the feed isn't a news feed. Use this URL to poll a news feed for updates.	28.0

ConnectApi.FeedPollChoice

Feed poll choice.

Name	Type	Description	Available Version
`id`	String	Poll choice ID.	28.0

Name	Type	Description	Available Version
`position`	Integer	The location in the poll where this poll choice exists. The first poll choice starts at 1.	28.0
`text`	String	Label text associated with the poll choice.	28.0
`voteCount`	Integer	Total number of votes for this poll choice.	28.0
`voteCountRatio`	Double	The ratio of total number of votes for this poll choice to all votes cast in the poll. Multiply the ratio by 100 to get the percentage of votes cast for this poll choice.	28.0

SEE ALSO:

ConnectApi.PollCapability

ConnectApi.FeedPostSummary

Summary of the post.

Subclass of ConnectApi.UserActivitySummary.

Property Name	Type	Description	Available Version
`feedItemId`	String	ID of the post.	42.0

ConnectApi.FeedReadSummary

Summary of the feed that was read.

Subclass of ConnectApi.UserActivitySummary.

Property Name	Type	Description	Available Version
`containerId`	String	ID of the parent of the feed.	42.0
`feedType`	`ConnectApi.FeedType`	Type of feed. • `Bookmarks`—Contains all feed items saved as bookmarks by the context user. • `Company`—Contains all feed items except feed items of type `TrackedChange`. To see the feed item, the user must have sharing access to its parent. • `DirectMessageModeration`—Contains all direct messages that are flagged for moderation. The Direct Message Moderation feed is available only to users with Moderate Experiences Chatter Messages permissions. • `DirectMessages`—Contains all feed items of the context user's direct messages.	42.0

Property Name	Type	Description	Available Version
		• `Draft`—Contains all the feed items that the context user drafted. • `Files`—Contains all feed items that contain files posted by people or groups that the context user follows. • `Filter`—Contains the news feed filtered to contain feed items whose parent is a specified object type. • `Groups`—Contains all feed items from all groups the context user either owns or is a member of. • `Home`—Contains all feed items associated with any managed topic in an Experience Cloud site. • `Isolated`—Contains all the feed items and comments that are isolated. • `Landing`—Contains all feed items that best drive user engagement when the feed is requested. Allows clients to avoid an empty feed when there aren't many personalized feed items. • `Moderation`—Contains all feed items that are flagged for moderation, except direct messages. The moderation feed is available only to users with Moderate Experiences Feeds permissions. • `Mute`—Contains all feed items that the context user muted. • `News`—Contains all updates for people the context user follows, groups the user is a member of, and files and records the user is following. Contains all updates for records whose parent is the context user. • `PendingReview`—Contains all feed items and comments that are pending review. • `People`—Contains all feed items posted by all people the context user follows. • `Record`—Contains all feed items whose parent is a specified record, which could be a group, user, object, file, or any other standard or custom object. When the record is a group, the feed also contains feed items that mention the group. When the record is a user, the feed contains only feed items on that user. You can get another user's record feed.	

Property Name	Type	Description	Available Version
		• `Streams`—Contains all feed items for any combination of up to 25 feed-enabled entities that the context user subscribes to in a stream. Examples of feed-enabled entities include people, groups, and records, • `To`—Contains all feed items with mentions of the context user. Contains feed items the context user commented on and feed items created by the context user that are commented on. • `Topics`—Contains all feed items that include the specified topic. • `UserProfile`—Contains feed items created when a user changes records that can be tracked in a feed. Contains feed items whose parent is the user and feed items that @mention the user. This feed is different than the news feed, which returns more feed items, including group updates. You can get another user's user profile feed.	

ConnectApi.FieldChangeNameSegment

Field change name segment.

Subclass of ConnectApi.MessageSegment.

No additional properties.

ConnectApi.FieldChangeSegment

Field change segment.

Subclass of ConnectApi.ComplexSegment.

No additional properties.

SEE ALSO:

ConnectApi.MoreChangesSegment

ConnectApi.FieldChangeValueSegment

Field change value segment.

Subclass of ConnectApi.MessageSegment.

Name	Type	Description	Available Version
`valueType`	`ConnectApi.FieldChangeValueType Enum`	Value type of a field change. • `NewValue`—A new value • `OldValue`—An old value	28.0
`url`	String	URL value if the field change is to a URL field (such as a web address)	28.0

ConnectApi.FieldMetadata

Search metadata for the field of an object.

Property Name	Type	Description	Available Version
`domain`	String	The object that the field is associated with.	63.0
`field`	String	Field path through the object.	63.0
`fieldApiName`	String	API name of the field.	63.0
`fieldType`	`ConnectApi.FieldType`	Field type. Values are: • `Address` • `AnyType` • `Base64` • `Boolean` • `Combobox` • `ComplexValue` • `Currency` • `DataCategoryGroupReference` • `Date` • `DateTime` • `Double` • `Email` • `EncryptedString` • `ExtensionEntityLookup` • `ExternalLookup` • `FloatArray` • `Id` • `ImageUrl` • `IndirectLookup` • `Integer` • `Json` • `Location`	63.0

Property Name	Type	Description	Available Version
		• `Long` • `MultiPicklist` • `Percent` • `PersonName` • `Phone` • `Picklist` • `PlainTextArea` • `Reference` • `RichTextArea` • `Sobject` • `String` • `SwitchablePersonName` • `TextArea` • `Time` • `Url`	
`filterable`	Boolean	Specifies whether the field is filterable (`true`) or not (`false`).	63.0
`highlightable`	Boolean	Specifies whether the field is highlightable (`true`) or not (`false`).	63.0
`label`	String	Label of the field.	63.0
`sortable`	Boolean	Specifies whether the field is sortable (`true`) or not (`false`).	63.0

SEE ALSO:

ConnectApi.ObjectMetadata

ConnectApi.FieldValue

Field's value in product search results.

Property Name	Type	Description	Available Version
`value`	String	Value of the field.	52.0

SEE ALSO:

ConnectApi.ProductSummary

ConnectApi.File

File.

This class is abstract.

Subclass of ConnectApi.ActorWithId.

Superclass of ConnectApi.FileSummary.

Name	Type	Description	Available Version
`checksum`	String	MD5 checksum for the file.	28.0
`contentModifiedDate`	Datetime	ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z. File-specific modified date, which is updated only for direct file operations, such as rename. Modifications to the file from outside of Salesforce can update this date.	32.0
`contentSize`	Integer	Size of the file in bytes.	28.0
`contentUrl`	String	If the file is a link, returns the URL, otherwise, the string `null`.	28.0
`createdDate`	Datetime	ISO 8601 date string when the file was created.	41.0
`description`	String	Description of the file.	28.0
`downloadUrl`	String	URL to the file, that can be used for downloading the file.	28.0
`fileExtension`	String	Extension of the file.	28.0
`fileType`	String	Type of file, such as PDF, PowerPoint.	28.0
`flashRenditionStatus`	String	Specifies if a flash preview version of the file has been rendered. Note: Flash renditions were retired on July 16, 2021.	28.0
`isFileAsset`	Boolean	Specifies whether the file is an asset.	46.0
`isInMyFileSync`	Boolean	`true` if the file is synced with Salesforce Files Sync; `false` otherwise. Note: Salesforce Files Sync was retired on May 25, 2018.	28.0
`isMajorVersion`	Boolean	`true` if the file is a major version; `false` if the file is a minor version. Major versions can't be replaced.	31.0
`mimeType`	String	File's MIME type.	28.0
`moderationFlags`	`ConnectApi.ModerationFlags`	Information about the moderation flags on a file. If `ConnectApi.Features.communityModeration` is `false`, this property is `null`.	30.0

Name	Type	Description	Available Version
`modifiedDate`	Datetime	ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z. Modifications to the file from within Salesforce update this date.	28.0
`name`	String	Name of the file.	28.0
`origin`	String	Specifies the file source. Valid values are: • `Chatter`—file came from Chatter • `Content`—file came from content	28.0
`owner`	`ConnectApi.UserSummary`	File's owner.	28.0
`pdfRenditionStatus`	String	Specifies if a PDF preview version of the file has been rendered.	28.0
`publishStatus`	`ConnectApi.FilePublishStatus`	Specifies the publish status of the file. • `PendingAccess`—File is pending publishing. • `PrivateAccess`—File is private. • `PublicAccess`—File is public.	28.0
`renditionUrl`	String	URL to the rendition for the file.	28.0
`renditionUrl240By180`	String	URL to the 240 x 180 rendition resource for the file. For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	29.0
`renditionUrl720By480`	String	URL to the 720 x 480 rendition resource for the file. For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	29.0
`sharingOption`	`ConnectApi.FileSharingOption`	Sharing option of the file. Values are: • `Allowed`—Resharing of the file is allowed. • `Restricted`—Resharing of the file is restricted.	35.0
`sharingPrivacy`	`ConnectApi.FileSharingPrivacy`	Sharing privacy of a file. Values are: • `None`—File is visible to anyone with record access. • `PrivateOnRecords`—File is private on records.	41.0
`sharingRole`	`ConnectApi.FileSharingType`	Sharing role of the file. • `Admin`—Owner permission, but doesn't own the file. • `Collaborator`—Viewer permission, and can edit, change permissions, and upload a new version of a file.	28.0

Name	Type	Description	Available Version
		• `Owner`—Collaborator permission, and can make a file private, and delete a file. • `Viewer`—Can view, download, and share a file. • `WorkspaceManaged`—Permission controlled by the library.	
`systemModstamp`	Datetime	ISO 8601 date string indicating when a user or any automated system process, such as a trigger, updated the file.	41.0
`textPreview`	String	Text preview of the file if available; `null` otherwise.	30.0
`thumb120By90 RenditionStatus`	String	Specifies the rendering status of the 120 x 90 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	28.0
`thumb240By180 RenditionStatus`	String	Specifies the rendering status of the 240 x 180 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	28.0
`thumb720By480 RenditionStatus`	String	Specifies the rendering status of the 720 x 480 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	28.0
`title`	String	Title of the file.	28.0
`versionNumber`	String	File's version number.	28.0

ConnectApi.FileAsset

An asset file.

Property Name	Type	Description	Available Version
`baseAssetUrl`	String	Base download URL of the asset.	45.0

Property Name	Type	Description	Available Version
`baseUnauthenticatedAssetUrl`	String	Base download URL of the asset for unauthenticated users if `isVisibleByExternalUsers` is `true`, otherwise `null`.	45.0
`id`	String	ID of the asset.	45.0
`isVisibleByExternalUsers`	Boolean	Indicates whether unauthenticated users can see the asset file (`true`) or not (`false`).	45.0
`masterLabel`	String	Label of the asset.	45.0
`name`	String	Unique name of the asset.	45.0
`namespacePrefix`	String	Namespace prefix of the package containing the asset.	45.0
`type`	String	Type of asset.	45.0

SEE ALSO:

ConnectApi.Recommendation

ConnectApi.NBANativeRecommendation

ConnectApi.FilePreview

A file preview.

Property Name	Type	Description	Available Version
`format`	`ConnectApi.FilePreviewFormat`	The format of the preview. Values are: • `Jpg`—Preview format is JPG. • `Pdf`—Preview format is PDF. • `Svg`—Preview format is compressed SVG. • `Thumbnail`—Preview format is 240 x 180 PNG. • `ThumbnailBig`—Preview format is 720 x 480 PNG. • `ThumbnailTiny`—Preview format is 120 x 90 PNG.	39.0
`previewUrlCount`	Integer	The total number of preview URLs for this preview format.	39.0
`previewUrls`	List<`ConnectApi.FilePreviewUrl`>	A list of file preview URLs.	39.0
`status`	`ConnectApi.FilePreviewStatus`	The availability status of the preview. Values are: • `Available`—Preview is available. • `InProgress`—Preview is being processed.	39.0

Property Name	Type	Description	Available Version
		• `NotAvailable`—Preview is unavailable. • `NotScheduled`—Generation of the preview isn't scheduled yet.	
`url`	String	The URL for the file preview.	39.0

SEE ALSO:

ConnectApi.FilePreviewCollection

ConnectApi.FilePreviewCollection

A collection of file previews.

Property Name	Type	Description	Available Version
`fileId`	String	ID of the file.	39.0
`previews`	List<`ConnectApi.FilePreview`>	Previews supported for the file.	39.0
`url`	String	URL to the current page of file previews.	39.0
`versionNumber`	String	Version number of the file.	40.0

SEE ALSO:

ConnectApi.InlineImageSegment

ConnectApi.FilePreviewUrl

A URL to a file preview.

Property Name	Type	Description	Available Version
`pageNumber`	Integer	Preview page number starting from zero, or `null` for PDF files.	39.0
`previewUrl`	String	File preview URL.	39.0

SEE ALSO:

ConnectApi.FilePreview

ConnectApi.FilesCapability

If a feed element has this capability, it has one or more file attachments.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
items	List<ConnectApi.Content>	Collection of files.	36.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.FileSummary

A file summary.

Subclass of ConnectApi.File.

No additional properties.

ConnectApi.FindRoutesWithFewestSplitsOutputRepresentation

A list of inventory location combinations that can fulfill an order without exceeding the maximum number of shipments.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
targetLocations	List<ConnectApi.AvailableLocationOutputRepresentation>	Each element of the list is a set of inventory locations that together can fulfill the order being routed.	51.0

SEE ALSO:

findRoutesWithFewestSplits(findRoutesWithFewestSplitsInputRepresentation)

ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation

A list of order fulfillment routes with inventory availability information.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
results	List<ConnectApi.FindRoutesWithFewestSplitsWithInventoryOutputRepresentation>	Each element of the list is the response for one element of the input list.	54.0

SEE ALSO:

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

ConnectApi.FindRoutesWithFewestSplitsWithInventoryOutputRepresentation

Sets of inventory locations that can combine to fulfill an order, with availability data for those locations.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`inventory`	`ConnectApi.OCIGetInventoryAvailabilityOutputRepresentation`	Inventory availability data for the location groups and locations specified in the input.	54.0
`targetLocations`	`List<ConnectApi.AvailableLocationOutputRepresentation>`	Each entry in the list is a set of inventory locations that can combine to fulfill an order.	54.0

SEE ALSO:

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation

ConnectApi.FollowerPage

Page of followers.

Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	28.0
`followers`	`List<ConnectApi.Subscription>`	List of subscriptions.	28.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	28.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	28.0
`total`	Integer	Total number of followers across all pages.	28.0

ConnectApi.FollowingCounts

Following counts.

Name	Type	Description	Available Version
`people`	Integer	Number of people user is following.	28.0
`records`	Integer	Number of records user is following. Topics are a type of record that can be followed as of version 29.0.	28.0

Name	Type	Description	Available Version
`total`	Integer	Total number of items user is following.	28.0

SEE ALSO:

ConnectApi.UserDetail

ConnectApi.FollowingPage

Page of following subscriptions.

Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	28.0
`following`	`List<ConnectApi.Subscription>`	List of subscriptions.	28.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	28.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	28.0
`total`	Integer	Total number of records being followed across all pages.	28.0

ConnectApi.FollowIntents

A list of follow intents for a social persona.

Property Name	Type	Description	Available Version
`follows`	`List<ConnectApi.FollowSocialPersonaIntent>`	List of follow intents for the social persona.	45.0

SEE ALSO:

ConnectApi.SocialPostIntents

ConnectApi.FollowSocialPersonaIntent

Follow intent on a social persona.

Property Name	Type	Description	Available Version
`managedSocialAccount`	`ConnectApi.ManagedSocialAccount`	Managed social account that follows the social persona.	45.0

Property Name	Type	Description	Available Version
socialPersonaId	String	ID of the social persona to follow.	45.0

SEE ALSO:

ConnectApi.FollowIntents

ConnectApi.Form

Marketing integration form.

Property Name	Type	Description	Available Version
dataExtensionId	String	ID of the data extension associated with the marketing integration form.	53.0
formFieldsList	ConnectApi.FormFields	List of form fields associated with the marketing integration form.	53.0
formId	String	ID of the marketing integration form.	53.0
formName	String	Name of the marketing integration form.	53.0

ConnectApi.FormField

Marketing integration form field.

Property Name	Type	Description	Available Version
name	String	Name of the marketing integration form field.	53.0
type	ConnectApi.FormFieldType	Type of marketing integration form field. Values are: • Boolean • Date • EmailAddress • Number • Text	53.0

SEE ALSO:

ConnectApi.FormFields

ConnectApi.FormFields

List of marketing integration form fields.

Property Name	Type	Description	Available Version
formFields	List<ConnectApi.FormField>	List of form fields associated with the marketing integration form.	53.0

SEE ALSO:

ConnectApi.Form

ConnectApi.FormSubmission

Marketing integration form submission.

Property Name	Type	Description	Available Version
formSubmissionId	String	ID of the form submission, representing the submission data that was saved.	53.0

ConnectApi.FormulaScope

Formula scope for a target.

Property Name	Type	Description	Available Version
contextValues	Map<String, String>	Map of context values for the scope. Note: In version 52.0 and later, use the contextValuesMap property.	50.0–51.0
contextValuesMap	Map<String, Object>	Map of context values for the scope.	52.0
fields	List<String>	List of fields of the scope.	50.0
formula	String	Formula of the scope.	50.0

SEE ALSO:

ConnectApi.Target

ConnectApi.FulfillmentGroupOutputRepresentation

Information about one FulfillmentOrder from a request to create fulfillment orders from multiple OrderDeliveryGroupSummaries. If the FulfillmentOrder was created, then its ID is returned. If it failed, then data from the input is returned so you can resubmit it.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
fulfilledFromLocationId	String	(Creation failed) The input FulfilledFromLocationId.	50.0

Property Name	Type	Description	Available Version
`fulfillmentOrderId`	String	The FulfillmentOrderId from the successfully created FulfillmentOrder.	50.0
`fulfillmentType`	String	(Creation failed) The input FulfillmentType.	50.0
`orderDeliveryGroupSummaryId`	String	(Creation failed) The input OrderDeliveryGroupSummaryId.	50.0
`orderItemSummaries`	List<`ConnectApi.OrderItemSummaryOutputRepresentation`>	(Creation failed) The input list of OrderItemSummaries.	50.0
`orderSummaryId`	String	(Creation failed) The input OrderSummaryId.	50.0
`referenceId`	String	The referenceId from the FulfillmentGroup input representation. Use this value to troubleshoot a failure.	50.0

ConnectApi.FulfillmentOrderCancelLineItemsOutputRepresentation

Wraps the base output.

Subclass of ConnectApi.BaseOutputRepresentation.

No additional properties.

ConnectApi.FulfillmentOrderInvoiceOutputRepresentation

ID of the created invoice.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`invoiceId`	String	ID of the created invoice.	48.0

ConnectApi.FulfillmentOrderOutputRepresentation

A list of IDs of the created FulfillmentOrders.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`fulfillmentOrderIds`	List<String>	A list of IDs of created Fulfillment Orders.	48.0

ConnectApi.GatewayLogResponse

Gateway log output.

Property Name	Type	Description	Available Version
`createdDate`	Datetime	Date when the gateway log was created.	50.0
`gatewayResultCode`	String	Result codes that show the status of a transaction as it is passed to the financial institution and then returned to the client.	50.0
`id`	String	ID of the gateway log record.	50.0
`interactionStatus`	String	Gateway interaction status. It can be SUCCESS, FAILED, or TIMEOUT.	50.0

ConnectApi.GenericBundleCapability

If a feed element has this capability, the feed element has a group of other feed elements condensed into one feed element. This group is called a *bundle*.

Subclass of ConnectApi.BundleCapability.

ConnectApi.GenericFeedElement

A concrete implementation of the abstract `ConnectApi.FeedElement` class.

Subclass of ConnectApi.FeedElement.

ConnectApi.GetFOCapacityValuesOutputRepresentation

Response to a request for fulfillment order capacity values for one or more locations.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`locations`	List<`ConnectApi.LocationCapacityOutputRepresentation`>	List of fulfillment order capacity values for one or more locations.	55.0

ConnectApi.GlobalInfluence

Chatter influence.

Name	Type	Description	Available Version
`percentile`	String	Percentile value for the user's influence rank within the org or Experience Cloud site.	28.0

Name	Type	Description	Available Version
`rank`	Integer	Number indicating the user's influence rank, relative to all other users within the org or Experience Cloud site.	28.0

SEE ALSO:

ConnectApi.UserDetail

ConnectApi.GroupChatterSettings

A user's Chatter settings for a specific group.

Name	Type	Description	Available Version
`emailFrequency`	`ConnectApi.GroupEmailFrequency` on page 2366	The frequency with which a group member receives email from a group.	28.0

ConnectApi.GroupInformation

Describes the Information section of the group. If the group is private, this section is visible only to members.

Name	Type	Description	Available Version
`text`	String	The text of the "Information" section of the group.	28.0
`title`	String	The title of the "Information" section of the group.	28.0

SEE ALSO:

ConnectApi.ChatterGroupDetail

ConnectApi.GroupMember

Member of a group.

Name	Type	Description	Available Version
`id`	String	User's 18-character ID.	28.0
`lastFeedAccessDate`	Datetime	The date and time at which the group member last accessed the group feed.	31.0
`role`	`ConnectApi.GroupMembershipType` Enum	Type of membership the user has with the group. • `GroupOwner` • `GroupManager` • `NotAMember` • `NotAMemberPrivateRequested`	28.0

Name	Type	Description	Available Version
		• StandardMember	
url	String	Connect REST API URL to this membership.	28.0
user	ConnectApi.UserSummary	Information about the user who is subscribed to this group.	28.0

SEE ALSO:

ConnectApi.GroupMemberPage

ConnectApi.GroupMemberPage

Page of group members.

Name	Type	Description	Available Version
currentPageUrl	String	Connect REST API URL identifying the current page.	28.0
members	List<ConnectApi.GroupMember>	List of group members.	28.0
myMembership	ConnectApi.Reference	If the context user is a member of this group, returns information about that membership, otherwise, null.	28.0
nextPageUrl	String	Connect REST API URL identifying the next page, or null if there isn't a next page.	28.0
previousPageUrl	String	Connect REST API URL identifying the previous page, or null if there isn't a previous page.	28.0
totalMemberCount	Integer	Total number of group members across all pages.	28.0

ConnectApi.GroupMembershipRequest

Request to become a group member.

Name	Type	Description	Available Version
createdDate	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	28.0
id	String	ID for the group membership request object.	28.0
lastUpdateDate	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	28.0
requestedGroup	ConnectApi.Reference	Information about the group the context user is requesting to join.	28.0

Name	Type	Description	Available Version
`responseMessage`	String	A message for the user if their membership request is declined. The value of this property is used only when the value of the `status` property is `Declined`. The maximum length is 756 characters.	28.0
`status`	`ConnectApi.GroupMembershipRequestStatus` Enum	Status of a request to join a private group. Values are: • `Accepted` • `Declined` • `Pending`	28.0
`url`	String	URL of the group membership request object.	28.0
`user`	`ConnectApi.UserSummary`	Information about the user requesting membership in a group.	28.0

SEE ALSO:

ConnectApi.GroupMembershipRequests

ConnectApi.GroupMembershipRequests

Requests to become group members.

Name	Type	Description	Available Version
`requests`	`List<ConnectApi.GroupMembershipRequest>`	Information about group membership requests.	28.0
`total`	Integer	The total number of requests.	28.0

ConnectApi.GroupRecord

A record associated with a group.

Property	Type	Description	Available Version
`id`	String	Record's 18-character ID.	33.0
`record`	`ConnectApi.ActorWithId`	Information about the record associated with the group.	33.0
`url`	String	Record URL.	33.0

SEE ALSO:

ConnectApi.GroupRecordPage

ConnectApi.GroupRecordPage

A paginated list of `ConnectApi.GroupRecord` objects.

Property	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	33.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	33.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	33.0
`records`	`List<ConnectApi.GroupRecord>`	List of records on the current page.	33.0
`totalRecordCount`	Integer	Total number of records associated with the group.	33.0

ConnectApi.HashtagSegment

Hashtag segment.

Subclass of ConnectApi.MessageSegment.

Name	Type	Description	Available Version
`tag`	String	Text of the topic without the hash symbol (#).	28.0
`topicUrl`	String	Connect REST API Topics resource that searches for the topic: `/services/data/v63.0/chatter/topics?exactMatch=true&q=topic`	28.0
`url`	String	Connect REST API Feed Items resource URL that searches for the topic in all feed items in an organization: `/services/data/v63.0/chatter/feed-items?q=topic`	28.0

ConnectApi.HideSocialPostIntent

Hide intent for a social post.

Property Name	Type	Description	Available Version
`isHidden`	Boolean	Specifies whether the managed social account hid the social post (`true`) or not (`false`).	45.0

Property Name	Type	Description	Available Version
managedSocialAccount	ConnectApi.ManagedSocialAccount	Managed social account that hides the social post.	45.0

SEE ALSO:

ConnectApi.SocialPostIntents

ConnectApi.HoldFOCapacityOutputRepresentation

Response to a request to hold fulfillment order capacity at one or more locations. Can correspond to one action call.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
holdFOCapacityResponses	List<ConnectApi.HoldFOCapacityResponseOutputRepresentation>	List of responses to the requests to hold fulfillment order capacity at one or more locations.	55.0

ConnectApi.HoldFOCapacityResponseOutputRepresentation

Response to a request to hold fulfillment order capacity at one or more locations.

Property Name	Type	Description	Available Version
capacityResponses	List<ConnectApi.CapacityResponseOutputRepresentation>	List of responses to the requests to hold fulfillment order capacity at individual locations.	55.0

ConnectApi.HttpHeaderOutputRepresentation

HTTP header with information about a text classification

Property Name	Type	Description	Available Version
name	String	Name of the HTTP header.	59.0
value	String	Value of the HTTP header.	59.0

ConnectApi.Icon

Icon.

Property	Type	Description	Available Version
`height`	Integer	The height of the icon in pixels.	28.0
`width`	Integer	The width of the icon in pixels.	28.0
`url`	String	The URL of the icon. This URL is available to unauthenticated users. This URL does not expire.	28.0

SEE ALSO:

- ConnectApi.CanvasCapability
- ConnectApi.EnhancedLinkCapability
- ConnectApi.SocialPostCapability

ConnectApi.InlineImageSegment

An inline image in the feed body.

Subclass of ConnectApi.MessageSegment.

Property Name	Type	Description	Available Version
`altText`	String	Alt text for the inline image.	35.0
`contentSize`	Integer	Size of the file in bytes.	35.0
`fileExtension`	String	Extension of the file, such as gif.	37.0
`thumbnails`	`ConnectApi.FilePreviewCollection`	Information about the available thumbnails for the image.	35.0
`url`	String	URL to the latest version of the inline image.	35.0

ConnectApi.InteractionsCapability

If a feed element has this capability, it has information about user interactions.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`count`	Long	The number of individual views, likes, and comments on a feed post. Note: This count appears in the UI under the feed post as the number of views, for example, "5 views."	37.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.RelatedQuestion

ConnectApi.Invitation

An invitation.

Property Name	Type	Description	Available Version
`email`	String	Email address of the user.	39.0
`status`	`ConnectApi.GroupViralInvitationsStatus`	Specifies the status of an invitation to join a group. Values are: • `ActedUponUser`—The user was added to the group. An email was sent asking the user to visit the group. • `Invited`—An email was sent asking the user to sign up for the org. • `MaxedOutUsers`—The group has the maximum allowed members. • `MultipleError`—The user wasn't invited due to multiple errors. • `NoActionNeededUser`—The user is already a member of the group. • `NotVisibleToExternalInviter`—The user is not accessible to the user sending the invitation. • `Unhandled`—The user couldn't be added to the group for an unknown reason.	39.0
`userId`	String	ID of the user.	39.0

SEE ALSO:

ConnectApi.Invitations

ConnectApi.Invitations

A collection of invitations.

Property Name	Type	Description	Available Version
`invitations`	List<`ConnectApi.Invitation`>	Collection of invitations.	39.0

ConnectApi.KnowledgeArticleVersion

A knowledge article version.

Property Name	Type	Description	Available Version
`articleType`	String	Type of the knowledge article.	36.0
`id`	String	ID of the knowledge article version.	36.0
`knowledgeArticleId`	String	ID of the corresponding knowledge article.	36.0
`lastPublishedDate`	Datetime	Last published date of the knowledge article.	36.0
`summary`	String	Summary of the knowledge article contents.	36.0
`title`	String	Title of the knowledge article.	36.0
`urlName`	String	URL name of the knowledge article.	36.0

SEE ALSO:

ConnectApi.KnowledgeArticleVersionCollection

ConnectApi.KnowledgeArticleVersionCollection

A collection of knowledge article versions.

Property Name	Type	Description	Available Version
`items`	List<ConnectApi.KnowledgeArticleVersion>	A collection of knowledge article versions.	36.0

ConnectApi.LabeledRecordField

Record field containing a label and a text value.

This class is abstract.

Subclass of ConnectApi.AbstractRecordField.

Superclass of:

- ConnectApi.CompoundRecordField
- ConnectApi.CurrencyRecordField
- ConnectApi.DateRecordField

- ConnectApi.PercentRecordField
- ConnectApi.PicklistRecordField
- ConnectApi.RecordField
- ConnectApi.ReferenceField
- ConnectApi.ReferenceWithDateRecordField

Important: The composition of a feed can change between releases. Write your code to handle instances of unknown subclasses.

Name	Type	Description	Available Version
`label`	String	Localized string describing the record field.	29.0
`text`	String	Text value of the record field. All record fields have a text value. To ensure that all clients can consume new content, inspect the record field's `type` property. If it isn't recognized, render the text value as the default case.	29.0

ConnectApi.LightningExtensionInformation

Lightning extension information.

Subclass of ConnectApi.AbstractExtensionInformation.

Property Name	Type	Description	Available Version
`compositionComponent`	String	Component to use in compose state.	40.0
`headerTextLabel`	String	Label for the extension's header.	40.0
`hoverTextLabel`	String	Label for hovering over the extension.	40.0
`renderComponent`	String	Component to use in render or preview state.	40.0

SEE ALSO:

ConnectApi.ExtensionDefinition

ConnectApi.LikeIntent

Like intent for a social post.

Property Name	Type	Description	Available Version
`isLiked`	Boolean	Specifies whether the managed social account liked the social post (`true`) or not (`false`).	45.0

Property Name	Type	Description	Available Version
managedSocialAccount	ConnectApi.ManagedSocialAccount	Managed social account that likes the social post.	45.0

SEE ALSO:

ConnectApi.LikeIntents

ConnectApi.LikeIntents

List of like intents for a social post.

Property Name	Type	Description	Available Version
likes	List<ConnectApi.LikeIntent>	List of like intents for the social post.	45.0

SEE ALSO:

ConnectApi.SocialPostIntents

ConnectApi.LikeSocialPostIntent

Like intent on a social post.

Property Name	Type	Description	Available Version
socialAccountId	String	ID of the social account that likes the social post.	46.0
socialPostId	String	ID of the social post to like.	46.0

ConnectApi.LikeSummary

Summary of a like.

Subclass of ConnectApi.UserFeedEntityActivitySummary.

Property Name	Type	Description	Available Version
likeId	String	ID of the like.	42.0

ConnectApi.LineItemResponse

Response class that stores information about a list of one or more line items on which the tax engine has calculated tax.

Property Name	Type	Description	Available Version
addresses	ConnectApi.TaxAddressesResponse	The Ship From, Ship To, and Sold To addresses used during tax calculation.	55.0
amountDetails	ConnectApi.TaxAmountDetailsResponse	Information about tax amount values on the line item.	55.0
effectiveDate	Datetime	The date that the tax calculation takes effect.	55.0
lineNumber	String	System-generated number used to identify the tax line.	55.0
productCode	String	Product code for the product related to the taxed line item.	55.0
quantity	Double	Quantity of the taxed line item.	55.0
taxCode	String	Tax code for the taxed line item.	55.0
taxes	List<ConnectApi.TaxDetailsResponse>	Tax details for each line item in a tax line item output.	55.0

ConnectApi.LinkCapability

If a feed element has this capability, it has a link.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
url	String	Link URL. The URL can be to an external site.	32.0
urlName	String	Description of the link.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.LinkMetadata

Metadata for a link.

Property Name	Type	Description	Available Version
description	String	Description of the link.	42.0
frameSource	String	HTML required to display the resource.	42.0
height	Integer	Height required to display the HTML.	42.0

Property Name	Type	Description	Available Version
`originalUrl`	String	Original URL that was used to request the metadata.	42.0
`providerUrl`	String	URL of the provider that the information is retrieved from.	42.0
`source`	`ConnectApi.LinkMetadataSource`	Source of the link metadata. Values are: • `None`—Link metadata wasn't retrieved. • `Sfdc`—Salesforce is the source.	42.0
`thumbnailUrl`	String	Thumbnail of the resource.	42.0
`title`	String	Title of the link.	42.0
`type`	`ConnectApi.LinkMetadataType`	Type of link that the metadata represents. Values are: • `Error`—Link metadata couldn't be retrieved. • `Link`—Represents a link. • `None`—Link metadata wasn't retrieved because the link isn't an allowed domain. • `Photo`—Represents a photo. • `Rich`—Represents rich content, typically HTML content. • `Unknown`—Link metadata was retrieved, but the type is unknown. • `Video`—Represents a video.	42.0
`url`	String	URL of the image to display, if one is available.	42.0
`width`	Integer	Width required to display the HTML.	42.0

SEE ALSO:

ConnectApi.LinkMetadataCollection

ConnectApi.LinkMetadataCollection

Collection of link metadata.

Property Name	Type	Description	Available Version
`linkMetadataList`	List<`ConnectApi.LinkMetadata`>	List of metadata for links.	42.0

ConnectApi.LinkSegment

Link segment.

Subclass of ConnectApi.MessageSegment.

Name	Type	Description	Available Version
`url`	String	The link URL.	28.0

ConnectApi.LocationCapacityOutputRepresentation

Fulfillment order capacity values for a location.

Property Name	Type	Description	Available Version
`assigned`	Integer	Value of the location's Assigned Fulfillment Order Count.	55.0
`capacity`	Integer	Value of the location's Fulfillment Order Capacity. This property represents the location's maximum capacity.	55.0
`error`	`ConnectApi.ErrorResponse`	Error returned by the request, if any.	55.0
`heldCapacity`	Integer	Number of fulfillment orders that the location is holding capacity for.	55.0
`locationId`	String	ID of the location.	55.0

ConnectApi.LocationOutputRepresentation

An inventory location's distance to an order recipient.

Property Name	Type	Description	Available Version
`distance`	Double	The distance from the location to the order recipient.	51.0
`locationIdentifier`	String	The location identifier.	51.0

ConnectApi.MaintenanceInfo

Information about the upcoming scheduled maintenance for the organization.

Property Name	Type	Description	Available Version
`description`	String	Description of the maintenance.	34.0
`maintenanceTitle`	String	Title of the maintenance.	34.0
`maintenanceType`	`ConnectApi.MaintenanceType`	Type of maintenance. Values are: • `Downtime`—Downtime maintenance. • `GenerallyAvailable`—Generally available mode.	34.0

Property Name	Type	Description	Available Version
		• `MaintenanceAndAvailable`—Maintenance with available mode. • `MaintenanceWithDowntime`—Scheduled maintenance with downtime. • `ReadOnly`—Maintenance with read-only mode.	
`messageEffectiveTime`	Datetime	Effective time when users start seeing the maintenance message.	34.0
`messageExpirationTime`	Datetime	Expiration time of the maintenance message.	34.0
`scheduledEndDowntime`	Datetime	Scheduled end of downtime. `null` for `GenerallyAvailable` and `ReadOnly` maintenance types.	34.0
`scheduledEndMaintenanceTime`	Datetime	Scheduled end of maintenance. `null` for `Downtime` maintenance type.	34.0
`scheduledStartDowntime`	Datetime	Scheduled start of downtime. `null` for `GenerallyAvailable` and `ReadOnly` maintenance types.	34.0
`scheduledStartMaintenanceTime`	Datetime	Scheduled start time of maintenance. `null` for `Downtime` maintenance type.	34.0

SEE ALSO:

ConnectApi.OrganizationSettings

ConnectApi.ManagedContentAssociations

Content topics associated with managed content.

Property Name	Type	Description	Available Version
`topics`	List<`ConnectApi.TopicSummary`>	A collection of topics associated with the managed content.	47.0

SEE ALSO:

ConnectApi.ManagedContentVersion

ConnectApi.ManagedContentChannel

Managed content channel.

Subclass of ConnectApi.AbstractManagedContentChannelRepresentation in version 62.0 and later

Property Name	Type	Description	Available Version
`cacheControlMaxAge`	Long	HTTP cache control max age response header for content delivered from the channel.	55.0
`channelId`	String	ID of the managed content channel.	48.0–61.0
`channelName`	String	Name of the managed content channel.	48.0–61.0
`channelType`	`ConnectApi.ManagedContentChannelType`	Type of managed content channel. Values are: • `CloudToCloud`—Cloud-to-Cloud integrated channel. • `Community`—Experience Cloud site channel. • `ConnectedApp`—Channel served by a connected app. • `PublicUnauthenticated`—Public channel. All published content is publicly available. • `UserPermission`—Channel backed by a system permission. All published content is available only to users with the permission.	48.0–61.0
`domain`	String	ID or name of the domain assigned to the channel.	52.0–61.0
`domainId`	String	ID of the domain assigned to the channel. In version 52.0 and later, this information is returned in the `domain` property.	50.0–51.0
`domainName`	String	Name of the domain assigned to the channel.	50.0–61.0
`id`	String	ID of the managed content channel.	62.0
`isChannelSearchable`	Boolean	Specifies whether the text contents of the channel are searchable (`true`) or not (`false`).	48.0–61.0
`isDedicatedContentDelivery`	Boolean	Specifies whether the channel has off-core dedicated content delivery enabled (`true`) or not (`false`). Orgs hosted on Hyperforce use off-core dedicated content delivery to deliver content in public channels with high performance and low latency.	63.0
`isDomainLocked`	Boolean	Specifies whether the domain is locked and can't be changed (`true`) or not (`false`).	50.0–61.0
`isSearchable`	Boolean	Specifies whether the text contents of the channel are searchable (`true`) or not (`false`).	62.0
`managedContentChannelDomain`	`ConnectApi.ManagedContentChannelDomainRepresentation`	Domain associated with the channel.	62.0

Property Name	Type	Description	Available Version
`mediaCacheControlMaxAge`	Long	HTTP cache control max age response header for media delivered from the channel.	57.0
`name`	String	Name of the managed content channel.	62.0
`targetId`	String	ID of the target associated with the channel.	62.0
`type`	`ConnectApi.ManagedContentChannelType`	Type of managed content channel. Values are: • `CloudToCloud`—Cloud-to-Cloud integrated channel. • `Community`—Experience Cloud site channel. • `ConnectedApp`—Channel served by a connected app. • `PublicUnauthenticated`—Public channel. All published content is publicly available. • `UserPermission`—Channel backed by a system permission. All published content is available only to users with the permission.	62.0

SEE ALSO:

ConnectApi.ManagedContentChannelCollection

postManagedContentChannel(ManagedContentCreateInputParam)

getManagedContentChannel(channelId)

patchManagedContentChannel(channelId, ManagedContentChannelInput)

ConnectApi.ManagedContentChannelCollection

Collection of managed content channels.

Property Name	Type	Description	Available Version
`channels`	List<`ConnectApi.ManagedContentChannel`>	List of managed content channels.	48.0–61.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	48.0–61.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	48.0–61.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	48.0–61.0
`totalChannels`	Integer	Total number of managed content channels.	48.0–61.0

ConnectApi.ManagedContentChannelDetail

Managed content channel detail.

Property Name	Type	Description	Available Version
`channelId`	String	ID of the managed content channel.	54.0–61.0
`channelName`	String	Name of the managed content channel.	54.0–61.0
`channelType`	`ConnectApi.ManagedContentChannelType`	Type of managed content channel. Values are: • `CloudToCloud`—Cloud-to-Cloud integrated channel. • `Community`—Experience Cloud site channel. • `ConnectedApp`—Channel served by a connected app. • `PublicUnauthenticated`—Public channel. All published content is publicly available. • `UserPermission`—Channel backed by a system permission. All published content is available only to users with the permission.	54.0–61.0
`domain`	String	Domain assigned to the managed content channel.	54.0–61.0
`domainName`	String	Name of the domain assigned to the managed content channel.	54.0–61.0
`isChannelSearchable`	Boolean	Specifies whether the text of the channel's contents is searchable (`true`) or not (`false`).	54.0–61.0
`isDomainLocked`	Boolean	Specifies whether the channel's domain is locked and can't be changed (`true`) or not (`false`).	54.0–61.0

ConnectApi.ManagedContentChannelDomainRepresentation

Domain associated with a managed content channel.

Property Name	Type	Description	Available Version
`isLocked`	Boolean	Specifies whether the domain is locked and can't be changed (`true`) or not (`false`).	62.0
`name`	String	Name of the domain assigned to the channel.	62.0
`value`	String	Value of the domain (name or ID) associated with the channel.	62.0

SEE ALSO:

ConnectApi.ManagedContentChannel

ConnectApi.ManagedContentChannelsRepresentation

Collection of managed content channels.

Property Name	Type	Description	Available Version
`channels`	List<`ConnectApi.AbstractManagedContentChannelRepresentation`>	List of managed content channels.	62.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	62.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	62.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	62.0
`totalChannels`	Integer	Total number of managed content channels.	62.0

SEE ALSO:

getManagedContentChannels(pageParam, pageSize, showDetails)

ConnectApi.ManagedContentChannelSummary

Managed content channel.

Subclass of ConnectApi.AbstractManagedContentChannelRepresentation in version 62.0 and later

Property Name	Type	Description	Available Version
`domainUrl`	String	Domain URL of the channel.	55.0–61.0
`id`	String	ID of the managed content channel.	62.0
`name`	String	Name of the managed content channel.	54.0
`resourceUrl`	String	Resource URL to complete information of the channel.	54.0–61.0
`target`	`ConnectApi.ManagedContentChannelTargetSummary`	Target site associated with the channel.	54.0–61.0
`type`	`ConnectApi.ManagedContentChannelType`	Type of managed content channel. Values are: • `CloudToCloud`—Cloud-to-Cloud integrated channel. • `Community`—Experience Cloud site channel. • `ConnectedApp`—Channel served by a connected app.	62.0

Property Name	Type	Description	Available Version
		• `PublicUnauthenticated`—Public channel. All published content is publicly available. • `UserPermission`—Channel backed by a system permission. All published content is available only to users with the permission.	
`url`	String	URL to the channel resource.	62.0

SEE ALSO:

ConnectApi.ManagedContentDeliveryDocument

ConnectApi.ManagedContentCollectionItems

ConnectApi.ManagedContentDeliveryDocumentCollection

ConnectApi.ManagedContentChannelTargetSummary

Target site associated with the channel.

Property Name	Type	Description	Available Version
`id`	String	ID of the site associated with the channel.	54.0

SEE ALSO:

ConnectApi.ManagedContentChannelSummary

ConnectApi.ManagedContentDeliveryChannelSummaryRepresentation

ConnectApi.ManagedContentCloneStatus

Information about managed content's clone status.

Property Name	Type	Description	Available Version
`label`	String	Localized label for the status.	61.0
`status`	`ConnectApi.ManagedContentCloneStatus`	Status of the managed content clone. Values are: • `PartialSuccess` • `Success`	61.0

SEE ALSO:

ConnectApi.ManagedContentDocumentClone

ConnectApi.ManagedContentClonedVariants

Information about clone variants.

Property Name	Type	Description	Available Version
`language`	String	Language of the translated clone variant.	61.0
`managedContentVariantId`	String	ID of the clone variant.	61.0
`resourceURL`	String	Resource URL of the clone variant.	61.0

SEE ALSO:

ConnectApi.ManagedContentDocumentClone

ConnectApi.ManagedContentCollectionItem

Managed content collection item.

Property Name	Type	Description	Available Version
`body`	Map<String, Object>	Map of properties of the collection item with their values.	56.0
`contentType`	`ConnectApi.ManagedContentCollectionItemTypeSummary`	Type of collection item.	56.0
`id`	String	ID of the collection item.	56.0
`name`	String	Name or title for collection item.	56.0

SEE ALSO:

ConnectApi.ManagedContentCollectionItems

ConnectApi.ManagedContentCollectionItems

Managed content collection Items.

Property Name	Type	Description	Available Version
`channelInfo`	`ConnectApi.ManagedContentChannelSummary`	Information about the managed content channel.	56.0–61.0

Property Name	Type	Description	Available Version
channelSummary	ConnectApi.ManagedContentDeliveryChannelSummaryRepresentation	Summary information about the managed content delivery channel.	62.0
collectionKey	String	Unique identifier for the collection.	56.0
collectionType	ConnectApi.ManagedContentTypeSummary	Type of collection.	56.0
currentPageUrl	String	URL to the current page.	63.0
id	String	ID of the collection.	56.0
items	List<ConnectApi.ManagedContentCollectionItem>	List of collection Items.	56.0
language	String	Language locale of the collection.	56.0
nextPageUrl	String	URL to the next page.	63.0
previousPageUrl	String	URL to the previous page.	63.0
publishedDate	Datetime	Most recent publish date of the collection.	56.0
title	String	Title of the collection.	56.0
total	Integer	Total number of items in the current collection detail page.	56.0
urlName	String	URL name of the collection.	56.0

SEE ALSO:

getCollectionItemsForChannel(channelId, collectionKeyOrId, language)

getCollectionItemsForSite(siteId, collectionKeyOrId, language)

ConnectApi.ManagedContentCollectionItemTypeSummary

Summary of a collection item type.

Property Name	Type	Description	Available Version
fullyQualifiedName	String	Fully qualified name of the collection item type.	56.0
name	String	Name of the collection item type.	56.0

SEE ALSO:

ConnectApi.ManagedContentCollectionItem

ConnectApi.ManagedContentDateAndTimeNodeValue

Managed content node of date and time type.

Subclass of ConnectApi.ManagedContentNodeValue.

Property Name	Type	Description	Available Version
`dateTimeValue`	Datetime	UTC date and time value of the managed content node.	48.0
`timeZone`	String	Time zone in which the date and time is authored.	48.0

ConnectApi.ManagedContentDateNodeValue

Managed content node of date type.

Subclass of ConnectApi.ManagedContentNodeValue.

Property Name	Type	Description	Available Version
`value`	Datetime	Date value of the managed content node.	48.0

ConnectApi.ManagedContentDeliveryChannelRepresentation

Managed content delivery channel.

Property Name	Type	Description	Available Version
`domain`	String	Domain assigned to the managed content channel.	62.0
`domainName`	String	Name of the domain assigned to the managed content channel.	62.0
`id`	String	ID of the managed content channel.	62.0
`isDedicated ContentDelivery`	Boolean	Specifies whether the channel has off-core dedicated content delivery enabled (`true`) or not (`false`). Orgs hosted on Hyperforce use off-core dedicated content delivery to deliver content in public channels with high performance and low latency.	63.0
`isDomainLocked`	Boolean	Specifies whether the channel's domain is locked and can't be changed (`true`) or not (`false`).	62.0
`isSearchable`	Boolean	Specifies whether the text of the channel's contents is searchable (`true`) or not (`false`).	62.0
`name`	String	Name of the managed content channel.	62.0

Property Name	Type	Description	Available Version
`type`	`ConnectApi.ManagedContentChannelType`	Type of managed content channel. Values are: • `CloudToCloud`—Cloud-to-Cloud integrated channel. • `Community`—Experience Cloud site channel. • `ConnectedApp`—Channel served by a connected app. • `PublicUnauthenticated`—Public channel. All published content is publicly available. • `UserPermission`—Channel backed by a system permission. All published content is available only to users with the permission.	62.0

SEE ALSO:

getManagedContentDeliveryChannel(channelId)

ConnectApi.ManagedContentDeliveryChannelsRepresentation

Collection of managed content delivery channels.

Property Name	Type	Description	Available Version
`channels`	List<`ConnectApi.ManagedContentDeliveryChannelSummaryRepresentation`>	List of managed content delivery channels.	62.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	62.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	62.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	62.0
`totalChannels`	Integer	Total number of managed content delivery channels.	62.0

SEE ALSO:

getAllDeliveryChannels(pageParam, pageSize)

ConnectApi.ManagedContentDeliveryChannelSummaryRepresentation

Summary information of a managed content delivery channel.

Property Name	Type	Description	Available Version
`domainUrl`	String	Domain URL of the channel.	62.0
`id`	String	ID of the managed content delivery channel.	62.0
`name`	String	Name of the managed content channel.	62.0
`resourceUrl`	String	Resource URL to complete information of the channel.	62.0
`target`	`ConnectApi.ManagedContentChannelTargetSummary`	Target site associated with the channel.	62.0
`type`	`ConnectApi.ManagedContentChannelType`	Type of managed content channel. Values are: • `CloudToCloud`—Cloud-to-Cloud integrated channel. • `Community`—Experience Cloud site channel. • `ConnectedApp`—Channel served by a connected app. • `PublicUnauthenticated`—Public channel. All published content is publicly available. • `UserPermission`—Channel backed by a system permission. All published content is available only to users with the permission.	62.0

SEE ALSO:

ConnectApi.ManagedContentDeliveryDocumentCollection

ConnectApi.ManagedContentDeliveryDocument

ConnectApi.ManagedContentCollectionItems

ConnectApi.ManagedContentDeliveryDocument

Managed content in delivery scope.

Subclass of ConnectApi.AbstractManagedContentDeliveryDocument in version 55.0 and later. Properties with an available version of 54.0 only are included in ConnectApi.AbstractManagedContentDeliveryDocument in version 55.0 and later.

Property Name	Type	Description	Available Version
`channelInfo`	`ConnectApi.ManagedContentChannelSummary`	Information about the managed content channel.	54.0–61.0

Property Name	Type	Description	Available Version
channelSummary	ConnectApi.ManagedContentDeliveryChannelSummaryRepresentation	Summary information about the managed content delivery channel.	62.0
contentBody	Map<String, Object>	Map of properties of the managed content with their values.	54.0
contentKey	String	Globally unique identifier (GUID) for the managed content.	54.0 only
contentType	ConnectApi.ManagedContentTypeSummary	Type of managed content.	54.0 only
language	String	Language locale of the managed content.	54.0 only
managedContentId	String	ID of the managed content.	54.0 only
publishedDate	Datetime	Most recent publish date of the managed content.	54.0 only
references	Map<String, ConnectApi.AbstractManagedContentReference>	Map of references with `contentKey` as the key.	54.0
referencesList	List<ConnectApi.AbstractManagedContentReference>	List of references.	54.0
title	String	Title of the managed content.	54.0 only
unauthenticatedUrl	String	Public URL for the managed content.	54.0 only
urlName	String	URL name of the managed content.	54.0 only

SEE ALSO:

ConnectApi.ManagedContentDeliveryDocumentCollection

ConnectApi.ManagedContentDeliveryDocumentCollection

Managed content delivery document collection.

Property Name	Type	Description	Available Version
channelInfo	ConnectApi.ManagedContentChannelSummary	Information about the managed content channel.	55.0–61.0

Property Name	Type	Description	Available Version
channelSummary	ConnectApi.ManagedContentDeliveryChannelSummaryRepresentation	Summary information about the managed content delivery channel.	62.0
contents	List<ConnectApi.AbstractManagedContentDeliveryDocument>	List of managed content delivery documents.	55.0
currentPageUrl	String	URL to the current page of managed content records.	55.0
nextPageUrl	String	URL to the next page of managed content records.	55.0
previousPageUrl	String	URL to the previous page of managed content records.	55.0
references	Map<String, ConnectApi.AbstractManagedContentReference>	Map of references with contentKey as the key.	55.0
referencesList	List<ConnectApi.AbstractManagedContentReference>	List of references.	55.0

ConnectApi.ManagedContentDeliveryDocumentSummary

Managed content delivery document summary.

Subclass of ConnectApi.AbstractManagedContentDeliveryDocument.

No additional properties.

ConnectApi.ManagedContentDocument

Information about a piece of managed content in an authoring space.

Property Name	Type	Description	Available Version
apiName	String	API name of the managed content.	61.0
contentBody	Map<String, Object>	Map of properties of the managed content with their values.	60.0
contentKey	String	Globally unique identifier (GUID) for the managed content.	60.0
contentSpace	ConnectApi.ManagedContentSpaceSummary	Content space of the managed content.	60.0

Property Name	Type	Description	Available Version
contentType	ConnectApi.ManagedContentTypeSummary	Type of managed content.	60.0
createdBy	ConnectApi.ManagedContentUserSummary	User who created the managed content.	60.0
createdDate	Datetime	Date when the managed content was created.	60.0
externalId	String	External ID of the managed content.	60.0
folder	ConnectApi.ManagedContentFolderSummary	Folder of the managed content.	60.0
isPublished	Boolean	Specifies whether the managed content variant is published to a channel (`true`) or not (`false`).	60.0
language	String	Language locale of the managed content.	60.0
lastModifiedBy	ConnectApi.ManagedContentUserSummary	User who last modified the managed content.	60.0
lastModifiedDate	Datetime	Date when the managed content was last modified.	60.0
managedContentId	String	ID of the managed content.	60.0
managedContentVariantId	String	Managed content variant ID.	60.0
managedContentVersionId	String	Managed content version ID.	60.0
status	ConnectApi.ManagedContentVariantStatusOutput	Status of the managed content variant.	60.0
title	String	Title of the managed content.	60.0
urlName	String	URL name of the managed content.	60.0
versionNumber	String	Version number of the managed content.	60.0

ConnectApi.ManagedContentDocumentClone

Managed content document clone.

Property Name	Type	Description	Available Version
apiName	String	API name of the cloned content.	61.0

Property Name	Type	Description	Available Version
cloneStatus	ConnectApi.ManagedContentCloneStatus	Status of the cloned content.	61.0
contentKey	String	Globally unique identifier (GUID) for the cloned content.	61.0
errorMessage	String	Error message if the primary variant failed to clone.	61.0
failedVariants	List<ConnectApi.ManagedContentFailedVariants>	Information about failed cloned variants if cloning was partially successful.	61.0
folder	ConnectApi.ManagedContentFolderSummary	Folder of the cloned content.	61.0
managedContentId	String	ID of the cloned content in the authoring workspace.	61.0
resourceURL	String	Resource URL of the cloned content.	61.0
sourceContentKeyOrId	String	ID or content key of the source managed content in the authoring workspace.	61.0
title	String	Title of cloned content.	61.0
variants	List<ConnectApi.ManagedContentClonedVariants>	List of cloned variants.	61.0

SEE ALSO:

cloneManagedContentDocument(contentKeyOrId, ManagedContentCloneInputParam)

ConnectApi.ManagedContentFailedVariants

Information about failed cloned managed content variants if cloning was partially successful.

Property Name	Type	Description	Available Version
errorMessage	String	Error message for the failure.	61.0
language	String	Language of the failed translated variant.	61.0
sourceManagedContentVariantId	String	ID of the managed content variant that failed to clone.	61.0

SEE ALSO:

ConnectApi.ManagedContentDocumentClone

ConnectApi.ManagedContentFolderSummary

Information about the managed content folder.

Property Name	Type	Description	Available Version
`id`	String	ID of the managed content folder in the authoring space.	60.0
`resourceUrl`	String	Resource URL of the managed content folder.	60.0

SEE ALSO:

- ConnectApi.ManagedContentDocument
- ConnectApi.ManagedContentVariant
- ConnectApi.ManagedContentDocumentClone

ConnectApi.ManagedContentMediaNodeValue

Managed content node of media type.

Subclass of ConnectApi.ManagedContentNodeValue.

Property Name	Type	Description	Available Version
`altText`	String	Alternative text for the managed content node.	47.0
`altUrl`	String	Alternative URL to the managed content node. In version 49.0 and later, this information is returned in the `thumbnailUrl` property.	47.0–48.0
`contentKey`	String	Content key of the managed content.	51.0
`fileName`	String	File name of the managed content node.	48.0
`mediaType`	`ConnectApi.ManagedContentMediaType`	Type of managed content media. Value is `Image`.	47.0
`mimeType`	String	MIME type of the managed content node.	47.0
`resourceUrl`	String	Resource URL to the image. In version 48.0, the resource URL is available if referencing asset files and is `null` if referencing media. In version 49.0 and later, the resource URL is available if referencing asset files or media.	48.0
`thumbnailUrl`	String	URL to the thumbnail of the media.	49.0
`title`	String	Title of the managed content node.	47.0
`unauthenticatedUrl`	String	Unauthenticated URL to the image or `null` if the image isn't visible to external users.	48.0

Property Name	Type	Description	Available Version
`url`	String	URL to the image.	47.0

ConnectApi.ManagedContentMediaSourceNodeValue

Source of managed content media.

Property Name	Type	Description	Available Version
`fileName`	String	File name of the media source.	49.0
`isExternal`	Boolean	Specifies whether the media source is referenced via an external URL (`true`) or uploaded (`false`).	49.0
`mediaType`	`ConnectApi.ManagedContentMediaType`	Type of managed content media. Values are: • `Document` • `Image`	49.0
`mimeType`	String	MIME type of the media source.	49.0
`referenceId`	String	Reference ID of the uploaded media source.	49.0
`resourceUrl`	String	Resource URL of the media source.	49.0
`unauthenticatedUrl`	String	URL to the media source for unauthenticated users, or `null` if the media source isn't available to external users.	49.0
`url`	String	URL to the media source for authenticated users.	49.0

ConnectApi.ManagedContentNodeType

Managed content node type.

Property Name	Type	Description	Available Version
`label`	String	Label of the managed content node type.	47.0
`name`	String	Developer name of the managed content node type.	47.0

Property Name	Type	Description	Available Version
nodeType	ConnectApi.ManagedContentNodeTypeEnum	Type of managed content node. Values are: • Date • DateTime • Media • MediaSource • MultilineText • NameField • RichText • Text • Url	47.0

SEE ALSO:

ConnectApi.ManagedContentType

ConnectApi.ManagedContentNodeValue

Managed content node.

This class is abstract.

Superclass of:

- ConnectApi.ManagedContentDateAndTimeNodeValue
- ConnectApi.ManagedContentDateNodeValue
- ConnectApi.ManagedContentMediaNodeValue
- ConnectApi.ManagedContentMediaSourceNodeValue
- ConnectApi.ManagedContentTextNodeValue

Property Name	Type	Description	Available Version
nodeType	ConnectApi.ManagedContentNodeType	Type of managed content node. Values are: • Date • DateTime • Media • MediaSource • MultilineText • NameField • RichText • Text • Url	47.0

SEE ALSO:

ConnectApi.ManagedContentVersion

ConnectApi.ManagedContentPublishOutput

Information about a Publish action

Property Name	Type	Description	Available Version
deploymentId	String	ID of the managed content deployment.	60.0
description	String	Publish description.	60.0
publishDate	Datetime	Publish date.	60.0

ConnectApi.ManagedContentReference

Managed content reference.

Subclass of ConnectApi.AbstractManagedContentReference.

Property Name	Type	Description	Available Version
contentBody	Map<String, Object>	Map of properties of the managed content reference with their values.	54.0
title	String	Title of the managed content reference.	54.0

SEE ALSO:

ConnectApi.ManagedContentReferenceSummary

ConnectApi.ManagedContentReferenceSummary

Summary of the managed content reference.

Subclass of ConnectApi.AbstractManagedContentReference.

Property Name	Type	Description	Available Version
`title`	String	Title of the managed content reference.	54.0

ConnectApi.ManagedContentSpace

Managed content space.

Property Name	Type	Description	Available Version
`apiName`	String	API name of the managed content space.	61.0
`createdBy`	String	ID of the user who created the managed content space.	55.0
`createdDate`	Datetime	Date when the managed content space was created.	55.0
`defaultLanguage`	String	Default language of the managed content space.	55.0
`description`	String	Description of the managed content space.	55.0
`fullyQualifiedName`	String	Fully qualified name of the managed content space.	63.0
`id`	String	ID of the managed content space.	55.0
`isEnhancedSpace`	Boolean	Specifies whether the space is enhanced (`true`) or not (`false`).	60.0
`lastModifiedBy`	String	ID of the user who last modified the managed content space.	55.0
`lastModifiedDate`	Datetime	Date when the managed content space was last modified.	55.0
`name`	String	Name of the managed content space.	55.0
`rootFolderId`	String	ID of the root folder of the managed content space.	55.0

ConnectApi.ManagedContentSpaceChannelRepresentation

Managed content space channel.

Property Name	Type	Description	Available Version
`channelSummary`	`ConnectApi.ManagedContentChannelSummary`	Information about the managed content space channel.	62.0

Property Name	Type	Description	Available Version
`createdBy`	`ConnectApi.ManagedContentUserSummary`	Information about the user who created the managed content space channel.	62.0
`createdDate`	Datetime	Date when the managed content space channel was created.	62.0
`status`	`ConnectApi.ManagedContentSpaceChannelStatus` on page 2369	Status of the add or remove operation for a channel and managed content space. • `Added`—Channel was added to the managed content space. • `Failed`—Add or remove operation failed. • `Pending`—Add or remove operation is pending. • `Removed`—Channel was removed from the managed content space.	62.0

SEE ALSO:

ConnectApi.ManagedContentSpaceChannelsRepresentation

ConnectApi.ManagedContentSpaceChannelsRepresentation

List of managed content space channels.

Property Name	Type	Description	Available Version
`currentPageUrl`	String	URL to the current page of managed content space channels.	62.0
`nextPageUrl`	String	URL to the next page of Mmanaged content space channels.	62.0
`previousPageUrl`	String	URL to the previous page of managed content space channels.	62.0
`spaceChannels`	List<`ConnectApi.ManagedContentSpaceChannelRepresentation`>	List of managed content space channels.	62.0
`totalSpaceChannels`	Integer	Total count of managed content space channels returned for the request.	62.0

SEE ALSO:

patchManagedContentSpaceChannels(contentSpaceId, spaceChannels)

getManagedContentSpaceChannels(contentSpaceId, pageParam, pageSize)

ConnectApi.ManagedContentSpaceSummary

Information about the managed content space.

Property Name	Type	Description	Available Version
`id`	String	ID of the managed content space.	60.0
`resourceUrl`	String	Resource URL of the managed content space.	60.0

SEE ALSO:

- ConnectApi.ManagedContentDocument
- ConnectApi.ManagedContentVariant

ConnectApi.ManagedContentTextNodeValue

Managed content node of text type.

Subclass of ConnectApi.ManagedContentNodeValue.

Property Name	Type	Description	Available Version
`value`	String	Text value of the managed content node.	47.0

ConnectApi.ManagedContentType

Managed content type.

Property Name	Type	Description	Available Version
`label`	String	Label of the managed content type.	47.0
`name`	String	Developer name of the managed content type.	47.0
`nodeTypes`	Map<String, `ConnectApi.ManagedContentNodeType`>	Map of node types for the managed content type.	47.0

SEE ALSO:

- ConnectApi.ManagedContentVersionCollection

ConnectApi.ManagedContentTypeSummary

Managed content type.

Property Name	Type	Description	Available Version
`fullyQualifiedName`	String	Fully qualified name of the managed content type.	54.0
`name`	String	Reserved for future use.	55.0

SEE ALSO:

- ConnectApi.ManagedContentDeliveryDocument
- ConnectApi.ManagedContentCollectionItems
- ConnectApi.ManagedContentDocument
- ConnectApi.ManagedContentVariant

ConnectApi.ManagedContentUnpublishOutput

Managed content unpublish action.

Property Name	Type	Description	Available Version
`deploymentId`	String	ID of the Managed content deployment.	60.0
`description`	String	Unpublish description.	60.0
`unpublishDate`	Datetime	Unpublish date.	60.0

ConnectApi.ManagedContentUserSummary

Information about the user who created or modified the content.

Property Name	Type	Description	Available Version
`id`	String	ID of the user.	60.0
`name`	String	Reserved for future use.	60.0
`resourceUrl`	String	Resource URL of the user.	60.0

SEE ALSO:

- ConnectApi.ManagedContentDocument
- ConnectApi.ManagedContentVariant

ConnectApi.ManagedContentVariant

Managed content variant.

Property Name	Type	Description	Available Version
`apiName`	String	API name of the managed content variant.	63.0

Property Name	Type	Description	Available Version
contentBody	Map<String, Object>	Map of properties of the managed content with their values.	60.0
contentKey	String	Globally unique identifier (GUID) for the managed content.	60.0
contentSpace	ConnectApi.ManagedContentSpaceSummary	Content space of the managed content.	60.0
contentType	ConnectApi.ManagedContentTypeSummary	Type of managed content.	60.0
createdBy	ConnectApi.ManagedContentUserSummary	User who created the managed content variant.	60.0
createdDate	Datetime	Date when the managed content variant was created.	60.0
externalId	String	External ID of the managed content.	60.0
folder	ConnectApi.ManagedContentFolderSummary	Folder of the managed content.	60.0
isPublished	Boolean	Specifies whether the managed content variant is published to a channel (true) or not (false).	60.0
language	String	Language locale of the managed content.	60.0
lastModifiedBy	ConnectApi.ManagedContentUserSummary	User who last modified the managed content variant.	60.0
lastModifiedDate	Datetime	Date when the managed content variant was last modified.	60.0
managedContentId	String	ID of the managed content.	60.0
managedContentVariantId	String	ID of the managed content variant.	60.0
managedContentVersionId	String	Managed content version ID.	60.0
status	ConnectApi.ManagedContentVariantStatusOutput	Information about a managed content variant's status in the authoring space.	60.0
title	String	Title of the managed content.	60.0
urlName	String	URL name of the managed content.	60.0

ConnectApi.ManagedContentVariantStatusOutput

Information about a managed content variant's status in the authoring space.

Property Name	Type	Description	Available Version
`label`	String	Localized label for the status.	60.0
`status`	`ConnectApi.ManagedContentVariantStatus`	Status of the managed content variant. Values are: • `Draft`—Content isn't published. • `Published`—Content is published and available for use in your live sites. • `Revised`—Content that's published and edited. Publish this content to make the changes available for use in your live sites.	60.0

SEE ALSO:

ConnectApi.ManagedContentDocument

ConnectApi.ManagedContentVariant

ConnectApi.ManagedContentVersion

Managed content version.

Property Name	Type	Description	Available Version
`associations`	`ConnectApi.ManagedContentAssociations`	Content topics associated with the managed content.	47.0
`contentKey`	String	Content key of the managed content.	51.0
`contentNodes`	Map<String, `ConnectApi.ManagedContentNodeValue`>	Map of content nodes.	47.0
`contentUrlName`	String	Content URL name of the managed content version.	48.0
`language`	String	Language of the managed content version.	48.0
`managedContentId`	String	ID of the managed content.	47.0
`publishedDate`	Datetime	Date when the managed content version was last published.	47.0
`title`	String	Title of the managed content version.	47.0
`type`	String	Type of managed content version.	47.0
`typeLabel`	String	Type label of the managed content type.	47.0

Property Name	Type	Description	Available Version
`unauthenticatedUrl`	String	Unauthenticated delivery URL.	50.0

SEE ALSO:

ConnectApi.ManagedContentVersionCollection

ConnectApi.ManagedContentVersionCollection

Collection of managed content versions.

Property Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	47.0
`items`	List<`ConnectApi.ManagedContentVersion`>	List of managed content versions.	47.0
`managedContentTypes`	Map<String, `ConnectApi.ManagedContentType`>	Map of managed content types.	47.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	47.0
`total`	Integer	Total number of managed content versions.	47.0
`totalTypes`	Integer	Total number of managed content types.	47.0

ConnectApi.ManagedSocialAccount

Information describing a managed social account or fan page of a social network.

Subclass of ConnectApi.BaseManagedSocialAccount

No additional properties.

ConnectApi.ManagedSocialAccounts

A list of managed social accounts.

Property Name	Type	Description	Available Version
`managedSocialAccounts`	List<`ConnectApi.ManagedSocialAccount`>	List of managed social accounts.	44.0

ConnectApi.ManagedTopic

Represents a managed topic in an Experience Cloud site.

Property Name	Type	Description	Available Version
children	List<ConnectApi.ManagedTopic>	Children managed topics of the managed topic; null if the depth request parameter isn't specified or is 1.	35.0
id	String	ID of managed topic.	32.0
managedTopicType	ConnectApi.ManagedTopicType	Type of managed topic. • Content—Topics that are associated with native content. • Featured—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation. • Navigational—Topics that display in a navigational menu in the Experience Cloud site.	32.0
parent	ConnectApi.Reference	Parent managed topic of the managed topic.	35.0
topic	ConnectApi.Topic	Information about the topic.	32.0
url	String	Connect REST API URL to the managed topic.	32.0

SEE ALSO:

ConnectApi.ManagedTopicCollection

ConnectApi.ManagedTopicCollection

A collection of managed topics.

Property Name	Type	Description	Available Version
currentPageUrl	String	Connect REST API URL identifying the current page.	32.0
managedTopics	List<ConnectApi.ManagedTopic>	List of managed topics.	32.0
nextPageUrl	String	Connect REST API URL identifying the next page, or null if there isn't a next page.	44.0

ConnectApi.MarkupBeginSegment

The beginning of rich text markup.

Subclass of ConnectApi.MessageSegment.

Property Name	Type	Description	Available Version
altText	String	Alternative text for the segment, if available.	45.0
htmlTag	String	The HTML tag for this markup.	35.0

Property Name	Type	Description	Available Version
markupType	ConnectApi.MarkupType	Type of rich text markup. • Bold—Bold tag. • Code—Code tag. • Hyperlink—Hyperlink anchor tag. • Italic—Italic tag. • ListItem—List item tag. • OrderedList—Ordered list tag. • Paragraph—Paragraph tag. • Strikethrough—Strikethrough tag. • Underline—Underline tag. • UnorderedList—Unordered list tag.	35.0
url	String	URL to the segment, if available.	45.0

ConnectApi.MarkupEndSegment

The end of rich text markup.

Subclass of ConnectApi.MessageSegment.

Property Name	Type	Description	Available Version
htmlTag	String	The HTML tag for this markup.	35.0
markupType	ConnectApi.MarkupType	Type of rich text markup. • Bold—Bold tag. • Code—Code tag. • Hyperlink—Hyperlink anchor tag. • Italic—Italic tag. • ListItem—List item tag. • OrderedList—Ordered list tag. • Paragraph—Paragraph tag. • Strikethrough—Strikethrough tag. • Underline—Underline tag. • UnorderedList—Unordered list tag.	35.0

ConnectApi.MatchInfo

Search information related to the search result.

Property Name	Type	Description	Available Version
`isPromoted`	Boolean	Specifies whether search promotion affected the result (`true`) or not (`false`).	63.0
`isSpellCorrected`	Boolean	Specifies whether spell correction affected the result (`true`) or not (`false`).	63.0

SEE ALSO:

ConnectApi.SearchResult

ConnectApi.MCSFolderShare

Target that a managed content space folder is shared with.

Property Name	Type	Description	Available Version
`canUserUnshare`	Boolean	Specifies whether the user has permission to unshare with the target space (`true`) or not (`false`). Content Manager or higher role in the target workspace has permission to unshare.	63.0
`shareStatus`	`ConnectApi.MCSFolderShareStatus`	Status of sharing a managed content space folder. Values are: • `PendingShare` • `PendingUnshare` • `Shared`	63.0
`targetId`	String	ID of the share target.	63.0
`targetLabel`	String	Label of the share target.	63.0

SEE ALSO:

ConnectApi.MCSFolderShareCollection

ConnectApi.MCSFolderShareCollection

Collection of targets that a managed content space folder is shared with.

Property Name	Type	Description	Available Version
`folderId`	String	ID of the managed content space folder.	63.0

Property Name	Type	Description	Available Version
shares	List<ConnectApi.MCSFolderShare>	List of targets that a managed content space folder is shared with.	63.0

SEE ALSO:

patchMCSFolderShares(folderId, mcsFolderShareCollectionUpdateInput)

getMCSFolderShares(folderId)

ConnectApi.MCSFolderShareTarget

Target that a managed content space folder can be shared with.

Property Name	Type	Description	Available Version
id	String	ID of the share target.	63.0
label	String	Label of the share target.	63.0
resourceUrl	String	Resource URL of the share target that provides target details.	63.0

SEE ALSO:

ConnectApi.MCSFolderShareTargetCollection

ConnectApi.MCSFolderShareTargetCollection

Collection of targets that a managed content space folder can be shared with.

Property Name	Type	Description	Available Version
shareTargets	List<ConnectApi.MCSFolderShareTarget>	List of targets that a managed content space folder can be shared with.	63.0

SEE ALSO:

getMCSFolderShareTargets(folderId)

ConnectApi.MediaReference

A media reference.

Property Name	Type	Description	Available Version
mediaUrl	String	URL to stream or download the media.	41.0

Property Name	Type	Description	Available Version
thumbnailUrl	String	If one exists, URL of the media's thumbnail.	41.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.MediaReferenceCapability

ConnectApi.MediaReferenceCapability

If a feed element has this capability, it has one or more media references.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
media	List<ConnectApi.MediaReference>	Collection of media references.	41.0

ConnectApi.MentionCompletion

Information about a record that could be used to @mention a user or group.

Name	Type	Description	Available Version
additionalLabel	String	If one exists, an additional label for the record represented by this completion, for example, "(Customer)" or "(Acme Corporation)".	29.0
description	String	A description of the record represented by this completion.	29.0
name	String	The name of the record represented by this completion. The name is localized, if possible.	29.0
outOfOffice	ConnectApi.OutOfOffice	If the record represented by this completion is a user, an additional out-of-office message, if one exists, for the user.	40.0
photoUrl	String	A URL to the photo or icon of the record represented by this completion.	29.0
recordId	String	The ID of the record represented by this completion.	29.0

Name	Type	Description	Available Version
`userType`	`ConnectApi.UserType` Enum	If the record represented by this completion is a user, this value is the user type associated with that user; otherwise the value is `null`. One of these values: • `ChatterGuest`—User is an external user in a private group. • `ChatterOnly`—User is a Chatter Free customer. • `Guest`—User is unauthenticated. • `Internal`—User is a standard org member. • `Portal`—User is an external user in an Experience Cloud site. • `System`—User is Chatter Expert or a system user. • `Undefined`—User is a user type that is a custom object.	30.0

SEE ALSO:

ConnectApi.MentionCompletionPage

ConnectApi.MentionCompletionPage

Paginated list of Mention Completion response bodies.

Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	29.0
`mentionCompletions`	`List<ConnectApi.MentionCompletion>`	A list of mention completion proposals. Use these proposals to build a feed post body.	29.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	29.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	29.0

ConnectApi.MentionSegment

Mention segment.

Subclass of ConnectApi.MessageSegment.

Name	Type	Description	Available Version
`accessible`	Boolean	Specifies whether the mentioned user or group can see the post in which they are mentioned (`true`) or not (`false`).	28.0
`name`	String	Name of the mentioned user or group.	28.0

Name	Type	Description	Available Version
`record`	`ConnectApi.ActorWithId`	Information about the mentioned user or group.	29.0
`user`	`ConnectApi.UserSummary`	Information about the mentioned user. **Important:** In versions 29.0 and later, use the `record` property.	28.0 only In versions before 29.0, if the mention is not a user, the mention is in a `ConnectApi.TextSegment` object.

ConnectApi.MentionValidation

Information about whether a proposed mention is valid for the context user.

Name	Type	Description	Available Version
`recordId`	String	The ID of the mentioned record.	29.0
`validationStatus`	`ConnectApi.MentionValidationStatus` Enum	Type of validation error for a proposed mention, if any. • `Disallowed`—The proposed mention is invalid and is rejected because the context user is trying to mention something that is not allowed. For example, a user who is not a member of a private group is trying to mention the private group. • `Inaccessible`—The proposed mention is allowed, but the user or record being mentioned isn't notified. They don't have access to the parent record that's being discussed. • `Ok`—There is no validation error for this proposed mention.	29.0

SEE ALSO:

ConnectApi.MentionValidations

ConnectApi.MentionValidations

Information about whether a set of mentions is valid for the context user.

Name	Type	Description	Available Version
`hasErrors`	Boolean	Indicates whether at least one of the proposed mentions has an error (`true`), or not (`false`). For example, context users can't mention private groups	29.0

Name	Type	Description	Available Version
		they don't belong to. If such a group is included in the list of mention validations, `hasErrors` is `true` and the group has a `validationStatus` of `Disallowed` in its mention validation.	
`mentionValidations`	`List<ConnectApi.MentionValidation>`	List of mention validation information in the same order as the provided record IDs.	29.0

ConnectApi.MessageBody

Message body.

Subclass of ConnectApi.AbstractMessageBody.

No additional properties.

SEE ALSO:

- ConnectApi.ChatterLikesCapability
- ConnectApi.ChatterMessage
- ConnectApi.Comment
- ConnectApi.FeedElement
- ConnectApi.FeedItemSummary

ConnectApi.MessageSegment

Message segment.

This class is abstract.

Superclass of:

- ConnectApi.ComplexSegment
- ConnectApi.EntityLinkSegment
- ConnectApi.FieldChangeSegment
- ConnectApi.FieldChangeNameSegment
- ConnectApi.FieldChangeValueSegment
- ConnectApi.HashtagSegment
- ConnectApi.InlineImageSegment
- ConnectApi.LinkSegment
- ConnectApi.MarkupBeginSegment
- ConnectApi.MarkupEndSegment
- ConnectApi.MentionSegment
- ConnectApi.MoreChangesSegment
- ConnectApi.ResourceLinkSegment
- ConnectApi.TextSegment

Message segments in a feed item are typed as `ConnectApi.MessageSegment`. Feed item capabilities are typed as `ConnectApi.FeedItemCapability`. Record fields are typed as `ConnectApi.AbstractRecordField`. These classes are all abstract and have several concrete subclasses. At runtime you can use `instanceof` to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

Important: The composition of a feed can change between releases. Write your code to handle instances of unknown subclasses.

Name	Type	Description	Available Version
`text`	String	Text-only rendition of this segment. If a client encounters an unknown message segment type, it can render this value.	28.0
`type`	`ConnectApi.MessageSegmentType` Enum	The message segment type. One of these values: • `EntityLink` • `FieldChange` • `FieldChangeName` • `FieldChangeValue` • `Hashtag` • `InlineImage` • `Link` • `MarkupBegin` • `MarkupEnd` • `Mention` • `MoreChanges` • `ResourceLink` • `Text`	28.0

SEE ALSO:

ConnectApi.AbstractMessageBody

ConnectApi.ModerationCapability

If a feed element has this capability, users in an Experience Cloud site can flag it for moderation.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`moderationFlags`	`ConnectApi.ModerationFlags`	The moderation flags for this feed element. Moderators can view and take action on flagged items.	31.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.ModerationFlagItemDetail

Flag details on a feed item, comment, or file.

Property Name	Type	Description	Available Version
`createdBy`	String	ID of the user who flagged the item.	40.0
`createdDate`	Datetime	Date when the item was flagged.	40.0
`id`	String	ID of the moderation flag.	40.0
`moderationType`	`ConnectApi.CommunityFlagType`	Type of moderation flag. Values are: • `FlagAsInappropriate`—Flag for inappropriate content. • `FlagAsSpam`—Flag for spam.	40.0
`note`	String	Note from user who flagged the item.	40.0
`visibility`	`ConnectApi.CommunityFlagVisibility`	Visibility behavior of a flag for various user types. Values are: • `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item. • `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.	40.0

SEE ALSO:

ConnectApi.ModerationFlagsCollection

ConnectApi.ModerationFlags

Information about the moderation flags on a feed item, comment, or file.

Name	Type	Description	Available Version
`flagCount`	Integer	Number of moderation flags on this feed item, comment, or file. If the context user is not a moderator, the property is `null`.	29.0
`flagCountByReason`	`Map<ConnectApi.CommunityFlagReasonType, Integer>`	Number of moderation flags categorized by reason. Values for `ConnectApi.CommunityFlagReasonType` are: • `FlaggedByRule`—Moderation rule flagged the item. • `FlaggedBySystem`—Einstein flagged the item. • `FlaggedByUserAsInappropriate`—User flagged the item as inappropriate. • `FlaggedByUserAsSpam`—User flagged the item as spam.	40.0

Name	Type	Description	Available Version
`flaggedByMe`	Boolean	`true` if the context user flagged the feed item, comment, or file for moderation; `false` otherwise.	29.0
`flags`	[illegible]	Collection of flags.	40.0

SEE ALSO:

- ConnectApi.Comment
- ConnectApi.File
- ConnectApi.ModerationCapability

ConnectApi.ModerationFlagsCollection

A collection of flags on a feed item, comment, or file.

Property Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	40.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	40.0
`flags`	List<`ConnectApi.ModerationFlagItemDetail`>	List of flag details.	40.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	40.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	40.0
`pageSize`	Integer	Number of items per page.	40.0

SEE ALSO:

- ConnectApi.ModerationFlags

ConnectApi.MoreChangesSegment

In feed items with a large number of tracked changes, the message is formatted as: "changed A, B, and made X more changes." The `MoreChangesSegment` contains the "X more changes."

Subclass of ConnectApi.MessageSegment.

Name	Type	Description	Available Version
`moreChanges`	List<`ConnectApi.FieldChangeSegment`>	Complete list of tracked changes.	29.0

Name	Type	Description	Available Version
moreChangesCount	Integer	Number of additional changes.	28.0

ConnectApi.Motif

The motif properties contain URLs for small, medium, and large icons that indicate the Salesforce record type. Common record types are files, users, and groups, but all record types have a set of motif icons. Custom object records use their tab style icon. All icons are available to unauthenticated users so that, for example, you can display the motif icons in an email. The motif can also contain the record type's base color.

The motif images are icons, not user uploaded images or photos. For example, every user has the same set of motif icons.

Custom object records use their tab style icon, for example, the following custom object uses the "boat" tab style:

```
"motif": {
   "color: "8C004C",
   "largeIconUrl": "/img/icon/custom51_100/boat64.png",
   "mediumIconUrl": "/img/icon/custom51_100/boat32.png",
   "smallIconUrl": "/img/icon/custom51_100/boat16.png",
   "svgIconUrl": null
},
```

Users use the following icons:

```
"motif": {
   "color: "1797C0",
   "largeIconUrl": "/img/icon/profile64.png",
   "mediumIconUrl": "/img/icon/profile32.png",
   "smallIconUrl": "/img/icon/profile16.png",
   "svgIconUrl": null
},
```

Groups use the following icons:

```
"motif": {
   "color: "1797C0",
   "largeIconUrl": "/img/icon/groups64.png",
   "mediumIconUrl": "/img/icon/groups32.png",
   "smallIconUrl": "/img/icon/groups16.png",
   "svgIconUrl": null
},
```

Files use the following icons:

```
"motif": {
    "color: "1797C0",
    "largeIconUrl": "/img/content/content64.png",
    "mediumIconUrl": "/img/content/content32.png",
    "smallIconUrl": "/img/icon/files16.png",
    "svgIconUrl": null
},
```

Note: To view the icons in the previous examples, preface the URL with `https://instance_name`. For example, `https://instance_name/img/icon/profile64.png`.

Name	Type	Description	Available Version
`color`	String	A hex value representing the base color of the record type, or `null`.	29.0
`largeIconUrl`	String	A large icon indicating the record type.	28.0
`mediumIconUrl`	String	A medium icon indicating the record type.	28.0
`smallIconUrl`	String	A small icon indicating the record type.	28.0
`svgIconUrl`	String	An icon in SVG format indicating the record type, or `null` if the icon doesn't exist.	34.0

ConnectApi.MultipleAsyncOutputRepresentation

IDs of the asynchronous background operations. This output only includes the operation IDs, regardless of whether calls are made to an external payment gateway. It doesn't include any errors from the operations.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`asyncOutputs`	List<`ConnectApi.AsyncOutputRepresentation`>	List of IDs of background operations.	56.0

SEE ALSO:

multipleEnsureFundsAsync(multipleEnsureFundsInput)

ConnectApi.MultipleFulfillmentOrderInvoicesOutputRepresentation

IDs of the created Invoices.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`invoiceIds`	List<String>	List of IDs of the created Invoices.	52.0

ConnectApi.MultipleFulfillmentOrderOutputRepresentation

List of responses for the individual FulfillmentOrder creation attempts from a create multiple fulfillment orders request.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`fulfillmentOrders`	List<`ConnectApi.FulfillmentGroupOutputRepresentation`>	A list of response data for created and failed FulfillmentOrders.	50.0

ConnectApi.MuteCapability

If a feed element has this capability, users can mute it. Muted feed elements are visible in the muted feed, and invisible in all other feeds that respect mute.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`isMutedByMe`	Boolean	Indicates whether the context user muted the feed element.	35.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.MuteSummary

Summary of a mute.

Subclass of ConnectApi.UserFeedEntityActivitySummary.

No additional properties.

ConnectApi.NamedCredential

Named credential associated with an external credential.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Property Name	Type	Description	Available Version
`calloutOptions`	`ConnectApi.NamedCredentialCalloutOptions`	Callout options for the named credential.	58.0
`calloutStatus`	`ConnectApi.CalloutStatus`	Indicates whether a named credential is enabled for callout. Values are: • `Disabled` • `Enabled`	59.0
`calloutUrl`	String	URL of the named credential in a callout.	58.0
`createdByNamespace`	String	Namespace of the package that created the named credential.	59.0
`customHeaders`	List<`ConnectApi.CredentialCustomHeader`>	Custom HTTP headers for the named credential.	58.0
`developerName`	String	Fully qualified developer name of the named credential.	56.0

Property Name	Type	Description	Available Version
`externalCredentials`	List<`ConnectApi.ExternalCredential`>	External credentials used by the named credential.	58.0
`id`	String	Named credential ID.	58.0
`masterLabel`	String	Named credential label.	56.0
`networkConnection`	`ConnectApi.NetworkConnection`	PrivateConnect outbound network connection for the named credential.	58.0
`parameters`	List<`ConnectApi.NamedCredentialParameter`>	Named credential parameters.	58.0
`type`	`ConnectApi.NamedCredentialType`	Type of named credential. Values are: • `PrivateEndpoint` • `SecuredEndpoint`	58.0
`url`	String	Connect REST API URL of the named credential.	58.0

SEE ALSO:

ConnectApi.ExternalCredential

ConnectApi.NamedCredentialList

ConnectApi.NamedCredentialCalloutOptions

Named credential callout options.

Property Name	Type	Description	Available Version
`allowMergeFieldsInBody`	Boolean	Specifies whether to allow merge fields in the HTTP body (`true`) or not (`false`).	58.0
`allowMergeFieldsInHeader`	Boolean	Specifies whether to allow merge fields in the HTTP header (`true`) or not (`false`).	58.0
`generateAuthorizationHeader`	Boolean	Specifies whether to generate an authorization header (`true`) or not (`false`).	58.0

SEE ALSO:

ConnectApi.NamedCredential

ConnectApi.NamedCredentialList

List of named credentials.

Property Name	Type	Description	Available Version
`namedCredentials`	List<`ConnectApi.NamedCredential`>	List of named credentials.	58.0

ConnectApi.NamedCredentialParameter

Named credential parameter.

Property Name	Type	Description	Available Version
`id`	String	ID of the parameter.	58.0
`parameterName`	String	Name of the parameter.	58.0
`parameterType`	`ConnectApi.NamedCredentialParameterType`	Type of named credential parameter. Values are: • `AllowedManagedPackageNamespaces` • `ClientCertificate`	58.0
`parameterValue`	String	Value of the parameter.	58.0

SEE ALSO:

ConnectApi.NamedCredential

ConnectApi.NavigationMenuItem

Navigation menu item.

Property Name	Type	Description	Available Version
`actionType`	`ConnectApi.NavigationMenuItemActionType`	Event, URL type, or modal navigation menu item. Values are: • `Event`—Event-based navigation. Note: `Event` is internal only and can't be used in custom components. • `ExternalLink`—URL outside of your Experience Cloud site. • `InternalLink`—Relative URL inside your Experience Cloud site. • `Modal`—Modal, such as Account Switcher.	52.0
`actionValue`	String	For `Event` action type, the event fully qualified name for the navigation menu item. For `ExternalLink` and `InternalLink` action types, the route URL for the navigation menu item.	52.0

Property Name	Type	Description	Available Version
		For `Modal` action type, the component fully qualified name for the navigation menu item.	
`imageUrl`	String	URL to the image of the navigation menu item.	52.0
`label`	String	Label for the navigation menu item.	52.0
`pageReference`	`ConnectApi.NavigationMenuPageReference`	Page reference for the navigation menu item. Page reference is returned only for the Storefront Categories data source.	59.0
`subMenu`	List<`ConnectApi.NavigationMenuItem`>	Submenu for the navigation menu item.	52.0
`target`	`ConnectApi.NavigationMenuItemOpenTarget`	Target for the navigation menu item. Values are: • `CurrentWindow`—Navigation menu item opens in the current window. • `NewWindow`—Navigation menu item opens in a new window.	52.0

SEE ALSO:

ConnectApi.NavigationMenuItemCollection

ConnectApi.NavigationMenuItemCollection

Collection of navigation menu items.

Property Name	Type	Description	Available Version
`menuItems`	List<`ConnectApi.NavigationMenuItem`>	Collection of navigation menu items.	52.0

ConnectApi.NavigationMenuPageReference

Navigation menu item page reference.

Property Name	Type	Description	Available Version
`attributes`	Map<String, String>	Attributes for the navigation menu item page reference.	59.0
`state`	Map<String, String>	State for the navigation menu item page reference.	59.0
`type`	String	Type for the navigation menu item page reference.	59.0

SEE ALSO:

ConnectApi.NavigationMenuItem

ConnectApi.NBAActionParameter

A parameter for an action.

Property Name	Type	Description	Available Version
`name`	String	Name of the parameter.	45.0
`type`	String	Type of the parameter.	45.0
`value`	String	Value of the parameter.	45.0

ConnectApi.NBAFlowAction

A recommended flow.

Subclass of ConnectApi.AbstractNBAAction.

Property Name	Type	Description	Available Version
`flowLabel`	String	Label of the recommended flow.	47.0
`flowType`	`ConnectApi.NBAFlowType`	Type of recommended flow. Values are: • `AutoLaunchedFlow`—Autolaunched flow that runs in the background. • `Flow`—Screen flow that accepts user inputs.	47.0
`id`	String	ID of the flow.	45.0
`name`	String	Name of the flow.	45.0

ConnectApi.NBANativeRecommendation

A record the user is recommended to take action on.

Subclass of ConnectApi.AbstractNBATarget.

Property Name	Type	Description	Available Version
`id`	String	ID of the recommendation.	45.0
`name`	String	Name of the recommendation.	45.0
`url`	String	URL to the recommendation.	45.0

ConnectApi.NBARecommendation

A recommendation returned by a recommendation strategy.

Property Name	Type	Description	Available Version
`aiModel`	String	Reserved for future use.	47.0

Property Name	Type	Description	Available Version
acceptanceLabel	String	Text indicating user acceptance of the recommendation.	45.0
description	String	Description of the recommendation.	45.0
externalId	String	External ID of the recommendation. This ID doesn't need to be a Salesforce 18-character ID. For example, it can be a product number from an external system.	46.0
imageUrl	String	URL to the asset file to display.	45.0
recommendationMode	String	Reserved for future use.	46.0
recommendationScore	Double	Reserved for future use.	46.0
rejectionLabel	String	Text indicating user rejection of the recommendation.	45.0
target	ConnectApi.AbstractNBATarget	Target to act on.	45.0
targetAction	ConnectApi.AbstractNBAAction	Action to recommend.	45.0

SEE ALSO:

ConnectApi.NBARecommendations

ConnectApi.NBARecommendations

Recommendations returned by a recommendation strategy.

Property Name	Type	Description	Available Version
debug	String	Runtime debug information recorded during recommendation strategy execution.	45.0
errors	String	Runtime errors that occurred during recommendation strategy execution.	45.0
executionId	String	ID of the recommendation strategy execution.	45.0
onBehalfOfId	String	ID of the user or entity for which the recommendation strategy was executed.	45.0
recommendations	List<ConnectApi.NBARecommendation>	List of recommendations returned by a recommendation strategy.	45.0
trace	ConnectApi.StrategyTrace	Trace information for the recommendation strategy execution, if requested.	45.0

ConnectApi.NetworkConnection

External network connection.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Property Name	Type	Description	Available Version
`developerName`	String	Name of the network connection.	58.0
`id`	String	ID of the network connection.	58.0
`masterLabel`	String	Label of the network connection.	58.0
`namespacePrefix`	String	Namespace prefix of the network connection.	58.0

SEE ALSO:

ConnectApi.NamedCredential

ConnectApi.NewUserAudienceCriteria

Criteria for the new members type of custom recommendation audience.

Subclass of ConnectApi.AudienceCriteria.

Property Name	Type	Description	Available Version
`maxDaysInCommunity`	Double	The maximum number of days since a user became a site member.	36.0

ConnectApi.OAuthCredentialAuthUrl

OAuth authentication URL for a credential.

Property Name	Type	Description	Available Version
`authenticationUrl`	String	Authentication URL for the user external credential. Authentication URLs have encoded and escaped special characters. Before using the URL, undo the encoded and escaped characters.	56.0
`external Credential`	String	Fully qualified developer name of the external credential.	56.0
`principalName`	String	Name of the external credential named principal.	56.0
`principalType`	`ConnectApi.CredentialPrincipalType`	Type of credential principal. Values are: • `AwsStsPrincipal` • `NamedPrincipal` • `PerUserPrincipal`	56.0

ConnectApi.OauthProviderInfo

OAuth provider information.

Name	Type	Description	Available Version
`authorizationUrl`	String	The URL used for authorization.	37.0
`name`	String	The name of the OAuth service provider.	37.0

SEE ALSO:

ConnectApi.UserOauthInfo

ConnectApi.ObjectMetadata

Search metadata related to the object.

Property Name	Type	Description	Available Version
`dataCategories`	Map<String, `ConnectApi.DataCategoryMetadata`>	Metadata on each data category for the object.	63.0
`fields`	Map<String, `ConnectApi.FieldMetadata`>	Metadata on each field of the object.	63.0
`label`	String	Name of the object.	63.0
`labelPlural`	String	Plural name of the object.	63.0
`objectApiName`	String	API name of the object	63.0
`themeInfo`	`ConnectApi.ThemeInfo`	Theme related to the object.	63.0

ConnectApi.ScopedSearchResults

ConnectApi.OCIBaseOutputRepresentation

Base Omnichannel Inventory output class.

This class is abstract.

Superclass of:

- ConnectApi.OCIGetInventoryAvailabilityOutputRepresentation
- ConnectApi.OCIPublishLocationStructureOutputRepresentation

- ConnectApi.OCIPublishLocationStructureStatusOutputRepresentation
- ConnectApi.OCIUploadInventoryAvailabilityOutputRepresentation
- ConnectApi.OCIUploadInventoryAvailabilityStatusOutputRepresentation

Property Name	Type	Description	Available Version
errors	List<ConnectApi.ErrorResponse>	Any errors that were returned.	51.0
success	Boolean	Indicates whether the request was successful.	51.0

ConnectApi.OCICreateReservationErrorOutputRepresentation

Error returned from an attempt to create an Omnichannel Inventory reservation.

Property Name	Type	Description	Available Version
errorCode	String	The error code.	51.0
message	String	Details of the error, if available.	51.0

ConnectApi.OCICreateReservationOutputRepresentation

Result of an Omnichannel Inventory reservation creation request.

Property Name	Type	Description	Available Version
details	List<ConnectApi.OCICreateReservationSingleOutputRepresentation>	Details for each product in the reservation.	51.0
errors	List<ConnectApi.OCICreateReservationErrorOutputRepresentation>	Any errors returned by the reservation request.	51.0
expirationTime	String	The time at which the reservation would expire.	51.0
reservationTime	String	The time when the reservation was recorded.	51.0
success	Boolean	Indicates whether the reservation was successfully created.	51.0

ConnectApi.OCICreateReservationSingleOutputRepresentation

Details of an inventory reservation for one product.

Property Name	Type	Description	Available Version
errorCode	String	The error code, if any.	51.0

Property Name	Type	Description	Available Version
locationGroupIdentifier	String	Identifier of the location group where the inventory is reserved.	51.0
locationIdentifier	String	Identifier of the location where the inventory is reserved.	51.0
quantity	Double	The reserved quantity of the product.	51.0
stockKeepingUnit	String	The SKU of the reserved product.	51.0

ConnectApi.OCIFulfillReservationErrorOutputRepresentation

Response to a request to fulfill one inventory reservation.

Property Name	Type	Description	Available Version
details	ConnectApi.OCIFulfillReservationSingleOutputRepresentation	Details of the fulfilled reservation, if successful.	51.0
errorCode	String	Error code, if any.	51.0
message	String	Details of the error, if available.	51.0

ConnectApi.OCIFulfillReservationOutputRepresentation

Response to a request to fulfill one or more inventory reservations.

Property Name	Type	Description	Available Version
errors	List<ConnectApi.OCIFulfillReservationErrorOutputRepresentation>	Responses for the individual reservations in the fulfillment request.	51.0
success	Boolean	Indicates whether the request was successful.	51.0

ConnectApi.OCIFulfillReservationSingleOutputRepresentation

Details of a single fulfilled reservation.

Property Name	Type	Description	Available Version
actionRequestId	String	The UUID that identifies the original fulfill reservation request.	51.0
externalRefId	String	The external reference ID of the location that fulfilled the reservation.	51.0
locationIdentifier	String	The identifier of the location that fulfilled the reservation.	51.0

Property Name	Type	Description	Available Version
`quantity`	Double	The fulfilled quantity.	51.0
`stockKeepingUnit`	String	The SKU of the fulfilled product.	51.0

ConnectApi.OCIFutureInventoryOutputRepresentation

An expected future inventory restock.

Property Name	Type	Description	Available Version
`expectedDate`	Datetime	Date when the future inventory is expected.	51.0
`quantity`	Double	Quantity of the future inventory.	51.0

ConnectApi.OCIGetInventoryAvailabilityOutputRepresentation

Response to a request for inventory availability data.

Subclass of ConnectApi.OCIBaseOutputRepresentation.

Property Name	Type	Description	Available Version
`locationGroups`	List<`ConnectApi.OCILocationGroupAvailabilityOutputRepresentation`>	A list of inventory availability data for individual location groups.	51.0
`locations`	List<`ConnectApi.OCILocationAvailabilityOutputRepresentation`>	A list of inventory availability data for individual locations.	51.0

SEE ALSO:

getInventoryAvailability(inventoryAvailabilityInputRepresentation)

findRoutesWithFewestSplitsUsingOCI(findRoutesWithFewestSplitsUsingOCIInput)

ConnectApi.FindRoutesWithFewestSplitsUsingOCIOutputRepresentation

ConnectApi.OCIInventoryRecordOutputRepresentation

Inventory availability data for a product.

Property Name	Type	Description	Available Version
`availableToFulfill`	Double	The Available To Fulfill quantity.	51.0
`availableToOrder`	Double	The Available To Order quantity.	51.0
`effectiveDate`	Datetime	The effective date of the inventory. Indicates if the SKU exists in the inventory.	51.0

Property Name	Type	Description	Available Version
`exists`	Boolean	Indicates if the SKU exists in the inventory.	62.0
`futures`	List<`ConnectApi.OCIFutureInventoryOutputRepresentation`>	A list of any expected future inventory restocks.	51.0
`onHand`	Double	The On Hand quantity.	51.0
`reserved`	Double	The Reserved quantity.	51.0
`safetyStockCount`	Double	The Safety Stock Count.	51.0
`stockKeepingUnit`	String	The SKU of the product.	51.0

ConnectApi.OCILocationAvailabilityOutputRepresentation

A set of inventory availability data for one inventory location.

Property Name	Type	Description	Available Version
`inventoryRecords`	List<`ConnectApi.OCIInventoryRecordOutputRepresentation`>	A list of availability data for individual products at this location.	51.0
`locationIdentifier`	String	The identifier of the location.	51.0

ConnectApi.OCILocationGroupAvailabilityOutputRepresentation

A set of inventory availability data for one inventory location group.

Property Name	Type	Description	Available Version
`inventoryRecords`	List<`ConnectApi.OCIInventoryRecordOutputRepresentation`>	A list of availability data for individual products. The data combines the quantities for all locations belonging to this location group.	51.0
`locationGroupIdentifier`	String	The identifier of the location group.	51.0

ConnectApi.OCIPublishLocationStructureOutputRepresentation

Response to a publish location structure request.

Subclass of ConnectApi.OCIBaseOutputRepresentation.

Property Name	Type	Description	Available Version
`uploadId`	String	Identifier of the publish job. Use this value to retrieve the status of the job.	51.0

ConnectApi.OCIPublishLocationStructureStatusOutputRepresentation

Detailed status of a publish location structure job.

Subclass of ConnectApi.OCIBaseOutputRepresentation.

Property Name	Type	Description	Available Version
`endTimeUTC`	String	The UTC time when the job finished. (for example: "2020-07-06T22:54:08.012Z")	51.0
`recordsProcessedCount`	Integer	The number of records processed by the job.	51.0
`recordsReadCount`	Integer	The number of records read by the job.	51.0
`recordsSkippedCount`	Integer	The number of records skipped by the job.	51.0
`startTimeUTC`	String	The UTC time when the job started. (for example: "2020-07-06T22:53:06.788Z")	51.0
`status`	String	The status of the job. (e.g., "PENDING," "COMPLETED," etc.).	51.0
`uploadId`	String	Identifier of the job.	51.0
`validationErrors`	List<`String`>	List of any validation errors returned by the job.	51.0
`validationStatus`	String	The validation status of the job.	51.0

ConnectApi.OCIReleaseReservationErrorOutputRepresentation

Response to a request to release one inventory reservation.

Property Name	Type	Description	Available Version
`details`	`ConnectApi.OCIReleaseReservationSingleOutputRepresentation`	Details of the released reservation, if successful.	51.0
`errorCode`	String	Error code, if any.	51.0
`message`	String	Details of the error, if available.	51.0

ConnectApi.OCIReleaseReservationOutputRepresentation

Response to a request to release one or more inventory reservations.

Property Name	Type	Description	Available Version
`errors`	List<`ConnectApi.OCIReleaseReservationErrorOutputRepresentation`>	Responses for the individual reservations in the release request.	51.0
`success`	Boolean	Indicates whether the request was successful.	51.0

ConnectApi.OCIReleaseReservationSingleOutputRepresentation

Details of a single released reservation.

Property Name	Type	Description	Available Version
`actionRequestId`	String	The UUID that identifies the original release reservation request.	51.0
`externalRefId`	String	The external reference ID of the location that released the reservation.	51.0
`locationGroupIdentifier`	String	The identifier of the location group that released the reservation.	51.0
`locationIdentifier`	String	The identifier of the location that released the reservation.	51.0
`quantity`	Double	The released quantity.	51.0
`stockKeepingUnit`	String	The SKU of the released product.	51.0

ConnectApi.OCITransferReservationErrorOutputRepresentation

Response to a request to fulfill one inventory reservation.

Property Name	Type	Description	Available Version
`details`	`ConnectApi.OCITransferReservationSingleOutputRepresentation`	Details of the transferred reservation, if successful.	51.0
`errorCode`	String	Error code, if any.	51.0
`message`	String	Details of the error, if available.	51.0

ConnectApi.OCITransferReservationOutputRepresentation

Response to a request to transfer one or more inventory reservations.

Property Name	Type	Description	Available Version
`errors`	List<`ConnectApi.OCITransferReservationErrorOutputRepresentation`>	Responses for the individual reservations in the transfer request.	51.0
`success`	Boolean	Indicates whether the request was successful.	51.0

ConnectApi.OCITransferReservationSingleOutputRepresentation

Details of a single transferred reservation.

Property Name	Type	Description	Available Version
actionRequestId	String	The UUID that identifies the original transfer reservation request.	51.0
externalRefId	String	The external reference ID of the location that received the reservation.	51.0
fromLocationGroupIdentifier	String	The identifier of the location group that sent the reservation.	51.0
fromLocationIdentifier	String	The identifier of the location that sent the reservation.	51.0
ignoreAvailabilityCheck	Boolean	Whether this call ignored availability data at the location that received the reservation.	52.0
quantity	Double	The quantity of transferred inventory.	51.0
stockKeepingUnit	String	The SKU of the transferred product.	51.0
toLocationGroupIdentifier	String	The identifier of the location group that received the reservation.	51.0
toLocationIdentifier	String	The identifier of the location that received the reservation.	51.0

ConnectApi.OCIUpdateReservationErrorOutputRepresentation

Error output representation for the update inventory reservation.

Property Name	Type	Description	Available Version
errorCode	String	The error code.	61.0
message	String	Details of the error, if available.	61.0

ConnectApi.OCIUpdateReservationOutputRepresentation

Result of an Omnichannel Inventory update request for reserved inventory.

Property Name	Type	Description	Available Version
details	List<ConnectApi.OCIUpdateReservationDetailOutputRepresentation>[]	Details for each product in the reservation.	61.0
errors	List<ConnectApi.OCIUpdateReservationErrorOutputRepresentation>[]	Any errors returned by the reservation update request.	61.0
reservationTime	String	The time when the reservation was updated.	61.0
success	Boolean	Indicates whether the reservation was successfully updated.	61.0

ConnectApi.OCIUpdateReservationSingleOutputRepresentation

Details of an updated reservation for one product.

Property Name	Type	Description	Available Version
`adjustment`	Double	The total reservation adjustment.	61.0
`errorCode`	String	The error code, if any.	61.0
`locationGroupIdentifier`	String	Identifier of the location group where the inventory is reserved.	61.0
`locationIdentifier`	String	Identifier of the location where the inventory is reserved.	61.0
`quantity`	Double	The total reservation quantity of the product.	61.0
`stockKeepingUnit`	String	The SKU of the updated product.	61.0

ConnectApi.OCIUploadInventoryAvailabilityOutputRepresentation

Response to an upload inventory availability job.

Subclass of ConnectApi.OCIBaseOutputRepresentation.

Property Name	Type	Description	Available Version
`uploadId`	String	Identifier of the upload job. Use this value to retrieve the status of the job.	51.0

ConnectApi.OCIUploadInventoryAvailabilityStatusOutputRepresentation

Detailed status of an upload inventory availability job.

Subclass of ConnectApi.OCIBaseOutputRepresentation.

Property Name	Type	Description	Available Version
`endTimeUTC`	String	The UTC time when the job finished. (for example: "2020-07-06T22:54:08.012Z")	51.0
`recordsProcessedCount`	Integer	The number of records processed by the job.	51.0
`recordsReadCount`	Integer	The number of records read by the job.	51.0
`recordsSkippedCount`	Integer	The number of records skipped by the job.	51.0
`startTimeUTC`	String	The UTC time when the job started. (for example: "2020-07-06T22:53:06.788Z")	51.0
`status`	String	The overall status of the inventory availability upload (e.g. "PENDING", "COMPLETED").	51.0
`uploadId`	String	Identifier of the job.	51.0

Property Name	Type	Description	Available Version
validationErrors	List<String>	List of any validation errors returned by the job.	51.0
validationStatus	String	The validation status of the job.	51.0

ConnectApi.OrchestrationInstance

Orchestration instance.

Property Name	Type	Description	Available Version
flowDefinitionDeveloperName	String	Developer name of the flow definition.	54.0
flowDefinitionId	String	ID of the flow definition.	54.0
flowDefinitionName	String	Name of the flow definition.	54.0
id	String	ID of the orchestration instance.	54.0
interviewId	String	ID of the interview to resume.	54.0
stageInstances	List<ConnectApi.OrchestrationStageInstance>	Orchestration stage instances.	54.0
status	ConnectApi.OrchestrationStatus	Status of the orchestration instance. Values are: • Canceled • Completed • Discontinued • Error • InProgress • NotStarted • Suspended	54.0

SEE ALSO:

ConnectApi.OrchestrationInstanceCollection

ConnectApi.OrchestrationInstanceCollection

Collection of orchestration instances.

Property Name	Type	Description	Available Version
instances	List<ConnectApi.OrchestrationInstance>	Collection of orchestration instances.	54.0

ConnectApi.OrchestrationStageInstance

Orchestration stage instance.

Property Name	Type	Description	Available Version
`completionTime`	String	The duration of the stage in seconds.	63.0
`id`	String	ID of the orchestration stage instance.	54.0
`label`	String	Orchestration stage instance label.	54.0
`name`	String	Orchestration stage instance name.	54.0
`status`	`ConnectApi.OrchestrationStatus`	Status of the orchestration instance. Values are: • `Canceled` • `Completed` • `Discontinued` • `Error` • `InProgress` • `NotStarted` • `Suspended`	54.0
`stepInstances`	List<`ConnectApi.OrchestrationStepInstance`>	Orchestration stage instance steps.	54.0

SEE ALSO:

ConnectApi.OrchestrationInstance

ConnectApi.OrchestrationStepInstance

Orchestration step instance.

Property Name	Type	Description	Available Version
`assignedTo`	String	The ID of the user, group, or queue that's assigned to a work item.	63.0
`assigneeType`	String	The assignee type associated with a work item. Valid values are: • Group • Invalid • Queue • User	63.0

Property Name	Type	Description	Available Version
`comments`	String	The string stored in an output variable with the API name of Comments from a flow called by a completed orchestration step.	63.0
`completedBy`	String	The user ID of the user who completed the work item.	63.0
`completionTime`	String	The duration of the step in seconds.	63.0
`description`	String	The description associated with the orchestration step.	63.0
`id`	String	ID of the orchestration step instance.	54.0
`label`	String	Orchestration step instance label.	54.0
`name`	String	Orchestration step instance name.	54.0
`status`	`ConnectApi.OrchestrationStatus`	Status of the orchestration instance. Values are: • `Canceled` • `Completed` • `Discontinued` • `Error` • `InProgress` • `NotStarted` • `Suspended`	54.0
`stepType`	`ConnectApi.OrchestrationStepType`	Type of orchestration step. Values are: • `AsynchronousBackgroundStep` • `ApprovalStep` • `BackgroundStep` • `InteractiveStep` • `ManagedContentRoleInteractiveStep` • `ManagedContentVariantAutoPublishBackgroundStep` • `ManagedContentVariantAutoUnpublishBackgroundStep` • `ManagedContentVariantSetLockBackgroundStep` • `ManagedContentVariantSetReadyBackgroundStep` • `MuleSoftStep`	54.0

Property Name	Type	Description	Available Version
workItems	List<ConnectApi.OrchestrationWorkItem>	Orchestration step instance work items.	54.0

SEE ALSO:

ConnectApi.OrchestrationStageInstance

ConnectApi.OrchestrationWorkItem

Orchestration work item.

Property Name	Type	Description	Available Version
assigneeId	String	ID of the assignee for the orchestration work item.	54.0
createdDate	Datetime	Date when the orchestration work item was created.	61.0
description	String	Description of the orchestration work item.	54.0
flowType	String	Flow type of the orchestration that created the orchestration work item.	62.0
id	String	ID of the orchestration work item.	54.0
label	String	Label key for the orchestration work item.	54.0
lastModifiedDate	Datetime	Date when the work item was last modified.	61.0
relatedRecordId	String	ID of the record the orchestration work item is related to.	54.0
screenFlowDeveloperName	String	Developer name of the screen flow to start when assignees work on the orchestration work item.	54.0
screenFlowId	String	ID of the screen flow to start when assignees work on the orchestration work item.	54.0
screenFlowInputs	String	Input parameters for the screen flow.	54.0
status	ConnectApi.OrchestrationWorkItemStatus	Status of the orchestration work item. Values are: • Assigned • Completed	54.0

SEE ALSO:

ConnectApi.OrchestrationStepInstance

ConnectApi.OrderDeliveryGroupSummary

Order delivery group summary.

Property Name	Type	Description	Available Version
fields	Map<String, ConnectApi.RecordField>	Map of fields from order delivery group summary and other related objects that were queried.	51.0

SEE ALSO:

ConnectApi.OrderDeliveryGroupSummaryCollection

ConnectApi.OrderDeliveryGroupSummaryCollection

Collection of order delivery group summaries.

Property Name	Type	Description	Available Version
currentPageToken	String	Token identifying the current page of order delivery group summaries.	51.0
currentPageUrl	String	URL to the current page of order delivery group summaries.	51.0
nextPageToken	String	Token identifying the next page of order delivery group summaries.	51.0
nextPageUrl	String	URL to the next page of order delivery group summaries.	51.0
orderDeliveryGroups	List<ConnectApi.OrderDeliveryGroupSummary>	Collection of order delivery group summaries.	51.0
previousPageToken	String	Token identifying previous page of order delivery group summaries.	51.0
previousPageUrl	String	URL to the previous page of order delivery group summaries.	51.0

ConnectApi.OrderDeliveryGroupSummaryLookupOutput

Order delivery group summary lookup output.

Property Name	Type	Description	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the order delivery group summary record.	58.0
deliveryMethod	ConnectApi.OrderDeliveryMethodLookupOutput	Delivery method associated with order the delivery group summary.	58.0
fields	Map<String, ConnectApi.RecordFieldCollection on page 2270>	Map of requested order delivery group summary fields.	58.0

Property Name	Type	Description	Available Version
id	String	ID of the order delivery group summary.	58.0
lineItems	List<ConnectApi.OrderSummaryLookupOutput>	Line items associated with the order delivery group summary.	58.0

ConnectApi.OrderDeliveryMethodLookupOutput

Order delivery method lookup output.

Property Name	Type	Description	Available Version
fields	Map<String, ConnectApi.RecordField>	Map of requested order delivery method fields.	58.0
id	String	ID of the order delivery method.	58.0

ConnectApi.OrderItemSummary

Order item summary.

Property Name	Type	Description	Available Version
adjustmentAggregates	ConnectApi.OrderItemSummaryAdjustmentAggregates	Adjustment aggregates associated with an order item summary.	55.0
fields	Map<String, ConnectApi.RecordField>	Map of fields from order item summary and other related objects that were queried.	51.0
orderItemSummaryId	String	ID of the order item summary.	51.0
orderSummaryId	String	ID of the order summary.	51.0
product	ConnectApi.OrderItemSummaryProduct	Associated product item information.	51.0

SEE ALSO:

ConnectApi.OrderItemSummaryCollection

ConnectApi.OrderItemSummaryAdjustmentAggregates

Adjustment aggregates associated with an order item summary.

Property Name	Type	Description	Available Version
`available`	Boolean	Indicates whether adjustment aggregates are available (`true`) or not (`false`).	55.0
`status`	`ConnectApi.OrderSummaryAdjustmentAggregatesStatus`	Order summary adjustment aggregate job status. • `Failed`—The adjustment aggregate data job for the order summary failed. • `InProgress`—The adjustment aggregate data job for the order summary is in progress. • `NotInitiated`—The adjustment aggregate data job for the order summary is not initiated. • `Submitted`—The adjustment aggregate data job for the order summary is submitted.	55.0
`totalLinePromotionAmount`	String	Total of all line item promotions applied to this specific product.	55.0
`totalPromotionDistAmount`	String	Total of all order level promotions applied to this specific product.	55.0

ConnectApi.OrderItemSummaryAdjustmentCollection

Collection of adjustments for order item summaries.

Property Name	Type	Description	Available Version
`orderItemSummaries`	Map<String, `ConnectApi.OrderItemSummaryAdjustmentList`>	Order item summaries and their associated adjustments.	53.0

ConnectApi.OrderItemSummaryAdjustmentList

Representation for list of adjustments for an Order Item Summary.

Property Name	Type	Description	Available Version
`adjustments`	List<`ConnectApi.OrderSummaryAdjustment`>	Adjustments associated with an order item summary.	53.0

SEE ALSO:

ConnectApi.OrderItemSummaryAdjustmentCollection

ConnectApi.OrderItemSummaryCollection

Collection of order item summaries.

Property Name	Type	Description	Available Version
currentPageToken	String	Token identifying the current page of items.	51.0
currentPageUrl	String	URL to the current page of items.	51.0
items	List<ConnectApi.OrderItemSummary>	Collection of order item summaries.	51.0
nextPageToken	String	Token identifying the next page of items.	51.0
nextPageUrl	String	URL to the next page of items.	51.0
previousPageToken	String	Token identifying the previous page of items.	51.0
previousPageUrl	String	URL to the previous page of items.	51.0

ConnectApi.OrderItemSummaryLookupOutput

Order item summary lookup output.

Property Name	Type	Description	Available Version
adjustmentAggregates	[illegible]	Adjustment aggregates for the order item summary.	58.0
adjustments	[illegible]	Adjustments associated with the order item summary.	58.0
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the order item summary record.	58.0
fields	Map<String, ConnectApi.RecordField>	Map of requested order item summary fields.	58.0
id	String	ID of the order item summary.	58.0
product	[illegible]	Details of the product associated with order item summary.	58.0

ConnectApi.OrderItemSummaryOutputRepresentation

Details of an OrderItemSummary from a failed FulfillmentOrder in a create multiple fulfillment orders request.

Property Name	Type	Description	Available Version
errors	List<ConnectApi.ErrorResponse>	List of errors specific to the OrderItemSummary, if any.	50.0
orderItemSummaryId	String	ID of the OrderItemSummary.	50.0
quantity	Double	Quantity of the OrderItemSummary.	50.0

ConnectApi.OrderItemSummaryProduct

Product item mapped to the order item summary.

Property Name	Type	Description	Available Version
`canViewProduct`	Boolean	Specifies whether the context user can view the product (`true`) or not (`false`).	51.0
`errorCode`	String	Error code for the product with errors.	51.0
`errorMessage`	String	Error message for the product with errors.	51.0
`fields`	Map<String, `ConnectApi.RecordField`>	Map of the product fields queried.	51.0
`media`	`ConnectApi.ProductMedia`	Associated product media.	51.0
`productAttributes`	`ConnectApi.ProductAttributeSetSummary`	Summary of the product attributes.	51.0
`productId`	String	ID of the product.	51.0

SEE ALSO:

ConnectApi.OrderItemSummary

ConnectApi.OrderShipment

Order shipment.

Property Name	Type	Description	Available Version
`expectedDeliveryDate`	Datetime	Expected delivery date for the shipment.	52.0
`fields`	Map<String, `ConnectApi.RecordField`>	Map of requested fields.	52.0
`orderSummaryId`	String	ID of the order summary.	52.0
`shipmentId`	String	ID of the shipment.	52.0
`shipmentNumber`	String	Number of the shipment.	52.0
`status`	String	Status of the shipment.	52.0

SEE ALSO:

ConnectApi.OrderShipmentCollection

ConnectApi.OrderShipmentCollection

Collection of order shipments.

Property Name	Type	Description	Available Version
`count`	Integer	Total number of records returned in the collection.	52.0
`currentPageToken`	String	Token identifying the current page of order shipments.	52.0
`currentPageUrl`	String	URL to the current page of order shipments.	52.0
`nextPageToken`	String	Token identifying the next page of order shipments.	52.0
`nextPageUrl`	String	URL to the next page of order shipments.	52.0
`previousPageToken`	String	Token identifying the previous page of order shipments.	52.0
`previousPageUrl`	String	URL to the previous page of order shipments.	52.0
`shipments`	List<`ConnectApi.OrderShipment`>	Collection of order shipments.	52.0
`sortOrder`	`ConnectApi.OrderShipmentSort`	Sort order for order shipments. Values are: • `ExpectedDeliveryDateAsc`—Sorts by the oldest expected delivery date. • `ExpectedDeliveryDateDesc`—Sorts by the most recent expected delivery date. • `ShipmentNumberAsc`—Sorts by shipment number in ascending order (0–9). • `ShipmentNumberDesc`—Sorts by shipment number in descending order (9–0).	52.0

ConnectApi.OrderShipmentItem

Shipment item.

Property Name	Type	Description	Available Version
`fields`	Map<String, `ConnectApi.RecordField`>	Map of requested fields.	52.0
`orderItemSummaryId`	String	ID of the order item summary.	52.0
`product`	`ConnectApi.OrderItemSummaryProduct`	Product mapped to an order item summary.	52.0
`productId`	String	ID of the product.	52.0

Property Name	Type	Description	Available Version
quantity	Double	Quantity of the product.	52.0
shipmentId	String	ID of the shipment.	52.0
shipmentItemId	String	ID of the shipment item.	52.0

ConnectApi.OrderShipmentItemCollection

Collection of order shipment items.

Property Name	Type	Description	Available Version
count	Integer	Total number of records returned in a page.	52.0
currentPageToken	String	Token identifying the current page of order shipment items.	52.0
currentPageUrl	String	URL to the current page of order shipment items.	52.0
items	List<ConnectApi.OrderShipmentItem>	Collection of order shipment items.	52.0
nextPageToken	String	Token identifying the next page of order shipment items.	52.0
nextPageUrl	String	URL to the next page of order shipment items.	52.0
previousPageToken	String	Token identifying the previous page of order shipment items.	52.0
previousPageUrl	String	URL to the previous page of order shipment items.	52.0
sortOrder	ConnectApi.OrderShipmentItemSort	Sort order for order shipment items. Values are: • IdAsc—Sorts by ID in ascending alphanumeric order (A–Z, 0–9). • IdDesc—Sorts by ID in descending alphanumeric order (Z–A, 9–0).	52.0

ConnectApi.OrderSummaryAdjustment

Adjustment associated with an order summary.

Property Name	Type	Description	Available Version
amount	String	Amount associated with the adjustment.	53.0
basisReferenceDisplayName	String	Display name for secondary cause of the adjustment (for example, Null or the CouponCode that's associated with a Coupon)	54.0

Property Name	Type	Description	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the adjustment.	53.0
displayName	String	Display name for the primary cause of the adjustment (for example, Display name of the Promotion)	53.0
targetType	ConnectApi.OrderSummaryAdjustmentTargetType	Type of price adjustment in promotions. Values are: • SplitLine—Price adjustment on an order item. • Header—Price adjustment on the entire order.	56.0
type	String	Type of adjustment (for example, Promotion, Other).	53.0

SEE ALSO:

ConnectApi.OrderSummaryAdjustmentCollection

ConnectApi.OrderItemSummaryAdjustmentList

ConnectApi.OrderSummaryAdjustmentAggregates

Adjustment aggregates associated with an order summary.

Property Name	Type	Description	Available Version
available	Boolean	Indicates if adjustment aggregate values are available (true) or not (false).	55.0
status	ConnectApi.OrderSummaryAdjustmentAggregatesStatus	Order summary adjustment aggregate job status. Values are: • Failed—The adjustment aggregate data job for the order summary failed. • InProgress—The adjustment aggregate data job for the order summary is in progress. • NotInitiated—The adjustment aggregate data job for the order summary is not initiated. • Submitted—The adjustment aggregate data job for the order summary is submitted.	55.0
totalDeliveryPromotionDistAmount	String	Total distributed delivery promotion amounts associated with an order summary.	55.0
totalDeliveryPromotionLineAmount	String	Total delivery promotion line amounts associated with an order summary.	55.0
totalDeliveryPromotionTotalAmount	String	Total delivery promotion amount associated with an order summary.	55.0

Property Name	Type	Description	Available Version
`totalProductPromotionDistAmount`	String	Total distributed product promotion amounts associated with an order summary.	55.0
`totalProductPromotionLineAmount`	String	Total product promotion line amount associated with an order summary.	55.0
`totalProductPromotionTotalAmount`	String	Total product promotion amount associated with an order summary.	55.0

ConnectApi.OrderSummaryAdjustmentAggregatesAsyncOutput

Async adjustment aggregates output.

Property Name	Type	Description	Available Version
`statusURL`	String	Status URL.	55.0

ConnectApi.OrderSummaryAdjustmentCollection

Collection of adjustments for an order summary.

Property Name	Type	Description	Available Version
`adjustments`	List<`ConnectApi.OrderSummaryAdjustment`>	Collection of adjustments for an order summary.	53.0

ConnectApi.OrderSummaryCollectionRepresentation

Collection of order summaries.

Property Name	Type	Description	Available Version
`count`	Integer	Total count of order summaries returned on the current page.	51.0
`currentPageToken`	String	Token identifying the current page.	51.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	51.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	51.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	51.0

Property Name	Type	Description	Available Version
orderSummaries	List<ConnectApi.OrderSummaryRepresentation>	Collection of order summaries.	51.0
previousPageToken	String	Token identifying the previous page, or null if there isn't a previous page.	51.0
previousPageUrl	String	Connect REST API URL identifying the previous page, or null if there isn't a previous page.	51.0
sortOrder	ConnectApi.OrderSummarySortOrder	Sort order for order summaries. Values are: • CreatedDateAsc—Sorts by the oldest created date. • CreatedDateDesc—Sorts by the most recent created date. • OrderedDateAsc—Sorts by the oldest ordered date. • OrderedDateDesc—Sorts by the most recent ordered date.	51.0

ConnectApi.OrderSummaryLookupOutput

Order summary lookup output.

Property Name	Type	Description	Available Version
adjustmentAggregates	ConnectApi.OrderSummaryAdjustmentAggregates	Adjustment aggregates associated with the order summary.	58.0
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the order summary.	58.0
deliveryGroups	List<ConnectApi.OrderDeliveryGroupSummaryLookupOutput>	Delivery groups associated with the order summary.	58.0
fields	Map<String, ConnectApi.RecordField>	Map of requested order summary fields.	58.0
id	String	ID of the order summary.	58.0
orderNumber	String	Reference number of the order summary.	58.0
status	String	Status associated with the order summary.	58.0

ConnectApi.OrderSummaryOutputRepresentation

ID of the created Order Summary.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
orderSummaryId	String	ID of the Order Summary.	48.0

ConnectApi.OrderSummaryProductLookupOutput

Order summary product lookup output.

Property Name	Type	Description	Available Version
canViewProduct	Boolean	Specifies whether the context user can view the product (true) or not (false).	58.0
errorCode	String	Error code captured during product load.	58.0
errorMessage	String	Error message captured during product load.	58.0
fields	Map<String, ConnectApi.RecordField>	Map of requested product fields.	58.0
id	String	Id of the product	58.0
media	ConnectApi.ProductMedia	Associated product media.	58.0
variationAttributes	Map<String, ConnectApi.OrderSummaryProductAttribute>	Variation attributes (color, size, and so on) associated with the product.	58.0

ConnectApi.OrderSummaryRepresentation

Order summary.

Property Name	Type	Description	Available Version
adjustmentAggregates	ConnectApi.OrderSummaryAdjustmentAggregates	Adjustment aggregates associated with the order summary.	55.0
createdDate	Datetime	Created date of the order summary.	51.0
fields	Map< String, ConnectApi.RecordField >	Map of requested order summary fields.	51.0
orderNumber	String	Order number of the order summary.	51.0
orderSummaryId	String	ID of the order summary.	51.0
orderedDate	Datetime	Ordered date of the order summary.	51.0
ownerId	String	ID of the owner of the order summary.	51.0
status	String	Status of the order summary.	51.0

Property Name	Type	Description	Available Version
totalAmount	String	Total amount of the order summary.	51.0

SEE ALSO:

ConnectApi.OrderSummaryCollectionRepresentation

ConnectApi.OrderSummaryProductAttribute

Order summary product attribute representation.

Property Name	Type	Description	Available Version
label	String	Label or display name of the attribute.	58.0
sequence	Integer	Sequence of the attribute set with regard to the product.	58.0
value	String	Display value of the attribute.	58.0

ConnectApi.OrderToCartFailedProduct

Product that could not be added to the cart from an order, with error information.

Property Name	Type	Description	Available Version
errorCode	String	Error code.	57.0
errorMessage	String	Error message about the cause of the failure.	57.0
productId	String	ID of the product.	57.0
productName	String	Name of the product.	57.0
productSKU	String	SKU of the product.	57.0

ConnectApi.OrderToCartResult

Result of action adding an order to a cart.

Property Name	Type	Description	Available Version
cartId	String	ID of the cart.	57.0
totalFailedProductCount	Integer	Number of products that could not be successfully added to the cart from the order.	57.0
totalSucceededProductCount	Integer	Number of products successfully added to the cart from the order.	57.0
unaddedProducts	List<ConnectApi.OrderToCartFailedProduct>	List of products not successfully added to the cart.	57.0

ConnectApi.OrganizationSettings

Org settings.

Name	Type	Description	Available Version
`accessTimeout`	Integer	Amount of time after which the system prompts users who have been inactive to log out or continue working.	28.0
`features`	`ConnectApi.Features`	Information about features available in the org.	28.0
`maintenanceInfo`	`List<ConnectApi.MaintenanceInfo>`	Information about a list of upcoming scheduled maintenances for the org.	34.0
`name`	String	Org name.	28.0
`orgId`	String	18-character ID for the org.	28.0
`userSettings`	`ConnectApi.UserSettings`	Information about the org permissions for the user.	28.0

ConnectApi.OriginCapability

If a feed element has this capability, it was created by a feed action.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`actor`	ConnectApi.UserSummary	The user who executed the feed action.	33.0
`originRecord`	ConnectApi.Reference	A reference to the feed element containing the feed action.	33.0

SEE ALSO:

- ConnectApi.FeedElementCapabilities

ConnectApi.OutOfOffice

User's out-of-office message.

Property Name	Type	Description	Available Version
`message`	String	Out-of-office message for the user.	40.0

SEE ALSO:

- ConnectApi.User
- ConnectApi.MentionCompletion

ConnectApi.PageInfo

Page position information for the object search.

Property Name	Type	Description	Available Version
`hasNextPage`	Boolean	Specifies whether the search has more results to return (`true`) or not (`false`).	63.0
`offset`	Integer	Search page offset position.	63.0
`pageSize`	Integer	Number of results per page.	63.0

SEE ALSO:

ConnectApi.SearchObject

ConnectApi.PardotBusinessUnitContextItem

Pardot business unit context item.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Property Name	Type	Description	Available Version
`id`	String	ID of the PardotTenant record.	55.0
`isCurrent`	Boolean	Specifies whether the business unit is selected as the context user's current business unit context in the business unit switcher of the Pardot Lightning app (`true`) or not (`false`).	55.0
`name`	String	Name of the Pardot business unit as it is specified in the `MasterLabel` of the PardotTenant record.	55.0

SEE ALSO:

ConnectApi.PardotBusinessUnitContextOutput

ConnectApi.PardotBusinessUnitContextOutput

Pardot business unit context.

Property Name	Type	Description	Available Version
`businessUnits`	List<`ConnectApi.PardotBusinessUnitContextItem`>	List of the Pardot business unit context items that the context user has access to.	55.0
`isSuccess`	Boolean	Indicates whether the requested resource was successfully provided.	55.0

Property Name	Type	Description	Available Version
`totalBusinessUnits`	Integer	Indicates the total number of Pardot business units that the context user has access to.	55.0

ConnectApi.PaymentAuthAdjustmentResponse

Authorization Adjustment output representation.

Property Name	Type	Description	Available Version
`accountId`	String	ID of the account containing the payment authorization being adjusted.	51.0
`amount`	Double	Amount of the payment authorization adjustment.	51.0
`currencyIsoCode`	String	Three-letter ISO 4217 currency code associated with the payment authorization adjustment.	51.0
`effectiveDate`	Datetime	Date when the authorization adjustment becomes effective.	51.0
`id`	String	ID of the PaymentAuthAdjustment record.	51.0
`paymentAuthAdjustmentNumber`	String	System-defined reference number.	51.0
`requestDate`	Datetime	Date when the authorization adjustment transaction occurred.	51.0
`status`	String	Status of the payment authorization adjustment.Possible values are: • `Canceled`: The payment authorization reversal has been canceled. The parent authorization has returned to its pre-reversal balance. • `Draft`: The payment authorization reversal can be edited before applying it against the parent authorization. • `Processed`: The payment authorization reversal has been finalized. Users can change the status as follows: • Draft to Processed • Processed to Canceled • Draft to Canceled	51.0

ConnectApi.PaymentAuthorizationResponse

Payment authorization output representation.

Property Name	Type	Description	Available Version
accountId	String	Salesforce account for the payment authorization.	51.0
amount	Double	Amount that the gateway authorized for the payment transaction.	51.0
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the payment group record.	51.0
effectiveDate	Datetime	Date that the authorization becomes effective.	51.0
expirationDate	Datetime	Date that the authorization expires.	51.0
id	String	ID of the payment authorization record.	51.0
paymentAuthorizationNumber	String	System-defined number for the payment authorization record.	51.0
requestDate	Datetime	Date that the authorization occurred.	51.0
status	String	Status of the payment authorization as returned by the gateway.	51.0

ConnectApi.PaymentGroupResponse

Payment group.

Property Name	Type	Description	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the payment group record.	50.0
id	String	ID of the payment group record.	50.0
sourceObjectId	String	Source object ID of the payment group record. Supports only OrderId.	50.0

ConnectApi.PaymentMethodDetails

Details about the payment method.

Property Name	Type	Description	Available Version
alternativePaymentMethod	ConnectApi.AlternativePaymentMethodOutput	Alternative Payment Method details.	56.0
cardPaymentMethod	ConnectApi.CardPaymentMethodOutput	Card Payment Method details.	56.0

ConnectApi.PaymentMethodResponse

Payment method information response.

Property Name	Type	Description	Available Version
`accountId`	String	Salesforce Payments account to which this payment method is linked.	51.0
`id`	String	ID of the payment method.	51.0
`paymentMethodDetails`	ConnectApi.PaymentMethodDetails	Details about the payment method.	
`status`	String	Status of the payment method.	51.0

ConnectApi.PaymentMethodTokenizationGatewayResponse

Payment method tokenization gateway response representation.

Subclass of ConnectApi.AbstractGatewayResponse.

Property Name	Type	Description	Available Version
`gatewayToken`	String	The payment method token sent from the gateway.	52.0

ConnectApi.PaymentMethodTokenizationResponse

Payment method tokenization output representation.

Property Name	Type	Description	Available Version
`error`	`ConnectApi.ErrorResponse`	Error representation for the payment method tokenization process. Sent only if the tokenization process encounters an error in the gateway.	52.0
`gatewayResponse`	`ConnectApi.PaymentMethodTokenizationGatewayResponse`	Response containing the tokenized payment method value from the payment gateway.	52.0
`paymentGatewayLogs`	List<`ConnectApi.GatewayLogResponse`>	Logs showing more details about the tokenization process that occurred in the gateway.	52.0
`paymentMethod`	`ConnectApi.PaymentMethodResponse`	Object representation of the payment method object that was tokenized.	52.0

ConnectApi.PaymentResponse

Payment output.

Property Name	Type	Description	Available Version
`accountId`	String	ID of the account related the payment record.	50.0
`amount`	Double	Total amount of the payment transaction performed in the payment request.	50.0
`currencyIsoCode`	String	Three-letter ISO 4217 currency code associated with the payment output.	50.0
`effectiveDate`	Datetime	Date that the payment becomes effective.	50.0
`id`	String	ID of the payment record.	50.0
`paymentNumber`	String	Number of the payment record created as a result of the request processing.	50.0
`requestDate`	Datetime	Date when the payment transaction occurred.	50.0
`status`	String	Status of the new payment record. Can be DRAFT, PROCESSED or CANCELLED.	50.0

ConnectApi.PercentRecordField

Record field containing a percentage value.

Subclass of ConnectApi.LabeledRecordField.

Name	Type	Description	Available Version
`value`	Double	Value of the percentage.	29.0

ConnectApi.PhoneNumber

Phone number.

Name	Type	Description	Available Version
`label`	String	A localized string indicating the phone type.	30.0
`phoneNumber`	String	Phone number.	28.0
`phoneType`	String	Phone type. Values are: • `Fax` • `Mobile` • `Work` These values are not localized.	30.0

Name	Type	Description	Available Version
`type`	String	Note: This property is not available after version 29.0. Use the `phoneType` property instead. Values are: • `Fax` • `Mobile` • `Work` These values are not localized.	28.0–29.0

SEE ALSO:

ConnectApi.DatacloudCompany
ConnectApi.DatacloudContact
ConnectApi.UserDetail

ConnectApi.Photo

Profile photo.

Name	Type	Description	Available Version
`fullEmailPhotoUrl`	String	A temporary URL to the large profile picture. The URL expires after 30 days and is available to unauthenticated users.	28.0
`largePhotoUrl`	String	URL to the large profile picture. The default width is 200 pixels, and the height is scaled so the original image proportions are maintained. If a user hasn't uploaded a photo, this URL points to a default photo. If the user hasn't uploaded a photo and the request header included `X-Connect-Theme: Salesforce1`, this URL points to a default photo based on a theme that the admin selected for the org.	28.0
`mediumPhotoUrl`	String	URL to the medium profile picture. The default width is 160 pixels, and the height is scaled so the original image proportions are maintained. If a user hasn't uploaded a photo, this URL points to a default photo. If the user hasn't uploaded a photo and the request header included `X-Connect-Theme: Salesforce1`, this URL points to a default photo based on a theme that the admin selected for the org.	37.0
`photoVersionId`	String	18–character ID to that version of the photo	28.0

Name	Type	Description	Available Version
`smallPhotoUrl`	String	URL to the small profile picture. The default size is 64x64 pixels. If a user hasn't uploaded a photo, this URL points to a default photo. If the user hasn't uploaded a photo and the request header included `X-Connect-Theme: Salesforce1`, this URL points to a default photo based on a theme that the admin selected for the org.	28.0
`standardEmailPhotoUrl`	String	A temporary URL to the small profile. The URL expires after 30 days and is available to unauthenticated users.	28.0
`url`	String	A resource that returns a Photo object: for example, `/services/data/v63.0/chatter/users/005D0000001LL8OIAW/photo`	28.0

SEE ALSO:

- ConnectApi.ChatterGroup
- ConnectApi.RecommendationDefinition
- ConnectApi.User

ConnectApi.PicklistRecordField

Record field containing an enumerated value.

Subclass of ConnectApi.LabeledRecordField.

ConnectApi.PinCapability

If a feed element has this capability, users who have permission can pin it to a feed.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`isPinnableByMe`	Boolean	Specifies whether the context user can pin or unpin the entity to the feed (`true`) or not (`false`).	41.0
`isPinned`	Boolean	Specifies whether the entity is pinned (`true`) or not pinned (`false`) to the feed.	41.0

SEE ALSO:

- ConnectApi.FeedElementCapabilities

ConnectApi.PinnedFeedElements

List of pinned feed elements for a feed.

Property Name	Type	Description	Available Version
`elements`	List<`ConnectApi.FeedElement`>	List of pinned feed elements. Note: In the UI, pinned feed elements don't show all auxiliary information, such as comments, likes, interaction counts, or read by information. As a result, the `ConnectApi.PinnedFeedElements` output class doesn't include all the information for these capabilities.	41.0

ConnectApi.PlatformAction

A platform action instance with state information for the context user.

Property Name	Type	Description	Available Version
`actionUrl`	String	For action links of `subtype` `Ui` or `Download`, direct the user to download or visit the UI from this link. Salesforce issues a Javascript redirect for the link in this format: `/action-link-redirect/`***`communityId`***`/`***`actionLinkId`***`?_bearer=`***`bearerToken`***. For `Api` action links and for all platform actions, this value is `null` and Salesforce handles the call.	33.0
`apiName`	String	The API name. The value may be `null`.	33.0
`confirmationMessage`	String	If this action requires a confirmation and has a status of `NewStatus`, this is a default localized message that should be shown to an end user prior to invoking the action. Otherwise, this is `null`.	33.0
`executingUser`	`ConnectApi.UserSummary`	The user who initiated execution of this platform action.	33.0
`groupDefault`	Boolean	`true` if this platform action is the default or primary platform action in the platform action group; `false` otherwise. There can be only one default platform action per platform action group.	33.0
`iconUrl`	String	The URL of the icon for the platform action. This value may be `null`.	33.0
`id`	String	The ID for the platform action. If the `type` is `QuickAction` and the `subtype` is `Create`, this value is `null`.	33.0
`label`	String	The localized label for this platform action.	33.0

Property Name	Type	Description	Available Version
`modifiedDate`	Datetime	ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	33.0
`platformActionGroup`	`ConnectApi.Reference`	A reference to the platform action group containing this platform action.	33.0
`status`	`ConnectApi.PlatformActionStatus`	The execution status of the platform action. Values are: • `FailedStatus`—The action link execution failed. • `NewStatus`—The action link is ready to be executed. Available for `Download` and `Ui` action links only. • `PendingStatus`—The action link is executing. Choosing this value triggers the API call for `Api` and `ApiAsync` action links. • `SuccessfulStatus`—The action link executed successfully.	33.0
`subtype`	String	The subtype of a platform action or `null`. If the `type` property is `ActionLink`, possible values are: • `Api`—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server. • `ApiAsync`—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to `/connect/action-links/`***`actionLinkId`*** to set the status to `SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete. • `Download`—The action link downloads a file from the action URL. • `Ui`—The action link takes the user to a web page at the action URL. Note: Invoking `ApiAsync` action links from an app requires a call to set the status. However, there isn't currently a way to set the status of an action link using Apex. To set the status, use Connect REST API. See the Action	33.0

Property Name	Type	Description	Available Version
		Link resource in the Connect REST API Developer Guidefor more information.	
`type`	`ConnectApi.PlatformActionType`	The type of platform action. Values are: • `ActionLink`—An indicator on a feed element that targets an API, a web page, or a file, represented by a button in the Salesforce UI. • `CustomButton`—When clicked, opens a URL or a Visualforce page in a window or executes JavaScript. • `ProductivityAction`—Productivity actions are predefined and attached to a limited set of objects. Productivity actions include Send Email, Call, Map, View Website, and Read News. Except for the Call action, you can't edit productivity actions. • `QuickAction`—A global or object-specific action. • `StandardButton`—A predefined Salesforce button such as New, Edit, or Delete.	33.0
`url`	String	The URL for this platform action. If the `type` is `QuickAction` and the `subtype` is `Create`, this value is `null`.	33.0

SEE ALSO:

ConnectApi.PlatformActionGroup

ConnectApi.PlatformActionGroup

A platform action group instance with state appropriate for the context user.

Action link groups are one type of platform action group and are therefore represented as `ConnectApi.PlatformActionGroup` output classes.

Property Name	Type	Description	Available Version
`category`	`ConnectApi.PlatformActionGroupCategory`	Indicates the priority and relative locations of platform actions. Values are: • `Primary`—The action link group is displayed in the body of the feed element. • `Overflow`—The action link group is displayed in the overflow menu of the feed element.	33.0

Property Name	Type	Description	Available Version
`id`	String	The 18-character ID or an opaque string ID of the platform action group. If the `ConnectApi.PlatformAction` `type` is `QuickAction` and the `subtype` is `Create`, this value is `null`.	33.0
`modifiedDate`	Datetime	ISO 8601 date string, for example, 2014-02-25T18:24:31.000Z.	33.0
`platformActions`	List<`ConnectApi.PlatformAction`>	The platform action instances for this group. Within an action link group, action links are displayed in the order listed in the `actionLinks` property of the `ConnectApi.ActionLinkGroup DefinitionInput` class. Within a feed item, action link groups are displayed in the order specified in the `actionLinkGroupIds` property of the `ConnectApi.AssociatedActions CapabilityInput` class.	33.0
`url`	String	The URL for this platform action group. If the `ConnectApi.PlatformAction` `type` is `QuickAction` and the `subtype` is `Create`, this value is `null`.	33.0

SEE ALSO:

ConnectApi.AbstractRecommendation
ConnectApi.AssociatedActionsCapability

ConnectApi.PollCapability

If a feed element has this capability, it includes a poll.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`choices`	List<`ConnectApi.FeedPollChoice`>	Collection of poll choices that make up the poll.	32.0
`myChoiceId`	String	18-character ID of the poll choice that the context user has voted for in this poll. Returns `null` if the context user has not voted.	32.0

Property Name	Type	Description	Available Version
totalVoteCount	Integer	Total number of votes cast on the feed poll element.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.PostAuthGatewayResponse

Gateway response after confirmation that the merchant is ready to capture payment of an existing pre-authorized transaction.

Sublass of ConnectApi.AbstractGatewayResponse.

Property Name	Type	Description	Available Version
gatewayAuthorizationCode	String	Code used to authorize the payment that the payment gateway is processing.	54.0
paymentMethodDetails	ConnectApi.PaymentMethodDetails	Details about the payment method.	54.0

ConnectApi.PostAuthorizationResponse

Gateway response following a post authorization request.

Property Name	Type	Description	Available Version
error	ConnectApi.ErrorResponse	Information about errors that occurred in the payment gateway while evaluating the post authorization request.	54.0
gatewayResponse	ConnectApi.PostAuthGatewayResponse	Payment gateway's response to the post authorization request.	54.0
paymentAuthorization	ConnectApi.PaymentAuthorizationResponse	Payment gateway's response to the original payment authorization request.	54.0
paymentGatewayLogs	List<ConnectApi.GatewayLogResponse>	Stores information exchanged between the Salesforce payments platform and external payment gateways. Gateway logs can also record payloads from external payment entities.	54.0
paymentGroup	ConnectApi.PaymentGroupResponse	Payment group, consisting of one or more payments, sent to the gateway for the post authorization request.	54.0
paymentMethod	ConnectApi.PaymentMethodResponse	Payment method used in the post authorization request.	54.0

ConnectApi.PreserveCart

Represents a preserved cart.

Property Name	Type	Description	Available Version
cartId	String	ID of the authenticated cart.	60.0
currencyIsoCode	String	Currency ISO code for the authenticated cart.	60.0
failedCartItems	List<ConnectApi.CartItemBasicResult>	List of products that weren't successfully transferred from the guest cart to the authenticated cart.	60.0
numberOfProducts	Integer	Total number of products in the guest cart.	60.0
numberOfProductsWithError	Integer	Total number of products that weren't successfully transferred from the guest cart to the authenticated cart.	60.0
numberOfProductsWithSuccess	Integer	Total number of products successfully transferred from the guest cart to the authenticated cart.	60.0
succeededCartItems	List<ConnectApi.CartItemBasicResult>	List of products successfully transferred from the guest cart to the authenticated cart.	60.0

ConnectApi.PreviewCancelOutputRepresentation

Expected financial values for a proposed cancel action.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
changeBalances	ConnectApi.ChangeItemOutputRepresentation	Expected financial values for the proposed cancel action.	48.0
orderSummaryId	String	ID of the OrderSummary.	48.0

ConnectApi.PreviewCartToExchangeOrderOutputRepresentation

Expected change order financial values for the preview cart to exchange order action.

Property Name	Type	Description	Available Version
balanceStateExchangeWebCart	ConnectApi.BalanceStatePreviewOutput on page 1985	The balance state preview for the exchange web cart.	Big, 61.0
balanceStateOriginalOrderSummary	ConnectApi.BalanceStatePreviewOutput on page 1985	The balance state preview for the original order summary.	Big, 61.0
balanceStateReturnOrder	ConnectApi.BalanceStatePreviewOutput on page 1985	The balance state preview for the return order.	Big, 61.0

Property Name	Type	Description	Available Version
changeBalances	ConnectApi.ChangeItemOutputRepresentation on page 2027	Change order financial values for a preview order action.	Big, 60.0
errors	List<ConnectApi.ErrorResponse>	Any errors that were returned.	Big, 60.0
orderSummaryId	String	ID of the order summary.	Big, 60.0
success	Boolean	Indicates whether the transaction was successful.	Big, 60.0

ConnectApi.PreviewReturnOutputRepresentation

Expected financial values for a proposed return action.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
changeBalances	ConnectApi.ChangeItemOutputRepresentation	Expected financial values for the proposed return action.	48.0
orderSummaryId	String	ID of the OrderSummary.	48.0

ConnectApi.PriceAdjustmentSchedule

Price adjustment schedule.

Property Name	Type	Description	Available Version
adjustmentMethod		Reserved for future use.	59.0
id	String	ID of the price adjustment schedule.	49.0
priceAdjustmentTiers	List<ConnectApi.PriceAdjustmentTier>	List of price adjustment tiers.	49.0
scheduleType		Reserved for future use.	59.0

SEE ALSO:

ConnectApi.ProductPrice

ConnectApi.PriceAdjustmentTier

Price adjustment tier.

Property Name	Type	Description	Available Version
adjustmentType	ConnectApi.PriceAdjustmentTierType	Type of price adjustment for the tier. Values are: • AmountBasedAdjustment—Price is adjusted by a specified amount. • PercentageBasedAdjustment—Price is adjusted by a specified percentage.	49.0
adjustmentValue	String	Adjustment value of the tier.	49.0
id	String	ID of the price adjustment tier.	49.0
lowerBound	String	Lower limit of the tier.	49.0
tierUnitPrice	String	Unit price of the tier.	49.0
upperBound	String	Upper limit of the tier.	49.0

SEE ALSO:

ConnectApi.PriceAdjustmentSchedule

ConnectApi.PricingResult

Product pricing result.

Property Name	Type	Description	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the product.	49.0
error	ConnectApi.ErrorResponse	Error code and message.	49.0
pricingLineItemResults	List<ConnectApi.PricingResultLineItem>	Pricing result line Items.	49.0
success	Boolean	Specifies whether the execution was successful (true) or not (false).	49.0

ConnectApi.PricingResultLineItem

Pricing result line item.

Property Name	Type	Description	Available Version
error	ConnectApi.ErrorResponse	Error code and message.	49.0
listPrice	String	List price for the product.	49.0
lowestUnitPrice	String	Lowest unit price for the product.	49.0

Property Name	Type	Description	Available Version
`pricebookEntryId`	String	ID of the pricebook entry.	49.0
`productId`	String	ID of the product to price.	49.0
`success`	Boolean	Specifies whether the execution was successful (`true`) or not (`false`).	49.0
`unitPrice`	String	Unit price for the product.	49.0

ConnectApi.PricingResult

ConnectApi.ProductSummary

ConnectApi.ProductAttributeInfo

Product attribute information.

Property Name	Type	Description	Available Version
`allowableValues`	List<String>	Active attribute picklist values that can be used to create variations. These values are determined by the order of the picklist values in Object Manager.	50.0
`apiName`	String	API name of the attribute.	50.0
`availableValues`	List<String>	Attribute picklist values that are available for the product in the store. These values are sorted by the order of values in the `allowableValues` property.	50.0
`fieldEnumOrId`	String	Field ID for custom fields or enumeration value for standard fields.	50.0
`label`	String	Label of the attribute.	50.0
`objectName`	String	Name of the object that contains the field.	50.0
`options`	List<`ConnectApi.ProductAttributeValueMetadataRepresentation`>	List of product attribute value metadata.	63.0
`sequence`	Integer	Sequence value determined by the order of the attributes under Commerce Setup for the attribute set.	50.0

Property Name	Type	Description	Available Version
viewType	ConnectApi.ProductAttributeViewType	View type for product attributes. Values are: • ColorSwatch • Dropdown • Pill	63.0

SEE ALSO:

ConnectApi.ProductDetail
ConnectApi.ProductAttributeSetInfo
ConnectApi.ProductVariationInfo

ConnectApi.ProductAttributeSelectionInfo

Product attribute.

Property Name	Type	Description	Available Version
apiName	String	API name of the attribute.	50.0
label	String	Label of the attribute.	50.0
sequence	Integer	Sequence value determined by the order of the attributes under Commerce Setup for the attribute set.	50.0
value	String	Display value of the attribute.	50.0

SEE ALSO:

ConnectApi.ProductAttributesToProductEntry

ConnectApi.ProductAttributeSet

Product attribute set data.

Property Name	Type	Description	Available Version
attributes	Map<String, String>	Map of the attributes that are members of the attribute set.	50.0
developerName	String	Name of the attribute set.	50.0
id	String	ID of the product attribute record that represents the product attribute set.	50.0

ConnectApi.ProductAttributeSetInfo

Attribute set metadata.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Property Name	Type	Description	Available Version
`attributeInfo`	Map<String, `ConnectApi.ProductAttributeInfo`>	Map of the API name of the attribute field to the attribute metadata.	50.0
`description`	String	Description of the attribute set.	50.0
`developerName`	String	Developer name of the attribute set.	50.0
`id`	String	ID of the attribute set.	50.0
`masterLabel`	String	Label of the attribute set.	50.0
`sequence`	Integer	Sequence of the attribute set for the product.	50.0

SEE ALSO:

ConnectApi.ProductDetail

ConnectApi.ProductAttributeSetSummary

Summary of a product attribute set.

Property Name	Type	Description	Available Version
`apiName`	String	API name of the attribute set.	51.0
`attributes`	List<`ConnectApi.ProductAttributeSummary`>	List of attributes in the attribute set.	51.0
`label`	String	Display label of the attribute set.	51.0

SEE ALSO:

ConnectApi.OrderItemSummaryProduct

ConnectApi.ProductSummary

ConnectApi.ProductAttributeSummary

Summary of a product attribute.

Property Name	Type	Description	Available Version
`apiName`	String	API name of the attribute.	51.0

Property Name	Type	Description	Available Version
`label`	String	Display label of the attribute.	51.0
`sequence`	Integer	Sequence of the attribute in the attribute set.	51.0
`value`	String	Display value of the attribute.	51.0

SEE ALSO:

ConnectApi.ProductAttributeSetSummary

ConnectApi.ProductAttributesToProductEntry

Mapping of an attribute value combination to a variation product ID.

Property Name	Type	Description	Available Version
`canonicalKey`	String	Attribute API values concatenated with an underscore (_) based on the sequence number of the attributes in the attribute set.	50.0
`productId`	String	Variation product ID for the selection of attributes.	50.0
`selectedAttributes`	List<`ConnectApi.ProductAttributeSelectionInfo`>	Ordered list of attribute values and metadata that can be used to form a key that maps to product ID.	50.0
`urlName`	String	Variant URL name for the selection of attributes.	59.0

SEE ALSO:

ConnectApi.ProductVariationInfo

ConnectApi.ProductAttributeValueMetadataRepresentation

Metadata for a product attribute value.

Property Name	Type	Description	Available Version
`apiName`	String	API Name of the product attribute picklist value. For example, `blue__c`.	63.0
`colorHexCode`	String	Hex code value of a color attribute. For example, `#0000FF`.	63.0
`label`	String	Label of the picklist value for a custom field product attribute. For example, `Red`.	63.0
`variantAvailable`	Boolean	Specifies whether a variation product exists (`true`) or not (`false`).	63.0

ConnectApi.ProductCartItem

Cart items of a specific product type.

Property Name	Type	Description	Available Version
`cartItems`	List<`ConnectApi.CartItemResult` on page 2005>	Items in a cart.	60.0
`product`	`ConnectApi.CartItemProduct on page 2004`	Product summary for a cart item.	60.0

ConnectApi.ProductCartItemCollection

Items in the cart, grouped by product type.

Property Name	Type	Description	Available Version
`count`	Integer	Number of cart items returned on the current page	60.0
`currentPage`	Integer	Current page of cart items. The value matches the requested page number, unless the requested page number exceeds the total number of pages. In this scenario, the current page is the highest available page number.	60.0
`hasErrors`	Boolean	Indicates whether at least one of the results contains an error (`True`) or not (`False`).	60.0
`products`	List<`ConnectApi.ProductCartItem` on page 2240>	Products in the cart.	60.0
`totalItemCount`	Integer	Total number of unique products in the cart.	60.0
`totalNumberOfPages`	Integer	Total number of pages for the given page size.	60.0

ConnectApi.ProductCategoryData

Product category.

Property Name	Type	Description	Available Version
`description`	String	Description of the category.	49.0
`id`	String	ID of the category.	49.0
`name`	String	Name of the category.	49.0

Property Name	Type	Description	Available Version
`urlSlug`	String	SEO-friendly URL slug of the category.	59.0

SEE ALSO:

ConnectApi.ProductCategoryPath

ConnectApi.SearchCategory

ConnectApi.ProductCategoryDetail

Details of a product category.

Property Name	Type	Description	Available Version
`bannerImage`	`ConnectApi.ProductCategoryMedia`	Banner image of the product category.	49.0
`fields`	Map<String, String>	List of fields for the product category.	49.0
`id`	String	ID of the product category.	49.0
`mediaGroups`	List<`ConnectApi.ProductCategoryMediaGroup`>	List of media groups of the product category.	49.0
`tileImage`	`ConnectApi.ProductCategoryMedia`	Tile image of the product category.	49.0
`urlName`	String	SEO-friendly URL name of the product category.	59.0

SEE ALSO:

ConnectApi.ProductCategoryDetailCollection

ConnectApi.ProductCategoryDetailCollection

Collection of product category details.

Property Name	Type	Description	Available Version
`productCategories`	List<`ConnectApi.ProductCategoryDetail`>	List of product category details.	52.0

ConnectApi.ProductCategoryMedia

Media associated with a product category.

Property Name	Type	Description	Available Version
`alternateText`	String	Alternative text for the product category media.	49.0
`contentVersionId`	String	ID of the latest published content version if the media is stored as a ContentDocument. If the image is a customer-provided external URL, the value is `null`. Not supported in enhanced CMS workspaces.	49.0
`id`	String	ID of the product category image.	49.0
`mediaType`	`ConnectApi.ProductMediaType`	Type of product media. Values are: • `Document` • `Image` • `Video`	49.0
`sortOrder`	Integer	Sort order of a media item inside a media group.	49.0
`thumbnailUrl`	String	URL of the thumbnail for product media. If a value exists, it should be used for the thumbnail whether the image is natively uploaded or hosted externally. Not supported in enhanced CMS workspaces.	49.0
`title`	String	Title of the product category media.	49.0
`url`	String	URL of the product category media.	49.0

SEE ALSO:

ConnectApi.ProductCategoryMediaGroup

ConnectApi.ProductCategoryDetail

ConnectApi.ProductCategoryMediaGroup

Media group associated with a product category.

Property Name	Type	Description	Available Version
`developerName`	String	API name of the product category media group.	49.0
`id`	String	ID of the product category media group.	49.0
`mediaItems`	List<`ConnectApi.ProductCategoryMedia`>	List of media items within a product category media group.	49.0
`name`	String	Name of the product category media group.	49.0
`usageType`	`ConnectApi.ProductMediaUsageType`	Usage type of a product media item within a media group. Values are: • `Attachment`—Product media group with product documents as attachments.	49.0

Property Name	Type	Description	Available Version
		• `Banner`—Product category media group with banner images of the product. • `Listing`—Product media group with listing images of the product. • `Standard`—Product media group with standard images and videos of the product. • `Tile`—Product category media group with tile images of the product.	

ConnectApi.ProductCategoryPath

List of product categories in a path.

Property Name	Type	Description	Available Version
`path`	List<`ConnectApi.ProductCategoryData`>	List of product categories in a path.	49.0

SEE ALSO:

ConnectApi.ProductDetail

ConnectApi.ProductChild

Child product related to a parent product.

Property Name	Type	Description	Available Version
`defaultQuantity`	String	Default quantity of child products to be ordered.	57.0
`isEntitled`	Boolean	Specifies whether the child product can be viewed on the product detail page (`true`) or not (`false`).	62.0
`productInfo`	`ConnectApi.ProductDetail`	Product details of the child product.	57.0

ConnectApi.ProductChildCollection

Collection of child products related to a parent product.

Property Name	Type	Description	Available Version
`count`	Integer	Number of child products returned on this page.	57.0
`currentPageToken`	String	Current page token, if any.	57.0
`currentPageUrl`	String	URL of the current page in the response.	57.0

Property Name	Type	Description	Available Version
`items`	List<`ConnectApi.ProductChild`>	List of child products related to the parent product. The child products are sorted by their configured sequence values, in ascending order, with null values sorted last. If there are no configured sequence values, the child products are sorted by `createdDate`, in ascending order.	57.0
`nextPageToken`	String	Token for the next page, if any. A value is included in the response only if a value is returned for `nextPageUrl`.	57.0
`nextPageUrl`	String	URL of the next page, if any.	57.0
`previousPageToken`	String	Token for the previous page, if any. A value is included in the response only if a value is returned for `previousPageUrl`.	57.0
`previousPageUrl`	String	URL of the previous page, if any.	57.0
`productClass`	`ConnectApi.ProductClass`	Class of product. Values are: • `Bundle` • `Set` • `Simple` • `Variation` • `VariationParent`	62.0
`total`	Integer	Total number of child products in the collection.	57.0

ConnectApi.ProductDeliverEstimationOutputRepresentation

Delivery estimation information for each product.

Property Name	Type	Description	Available Version
`estimatedDeliveryDate`	DateConnectApi.ProductDeliverEstimationOutputRepresentation on page 2084	Estimated delivery date.	63.0
`estimatedShipDate`	Datetime	Estimated shipping date.	63.0
`quantity`	Double	Product quantity.	63.0
`routingCalculationType`	String	Routing calculation type.	63.0
`stockKeepingUnit`	String	Product stock keeping unit (SKU).	63.0

ConnectApi.ProductDetail

Details of a product.

Property Name	Type	Description	Available Version
`attributeSetInfo`	Map<String, `ConnectApi.ProductAttributeSetInfo`>	Map of the attribute set developer name to its metadata.	50.0
`defaultImage`	`ConnectApi.ProductMedia`	Default image of the product.	49.0
`entitlement`	`ConnectApi.ProductEntitlement`	Entitlement details for the product. To get pricing information for products in version 57 and later, use the CommerceStorePricing Class.	49.0–56.0
`fields`	Map<String, String>	List of fields for the product.	49.0
`id`	String	ID of the product.	49.0
`mediaGroups`	List<`ConnectApi.ProductMediaGroup`>	List of media groups of the product.	49.0
`primaryProductCategoryPath`	`ConnectApi.ProductCategoryPath`	Primary category path of the product.	49.0
`productClass`	`ConnectApi.ProductClass`	Class of product. Values are: • `Bundle` • `Set` • `Simple` • `Variation` • `VariationParent`	50.0
`productSellingModels`	List<`ConnectApi.ProductSellingModel`>	List of product selling models for the product.	56.0
`purchaseQuantityRule`	`ConnectApi.PurchaseQuantityRule`	If one exists, purchase quantity rule for the product.	52.0
`urlName`	String	SEO-friendly URL name for the product.	59.0
`variationAttributeSet`	`ConnectApi.ProductAttributeSet`	Variation attribute set for the product.	50.0
`variationInfo`	`ConnectApi.ProductVariationInfo`	Available and allowable values for variation attributes and a map to resolve variation product IDs from attribute value combinations.	50.0
`variationParentId`	String	ID of the variation parent.	50.0

ConnectApi.ProductDetailsOutputRepresentation

Details about a product.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
attributes	List<ConnectApi.ProductVariationAttributeOutputRepresentation>	List of variation attributes that define variations of the product.	55.0
currencyIsoCode	String	Currency ISO code.	55.0
description	String	Description of the product.	55.0
fields	Map<String, String>	List of the product's fields.	55.0
imageGroups	List<ConnectApi.ProductImageGroupOutputRepresentation>	List of the product's image groups.	55.0
listPrice	Double	List price.	55.0
name	String	Name.	55.0
productQuantityRule	Purchase Quantity Rule	If one exists, purchase quantity rule for the product.	55.0
productId	String	Product ID.	55.0
stockKeepingUnit	String	Stock keeping unit.	55.0
unitPrice	Double	Unit price.	55.0
variants	List<ConnectApi.ProductVariantOutputRepresentation>	List of variations of the product.	55.0

ConnectApi.ProductEntitlement

Entitlements for a product.

Property Name	Type	Description	Available Version
canViewPrice	Boolean	Specifies whether the product's price can be viewed (`true`) or not (`false`).	49.0

SEE ALSO:

ConnectApi.ProductDetail

ConnectApi.ProductExpandOutputRepresentation

Product expand information with return reasons.

Property Name	Type	Description	Available Version
`returnReasons`	List<`String`>	Return reasons for products.	59.0

ConnectApi.ProductImageGroupOutputRepresentation

Details about a product image group.

Property Name	Type	Description	Available Version
`images`	List<`ConnectApi.ProductImageOutputRepresentation`>	List of product images in the group.	55.0
`viewType`	String	The type of product images in the group.	55.0

ConnectApi.ProductImageOutputRepresentation

Details about a product image.

Property Name	Type	Description	Available Version
`alternateText`	String	Alternate text for accessibility.	55.0
`mediaType`	String	Media type.	55.0
`thumbnailUrl`	String	URL of the thumbnail version of the product image.	55.0
`title`	String	Title.	55.0
`url`	String	URL of the product image.	55.0

ConnectApi.ProductsListOutputRepresentation

Output representation of products with product data along with expand details.

Property Name	Type	Description	Available Version
`product`	List<ConnectApi.ProductOutputRepresentation>	The product's identifier.	**59.0**

ConnectApi.ProductMedia

Media associated with a product.

Property Name	Type	Description	Available Version
`alternateText`	String	Alternative text for the product media.	49.0
`contentVersionId`	String	ID of the latest published content version if the media is stored as a ContentDocument. If the image is a customer-provided external URL, the value is `null`. Not supported in enhanced CMS workspaces.	49.0
`id`	String	ID of the product image.	49.0
`mediaType`	`ConnectApi.ProductMediaType`	Type of product media. Values are: • `Document` • `Image` • `Video`	49.0
`sortOrder`	Integer	Sort order of a media item within a media group.	49.0
`thumbnailUrl`	String	URL of the thumbnail for product media. If a value exists, it should be used for the thumbnail whether the image is natively uploaded or hosted externally. Not supported in enhanced CMS workspaces.	49.0
`title`	String	Title of the product media.	49.0
`url`	String	URL of the product media.	49.0

- ConnectApi.ProductSummary

ConnectApi.ProductMediaGroup

Media group associated with a product.

Property Name	Type	Description	Available Version
`developerName`	String	API name of the product media group.	49.0
`id`	String	ID of the product media group.	49.0
`mediaItems`	List<`ConnectApi.ProductMedia`>	List of media items within a product media group.	49.0
`name`	String	Name of the product media group.	49.0

Property Name	Type	Description	Available Version
usageType	ConnectApi.ProductMediaUsageType	Usage type of a product media item within a media group. Values are: • Attachment—Product media group with product documents as attachments. • Banner—Product category media group with banner images of the product. • Listing—Product media group with listing images of the product. • Standard—Product media group with standard images and videos of the product. • Tile—Product category media group with tile images of the product.	49.0

SEE ALSO:

ConnectApi.ProductDetail

ConnectApi.ProductCategoryDetail

ConnectApi.ProductOutputRepresentation

Output representation for product data.

Property Name	Type	Description	Available Version
expand	[illegible]	Output representation for expand feature.	**59.0**
products	String	Product data.	**59.0**

ConnectApi.ProductOverview

Overview of a product, with summary information about prices, selected fields, and the product's default image.

Property Name	Type	Description	Available Version
defaultImage	ConnectApi.ProductMedia	Media representation of the product's default image.	54.0
error	ConnectApi.ErrorResponse	Error code and error message.	54.0
fields	Map<String, String>	Map of fields belonging to the product.	54.0
id	String	ID of the product.	54.0
prices	ConnectApi.PricingResultLineItem	Price of the product. To get pricing information for products in version 58 and later, use the CommerceStorePricing Class.	54.0–57.0

Property Name	Type	Description	Available Version
sku	String	SKU of the product.	54.0
success	Boolean	Represents whether execution was successful and product overview information was retrieved without error.	54.0

ConnectApi.ProductOverviewCollection

Collection of product overviews.

Property Name	Type	Description	Available Version
products	List<ConnectApi.ProductOverview>	Collection of product overview.	54.0
total	Integer	Total number of products returned.	54.0

ConnectApi.ProductPrice

Pricing information for a product.

Property Name	Type	Description	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the product. Products are priced using the currency for the buyer account or guest buyer profile. If your store doesn't support the currency for the buyer account or guest buyer profile, products are priced using the default currency for your store.	49.0
listPrice	String	List price for the product.	49.0
lowestUnitPrice	String	Lowest unit price for the product.	49.0
priceAdjustment	ConnectApi.PriceAdjustmentSchedule	Price adjustment schedule for the product. If a product selling model ID is specified in a request parameter, this property is empty.	49.0
pricebookEntryId	String	ID of the price book entry. If a product selling model ID is specified in a request parameter, this property is empty.	49.0
productPriceEntries	List<ConnectApi.ProductPriceEntry>	List of line item prices for the product.	56.0
unitPrice	String	Unit price for the product. If a product selling model ID is specified in a request parameter, this property is empty.	49.0

ConnectApi.ProductPriceEntry

Line item price for the product.

Property Name	Type	Description	Available Version
`error`	`ConnectApi.ErrorResponse`	Error code and error message.	56.0
`listPrice`	String	List price for the product entry.	56.0
`priceAdjustment`	`ConnectApi.PriceAdjustmentSchedule`	Price adjustment schedule.	56.0
`pricebookEntryId`	String	ID of the pricebook entry.	56.0
`productSellingModelId`	String	ID of the product selling model. If no product selling model ID is specified in a request parameter, this property is empty.	56.0
`success`	Boolean	Specifies whether execution was successful (`true`) or not (`false`).	56.0
`unitPrice`	String	Unit price for the product entry.	56.0

ConnectApi.ProductReturnRateListOutputRepresentation

Products with corresponding return rates.

Property Name	Type	Description	Available Version
`productReturnRateList`	[illegible]	List of product return rates.	59.0

ConnectApi.ProductReturnRateOutputRepresentation

Return rate of a product (units returned divided by units sold).

Property Name	Type	Description	Available Version
`productId`	String	ID of the product.	59.0
`returnRate`	Double	Return rate of specified product. Values range from 0 to 1.	59.0

ConnectApi.ProductSearchFacetOutputRepresentation

Product search facet value.

Property Name	Type	Description	Available Version
`attributeType`	String	Attribute type of the facet value.	59.0

Property Name	Type	Description	Available Version
displayName	String	Display name of the facet value.	59.0
displayRank	Integer	Display rank of the facet value.	59.0
displayType	String	Display type of the facet value.	59.0
facetType	String	Type of the facet.	59.0
nameOrId	String	Name or ID of the facet.	59.0
values	[illegible]	A list of facet values for the search.	59.0

ConnectApi.ProductSearchFacetValueOutputRepresentation

Output representation of a product search facet value.

Property Name	Type	Description	Available Version
displayName	String	Display name of the search facet.	59.0
nameOrId	String	Unique name or ID of the search facet.	59.0
productCount	Integer	Number of products found with the search facet.	59.0
type	String	Type of the search facet.	59.0

ConnectApi.ProductSearchImageOutputRepresentation

Output representation of the product search image.

Property Name	Type	Description	Available Version
alternateText	String	Alternate text for the product image.	59.0
mediaType	String	Media type of the product image.	59.0
sortOrder	Integer	Sort order of the product image.	59.0
title	String	Title of the product image.	59.0
url	String	URL of the product image.	59.0

ConnectApi.ProductSearchOutputRepresentation

Output representation of the product search response

Property Name	Type	Description	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the product.	59.0

Property Name	Type	Description	Available Version
facets	List<ConnectApi.ProductSearchFacetOutputRepresentation>	A list of facet names to filter the search.For example, ["size_medium", "color_red"].	59.0
locale	String	Locale used for the product search.	59.0
pageNumber	Integer	Maximum number of search results pages to return. If you don't specify a value, the default is 1.	59.0
pageSize	Integer	Number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 20.	59.0
products	List<ConnectApi.ProductSearchProductOutputRepresentation>	List of products found by the search.	59.0
totalRecordsFound	Integer	Total products found.	59.0

ConnectApi.ProductSearchProductOutputRepresentation

Product found by a product search.

Property Name	Type	Description	Available Version
description	String	Description of the product.	59.0
image	ConnectApi.ProductSearchImageOutputRepresentation	Image of the product.	59.0
name	String	Name of the product.	59.0
productClass	String	Class of the product.	59.0
stockKeepingUnit	String	Stock Keeping Unit (SKU) of the product.	59.0
variationAttributeSet	List<ConnectApi.ProductSearchVariationAttributeOutputRepresentation>	Variation attribute set of the product.	59.0

ConnectApi.ProductSearchResults

Product search results.

Property Name	Type	Description	Available Version
categories	ConnectApi.SearchCategory	Categories from the search results.	52.0
correlationId	String	Reserved for future use.	55.0
facets	List<ConnectApi.SearchFacet>	Facets from the search results.	52.0
locale	String	Locale of the search results.	52.0
productsPage	ConnectApi.ProductSummaryPage	Page of products from the search results.	52.0

ConnectApi.ProductSearchSuggestionsResults

Product search suggestions results.

Property Name	Type	Description	Available Version
`recentSearchSuggestions`	List<`ConnectApi.SearchSuggestion`>	Suggestions based on the user's recent searches.	52.0

ConnectApi.ProductSellingModel

Product selling model for Commerce subscriptions.

Property Name	Type	Description	Available Version
`description`	String	Description of the product selling model displayed on the UI.	60.0
`displayName`	String	Name of the product selling model displayed on the UI.	60.0
`id`	String	ID of the product selling model.	56.0
`name`	String	Name of the product selling model.	56.0
`pricingTerm`	Integer	Number of pricing term units in the pricing term. Used with `pricingTermUnit` to define the length of the pricing term. For example, if `pricingTermUnit` is `Months` and this property is 1, the subscription is priced monthly. However, if the `sellingModelType` property is set to `OneTime`, the `pricingTerm` property is empty, because the product isn't sold as a subscription. The only allowed value for this property is 1.	56.0
`pricingTermUnit`	`ConnectApi.PricingTermUnit`	Unit of time used to define a pricing term. Value is: • `Months`—Product is priced on a monthly basis. • `Annual`—Product is priced on an annual basis. This unit of time is combined with a number (specified by the `pricingTerm` property) to define the full term of the subscription. For example, if the unit of time is `Months` and the `pricingTerm` property is set to 1, the subscription is priced monthly. However, if the `sellingModelType` property is set to `OneTime`, the `pricingTermUnit` property is empty, because the product isn't sold as a subscription.	56.0

Property Name	Type	Description	Available Version
sellingModelType	ConnectApi.SellingModelType	Type of product selling model. Values are: • Evergreen—A subscription without an end date. An evergreen subscription continues until the shopper affirmatively cancels it. • OneTime—A product that isn't sold as a subscription. • TermDefined—A subscription with a defined end date. The subscription continues for a specified time period. When the term ends, the subscription ends.	56.0
subscriptionTermRule	ConnectApi.SubscriptionTermRule	Rules for the subscription term.	59.0

ConnectApi.ProductSummary

Product summary.

Property Name	Type	Description	Available Version
defaultImage	ConnectApi.ProductMedia	Default image of the product.	52.0
fields	Map<String, ConnectApi.FieldValue>	Map of fields belonging to the product.	52.0
id	String	ID of the product.	52.0
name	String	Name of the product.	52.0
prices	ConnectApi.PricingResultLineItem	Prices of the product.	52.0
productClass	ConnectApi.ProductClass	Class of product. Values are: • Bundle • Set • Simple • Variation • VariationParent	52.0
productSellingModelInformation	ConnectApi.CommerceProductSellingModel	Product selling model information.	59.0

Property Name	Type	Description	Available Version
purchaseQuantityRule	ConnectApi.PurchaseQuantityRule	If one exists, purchase quantity rule for the product.	52.0
urlName	String	SEO-friendly URL name for the product.	59.0
variationAttributeSet	ConnectApi.ProductAttributeSetSummary	Variation attribute set that's associated with the product.	52.0

SEE ALSO:

ConnectApi.ProductSummaryPage

ConnectApi.ProductSummaryPage

Page of product summaries.

Property Name	Type	Description	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the product.	52.0
pageSize	Integer	Number of products per page in the search results.	52.0
products	List<ConnectApi.ProductSummary>	Collection of product summaries.	52.0
total	Long	Total number of products in the search results.	52.0

SEE ALSO:

ConnectApi.ProductSearchResults

ConnectApi.ProductVariantOutputRepresentation

Details about a product variation.

Property Name	Type	Description	Available Version
listPrice	Double	List price.	55.0
price	Double	Price.	55.0
productId	String	Product ID.	55.0
stockKeepingUnit	String	Stock Keeping Unit.	55.0
unitPrice	Double	Unit price.	55.0
variationValues	Map<String, String>	The variation attribute values that define the variation.	55.0

ConnectApi.ProductVariationAttributeOutputRepresentation

Details about a product variation attribute.

Property Name	Type	Description	Available Version
`apiName`	String	API name of the attribute.	55.0
`label`	String	Label of the attribute.	55.0
`variationAttributeValues`	List<`ConnectApi.ProductVariationAttributeValueOutputRepresentation`>	List of valid values for the variation attribute.	55.0

ConnectApi.ProductVariationAttributeValueOutputRepresentation

Valid value for a product variation attribute.

Property Name	Type	Description	Available Version
`name`	String	API Name of the attribute this value belongs to.	55.0
`orderable`	Boolean	Whether the value defines an orderable product variation.	55.0
`value`	String	Value of the value.	55.0

ConnectApi.ProductVariationInfo

Product variation attributes, metadata, and mappings of attribute combinations to variation product IDs.

Property Name	Type	Description	Available Version
`attributesToProductMappings`	List<`ConnectApi.ProductAttributesToProductEntry`>	List ordered by `ProductAttribute.Sequence` values that map the attribute value combinations to the variation product ID.	50.0
`variationAttributeInfo`	Map<String, `ConnectApi.ProductAttributeInfo`>	Map of field API name to product attribute information.	51.0

SEE ALSO:

ConnectApi.ProductDetail

ConnectApi.PromotionCart

A cart, its items, and its adjustment groups.

Property Name	Type	Description	Available Version
`cartAdjustmentGroups`	List<ConnectApi.PromotionCartAdjustmentGroup>	Cart adjustment groups belonging to the cart.	57.0
`cartItems`	List<ConnectApi.PromotionCartItem>	Cart items belonging to the cart.	57.0
`currencyIsoCode`	String	Currency code of the cart.	57.0
`id`	String	ID of the cart.	57.0
`totalAdjustmentBaseAmount`	String	Total adjustment base amount for the cart.	57.0
`totalNetAmount`	String	Total price of the cart, including adjustments.	57.0
`totalProductBaseAmount`	String	Total price of all cart items in the cart.	57.0

SEE ALSO:

ConnectApi.PromotionEvaluation

evaluate(salesTransaction)

ConnectApi.PromotionCartAdjustmentGroup

Adjustment group associated with a cart.

Property Name	Type	Description	Available Version
`adjustmentBasisReference`	String	ID of the associated coupon, if applicable.	57.0
`adjustmentDescription`	String	Description of the adjustment.	57.0
`adjustmentType`	`ConnectApi.AdjustmentType`	How the price adjustment amount is calculated. Values are: • `AdjustmentAmount`—The adjustment is a fixed amount. • `AdjustmentPercentage`—The adjustment is a percentage.	57.0
`adjustmentValue`	String	Price value of the adjustment.	57.0
`baseAmount`	String	Total amount of the adjustment.	57.0
`cartId`	String	ID of the cart.	57.0
`id`	String	ID of the cart adjustment group.	57.0
`priceAdjustmentCauseId`	String	ID of the related promotion.	57.0

Property Name	Type	Description	Available Version
`priority`	Integer	Where in the sequence of adjustments this adjustment was applied.	57.0

SEE ALSO:

- ConnectApi.PromotionCart
- ConnectApi.PromotionEvaluation
- evaluate(salesTransaction)

ConnectApi.PromotionCartDeliveryMethodAdjustment

Adjustment for a cart delivery method in a promotion.

Property Name	Type	Description	Available Version
`adjustmentType`	String	Type of price adjustment. Valid values are: • `AdjustmentAmount`—The adjustment is a fixed amount. • `AdjustmentPercentage`—The adjustment is a percentage.	60.0
`adjustmentValue`	String	Price value of the adjustment.	60.0
`baseAmount`	String	Price value of the adjustment.	60.0
`priceAdjustmentCauseId`	String	ID of the related promotion.	60.0
`priority`	Integer	Where in the sequence of adjustments this adjustment was applied.	60.0

ConnectApi.PromotionCartItem

A cart item and its adjustments.

Property Name	Type	Description	Available Version
`cartDeliveryGroupId`	String	ID of the associated cart delivery group.	57.0
`cartId`	String	ID of the associated cart.	57.0
`cartItemPriceAdjustments`	List<ConnectApi.PromotionCartItemPriceAdjustment>	List of price adjustments applied to the cart item.	57.0
`id`	String	ID of the cart item.	57.0
`itemDescription`	String	Description of the cart item.	57.0

Property Name	Type	Description	Available Version
`itemName`	String	Name of the cart item.	57.0
`listPrice`	String	Unit list price of the cart item.	57.0
`product2Id`	String	ID of the product.	57.0
`quantity`	String	Quantity of the cart item.	57.0
`salesPrice`	String	Unit sales price of the cart item.	57.0
`sku`	String	Stock keeping unit of the cart item.	57.0
`totalAdjustmentBaseAmount`	String	Total adjustment amount for the cart item.	57.0
`totalLineBaseAmount`	String	Total amount for the cart item, based on sales price and quantity, not including adjustments.	57.0
`totalListBaseAmount`	String	Total amount for the cart item, based on list price and quantity, not including adjustments.	57.0
`totalNetAmount`	String	Total amount for the cart item, based on list price and quantity, including adjustments.	57.0
`type`	`ConnectApi.CartItemType`	Type of item in a cart. Values are: • `DeliveryCharge` • `Product`	57.0

SEE ALSO:

ConnectApi.PromotionCart

ConnectApi.PromotionEvaluation

evaluate(salesTransaction)

ConnectApi.PromotionCartItemPriceAdjustment

Price adjustments applied to a cart item.

Property Name	Type	Description	Available Version
`adjustmentAmountScope`	`ConnectApi.AdjustmentAmountScope`	Scope of the price adjustment amount. Values are: • `Total`—The adjustment scope is the total price. • `Unit`—The adjustment scope is the unit price. • `UnproratedTotal`—The adjustment scope is the unprorated total price.	57.0
`adjustmentBasisReference`	String	ID of the associated coupon, if applicable.	57.0

Property Name	Type	Description	Available Version
adjustmentDescription	String	Description of the adjustment.	57.0
adjustmentTargetType	ConnectApi.CartPromotionType	Level of the promotion target. Values are: • Cart—The target is cart-level. • Item—The target is item-level.	57.0
adjustmentType	ConnectApi.AdjustmentType	How the price adjustment amount is calculated. Values are: • AdjustmentAmount—The adjustment is a fixed amount. • AdjustmentPercentage—The adjustment is a percentage.	57.0
adjustmentValue	String	Value of the price adjustment.	57.0
baseAmount	String	Total adjustment amount.	57.0
cartAdjustmentGroupId	String	ID of the associated cart adjustment group.	57.0
cartItemId	String	ID of the associated cart item.	57.0
id	String	ID of the cart item price adjustment.	57.0
priceAdjustmentCauseId	String	ID of the associated promotion.	57.0
priority	Integer	Where in the sequence of adjustments this adjustment was applied.	57.0

SEE ALSO:

ConnectApi.PromotionCartItem
ConnectApi.PromotionCart
ConnectApi.PromotionEvaluation
evaluate(salesTransaction)

ConnectApi.PromotionCoupon

A coupon used in a promotion.

Property Name	Type	Description	Available Version
couponCode	String	Coupon code.	57.0
couponErrorCode	String	Error code returned if the coupon is invalid.	57.0
id	String	ID of the coupon.	57.0

Property Name	Type	Description	Available Version
`isValidCoupon`	Boolean	Indicates whether the coupon is valid (`true`) or invalid (`false`).	57.0

SEE ALSO:

- ConnectApi.PromotionEvaluation
- evaluate(salesTransaction)

ConnectApi.PromotionEvaluation

Results of a promotion evaluation.

Property Name	Type	Description	Available Version
`cart`	`ConnectApi.PromotionCart`	Cart and its items.	57.0
`coupons`	List<`ConnectApi.PromotionCoupon`>	Collection of coupon codes to enable promotions. A customer can apply a maximum of two coupons.	57.0

SEE ALSO:

- evaluate(salesTransaction)

ConnectApi.PurchaseQuantityRule

Rule that restricts the quantity of a product that can be purchased.

Property Name	Type	Description	Available Version
`increment`	String	Increment value of the quantity that can be purchased.	52.0
`maximum`	String	Maximum quantity that can be purchased.	52.0
`minimum`	String	Minimum quantity that can be purchased.	52.0

SEE ALSO:

- ConnectApi.CartItemProduct
- ConnectApi.ProductDetail
- ConnectApi.ProductSummary

ConnectApi.QuestionAndAnswersCapability

If a feed element has this capability, it has a question and comments on the feed element are answers to the question.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
bestAnswer	ConnectApi.Comment	Comment selected as the best answer for the question.	32.0
bestAnswerSelectedBy	ConnectApi.UserSummary	User who selected the best answer for the question.	32.0
canCurrentUserSelectOrRemoveBestAnswer	Boolean	Indicates whether the context user can select or remove a best answer (true) or not (false).	32.0
candidateAnswers	ConnectApi.CandidateAnswersStatus	Status of candidate answers for the question.	41.0
escalatedCase	ConnectApi.Reference	If a question post is escalated, this is the case to which it was escalated.	33.0
questionTitle	String	Title for the question.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.QuestionAndAnswersSuggestions

Question and answers suggestions.

Property Name	Type	Description	Available Version
articles	List<ConnectApi.ArticleItem>	List of articles.	32.0
questions	List<ConnectApi.FeedElement>	List of questions.	32.0

ConnectApi.RankAverageDistanceOutputRepresentation

The results of calculating the average distances from sets of inventory locations to an order recipient.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
distanceUnit	String	The specified unit of distance (miles or kilometers).	51.0
results	List<ConnectApi.AverageDistanceResultOutputRepresentation>	The results of the shipping distance calculations.	51.0

ConnectApi.ReadBy

Information about who read the feed element and when.

Property Name	Type	Description	Available Version
`lastReadDateByUser`	Datetime	When the user last read the feed element in ISO 8601 format.	40.0
`user`	`ConnectApi.UserSummary`	Information about the user who read the feed element.	40.0

SEE ALSO:

ConnectApi.ReadByPage

ConnectApi.ReadByCapability

If a feed element has this capability, the context user can mark it as read.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`isReadByMe`	Boolean	Specifies whether the feed element has been read (`true`) or not (`false`) by the context user.	40.0
`lastReadDateByMe`	Datetime	Last date when the feed element was marked read for the context user in ISO 8601 format. Otherwise, `null`.	40.0
`page`	`ConnectApi.ReadByPage`	First page of information about who read the feed element and when.	40.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.ReadByPage

A collection of information about who read the feed element and when.

Property Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	40.0
`currentPageUrl`	String	Connect REST API URL identifying the current page. The default is 25 items per page.	40.0
`items`	List<`ConnectApi.ReadBy`>	Collection of read-by information, including users and when they last read the feed element.	40.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	40.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	40.0

Property Name	Type	Description	Available Version
previousPageToken	String	Reserved for future use.	40.0
previousPageUrl	String	Reserved for future use.	40.0
total	Integer	Total number of users who read the feed element. Note: This count appears in the UI under feed posts in private and unlisted Chatter groups as the "seen by" number, for example, "Seen by 48."	40.0

SEE ALSO:

ConnectApi.ReadByCapability

ConnectApi.Recommendation

A Next Best Action recommendation object.

Property Name	Type	Description	Available Version
acceptanceLabel	String	Text indicating user acceptance of the recommendation.	45.0
actionReference	String	Reference to the action to perform, for example, launching a flow.	45.0
description	String	Description of the recommendation.	45.0
externalId	String	External ID of the recommendation. This ID doesn't need to be a Salesforce 18-character ID. For example, it can be a product number from an external system.	46.0
id	String	ID of the recommendation.	45.0
image	ConnectApi.FileAsset	Image to display.	45.0
name	String	Name of the recommendation.	45.0
rejectionLabel	String	Text indicating user rejection of the recommendation.	45.0
url	String	URL to the recommendation.	45.0

ConnectApi.RecommendationAudience

A custom recommendation audience.

Property Name	Type	Description	Available Version
criteria	ConnectApi.AudienceCriteria	The criteria for the custom recommendation audience type.	36.0
id	String	18-character ID of the custom recommendation audience.	35.0
memberCount	Integer	**Important:** This property is available only in version 35.0. In version 36.0 and later, this property is available in ConnectApi.CustomListAudienceCriteria. Number of members in the custom recommendation audience.	35.0 only
members	ConnectApi.UserReferencePage	**Important:** This property is available only in version 35.0. In version 36.0 and later, this property is available in ConnectApi.CustomListAudienceCriteria. Members of the custom recommendation audience.	35.0 only
modifiedBy	ConnectApi.User	User who last modified the custom recommendation audience.	36.0
modifiedDate	Datetime	ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	36.0
name	String	Name of the custom recommendation audience.	35.0
url	String	URL to the custom recommendation audience.	35.0

SEE ALSO:

ConnectApi.RecommendationAudiencePage

ConnectApi.RecommendationAudiencePage

A list of custom recommendation audiences.

Property Name	Type	Description	Available Version
audienceCount	Integer	The total number of custom recommendation audiences.	35.0
currentPageUrl	String	URL to the current page.	35.0
nextPageUrl	String	URL to the next page.	35.0
previousPageUrl	String	URL to the previous page.	35.0

Property Name	Type	Description	Available Version
recommendationAudiences	List<ConnectApi.RecommendationAudience>	A list of custom recommendation audiences.	35.0

ConnectApi.RecommendationCollection

A list of Chatter, custom, and static recommendations.

Property Name	Type	Description	Available Version
recommendations	List<ConnectApi.AbstractRecommendation>	Collection of Chatter, custom, and static recommendations.	33.0

ConnectApi.RecommendationDefinition

Represents a custom recommendation definition.

Property Name	Type	Description	Available Version
actionUrl	String	The URL for acting on this custom recommendation.	35.0
actionUrlName	String	The text label for the action URL in the user interface.	35.0
explanation	String	Explanation of the custom recommendation definition.	35.0
id	String	18-character ID of the custom recommendation definition.	35.0
name	String	Name of the custom recommendation definition. The name is displayed in Setup.	35.0
photo	ConnectApi.Photo	Photo of the custom recommendation definition.	35.0
title	String	Title of the custom recommendation definition.	35.0
url	String	URL to the Connect REST API resource for the custom recommendation definition.	35.0

SEE ALSO:

- ConnectApi.RecommendationDefinitionPage
- ConnectApi.ScheduledRecommendation

ConnectApi.RecommendationDefinitionPage

A list of custom recommendation definitions.

Property Name	Type	Description	Available Version
recommendationDefinitions	List<ConnectApi.RecommendationDefinition>	A list of custom recommendation definitions.	35.0
url	String	URL to the Connect REST API resource for the recommendation definition collection.	35.0

ConnectApi.RecommendationExplanation

Explanation for a Chatter recommendation.

Subclass of ConnectApi.AbstractRecommendationExplanation.

Property Name	Type	Description	Available Version
detailsUrl	String	URL to explanation details or `null` if the Chatter recommendation doesn't have a detailed explanation.	32.0

SEE ALSO:

ConnectApi.AbstractRecommendation

ConnectApi.RecommendationReaction

A reaction to a recommendation produced by a recommendation strategy

Property Name	Type	Description	Available Version
aiModel	String	Reserved for future use.	47.0
contextRecord	ConnectApi.Reference	Reference to the context record.	45.0
createdBy	ConnectApi.Reference	Reference to the reaction creator.	45.0
createdDate	Datetime	Reaction creation date.	45.0
externalId	String	External target ID of the recommendation reacted on. This ID doesn't need to be a Salesforce 18-character ID. For example, it can be a product number from an external system.	46.0
id	String	Reaction record ID.	45.0
onBehalfOf	ConnectApi.Reference	Reference to the user or record that is indirectly reacting to the recommendation.	45.0
reactionType	ConnectApi.RecommendationReactionType	Type of reaction to a recommendation. Values are: • `Accepted` • `Rejected`	45.0

Property Name	Type	Description	Available Version
recommendationMode	String	Reserved for future use.	46.0
recommendationScore	Double	Reserved for future use.	46.0
strategy	ConnectApi.RecordSnapshot	Strategy that recommended the target record.	45.0
targetAction	ConnectApi.RecordSnapshot	Target action that is recommended.	45.0
targetRecord	ConnectApi.Reference	Reference to the target record.	45.0
url	String	URL to the recommendation reaction.	45.0

SEE ALSO:

ConnectApi.RecommendationReactions

ConnectApi.RecommendationReactions

A list of recommendation reactions.

Property Name	Type	Description	Available Version
currentPageUrl	String	URL to the current page of reactions in the collection.	45.0
nextPageUrl	String	URL to the next page of reactions in the collection.	45.0
reactions	List<ConnectApi.RecommendationReaction>	Collection of recommendation reactions.	45.0

ConnectApi.RecommendationsCapability

If a feed element has this capability, it has a recommendation.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
items	List<ConnectApi.AbstractRecommendation>	A list of recommendations.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.RecommendedObject

A recommended object, such as a custom or static recommendation.

Subclass of ConnectApi.Actor

Property Name	Type	Description	Available Version
`idOrEnum`	String	ID of a recommendation definition for a custom recommendation or the enum value `Today` for static recommendations that don't have an ID (version 35.0 and later).	34.0
`motif`	`ConnectApi.Motif`	Motif of the recommended object.	34.0

ConnectApi.RecordCapability

If a comment has this capability, it has a record attachment.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`recordId`	String	ID of the record.	42.0
`url`	String	URL to the record.	42.0

ConnectApi.RecordField

Generic record field containing a label and text value.

Subclass of ConnectApi.LabeledRecordField.

No additional properties.

SEE ALSO:

- ConnectApi.CompoundRecordField
- ConnectApi.OrderItemSummary
- ConnectApi.OrderItemSummaryProduct
- ConnectApi.OrderDeliveryGroupSummary
- ConnectApi.OrderSummaryRepresentation

ConnectApi.RecordFieldValue

Field value.

Property Name	Type	Description	Available Version
`displayValue`	String	Field display value.	63.0
`highlight`	String	Represents field highlighting in the results.	63.0

Property Name	Type	Description	Available Version
`value`	Object	Field raw value.	63.0

SEE ALSO:

ConnectApi.SearchResult

ConnectApi.RecordSnapshot

A record snapshot in a recommendation reaction.

Property Name	Type	Description	Available Version
`id`	String	ID of the record.	45.0
`nameAtSnapshot`	String	Name of the record when the ID was recorded.	45.0

SEE ALSO:

ConnectApi.RecommendationReaction

ConnectApi.RecordSnapshotCapability

If a feed element has this capability, it contains all the snapshotted fields of a record for a single create record event.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`recordView`	`ConnectApi.RecordView`	A record representation that includes metadata and data so you can display the record easily.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.RecordSummary

Record summary.

Subclass of ConnectApi.AbstractRecordView.

Property Name	Type	Description	Available Version
entityLabel	ConnectApi.EntityLabel	Label of the record's entity.	40.0

SEE ALSO:

- ConnectApi.EmailAddress
- ConnectApi.EmailAttachment
- ConnectApi.ReferenceRecordField
- ConnectApi.ReferenceWithDateRecordField

ConnectApi.RecordSummaryList

Summary information about a list of records in the organization including custom objects.

Name	Type	Description	Available Version
records	List<ConnectApi.ActorWithId>	A list of records.	30.0
url	String	The URL to this list of records.	30.0

ConnectApi.RecordView

A view of any record in the org, including a custom object record. This object is used if a specialized object, such as User or ChatterGroup, isn't available for the record type.

Subclass of ConnectApi.AbstractRecordView.

Name	Type	Description	Available Version
sections	List<ConnectApi.RecordViewSection>	List of record view sections.	29.0

SEE ALSO:

- ConnectApi.RecordSnapshotCapability

ConnectApi.RecordViewSection

Section of record fields and values on a record detail.

Name	Type	Description	Available Version
columnCount	Integer	Number of columns to use to lay out the fields in a record section.	29.0

Name	Type	Description	Available Version
`columnOrder`	`ConnectApi.RecordColumnOrder` Enum	Order of the fields to use in the `fields` property to lay out the fields in a record section. • `LeftRight`—Fields are rendered from left to right. • `TopDown`—Fields are rendered from the top down.	29.0
`fields`	`ConnectApi.AbstractRecordField`	Fields and values for the record contained in this section.	29.0
`heading`	String	Localized label to display when rendering this section of fields.	29.0
`isCollapsible`	Boolean	Indicates whether the section can be collapsed to hide all the fields (`true`) or not (`false`).	29.0

SEE ALSO:

ConnectApi.RecordView

ConnectApi.RecordsetFilterCriteria

Recordset filter criteria and the filtered records.

Property Name	Type	Description	Available Version
`criteriaId`	String	Recordset filter criteria ID.	53.0
`recordIds`	List<String>	List of filtered record IDs.	53.0

SEE ALSO:

ConnectApi.RecordsetFilterCriteriaCollection

ConnectApi.RecordsetFilterCriteriaCollection

List of the recordset filters and records.

Property Name	Type	Description	Available Version
`recordsetFilters`	List<`ConnectApi.RecordsetFilterCriteria`>	Collection of recordset filter criteria IDs and filtered record IDs.	53.0

ConnectApi.Reference

Reference to a record.

Name	Type	Description	Available Version
id	String	The ID of the record being referenced, which could be an 18-character ID or some other string identifier.	28.0
url	String	The URL to the resource endpoint.	28.0

ConnectApi.ReferenceRecordField

Record field with a label and text value.

Subclass of ConnectApi.LabeledRecordField.

Name	Type	Description	Available Version
reference	ConnectApi.RecordSummary	Object referenced by the record field.	29.0

ConnectApi.ReferencedRefundResponse

Refund comprehensive output.

Property Name	Type	Description	Available Version
error	ConnectApi.ErrorResponse	Error response representation for the refund.	50.0
gatewayResponse	ConnectApi.RefundGatewayResponse	Gateway response received for the processed refund request.	50.0
paymentGatewayLogs	List<ConnectApi.GatewayLogResponse>	Gateway log collection representation for the refund.	50.0
paymentGroup	ConnectApi.PaymentGroupResponse	Payment group associated with the refund.	50.0
refund	ConnectApi.RefundResponse	Refund response representation.	50.0

ConnectApi.ReferenceWithDateRecordField

Record field containing a referenced object that acted at a specific time, for example, "Created By...".

Subclass of ConnectApi.LabeledRecordField.

Name	Type	Description	Available Version
dateValue	Datetime	Time at which the referenced object acted.	29.0
reference	ConnectApi.RecordSummary	Object referenced by the record field.	29.0

ConnectApi.RefundGatewayResponse

Refund gateway response.

Subclass of ConnectApi.AbstractGatewayResponse.

No additional properties.

ConnectApi.RefundResponse

Refund output.

Property Name	Type	Description	Available Version
`accountId`	String	ID of the account related to the refund record.	50.0
`amount`	Double	Total amount of the refund transaction performed in the payment request.	50.0
`currencyIsoCode`	String	Three-letter ISO 4217 currency code associated with the payment group record.	50.0
`effectiveDate`	Datetime	Date that the refund becomes effective.	50.0
`id`	String	ID of the refund record.	50.0
`refundNumber`	String	Number of the refund record that was created as a result of the request processing.	50.0
`requestDate`	Datetime	Date when the refund occurred.	50.0
`status`	String	Indicates the results of processing the refund transaction in the gateway. Can be DRAFT, PROCESSED or CANCELLED.	50.0

ConnectApi.RegisterGuestBuyerOutputRepresentation

Indicates success or failure of a register guest buyer action.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`errors`	List<`ConnectApi.ErrorResponse`>	Any errors that were returned.	48.0
`success`	Boolean	Indicates whether the transaction was successful.	48.0

ConnectApi.RelatedFeedPost

This class is abstract.

Subclass of ConnectApi.ActorWithId.

Superclass of: ConnectApi.RelatedQuestion.

Property Name	Type	Description	Available Version
score	Double	Score of the related feed post that indicates how closely related it is to the context feed post.	37.0
title	String	Title of the related feed post.	37.0

SEE ALSO:

ConnectApi.RelatedFeedPosts

ConnectApi.RelatedFeedPosts

A collection of related feed posts.

Property Name	Type	Description	Available Version
relatedFeedPosts	List<ConnectApi.RelatedFeedPost>	Collection of related feed posts.	37.0

ConnectApi.RelatedQuestion

A related question.

Subclass of ConnectApi.RelatedFeedPost.

Property Name	Type	Description	Available Version
hasBestAnswer	Boolean	Indicates whether the question has a best answer.	37.0
interactions	ConnectApi.InteractionCapability	The number of individual views, likes, and comments on a question.	38.0

ConnectApi.ReleaseHeldFOCapacityOutputRepresentation

Response to a request to confirm held fulfillment order capacity at one or more locations. Can correspond to one action call.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
releaseHeldFOCapacityResponses	List<ConnectApi.ReleaseHeldFOCapacityResponseOutputRepresentation>	List of responses to the requests to confirm held fulfillment order capacity at one or more locations.	55.0

ConnectApi.ReleaseHeldFOCapacityResponseOutputRepresentation

Response to a request to release held fulfillment order capacity at one or more locations.

Property Name	Type	Description	Available Version
capacityResponses	List<ConnectApi.CapacityResponseOutputRepresentation>	List of responses to the requests to release held fulfillment order capacity at individual locations.	55.0

ConnectApi.ReplyIntent

Reply intent for a social post.

Property Name	Type	Description	Available Version
managedSocialAccount	ConnectApi.ManagedSocialAccount	Managed social account that replies to the social post.	45.0

SEE ALSO:

ConnectApi.ReplyIntents

ConnectApi.ReplyIntents

List of reply intents for a social post.

Property Name	Type	Description	Available Version
replies	List<ConnectApi.ReplyIntent>	List of reply intents for the social post.	45.0

SEE ALSO:

ConnectApi.SocialPostIntents

ConnectApi.RepositoryFileDetail

A detailed description of a repository file.

Subclass of ConnectApi.AbstractRepositoryFile.

No additional properties.

ConnectApi.RepositoryFileSummary

A summary of a repository file.

Subclass of ConnectApi.AbstractRepositoryFile.

No additional properties.

SEE ALSO:

ConnectApi.RepositoryFolderItem

ConnectApi.RepositoryFolderDetail

A detailed description of a repository folder.

Subclass of ConnectApi.AbstractRepositoryFolder.

No additional properties.

ConnectApi.RepositoryFolderItem

A folder item.

Property Name	Type	Description	Available Version
`file`	`ConnectApi.RepositoryFileSummary`	If the folder item is a file, the file summary. If the folder item is a folder, `null`.	39.0
`folder`	`ConnectApi.RepositoryFolderSummary`	If the folder item is a folder, the folder summary. If the folder item is a file, `null`.	39.0
`type`	`ConnectApi.FolderItemType`	Type of item in a folder. Values are: • `file` • `folder`	39.0

SEE ALSO:

ConnectApi.RepositoryFolderItemsCollection

ConnectApi.RepositoryFolderItemsCollection

A collection of repository folder items.

Property Name	Type	Description	Available Version
`currentPageUrl`	String	URL to the current page of items.	39.0
`items`	List<`ConnectApi.RepositoryFolderItem`>	Collection of items in a repository folder.	39.0
`nextPageUrl`	String	URL to the next page of items, or `null` if there isn't a next page.	39.0
`previousPageUrl`	String	URL to the previous page of items, or `null` if there isn't a previous page.	39.0

ConnectApi.RepositoryFolderSummary

A summary of a repository folder.

Subclass of ConnectApi.AbstractRepositoryFolder.

No additional properties.

SEE ALSO:

ConnectApi.RepositoryFolderItem

ConnectApi.RepositoryGroupSummary

A group summary.

Subclass of ConnectApi.AbstractDirectoryEntrySummary.

Property Name	Type	Description	Available Version
`groupType`	`ConnectApi.ContentHubGroupType`	Type of group. Values are: • `Everybody`—Group is public to everybody. • `EverybodyInDomain`—Group is public to everybody in the same domain. • `Unknown`—Group type is unknown.	39.0
`name`	String	Name of the group.	39.0

SEE ALSO:

ConnectApi.ExternalFilePermissionInformation

ConnectApi.RepositoryUserSummary

A user summary.

Subclass of ConnectApi.AbstractDirectoryEntrySummary.

Property Name	Type	Description	Available Version
`firstName`	String	First name of the user.	39.0
`lastName`	String	Last name of the user.	39.0

ConnectApi.Reputation

Reputation for a user.

Property Name	Type	Description	Available Version
`reputationLevel`	`ConnectApi.ReputationLevel`	User's reputation level.	32.0
`reputationPoints`	Double	User's reputation points, which can be earned by performing different activities.	32.0

Property Name	Type	Description	Available Version
`url`	String	Connect REST API URL to the reputation.	32.0

SEE ALSO:

ConnectApi.User

ConnectApi.ReputationLevel

Reputation level for a user.

Property Name	Type	Description	Available Version
`levelImageUrl`	String	URL to the reputation level image.	32.0
`levelName`	String	Name of the reputation level.	32.0
`levelNumber`	Integer	Reputation level number, which is the numerical rank of the level, with the lowest level at 1. Administrators define the reputation level point ranges.	32.0

SEE ALSO:

ConnectApi.Reputation

ConnectApi.RequestHeader

An HTTP request header name and value pair.

Property Name	Type	Description	Available Version
`name`	String	The name of the request header.	33.0
`value`	String	The value of the request header.	33.0

SEE ALSO:

ConnectApi.ActionLinkDefinition

ConnectApi.ResourceLinkSegment

Resource link segment.

Name	Type	Description	Available Version
`url`	String	URL to a resource not otherwise identified by an ID field, for example, a link to a list of users.	28.0

ConnectApi.ReturnItemsOutputRepresentation

Output of Return Items. Includes the ID of the generated change order for items and delivery charges being returned, as well as the ID of the generated change order for any charged return fees. Also includes information about any ReturnOrderLineItems that were created to represent remaining return quantities.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`changeOrderId`	String	ID of the change order created by processing the ReturnOrderLineItems representing returned items and delivery charges. Use this change order to create a credit memo.	52.0
`feeChangeOrderId`	String	ID of the change order created by processing the ReturnOrderLineItems representing return fees. Use this change order to create an invoice.	56.0
`returnLineItemSplits`	List<`ConnectApi.ReturnOrderItemSplitLineOutputRepresentation`>	List of properties representing any remaining quantities from partial returns processed by this call. It includes order items, delivery charges, and return fees. Each element of the list includes the ID of a split ReturnOrderLineItem and the ID of the partially processed ReturnOrderLineItem whose remaining quantity it holds.	52.0

SEE ALSO:

returnItems(returnOrderId, returnItemsInput)

ConnectApi.ReturnOrderItemSplitLineOutputRepresentation

After a change order is created for a ReturnOrderLineItem, that ReturnOrderLineItem is read-only. If the Return Items API is used to return a partial quantity, it creates a new "split" ReturnOrderLineItem to hold the remaining quantity to be returned. In that case, it returns this output property, which contains the IDs of the original and split ReturnOrderLineItems.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`newReturnOrderItemId`	String	ID of the new ReturnOrderLineItem that holds the remaining return quantity.	52.0
`originalReturnOrderItemId`	String	ID of the original ReturnOrderLineItem.	52.0

SEE ALSO:

ConnectApi.ReturnItemsOutputRepresentation

returnItems(returnOrderId, returnItemsInput)

ConnectApi.ReturnOrderOutputRepresentation

ID of the created ReturnOrder.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
`returnOrderId`	String	ID of the created ReturnOrder.	50.0

SEE ALSO:

createReturnOrder(returnOrderInput)

ConnectApi.SaleGatewayResponse

Sale gateway response.

Subclass of ConnectApi.AbstractGatewayResponse.

No additional properties.

ConnectApi.SaleResponse

Payment sale response.

Property Name	Type	Description	Available Version
`error`	`ConnectApi.ErrorResponse`	Error representation for the payment sale.	54.0
`gatewayResponse`	`ConnectApi.SaleGatewayResponse`	Information from the payment gateway following the sale request.	54.0
`payment`	`ConnectApi.PaymentResponse`	Information about the payment used in the sale request.	54.0
`paymentGatewayLogs`	List<`ConnectApi.GatewayLogResponse`>	Collection of responses from the gateway following the sale request.	54.0
`paymentGroup`	`ConnectApi.PaymentGroupResponse`	Payment group used in the sale request.	54.0
`paymentMethod`	`ConnectApi.PaymentMethodResponse`	Payment method used in the sale request.	54.0

ConnectApi.ScheduledRecommendation

Represents a scheduled custom recommendation.

Property Name	Type	Description	Available Version
`channel`	`ConnectApi.RecommendationChannel`	A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. Values are: • `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear. • `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.	36.0
`enabled`	Boolean	Indicates whether scheduling is enabled. If `true`, the custom recommendation is enabled and appears in Experience Cloud sites. If `false`, custom recommendations in feeds in Salesforce mobile web aren't removed, but no new custom recommendations appear. In Customer Service and Partner Central sites, disabled custom recommendations no longer appear.	35.0
`id`	String	18-character ID of the scheduled custom recommendation.	35.0

Property Name	Type	Description	Available Version
`rank`	Integer	The rank determining the order of this scheduled custom recommendation.	35.0
`recommendationAudienceId`	String	ID of the audience for the scheduled custom recommendation.	35.0
`recommendationDefinitionRepresentation`	`ConnectApi.RecommendationDefinition`	Custom recommendation definition that this scheduled recommendation schedules.	35.0
`url`	String	URL to the Connect REST API resource for the scheduled custom recommendation.	35.0

SEE ALSO:

ConnectApi.ScheduledRecommendationPage

ConnectApi.ScheduledRecommendationPage

A list of scheduled custom recommendations.

Property Name	Type	Description	Available Version
`scheduledRecommendations`	List<`ConnectApi.ScheduledRecommendation`>	A list of scheduled custom recommendations.	35.0
`url`	String	URL to the Connect REST API resource for the scheduled custom recommendation collection.	35.0

ConnectApi.Scope

Scope information for a target.

Property Name	Type	Description	Available Version
`name`	String	Name of the scope for the target.	48.0–49.0
`value`	String	Value of the scope for the target.	48.0–49.0

SEE ALSO:

ConnectApi.Target

ConnectApi.ScopedSearchResults

Keyword search results for an object.

Property Name	Type	Description	Available Version
metadata	ConnectApi.ObjectMetadata	All search metadata associated with the object.	63.0
searchObject	ConnectApi.SearchObject	Record results for the keyword search.	63.0

SEE ALSO:

find(objectApiName, request)

ConnectApi.SearchAnswer

Results of searching objects using a natural language query.

Property Name	Type	Description	Available Version
content	String	AI generated response.	63.0
llmGenerationId	String	LLM generation ID used to track any feedback on the conversation.	63.0
metadata	Map<String, ConnectApi.ObjectMetadata>	All search related metadata associated with the objects found in the results.	63.0
searchObjects	List<ConnectApi.SearchObject>	Record results for the natural language search.	63.0

SEE ALSO:

answer(q, objectApiName)

answer(q, objectApiName, displayFields)

answer(q)

ConnectApi.SearchCategory

Search category.

Property Name	Type	Description	Available Version
category	ConnectApi.ProductCategoryData	Information about the category.	52.0
children	List<ConnectApi.SearchCategory>	First-level child categories of the category searched with non-empty search results.	52.0

Property Name	Type	Description	Available Version
`productCount`	Long	Number of products in the search results that belong to the category.	52.0

SEE ALSO:

ConnectApi.ProductSearchResults

ConnectApi.SearchFacet

Search facet.

This class is abstract and is a superclass of ConnectApi.DistinctValueSearchFacet.

Property Name	Type	Description	Available Version
`attributeType`	`ConnectApi.CommerceSearchAttributeType`	Search attribute type. Values are: • `Custom` • `ProductAttribute` • `ProductCategory` • `Product2` • `Standard`	52.0
`displayName`	String	Display name of the facet.	52.0
`displayRank`	Integer	Display rank of the facet. Valid values are from 1 through 50.	52.0
`displayType`	`ConnectApi.CommerceSearchFacetDisplayType`	Display type of the facet. Values are: • `CategoryTree` • `DatePicker` • `MultiSelect` • `SingleSelect`	52.0
`facetType`	`ConnectApi.CommerceSearchFacetType`	Search facet type. Value is: • `DistinctValue`	52.0
`nameOrId`	String	Developer name of the attribute. In version 52.0 and later, the ID of the attribute isn't supported.	52.0

SEE ALSO:

ConnectApi.ProductSearchResults

ConnectApi.SearchObject

Record results for the keyword search.

Property Name	Type	Description	Available Version
displayFields	List<String>	Fields to display from the response.	63.0
objectApiName	String	Object API name.	63.0
orderBy	List<ConnectApi.SearchAppliedOrderBy>	Applied order for object search.	63.0
pageInfo	ConnectApi.PageInfo	Page position information for the object search.	63.0
searchResults	List<ConnectApi.SearchResult>	Search results from the query.	63.0
spellCorrectionInfo	ConnectApi.SpellCorrectionInfo	Spell correction information for the object search.	63.0
status	ConnectApi.SearchStatus	Provides status on the object search such as error messages and warnings.	63.0

SEE ALSO:

- ConnectApi.SearchResultGroups
- ConnectApi.SearchAnswer
- ConnectApi.ScopedSearchResults

ConnectApi.SearchResult

Results from searching an object using keywords.

Property Name	Type	Description	Available Version
fields	Map<String, ConnectApi.RecordFieldValue>	Field values by field API name.	63.0
id	String	ID of the record.	63.0
matchInfo	ConnectApi.MatchInfo	Search information related to the search result.	63.0

SEE ALSO:

- ConnectApi.SearchObject

ConnectApi.SearchResultGroups

Results of searching objects using keywords.

Property Name	Type	Description	Available Version
`metadata`	Map<String, `ConnectApi.ObjectMetadata`>	All related metadata associated with the objects found in the results.	63.0
`searchObjects`	List<`ConnectApi.SearchObject`>	Record results for the keyword search grouped by object.	63.0

SEE ALSO:

findAndGroup(q)

findAndGroup(q, configurationName)

findAndGroup(q, configurationName, highlights)

ConnectApi.SearchStatus

Provides status on the object search.

Property Name	Type	Description	Available Version
`code`	String	Search status code.	63.0
`message`	String	Search status message.	63.0

SEE ALSO:

ConnectApi.SearchObject

ConnectApi.SearchSuggestion

Search suggestion.

Property Name	Type	Description	Available Version
`value`	String	Search suggestion.	52.0

SEE ALSO:

ConnectApi.ProductSearchSuggestionsResults

ConnectApi.ServiceAppointmentOutput

Output of the create service appointment request.

Property Name	Type	Description	Available Version
`result`	ConnectApi.ServiceAppointmentResult	Result of the create or update service appointment request.	53.0

ConnectApi.ServiceAppointmentResult

Contains result of the service appointment.

Property Name	Type	Description	Available Version
`assignedResourceIds`	List<String>	The IDs of the assigned resources.	53.0
`parentRecordId`	String	The ID of the parent record.	53.0
`serviceAppointmentId`	String	The ID of the service appointment record.	53.0

ConnectApi.ShiftsFromPattern

Shifts created from a pattern.

Property Name	Type	Description	Available Version
`count`	Integer	Total count of created shifts.	51.0
`error`	`ConnectApi.ShiftsFromPatternError`	Error details for shifts from a pattern.	53.0
`isSuccess`	Boolean	Indicates if the request is successful (`true`) or not (`false`).	53.0
`recordIds`	List<String>	Collection of created shift IDs.	51.0

ConnectApi.ShiftsFromPatternError

Shifts from pattern error response.

Property Name	Type	Description	Available Version
`code`	String	Error code.	53.0
`invalidServiceResourceId`	String	ID of invalid service resource.	53.0
`message`	String	Error message.	53.0

ConnectApi.SiteSearchItem

Site search result item.

Property Name	Type	Description	Available Version
`contentReference`	String	Content reference field, which is the route developer name for a site page or a content key for a content detail page.	54.0

Property Name	Type	Description	Available Version
`contentType DeveloperName`	String	Developer name of the content type of the site search result item.	54.0
`highlightedSnippet`	String	Text snippet that contains the query term.	54.0
`id`	String	ID of the site search result item.	54.0
`pageType`	`ConnectApi. SitesPageType`	Type of site search result item. Values are: • `ContentPage` • `SitePage`	54.0
`title`	String	Title of the site search result item.	54.0

SEE ALSO:

ConnectApi.SiteSearchResult

ConnectApi.SiteSearchResult

Site search result.

Property Name	Type	Description	Available Version
`currentPageToken`	String	Token for the current page of search results.	54.0
`currentPageUrl`	String	URL to the current page of search results.	54.0
`items`	List<`ConnectApi. SiteSearchItem`>	Collection of search result items.	54.0
`language`	String	Language of the search results.	54.0
`nextPageToken`	String	Token for the next page of search results.	54.0
`nextPageUrl`	String	URL to the next page of search results, or `null` if there isn't a next page.	54.0
`pageSize`	Integer	Number of items per page in search results.	54.0
`previousPageToken`	String	Token for the previous page of search results.	54.0
`previousPageUrl`	String	URL to the previous page of search results, or `null` if there isn't a previous page.	54.0
`totalItems`	Integer	Total number of items in the search results across all pages.	54.0

ConnectApi.SocialAccount

A social account on a social network.

Property Name	Type	Description	Available Version
`externalSocialAccountId`	String	ID of the external social account, if available.	38.0
`handle`	String	Social handle, screen name, or alias that identifies this account.	36.0
`name`	String	Name of the account as defined by the account's owner.	36.0
`profileUrl`	String	URL to the account's profile.	36.0
`socialPersonaId`	String	ID of the social persona account, if the external social account ID isn't available.	39.0

SEE ALSO:

ConnectApi.SocialPostCapability

ConnectApi.SocialAccountRelationship

Follow relationship between a managed social account and a social persona.

Property Name	Type	Description	Available Version
`isFollowed`	Boolean	Specifies whether the social account is followed by the social persona.	46.0
`isFollowing`	Boolean	Specifies whether the social account is following the social persona.	46.0
`socialAccountId`	String	ID of the social account.	46.0
`socialPersonaId`	String	ID of the social persona.	46.0

ConnectApi.SocialPostCapability

If a feed element has this capability, it can interact with a social post on a social network.

Subclass of ConnectApi.FeedElementCapabilities.

Property Name	Type	Description	Available Version
`author`	`ConnectApi.SocialAccount`	Social account that authored the social post.	36.0
`content`	String	Content body of the social post.	36.0
`deletedBy`	`ConnectApi.UserSummary`	User who deleted the social post.	38.0
`hiddenBy`	`ConnectApi.UserSummary`	User who hid the social post.	41.0
`icon`	`ConnectApi.Icon`	Icon of the social network.	36.0
`id`	String	ID associated with the social post Salesforce record.	36.0

Property Name	Type	Description	Available Version
`isOutbound`	Boolean	If `true`, the social post originated from the Salesforce application.	36.0
`likedBy`	String	External social account who liked the social post.	40.0
`messageType`	`ConnectApi.SocialPostMessageType`	Message type of the social post. Values are: • `Comment` • `Direct` • `Post` • `PrivateMessage` • `Reply` • `Retweet` • `Tweet`	38.0
`name`	String	Title or heading of the social post.	36.0
`postUrl`	String	External URL to the social post on the social network.	36.0
`provider`	`ConnectApi.SocialNetworkProvider`	Social network that this social post belongs to. Values are: • `Facebook` • `GooglePlus` • `Instagram` • `InstagramBusiness` • `KakaoTalk` • `Kik` • `Line` • `LinkedIn` • `Messenger` • `Other` • `Pinterest` • `QQ` • `Rypple` • `SinaWeibo` • `SMS` • `Snapchat` • `Telegram` • `Twitter` • `VKontakte` • `WeChat` • `WhatsApp` • `YouTube`	36.0

Property Name	Type	Description	Available Version
recipient	ConnectApi.SocialAccount	Social account that is the recipient of the social post.	36.0
recipientId	String	ID of the recipient of the social post.	38.0
reviewScale	Double	Review scale of the social post.	40.0
reviewScore	Double	Review score of the social post.	40.0
status	ConnectApi.SocialPostStatus	Status of the social post.	36.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.SocialPostIntents

Intents available for a social post.

Property Name	Type	Description	Available Version
approvalIntent	ConnectApi.ApprovalIntent	Approval intent for the social post.	45.0
deleteIntent	ConnectApi.DeleteIntents	Delete intents for the social post.	45.0
followIntent	ConnectApi.FollowIntents	Follow intents for the social persona.	45.0
hideIntent	ConnectApi.HideSocialPostIntent	Hide intent for the social post.	45.0
likeIntent	ConnectApi.LikeIntents	Like intents for the social post.	45.0
replyIntent	ConnectApi.ReplyIntents	Reply intents for the social post.	45.0

ConnectApi.SocialPostMassApprovalOutput

Approval or rejection of a large number of social posts.

Property Name	Type	Description	Available Version
isApproved	Boolean	Specifies whether the social posts were approved (`true`) or rejected (`false`) for publishing.	46.0

ConnectApi.SocialPostStatus

The status of a social post.

Property Name	Type	Description	Available Version
`message`	String	Status message.	36.0
`type`	`ConnectApi.SocialPostStatusType`	Status type. Values are: • `ApprovalPending` • `ApprovalRecalled` • `ApprovalRejected` • `Deleted` • `Failed` • `Hidden` • `Pending` • `Sent` • `Unknown`	36.0

SEE ALSO:

ConnectApi.SocialPostCapability

ConnectApi.SortRule

Sort rule.

Property Name	Type	Description	Available Version
`direction`	`ConnectApi.CommerceSearchSortRuleDirection`	Direction of the sort rule. Values are: • `Ascending`—Sorts in ascending alphanumeric order (A–Z, 0–9). • `Default`—When no direction is defined, sorts by relevance. • `Descending`—Sorts in descending alphanumeric order (Z–A, 9–0).	52.0
`label`	String	Label of the sort rule.	52.0
`labelSuffix`	`ConnectApi.CommerceSearchSortRuleLabelSuffix`	Label suffix of the sort rule.Values are: • `Ascen`—Label suffix for 'Asc' • `Ascending`—Label suffix for 'Ascending' • `Az`—Label suffix for 'A-Z' • `Descen`—Label suffix for 'Desc' • `Descending`—Label suffix for 'Descending' • `FewMany`—Label suffix for 'Few-Many'	54.0

Property Name	Type	Description	Available Version
		• `HeavyLight`—Label suffix for 'Heavy-Light' • `HighLow`—Label suffix for 'High-Low' • `HighestLowest`—Label suffix for 'Highest-Lowest' • `LightHeavy`—Label suffix for 'Light-Heavy' • `LowHigh`—Label suffix for 'Low-High' • `LowestHighest`—Label suffix for 'Lowest-Highest' • `ManyFew`—Label suffix for 'Many-Few' • `NewOld`—Label suffix for 'New-Old' • `Newest`—Label suffix for 'Newest' • `NewestOldest`—Label suffix for 'Newest-Oldest' • `NineZero`—Label suffix for '9-0' • `OldNew`—Label suffix for 'Old-New' • `Oldest`—Label suffix for 'Oldest' • `OldestNewest`—Label suffix for 'Oldest-Newest' • `PriceDecreasing`—Label suffix for '$$-$' • `PriceIncreasing`—Label suffix for '$-$$' • `ThickThin`—Label suffix for 'Thick-Thin' • `ThinThick`—Label suffix for 'Thin-Thick' • `Za`—Label suffix for 'Z-A' • `ZeroNine`—Label suffix for '0-9'	
`nameOrId`	String	Name of the sort rule field or, if the sort rule is based on a custom field, ID.	52.0
`sortOrder`	Integer	Sort order for the rule. A lower number has higher precedence. The first sort option is called when no other option is selected.	54.0
`sortRuleId`	String	ID of the sort rule.	52.0

Property Name	Type	Description	Available Version
`type`	`ConnectApi.CommerceSearchSortRuleType`	Type of sort rule. Values are: • `ProductAttributeBased`—Sorts by product attribute fields. • `ProductBased`—Sorts by product field data. • `Relevancy`—Sorts by product and catalog term frequency. • `SortByPricebook`—Sorts by product prices defined in the specified pricebook (version 55.0 and later).	52.0

SEE ALSO:

ConnectApi.SortRulesCollection

ConnectApi.SortRulesCollection

Collection of sort rules.

Property Name	Type	Description	Available Version
`sortRules`	List<`ConnectApi.SortRule`>	Collection of sort rules.	52.0

ConnectApi.SpellCorrectionInfo

Spell correction information for object search.

Property Name	Type	Description	Available Version
`correctedQuery`	String	Specifies corrected query.	63.0
`hasNonCorrectedResults`	Boolean	Specifies whether some non-corrected results were returned (`true`) or not (`false`).	63.0

SEE ALSO:

ConnectApi.SearchObject

ConnectApi.Stamp

A user stamp.

Property Name	Type	Description	Available Version
`description`	String	Description of the stamp.	39.0–43.0

Property Name	Type	Description	Available Version
`id`	String	ID of the stamp.	39.0–43.0
`imageUrl`	String	Image URL of the stamp.	39.0–43.0
`label`	String	Label of the stamp.	39.0–43.0

SEE ALSO:

ConnectApi.User

ConnectApi.StatusCapability

If a feed post or comment has this capability, it has a status that determines its visibility.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`feedEntityStatus`	`ConnectApi.FeedEntityStatus`	Status of the feed post or comment. Values are: • `Draft`—The feed post isn't published but is visible to the author and users with Modify All Data or View All Data permission. Comments can't be drafts. • `Isolated`—The feed post or comment is isolated, and only admins can see it. • `PendingReview`—The feed post or comment isn't approved yet and therefore isn't published or visible. • `Published`—The feed post or comment is approved and visible.	37.0
`isApprovableByMe`	Boolean	Specifies whether the context user can change the status of the feed post or comment.	37.0

SEE ALSO:

ConnectApi.CommentCapabilities

ConnectApi.FeedElementCapabilities

ConnectApi.StrategyTrace

Messages and trace nodes for a recommendation strategy execution.

Property Name	Type	Description	Available Version
`messages`	List<String>	Messages and errors from the strategy execution.	45.0

Property Name	Type	Description	Available Version
nodes	List<ConnectApi.StrategyTraceNode>	Nodes of the strategy execution used for debugging.	45.0

SEE ALSO:

ConnectApi.NBARecommendations

ConnectApi.StrategyTraceNode

A trace node for a recommendation strategy execution.

Property Name	Type	Description	Available Version
inputCount	Integer	Number of items put into the node.	45.0
messages	List<String>	Messages that occurred during node execution.	45.0
nodeName	String	Name of the node.	45.0
nodeTime	Long	Time spent processing inside the node.	45.0
nodeType	String	Type of node.	45.0
outputCount	Integer	Number of items returned from the node.	45.0
outputs	List<String>	Recommendations that are returned from the node.	45.0
totalTime	Long	Total time spent processing.	45.0

SEE ALSO:

ConnectApi.StrategyTrace

ConnectApi.SubmitCancelOutputRepresentation

ID of the change order created for a cancel action, and a set of its financial values.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
changeBalances	ConnectApi.ChangeItemOutputRepresentation	Financial values resulting from the cancel.	48.0
changeOrderId	String	ID of the change order created for the canceled order items and shipping charges. Use this change order to create a credit memo.	48.0
feeChangeOrderId	String	ID of the change order created by canceling order items with associated cancel fees. Use this change order to create an invoice.	57.0

ConnectApi.SubmitCartToExchangeOrderOutputRepresentation

Exhange order summary resulting from a submit cart to exchange order action.

Property Name	Type	Description	Available Version
balanceStateExchangeWebCart	ConnectApi.BalanceStatePreviewOutput on page 1985	The balance state preview for the exchange web cart.	Big, 61.0
balanceStateOriginalOrderSummary	ConnectApi.BalanceStatePreviewOutput on page 1985	The balance state preview for the original order summary.	Big, 61.0
balanceStateReturnOrder	ConnectApi.BalanceStatePreviewOutput on page 1985	The balance state preview for the return order.	Big, 61.0
changeBalances	ConnectApi.ChangeItemOutputRepresentation on page 2027	Change order financial values for a preview order action.	Big, 60.0
errors	List<ConnectApi.ErrorResponse>	Any errors that were returned.	Big, 60.0
exchangeOrderSummaryId	String	Exchange order summary ID.	Big, 60.0
orderSummaryId	String	ID of the order summary.	Big, 60.0
success	Boolean	Indicates whether the transaction was successful.	Big, 60.0

ConnectApi.SubmitReturnOutputRepresentation

ID of the change order created for a return action, and a set of its financial values.

Subclass of ConnectApi.BaseOutputRepresentation.

Property Name	Type	Description	Available Version
changeBalances	ConnectApi.ChangeItemOutputRepresentation	Financial values resulting from the return.	48.0
changeOrderId	String	ID of the change order created for the returned order items and shipping charges. Use this change order to create a credit memo.	48.0
feeChangeOrderId	String	ID of the change order created by returning order items with associated return fees. Use this change order to create an invoice.	57.0

ConnectApi.Subscription

Subscription.

Name	Type	Description	Available Version
`community`	`ConnectApi.Reference`	Information about the Experience Cloud site in which the subscription exists.	28.0
`id`	String	Subscription's 18–character ID.	28.0
`subject`	`ConnectApi.Actor`	Information about the parent, that is, the thing or person being followed.	28.0
`subscriber`	`ConnectApi.Actor`	Information about the subscriber, that is, the person following this item.	28.0
`url`	String	Connect REST API URL to this specific subscription.	28.0

SEE ALSO:

ConnectApi.FollowerPage

ConnectApi.FollowingPage

ConnectApi.SubscriptionTermRule

Subscription term rules.

Property Name	Type	Description	Available Version
`increment`	Integer	Number of pricing term units that can be used to increase the subscription term.	59.0
`maximum`	Integer	Maximum number of pricing term units per subscription term.	59.0
`minimum`	Integer	Minimum number of pricing term units per subscription term.	59.0

ConnectApi.SupportedEmojis

A collection of supported emoji.

Property Name	Type	Description	Available Version
`supportedEmojis`	`ConnectApi.EmojiCollection`	A collection of supported emoji.	39.0

ConnectApi.SurveyInvitationEmailOutput

Survey invitation email.

Property Name	Type	Description	Available Version
`errorCode`	Integer	Error code for the failed call.	50.0

Property Name	Type	Description	Available Version
errorMessage	String	Details explaining why the call failed.	50.0
status	ConnectApi.SurveyEmailStatusEnum	Status of a survey invitation email. Values are: • Failed—The survey invitation email wasn't sent. • Queued—The survey invitation email is queued for sending.	50.0

ConnectApi.Target

Personalization target information.

Property Name	Type	Description	Available Version
audience	ConnectApi.AudienceTarget	Audience assigned to the target.	48.0
formulaScope	ConnectApi.FormulaScope	Formula scope of the target.	50.0
groupName	String	Group name of the target. Groups bundle related target and audience pairs.	48.0
id	String	ID of the target.	48.0
priority	Integer	Priority of the target. Within a group, priority determines which target is returned if the user matches more than one audience.	48.0
publishStatus	ConnectApi.PublishStatus	Publish status of the target. Values are: • Draft • Live	48.0
scope	List<ConnectApi.Scope>	List of scopes for the target. In version 50.0 and later, the formulaScope property returns this information.	48.0–49.0
targetType	String	Type of target, indicating the nature of the data being targeted.	48.0
targetValue	String	Value of the target.	48.0
url	String	URL to the target.	48.0

SEE ALSO:

ConnectApi.TargetCollection

ConnectApi.TargetCollection

List of personalization targets.

Property Name	Type	Description	Available Version
`targets`	List<`ConnectApi.Target`>	List of personalization targets.	48.0

ConnectApi.TaxAddressesResponse

The Ship From, Ship To, and Sold To addresses used during tax calculation.

Property Name	Type	Description	Available Version
`shipFrom`	`ConnectApi.TaxAddressResponse`	The Ship From address used in tax calculation.	55.0
`shipTo`	`ConnectApi.TaxAddressResponse`	The Ship To address used in tax calculation.	55.0
`soldTo`	`ConnectApi.TaxAddressResponse`	The Sold To address used in tax calculation.	55.0

ConnectApi.TaxAddressResponse

Location code of an address.

Property Name	Type	Description	Available Version
`locationCode`	String	Location code of an address.	55.0

ConnectApi.TaxAmountDetailsResponse

Information about tax amount values on the line item.

Property Name	Type	Description	Available Version
`exemptAmount`	Double	Amount of the line item exempt from tax application.	55.0
`taxAmount`	Double	Tax amount for the line item.	55.0
`totalAmount`	Double	Total amount of the line item.	55.0
`totalAmountWithTax`	Double	The line item's total amount with tax.	55.0

ConnectApi.TaxDetailsResponse

Tax details for each line item in a tax line item output.

Property Name	Type	Description	Available Version
`exemptAmount`	Double	Amount of the line item that is exempt from taxation.	55.0
`exemptReason`	String	The reason that any tax exemption applied to the line item.	55.0
`imposition`	`ConnectApi.TaxImpositionResponse`	The business justification for applying tax to a line item.	55.0
`jurisdiction`	`ConnectApi.TaxJurisdictionResponse`	Business address used to calculate the tax rate for the line item.	55.0
`rate`	Double	Tax rate for the line item.	55.0
`tax`	Double	Total amount of tax on the line item.	55.0
`taxId`	String	ID for the type of tax applied to the line item.	55.0
`taxableAmount`	Double	Amount of line item that can be taxed.	55.0

ConnectApi.TaxEngineLogResponse

Shows the results of the tax calculation request to the tax engine.

Property Name	Type	Description	Available Version
`createdDate`	Datetime	The date that the gateway log was created.	55.0
`id`	String	ID of the tax engine log record.	55.0
`resultCode`	String	Result code sent from the external tax engine. Review the tax engine provider's documentation for more information about the code.	55.0

ConnectApi.TaxImpositionResponse

Tax imposition output representation.

Property Name	Type	Description	Available Version
`name`	String	Name of the tax imposition.	55.0
`type`	String	Type of the tax imposition.	55.0

ConnectApi.TaxJurisdictionResponse

Represents the address or jurisdiction of the primary business used for calculating tax.

Property Name	Type	Description	Available Version
`country`	String	Country of the tax jurisdiction address.	55.0
`id`	String	ID of the tax jurisdiction address.	55.0
`level`	String	Level of the tax jurisdiction address.	55.0
`name`	String	Name of the tax jurisdiction address.	55.0
`region`	String	Region of the tax jurisdiction address.	55.0
`stateAssignedNo`	String	State-assigned number of the tax jurisdiction address.	55.0

ConnectApi.TaxTransactionResponse

Tax transaction output representation

This class is abstract.

Superclass of ConnectApi.CalculateTaxResponse.

Property Name	Type	Description	Available Version
`addresses`	`ConnectApi.TaxAddressesResponse`	The Ship From, Ship To, and Sold To addresses used during tax calculation.	55.0
`amountDetails`	`ConnectApi.TaxAmountDetailsResponse`	Information about tax amount values on the line item.	55.0
`currencyIsoCode`	String	Three-letter ISO 4217 currency code associated with the payment group record.	55.0
`description`	String	Information about whether the tax transaction failed or was successful.	55.0
`documentCode`	String	Document code.	55.0
`effectiveDate`	Datetime	The date that tax is applied to the taxed entity.	55.0
`lineItems`	List<`ConnectApi.LineItemResponse`>	A list of line items on which tax was calculated.	55.0
`referenceDocumentCode`	String	The original document code. Used in case of subsequent transactions such as credit tax.	55.0
`referenceEntityId`	String	ID of the reference entity used during tax calculation.	55.0
`taxTransactionId`	String	ID of the tax transaction.	55.0

Property Name	Type	Description	Available Version
`transactionDate`	Datetime	The date that the tax transaction occurred.	55.0

ConnectApi.TextClassificationsBulkResultsOutputRepresentation

Text classification to get results for multiple text classification request IDs.

Property Name	Type	Description	Available Version
`resultsList`	[illegible]	List of results for passed request IDs.	**59.0**

ConnectApi.TextClassificationsOutputRepresentation

HTTP headers containing URLs associating text strings and classifications.

Property Name	Type	Description	Available Version
`httpHeaders`	[illegible]	HTTP headers for text classifications output. Each header provides a URL you can use to get the result of the classification. The URL takes a list of text strings and classifiers that each text string can be classified in.	**59.0**

ConnectApi.TextClassificationsResultOutputRepresentation

Text classifications result.

Property Name	Type	Description	Available Version
`classifications`	[illegible]	List of classifications that each text string was given after analysis.	**59.0**
`classificationsId`	String	Response ID to receive feedback for classification.	**59.0**

ConnectApi.TextClassificationsResultWithIdOutputRepresentation

Classified text with status and text classification request IDs.

Property Name	Type	Description	Available Version
`id`	String	Request ID for text classifications.	**59.0**
`result`	[illegible]	Result for text classifications.	**59.0**
`status`	String	Request status for text classification.	**59.0**

ConnectApi.TextSegment

Text segment.

Subclass of ConnectApi.MessageSegment.

No additional properties.

ConnectApi.ThemeInfo

Theme information related to an object.

Property Name	Type	Description	Available Version
`color`	String	Color that represents the object.	63.0
`iconUrl`	String	Icon that represents the object.	63.0

SEE ALSO:

ConnectApi.ObjectMetadata

ConnectApi.TimeZone

User's time zone as selected in the user's personal settings in Salesforce. This value doesn't reflect a device's current location.

Name	Type	Description	Available Version
`gmtOffset`	Double	Signed offset, in hours, from GMT.	30.0
`name`	String	Display name of this time zone.	30.0

SEE ALSO:

ConnectApi.UserSettings

ConnectApi.Topic

Topic.

Name	Type	Description	Available Version
`createdDate`	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z.	29.0
`description`	String	Description of the topic.	29.0
`id`	String	18-character ID.	29.0
`images`	`ConnectApi.TopicImages`	Images associated with the topic.	32.0

Name	Type	Description	Available Version
`isBeingDeleted`	Boolean	`true` if the topic is currently being deleted; `false` otherwise. After the topic is deleted, when attempting to retrieve the topic, the output is NOT_FOUND.	33.0
`name`	String	Name of the topic.	29.0
`nonLocalizedName`	String	Non-localized name of the topic.	36.0
`talkingAbout`	Integer	Number of people talking about this topic over the last two months, based on factors such as topic additions and comments on posts with the topic.	29.0
`url`	String	URL to the topic detail page.	29.0

SEE ALSO:

- ConnectApi.ManagedTopic
- ConnectApi.TopicPage
- ConnectApi.TopicEndorsement
- ConnectApi.TopicEndorsementCollection
- ConnectApi.TopicSuggestion
- ConnectApi.TopicsCapability

ConnectApi.TopicEndorsement

Represents one user endorsing another user for a single topic.

Name	Type	Description	Available Version
`endorsee`	`ConnectApi.UserSummary`	User being endorsed.	30.0
`endorsementId`	String	18-character ID of the endorsement record.	30.0
`endorser`	`ConnectApi.UserSummary`	User performing the endorsement.	30.0
`topic`	`ConnectApi.Topic`	Topic the user is being endorsed for.	30.0
`url`	String	URL to the resource for the endorsement record.	30.0

ConnectApi.TopicEndorsementCollection

Collection of topic endorsement response bodies.

Name	Type	Description	Available Version
currentPageUrl	String	Connect REST API URL identifying the current page.	30.0
nextPageUrl	String	Connect REST API URL identifying the next page, or null if there isn't a next page.	30.0
previousPageUrl	String	Connect REST API URL identifying the previous page, or null if there isn't a previous page.	30.0
topicEndorsements	List<ConnectApi.Topic>	List of topic endorsements.	30.0

ConnectApi.TopicEndorsementSummary

Topic endorsement summary.

Subclass of ConnectApi.UserActivitySummary.

Property Name	Type	Description	Available Version
endorsementId	ID	ID of the topic endorsement.	42.0

ConnectApi.TopicImages

Images associated with a topic.

Property Name	Type	Description	Available Version
coverImageUrl	String	URL to a topic's cover image, which appears on the topic page. Both topics and managed topics can have cover images.	32.0
featuredImageUrl	String	URL to a managed topic's featured image, which appears wherever you feature it, for example, on your Experience Cloud site home page.	32.0

SEE ALSO:

ConnectApi.Topic

ConnectApi.TopicPage

Page of topics.

Name	Type	Description	Available Version
currentPageUrl	String	Connect REST API URL identifying the current page.	29.0

Name	Type	Description	Available Version
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	29.0
`topics`	`List<ConnectApi.Topic>`	List of topics.	29.0

ConnectApi.TopicsCapability

If a feed element has this capability, the context user can add topics to it. Topics help users organize and discover conversations.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`canAssignTopics`	Boolean	`true` if a topic can be assigned to the feed element, `false` otherwise.	32.0
`items`	`List<ConnectApi.Topic>`	A collection of topics associated with this feed element.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.TopicSuggestion

Topic suggestion.

Name	Type	Description	Available Version
`existingTopic`	`ConnectApi.Topic`	Topic that already exists or `null` for a new topic	29.0
`name`	String	Topic name	29.0

SEE ALSO:

ConnectApi.TopicSuggestionPage

ConnectApi.TopicSuggestionPage

Page of topic suggestions.

Name	Type	Description	Available Version
`TopicSuggestions`	`List<ConnectApi.TopicSuggestion>`	List of topic suggestions.	29.0

ConnectApi.TopicSummary

Summary of a topic.

Property Name	Type	Description	Available Version
`id`	String	ID of the topic.	47.0
`name`	String	Name of the topic.	47.0

SEE ALSO:

ConnectApi.ManagedContentAssociations

ConnectApi.TrackedChangeBundleCapability

If a feed element has this capability, it has a group of other feed elements aggregated into one feed element called a *bundle*. This type of bundle aggregates feed tracked changes.

Subclass of ConnectApi.BundleCapability.

Property Name	Type	Description	Available Version
`changes`	List<`ConnectApi.TrackedChangeItem`>	Collection of feed tracked changes.	31.0

ConnectApi.TrackedChangeItem

Tracked change item.

Name	Type	Description	Available Version
`fieldName`	String	The name of the field that was updated.	28.0
`newValue`	String	The new value of the field or `null` if the field length is long.	28.0
`oldValue`	String	The old value of the field or `null` if the field length is long.	28.0

SEE ALSO:

ConnectApi.TrackedChangesCapability

ConnectApi.TrackedChangeBundleCapability

ConnectApi.TrackedChangesCapability

If a feed element has this capability, it contains all changes to a record for a single tracked change event.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
changes	List<ConnectApi.TrackedChangeItem>	Collection of feed tracked changes.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities

ConnectApi.UnauthenticatedUser

Unauthenticated user.

Subclass of ConnectApi.Actor.

No additional properties.

Instances of this class are used as the actor for feed items and comments posted by Chatter customers.

ConnectApi.UnreadConversationCount

Unread count for a conversation.

Name	Type	Description	Available Version
hasMore	Boolean	Specifies if there are more than 50 unread messages (true) or not (false).	29.0
unreadCount	Integer	The total number of unread messages.	29.0

ConnectApi.UpDownVoteCapability

If a feed post or comment has this capability, users can upvote or downvote it.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
downVoteCount	Long	Number of downvotes.	41.0
myVote	ConnectApi.UpDownVoteValue	Specifies the context user's vote. Values are: • Down • None • Up	41.0

Property Name	Type	Description	Available Version
`upVoteCount`	Long	Number of upvotes.	41.0

SEE ALSO:

- ConnectApi.CommentCapabilities
- ConnectApi.FeedElementCapabilities

ConnectApi.UpVoteSummary

Summary of an upvote.

Subclass of ConnectApi.UserFeedEntityActivitySummary.

No additional properties.

ConnectApi.User

User.

This class is abstract.

Subclass of ConnectApi.ActionWithId.

Superclass of:

- ConnectApi.UserDetail
- ConnectApi.UserSummary

Name	Type	Description	Available Version
`additionalLabel`	String	If one exists, an extra label for the user, for example, “Customer,” “Partner,” or “Acme Corporation.”	30.0
`communityNickname`	String	User’s nickname in the site.	32.0
`companyName`	String	Name of the company. If your Experience Cloud site allows access without logging in, the value is `null` for guest users.	28.0
`displayName`	String	User’s name that is displayed in the site. If nicknames are enabled, the nickname is displayed. If nicknames aren’t enabled, the full name is displayed.	32.0
`firstName`	String	User's first name. In version 39.0 and later, if nicknames are enabled, `firstName` is `null`.	28.0
`isChatterGuest`	Boolean	`true` if user is a Chatter customer; `false` otherwise.	28.0
`isInThisCommunity`	Boolean	`true` if user is in the same site as the context user; `false` otherwise.	28.0
`lastName`	String	User's last name. In version 39.0 and later, if nicknames are enabled, `lastName` is `null`.	28.0

Name	Type	Description	Available Version
outOfOffice	ConnectApi.OutOfOffice	If one exists, extra out-of-office message for the user.	40.0
photo	ConnectApi.Photo	Information about the user's photos.	28.0
reputation	ConnectApi.Reputation	Reputation of the user.	32.0
stamps	List<ConnectApi.Stamp>	Collection of the user's stamps. In version 44.0 and later, use SOQL to get a user's stamps.	39.0–43.0
title	String	User's title. If your Experience Cloud site allows access without logging in, the value is `null` for guest users.	28.0
userType	ConnectApi.UserType Enum	Type of user. • ChatterGuest—User is an external user in a private group. • ChatterOnly—User is a Chatter Free customer. • Guest—User is unauthenticated. • Internal—User is a standard org member. • Portal—User is an external user in an Experience Cloud site. • System—User is Chatter Expert or a system user. • Undefined—User is a user type that is a custom object.	28.0

SEE ALSO:

ConnectApi.RecommendationAudience

ConnectApi.UserActivitiesJob

User activities job.

Property Name	Type	Description	Available Version
jobToken	String	Token that identifies the user activities job.	42.0
jobType	String	Type of user activities job. Value is `export` or `purge`.	42.0

Property Name	Type	Description	Available Version
`message`	String	Message describing the status and expected outcome of the job. When the job completes, you receive an email with information about the Salesforce file that contains `ConnectApi.UserActivityCollection`.	42.0

SEE ALSO:

exportUserActivities(communityId, userId)

purgeUserActivities(communityId, userId)

ConnectApi.UserActivityCollection

User activity collection.

Property Name	Type	Description	Available Version
`activityType`	String	Type of user activity. Values are: • `Bookmark`—User bookmarked a post. • `ChatterActivity`—Total counts of posts and comments made and likes and comments received for a user. • `ChatterLike`—User liked a post or comment. • `Comment`—User commented on a post. • `CompanyVerify`—User verified comment. • `DownVote`—User downvoted a post or comment. • `FeedEntityRead`—User read a post. • `FeedRead`—User read a feed. • `Mute`—User muted a post. • `Post`—User made a post. • `TopicEndorsement`—User endorsed another user on a topic or received endorsement on a topic. • `UpVote`—User upvoted a post or comment.	42.0
`userActivities`	List<`ConnectApi.UserActivitySummary`>	Collection of user activities.	42.0

SEE ALSO:

ConnectApi.UserActivitiesJob

ConnectApi.UserActivitySummary

User activity summary.

This class is abstract.

Superclass of:

- ConnectApi.CommentSummary
- ConnectApi.FeedPostSummary
- ConnectApi.FeedReadSummary
- ConnectApi.TopicEndorsementSummary
- ConnectApi.UserFeedEntityActivitySummary

Property Name	Type	Description	Available Version
`activityDate`	Datetime	Date of the user activity.	42.0
`activityType`	String	Type of user activity. Values are: • `Bookmark`—User bookmarked a post. • `ChatterActivity`—Total counts of posts and comments made and likes and comments received for a user. • `ChatterLike`—User liked a post or comment. • `Comment`—User commented on a post. • `CompanyVerify`—User verified comment. • `DownVote`—User downvoted a post or comment. • `FeedEntityRead`—User read a post. • `FeedRead`—User read a feed. • `Mute`—User muted a post. • `Post`—User made a post. • `TopicEndorsement`—User endorsed another user on a topic or received endorsement on a topic. • `UpVote`—User upvoted a post or comment.	42.0
`activityUrl`	String	URL to the user activity.	42.0
`community`	`ConnectApi.CommunitySummary`	Experience Cloud site in which the user performed the activity.	42.0

SEE ALSO:

ConnectApi.UserActivityCollection

ConnectApi.UserCapabilities

Capabilities associated with a user profile.

Name	Type	Description	Available Version
`canChat`	Boolean	Specifies if the context user can use Chatter Messenger with the subject user (`true`) or not (`false`)	29.0
`canDirectMessage`	Boolean	Specifies if the context user can direct message the subject user (`true`) or not (`false`)	29.0
`canEdit`	Boolean	Specifies if the context user can edit the subject user's account (`true`) or not (`false`)	29.0
`canFollow`	Boolean	Specifies if the context user can follow the subject user's feed (`true`) or not (`false`)	29.0
`canViewFeed`	Boolean	Specifies if the context user can view the feed of the subject user (`true`) or not (`false`)	29.0
`canViewFullProfile`	Boolean	Specifies if the context user can view the full profile of the subject user (`true`) or only the limited profile (`false`)	29.0
`isModerator`	Boolean	Specifies if the subject user is a Chatter moderator or admin (`true`) or not (`false`)	29.0

SEE ALSO:

ConnectApi.UserProfile

ConnectApi.UserChatterSettings

User's global Chatter settings.

Name	Type	Description	Available Version
`defaultGroupEmailFrequency`	`ConnectApi.GroupEmailFrequency` Enum	The default frequency with which a user receives email from a group when they join it.	28.0

ConnectApi.UserDetail

Details about a user in an org.

Subclass of ConnectApi.User.

If the context user doesn't have permission to see a property, its value is set to `null`.

Name	Type	Description	Available Version
`aboutMe`	String	Text from user's profile.	28.0

Name	Type	Description	Available Version
address	ConnectApi.Address	User's address.	28.0
bannerPhoto	ConnectApi.BannerPhoto	User's banner photo.	36.0
chatterActivity	ConnectApi.ChatterActivity	Chatter activity statistics.	28.0
chatterInfluence	ConnectApi.GlobalInfluence	User's influence rank.	28.0
email	String	User's email address.	28.0
followersCount	Integer	Number of users following this user.	28.0
followingCounts	ConnectApi.FollowingCounts	Information about items the user is following.	28.0
groupCount	Integer	Number of groups user is following.	28.0
hasChatter	Boolean	`true` if user has access to Chatter; `false` otherwise.	31.0
isActive	Boolean	`true` if user is active; `false` otherwise.	28.0
managerId	String	18-character ID of the user's manager.	28.0
managerName	String	Locale-based concatenation of manager's first and last names.	28.0
phoneNumbers	List<ConnectApi.PhoneNumber>	Collection of user's phone numbers.	28.0
thanksReceived	Integer	The number of times the user has been thanked.	29.0
username	String	Username of the user, such as *Admin@mycompany.com*.	28.0

SEE ALSO:

- ConnectApi.UserPage
- ConnectApi.UserProfile

ConnectApi.UserFeedEntityActivitySummary

User feed entity activity summary.

This class is abstract.

Subclass of ConnectApi.UserActivitySummary.

Superclass of:

- ConnectApi.BookmarkSummary
- ConnectApi.ChatterActivitySummary
- ConnectApi.CompanyVerifySummary

- ConnectApi.DownVoteSummary
- ConnectApi.FeedEntityReadSummary
- ConnectApi.LikeSummary
- ConnectApi.MuteSummary
- ConnectApi.UpVoteSummary

Property Name	Type	Description	Available Version
`feedEntityId`	String	ID of the feed entity.	42.0

ConnectApi.UserGroupDetailPage

A page of groups that a user is a member of.

Property Name	Type	Description	Available Version
`currentPageUrl`	String	URL to the current page.	45.0
`groups`	List<`ConnectApi.ChatterGroupDetail`>	Collection of groups that the user is a member of.	45.0
`nextPageUrl`	String	URL to the next page, or `null` if there is no next page.	45.0
`previousPageUrl`	String	URL to the previous page, or `null` if there is no previous page.	45.0
`total`	Integer	Total number of groups that the user is a member of.	45.0

ConnectApi.UserGroupPage

A paginated list of groups the context user is a member of.

Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	28.0
`groups`	`List<ConnectApi.ChatterGroupSummary>`	List of groups.	28.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	28.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	28.0
`total`	Integer	Total number of groups across all pages.	28.0

ConnectApi.UserMission

Mission details for a user.

Subclass of ConnectApi.AbstractUserMissionActivity.

Property Name	Type	Description	Available Version
`missionName`	String	Name of the mission.	46.0
`missionThreshold`	Integer	Threshold of the mission. When a user reaches this activity count, the mission is achieved.	46.0

ConnectApi.UserMissionActivitiesJob

User mission activities job.

Property Name	Type	Description	Available Version
`jobToken`	String	Token that identifies the mission user activities job.	45.0
`jobType`	String	Type of user activities job, either `export` or `purge`.	45.0
`message`	String	Message describing the status and expected outcome of the job. When the job completes, you receive an email with information about the Salesforce file that contains `ConnectApi.UserMissionActivityCollection`.	45.0

ConnectApi.UserMissionActivity

User activity associated with missions.

Subclass of ConnectApi.AbstractUserMissionActivity.

No additional properties.

ConnectApi.UserMissionActivityCollection

List of mission activities for a user.

Property Name	Type	Description	Available Version
`community`	`ConnectApi.CommunitySummary`	Experience Cloud site in which the user performed activities.	45.0
`userId`	String	ID of the user.	45.0
`userMissionActivities`	List<`ConnectApi.AbstractUserMissionActivity`>	List of mission activities performed by the user.	45.0

Property Name	Type	Description	Available Version
`userName`	String	Name of the user.	45.0

SEE ALSO:

ConnectApi.UserMissionActivitiesJob

ConnectApi.UserMissionActivityStatus

Status of mission activity for a user.

Property Name	Type	Description	Available Version
`message`	String	Success or error message.	45.0
`status`	String	Status of mission activity for a user.	45.0

ConnectApi.UserOauthInfo

User OAuth information.

Name	Type	Description	Available Version
`availableExternalEmailService`	`Connect.OauthProviderInfo`	The available OAuth service provider.	37.0
`isAuthenticated`	Boolean	Specifies whether the user is authenticated (`true`) or not (`false`).	37.0

ConnectApi.UserPage

Page of users.

Name	Type	Description	Available Version
`currentPageToken`	Integer	Token identifying the current page.	28.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	28.0
`nextPageToken`	Integer	Token identifying the next page, or `null` if there isn't a next page.	28.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	28.0
`previousPageToken`	Integer	Token identifying the previous page, or `null` if there isn't a previous page.	28.0
`previousPageUrl`	String	Connect REST API URL identifying the previous page, or `null` if there isn't a previous page.	28.0

Name	Type	Description	Available Version
users	List<ConnectApi.UserDetail>	List of user detail information. If the context user doesn't have permission to see a property, the property is set to null.	28.0

ConnectApi.UserProfile

Details necessary to render a view of a user profile.

Name	Type	Description	Available Version
capabilities	ConnectApi.UserCapabilities	The context user's capabilities specific to the subject user's profile.	29.0
id	String	The ID of the user attached to the profile.	29.0
tabs	List<ConnectApi.UserProfileTab>	The tabs visible to the context user specific to the subject user's profile.	29.0
url	String	The URL of the user's profile.	29.0
userDetail	ConnectApi.UserDetail	The details about the user attached to the profile.	29.0

ConnectApi.UserProfileTab

Information about a profile tab.

Name	Type	Descriptio	Available Version
id	String	The tab's unique identifier or 18–character ID	29.0
isDefault	Boolean	Specifies if the tab appears first when clicking the user profile (true) or not (false)	29.0
tabType	ConnectApi.UserProfileTabType Enum	Specifies the type of tab • CustomVisualForce—Tab that displays data from a Visualforce page. • CustomWeb—Tab that displays data from any external web-based application or web page. • Element—Tab that displays generic content inline. • Feed—Tab that displays the Chatter feed. • Overview—Tab that displays user details.	29.0

Name	Type	Descriptio	Available Version
`tabUrl`	String	The current tab's content URL (for non built-in tab types)	29.0

SEE ALSO:

ConnectApi.UserProfile

ConnectApi.UserReferencePage

A list of user references.

Property Name	Type	Description	Available Version
`currentPageUrl`	String	URL to the current page.	35.0
`nextPageUrl`	String	URL to the next page.	35.0
`previousPageUrl`	String	URL to the previous page.	35.0
`userCount`	Integer	Number of users in the collection.	35.0
`users`	List<`ConnectApi.Reference`>	A collection of user references.	35.0

SEE ALSO:

ConnectApi.CustomListAudienceCriteria

ConnectApi.UserSettings

Settings specific to a user.

Property	Type	Description	Available Version
`approvalPosts`	Boolean	User can approve workflows from Chatter posts.	28.0
`canAccessPersonalStreams`	Boolean	User can access personal stream feeds.	40.0
`canFollow`	Boolean	User can follow users and records.	28.0
`canModifyAllData`	Boolean	User has Modify all Data permission.	28.0
`canOwnGroups`	Boolean	User can own groups.	28.0
`canViewAllData`	Boolean	User has View all Data permission.	28.0
`canViewAllGroups`	Boolean	User has View all Groups permission.	28.0

Property	Type	Description	Available Version
`canViewAllUsers`	Boolean	User has View all Users permission.	28.0
`canViewCommunitySwitcher`	Boolean	User can see the site switcher menu.	34.0
`canViewFullUserProfile`	Boolean	User can see other user's Chatter profile.	28.0
`canViewPublicFiles`	Boolean	User can see all files that are public.	28.0
`currencySymbol`	String	Currency symbol to use for displaying currency values. Applicable only when the `ConnectApi.Features.multiCurrency` property is `false`.	28.0
`externalUser`	Boolean	User is a Chatter customer.	28.0
`fileSyncLimit`	Integer	Maximum number of files user can sync.	32.0
`fileSyncStorageLimit`	Integer	Maximum storage for synced files, in megabytes (MB).	29.0
`folderSyncLimit`	Integer	Maximum number of folders user can sync.	32.0
`hasAccessToInternalOrg`	Boolean	User is a member of the internal org.	28.0
`hasChatter`	Boolean	User has access to Chatter.	31.0
`hasFileSync`	Boolean	User has Sync Files permission.	28.0
`hasFieldServiceLocationTracking`	Boolean	User has Field Service GPS tracking enabled.	41.0
`hasFieldServiceMobileAccess`	Boolean	User has access to the Field Service mobile app.	41.0
`hasFileSyncManagedClientAutoUpdate`	Boolean	Administrator for the user's org allows file sync clients to update automatically.	34.0
`hasRestDataApiAccess`	Boolean	User has access to REST API.	29.0
`timeZone`	`ConnectApi.TimeZone`	The user's time zone as selected in the user's personal settings in Salesforce. This value does not reflect a device's current location.	30.0
`userDefaultCurrencyIsoCode`	String	The ISO code for the default currency. Applicable only when the `ConnectApi.Features.multiCurrency` property is `true`.	28.0
`userId`	String	18-character ID of the user.	28.0

Property	Type	Description	Available Version
`userLocale`	String	Locale of user.	28.0

SEE ALSO:

ConnectApi.OrganizationSettings

ConnectApi.UserSummary

User summary.

Subclass of ConnectApi.User.

Name	Type	Description	Available Version
`isActive`	Boolean	`true` if user is active; `false` otherwise.	28.0

ConnectApi.VerifiedCapability

If a comment has this capability, users with permission can mark it as verified or unverified.

Subclass of ConnectApi.FeedElementCapability.

Property Name	Type	Description	Available Version
`isVerifiableByMe`	Boolean	Specifies whether the context user has permission to mark comments as verified or unverified (`true`) or not (`false`).	41.0
`isVerified`	Boolean	Specifies whether the comment is marked as verified (`true`) or not (`false`).	41.0
`isVerifiedBy Anonymized`	Boolean	Specifies whether the comment is marked as verified by an anonymous user (`true`) or not (`false`). If the comment has never been marked as verified or unverified, `null`. Also `null` if the context user doesn't have permission to mark comments as verified or unverified.	43.0
`lastVerifiedByUser`	`ConnectApi.UserSummary`	User who last marked the comment as verified or unverified, otherwise `null`. Also `null` if the context user doesn't have permission to mark comments as verified or unverified.	41.0
`lastVerifiedDate`	Datetime	Date when the comment was last marked as verified or unverified, otherwise `null`. Also `null` if the context user doesn't have permission to mark comments as verified or unverified.	41.0

SEE ALSO:

ConnectApi.CommentCapabilities

ConnectApi.Vote

An upvote or downvote on a feed element or comment.

Property Name	Type	Description	Available Version
`type`	`ConnectApi. UpDownVoteValue`	Type of vote for a feed element or comment. • `Down` • `Up`	42.0
`user`	`ConnectApi. UserSummary`	User who voted on the feed element or comment.	42.0

Property Name	Type	Description	Available Version
votedItem	ConnectApi.Reference	Reference to the feed element or comment that was voted on.	42.0

SEE ALSO:

ConnectApi.VotePage

ConnectApi.VotePage

A page of upvotes or downvotes on a feed element or comment.

Property Name	Type	Description	Available Version
currentPageToken	Integer	Token identifying the current page.	42.0
currentPageUrl	String	Connect REST API URL identifying the current page.	42.0
items	List<ConnectApi.Vote>	Collection of users and their upvotes or downvotes. Upvotes include likes and upvotes. For example, if a post receives five likes and three upvotes, the number of upvotes is eight. For this reason, the collection of users and their upvotes also includes users who liked the post or comment. If a user both liked and upvoted a post, they appear only once in the collection.	42.0
nextPageToken	Integer	Token identifying the next page, or null if there isn't a next page.	42.0
nextPageUrl	String	Connect REST API URL identifying the next page, or null if there isn't a next page.	42.0
previousPageToken	Integer	Token identifying the previous page, or null if there isn't a previous page.	42.0
previousPageUrl	String	Connect REST API URL identifying the previous page, or null if there isn't a previous page.	42.0
total	Long	Total number of upvotes or downvotes for the feed element or comment. The number of upvotes includes the number of likes and upvotes. For example, if a post receives five likes and three upvotes, the total number of upvotes is eight. If a user both liked and upvoted a post, we count that as two upvotes.	42.0

ConnectApi.Wishlist

Wishlist, including summary and items.

Property Name	Type	Description	Available Version
page	ConnectApi.WishlistItemCollection	Page of wishlist items.	49.0
summary	ConnectApi.WishlistSummary	Summary of the wishlist.	49.0

SEE ALSO:

ConnectApi.WishlistsSummary

ConnectApi.WishlistItem

Item in a wishlist.

Property Name	Type	Description	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the product.	49.0
error	ConnectApi.ErrorResponse	Error information.	49.0
listPrice	Double	List price of the wishlist item.	49.0
productSummary	ConnectApi.CartItemProduct	Product summary for the wishlist item.	49.0
salesPrice	Double	Sales price of the wishlist item.	49.0
wishlistItemId	String	ID of the wishlist item.	49.0

SEE ALSO:

ConnectApi.WishlistItemCollection

ConnectApi.WishlistItemCollection

Collection of wishlist items.

Property Name	Type	Description	Available Version
currencyIsoCode	String	Three-letter ISO 4217 currency code associated with the product.	49.0
currentPageToken	String	Token identifying the current page.	49.0
currentPageUrl	String	Connect REST API URL identifying the current page.	49.0
hasErrors	Boolean	Specifies whether at least one of the results contains an error (`true`) or not (`false`).	49.0

Property Name	Type	Description	Available Version
items	List<ConnectApi.WishlistItem>	Collection of wishlist items.	49.0
nextPageToken	String	Token identifying the next page, or null if there isn't a next page.	49.0
nextPageUrl	String	Connect REST API URL identifying the next page, or null if there isn't a next page.	49.0
previousPageToken	String	Token identifying the previous page, or null if there isn't a previous page.	49.0
previousPageUrl	String	Connect REST API URL identifying the previous page, or null if there isn't a previous page.	49.0

SEE ALSO:

ConnectApi.Wishlist

ConnectApi.WishlistsSummary

List of wishlist summaries and the displayed list for the context user.

Property Name	Type	Description	Available Version
displayedList	ConnectApi.Wishlist	Oldest wishlist displayed for the context user.	49.0
summaries	List<ConnectApi.WishlistSummary>	Summary of wishlists belonging to the context user.	49.0
wishlistCount	Integer	Total number of wishlists belonging to the context user.	49.0

ConnectApi.WishlistSummary

Summary of a wishlist.

Property Name	Type	Description	Available Version
createdDate	Datetime	Created date for the wishlist in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.	49.0
id	String	ID of the wishlist.	49.0
modifiedDate	Datetime	Last modified date of the wishlist in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.	49.0
name	String	Name of the wishlist.	49.0

Property Name	Type	Description	Available Version
`wishlistProductCount`	Integer	Unique product count in the wishlist.	49.0

SEE ALSO:

- ConnectApi.Wishlist
- ConnectApi.WishlistsSummary

ConnectApi.WishlistToCartResult

Result of adding a wishlist to a cart.

Property Name	Type	Description	Available Version
`cartId`	String	ID of the cart to which the products were added.	49.0
`failedWishlistToCartItems`	List<`ConnectApi.CartItemResult`>	Wishlist items that weren't successfully added to the cart.	49.0
`productsFailedCount`	Integer	Total number of products that weren't added to the cart.	49.0
`productsRequestedCount`	Integer	Total number of products requested to add to the cart.	49.0
`productsSucceededCount`	Integer	Total number of products that were successfully added to the cart.	49.0
`succeededWishlistToCartItems`	List<`ConnectApi.CartItemResult`>	Wishlist items that were successfully added to the cart.	49.0

ConnectApi.WrappedMapObject

Map of a parameter name and value.

Property Name	Type	Description	Available Version
`wrappedMap`	Map<String, Object>	Map of parameter name and value.	60.0

ConnectApi.Zone

Information about a Chatter Answers zone.

Name	Type	Description	Available Version
`description`	String	The description of the zone.	29.0
`id`	String	The zone ID.	29.0

Name	Type	Description	Available Version
`isActive`	Boolean	Indicates whether or not the zone is active.	29.0
`isChatterAnswers`	Boolean	Indicates whether or not the zone is available for Chatter Answers.	29.0
`name`	String	Name of the zone.	29.0
`url`	String	The URL of the zone.	30.0
`visibility`	`ConnectApi.ZoneShowIn`	Zone visibility type. • `Community`—Available in an Experience Cloud site. • `Internal`—Available internally only. • `Portal`—Available in a portal.	29.0
`visibilityId`	String	If the zone is available in a site, this property contains the ID of the site. If the zone is available to all sites, this property contains the value `All`.	29.0

SEE ALSO:

ConnectApi.ZonePage

ConnectApi.ZonePage

Page of zones.

Name	Type	Description	Available Version
`zones`	`List<ConnectApi.Zone>`	A list of one or more zones.	29.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	29.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	29.0

ConnectApi.ZoneSearchPage

Page of zone search results.

Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	29.0

Name	Type	Description	Available Version
`currentPageUrl`	String	Connect REST API URL identifying the current page.	29.0
`items`	`List<ConnectApi.ZoneSearchResult>`	List of search results.	29.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	29.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	29.0

ConnectApi.ZoneSearchResult

Information about a specific zone search result.

Name	Type	Description	Available Version
`hasBestAnswer`	Boolean	Indicates if the search result has a best answer.	29.0
`id`	String	ID of the search result. The search result can be a question or an article.	29.0
`title`	String	Title of the search result.	29.0
`type`	`ConnectApi.ZoneSearchResultType` Enum	Specifies the zone search result type. • `Article`—Search results contain only articles. • `Question`—Search results contain only questions.	29.0
`voteCount`	String	Number of votes given to the search result.	29.0

SEE ALSO:

ConnectApi.ZoneSearchPage

Retired `ConnectApi` Output Classes

These `ConnectApi` output classes are retired.

IN THIS SECTION:

ConnectApi.ApprovalAttachment
Attach an approval to a feed item.

ConnectApi.BasicTemplateAttachment
Attachments in feed items with type `BasicTemplate`.

ConnectApi.CanvasTemplateAttachment

Attachments in feed items with type `CanvasPost`.

ConnectApi.CaseComment

Attachments in feed items with type `CaseCommentPost`.

ConnectApi.ContentAttachment

Attachments in feed items with the type `ContentPost`.

ConnectApi.DashboardComponentAttachment

Attachments in feed items with type `DashboardSnapshot`.

ConnectApi.DatacloudCompany

Information about a Data.com company.

ConnectApi.DatacloudCompanies

Lists all companies that were purchased in a specific order, page URLs, and the number of companies in the order.

ConnectApi.DatacloudContact

Information about a Data.com contact.

ConnectApi.DatacloudContacts

Lists all contacts that were purchased in the specific order, page URLs, and the number of contacts in the order.

ConnectApi.DatacloudOrder

Represents a Datacloud order.

ConnectApi.DatacloudPurchaseUsage

Information about Data.com point usage for monthly and list pool users.

ConnectApi.EmailMessage

Email message from a case.

ConnectApi.FeedItemAttachment

Feed item attachment.

ConnectApi.FeedItemPage

A paged collection of `ConnectApi.FeedItem` objects.

ConnectApi.FeedItemTopicPage

Feed item topic page.

ConnectApi.FeedPoll

Attachment of `ConnectApi.FeedItem` objects where the `type` property is `PollPost`.

ConnectApi.LinkAttachment

Link attached to a feed item.

ConnectApi.NonEntityRecommendation

A recommendation for a non-Salesforce entity, such as an application.

ConnectApi.RecordSnapshotAttachment

Fields of a record at the point in time when the record was created.

ConnectApi.TrackedChangeAttachment

Tracked change attachment to a feed item.

ConnectApi.ApprovalAttachment

Attach an approval to a feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.ApprovalCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Name	Type	Description	Available Version
`id`	String	A work item ID.	28.0–31.0
`postTemplateFields`	`List<ConnectApi.ApprovalPostTemplateField>`	Collection of approval post template fields	28.0–31.0
`processInstanceStepId`	String	An approval step ID.	30.0–31.0
`status`	`ConnectApi.WorkflowProcessStatus` Enum	Status of a workflow process. • `Approved` • `Fault` • `Held` • `NoResponse` • `Pending` • `Reassigned` • `Rejected` • `Removed` • `Started`	28.0–31.0

ConnectApi.BasicTemplateAttachment

Attachments in feed items with type `BasicTemplate`.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.EnhancedLinkCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Property	Type	Description	Available Version
`description`	String	An optional description with a 500 character limit.	28.0–31.0
`icon`	`ConnectApi.Icon`	An optional icon.	28.0–31.0
`linkRecordId`	String	If `linkURL` refers to a Salesforce record, `linkRecordId` contains the ID of the record.	28.0–31.0

Property	Type	Description	Available Version
`linkUrl`	String	An optional URL to a detail page if there is more content that can't be displayed inline. Do not specify `linkUrl` unless you specify a `title`.	28.0–31.0
`title`	String	An optional title to the detail page. If `linkUrl` is specified, the title links to `linkUrl`.	28.0–31.0

ConnectApi.CanvasTemplateAttachment

Attachments in feed items with type `CanvasPost`.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.CanvasCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Property	Type	Description	Available Version
`description`	String	Optional. Description of the canvas app. The maximum length of this field is 500 characters.	29.0–31.0
`developerName`	String	Specifies the developer name (API name) of the canvas app.	29.0–31.0
`height`	String	Optional. The height of the canvas app in pixels. Default height is 200 pixels.	29.0–31.0
`icon`	ConnectApi.Icon	The canvas app icon.	29.0–31.0
`namespacePrefix`	String	Optional. The namespace prefix of the Developer Edition organization in which the canvas app was created.	29.0–31.0
`parameters`	String	Optional. Parameters passed to the canvas app in JSON format. Example: `{'isUpdated'='true'}`	29.0–31.0
`thumbnailUrl`	String	Optional. A URL to a thumbnail image for the canvas app. Maximum dimensions are 120x120 pixels.	29.0–31.0
`title`	String	Specifies the title of the link used to call the canvas app.	29.0–31.0

ConnectApi.CaseComment

Attachments in feed items with type `CaseCommentPost`.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.CaseCommentCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Name	Type	Description	Available Version
`actorType`	`ConnectApi.CaseActorType` Enum	Type of user who made the comment. • `Customer`—if a Chatter customer made the comment • `CustomerService`—if a service representative made the comment	28.0–31.0
`createdBy`	`ConnectApi.UserSummary`	Comment's creator	28.0–31.0
`createdDate`	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z	28.0–31.0
`id`	String	Comment's 18–character ID	28.0–31.0
`published`	Boolean	Specifies whether the comment has been published	28.0–31.0
`text`	String	Comment's text	28.0–31.0

ConnectApi.ContentAttachment

Attachments in feed items with the type `ContentPost`.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.ContentCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Name	Type	Description	Available Version
`checkSum`	String	MD5 checksum for the file.	28.0–31.0
`contentUrl`	String	URL for link files and Google Docs; otherwise the value is `null`.	31.0–31.0
`description`	String	Description of the attachment.	28.0–31.0
`downloadUrl`	String	File's URL. This value is `null` if the content is a link or a Google Doc.	28.0–31.0
`fileExtension`	String	File's extension.	28.0–31.0
`fileSize`	String	Size of the file in bytes. If size cannot be determined, returns `unknown`.	28.0–31.0
`fileType`	String	Type of file.	28.0–31.0
`hasImagePreview`	Boolean	`true` if the file has a preview image available, otherwise ,`false`.	28.0–29.0
`hasPdfPreview`	Boolean	`true` if the file has a PDF preview available, otherwise, `false`.	28.0–31.0
`id`	String	Content's 18-character ID.	28.0–31.0
`isInMyFileSync`	Boolean	`true` if the file is synced with Salesforce Files Sync; `false` otherwise. **Note:** Salesforce Files Sync was retired on May 25, 2018.	28.0–31.0

Name	Type	Description	Available Version
`mimeType`	String	File's MIME type.	28.0–31.0
`renditionUrl`	String	URL to the file's rendition resource.	28.0–31.0
`renditionUrl240By180`	String	URL to the 240 x 180 rendition resource for the file.For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	30.0–31.0
`renditionUrl720By480`	String	URL to the 720 x 480 rendition resource for the file.For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	30.0–31.0
`textPreview`	String	Text preview of the file if available; `null` otherwise.	30.0–31.0
`thumb120By90RenditionStatus`	String	Specifies the rendering status of the 120 x 90 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	30.0–31.0
`thumb240By180RenditionStatus`	String	Specifies the rendering status of the 240 x 180 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	30.0–31.0
`thumb720By480RenditionStatus`	String	Specifies the rendering status of the 720 x 480 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	30.0–31.0
`title`	String	Title of the file.	28.0–31.0
`versionId`	String	18-character ID for this version of the content.	28.0–31.0

ConnectApi.DashboardComponentAttachment

Attachments in feed items with type `DashboardSnapshot`.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.DashboardComponentSnapshotCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Name	Type	Description	Available Version
componentId	String	Component's 18–character ID.	28.0–31.0
componentName	String	Name of the component. If no name is saved with the component, returns the localized string, "Untitled Component.".	28.0–31.0
dashboardBodyText	String	Text displayed next to the actor in the body of a feed item. This is used instead of the default body text. If no text is specified, and there is no default body text, returns null.	28.0–31.0
dashboardId	String	Dashboard's 18–character ID.	28.0–31.0
dashboardName	String	Name of the dashboard.	28.0–31.0
fullSizeImageUrl	String	URL of the full-sized dashboard image.	28.0–31.0
lastRefreshDate	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z, specifying when this dashboard was last refreshed.	28.0–31.0
lastRefreshDate DisplayText	String	The text of the last refresh date to be displayed, such as, "Last refreshed on October 31, 2011."	28.0–31.0
runningUser	ConnectApi. User Summary	The user running the dashboard.	28.0–31.0
thumbnailUrl	String	URL of the thumbnail-sized dashboard image.	28.0–31.0

ConnectApi.DatacloudCompany

Information about a Data.com company.

All company information is visible for companies that you purchased and own. If you haven't purchased a company, some of the fields are hidden. Hidden fields are fully or partially hidden by asterisks "***."

Property Name	Type	Description	Available Version
activeContacts	Integer	The number of active Data.com contacts who work in the company.	32.0
address	ConnectApi.Address	The postal address for the company. This is typically a physical address that can include the city, state, street, and postal code.	32.0
annualRevenue	Double	The amount of money that the company makes in one year. Annual revenue is measured in US dollars.	32.0
companyId	String	A unique numerical identifier for the company. This is the Data.com identifier for a company.	32.0

Property Name	Type	Description	Available Version
`description`	String	A brief synopsis of the company that provides a general overview of the company and what it does.	32.0
`dunsNumber`	String	A randomly generated nine-digit number that's assigned by Dun & Bradstreet (D&B) to identify unique business establishments.	32.0
`industry`	String	A description of the type of industry such as "Telecommunications," "Agriculture," or "Electronics."	32.0
`isInactive`	Boolean	Indicates whether this company is active (true) or not (false). Inactive companies have out-of-date information in Data.com.	32.0
`isOwned`	Boolean	• True: You or your organization owns this company. • False: Neither you nor your organization owns this company.	32.0
`naicsCode`	String	North American Industry Classification System (NAICS) codes were created to provide more details about a business's service orientation. The code descriptions are focused on what a business does.	32.0
`naicsDescription`	String	A description of the NAICS classification.	32.0
`name`	String	The name of the company.	32.0
`numberOf Employees`	Integer	The number of employees who are working for the company.	32.0
`ownership`	String	The type of ownership of the company: • Public • Private • Government • Other	32.0
`phoneNumbers`	ConnectApi.PhoneNumber	The list of telephone numbers for the company, including the type. Here are some possible types of telephone numbers. • Mobile • Work • Fax	32.0

Property Name	Type	Description	Available Version
`sic`	String	Standard Industrial Codes (SIC) is a numbering convention that indicates what type of service a business provides. It's a four-digit value.	32.0
`sicDescription`	String	A description of the SIC classification.	32.0
`site`	String	Company's site. For example, HQ, Single Location, or Branch. An organization status of the company. • Branch: a secondary location to a headquarter location. • Headquarter: the parent company has branches or subsidiaries. • Single Location: a single business with no subsidiaries or branches.	32.0
`tickerSymbol`	String	The symbol that uniquely identifies companies that are traded on public stock exchanges.	32.0
`tradeStyle`	String	A legal name under which a company conducts business.	32.0
`updatedDate`	Datetime	The date of the most recent change to this company's information.	32.0
`website`	String	The standard URL for the company's home page.	32.0
`yearStarted`	String	The year when the company was founded.	32.0

ConnectApi.DatacloudCompanies

Lists all companies that were purchased in a specific order, page URLs, and the number of companies in the order.

Property Name	Type	Description	Available Version
`companies`	ConnectApi.DatacloudCompany	A detailed list of companies that were part of a single order.	32.0
`currentPageUrl`	String	The URL for the current page of a list of companies.	32.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	32.0
`previousPageUrl`	String	The URL to the previous page of companies that were viewed before the current page. If this value is `null`, there's no previous page.	32.0

Property Name	Type	Description	Available Version
total	Integer	The number of companies in the order. You can calculate the number of pages to display by dividing this number by your page size. The default page size is 25.	32.0

ConnectApi.DatacloudContact

Information about a Data.com contact.

All contact information is visible for contacts that you purchased. If you have not purchased a contact, some of the fields will be hidden. Hidden fields are fully or partially hidden by asterisks "***."

Property Name	Type	Description	Available Version
address	ConnectApi.Address	The contact's business address.	32.0
companyId	String	A unique numerical identifier for the company where the contact works. This is the Data.com identifier for a company.	32.0
companyName	String	The company name where the contact works.	32.0
contactId	String	A unique numerical identifier for the contact. This is the Data.com identifier for a contact.	32.0
department	String	The department in the company where the contact works. Here are some possible departments. • Engineering • IT • Marketing • Sales	32.0
email	String	The most current business email address for the contact.	32.0
firstName	String	The first name of the contact.	32.0
isInactive	Boolean	Whether this contact is active (true) or not (false). Inactive contacts have out-of-date information in Data.com.	32.0
isOwned	Boolean	Whether this contact is owned (true) or not (false).	32.0
lastName	String	The last name of the contact.	32.0
level	String	A human resource label that designates a person's level in the company. Here are some possible levels. • C-Level	32.0

Property Name	Type	Description	Available Version
		• Director • Manager • Staff	
`phoneNumbers`	ConnectApi.PhoneNumber	Telephone numbers for the contact, which can include direct-dial business telephone numbers, mobile telephone numbers, and business headquarters telephone numbers. The type of telephone number is also indicated.	32.0
`title`	String	The title of the contact, such as CEO or Vice President.	32.0
`updatedDate`	Datetime	The date of the most recent change to this contact's information.	32.0

SEE ALSO:

ConnectApi.DatacloudContacts

ConnectApi.DatacloudContacts

Lists all contacts that were purchased in the specific order, page URLs, and the number of contacts in the order.

Property Name	Type	Description	Available Version
`contacts`	List<ConnectApi.DatacloudContact>	A detailed list of purchased contacts.	32.0
`currentPageUrl`	String	URL to the current page of contacts.	32.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	32.0
`previousPageUrl`	String	URL to the previous page of contacts. This value is null if there is no previous page.	32.0
`total`	Integer	Number of contacts that are associated with this order. Can be greater than the number of contacts that are shown on a single page.	32.0

ConnectApi.DatacloudOrder

Represents a Datacloud order.

Property Name	Type	Description	Available Version
`entityUrl`	String	URL to a list of contacts or companies that were purchased with this order.	32.0

Property Name	Type	Description	Available Version
`id`	String	Unique number that's used to track your order information.	32.0
`purchaseCount`	Integer	Number of contacts or companies that were purchased for this order.	32.0
`purchaseDate`	Datetime	Purchase date for this order.	32.0
`url`	String	GET request URL for this order.	32.0

ConnectApi.DatacloudPurchaseUsage

Information about Data.com point usage for monthly and list pool users.

Property Name	Type	Description	Available Version
`listpoolCreditsAvailable`	Integer	The points or credits that are available in a pool of credits for your organization. This pool of credits can be used by any List Pool User in your organization.	32.0
`listpoolCreditsUsed`	Integer	The points or credits that have been used from a pool of credits that are used by List Pool Users to purchase records.	32.0
`monthlyCreditsAvailable`	Integer	The total credits that are assigned to a Monthly User. Unused credits expire at the end of each month.	32.0
`monthlyCreditsUsed`	Integer	The credits that are used by a Monthly User for the current month.	32.0

ConnectApi.EmailMessage

Email message from a case.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.EmailMessageCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Name	Type	Description	Available Version
`direction`	`ConnectApi.EmailMessageDirection` Enum	The direction of the email message. • `Inbound`—An inbound message (sent by a customer). • `Outbound`—An outbound message (sent to a customer by a support agent).	29.0–31.0
`emailMessageId`	String	The ID of the email message.	29.0–31.0

Name	Type	Description	Available Version
`subject`	String	The subject of the email message.	29.0–31.0
`textBody`	String	The body of the email message.	29.0–31.0
`toAddresses`	List<ConnectApi.EmailAddress>	A list of email addresses to send the message to.	29.0–31.0

ConnectApi.FeedItemAttachment

Feed item attachment.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.FeedElementCapability is used.

This class is abstract.

Subclasses:

- ConnectApi.ApprovalAttachment
- ConnectApi.BasicTemplateAttachment
- ConnectApi.CanvasTemplateAttachment
- Connectapi.EmailMessage
- ConnectApi.CaseComment
- ConnectApi.ContentAttachment
- ConnectApi.DashboardComponentAttachment
- ConnectApi.FeedPoll
- ConnectApi.LinkAttachment
- ConnectApi.RecordSnapshotAttachment
- ConnectApi.TrackedChangeAttachment

Message segments in a feed item are typed as `ConnectApi.MessageSegment`. Feed item capabilities are typed as `ConnectApi.FeedItemCapability`. Record fields are typed as `ConnectApi.AbstractRecordField`. These classes are all abstract and have several concrete subclasses. At runtime you can use `instanceof` to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

Important: The composition of a feed can change between releases. Write your code to handle instances of unknown subclasses.

ConnectApi.FeedItemPage

A paged collection of `ConnectApi.FeedItem` objects.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.FeedElementPage is used.

Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	28.0–31.0
`currentPageUrl`	String	Connect REST API URL identifying the current page.	28.0–31.0

Name	Type	Description	Available Version
`isModifiedToken`	String	Opaque polling token to use in the *`since`* parameter of the `ChatterFeeds.isModified` method. The token describes when the feed was last modified. **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	28.0–31.0
`isModifiedUrl`	String	Connect REST API URL with a *`since`* request parameter that contains an opaque token that describes when the feed was last modified. Returns `null` if the feed isn't a news feed. Use this URL to poll a news feed for updates. **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	28.0–31.0
`items`	`List<ConnectApi.FeedItem>`	List of feed items	28.0–31.0
`nextPageToken`	String	Token identifying the next page, or `null` if there isn't a next page.	28.0–31.0
`nextPageUrl`	String	Connect REST API URL identifying the next page, or `null` if there isn't a next page.	28.0–31.0
`updatesToken`	String	Token to use in an `updatedSince` parameter, or `null` if not available.	30.0–31.0
`updatesUrl`	String	A Connect REST API resource with a query string containing the value of the `updatesToken` property. The resource returns the feed items that have been updated since the last request. Use the URL as it is—do not modify it. Property is `null` if not available.	30.0–31.0

ConnectApi.FeedItemTopicPage

Feed item topic page.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.TopicsCapability is used.

Name	Type	Description	Available Version
`canAssignTopics`	Boolean	`true` if a topic can be assigned to the feed item, `false` otherwise.	28.0–31.0
`topics`	`List<ConnectApi.Topic>`	List of topics.	28.0–31.0

ConnectApi.FeedPoll

Attachment of `ConnectApi.FeedItem` objects where the `type` property is `PollPost`.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.PollCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Name	Type	Description	Available Version
`choices`	`List<ConnectApi.FeedPollChoice>`	List of choices for poll.	28.0–31.0
`myChoiceId`	String	ID of the poll choice that the context user has voted for in this poll. Returns `null` if the context user hasn't voted.	28.0–31.0
`totalVoteCount`	Integer	Total number of votes cast on the feed poll item.	28.0–31.0

ConnectApi.LinkAttachment

Link attached to a feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.LinkCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Name	Type	Description	Available Version
`title`	String	Title given to the link if available, otherwise, `null`.	28.0–31.0
`url`	String	The link URL.	28.0–31.0

ConnectApi.NonEntityRecommendation

A recommendation for a non-Salesforce entity, such as an application.

Subclass of ConnectApi.AbstractRecommendation.

Important: ConnectApi.NonEntityRecommendation isn't used in version 34.0 and later. In version 34.0 and later, ConnectApi.EntityRecommendation is used for all recommendations.

Property Name	Type	Description	Available Version
`displayLabel`	String	Localized label of the non-entity object.	32.0
`motif`	`ConnectApi.Motif`	Motif for the non-entity object.	32.0

ConnectApi.RecordSnapshotAttachment

Fields of a record at the point in time when the record was created.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.RecordSnapshotCapability is used.

Subclass of ConnectApi.FeedItemAttachment.

Name	Type	Description	Available Version
`recordView`	`ConnectApi.RecordView`	The representation of the record.	29.0–31.0

ConnectApi.TrackedChangeAttachment

Tracked change attachment to a feed item.

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.TrackedChangesCapability is used.

Name	Type	Description	Available Version
`changes`	`List<ConnectApi.TrackedChangeItem>`	A list of tracked changes.	28.0–31.0

`ConnectApi` Enums

Enums specific to the `ConnectApi` namespace.

`ConnectApi` enums inherit all properties and methods of Apex enums.

Enums are not versioned. Enum values are returned in all API versions. Clients should handle values they don't understand gracefully.

Enum	Description
`ConnectApi.ActionLinkExecutionsAllowed`	Number of times an action link can be executed. • `Once`—An action link can be executed only one time across all users. • `OncePerUser`—An action link can be executed only one time for each user. • `Unlimited`—An action link can be executed an unlimited number of times by each user. If the action link's `actionType` is `Api` or `ApiAsync`, you can't use this value.
`ConnectApi.ActionLinkType`	Type of action link. • `Api`—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server. • `ApiAsync`—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to `/connect/action-links/`***`actionLinkId`*** to set the status to `SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete. • `Download`—The action link downloads a file from the action URL. • `Ui`—The action link takes the user to a web page at the action URL.

Enum	Description
`ConnectApi.ActivitySharingTypeEnum`	Type of sharing operation. • `Everyone`—The activity is shared with everyone. • `MyGroups`—The activity is shared only with a selection of the context user's groups. • `OnlyMe`—The activity is private.
`ConnectApi.AdjustmentAmountScope`	Scope of the price adjustment amount. • `Total`—The adjustment scope is the total price. • `Unit`—The adjustment scope is the unit price. • `UnproratedTotal`—The adjustment scope is the unprorated total price.
`ConnectApi.AdjustmentType`	How the price adjustment amount is calculated. • `AdjustmentAmount`—The adjustment is a fixed amount. • `AdjustmentPercentage`—The adjustment is a percentage.
`ConnectApi.ArticleTopicJobType`	Type of operation to perform on articles and topics. • `AssignTopicsToArticle`—Assign topics to articles in a data category. • `UnassignTopicsFromArticle`—Unassign topics from articles in a data category.
`ConnectApi.AsyncOperationStatus`	Asynchronous processing status of the cart, if asynchronous processing is enabled for the store. • `Completed` • `Errored` • `Processing`
`ConnectApi.AudienceCriteriaOperator`	Operator used in the personalization audience criterion. • `Contains` • `Equal` • `GreaterThan` • `GreaterThanOrEqual` • `Includes` • `LessThan` • `LessThanOrEqual` • `NotEqual` • `NotIncludes` • `StartsWith`
`ConnectApi.AudienceCriteriaType`	Type of personalization audience criterion. • `Audience`—Criterion based on audience. • `Default`—Audience has no criteria. • `Domain`—Criterion based on domain. • `FieldBased`—Criterion based on object fields.

Enum	Description
	• `GeoLocation`—Criterion based on location. • `Permission`—Criterion based on standard or custom permissions. • `Profile`—Criterion based on profile.
`ConnectApi.BannerStyle`	Decorates a feed item with a color and set of icons. • `Announcement`—An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.
`ConnectApi.BillingFrequency`	Billing frequency for a subscription. • `Annual` • `Monthly`
`ConnectApi.BotVersion ActivationStatus`	Activation status of the bot version. • `Active` • `Inactive`
`ConnectApi.BundleType`	Type of bundle. • `GenericBundle`—A bundle that contains no additional information and is just a collection of feed elements. • `TrackedChanges`—A bundle that represents a collection of feed-tracked changes. The bundle includes summary information about the feed-tracked changes that make up the bundle.
`ConnectApi. CalculatedInsight DefinitionTypeEnum`	Definition type of the calculated insight. • `CALCULATED_METRIC` • `CALCULATED_METRIC` • `CALCULATED_METRIC`
`ConnectApi. CalculateTaxType`	Type of tax calculation. • `Actual`—Calculated tax represents the final taxed amount for the transaction. • `Estimated`—Calculated tax represents only an estimated value before the transaction is finalized.
`ConnectApi.CalloutStatus`	Indicates whether a named credential is enabled for callout. • `Disabled` • `Enabled`
`ConnectApi.CardCategory`	Indicates a credit card or debit card. • `CreditCard` • `DebitCard`

Enum	Description
`ConnectApi.CardType`	Credit card issuer. • `AmericanExpress` • `DinersClub` • `JCB` • `Maestro` • `MasterCard` • `Visa`
`ConnectApi.CartItemSortOrder`	Sort order for items in a cart. • `CreatedDateAsc`—Sorts by oldest creation date. • `CreatedDateDesc`—Sorts by most recent creation date. • `NameAsc`—Sorts by name in ascending alphabetical order (A–Z). • `NameDesc`—Sorts by name in descending alphabetical order (Z–A). • `SalesPriceAsc`—Sorts from lowest to highest negotiated price. • `SalesPriceDesc`—Sorts from highest to lowest negotiated price.
`ConnectApi.CartItemType`	Type of item in a cart. • `DeliveryCharge` • `Product`
`ConnectApi.CartMessageSeverity`	Severity of cart message. • `Error` • `Info` • `Warning`
`ConnectApi.CartPromotionType`	Level of the promotion target. • `Cart`—The target is cart-level. • `Item`—The target is item-level.
`ConnectApi.CartStatus`	Status of the cart. • `Active`—Cart is created and available for modifications, like adding or removing products or promotions. • `Checkout`—Cart is in checkout. If the customer modifies the cart, the current checkout session is canceled. • `Closed`—Checkout is complete and an order was created. The cart cannot be modified. • `PendingClosed`—Cart is marked to be closed, but the request isn't completed yet. The cart can't be modified. This value is available in API version 57.0 and later. • `PendingDelete`—Cart is marked for delete, but the request isn't completed yet. The cart can't be modified. • `Processing`—Cart is processing. For example, taxes are being calculated. The cart can't be modified.

Enum	Description
`ConnectApi.CartTaxType`	Tax type of the cart. • `Automatic`—Automatic taxation policy. • `Gross`—Gross taxation policy. • `Net`—Net taxation policy.
`ConnectApi.CartType`	Type of cart. • `Cart`—Cart created by a customer. • `PayNowReadOnly`—Clone of a Template cart that the customer can check out with using the Pay Now feature. • `Template`—Cart created by an internal user.
`ConnectApi.CaseActorType`	Type of user who made the comment. • `Customer`—if a Chatter customer made the comment • `CustomerService`—if a service representative made the comment
`ConnectApi.CaseCommentEventType`	Event type of a comment in Case Feed. • `NewInternal`—A case comment that has newly been marked Internal Only. • `NewPublished`—A newly published case comment. • `NewPublishedByCustomer`—A case comment by a customer that was newly published. • `PublishExisting`—An existing case comment that was republished. • `PublishExistingByCustomer`—An existing case comment by a customer that was republished. • `UnpublishExistingByCustomer`—An existing case comment by a customer that was unpublished. • `UnpublishExsiting`—An existing case comment that was unpublished. Note: Unfortunately, this typo is in the code, not the documentation. Use this spelling in your code.
`ConnectApi.CdpIdentityResolutionConfigurationType`	Source object for an identity resolution ruleset. • `Account` • `Individual`
`ConnectApi.CdpIdentityResolutionMatchMethodType`	Match method for a match rule criterion. • `Exact`—Exact match. • `ExactNormalized`—Exact normalized match. • `Fuzzy`—Fuzzy match with medium precision. • `FuzzyHigh`—Fuzzy match with high precision. • `FuzzyLow`—Fuzzy match with low precision.

Enum	Description
`ConnectApi.CdpIdentityResolutionReconciliationRuleType`	Default reconciliation rule applied to fields in the object the reconciliation rule applies to. • `LastUpdated` • `MostFrequent` • `SourceSequence`
`ConnectApi.CdpIdentityResolutionRunNowResultCode`	Result of an identity resolution ruleset job run. • `ExceededMaximumNumberOfSuccessfulRunsAllowedIn24Hours` • `IdentityResolutionJobIsAlreadyRunning` • `NoPendingChangesJobRunSkipped` • `SuccessfullySubmittedIdentityResolutionJobRunRequest`
`ConnectApi.CommentType`	Type of comment. • `ContentComment`—Comment holds a content capability. • `TextComment`—Comment contains only text.
`ConnectApi.CommerceAddressSort`	Sort order for Commerce addresses. • `CreatedDateAsc`—Sort in ascending order of created date. • `CreatedDateDesc`—Sort in descending order of created date. • `NameAsc`—Sort in ascending order of name. • `NameDesc`—Sort in descending order of name.
`ConnectApi.CommerceSearchAttributeType`	Search attribute type. • `Custom` • `ProductAttribute` • `ProductCategory` • `Product2` • `Standard`
`ConnectApi.CommerceSearchFacetDisplayType`	Display type of the facet. • `CategoryTree` • `DatePicker` • `MultiSelect` • `SingleSelect`
`ConnectApi.CommerceSearchFacetType`	Search facet type. • `DistinctValue`
`ConnectApi.CommerceSearchGroupingOption`	Grouping option for search results. • `BestMatch`—Search results are grouped by the best-match product of the variation group. • `NoGrouping`—Search results aren't grouped.

Enum	Description
	• `VariationParent`—Search results are grouped by the variation parent.
`ConnectApi.CommerceSearchIndexBuildType`	Build type of the index. • `Full` • `Incremental`
`ConnectApi.CommerceSearchIndexCreationType`	Creation type of the index. • `Manual` • `Scheduled`
`ConnectApi.CommerceSearchIndexStatus`	Status of the index. • `Completed` • `Failed` • `InProgress`
`ConnectApi.CommerceSearchIndexUsage`	Usage of the index. • `Live` • `OutOfUse`
`ConnectApi.CommerceSearchSortRuleDirection`	Direction of the sort rule. • `Ascending`—Sorts in ascending alphanumeric order (A–Z, 0–9). • `Default`—When no direction is defined, sorts by relevance. • `Descending`—Sorts in descending alphanumeric order (Z–A, 9–0).
`ConnectApi.CommerceSearchSortRuleLabelSuffix`	Label suffix of the sort rule. • `Ascen`—Label suffix for 'Asc' • `Ascending`—Label suffix for 'Ascending' • `Az`—Label suffix for 'A-Z' • `Descen`—Label suffix for 'Desc' • `Descending`—Label suffix for 'Descending' • `FewMany`—Label suffix for 'Few-Many' • `HeavyLight`—Label suffix for 'Heavy-Light' • `HighLow`—Label suffix for 'High-Low' • `HighestLowest`—Label suffix for 'Highest-Lowest' • `LightHeavy`—Label suffix for 'Light-Heavy' • `LowHigh`—Label suffix for 'Low-High' • `LowestHighest`—Label suffix for 'Lowest-Highest' • `ManyFew`—Label suffix for 'Many-Few' • `NewOld`—Label suffix for 'New-Old' • `Newest`—Label suffix for 'Newest'

Enum	Description
	• `NewestOldest`—Label suffix for 'Newest-Oldest' • `NineZero`—Label suffix for '9-0' • `OldNew`—Label suffix for 'Old-New' • `Oldest`—Label suffix for 'Oldest' • `OldestNewest`—Label suffix for 'Oldest-Newest' • `PriceDecreasing`—Label suffix for '$$-$' • `PriceIncreasing`—Label suffix for '$-$$' • `ThickThin`—Label suffix for 'Thick-Thin' • `ThinThick`—Label suffix for 'Thin-Thick' • `Za`—Label suffix for 'Z-A' • `ZeroNine`—Label suffix for '0-9'
`ConnectApi.CommerceSearchSortRuleType`	Type of sort rule. • `ProductAttributeBased`—Sorts by product attribute fields. • `ProductBased`—Sorts by product field data. • `Relevancy`—Sorts by product and catalog term frequency. • `SortByPricebook`—Sorts by product prices defined in the specified pricebook (version 55.0 and later).
`ConnectApi.CommerceSearchTopProductType`	Type of the top product to return for each product group in search results. • `VariationParent`
`ConnectApi.CommunityFlagReasonType`	Reason a post, comment, or file is flagged. • `FlaggedByRule`—Moderation rule flagged the item. • `FlaggedBySystem`—Einstein flagged the item. • `FlaggedByUserAsInappropriate`—User flagged the item as inappropriate. • `FlaggedByUserAsSpam`—User flagged the item as spam.
`ConnectApi.CommunityFlagType`	Type of moderation flag. • `FlagAsInappropriate`—Flag for inappropriate content. • `FlagAsSpam`—Flag for spam.
`ConnectApi.CommunityFlagVisibility`	Visibility behavior of a flag for various user types. • `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item. • `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.
`ConnectApi.CommunityStatus`	Status of the Experience Cloud site. • `Live` • `Inactive`

Enum	Description
	• `UnderConstruction`
`ConnectApi.ActivityType`	Type of activity. • `All` • `Event` • `Task`
`ConnectApi.ContentHub AuthenticationProtocol`	Authentication protocol used for the repository. • `NoAuthentication`—Repository doesn't require authentication. • `Oauth`—Repository uses OAuth authentication protocol. • `Password`—Repository uses user name and password authentication protocol.
`ConnectApi.ContentHub DirectoryEntryType`	Type of directory entry. • `GroupEntry` • `UserEntry`
`ConnectApi.ContentHub ExternalItemSharingType`	Sharing status for the external file. • `DomainSharing`—File is shared with the domain. • `PrivateSharing`—File is private or shared only with individuals. • `PublicSharing`—File is publicly shared.
`ConnectApi.ContentHub GroupType`	Type of group. • `Everybody`—Group is public to everybody. • `EverybodyInDomain`—Group is public to everybody in the same domain. • `Unknown`—Group type is unknown.
`ConnectApi.ContentHub ItemType`	Item types. • `Any`—Includes files and folders. • `FilesOnly`—Includes files only. • `FoldersOnly`—Includes folders only.
`ConnectApi.ContentHub StreamSupport`	Support for content streaming. • `ContentStreamAllowed` • `ContentStreamNotAllowed` • `ContentStreamRequired`
`ConnectApi.ContentHub VariableType`	Data type of the value of the field. • `BooleanType` • `DateTimeType` • `DecimalType` • `HtmlType`

Enum	Description
	• `IdType` • `IntegerType` • `StringType` • `UriType` • `XmlType`
`ConnectApi.ConversationApplicationIntegrationType`	Conversation application integration types. • `Api` • `Slack`
`ConnectApi.CreateCredentialAction`	Action to take when creating the credential. • `Refresh`
`ConnectApi.CredentialAuthenticationProtocol`	Authentication protocol of the external credential. • `AwsSv4` • `Basic` • `Custom` • `Jwt` • `OAuth`
`ConnectApi.CredentialAuthenticationProtocolVariant`	Authentication protocol variant of the external credential. • `AwsSv4_STS`—AWS Signature Version 4 with Security Token Service. • `ClientCredentialsClientSecret`—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's request body. • `ClientCredentialsClientSecretBasic`—OAuth 2.0 Client Credentials client secret. Client secrets are sent in the callout's authorization header, as with Basic authentication. • `ClientCredentialsJwtAssertion`—OAuth 2.0 Client Credentials JSON Web Token assertion. • `JwtBearer`—OAuth 2.0 JSON Web Token bearer flow. • `NoAuthentication`—No authentication. • `RolesAnywhere`—AWS Signature Version 4 with Identity and Access Management (IAM) Roles Anywhere.
`ConnectApi.CredentialAuthenticationStatus`	Status of the credential authentication. • `Configured`—Credential has all required credentials for at least one principal. • `NotConfigured`—Credential isn't configured. • `Unknown`—Credential status can't be determined because the authentication protocol is custom.
`ConnectApi.CredentialPrincipalType`	Type of credential principal. • `AwsStsPrincipal`

Enum	Description
	• `NamedPrincipal` • `PerUserPrincipal`
`ConnectApi.DataCategoryOperator`	Data category operator. • `Above`—Queries the data category and all of its parent categories. • `AboveOrBelow`—Queries the data category, all of its parent categories, and all of its subcategories. • `At`—Queries the data category. • `Below`—Queries the data category and all of its subcategories.
`ConnectApi.DatacloudUserType`	Type of user. • `Monthly`—A user type that's assigned monthly point limits for purchasing Data.com records. Only the assigned user can use monthly points. Points expire at the end of the month. Monthly is the default setting for `DatacloudUserType`. • `Listpool`—A user type that allows users to draw from a pool of points to purchase Data.com records.
`ConnectApi.DatacloudImportStatusTypeEnum`	Status of the import. • `Success`—Indicates that selected records were added to the org's CRM. • `Duplicate`—Marks a record that is already in the org's CRM. The API determines whether an org allows the addition of duplicate records in its CRM. • `Error`—Indicates that the selected records weren't added to the org's CRM.
`ConnectApi.DigestPeriod`	Time period that's included in a Chatter email digest. • `DailyDigest`—The email includes up to the 50 latest posts from the previous day. • `WeeklyDigest`—The email includes up to the 50 latest posts from the previous week.
`ConnectApi.EmailMessageAutomationType`	Automation type of the email message. • `aiAssisted`—The email message was created with the assistance of AI. • `aiAutomated`—The email message was created automatically by AI.
`ConnectApi.EmailMessageDirection`	Direction of an email message on a case. • `Inbound`—An inbound message (sent by a customer). • `Outbound`—An outbound message (sent to a customer by a support agent).
`ConnectApi.EmailMessageStatus`	Status of an email message on a case. • `DraftStatus` • `ForwardedStatus` • `NewStatus` • `ReadStatus` • `RepliedStatus` • `SentStatus`

Enum	Description
`ConnectApi.ExtensionInformationType`	Information type of the extension. • `Lightning`
`ConnectApi.ExternalAuthIdentityProviderParamType`	Parameter type for an external auth identity provider. • `AuthorizeRequestQueryParameter` • `IdentityProviderOptions` • `RefreshRequestBodyParameter` • `RefreshRequestHttpHeader` • `RefreshRequestQueryParameter` • `TokenRequestBodyParameter` • `TokenRequestHttpHeader` • `TokenRequestQueryParameter`
`ConnectApi.ExternalCredentialParameterType`	Parameter type of the external credential. • `AdditionalRefreshStatusCode` • `AuthParameter` • `AuthProvider` • `AuthProviderUrl` • `AuthProviderUrlQueryParameter` • `JwtBodyClaim` • `JwtHeaderClaim` • `SigningCertificate`
`ConnectApi.ExternalCredentialPrincipalAccessType`	Access type of the external credential principal. • `PermissionSet` • `PermissionSetGroup` • `Profile`
`ConnectApi.FeedCommentSortOrder`	Order of comments. • `CreatedDateLatestAsc`—Sorts by most recently created comments in ascending order. • `CreatedDateOldestAsc`—Sorts by oldest comments in ascending order. • `Relevance`—Sorts by most relevant content.
`ConnectApi.FeedDensity`	Density of the feed. • `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations. • `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. Also displays custom recommendations, but hides some system-generated updates from records.

Enum	Description
`ConnectApi.FeedElementCapabilityType`	Capabilities of a feed element in API versions 31.0 and later. If a capability exists on a feed element, the capability is available, even if the value doesn't exist or is `null`. If the capability doesn't exist, it isn't available. • `AssociatedActions`—The feed element includes information about actions associated with it. • `Approval`—The feed element includes information about an approval. • `Banner`—The body of the feed element has an icon and border. • `Bookmarks`—The context user can bookmark the feed element. Bookmarked feed elements are visible in the bookmarks feed. • `Bundle`—The feed element has a group of other feed elements that display as a bundle in the feed. The bundle type determines the additional data associated with the bundle. • `CallCollaboration`—The feed element has a recording comment. • `Canvas`—The feed element renders a canvas app. • `CaseComment`—The feed element has a case comment in the case feed. • `ChatterLikes`—The context user can like the feed element. • `Close`—The feed element can't be edited, commented on, or deleted. If the feed element is a poll, it can't be voted on. • `Comments`—The context user can add comments to the feed element. • `Content`—The feed element has a file. • `DashboardComponentSnapshot`—The feed element has a dashboard component snapshot. • `DirectMessage`—The feed element is a direct message. • `Edit`—Users who have permission can edit the feed element. • `EmailMessage`—The feed element has an email message from a case. • `EnhancedLink`—The feed element has a link that can contain supplemental information like an icon, a title, and a description. • `Extensions`—The feed element has one or more extension attachments. • `FeedEntityShare`—The feed element has a feed entity shared with it. • `Files`—The feed element has one or more file attachments. • `Interactions`—The feed element has information about user interactions. • `Link`—The feed element has a URL. • `MediaReferences`—The feed element has one or more media references. • `Moderation`—Users in an Experience Cloud site can flag the feed element for moderation. • `Mute`—The context user can mute the feed element. • `Origin`—A feed action created the feed element. • `Pin`—Users who have permission can pin the feed element. • `Poll`—The feed element has poll voting. • `QuestionAndAnswers`—The feed element has a question, and users can add answers to the feed element instead of comments. Users can also select the best answer. • `ReadBy`—The context user can mark the feed element as read.

Enum	Description
	• `Recommendations`—The feed element has a recommendation. • `Record`—The comment has a record attachment. • `RecordSnapshot`—The feed element has all the snapshot fields of a record for a single create record event. • `SocialPost`—The feed element can interact with a social post on a social network. • `Status`—The feed element has a status that determines its visibility. • `Topics`—The context user can add topics to the feed element. • `TrackedChanges`—The feed element has all changes to a record for a single tracked change event. • `UpDownVote`—Users can upvote or downvote the feed element. • `Verified`—Users who have permission can mark a comment as verified or unverified.
`ConnectApi.FeedElementType`	Feed elements are the top-level objects that a feed contains. The feed element type describes the characteristics of that feed element. • `Bundle`—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values. • `FeedItem`—A feed item has a single parent and is scoped to oneExperience Cloud site or across all Experience Cloud sites. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values. • `Recommendation`—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user.
`ConnectApi.FeedEntityStatus`	Status of the feed post or comment. • `Draft`—The feed post isn't published but is visible to the author and users with Modify All Data or View All Data permission. Comments can't be drafts. • `Isolated`—The feed post or comment is isolated, and only admins can see it. • `PendingReview`—The feed post or comment isn't approved yet and therefore isn't published or visible. • `Published`—The feed post or comment is approved and visible.
`ConnectApi.FeedFavoriteType`	Origin of the feed favorite. • `ListView` • `Search` • `Topic`
`ConnectApi.FeedFilter`	Filter value for a feed. • `AllQuestions`—Feed elements that are questions. • `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.

Enum	Description
	• `CommunityScoped`—Feed elements that are scoped to Experience Cloud sites. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to sites in the future. Feed elements that are always visible in all sites are filtered out. This value is valid only for the `UserProfile` feed. • `QuestionsWithCandidateAnswers`—Feed elements that are questions that have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission. • `QuestionsWithCandidateAnswersReviewedPublished`—Feed elements that are questions that have candidate answers that have been reviewed or published. This value is valid only for users with the Access Einstein-Generated Answers permission. • `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group. • `SolvedQuestions`—Feed elements that are questions and that have a best answer. • `UnansweredQuestions`—Feed elements that are questions and that don't have any answers. • `UnansweredQuestionsWithCandidateAnswers`—Feed elements that are questions that don't have answers but have candidate answers associated with them. This value is valid only for users with the Access Einstein-Generated Answers permission. • `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group. • `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.
`ConnectApi.FeedItem AttachmentType`	Attachment type for feed item output objects. • `Approval`—A feed item requiring approval. • `BasicTemplate`—A feed item with a generic rendering of an image, link, and title. • `Canvas`—A feed item that contains the metadata to render a link to a canvas app. • `CaseComment`—A feed item created from a comment to a case record. • `CaseComment`—A feed item created from a comment to a case record. • `Content`—A feed item with a file attached. • `DashboardComponent`—A feed item with a dashboard attached. • `EmailMessage`—An email attached to a case record in Case Feed. • `Link`—A feed item with a URL attached. • `Poll`—A feed item with a poll attached. • `Question`—A feed item with a question attached. • `RecordSnapshot`—The feed item attachment contains a view of a record at a single `ConnectApi.FeedItemType.CreateRecordEvent`. • `TrackedChange`—All changes to a record for a single `ConnectApi.FeedItemType.TrackedChange` event.

Enum	Description
`ConnectApi.FeedItemType`	Type of feed item. • `ActivityEvent`—Feed item generated in Case Feed when an event or task associated with a parent record with a feed enabled is created or updated. • `AdvancedTextPost`—A feed item with advanced text formatting, such as a group announcement post. • `ApprovalPost`—Feed item with an approval capability. Approvers can act on the feed item parent. • `AttachArticleEvent`—Feed item generated when an article is attached to a case in Case Feed. • `BasicTemplateFeedItem`—Feed item with an enhanced link capability. • `CallLogPost`—Feed item generated when a call log is saved to a case in Case Feed. • `CanvasPost`—Feed item generated by a canvas app in the publisher or from Connect REST API or Connect in Apex. The post itself is a link to a canvas app. • `CaseCommentPost`—Feed item generated when a case comment is saved in Case Feed. • `ChangeStatusPost`—Feed item generated when the status of a case is changed in Case Feed. • `ChatTranscriptionPost`—Feed item generated in Case Feed when a Live Agent chat transcript is saved to a case. • `CollaborationGroupCreated`—Feed item generated when a new public group is created. Contains a link to the new group. • `CollaborationGroupUnarchived`—Deprecated. Feed item generated when an archived group is activated. • `ContentPost`—Feed item with a content capability. • `CreateRecordEvent`—Feed item that describes a record created in the publisher. • `DashboardComponentAlert`—Feed item with a dashboard alert. • `DashboardComponentSnapshot`—Feed item with a dashboard component snapshot capability. • `EmailMessageEvent`—Feed item generated when an email is sent from a case in Case Feed. • `FacebookPost`—Deprecated. Feed item generated when a Facebook post is created from a case in Case Feed. • `LinkPost`—Feed item with a link capability. • `MilestoneEvent`—Feed item generated when a case milestone is either completed or reaches a violation status. Contains a link to the case milestone. • `PollPost`—Feed item with a poll capability. Viewers of the feed item are allowed to vote on the options in the poll. • `ProfileSkillPost`—Feed item generated when a skill is added to a user's profile. • `QuestionPost`—Feed item generated when a question is asked. As of API version 33.0, a feed item of this type can have a content capability and a link capability. • `ReplyPost`—Feed item generated by a Chatter Answers reply.

Enum	Description
	• `RypplePost`—Feed item generated when a user posts thanks. • `SocialPost`—Feed item generated when a social post is created from a case in Case Feed. • `TextPost`—Feed item containing text only. • `TrackedChange`—Feed item created when one or more fields on a record have been changed. • `UserStatus`—Deprecated. A user's post to their own profile.
`ConnectApi.FeedItem VisibilityType`	Type of users who can see a feed item. • `AllUsers`—Visibility is not limited to internal users. • `InternalUsers`—Visibility is limited to internal users.
`ConnectApi. FeedSortOrder`	Order of feed items in the feed. • `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Draft`, `Isolated`, `Moderation`, and `PendingReview` feeds. • `CreatedDateDesc`—Sorts by most recent creation date. • `LastModifiedDateDesc`—Sorts by most recent activity. • `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`. • `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.
`ConnectApi.FeedType`	Type of feed. • `Bookmarks`—Contains all feed items saved as bookmarks by the context user. • `Company`—Contains all feed items except feed items of type `TrackedChange`. To see the feed item, the user must have sharing access to its parent. • `DirectMessageModeration`—Contains all direct messages that are flagged for moderation. The Direct Message Moderation feed is available only to users with Moderate Experiences Chatter Messages permissions. • `DirectMessages`—Contains all feed items of the context user's direct messages. • `Draft`—Contains all the feed items that the context user drafted. • `Files`—Contains all feed items that contain files posted by people or groups that the context user follows. • `Filter`—Contains the news feed filtered to contain feed items whose parent is a specified object type. • `Groups`—Contains all feed items from all groups the context user either owns or is a member of. • `Home`—Contains all feed items associated with any managed topic in an Experience Cloud site. • `Isolated`—Contains all the feed items and comments that are isolated.

Enum	Description
	• `Landing`—Contains all feed items that best drive user engagement when the feed is requested. Allows clients to avoid an empty feed when there aren't many personalized feed items. • `Moderation`—Contains all feed items that are flagged for moderation, except direct messages. The moderation feed is available only to users with Moderate Experiences Feeds permissions. • `Mute`—Contains all feed items that the context user muted. • `News`—Contains all updates for people the context user follows, groups the user is a member of, and files and records the user is following. Contains all updates for records whose parent is the context user. • `PendingReview`—Contains all feed items and comments that are pending review. • `People`—Contains all feed items posted by all people the context user follows. • `Record`—Contains all feed items whose parent is a specified record, which could be a group, user, object, file, or any other standard or custom object. When the record is a group, the feed also contains feed items that mention the group. When the record is a user, the feed contains only feed items on that user. You can get another user's record feed. • `Streams`—Contains all feed items for any combination of up to 25 feed-enabled entities that the context user subscribes to in a stream. Examples of feed-enabled entities include people, groups, and records, • `To`—Contains all feed items with mentions of the context user. Contains feed items the context user commented on and feed items created by the context user that are commented on. • `Topics`—Contains all feed items that include the specified topic. • `UserProfile`—Contains feed items created when a user changes records that can be tracked in a feed. Contains feed items whose parent is the user and feed items that @mention the user. This feed is different than the news feed, which returns more feed items, including group updates. You can get another user's user profile feed.
`ConnectApi.FieldChangeValueType`	Value type of a field change. • `NewValue`—A new value • `OldValue`—An old value
`ConnectApi.FieldType`	Field type. • `Address` • `AnyType` • `Base64` • `Boolean` • `Combobox` • `ComplexValue` • `Currency` • `DataCategoryGroupReference` • `Date`

Enum	Description
	• DateTime • Double • Email • EncryptedString • ExtensionEntityLookup • ExternalLookup • FloatArray • Id • ImageUrl • IndirectLookup • Integer • Json • Location • Long • MultiPicklist • Percent • PersonName • Phone • Picklist • PlainTextArea • Reference • RichTextArea • Sobject • String • SwitchablePersonName • TextArea • Time • Url
ConnectApi. FilePreviewFormat	Format of the file preview. • Jpg—Preview format is JPG. • Pdf—Preview format is PDF. • Svg—Preview format is compressed SVG. • Thumbnail—Preview format is 240 x 180 PNG. • ThumbnailBig—Preview format is 720 x 480 PNG. • ThumbnailTiny—Preview format is 120 x 90 PNG.
ConnectApi. FilePreviewStatus	Availability status of the file preview. • Available—Preview is available.

Enum	Description
	• `InProgress`—Preview is being processed. • `NotAvailable`—Preview is unavailable. • `NotScheduled`—Generation of the preview isn't scheduled yet.
`ConnectApi.FilePublishStatus`	Publish status of the file. • `PendingAccess`—File is pending publishing. • `PrivateAccess`—File is private. • `PublicAccess`—File is public.
`ConnectApi.FileSharingOption`	Sharing option of the file. • `Allowed`—Resharing of the file is allowed. • `Restricted`—Resharing of the file is restricted.
`ConnectApi.FileSharingPrivacy`	Sharing privacy of a file. • `None`—File is visible to anyone with record access. • `PrivateOnRecords`—File is private on records.
`ConnectApi.FileSharingType`	Sharing role of the file. • `Admin`—Owner permission, but doesn't own the file. • `Collaborator`—Viewer permission, and can edit, change permissions, and upload a new version of a file. • `Owner`—Collaborator permission, and can make a file private, and delete a file. • `Viewer`—Can view, download, and share a file. • `WorkspaceManaged`—Permission controlled by the library.
`ConnectApi.FilterOperator`	Filter operator. • `EqOp`—Equal • `ExcludesOp`—Excludes • `GtOp`—Greater than • `GteOp`—Greater than or equal • `InOp`—In • `IncludesOp`—Includes • `LikeOp`—Like • `LtOp`—Less than • `LteOp`—Less than or equal • `NeOp`—Not equal • `NinOp`—Not in
`ConnectApi.FolderItemType`	Type of item in a folder. • `file`

Enum	Description
	• `folder`
`ConnectApi.FormFieldType`	Type of marketing integration form field. • `Boolean` • `Date` • `EmailAddress` • `Number` • `Text`
`ConnectApi.FormulaFilterType`	Formula filter type for the personalization audience. • `AllCriteriaMatch`—All audience criteria are true (AND operation). • `AnyCriterionMatches`—Any audience criterion is true (OR operation). • `CustomLogicMatches`—Audience criteria match the custom formula (for example, (1 AND 2) OR 3).
`ConnectApi.GroupArchiveStatus`	Archive status of groups. • `All`—All groups, including groups that are archived and groups that aren't archived. • `Archived`—Groups that are archived. • `NotArchived`—Groups that aren't archived.
`ConnectApi.GroupEmailFrequency`	Frequency with which a user receives email. • `EachPost` • `DailyDigest` • `WeeklyDigest` • `Never` • `UseDefault`
`ConnectApi.GroupMembershipType`	Type of membership the user has with the group. • `GroupOwner` • `GroupManager` • `NotAMember` • `NotAMemberPrivateRequested` • `StandardMember`
`ConnectApi.GroupMembershipRequestStatus`	Status of a request to join a private group. • `Accepted` • `Declined` • `Pending`

Enum	Description
`ConnectApi.GroupViralInvitationsStatus`	Status of an invitation to join a group. • `ActedUponUser`—The user was added to the group. An email was sent asking the user to visit the group. • `Invited`—An email was sent asking the user to sign up for the org. • `MaxedOutUsers`—The group has the maximum allowed members. • `MultipleError`—The user wasn't invited due to multiple errors. • `NoActionNeededUser`—The user is already a member of the group. • `NotVisibleToExternalInviter`—The user is not accessible to the user sending the invitation. • `Unhandled`—The user couldn't be added to the group for an unknown reason.
`ConnectApi.GroupVisibilityType`	Group visibility type. • `PrivateAccess`—Only members of the group can see posts to this group. • `PublicAccess`—All users within the Experience Cloud site can see posts to this group. • `Unlisted`—Reserved for future use.
`ConnectApi.HttpRequestMethod`	HTTP method. • `HttpDelete`—Returns HTTP 204 on success. Response body or output class is empty. • `HttpGet`—Returns HTTP 200 on success. • `HttpHead`—Returns HTTP 200 on success. Response body or output class is empty. • `HttpPatch`—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty. • `HttpPost`—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success. • `HttpPut`—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty.
`ConnectApi.IdentityProviderAuthFlow`	Authentication flow to get tokens to call protected APIs. • `AuthorizationCode`
`ConnectApi.IdentityProviderAuthProtocol`	Authentication protocol required to access the external system. • `OAuth`
`ConnectApi.IdentityProviderClientAuth`	Client authentication method that describes how credentials are sent to the authorization server. • `ClientSecretBasic` • `ClientSecretPost`
`ConnectApi.LinkMetadataSource`	Source of the link metadata. • `None`—Link metadata wasn't retrieved. • `Sfdc`—Salesforce is the source.

Enum	Description
`ConnectApi.LinkMetadataType`	Type of link that the metadata represents. • `Error`—Link metadata couldn't be retrieved. • `Link`—Represents a link. • `None`—Link metadata wasn't retrieved because the link isn't an allowed domain. • `Photo`—Represents a photo. • `Rich`—Represents rich content, typically HTML content. • `Unknown`—Link metadata was retrieved, but the type is unknown. • `Video`—Represents a video.
`ConnectApi.MaintenanceType`	Type of maintenance. • `Downtime`—Downtime maintenance. • `GenerallyAvailable`—Generally available mode. • `MaintenanceAndAvailable`—Maintenance with available mode. • `MaintenanceWithDowntime`—Scheduled maintenance with downtime. • `ReadOnly`—Maintenance with read-only mode.
`ConnectApi.ManagedContentChannelType`	Type of managed content channel. • `CloudToCloud`—Cloud-to-Cloud integrated channel. • `Community`—Experience Cloud site channel. • `ConnectedApp`—Channel served by a connected app. • `PublicUnauthenticated`—Public channel. All published content is publicly available. • `UserPermission`—Channel backed by a system permission. All published content is available only to users with the permission.
`ConnectApi.ManagedContentCloneStatus`	Status of the managed content clone. • `PartialSuccess` • `Success`
`ConnectApi.ManagedContentMediaType`	Type of managed content media. • `Document` • `Image`
`ConnectApi.ManagedContentNodeType`	Type of managed content node. • `Date` • `DateTime` • `Media` • `MediaSource` • `MultilineText` • `NameField` • `RichText`

Enum	Description
	• `Text` • `Url`
`ConnectApi.ManagedContentSpaceChannelOperation`	Operation to perform on the channel and managed content space. • `Add`—Add a channel to a managed content space. • `Remove`—Remove a channel from a managed content space.
`ConnectApi.ManagedContentSpaceChannelStatus`	Status of the add or remove operation for a channel and managed content space. • `Added`—Channel was added to the managed content space. • `Failed`—Add or remove operation failed. • `Pending`—Add or remove operation is pending. • `Removed`—Channel was removed from the managed content space.
`ConnectApi.ManagedContentVariantStatus`	Status of the managed content variant. • `Draft`—Content isn't published. • `Published`—Content is published and available for use in your live sites. • `Revised`—Content that's published and edited. Publish this content to make the changes available for use in your live sites.
`ConnectApi.ManagedTopicType`	Type of managed topic. • `Content`—Topics that are associated with native content. • `Featured`—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation. • `Navigational`—Topics that display in a navigational menu in the Experience Cloud site.
`ConnectApi.MarkupType`	Type of rich text markup. • `Bold`—Bold tag. • `Code`—Code tag. • `Hyperlink`—Hyperlink anchor tag. • `Italic`—Italic tag. • `ListItem`—List item tag. • `OrderedList`—Ordered list tag. • `Paragraph`—Paragraph tag. • `Strikethrough`—Strikethrough tag. • `Underline`—Underline tag. • `UnorderedList`—Unordered list tag.
`ConnectApi.MCSFolderShareStatus`	Status of sharing a managed content space folder. • `PendingShare` • `PendingUnshare`

Enum	Description
	• `Shared`
`ConnectApi.MentionCompletionType`	Type of mention completion. • `All`—All mention completions, regardless of the type of record to which the mention refers. • `Group`—Mention completions for groups. • `User`—Mention completions for users.
`ConnectApi.MentionValidationStatus`	Type of validation error for a proposed mention, if any. • `Disallowed`—The proposed mention is invalid and is rejected because the context user is trying to mention something that is not allowed. For example, a user who is not a member of a private group is trying to mention the private group. • `Inaccessible`—The proposed mention is allowed, but the user or record being mentioned isn't notified. They don't have access to the parent record that's being discussed. • `Ok`—There is no validation error for this proposed mention.
`ConnectApi.MessageSegmentType`	Type of message segment, such as text, link, field change name, or field change value. • `EntityLink` • `FieldChange` • `FieldChangeName` • `FieldChangeValue` • `Hashtag` • `InlineImage` • `Link` • `MarkupBegin` • `MarkupEnd` • `Mention` • `MoreChanges` • `ResourceLink` • `Text`
`ConnectApi.NamedCredentialParameterType`	Type of named credential parameter. • `AllowedManagedPackageNamespaces` • `ClientCertificate`
`ConnectApi.NamedCredentialType`	Type of named credential. • `PrivateEndpoint` • `SecuredEndpoint`
`ConnectApi.NavigationMenuItemActionType`	Event, URL type, or modal navigation menu item. • `Event`—Event-based navigation.

Enum	Description
	Note: `Event` is internal only and can't be used in custom components. • `ExternalLink`—URL outside of your Experience Cloud site. • `InternalLink`—Relative URL inside your Experience Cloud site. • `Modal`—Modal, such as Account Switcher.
`ConnectApi.NavigationMenuItemOpenTarget`	Target for the navigation menu item. • `CurrentWindow`—Navigation menu item opens in the current window. • `NewWindow`—Navigation menu item opens in a new window.
`ConnectApi.NavigationMenuItemType`	Type of navigation menu item. • `DataSourceDriven`—Menu items dynamically added from a data source. • `Event`—Event, such as logging in, logging out, or switching accounts. • `ExternalLink`—URL outside of your site. • `GlobalAction`—Lets users create records that aren't related to other records. • `InternalLink`—Relative URL inside your site. • `MenuLabel`—Menu label. • `Modal`—Modal, such as Account Switcher. • `NavigationalTopic`—Dropdown list with links to the navigational topics in your site. • `SalesforceObject`—Objects such as accounts, cases, contacts, and custom objects. • `SystemLink`—System link, such as a link to Builder, Workspaces, or Setup.
`ConnectApi.NBAActionType`	Type of action. • `Flow`—Automated process tool with multiple subtypes.
`ConnectApi.NBAFlowType`	Type of recommended flow. • `AutoLaunchedFlow`—Autolaunched flow that runs in the background. • `Flow`—Screen flow that accepts user inputs.
`ConnectApi.NBATargetType`	Type of target. • `Recommendation`
`ConnectApi.OperationType`	Operation to carry out on the file. • `Add`—Adds the file to the feed element. • `Remove`—Removes the file from the feed element.
`ConnectApi.OrchestrationInstanceStatus`	Status of the orchestration instance. • `Canceled` • `Completed` • `Discontinued` • `Error`

Enum	Description
	• `InProgress` • `NotStarted` • `Suspended`
`ConnectApi.OrchestrationStepType`	Type of orchestration step. • `AsynchronousBackgroundStep` • `ApprovalStep` • `BackgroundStep` • `InteractiveStep` • `ManagedContentRoleInteractiveStep` • `ManagedContentVariantAutoPublishBackgroundStep` • `ManagedContentVariantAutoUnpublishBackgroundStep` • `ManagedContentVariantSetLockBackgroundStep` • `ManagedContentVariantSetReadyBackgroundStep` • `MuleSoftStep`
`ConnectApi.OrchestrationWorkItemStatus`	Status of the orchestration work item. • `Assigned` • `Completed`
`ConnectApi.OrderDeliveryGroupSummarySort`	Sort order for order delivery group summaries. • `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9). • `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).
`ConnectApi.OrderDirection`	Order direction. • `Ascending` • `Descending`
`ConnectApi.OrderItemSummarySort`	Sort order for order item summaries. • `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9). • `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).
`ConnectApi.OrderNulls`	Null value order. • `Firsts`—Null values are sorted first. • `Lasts`—Null values are sorted last.
`ConnectApi.OrderShipmentItemSort`	Sort order for order shipment items. • `IdAsc`—Sorts by ID in ascending alphanumeric order (A–Z, 0–9). • `IdDesc`—Sorts by ID in descending alphanumeric order (Z–A, 9–0).

Enum	Description
`ConnectApi.OrderShipmentSort`	Sort order for order shipments. • `ExpectedDeliveryDateAsc`—Sorts by the oldest expected delivery date. • `ExpectedDeliveryDateDesc`—Sorts by the most recent expected delivery date. • `ShipmentNumberAsc`—Sorts by shipment number in ascending order (0–9). • `ShipmentNumberDesc`—Sorts by shipment number in descending order (9–0).
`ConnectApi.OrderSummaryAdjustmentAggregatesStatus`	Order summary adjustment aggregate job status. • `Failed`—The adjustment aggregate data job for the order summary failed. • `InProgress`—The adjustment aggregate data job for the order summary is in progress. • `NotInitiated`—The adjustment aggregate data job for the order summary is not initiated. • `Submitted`—The adjustment aggregate data job for the order summary is submitted.
`ConnectApi.OrderSummaryAdjustmentTargetType`	Type of price adjustment in promotions. • `SplitLine`—Price adjustment on an order item. • `Header`—Price adjustment on the entire order.
`ConnectApi.OrderSummarySortOrder`	Sort order for order summaries. • `CreatedDateAsc`—Sorts by the oldest created date. • `CreatedDateDesc`—Sorts by the most recent created date. • `OrderedDateAsc`—Sorts by the oldest ordered date. • `OrderedDateDesc`—Sorts by the most recent ordered date.
`ConnectApi.PeriodType`	Time period used for forecasting. • `Month` • `Quarter` • `Week` • `Year`
`ConnectApi.PlatformActionGroupCategory`	Location of an action link group on an associated feed element. • `Primary`—The action link group is displayed in the body of the feed element. • `Overflow`—The action link group is displayed in the overflow menu of the feed element.
`ConnectApi.PlatformActionStatus`	Status of the action. • `FailedStatus`—The action link execution failed. • `NewStatus`—The action link is ready to be executed. Available for `Download` and `Ui` action links only. • `PendingStatus`—The action link is executing. Choosing this value triggers the API call for `Api` and `ApiAsync` action links. • `SuccessfulStatus`—The action link executed successfully.

Enum	Description
`ConnectApi.PlatformActionType`	Type of platform action. • `ActionLink`—An indicator on a feed element that targets an API, a web page, or a file, represented by a button in the Salesforce UI. • `CustomButton`—When clicked, opens a URL or a Visualforce page in a window or executes JavaScript. • `ProductivityAction`—Productivity actions are predefined and attached to a limited set of objects. Productivity actions include Send Email, Call, Map, View Website, and Read News. Except for the Call action, you can't edit productivity actions. • `QuickAction`—A global or object-specific action. • `StandardButton`—A predefined Salesforce button such as New, Edit, or Delete.
`ConnectApi.PriceAdjustmentTierType`	Type of price adjustment for the tier. • `AmountBasedAdjustment`—Price is adjusted by a specified amount. • `PercentageBasedAdjustment`—Price is adjusted by a specified percentage.
`ConnectApi.PricingTermUnit`	Unit of time used to define a pricing term. • `Months`—Product is priced on a monthly basis. • `Annual`—Product is priced on an annual basis.
`ConnectApi.ProductAttributeViewType`	View type for product attributes. • `ColorSwatch` • `Dropdown` • `Pill`
`ConnectApi.ProductClass`	Class of product. • `Bundle` • `Set` • `Simple` • `Variation` • `VariationParent`
`ConnectApi.ProductMediaType`	Type of product media. • `Document` • `Image` • `Video`
`ConnectApi.ProductMediaUsageType`	Usage type of a product media item within a media group. • `Attachment`—Product media group with product documents as attachments. • `Banner`—Product category media group with banner images of the product. • `Listing`—Product media group with listing images of the product. • `Standard`—Product media group with standard images and videos of the product.

Enum	Description
	• `Tile`—Product category media group with tile images of the product.
`ConnectApi.PublishSchedule`	Publish refresh schedule. • `One`—Refreshes every hour. Used to rapidly publish UI and DBT-based segments. • `Four`—Refreshes every four hours. Used to rapidly publish UI and DBT-based segments. • `Twelve`—Refreshes every twelve hours. • `TwentyFour`—Refreshes every twenty-four hours.
`ConnectApi.PublishStatus`	Publish status of a personalization audience, target, or navigation menu item. • `Draft` • `Live`
`ConnectApi.RecommendationActionType`	Action to take on a recommendation. • `follow`—Follow a file, record, topic, or user. • `join`—Join a group. • `view`—View a file, group, article, record, user, custom, or static recommendation.
`ConnectApi.RecommendationAudienceCriteriaType`	Custom recommendation audience criteria type. • `CustomList`—A custom list of users makes up the audience. • `MaxDaysInCommunity`—New members make up the audience.
`ConnectApi.RecommendationAudienceMemberOperationType`	Operation to carry out on the custom recommendation audience members. • `Add`—Adds specified members to the audience. • `Remove`—Removes specified members from the audience.
`ConnectApi.RecommendationChannel`	A way to tie custom recommendations together. For example, display recommendations in specific places in the UI or show recommendations based on time of day or geographic locations. • `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Experience Builder to determine where recommendations appear. • `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Home and Question Detail pages of Customer Service and Partner Central Experience Builder templates. They also appear in the feed in the Salesforce mobile web and anywhere community managers add recommendations using Experience Builder.

Enum	Description
`ConnectApi.RecommendationExplanationType`	Reason for a Chatter recommendation. • `ArticleHasRelatedContent`—Articles with related content to a context article. • `ArticleViewedTogether`—Articles often viewed together with the article that the context user just viewed. • `ArticleViewedTogetherWithViewers`—Articles often viewed together with other records that the context user views. • `Custom`—Custom recommendations. • `FilePopular`—Files with many followers or views. • `FileViewedTogether`—Files often viewed at the same time as other files that the context user views. • `FollowedTogetherWithFollowees`—Users often followed together with other records that the context user follows. • `GroupMembersFollowed`—Groups with members that the context user follows. • `GroupNew`—Recently created groups. • `GroupPopular`—Groups with many active members. • `ItemViewedTogether`—Records often viewed at the same time as other records that the context user views. • `PopularApp`—Applications that are popular. • `RecordOwned`—Records that the context user owns. • `RecordParentOfFollowed`—Parent records of records that the context user follows. • `RecordViewed`—Records that the context user recently viewed. • `TopicFollowedTogether`—Topics often followed together with the record that the context user just followed. • `TopicFollowedTogetherWithFollowees`—Topics often followed together with other records that the context user follows. • `TopicPopularFollowed`—Topics with many followers. • `TopicPopularLiked`—Topics on posts that have many likes. • `UserDirectReport`—Users who report to the context user. • `UserFollowedTogether`—Users often followed together with the record that the context user followed . • `UserFollowsSameUsers`—Users who follow the same users as the context user. • `UserManager`—The context user's manager. • `UserNew`—Recently created users. • `UserPeer`—Users who report to the same manager as the context user. • `UserPopular`—Users with many followers. • `UserViewingSameRecords`—Users who view the same records as the context user.
`ConnectApi.RecommendationReactionType`	Type of reaction to a recommendation. • `Accepted` • `Rejected`

Enum	Description
`ConnectApi.RecommendationType`	Type of record being recommended. • `apps` • `articles` • `files` • `groups` • `records` • `topics` • `users`
`ConnectApi.RecommendedObjectType`	Type of object being recommended. • `Today`—Static recommendations that don't have an ID, for example, the Today app recommendation.
`ConnectApi.RecordColumnOrder`	Order in which fields are rendered in a grid. • `LeftRight`—Fields are rendered from left to right. • `TopDown`—Fields are rendered from the top down.
`ConnectApi.RecordFieldType`	Data type of a record field. • `Address` • `Blank` • `Boolean` • `Compound` • `CreatedBy` • `Date` • `DateTime` • `Email` • `LastModifiedBy` • `Location` • `Name` • `Number` • `Percent` • `Phone` • `Picklist` • `Reference` • `Text` • `Time`
`ConnectApi.RelatedFeedPostType`	Type of related feed post. • `Answered`—Related questions that have at least one answer. • `BestAnswer`—Related questions that have a best answer.

Enum	Description
	• `Generic`—All types of related questions, including answered, with a best answer, and unanswered. • `Unanswered`—Related questions that don't have answers.
`ConnectApi.SearchBoostBuryRuleAction`	Action of the boost and bury rule. • `Boost`—Boost rule. Increases search result rankings for targeted products. • `Bury`—Bury rule. Decreases search result rankings for targeted products.
`ConnectApi.SearchBoostBuryRuleOperation`	Operation for the conditions of the target expression in the boost and bury rule. • `AllOf`—All-of operation. • `AnyOf`—Any-of operation.
`ConnectApi.SegmentType`	Type of segment. • `Dbt`—Data build tool
`ConnectApi.SellingModelType`	Type of product selling model. • `Evergreen`—A subscription without an end date. An evergreen subscription continues until the shopper affirmatively cancels it. • `OneTime`—A product that isn't sold as a subscription. • `TermDefined`—A subscription with a defined end date. The subscription continues for a specified time period. When the term ends, the subscription ends.
`ConnectApi.SitesPageType`	Type of site search result item. • `ContentPage` • `SitePage`
`ConnectApi.SocialNetworkProvider`	Social network provider. • `Facebook` • `GooglePlus` • `Instagram` • `InstagramBusiness` • `KakaoTalk` • `Kik` • `Line` • `LinkedIn` • `Messenger` • `Other` • `Pinterest` • `QQ` • `Rypple` • `SinaWeibo`

Enum	Description
	• SMS • Snapchat • Telegram • Twitter • VKontakte • WeChat • WhatsApp • YouTube
ConnectApi.SocialPostMessageType	Message type of the social post. • Comment • Direct • Post • PrivateMessage • Reply • Retweet • Tweet
ConnectApi.SocialPostStatusType	State of the social post. • ApprovalPending • ApprovalRecalled • ApprovalRejected • Deleted • Failed • Hidden • Pending • Sent • Unknown
ConnectApi.SortOrder	Order for sorting. • Ascending—Items are in ascending alphabetical order (A-Z). • Descending—Items are in descending alphabetical order (Z-A). • MostRecentlyViewed—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.
ConnectApi.SurveyEmailStatusEnum	Status of a survey invitation email. • Failed—The survey invitation email wasn't sent. • Queued—The survey invitation email is queued for sending.

Enum	Description
`ConnectApi.SvcApptModeEnum`	Mode of the service appointment. • `Group`— Service appointment mode is Group. • `Regular`— Default mode of service appointment.
`ConnectApi.TaxTransactionStatus`	Status of a tax transaction. • `Committed`—Tax has been committed to the transaction. • `Uncommitted`—Tax hasn't been committed to the transaction.
`ConnectApi.TaxTransactionType`	Type of tax transaction. • `Credit`—Transaction is a credit transaction. • `Debit`—Transaction is a debit transaction.
`ConnectApi.TopicSort`	Order returned by the sort. • `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default. • `alphaAsc`—Sorts topics alphabetically.
`ConnectApi.UpDownVoteValue`	Type of vote for a feed element or comment. • `Down` • `None` • `Up`
`ConnectApi.UserActivityType`	Type of user activity. • `Bookmark`—User bookmarked a post. • `ChatterActivity`—Total counts of posts and comments made and likes and comments received for a user. • `ChatterLike`—User liked a post or comment. • `Comment`—User commented on a post. • `CompanyVerify`—User verified comment. • `DownVote`—User downvoted a post or comment. • `FeedEntityRead`—User read a post. • `FeedRead`—User read a feed. • `Mute`—User muted a post. • `Post`—User made a post. • `TopicEndorsement`—User endorsed another user on a topic or received endorsement on a topic. • `UpVote`—User upvoted a post or comment.
`ConnectApi.UserMissionActivityType`	Type of mission activity for a user. • `FeedItemAnswerAQuestion`—User answered a question. • `FeedItemLikeSomething`—User liked a post or comment.

Enum	Description
	• `FeedItemMarkAnswerAsBest`—User marked an answer as the best answer. • `FeedItemPostQuestion`—User posted a question. • `FeedItemReceiveAComment`—User received a comment on a post. • `FeedItemReceiveALike`—User received a like on a post or comment. • `FeedItemReceiveAnAnswer`—User received an answer to a question. • `FeedItemWriteAComment`—User commented on a post. • `FeedItemWriteAPost`—User made a post. • `FeedItemYourAnswerMarkedBest`—User's answer was marked as the best answer.
`ConnectApi.UserProfileTabType`	Type of user profile tab. • `CustomVisualForce`—Tab that displays data from a Visualforce page. • `CustomWeb`—Tab that displays data from any external web-based application or web page. • `Element`—Tab that displays generic content inline. • `Feed`—Tab that displays the Chatter feed. • `Overview`—Tab that displays user details.
`ConnectApi.UserType`	Type of user. • `ChatterGuest`—User is an external user in a private group. • `ChatterOnly`—User is a Chatter Free customer. • `Guest`—User is unauthenticated. • `Internal`—User is a standard org member. • `Portal`—User is an external user in an Experience Cloud site. • `System`—User is Chatter Expert or a system user. • `Undefined`—User is a user type that is a custom object.
`ConnectApi.WishlistItemSortOrder`	Sort order for wishlist items. • `CreatedDateAsc`—Sorts by oldest creation date. • `CreatedDateDesc`—Sorts by most recent creation date.
`ConnectApi.WorkflowProcessStatus`	Status of a workflow process. • `Approved` • `Fault` • `Held` • `NoResponse` • `Pending` • `Reassigned` • `Rejected` • `Removed` • `Started`

Enum	Description
`ConnectApi.ZoneSearchResultType`	Zone search result type. • `Article`—Search results contain only articles. • `Question`—Search results contain only questions.
`ConnectApi.ZoneShowIn`	Zone search result location. • `Community`—Available in an Experience Cloud site. • `Internal`—Available internally only. • `Portal`—Available in a portal.

`ConnectApi` Exceptions

The `ConnectApi` namespace contains exception classes.

All exceptions classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions on page 3499.

The `ConnectApi` namespace contains these exceptions:

Exception	Description
`ConnectApi.ConnectApiException`	Any logic error in the way your application is utilizing `ConnectApi` code. This is equivalent to receiving a 400 error from Connect REST API.
`ConnectApi.NotFoundException`	Any issues with the specified resource being found. This is equivalent to receiving a 404 error from Connect REST API.
`ConnectApi.RateLimitException`	When you exceed the rate limit. This is equivalent to receiving a 503 Service Unavailable error from Connect REST API.

`ConnectApi` Utilities

The `ConnectApi` namespace contains a utility class.

Utility	Description
`ConnectApi.ConnectUtilities.unwrapApexWrapper()`	Unwraps obfuscated, Apex-wrapped objects into known types such as `Map<String, Object>`. Example from Apex Debug log: `core.connect.apex.ApexMapWrapper@7270879d`

Example

This example calls `getManagedContentForSite(siteId, contentKeyOrId, showAbsoluteUrl)` to get a custom content type with an image reference and uses the `ConnectApi.ConnectUtilities.unwrapApexWrapper()` utility.

```
ConnectApi.ManagedContentDeliveryDocument res =
    ConnectApi.ManagedContentDelivery.getManagedContentForSite
('0DMXXXXXXXXXXXXXXX','MCLXXXXXXXXXXXXXXXXXXXXXXXXXX',true);

//before contentBody field ApexWrapper is unwrapped
system.debug(res.contentBody);

//unwrap contentBody field in res
Map<String,Object> contentBody =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(res.contentBody);

//after contentBody field ApexWrapper is unwrapped, but image field still wrapped
system.debug(contentBody);

//before image field ApexWrapper is unwrapped
system.debug(contentBody.get('Image'));

//unwrap Image field in contentBody
Map<String,Object> Image =
(Map<String,Object>)ConnectApi.ConnectUtilities.unwrapApexWrapper(contentBody.get('Image'));

//after image field ApexWrapper is unwrapped
system.debug(Image);

//replace wrapped primary_image in contentBody with unwrapped version
contentBody.put('Image', Image);

//after contentBody field ApexWrapper is unwrapped, with image field also unwrapped
system.debug(contentBody);
```

ConnectApi Release Notes

Use the Salesforce Release Notes to learn about the most recent updates and changes to the ConnectApi namespace in Apex.

For updates and changes that impact Apex, including ConnectApi, see the Apex Release Notes.

For new and changed ConnectApi classes and enums, see ConnectApi (Connect in Apex): New and Changed Classes and Enums in the Salesforce Release Notes.

Context Namespace

The `Context` namespace provides classes and methods to manage the sharing and consumption of business application data by using Context Service.

The `Context` namespace includes the IndustriesContext class.

Database Namespace

The `Database` namespace provides classes used with DML operations.

The following are the classes in the `Database` namespace.

IN THIS SECTION:

Batchable Interface
The class that implements this interface can be executed as a batch Apex job.

BatchableContext Interface
Represents the parameter type of a batch job method and contains the batch job ID. This interface is implemented internally by Apex.

Cursor Class (Beta)
Contains methods to fetch records and to get the number of cursor rows returned from a SOQL query.

DeletedRecord Class
Contains information about a deleted record.

DeleteFilter Enum
Determines if deleted rows are included in Apex cursor rows.

DeleteResult Class
Represents the result of a delete DML operation returned by the `Database.delete` method.

DMLOptions Class
Enables you to set options related to DML operations.

DmlOptions.AssignmentRuleHeader Class
Enables setting assignment rule options.

DMLOptions.DuplicateRuleHeader Class
Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.

DmlOptions.EmailHeader Class
Enables setting email options.

DuplicateError Class
Contains information about an error that occurred when an attempt was made to save a duplicate record. Use if your organization has set up duplicate rules, which are part of the Duplicate Management feature.

EmptyRecycleBinResult Class
The result of the emptyRecycleBin DML operation returned by the `Database.emptyRecycleBin` method.

Error Class
Represents information about an error that occurred during a DML operation when using a Database method.

GetDeletedResult Class
Contains the deleted records retrieved for a specific sObject type and time window.

GetUpdatedResult Class
Contains the result for the `Database.getUpdated` method call.

LeadConvert Class
Contains information used for lead conversion.

LeadConvertResult Class
The result of a lead conversion.

MergeResult Class
Contains the result of a merge Database method operation.

QueryLocator Class
Represents the record set returned by `Database.getQueryLocator` and used with Batch Apex.

QueryLocatorIterator Class
Represents an iterator over a query locator record set.

SaveResult Class
The result of an insert or update DML operation returned by a Database method.

UndeleteResult Class
The result of an undelete DML operation returned by the `Database.undelete` method.

UpsertResult Class
The result of an upsert DML operation returned by the `Database.upsert` method.

Batchable Interface

The class that implements this interface can be executed as a batch Apex job.

Namespace

Database

SEE ALSO:

Apex Developer Guide: Using Batch

Batchable Methods

The following are methods for `Batchable`.

IN THIS SECTION:

execute(jobId, recordList)
Gets invoked when the batch job executes and operates on one batch of records. Contains or calls the main execution logic for the batch job.

finish(jobId)
Gets invoked when the batch job finishes. Place any clean up code in this method.

start(jobId)
Gets invoked when the batch job starts. Returns the record set as an iterable that will be batched for execution.

start(jobId)
Gets invoked when the batch job starts. Returns the record set as a QueryLocator object that will be batched for execution.

execute(jobId, recordList)

Gets invoked when the batch job executes and operates on one batch of records. Contains or calls the main execution logic for the batch job.

Signature

```
public Void execute(Database.BatchableContext jobId, List<sObject> recordList)
```

Parameters

jobId
Type: Database.BatchableContext

Contains the job ID.

recordList
Type: List<sObject>

Contains the batch of records to process.

Return Value

Type: Void

finish(jobId)

Gets invoked when the batch job finishes. Place any clean up code in this method.

Signature

```
public Void finish(Database.BatchableContext jobId)
```

Parameters

jobId
Type: Database.BatchableContext

Contains the job ID.

Return Value

Type: Void

start(jobId)

Gets invoked when the batch job starts. Returns the record set as an iterable that will be batched for execution.

Signature

```
public System.Iterable start(Database.BatchableContext jobId)
```

Parameters

jobId
Type: Database.BatchableContext

Contains the job ID.

Return Value

Type: System.Iterable

`start(jobId)`

Gets invoked when the batch job starts. Returns the record set as a QueryLocator object that will be batched for execution.

Signature

```
public Database.QueryLocator start(Database.BatchableContext jobId)
```

Parameters

jobId
Type: Database.BatchableContext

Contains the job ID.

Return Value

Type: Database.QueryLocator

BatchableContext Interface

Represents the parameter type of a batch job method and contains the batch job ID. This interface is implemented internally by Apex.

Namespace

Database

SEE ALSO:

Batchable Interface

BatchableContext Methods

The following are methods for `BatchableContext`.

IN THIS SECTION:

getChildJobId()
Returns the ID of the current batch job chunk that is being processed.

getJobId()
Returns the batch job ID.

`getChildJobId()`

Returns the ID of the current batch job chunk that is being processed.

Signature

```
public Id getChildJobId()
```

Return Value

Type: ID

`getJobId()`

Returns the batch job ID.

Signature

```
public Id getJobId()
```

Return Value

Type: ID

Cursor Class (Beta)

Contains methods to fetch records and to get the number of cursor rows returned from a SOQL query.

Namespace

Database

Usage

Note: This feature is a Beta Service. Customer may opt to try such Beta Service in its sole discretion. Any use of the Beta Service is subject to the applicable Beta Services Terms provided at Agreements and Terms. You can provide feedback and suggestions for the feature in the Trailblazer Community.

A cursor is created when a SOQL query is executed on a `Database.getCursor()` or a `Database.getCursorWithBinds()` call. When the SOQL query is invoked, the corresponding rows are returned from the cursor. The maximum number of rows per cursor is 50 million, regardless of the operation being synchronous or asynchronous.

Example

```
public class QueryChunkingQueuable implements Queueable {
    private Database.Cursor locator;
```

```
    private integer position;

    public QueryChunkingQueuable() {
        locator = Database.getCursor
                  ('SELECT Id FROM Contact WHERE LastActivityDate = LAST_N_DAYS:400');
        position = 0;
    }

    public void execute(QueueableContext ctx) {
        List<Contact> scope = locator.fetch(position, 200);
        position += scope.size();
        // do something, like archive or delete the scope list records
        if(position < locator.getNumRecords() ) {
            // process the next chunk
            System.enqueueJob(this);
        }
    }
}
```

IN THIS SECTION:

Cursor Methods

Cursor Methods

The following are methods for `Cursor`.

IN THIS SECTION:

fetch(position, count)

Fetches cursor rows that correspond to the offset position and the specified record count. The maximum number of rows per cursor is 50 million, regardless of the operation being synchronous or asynchronous.

getNumRecords()

Gets the number of rows returned in an Apex cursor from a `Cursor.fetch(position, count)` operation.

`fetch(position, count)`

Fetches cursor rows that correspond to the offset position and the specified record count. The maximum number of rows per cursor is 50 million, regardless of the operation being synchronous or asynchronous.

Signature

```
public static List<SObject> fetch(Integer position, Integer count)
```

Parameters

`position`

Type: Integer

The offset position from which records are fetched.

count
Type: Integer

The number of sObjects to fetch from the cursor, up to a maximum of 2,000.

Return Value

Type: List on page 3603<sObject>

The list of sObjects from the SOQL query, starting from the specified position.

`getNumRecords()`

Gets the number of rows returned in an Apex cursor from a `Cursor.fetch(position, count)` operation.

Signature

```
public static Integer getNumRecords()
```

Return Value

Type: Integer

DeletedRecord Class

Contains information about a deleted record.

Namespace

Database

Usage

The `getDeletedRecords` method of the `Database.GetDeletedResult` class returns a list of `Database.DeletedRecord` objects. Use the methods in the `Database.DeletedRecord` class to retrieve details about each deleted record.

DeletedRecord Methods

The following are methods for `DeletedRecord`. All are instance methods.

IN THIS SECTION:

getDeletedDate()
Returns the deleted date of this record.

getId()
Returns the ID of a record deleted within the time window specified in the `Database.getDeleted` method.

`getDeletedDate()`

Returns the deleted date of this record.

Signature

```
public Date getDeletedDate()
```

Return Value

Type: Date

`getId()`

Returns the ID of a record deleted within the time window specified in the `Database.getDeleted` method.

Signature

```
public Id getId()
```

Return Value

Type: ID

`DeleteFilter Enum`

Determines if deleted rows are included in Apex cursor rows.

Enum Values

The following are the values of the `Database.DeleteFilter` enum.

Value	Description
`DELETED_ROWS_ONLY`	Includes only deleted rows.
`NO_DELETED_ROWS`	Excludes deleted rows.
`NO_DELETED_SHARING_ROWS`	Excludes deleted rows as per sharing rules.
`NO_FILTER`	Includes all rows, including deleted rows.

DeleteResult Class

Represents the result of a delete DML operation returned by the `Database.delete` method.

Namespace

Database

Usage

An array of `Database.DeleteResult` objects is returned with the `delete` database method. Each element in the DeleteResult array corresponds to the sObject array passed as the *`sObject[]`* parameter in the `delete` Database method; that is, the first element in the DeleteResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the DeleteResult array contains a single element.

Example

The following example shows how to obtain and iterate through the returned `Database.DeleteResult` objects. It deletes some queried accounts using `Database.delete` with a false second parameter to allow partial processing of records on failure. Next, it iterates through the results to determine whether the operation was successful or not for each record. It writes the ID of every record that was processed successfully to the debug log, or error messages and fields of the failed records.

```
// Query the accounts to delete
Account[] accts = [SELECT Id from Account WHERE Name LIKE 'Acme%'];
// Delete the accounts
Database.DeleteResult[] drList = Database.delete(accts, false);

// Iterate through each returned result
for(Database.DeleteResult dr : drList) {
    if (dr.isSuccess()) {
        // Operation was successful, so get the ID of the record that was processed
        System.debug('Successfully deleted account with ID: ' + dr.getId());
    }
    else {
        // Operation failed, so get all errors
        for(Database.Error err : dr.getErrors()) {
            System.debug('The following error has occurred.');
            System.debug(err.getStatusCode() + ': ' + err.getMessage());
            System.debug('Account fields that affected this error: ' + err.getFields());
        }
    }
}
```

DeleteResult Methods

The following are methods for `DeleteResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

getId()
Returns the ID of the sObject you were trying to delete.

isSuccess()
A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error[]

`getId()`

Returns the ID of the sObject you were trying to delete.

Signature

```
public ID getId()
```

Return Value

Type: ID

`isSuccess()`

A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

DMLOptions Class

Enables you to set options related to DML operations.

Namespace

Database

Usage

`Database.DMLOptions` is only available for Apex saved against API versions 15.0 and higher. DMLOptions settings take effect only for record operations performed using Apex DML and not through the Salesforce user interface. The DMLOptions class has three child options.

DML Child Options

DmlOptions.AssignmentRuleHeader—Enables setting assignment rule options.

DmlOptions.DuplicateRuleHeader—Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.

DmlOptions.EmailHeader—Enables setting email options.

DmlOptions Properties

The following are properties for `DmlOptions`.

IN THIS SECTION:

allowFieldTruncation
Specifies the truncation behavior of large strings.

assignmentRuleHeader
Specifies the assignment rule to be used when creating a case or lead.

emailHeader
Specifies additional information regarding the automatic email that gets sent when an events occurs.

localeOptions
Specifies the language of any labels that are returned by Apex.

optAllOrNone
Specifies whether the operation allows for partial success.

`allowFieldTruncation`

Specifies the truncation behavior of large strings.

Signature

```
public Boolean allowFieldTruncation {get; set;}
```

Property Value

Type: Boolean

Usage

In Apex saved against API versions previous to 15.0, if you specify a value for a string and that value is too large, the value is truncated. For API version 15.0 and later, if a value is specified that is too large, the operation fails and an error message is returned. The `allowFieldTruncation` property allows you to specify that the previous behavior, truncation, be used instead of the new behavior in Apex saved against API versions 15.0 and later.

`assignmentRuleHeader`

Specifies the assignment rule to be used when creating a case or lead.

Signature

```
public Database.DmlOptions.Assignmentruleheader assignmentRuleHeader {get; set;}
```

Property Value

Type: Database.DMLOptions.AssignmentRuleHeader

Usage

DMLOption.AssignmentRuleHeader.useDefaultRule affects only the default assignment rule and does not disable other existing assignment rules on the object.

Note: The Database.DMLOptions object supports assignment rules for cases and leads, but not for accounts.

emailHeader

Specifies additional information regarding the automatic email that gets sent when an events occurs.

Signature

```
public Database.DmlOptions.EmailHeader emailHeader {get; set;}
```

Property Value

Type: Database.DMLOptions.EmailHeader

Usage

The Salesforce user interface allows you to specify whether or not to send an email when the following events occur.

- Creation of a new case or task
- Conversion of a case email to a contact
- New user email notification
- Lead queue email notification
- Password reset

In Apex saved against API version 15.0 or later, the Database.DMLOptions `emailHeader` property enables you to specify additional information regarding the email that gets sent when one of the events occurs because of the code's execution.

localeOptions

Specifies the language of any labels that are returned by Apex.

Signature

```
public Database.DmlOptions.LocaleOptions localeOptions {get; set;}
```

Property Value

Type: Database.DMLOptions.LocaleOptions

Usage

The value must be a valid user locale (language and country), such as de_DE or en_GB. The value is a String, 2-5 characters long. The first two characters are always an ISO language code, for example 'fr' or 'en.' If the value is further qualified by a country, then the string also has an underscore (_) and another ISO country code, for example 'US' or 'UK'. For example, the string for the United States is 'en_US', and the string for French Canadian is 'fr_CA'.

`optAllOrNone`

Specifies whether the operation allows for partial success.

Signature

```
public Boolean optAllOrNone {get; set;}
```

Property Value

Type: Boolean

Usage

If `optAllOrNone` is set to `true`, all changes are rolled back if any record causes errors. The default for this property is `false` and successfully processed records are committed while records with errors aren't. If `optAllOrNone` is set to `false` and a record fails, the remainder of the DML operation can still succeed. You must iterate through the returned results to identify which records succeeded or failed.

This property is available in Apex saved against Salesforce API version 20.0 and later.

DmlOptions.AssignmentRuleHeader Class

Enables setting assignment rule options.

Namespace

Database

Example

The following example uses the `useDefaultRule` option:

```
Database.DMLOptions dmo = new Database.DMLOptions();
dmo.assignmentRuleHeader.useDefaultRule= true;

Lead l = new Lead(company='ABC', lastname='Smith');
l.setOptions(dmo);
insert l;
```

The following example uses the `assignmentRuleID` option:

```
Database.DMLOptions dmo = new Database.DMLOptions();
dmo.assignmentRuleHeader.assignmentRuleId= '01QD0000000EqAn';
```

```
Lead l = new Lead(company='ABC', lastname='Smith');
l.setOptions(dmo);
insert l;
```

DmlOptions.AssignmentRuleHeader Properties

The following are properties for `DmlOptions.AssignmentRuleHeader`.

IN THIS SECTION:

assignmentRuleID

Specifies the ID of a specific assignment rule to run for the case or lead. The assignment rule can be active or inactive.

useDefaultRule

If specified as `true` for a case or lead, the system uses the default (active) assignment rule for the case or lead. If specified, do not specify an `assignmentRuleId`.

assignmentRuleID

Specifies the ID of a specific assignment rule to run for the case or lead. The assignment rule can be active or inactive.

Signature

```
public Id assignmentRuleID {get; set;}
```

Property Value

Type: ID

Usage

The ID can be retrieved by querying the AssignmentRule sObject. If specified, do not specify `useDefaultRule`.

If the value is not in the correct ID format (15-character or 18-character Salesforce ID), the call fails and an exception is returned.

useDefaultRule

If specified as `true` for a case or lead, the system uses the default (active) assignment rule for the case or lead. If specified, do not specify an `assignmentRuleId`.

Signature

```
public Boolean useDefaultRule {get; set;}
```

Property Value

Type: Boolean

Usage

If there are no assignment rules in the organization, in API version 29.0 and earlier, creating a case or lead with `useDefaultRule` set to `true` results in the case or lead being assigned to the predefined default owner. In API version 30.0 and later, the case or lead is unassigned and doesn't get assigned to the default owner.

DMLOptions.DuplicateRuleHeader Class

Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.

Namespace

Database

Example

The following example shows how to save an account record that's been identified as a duplicate. To learn how to iterate through duplicate errors, see DuplicateError Class

```
Database.DMLOptions dml = new Database.DMLOptions();
dml.DuplicateRuleHeader.allowSave = true;
dml.DuplicateRuleHeader.runAsCurrentUser = true;
Account duplicateAccount = new Account(Name='dupe');
Database.SaveResult sr = Database.insert(duplicateAccount, dml);
if (sr.isSuccess()) {
 System.debug('Duplicate account has been inserted in Salesforce!');
}
```

IN THIS SECTION:

DMLOptions.DuplicateRuleHeader Properties

DMLOptions.DuplicateRuleHeader Properties

The following are properties for `DMLOptions.DuplicateRuleHeader`.

IN THIS SECTION:

allowSave

For a duplicate rule, when the Alert option is enabled, bypass alerts and save duplicate records by setting this property to `true`. Prevent duplicate records from being saved by setting this property to `false`.

runAsCurrentUser

Make sure that sharing rules for the current user are enforced when duplicate rules run by setting this property to `true`. Use the sharing rules specified in the class for the request by setting this property to `false`. If no sharing rules are specified, Apex code runs in system context and sharing rules for the current user are not enforced.

`allowSave`

For a duplicate rule, when the Alert option is enabled, bypass alerts and save duplicate records by setting this property to `true`. Prevent duplicate records from being saved by setting this property to `false`.

Signature

```
public Boolean allowSave {get; set;}
```

Property Value

Type: Boolean

Example

This example shows how to save an account record that's been identified as a duplicate. `dml.DuplicateRuleHeader.allowSave = true` means the user should be allowed to save the duplicate. To learn how to iterate through duplicate errors, see DuplicateError Class.

```
Database.DMLOptions dml = new Database.DMLOptions();
dml.DuplicateRuleHeader.allowSave = true;
dml.DuplicateRuleHeader.runAsCurrentUser = true;
Account duplicateAccount = new Account(Name='dupe');
Database.SaveResult sr = Database.insert(duplicateAccount, dml);
if (sr.isSuccess()) {
 System.debug('Duplicate account has been inserted in Salesforce!');
}
```

runAsCurrentUser

Make sure that sharing rules for the current user are enforced when duplicate rules run by setting this property to `true`. Use the sharing rules specified in the class for the request by setting this property to `false`. If no sharing rules are specified, Apex code runs in system context and sharing rules for the current user are not enforced.

Signature

```
public Boolean runAsCurrentUser {get; set;}
```

Property Value

Type: Boolean

Usage

If specified as `true`, duplicate rules run for the current user, which ensures users can't view duplicate records that aren't available to them.

Use `runAsCurrentUser = true` to detect duplicates when converting leads to contacts. Typically, lead conversion Apex code runs in a system context and does not enforce sharing rules for the current user.

Example

This example shows how to set options so that duplicate rules run for the current user when saving a new account.

```
Database.DMLOptions dml = new Database.DMLOptions();
dml.DuplicateRuleHeader.allowSave = true;
dml.DuplicateRuleHeader.runAsCurrentUser = true;
Account duplicateAccount = new Account(Name='dupe');
```

```
Database.SaveResult sr = Database.insert(duplicateAccount, dml);
if (sr.isSuccess()) {
 System.debug('Duplicate account has been inserted in Salesforce!');
}
```

DmlOptions.EmailHeader Class

Enables setting email options.

Namespace

Database

Usage

Even though auto-sent emails can be triggered by actions in the Salesforce user interface, the DMLOptions settings for `emailHeader` take effect only for DML operations carried out in Apex code.

Example

In the following example, the `triggerAutoResponseEmail` option is specified:

```
Account a = new Account(name='Acme Plumbing');

    insert a;

    Contact c = new Contact(email='jplumber@salesforce.com',
firstname='Joe',lastname='Plumber', accountid=a.id);

    insert c;

    Database.DMLOptions dlo = new Database.DMLOptions();

    dlo.EmailHeader.triggerAutoResponseEmail = true;

    Case ca = new Case(subject='Plumbing Problems', contactid=c.id);

    database.insert(ca, dlo);
```

Suppose that you use an after-insert or after-update trigger to change ownership of leads, contacts, or opportunities. If you use the API to change record ownership, or if a Lightning Experience user changes a record's owner, no email notification is sent. To send email notifications to a record's new owner, set the `triggerUserEmail` property to `true`.

DmlOptions.EmailHeader Properties

The following are properties for `DmlOptions.EmailHeader`.

IN THIS SECTION:

triggerAutoResponseEmail
Indicates whether to trigger auto-response rules (`true`) or not (`false`), for leads and cases.

triggerOtherEmail
Indicates whether to trigger email outside the organization (`true`) or not (`false`).

triggerUserEmail
Indicates whether to trigger email that is sent to users in the organization (`true`) or not (`false`).

`triggerAutoResponseEmail`

Indicates whether to trigger auto-response rules (`true`) or not (`false`), for leads and cases.

Signature

```
public Boolean triggerAutoResponseEmail {get; set;}
```

Property Value

Type: Boolean

Usage

This email can be automatically triggered by a number of events, for example creating a case or resetting a user password. If this value is set to `true`, when a case is created, if there is an email address for the contact specified in `ContactID`, the email is sent to that address. If not, the email is sent to the address specified in `SuppliedEmail`

`triggerOtherEmail`

Indicates whether to trigger email outside the organization (`true`) or not (`false`).

Signature

```
public Boolean triggerOtherEmail {get; set;}
```

Property Value

Type: Boolean

Usage

This email can be automatically triggered by creating, editing, or deleting a contact for a case.

Note: Email sent through Apex because of a group event includes additional behaviors. A *group event* is an event for which `IsGroupEvent` is true. The `EventAttendee` object tracks the users, leads, or contacts that are invited to a group event. Note the following behaviors for group event email sent through Apex:

- Sending a group event invitation to a lead or contact respects the `triggerOtherEmail` option
- Email sent when updating or deleting a group event also respects the `triggerUserEmail` and `triggerOtherEmail` options, as appropriate

`triggerUserEmail`

Indicates whether to trigger email that is sent to users in the organization (`true`) or not (`false`).

Signature

```
public Boolean triggerUserEmail {get; set;}
```

Property Value

Type: Boolean

Usage

This email can be automatically triggered by a number of events; resetting a password, creating a new user, or creating or modifying a task.

Note: Adding comments to a case in Apex doesn't trigger email to users in the organization even if `triggerUserEmail` is set to `true`.

Note: Email sent through Apex because of a group event includes additional behaviors. A *group event* is an event for which `IsGroupEvent` is true. The EventAttendee object tracks the users, leads, or contacts that are invited to a group event. Note the following behaviors for group event email sent through Apex:

- Sending a group event invitation to a user respects the `triggerUserEmail` option
- Email sent when updating or deleting a group event also respects the `triggerUserEmail` and `triggerOtherEmail` options, as appropriate

DuplicateError Class

Contains information about an error that occurred when an attempt was made to save a duplicate record. Use if your organization has set up duplicate rules, which are part of the Duplicate Management feature.

Namespace

Database

Example

When you try to save a record that's identified as a duplicate record by a duplicate rule, you'll receive a duplicate error. If the duplicate rule contains the Allow action, an attempt will be made to bypass the error.

```
// Try to save a duplicate account
Account duplicateAccount = new Account(Name='Acme',  BillingCity='San Francisco');
Database.SaveResult sr = Database.insert(duplicateAccount, false);
if (!sr.isSuccess()) {

 // Insertion failed due to duplicate detected
 for(Database.Error duplicateError : sr.getErrors()){
  Datacloud.DuplicateResult duplicateResult =
                 ((Database.DuplicateError)duplicateError).getDuplicateResult();
  System.debug('Duplicate records have been detected by ' +
```

```
                    duplicateResult.getDuplicateRule());
   System.debug(duplicateResult.getErrorMessage());
  }

  // If the duplicate rule is an alert rule, we can try to bypass it
  Database.DMLOptions dml = new Database.DMLOptions();
  dml.DuplicateRuleHeader.AllowSave = true;
  Database.SaveResult sr2 = Database.insert(duplicateAccount, dml);
  if (sr2.isSuccess()) {
   System.debug('Duplicate account has been inserted in Salesforce!');
  }
 }
```

IN THIS SECTION:

DuplicateError Methods

SEE ALSO:

SaveResult Class

DuplicateResult Class

Error Class

DuplicateError Methods

The following are methods for `DuplicateError`.

IN THIS SECTION:

getDuplicateResult()

Returns the details of a duplicate rule and duplicate records found by the duplicate rule.

getFields()

Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

getMessage()

Returns the error message text.

getStatusCode()

Returns a code that characterizes the error.

`getDuplicateResult()`

Returns the details of a duplicate rule and duplicate records found by the duplicate rule.

Signature

```
public Datacloud.DuplicateResult getDuplicateResult()
```

Return Value

Type: Datacloud.DuplicateResult

Example

This example shows the code used to get the possible duplicates and related match information after saving a new contact. This code is part of a custom application that implements duplicate management when users add a contact. See DuplicateResult Class on page 2435 to check out the entire sample applicaton.

```
Datacloud.DuplicateResult duplicateResult =
                            duplicateError.getDuplicateResult();
```

`getFields()`

Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

Signature

```
public List<String> getFields()
```

Return Value

Type: List<String>

`getMessage()`

Returns the error message text.

Signature

```
public String getMessage()
```

Return Value

Type: String

`getStatusCode()`

Returns a code that characterizes the error.

Signature

```
public StatusCode getStatusCode()
```

Return Value

Type: StatusCode

EmptyRecycleBinResult Class

The result of the emptyRecycleBin DML operation returned by the `Database.emptyRecycleBin` method.

Namespace

Database

Usage

A list of `Database.EmptyRecycleBinResult` objects is returned by the `Database.emptyRecycleBin` method. Each object in the list corresponds to either a record ID or an sObject passed as the parameter in the `Database.emptyRecycleBin` method. The first index in the EmptyRecycleBinResult list matches the first record or sObject specified in the list, the second with the second, and so on.

EmptyRecycleBinResult Methods

The following are methods for `EmptyRecycleBinResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred during the delete for this record or sObject, returns a list of one or more Database.Error objects. If no errors occurred, the returned list is empty.

getId()
Returns the ID of the record or sObject you attempted to delete.

isSuccess()
Returns `true` if the record or sObject was successfully removed from the Recycle Bin; otherwise `false`.

`getErrors()`

If an error occurred during the delete for this record or sObject, returns a list of one or more Database.Error objects. If no errors occurred, the returned list is empty.

Signature

```
public Database.Errors[] getErrors()
```

Return Value

Type: Database.Errors []

`getId()`

Returns the ID of the record or sObject you attempted to delete.

Signature

```
public ID getId()
```

Return Value

Type: ID

isSuccess()

Returns `true` if the record or sObject was successfully removed from the Recycle Bin; otherwise `false`.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

Error Class

Represents information about an error that occurred during a DML operation when using a Database method.

Namespace

Database

Usage

`Error` class is part of `SaveResult`, which is generated when a user attempts to save a Salesforce record.

SEE ALSO:

- SaveResult Class
- DuplicateError Class

Error Methods

The following are methods for `Error`. All are instance methods.

IN THIS SECTION:

- getFields()
  Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.
- getMessage()
  Returns the error message text.
- getStatusCode()
  Returns a code that characterizes the error.

getFields()

Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

Signature

```
public String[] getFields()
```

Return Value

Type: String[]

`getMessage()`

Returns the error message text.

Signature

```
public String getMessage()
```

Return Value

Type: String

`getStatusCode()`

Returns a code that characterizes the error.

Signature

```
public StatusCode getStatusCode()
```

Return Value

Type: StatusCode

Usage

The full list of status codes is available in the WSDL file for your organization (see *Downloading Salesforce WSDLs and Client Authentication Certificates* in the Salesforce online help.)

GetDeletedResult Class

Contains the deleted records retrieved for a specific sObject type and time window.

Namespace

Database

Usage

The `Database.getDeleted` method returns the deleted record information as a `Database.GetDeletedResult` object.

GetDeletedResult Methods

The following are methods for `GetDeletedResult`. All are instance methods.

IN THIS SECTION:

getDeletedRecords()
Returns a list of deleted records for the time window specified in the `Database.getDeleted` method call.

getEarliestDateAvailable()
Returns the date in Coordinated Universal Time (UTC) of the earliest physically deleted object for the sObject type specified in `Database.getDeleted`.

getLatestDateCovered()
Returns the date in Coordinated Universal Time (UTC) of the last date covered in the `Database.getDeleted` call.

`getDeletedRecords()`

Returns a list of deleted records for the time window specified in the `Database.getDeleted` method call.

Signature

```
public List<Database.DeletedRecord> getDeletedRecords()
```

Return Value

Type: List<Database.DeletedRecord>

`getEarliestDateAvailable()`

Returns the date in Coordinated Universal Time (UTC) of the earliest physically deleted object for the sObject type specified in `Database.getDeleted`.

Signature

```
public Date getEarliestDateAvailable()
```

Return Value

Type: Date

`getLatestDateCovered()`

Returns the date in Coordinated Universal Time (UTC) of the last date covered in the `Database.getDeleted` call.

Signature

```
public Date getLatestDateCovered()
```

Return Value

Type: Date

Usage

If there is a value, it is less than or equal to the *endDate* argument of `Database.getDeleted`. A value here indicates that, for safety, you should use this value for the *startDate* of your next call to capture the changes that started after this date but didn't complete before *endDate* and were, therefore, not returned in the previous call.

GetUpdatedResult Class

Contains the result for the `Database.getUpdated` method call.

Namespace

Database

Usage

Use the methods in this class to obtain detailed information about the updated records returned by `Database.getUpdated` for a specific time window.

GetUpdatedResult Methods

The following are methods for `GetUpdatedResult`. All are instance methods.

IN THIS SECTION:

getIds()
Returns the IDs of records updated within the time window specified in the `Database.getUpdated` method.

getLatestDateCovered()
Returns the date in Coordinated Universal Time (UTC) of the last date covered in the `Database.getUpdated` call.

`getIds()`

Returns the IDs of records updated within the time window specified in the `Database.getUpdated` method.

Signature

```
public List<Id> getIds()
```

Return Value

Type: List<ID>

`getLatestDateCovered()`

Returns the date in Coordinated Universal Time (UTC) of the last date covered in the `Database.getUpdated` call.

Signature

```
public Date getLatestDateCovered()
```

Return Value

Type: Date

LeadConvert Class

Contains information used for lead conversion.

Namespace

Database

Usage

The `convertLead` Database method converts a lead into an account and contact or an account and person account, as well as (optionally) an opportunity. The `convertLead` takes an instance of the `Database.LeadConvert` class as a parameter. Create an instance of this class and set the information required for conversion, such as setting the lead, and destination account and contact.

Note: The `Database.convertLead()` method can take one `LeadConvert` object or a list of `LeadConvert` objects.

Example

This example shows how to use the `Database.convertLead` method to convert a lead. It inserts a new lead, creates a `LeadConvert` object, sets its status to `converted`, then passes it to the `Database.convertLead` method. Finally, it verifies that the conversion was successful.

```
Lead myLead = new Lead(LastName = 'Fry', Company='Fry And Sons');
insert myLead;

Database.LeadConvert lc = new Database.LeadConvert();
lc.setLeadId(myLead.id);

LeadStatus convertStatus = [SELECT Id, ApiName FROM LeadStatus WHERE IsConverted=true LIMIT
 1];
lc.setConvertedStatus(convertStatus.ApiName);

Database.LeadConvertResult lcr = Database.convertLead(lc);
System.assert(lcr.isSuccess());
```

IN THIS SECTION:

LeadConvert Constructors

LeadConvert Methods

LeadConvert Constructors

The following are constructors for `LeadConvert`.

IN THIS SECTION:

LeadConvert()
Creates a new instance of the `Database.LeadConvert` class.

`LeadConvert()`

Creates a new instance of the `Database.LeadConvert` class.

Signature

```
public LeadConvert()
```

LeadConvert Methods

The following are methods for `LeadConvert`. All are instance methods.

IN THIS SECTION:

getAccountId()
Gets the ID of the account into which the lead will be merged.

getAccountRecord()
This method is for internal use only.

getBypassAccountDedupeCheck()
This method is for internal use only.

getBypassContactDedupeCheck()
This method is for internal use only.

getContactId()
Gets the ID of the contact into which the lead will be merged.

getContactRecord()
This method is for internal use only.

getConvertedStatus()
Gets the lead status value for a converted lead.

getLeadID()
Gets the ID of the lead to convert.

getOpportunityId()
Gets the ID of the existing opportunity that will be related to the resulting contact.

getOpportunityName()
Gets the name of the opportunity to create.

getOpportunityRecord()
This method is for internal use only.

getOwnerID()
Gets the ID of the person to own any newly created account, contact, and opportunity.

getRelatedPersonAccountId()

Gets the ID of the existing person account into which the lead will be converted.

getRelatedPersonAccountRecord()

Gets the entity record of the new person account into which the lead will be converted.

isDoNotCreateOpportunity()

Indicates whether an Opportunity is created during lead conversion (`false`, the default) or not (`true`).

isOverWriteLeadSource()

Indicates whether the `LeadSource` field on the target Contact object is overwritten with the contents of the `LeadSource` field in the source Lead object (`true`), or not (`false`, the default).

isSendNotificationEmail()

Indicates whether a notification email is sent to the owner specified by `setOwnerId` (`true`) or not (`false`, the default).

setAccountId(accountId)

Sets the ID of the account into which the lead is merged. This value is required only when updating an existing account, including person accounts.

setAccountRecord(accountRecord)

This method is for internal use only.

setBypassAccountDedupeCheck(bypassAccountDedupeCheck)

This method is for internal use only.

setBypassContactDedupeCheck(bypassContactDedupeCheck)

This method is for internal use only.

setContactId(contactId)

Sets the ID of the contact into which the lead will be merged (this contact must be associated with the account specified with `setAccountId`, and `setAccountId` must be specified). This value is required only when updating an existing contact.

setContactRecord(contactRecord)

This method is for internal use only.

setConvertedStatus(status)

Sets the lead status value for a converted lead. This field is required.

setDoNotCreateOpportunity(createOpportunity)

Specifies whether to create an opportunity during lead conversion. The default value is `false`: opportunities are created by default. Set this flag to `true` only if you do not want to create an opportunity from the lead.

setLeadId(leadId)

Sets the ID of the lead to convert. This field is required.

setOpportunityId(opportunityId)

Sets the ID of the opportunity into which the lead is merged. This value is required only when updating an existing opportunity.

setOpportunityName(opportunityName)

Sets the name of the opportunity to create. If no name is specified, this value defaults to the company name of the lead.

setOpportunityRecord(opportunityRecord)

This method is for internal use only.

setOverwriteLeadSource(overwriteLeadSource)

Specifies whether to overwrite the `LeadSource` field on the target contact object with the contents of the `LeadSource` field in the source lead object. The default value is `false`, to not overwrite the field. If you specify this as `true`, you must also specify `setContactId` for the target contact.

setOwnerId(ownerId)

Specifies the ID of the person to own any newly created account, contact, and opportunity. If the application does not specify this value, the owner of the new object will be the owner of the lead.

setRelatedPersonAccountId(relatedPersonAccountId)

Sets the ID of the existing person account into which to convert the lead. This value is required only when updating an existing person account.

setSendNotificationEmail(sendEmail)

Specifies whether to send a notification email to the owner specified by `setOwnerId`. The default value is `false`, that is, to not send email.

getAccountId()

Gets the ID of the account into which the lead will be merged.

Signature

```
public ID getAccountId()
```

Return Value

Type: ID

getAccountRecord()

This method is for internal use only.

getBypassAccountDedupeCheck()

This method is for internal use only.

getBypassContactDedupeCheck()

This method is for internal use only.

getContactId()

Gets the ID of the contact into which the lead will be merged.

Signature

```
public ID getContactId()
```

Return Value

Type: ID

getContactRecord()

This method is for internal use only.

getConvertedStatus()

Gets the lead status value for a converted lead.

Signature

```
public String getConvertedStatus()
```

Return Value

Type: String

getLeadID()

Gets the ID of the lead to convert.

Signature

```
public ID getLeadID()
```

Return Value

Type: ID

getOpportunityId()

Gets the ID of the existing opportunity that will be related to the resulting contact.

Signature

```
public ID getOpportunityId()
```

Return Value

Type: ID

getOpportunityName()

Gets the name of the opportunity to create.

Signature

```
public String getOpportunityName()
```

Return Value

Type: String

getOpportunityRecord()

This method is for internal use only.

getOwnerID()

Gets the ID of the person to own any newly created account, contact, and opportunity.

Signature

```
public ID getOwnerID()
```

Return Value

Type: ID

getRelatedPersonAccountId()

Gets the ID of the existing person account into which the lead will be converted.

Signature

```
public ID getRelatedPersonAccountId()
```

Return Value

Type: ID

getRelatedPersonAccountRecord()

Gets the entity record of the new person account into which the lead will be converted.

Signature

```
public ID getRelatedPersonAccountRecord()
```

Return Value

Type: ID

isDoNotCreateOpportunity()

Indicates whether an Opportunity is created during lead conversion (`false`, the default) or not (`true`).

Signature

```
public Boolean isDoNotCreateOpportunity()
```

Return Value

Type: Boolean

isOverWriteLeadSource()

Indicates whether the `LeadSource` field on the target Contact object is overwritten with the contents of the `LeadSource` field in the source Lead object (`true`), or not (`false`, the default).

Signature

```
public Boolean isOverWriteLeadSource()
```

Return Value

Type: Boolean

isSendNotificationEmail()

Indicates whether a notification email is sent to the owner specified by `setOwnerId` (`true`) or not (`false`, the default).

Signature

```
public Boolean isSendNotificationEmail()
```

Return Value

Type: Boolean

setAccountId(accountId)

Sets the ID of the account into which the lead is merged. This value is required only when updating an existing account, including person accounts.

Signature

```
public Void setAccountId(ID accountId)
```

Parameters

accountId
Type: ID

Return Value

Type: Void

setAccountRecord(accountRecord)

This method is for internal use only.

setBypassAccountDedupeCheck(bypassAccountDedupeCheck)

This method is for internal use only.

setBypassContactDedupeCheck(bypassContactDedupeCheck)

This method is for internal use only.

setContactId(contactId)

Sets the ID of the contact into which the lead will be merged (this contact must be associated with the account specified with `setAccountId`, and `setAccountId` must be specified). This value is required only when updating an existing contact.

Signature

```
public Void setContactId(ID contactId)
```

Parameters

contactId
Type: ID

Return Value

Type: Void

Usage

If `setContactId` is specified, then the application creates a new contact that is implicitly associated with the account. The contact name and other existing data are not overwritten (unless `setOverwriteLeadSource` is set to true, in which case only the `LeadSource` field is overwritten).

Important: If you are converting a lead into a person account, do not specify `setContactId` or an error will result. Specify only `setAccountId` of the person account.

setContactRecord(contactRecord)

This method is for internal use only.

setConvertedStatus(status)

Sets the lead status value for a converted lead. This field is required.

Signature

```
public Void setConvertedStatus(String status)
```

Parameters

status
Type: String

Return Value

Type: Void

setDoNotCreateOpportunity(createOpportunity)

Specifies whether to create an opportunity during lead conversion. The default value is `false`: opportunities are created by default. Set this flag to `true` only if you do not want to create an opportunity from the lead.

Signature

```
public Void setDoNotCreateOpportunity(Boolean createOpportunity)
```

Parameters

createOpportunity
Type: Boolean

Return Value

Type: Void

setLeadId(leadId)

Sets the ID of the lead to convert. This field is required.

Signature

```
public Void setLeadId(ID leadId)
```

Parameters

leadId
Type: ID

Return Value

Type: Void

setOpportunityId(opportunityId)

Sets the ID of the opportunity into which the lead is merged. This value is required only when updating an existing opportunity.

Signature

```
public Void setOpportunityId(ID opportunityId)
```

Parameters

opportunityId
Type: ID

Return Value

Type: Void

setOpportunityName(opportunityName)

Sets the name of the opportunity to create. If no name is specified, this value defaults to the company name of the lead.

Signature

```
public Void setOpportunityName(String opportunityName)
```

Parameters

opportunityName
Type: String

Return Value

Type: Void

Usage

The maximum length of this field is 80 characters.

If `setDoNotCreateOpportunity` is true, no Opportunity is created and this field must be left blank; otherwise, an error is returned.

setOpportunityRecord(opportunityRecord)

This method is for internal use only.

setOverwriteLeadSource(overwriteLeadSource)

Specifies whether to overwrite the `LeadSource` field on the target contact object with the contents of the `LeadSource` field in the source lead object. The default value is `false`, to not overwrite the field. If you specify this as `true`, you must also specify `setContactId` for the target contact.

Signature

```
public Void setOverwriteLeadSource(Boolean overwriteLeadSource)
```

Parameters

overwriteLeadSource
Type: Boolean

Return Value

Type: Void

setOwnerId(ownerId)

Specifies the ID of the person to own any newly created account, contact, and opportunity. If the application does not specify this value, the owner of the new object will be the owner of the lead.

Signature

```
public Void setOwnerId(ID ownerId)
```

Parameters

ownerId
Type: ID

Return Value

Type: Void

Usage

This method is not applicable when merging with existing objects—if `setOwnerId` is specified, the `ownerId` field is not overwritten in an existing account or contact.

setRelatedPersonAccountId(relatedPersonAccountId)

Sets the ID of the existing person account into which to convert the lead. This value is required only when updating an existing person account.

Signature

```
public Void setRelatedPersonAccountId(ID relatedPersonAccountId)
```

Parameters

relatedPersonAccountId
Type: ID

Return Value

Type: Void

setSendNotificationEmail(sendEmail)

Specifies whether to send a notification email to the owner specified by `setOwnerId`. The default value is `false`, that is, to not send email.

Signature

```
public Void setSendNotificationEmail(Boolean sendEmail)
```

Parameters

sendEmail
Type: Boolean

Return Value

Type: Void

LeadConvertResult Class

The result of a lead conversion.

Namespace

Database

Usage

An array of LeadConvertResult objects is returned with the `convertLead` Database method. Each element in the LeadConvertResult array corresponds to the sObject array passed as the *`SObject[]`* parameter in the `convertLead` Database method, that is, the first element in the LeadConvertResult array matches the first element passed in the SObject array, the second element corresponds to the second element, and so on. If only one sObject is passed in, the LeadConvertResult array contains a single element.

LeadConvertResult Methods

The following are methods for `LeadConvertResult`. All are instance methods.

IN THIS SECTION:

getAccountId()
The ID of the new account (if a new account was specified) or the ID of the account specified when `convertLead` was invoked.

getContactId()
The ID of the new contact (if a new contact was specified) or the ID of the contact specified when `convertLead` was invoked.

getErrors()
If an error occurred, an array of one or more database error objects providing the error code and description.

getLeadId()
The ID of the converted lead.

getOpportunityId()
The ID of the new opportunity, if one was created when `convertLead` was invoked.

getRelatedPersonAccountId()
The ID of the new or existing person account specified when `convertLead` was invoked.

isSuccess()
A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise

`getAccountId()`

The ID of the new account (if a new account was specified) or the ID of the account specified when `convertLead` was invoked.

Signature

```
public ID getAccountId()
```

Return Value

Type: ID

getContactId()

The ID of the new contact (if a new contact was specified) or the ID of the contact specified when `convertLead` was invoked.

Signature

```
public ID getContactId()
```

Return Value

Type: ID

getErrors()

If an error occurred, an array of one or more database error objects providing the error code and description.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error[]

getLeadId()

The ID of the converted lead.

Signature

```
public ID getLeadId()
```

Return Value

Type: ID

getOpportunityId()

The ID of the new opportunity, if one was created when `convertLead` was invoked.

Signature

```
public ID getOpportunityId()
```

Return Value

Type: ID

`getRelatedPersonAccountId()`

The ID of the new or existing person account specified when `convertLead` was invoked.

Signature

```
public ID getRelatedPersonAccountId()
```

Return Value

Type: ID

`isSuccess()`

A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

MergeResult Class

Contains the result of a merge Database method operation.

Namespace

Database

Usage

The `Database.merge` method returns a `Database.MergeResult` object for each merged record.

MergeResult Methods

The following are methods for `MergeResult`. All are instance methods.

IN THIS SECTION:

getErrors()
Returns a list of `Database.Error` objects representing the errors encountered, if any, during a merge operation using the `Database.merge` method. If no error occurred, returns null.

getId()
Returns the ID of the master record into which other records were merged.

getMergedRecordIds()
Returns the IDs of the records merged into the master record.

getUpdatedRelatedIds()
Returns the IDs of all related records that were reparented as a result of the merge that are viewable by the user sending the merge call.

isSuccess()
Indicates whether the merge was successful (`true`) or not (`false`).

getErrors()

Returns a list of `Database.Error` objects representing the errors encountered, if any, during a merge operation using the `Database.merge` method. If no error occurred, returns null.

Signature

```
public List<Database.Error> getErrors()
```

Return Value

Type: List<Database.Error>

getId()

Returns the ID of the master record into which other records were merged.

Signature

```
public Id getId()
```

Return Value

Type: ID

getMergedRecordIds()

Returns the IDs of the records merged into the master record.

Signature

```
public List<String> getMergedRecordIds()
```

Return Value

Type: List<String>

getUpdatedRelatedIds()

Returns the IDs of all related records that were reparented as a result of the merge that are viewable by the user sending the merge call.

Signature

```
public List<String> getUpdatedRelatedIds()
```

Return Value

Type: List<String>

`isSuccess()`

Indicates whether the merge was successful (`true`) or not (`false`).

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

QueryLocator Class

Represents the record set returned by `Database.getQueryLocator` and used with Batch Apex.

Namespace

Database

QueryLocator Methods

The following are methods for `QueryLocator`. All are instance methods.

IN THIS SECTION:

getQuery()
Returns the query used to instantiate the `Database.QueryLocator` object. This is useful when testing the `start` method.

iterator()
Returns a new instance of a query locator iterator.

`getQuery()`

Returns the query used to instantiate the `Database.QueryLocator` object. This is useful when testing the `start` method.

Signature

```
public String getQuery()
```

Return Value

Type: String

Usage

You can't use the `FOR UPDATE` keywords with a getQueryLocator query to lock a set of records. The set of records in the batch is determined when the `start` method is run.

Example

```
System.assertEquals(QLReturnedFromStart.
getQuery(),
Database.getQueryLocator([SELECT Id
   FROM Account]).getQuery() );
```

`iterator()`

Returns a new instance of a query locator iterator.

Signature

```
public Database.QueryLocatorIterator iterator()
```

Return Value

Type: Database.QueryLocatorIterator

Usage

Warning: To iterate over a query locator, save the iterator instance that this method returns in a variable and then use this variable to iterate over the collection. Calling `iterator` every time you want to perform an iteration can result in incorrect behavior because each call returns a new iterator instance.

For an example, see QueryLocatorIterator Class.

QueryLocatorIterator Class

Represents an iterator over a query locator record set.

Namespace

Database

Example

This sample shows how to obtain an iterator for a query locator, which contains five accounts. This sample calls `hasNext` and `next` to get each record in the collection.

```
// Get a query locator
Database.QueryLocator q = Database.getQueryLocator(
    [SELECT Name FROM Account LIMIT 5]);
// Get an iterator
Database.QueryLocatorIterator it =  q.iterator();
```

```
// Iterate over the records
while (it.hasNext())
{
    Account a = (Account)it.next();
    System.debug(a);
}
```

QueryLocatorIterator Methods

The following are methods for `QueryLocatorIterator`. All are instance methods.

IN THIS SECTION:

hasNext()
Returns `true` if there are one or more records remaining in the collection; otherwise, returns `false`.

next()
Advances the iterator to the next sObject record and returns the sObject.

`hasNext()`

Returns `true` if there are one or more records remaining in the collection; otherwise, returns `false`.

Signature

```
public Boolean hasNext()
```

Return Value

Type: Boolean

`next()`

Advances the iterator to the next sObject record and returns the sObject.

Signature

```
public sObject next()
```

Return Value

Type: sObject

Usage

Because the return value is the generic sObject type, you must cast it if using a more specific type. For example:

```
Account a = (Account)myIterator.next();
```

Example

```
Account a = (Account)myIterator.next();
```

SaveResult Class

The result of an insert or update DML operation returned by a Database method.

Namespace

Database

Usage

An array of SaveResult objects is returned with the `insert` and `update` database methods. Each element in the SaveResult array corresponds to the sObject array passed as the *`sObject[]`* parameter in the Database method, that is, the first element in the SaveResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the SaveResult array contains a single element.

A SaveResult object is generated when a new or existing Salesforce record is saved.

Example

The following example shows how to obtain and iterate through the returned `Database.SaveResult` objects. It inserts two accounts using `Database.insert` with a false second parameter to allow partial processing of records on failure. One of the accounts is missing the Name required field, which causes a failure. Next, it iterates through the results to determine whether the operation was successful or not for each record. It writes the ID of every record that was processed successfully to the debug log, or error messages and fields of the failed records. This example generates one successful operation and one failure.

```
// Create two accounts, one of which is missing a required field
Account[] accts = new List<Account>{
    new Account(Name='Account1'),
    new Account()};
Database.SaveResult[] srList = Database.insert(accts, false);

// Iterate through each returned result
for (Database.SaveResult sr : srList) {
    if (sr.isSuccess()) {
        // Operation was successful, so get the ID of the record that was processed
        System.debug('Successfully inserted account. Account ID: ' + sr.getId());
    }
    else {
        // Operation failed, so get all errors
        for(Database.Error err : sr.getErrors()) {
            System.debug('The following error has occurred.');
            System.debug(err.getStatusCode() + ': ' + err.getMessage());
            System.debug('Account fields that affected this error: ' + err.getFields());
        }
```

```
        }
}
```

SEE ALSO:

Error Class

DuplicateError Class

SaveResult Methods

The following are methods for `SaveResult`. All are instance methods.

IN THIS SECTION:

getErrors()

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

getId()

Returns the ID of the sObject you were trying to insert or update.

isSuccess()

Returns a Boolean that is set to `true` if the DML operation was successful for this object, `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error[]

`getId()`

Returns the ID of the sObject you were trying to insert or update.

Signature

```
public ID getId()
```

Return Value

Type: ID

Versioned Behavior Changes

In API version 53.0 and later, the method returns the sObject ID. However, if record locking fails during the update operation, the method returns a null value.

In API version 52.0 and earlier, the method returned a null value if the record wasn't updated successfully.

`isSuccess()`

Returns a Boolean that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

Example

This example shows the code used to process duplicate records, which are detected when there is an unsuccessful save due to an error. This code is part of a custom application that implements duplicate management when users add a contact. See DuplicateResult Class on page 2435 to check out the entire sample applicaton.

```
if (!saveResult.isSuccess()) { ... }
```

UndeleteResult Class

The result of an undelete DML operation returned by the `Database.undelete` method.

Namespace

Database

Usage

An array of Database.UndeleteResult objects is returned with the `undelete` database method. Each element in the UndeleteResult array corresponds to the sObject array passed as the *`sObject[]`* parameter in the `undelete` Database method; that is, the first element in the UndeleteResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the UndeleteResults array contains a single element.

UndeleteResult Methods

The following are methods for `UndeleteResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns null.

getId()
Returns the ID of the sObject you were trying to undelete.

isSuccess()
Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns null.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error[]

`getId()`

Returns the ID of the sObject you were trying to undelete.

Signature

```
public ID getId()
```

Return Value

Type: ID

Usage

If this field contains a value, the object was successfully undeleted. If this field is empty, the operation was not successful for that object.

`isSuccess()`

Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

UpsertResult Class

The result of an upsert DML operation returned by the `Database.upsert` method.

Namespace

Database

Usage

An array of Database.UpsertResult objects is returned with the `upsert` database method. Each element in the UpsertResult array corresponds to the sObject array passed as the *`sObject[]`* parameter in the `upsert` Database method; that is, the first element in the UpsertResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the UpsertResults array contains a single element.

UpsertResult Methods

The following are methods for `UpsertResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

getId()
Returns the ID of the sObject you were trying to update or insert.

isCreated()
A Boolean value that is set to `true` if the record was created, `false` if the record was updated.

isSuccess()
Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error []

`getId()`

Returns the ID of the sObject you were trying to update or insert.

Signature

```
public ID getId()
```

Return Value

Type: ID

Versioned Behavior Changes

In API version 53.0 and later, the method returns the sObject ID. However, if record locking fails during the update operation, the method returns a null value.

In API version 52.0 and earlier, the method returned a null value if the record wasn't updated successfully.

`isCreated()`

A Boolean value that is set to `true` if the record was created, `false` if the record was updated.

Signature

```
public Boolean isCreated()
```

Return Value

Type: Boolean

`isSuccess()`

Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

Datacloud Namespace

The `Datacloud` namespace provides classes and methods for retrieving information about duplicate rules. Duplicate rules let you control whether and when users can save duplicate records within Salesforce.

The `Datacloud` namespace is related to the Duplicate Management feature. For more information, see Manage Duplicate Records in *Salesforce Help* and Duplicate Management in Trailhead. The `Datacloud` namespace isn't related to the Salesforce Data Cloud product. See Data Cloud.

The following are the classes in the `Datacloud` namespace.

IN THIS SECTION:

AdditionalInformationMap Class
Represents other information, if any, about matched records.

DuplicateResult Class

Represents the details of a duplicate rule that detected duplicate records and information about those duplicate records.

FieldDiff Class

Represents the name of a matching rule field and how the values of the field compare for the duplicate and its matching record.

FindDuplicates Class

Performs rule-based searches for duplicate records. The input is an array of sObjects. Each sObject represents a record you want to find duplicates of. The output identifies the detected duplicates for each input sObject based on active duplicate rules for the given object.

FindDuplicatesByIds Class

Performs rule-based searches for duplicate records. The input is an array of IDs. Each ID specifies records to search for duplicates among. The duplicates are detected based on the active duplicate rules applicable to the object type corresponding to the input IDs.

FindDuplicatesResult Class

Output for rule-based searches for duplicate records. `FindDuplicatesResult` contains results of detecting duplicates using instances of `FindDuplicates` or `FindDuplicatesByIds` classes.

MatchRecord Class

Represents a duplicate record detected by a matching rule.

MatchResult Class

Represents the duplicate results for a matching rule.

AdditionalInformationMap Class

Represents other information, if any, about matched records.

Namespace

Datacloud

IN THIS SECTION:

AdditionalInformationMap Methods

AdditionalInformationMap Methods

The following are methods for `AdditionalInformationMap`.

IN THIS SECTION:

getName()

Returns the element name.

getValue()

Returns the value of the element.

`getName()`

Returns the element name.

Signature

```
public String getName()
```

Return Value

Type: String

`getValue()`

Returns the value of the element.

Signature

```
public String getValue()
```

Return Value

Type: String

DuplicateResult Class

Represents the details of a duplicate rule that detected duplicate records and information about those duplicate records.

Namespace

Datacloud

Usage

The `DuplicateResult` class and its methods are available to organizations that use duplicate rules.

`DuplicateResult` is contained within `DuplicateError`, which is part of `SaveResult`. `SaveResult` is generated when a user attempts to save a record in Salesforce.

Example

This example shows a custom application that lets users add a contact. When a contact is saved, an alert displays if there are duplicate records.

The sample application consists of a Visualforce page and an Apex controller. The Visualforce page is listed first so that you can see how the page makes use of the Apex controller. Save the Apex class first before saving the Visualforce page.

```
<apex:page controller="ContactDedupeController">
    <apex:form >
        <apex:pageBlock title="Duplicate Records" rendered="{!hasDuplicateResult}">
            <apex:pageMessages />
            <apex:pageBlockTable value="{!duplicateRecords}" var="item">
                <apex:column >
                    <apex:facet name="header">Name</apex:facet>
                 <apex:outputLink value="/{!item['Id']}">{!item['Name']}</apex:outputLink>
```

```
                </apex:column>
                <apex:column >
                    <apex:facet name="header">Owner</apex:facet>
                    <apex:outputField value="{!item['OwnerId']}"/>
                </apex:column>
                <apex:column >
                    <apex:facet name="header">Last Modified Date</apex:facet>
                    <apex:outputField value="{!item['LastModifiedDate']}"/>
                </apex:column>
            </apex:pageBlockTable>
        </apex:pageBlock>

        <apex:pageBlock title="Contact" mode="edit">
            <apex:pageBlockButtons >
                <apex:commandButton value="Save" action="{!save}"/>
            </apex:pageBlockButtons>

            <apex:pageBlockSection >
                <apex:inputField value="{!Contact.FirstName}"/>
                <apex:inputField value="{!Contact.LastName}"/>
                <apex:inputField value="{!Contact.Email}"/>
                <apex:inputField value="{!Contact.Phone}"/>
                <apex:inputField value="{!Contact.AccountId}"/>
            </apex:pageBlockSection>
        </apex:pageBlock>
    </apex:form>
</apex:page>
```

This sample is the Apex controller for the page. This controller contains the action method for the Save button. The `save` method inserts the new contact. If errors are returned, this method iterates through each error, checks if it's a duplicate error, adds the error message to the page, and returns information about the duplicate records to be displayed on the page.

```
public class ContactDedupeController {

    // Initialize a variable to hold the contact record you're processing
    private final Contact contact;

    // Initialize a list to hold any duplicate records
    private List<sObject> duplicateRecords;

    // Define variable that's true if there are duplicate records
    public boolean hasDuplicateResult{get;set;}

    // Define the constructor
    public ContactDedupeController() {

        // Define the values for the contact you're processing based on its ID
        Id id = ApexPages.currentPage().getParameters().get('id');
        this.contact = (id == null) ? new Contact() :
            [SELECT Id, FirstName, LastName, Email, Phone, AccountId
             FROM Contact WHERE Id = :id];

        // Initialize empty list of potential duplicate records
        this.duplicateRecords = new List<sObject>();
        this.hasDuplicateResult = false;
```

```
}

// Return contact and its values to the Visualforce page for display
public Contact getContact() {
    return this.contact;
}

// Return duplicate records to the Visualforce page for display
public List<sObject> getDuplicateRecords() {
    return this.duplicateRecords;
}

// Process the saved record and handle any duplicates
public PageReference save() {

    // Optionally, set DML options here, use "DML" instead of "false"
    //   in the insert()
    // Database.DMLOptions dml = new Database.DMLOptions();
    // dml.DuplicateRuleHeader.allowSave = true;
    // dml.DuplicateRuleHeader.runAsCurrentUser = true;
    Database.SaveResult saveResult = Database.insert(contact, false);

    if (!saveResult.isSuccess()) {
        for (Database.Error error : saveResult.getErrors()) {
            // If there are duplicates, an error occurs
            // Process only duplicates and not other errors
            //   (e.g., validation errors)
            if (error instanceof Database.DuplicateError) {
                // Handle the duplicate error by first casting it as a
                //   DuplicateError class
                // This lets you use methods of that class
                //  (e.g., getDuplicateResult())
                Database.DuplicateError duplicateError =
                        (Database.DuplicateError)error;
                Datacloud.DuplicateResult duplicateResult =
                        duplicateError.getDuplicateResult();

                // Display duplicate error message as defined in the duplicate rule
                ApexPages.Message errorMessage = new ApexPages.Message(
                        ApexPages.Severity.ERROR, 'Duplicate Error: ' +
                        duplicateResult.getErrorMessage());
                ApexPages.addMessage(errorMessage);

                // Get duplicate records
                this.duplicateRecords = new List<sObject>();

                // Return only match results of matching rules that
                //  find duplicate records
                Datacloud.MatchResult[] matchResults =
                        duplicateResult.getMatchResults();

                // Just grab first match result (which contains the
                //   duplicate record found and other match info)
                Datacloud.MatchResult matchResult = matchResults[0];
```

```
                    Datacloud.MatchRecord[] matchRecords = matchResult.getMatchRecords();

                    // Add matched record to the duplicate records variable
                    for (Datacloud.MatchRecord matchRecord : matchRecords) {
                        System.debug('MatchRecord: ' + matchRecord.getRecord());
                        this.duplicateRecords.add(matchRecord.getRecord());
                    }
                    this.hasDuplicateResult = !this.duplicateRecords.isEmpty();
                }
            }

            //If there's a duplicate record, stay on the page
            return null;
        }

        //  After save, navigate to the view page:
        return (new ApexPages.StandardController(contact)).view();
    }

}
```

DuplicateResult Methods

SEE ALSO:

SaveResult Class

DuplicateError Class

DuplicateResult Methods

The following are methods for `DuplicateResult`.

IN THIS SECTION:

getDuplicateRule()

Returns the developer name of the executed duplicate rule that returned duplicate records.

getErrorMessage()

Returns the error message configured by the administrator to warn users they may be creating duplicate records. This message is associated with a duplicate rule.

getMatchResults()

Returns the duplicate records and match information.

isAllowSave()

Indicates whether the duplicate rule will allow a record that's identified as a duplicate to be saved. Set to `true` if duplicate rule should allow save; otherwise, `false`.

getDuplicateRule()

Returns the developer name of the executed duplicate rule that returned duplicate records.

Signature

```
public String getDuplicateRule()
```

Return Value

Type: String

getErrorMessage()

Returns the error message configured by the administrator to warn users they may be creating duplicate records. This message is associated with a duplicate rule.

Signature

```
public String getErrorMessage()
```

Return Value

Type: String

Example

This example shows the code used to display the error message when duplicates are found while saving a new contact. This code is part of a custom application that lets users add a contact. When a contact is saved, an alert displays if there are duplicate records. Review DuplicateResult Class on page 2435 to check out the entire sample applicaton.

```
ApexPages.Message errorMessage = new ApexPages.Message(
                            ApexPages.Severity.ERROR, 'Duplicate Error: ' +
                            duplicateResult.getErrorMessage());
                    ApexPages.addMessage(errorMessage);
```

getMatchResults()

Returns the duplicate records and match information.

Signature

```
public List<Datacloud.MatchResult> getMatchResults()
```

Return Value

Type: List<Datacloud.MatchResult>

Example

This example shows the code used to return duplicate record and match information and assign it to the `matchResults` variable. This code is part of a custom application that implements duplicate management when users add a contact. See DuplicateResult Class on page 2435 to check out the entire sample applicaton.

```
Datacloud.MatchResult[] matchResults =
                            duplicateResult.getMatchResults();
```

`isAllowSave()`

Indicates whether the duplicate rule will allow a record that's identified as a duplicate to be saved. Set to `true` if duplicate rule should allow save; otherwise, `false`.

Signature

```
public Boolean isAllowSave()
```

Return Value

Type: Boolean

FieldDiff Class

Represents the name of a matching rule field and how the values of the field compare for the duplicate and its matching record.

Namespace

Datacloud

IN THIS SECTION:

FieldDiff Methods

FieldDiff Methods

The following are methods for `FieldDiff`.

IN THIS SECTION:

getDifference()
Returns how the field values compare for the duplicate and its matching record.

getName()
Returns the name of a field on a matching rule that detected duplicates.

`getDifference()`

Returns how the field values compare for the duplicate and its matching record.

Signature

```
public String getDifference()
```

Return Value

Type: String

Possible values include:

- `SAME`: Indicates the field values match exactly.
- `DIFFERENT`: Indicates that the field values do not match.
- `NULL`: Indicates that the field values are a match because both values are blank.

`getName()`

Returns the name of a field on a matching rule that detected duplicates.

Signature

```
public String getName()
```

Return Value

Type: String

FindDuplicates Class

Performs rule-based searches for duplicate records. The input is an array of sObjects. Each sObject represents a record you want to find duplicates of. The output identifies the detected duplicates for each input sObject based on active duplicate rules for the given object.

Namespace

Datacloud

IN THIS SECTION:

FindDuplicates Methods

FindDuplicates Methods

The following are methods for `FindDuplicates`.

IN THIS SECTION:

findDuplicates(sObjects)
Identifies duplicates for sObjects provided and returns a list of `FindDuplicatesResult` objects.

`findDuplicates(sObjects)`

Identifies duplicates for sObjects provided and returns a list of `FindDuplicatesResult` objects.

Usage

Use `FindDuplicates` to apply active duplicate rules associated with an object to records represented by input sObjects.

`FindDuplicates` uses the duplicate rules for the object that has the same type as the input sObjects.

Input

- All sObjects in the input array must be of the same object type, and that type must correspond to an object type that supports duplicate rules.
- The input array is limited to 50 elements. If you exceed this limit, an exception is thrown with the following message: `Configuration error: The number of records to check is greater than the permitted batch size.`

Output

- The output of `FindDuplicates` is an array of objects with the same number of elements as the input array, and in the same order. The output objects encapsulate record IDs for duplicate records. The output objects also contain values from the duplicate records.
- Each element contains an array of `DuplicateResult` objects. If `FindDuplicates` doesn't find any duplicates, the `duplicateRule` field in `DuplicateResult` contains the name of the duplicate rule that `FindDuplicates` applied, but the `matchResults` array is empty.

Example

```
Account acct = new Account();
acct.Name = 'Acme';
acct.BillingStreet = '123 Fake St';
acct.BillingCity = 'Springfield';
acct.BillingState = 'VT';
acct.BillingCountry = 'US';

List<Account> acctList = new List<Account>();
acctList.add(acct);

if (Datacloud.FindDuplicates.findDuplicates(acctList).size() == 0) {
// If the new account doesn't have duplicates, insert it.
    insert(acct);
}
```

Signature

```
public static List<Datacloud.FindDuplicatesResult> findDuplicates(List<SObject> sObjects)
```

Parameters

sObjects

Type: List<SObject>

An array of sObjects for which you want to find duplicates.

Return Value

Type: List<FindDuplicatesResult>

FindDuplicatesByIds Class

Performs rule-based searches for duplicate records. The input is an array of IDs. Each ID specifies records to search for duplicates among. The duplicates are detected based on the active duplicate rules applicable to the object type corresponding to the input IDs.

Namespace

Datacloud

IN THIS SECTION:

FindDuplicatesByIds Methods

FindDuplicatesByIds Methods

The following are methods for `FindDuplicatesByIds`.

IN THIS SECTION:

findDuplicatesByIds(ids)
Identifies duplicates of sObjects provided and returns a list of `FindDuplicatesResult` objects.

`findDuplicatesByIds(ids)`

Identifies duplicates of sObjects provided and returns a list of `FindDuplicatesResult` objects.

Usage

Use `FindDuplicatesByIds` to apply active duplicate rules associated with an object to records represented by the record IDs.

`FindDuplicatesByIds` uses the duplicate rules for the object that has the same type as the input record IDs. For example, if the record ID represents an Account, `FindDuplicatesByIds` uses the duplicate rules associated with the Account object.

Input

- All record IDs in the input array must be of the same object type, and that type must correspond to an object type that supports duplicate rules.
- The input array is limited to 50 elements. If you exceed this limit, an exception is thrown with the following message: `Configuration error: The number of records to check is greater than the permitted batch size.`

Output

- The output of `FindDuplicatesByIds` is an array of objects with the same number of elements as the input array, and in the same order. The output objects encapsulate record IDs for duplicate records. The output objects also contain values from the duplicate records.
- Each element contains an array of `DuplicateResult` objects. If `FindDuplicatesByIds` doesn't find any duplicates, the `duplicateRule` field in `DuplicateResult` contains the name of the duplicate rule that `FindDuplicatesByIds` applied, but the `matchResults` array is empty.

Example

```
Account acct = new Account(name='Salesforce');
insert acct;

List<Id> idList = new List<Id>();
idList.add(acct.id);

if (Datacloud.FindDuplicatesByIds.findDuplicatesByIds(idList).size() > 0) {
System.debug('Found duplicates');
}
```

Signature

```
public static List<Datacloud.FindDuplicatesResult> findDuplicatesByIds(List<Id> ids)
```

Parameters

ids

Type: ListID>

A list of IDs for which you want to find duplicates.

Return Value

Type: List<FindDuplicatesResult>

FindDuplicatesResult Class

Output for rule-based searches for duplicate records. `FindDuplicatesResult` contains results of detecting duplicates using instances of `FindDuplicates` or `FindDuplicatesByIds` classes.

Namespace

Datacloud

IN THIS SECTION:

FindDuplicatesResult Properties

FindDuplicatesResult Methods

FindDuplicatesResult Properties

The following are properties for `FindDuplicatesResult`.

IN THIS SECTION:

duplicateresults

A list of `DuplicateResult` objects representing the results of calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`. Elements in the list correspond to sObjects or IDs in the input list.

errors

A list of `Database.Error` objects holding errors resulting from calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`.

success

Boolean signifying whether the call to `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)` was successful.

duplicateresults

A list of `DuplicateResult` objects representing the results of calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`. Elements in the list correspond to sObjects or IDs in the input list.

Signature

```
public List<Datacloud.DuplicateResult> duplicateresults
```

Property Value

Type: List<DuplicateResult>

errors

A list of `Database.Error` objects holding errors resulting from calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`.

Signature

```
public List<Database.Error> errors {get; set;}
```

Property Value

Type: List<Database.Error>

success

Boolean signifying whether the call to `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)` was successful.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

FindDuplicatesResult Methods

The following are methods for `FindDuplicatesResult`.

IN THIS SECTION:

getDuplicateResults()
Returns a list of `DuplicateResult` objects representing the results of calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`. Elements in the list correspond to sObjects or IDs in the input list.

getErrors()
Returns a list of `DatabaseError` objects containing errors resulting from calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`, if errors were encountered.

isSuccess()
Returns a Boolean signifying whether the call to `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)` was successful.

getDuplicateResults()

Returns a list of `DuplicateResult` objects representing the results of calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`. Elements in the list correspond to sObjects or IDs in the input list.

Example

```
Account acct = new Account(name='Salesforce');
List<Account> acctList = new List<Account>();
acctList.add(acct);

Datacloud.FindDuplicatesResult[] results = Datacloud.FindDuplicates.findDuplicates(acctList);
for (Datacloud.FindDuplicatesResult findDupeResult : results) {
  for (Datacloud.DuplicateResult dupeResult : findDupeResult.getDuplicateResults()) {
    for (Datacloud.MatchResult matchResult : dupeResult.getMatchResults()) {
      for (Datacloud.MatchRecord matchRecord : matchResult.getMatchRecords()) {
          System.debug('Duplicate Record: ' + matchRecord.getRecord());
      }
    }
  }
}
```

Signature

```
public List<Datacloud.DuplicateResult> getDuplicateResults()
```

Return Value

Type: List<DuplicateResult>

getErrors()

Returns a list of `DatabaseError` objects containing errors resulting from calling `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)`, if errors were encountered.

Signature

```
public List<Database.Error> getErrors()
```

Return Value

Type: List<Database.Error>

`isSuccess()`

Returns a Boolean signifying whether the call to `FindDuplicates.findDuplicates(sObjects)` or `FindDuplicatesByIds.findDuplicatesByIds(ids)` was successful.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

MatchRecord Class

Represents a duplicate record detected by a matching rule.

Namespace

Datacloud

IN THIS SECTION:

MatchRecord Methods

MatchRecord Methods

The following are methods for `MatchRecord`.

IN THIS SECTION:

getAdditionalInformation()
Returns other information about a matched record. For example, a `matchGrade` represents the quality of the data for the D&B fields in the matched record.

getFieldDiffs()
Returns all matching rule fields and how each field value compares for the duplicate and its matching record.

getMatchConfidence()
Returns the ranking of how similar a matched record's data is to the data in your request. Must be equal to or greater than the value of the `minMatchConfidence` specified in your request. Returns -1 if unused.

getRecord()
Returns the fields and field values for the duplicate.

getAdditionalInformation()

Returns other information about a matched record. For example, a `matchGrade` represents the quality of the data for the D&B fields in the matched record.

Signature

```
public List<Datacloud.AdditionalInformationMap> getAdditionalInformation()
```

Return Value

Type: List<Datacloud.AdditionalInformationMap>

getFieldDiffs()

Returns all matching rule fields and how each field value compares for the duplicate and its matching record.

Signature

```
public List<Datacloud.FieldDiff> getFieldDiffs()
```

Return Value

Type: List<Datacloud.FieldDiff>

getMatchConfidence()

Returns the ranking of how similar a matched record's data is to the data in your request. Must be equal to or greater than the value of the `minMatchConfidence` specified in your request. Returns -1 if unused.

Signature

```
public Double getMatchConfidence()
```

Return Value

Type: Double

getRecord()

Returns the fields and field values for the duplicate.

Signature

```
public SObject getRecord()
```

Return Value

Type: SObject

MatchResult Class

Represents the duplicate results for a matching rule.

Namespace

Datacloud

IN THIS SECTION:

MatchResult Methods

MatchResult Methods

The following are methods for `MatchResult`.

IN THIS SECTION:

getEntityType()
Returns the entity type of the matching rule.

getErrors()
Returns errors that occurred during matching for the matching rule.

getMatchEngine()
Returns the match engine for the matching rule.

getMatchRecords()
Returns information about the duplicates for the matching rule.

getRule()
Returns the developer name of the matching rule.

getSize()
Returns the number of duplicates detected by the matching rule.

isSuccess()
Returns `false` if there's an error with the matching rule, and `true` if the matching rule successfully ran.

`getEntityType()`

Returns the entity type of the matching rule.

Signature

```
public String getEntityType()
```

Return Value

Type: String

`getErrors()`

Returns errors that occurred during matching for the matching rule.

Signature

```
public List<Database.Error> getErrors()
```

Return Value

Type: List<Database.Error>

`getMatchEngine()`

Returns the match engine for the matching rule.

Signature

```
public String getMatchEngine()
```

Return Value

Type: String

`getMatchRecords()`

Returns information about the duplicates for the matching rule.

Signature

```
public List<Datacloud.MatchRecord> getMatchRecords()
```

Return Value

Type: List<Datacloud.MatchRecord>

`getRule()`

Returns the developer name of the matching rule.

Signature

```
public String getRule()
```

Return Value

Type: String

`getSize()`

Returns the number of duplicates detected by the matching rule.

Signature

```
public Integer getSize()
```

Return Value

Type: Integer

`isSuccess()`

Returns `false` if there's an error with the matching rule, and `true` if the matching rule successfully ran.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

DataRetrieval Namespace

The `DataRetrieval` namespace provides classes and methods to record details of customer-agent engagements, as well as transcripts of their conversations.

The following are the classes in the `DataRetrieval` namespace.

Engagement Class

Engagements Class

EngagementRecordDetails Class

EngagementRecordDetailsList Class

FieldDetailsRepresentation Class

ObjectDetailsRepresentation Class

RecordDetailsRepresentation Class

RecordTranscripts Class

RecordTranscriptsList Class

Transcript Class

DataSource Namespace

The `DataSource` namespace provides the classes for the Apex Connector Framework. Use the Apex Connector Framework to develop a custom adapter for Salesforce Connect. Then connect your Salesforce organization to any data anywhere via the Salesforce Connect custom adapter.

The following are the classes in the `DataSource` namespace.

IN THIS SECTION:

AsyncDeleteCallback Class

A callback class that the `Database.deleteAsync` method references. Salesforce calls this class after the remote `deleteAsync` operation is completed. This class provides the compensating transaction in the completion context of the delete operation. Extend this class to define the actions to execute after the remote delete operation finishes execution.

AsyncSaveCallback Class

A callback class that the `Database.insertAsync` or `Database.updateAsync` method references. Salesforce calls this class after the remote operation is completed. This class provides the compensating transaction in the completion context of the insert or update operation. Extend this class to define the actions to execute after the remote insert or update operation finishes execution.

AuthenticationCapability Enum

Specifies the types of authentication that can be used to access the external system.

AuthenticationProtocol Enum

Determines what type of credentials are used to authenticate to the external system.

Capability Enum

Declares which functional operations the external system supports. Also specifies required endpoint settings for the external data source definition.

Column Class

Describes a column on a `DataSource.Table`. This class extends the `DataSourceUtil` class and inherits its methods.

ColumnSelection Class

Identifies the list of columns to return during a query or search.

Connection Class

Extend this class to enable your Salesforce org to sync the external system's schema and to handle queries, searches, and write operations (upsert and delete) of the external data. This class extends the `DataSourceUtil` class and inherits its methods.

ConnectionParams Class

Contains the credentials for authenticating to the external system.

DataSourceUtil Class

Parent class for the `DataSource.Provider`, `DataSource.Connection`, `DataSource.Table`, and `DataSource.Column` classes.

DataType Enum

Specifies the data types that are supported by the Apex Connector Framework.

DeleteContext Class

An instance of `DeleteContext` is passed to the `deleteRows()` method on your `Database.Connection` class. The class provides context information about the delete request to the implementor of `deleteRows()`.

DeleteResult Class

Represents the result of a delete operation on an sObject record. The result is returned by the `DataSource.deleteRows` method of the `DataSource.Connection` class.

Filter Class

Represents a `WHERE` clause in a SOSL or SOQL query.

FilterType Enum

Referenced by the `type` property on a `DataSource.Filter`.

IdentityType Enum

Determines which set of credentials is used to authenticate to the external system.

Order Class

Contains details about how to sort the rows in the result set. Equivalent to an `ORDER BY` statement in a SOQL query.

OrderDirection Enum

Specifies the direction for sorting rows based on column values.

Provider Class

Extend this base class to create a custom adapter for Salesforce Connect. The class informs Salesforce of the functional and authentication capabilities that are supported by or required to connect to the external system. This class extends the `DataSourceUtil` class and inherits its methods.

QueryAggregation Enum

Specifies how to aggregate a column in a query.

QueryContext Class

An instance of `QueryContext` is provided to the `query` method on your `DataSource.Connection` class. The instance corresponds to a SOQL request.

QueryUtils Class

Contains helper methods to locally filter, sort, and apply limit and offset clauses to data rows. This helper class is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

ReadContext Class

Abstract base class for the `QueryContext` and `SearchContext` classes.

SearchContext Class

An instance of `SearchContext` is provided to the search method on your `DataSource.Connection` class. The instance corresponds to a search or SOSL request.

SearchUtils Class

Helper class for implementing search on a custom adapter for Salesforce Connect.

Table Class

Describes a table on an external system that the Salesforce Connect custom adapter connects to. This class extends the `DataSourceUtil` class and inherits its methods.

TableResult Class

Contains the results of a search or query.

TableSelection Class

Contains a breakdown of the SOQL or SOSL query. Its properties represent the FROM, ORDER BY, SELECT, and WHERE clauses in the query.

UpsertContext Class

An instance of `UpsertContext` is passed to the `upsertRows()` method on your `Datasource.Connection` class. This class provides context information about the upsert request to the implementor of `upsertRows()`.

UpsertResult Class

Represents the result of an upsert operation on an external object record. The result is returned by the `upsertRows` method of the `DataSource.Connection` class.

DataSource Exceptions

The `DataSource` namespace contains exception classes.

AsyncDeleteCallback Class

A callback class that the `Database.deleteAsync` method references. Salesforce calls this class after the remote `deleteAsync` operation is completed. This class provides the compensating transaction in the completion context of the delete operation. Extend this class to define the actions to execute after the remote delete operation finishes execution.

Namespace

DataSource

IN THIS SECTION:

AsyncDeleteCallback Methods

AsyncDeleteCallback Methods

The following are methods for `AsyncDeleteCallback`.

IN THIS SECTION:

processDelete(deleteResult)
Override this method to define actions that Salesforce executes after a remote `Database.deleteAsync` operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org..

`processDelete(deleteResult)`

Override this method to define actions that Salesforce executes after a remote `Database.deleteAsync` operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org..

Signature

```
public void processDelete(Database.DeleteResult deleteResult)
```

Parameters

`deleteResult`
Type: Database.DeleteResult

The result of the asynchronous delete operation.

Return Value

Type: void

AsyncSaveCallback Class

A callback class that the `Database.insertAsync` or `Database.updateAsync` method references. Salesforce calls this class after the remote operation is completed. This class provides the compensating transaction in the completion context of the insert or update operation. Extend this class to define the actions to execute after the remote insert or update operation finishes execution.

Namespace

DataSource

IN THIS SECTION:

AsyncSaveCallback Methods

AsyncSaveCallback Methods

The following are methods for `AsyncSaveCallback`.

IN THIS SECTION:

processSave(saveResult)
Override this method to define actions that Salesforce executes after the remote `Database.insertAsync` or `Database.updateAsync` operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org.

`processSave(saveResult)`

Override this method to define actions that Salesforce executes after the remote `Database.insertAsync` or `Database.updateAsync` operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org.

Signature

```
public void processSave(Database.SaveResult saveResult)
```

Parameters

`saveResult`
Type: Database.SaveResult

The result of the asynchronous insert or update operation.

Return Value

Type: void

AuthenticationCapability Enum

Specifies the types of authentication that can be used to access the external system.

Usage

The `DataSource.Provider` class returns `DataSource.AuthenticationCapability` enum values. The returned values determine which authentication settings are available on the external data source definition in Salesforce.

If you set up callouts in your `DataSource.Connection` class, you can specify the callout endpoints as named credentials instead of URLs. If you do so for all callouts, return `ANONYMOUS` as the sole entry in the list of data source authentication capabilities. That way, the external data source definition doesn't require authentication settings. Salesforce manages all authentication for Apex callouts that specify a named credential as the callout endpoint so that your code doesn't have to.

Enum Values

The following are the values of the `DataSource.AuthenticationCapability` enum.

Value	Description
`ANONYMOUS`	No credentials are required to authenticate to the external system.
`BASIC`	A username and password can be used to authenticate to the external system.
`CERTIFICATE`	A security certificate can be supplied when establishing each connection to the external system.
`OAUTH`	OAuth can be used to authenticate to the external system.

AuthenticationProtocol Enum

Determines what type of credentials are used to authenticate to the external system.

Enum Values

The following are the values of the `DataSource.AuthenticationProtocol` enum.

Value	Description
`NONE`	No credentials are used to authenticate to the external system.
`OAUTH`	OAuth 2.0 is used to authenticate to the external system.
`PASSWORD`	A username and password are used to authenticate to the external system.

Capability Enum

Declares which functional operations the external system supports. Also specifies required endpoint settings for the external data source definition.

Usage

The `DataSource.Provider` class returns `DataSource.Capability` enum values, which:

- Specify the functional capabilities of the external system.

- Determine which endpoint settings are available on the external data source definition in Salesforce.

Enum Values

The following are the values of the `DataSource.Capability` enum.

Value	Description
`MULTI_PICKLIST`	The external system supports multi-picklist fields.
`PICKLIST`	The external system supports picklist fields.
`QUERY_PAGINATION_SERVER_DRIVEN`	With server-driven paging, the external system determines the page sizes and batch boundaries. The external system's paging settings can optimize the external system's performance and improve the load times for external objects in your org. Also, the external data set can change while your users or the Lightning Platform are paging through the result set. Typically, server-driven paging adjusts batch boundaries to accommodate changing data sets more effectively than client-driven paging. If you enable server-driven paging on an external data source, Salesforce ignores the requested page sizes, including the default `queryMore()` batch size of 500 rows. The pages returned by the external system determine the batches, but each page can't exceed 2,000 rows. Also, the Apex code must generate a query token and use it to determine and fetch the next batch of results.
`QUERY_TOTAL_SIZE`	The external system can provide the total number of rows that meet the query criteria, even when requested to return a smaller batch size. This capability enables you to simplify how you paginate results by using `queryMore()`.
`REQUIRE_ENDPOINT`	Requires the administrator to specify the endpoint in the URL field in the external data source definition.
`REQUIRE_HTTPS`	Requires the endpoint URL to use secure HTTP. If `REQUIRE_ENDPOINT` isn't declared, `REQUIRE_HTTPS` is ignored.
`ROW_CREATE`	Allows creating of external data.
`ROW_DELETE`	Allows deleting external data.
`ROW_QUERY`	Allows API and SOQL queries of the external data. Also allows reports on the external objects.
`ROW_UPDATE`	Allows updating external data.
`SEARCH`	Allows SOSL and Salesforce searches of the external data. When the custom adapter declares the `SEARCH` capability, you can control which external objects are searchable by selecting or deselecting **Allow Search** on each external object. However, syncing always overwrites the external object's search status to match the search status of the external data source.

Value	Description
	Only text, text area, and long text area fields on external objects can be searched. If an external object has no searchable fields, searches on that object return no records.

SEE ALSO:

Salesforce Help: Validate and Sync an External Data Source

Column Class

Describes a column on a `DataSource.Table`. This class extends the `DataSourceUtil` class and inherits its methods.

Namespace

DataSource

Usage

A list of column metadata is provided by the `DataSource.Connection` class when the `sync()` method is invoked. Each column can become a field on an external object.

The metadata is stored in Salesforce. Updating the Apex code to return new or updated values for the column metadata doesn't automatically update the stored metadata in Salesforce.

IN THIS SECTION:

Column Properties

Column Methods

Column Properties

The following are properties for `Column`.

IN THIS SECTION:

decimalPlaces
If the data type is numeric, the number of decimal places to the right of the decimal point.

description
Description of what the column represents.

filterable
Whether a result set can be filtered based on the values of the column.

isPicklistAlphabeticallySorted
Returns `true` if the picklist is sorted alphabetically, `false` otherwise.

isPicklistRestricted
Returns `true` if the picklist is restricted, `false` otherwise.

label

User-friendly name for the column that appears in the Salesforce user interface.

length

If the column is a string data type, the number of characters in the column. If the column is a numeric data type, the total number of digits on both sides of the decimal point, but excluding the decimal point.

name

Name of the column in the external system.

picklistValues

If the data type is a picklist, the picklist values.

referenceTargetField

API name of the custom field on the parent object whose values are compared against this column's values. Matching values identify related records in an indirect lookup relationship. Applies only when the column's data type is `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

referenceTo

API name of the parent object in the relationship that's represented by this column. Applies only when the column's data type is `LOOKUP_TYPE`, `EXTERNAL_LOOKUP_TYPE`, or `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

sortable

Whether a result set can be sorted based on the values of the column via an `ORDER BY` clause.

type

Data type of the column.

decimalPlaces

If the data type is numeric, the number of decimal places to the right of the decimal point.

Signature

```
public Integer decimalPlaces {get; set;}
```

Property Value

Type: Integer

description

Description of what the column represents.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

filterable

Whether a result set can be filtered based on the values of the column.

Signature

```
public Boolean filterable {get; set;}
```

Property Value

Type: Boolean

isPicklistAlphabeticallySorted

Returns `true` if the picklist is sorted alphabetically, `false` otherwise.

Signature

```
public Boolean isPicklistAlphabeticallySorted {get; set;}
```

Property Value

Type: Boolean

isPicklistRestricted

Returns `true` if the picklist is restricted, `false` otherwise.

Signature

```
public Boolean isPicklistRestricted {get; set;}
```

Property Value

Type: Boolean

label

User-friendly name for the column that appears in the Salesforce user interface.

Signature

```
public String label {get; set;}
```

Property Value

Type: String

`length`

If the column is a string data type, the number of characters in the column. If the column is a numeric data type, the total number of digits on both sides of the decimal point, but excluding the decimal point.

Signature

```
public Integer length {get; set;}
```

Property Value

Type: Integer

`name`

Name of the column in the external system.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

`picklistValues`

If the data type is a picklist, the picklist values.

Signature

```
public List<Map<String,String>> picklistValues {get; set;}
```

Property Value

Type: List<Map<String,String>>

`referenceTargetField`

API name of the custom field on the parent object whose values are compared against this column's values. Matching values identify related records in an indirect lookup relationship. Applies only when the column's data type is `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

Signature

```
public String referenceTargetField {get; set;}
```

Property Value

Type: String

referenceTo

API name of the parent object in the relationship that's represented by this column. Applies only when the column's data type is `LOOKUP_TYPE`, `EXTERNAL_LOOKUP_TYPE`, or `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

Signature

```
public String referenceTo {get; set;}
```

Property Value

Type: String

sortable

Whether a result set can be sorted based on the values of the column via an `ORDER BY` clause.

Signature

```
public Boolean sortable {get; set;}
```

Property Value

Type: Boolean

type

Data type of the column.

Signature

```
public DataSource.DataType type {get; set;}
```

Property Value

Type: DataSource.DataType

Column Methods

The following are methods for `Column`.

IN THIS SECTION:

boolean(name)
Returns a new column of data type `BOOLEAN_TYPE`.

currency(name, length, decimalPlaces)
Returns a new column of data type `CURRENCY_TYPE`.

date(name)
Returns a new column of data type `DATE_TYPE`.

datetime(name)

Returns a new column of data type `DATETIME_TYPE`.

email(name)

Returns a new column of data type `EMAIL_TYPE`.

externalLookup(name, domain)

Returns a new column of data type `EXTERNAL_LOOKUP_TYPE`.

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces, referenceTo, referenceTargetField, picklistValuesObj, isPicklistAlphabeticallySorted, isPicklistRestricted)

Returns a new column with the 13 specified `Column` property values.

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces, referenceTo, referenceTargetField)

Returns a new column with the ten specified `Column` property values.

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces)

Returns a new column with the eight specified `Column` property values.

get(name, label, description, isSortable, isFilterable, type, length)

Returns a new column with the seven specified `Column` property values.

indirectLookup(name, domain, targetField)

Returns a new column of data type `INDIRECT_LOOKUP_TYPE`.

integer(name, length)

Returns a new numeric column with no decimal places using the specified name and length.

lookup(name, domain)

Returns a new column of data type `LOOKUP_TYPE`.

multipicklist(name, picklistValues, isPicklistAlphabeticallySorted, isPicklistRestricted)

Returns a new column of data type `PICKLIST_MULTISELECT_TYPE` with the specified name and picklist values. You can also specify whether the picklist is sorted alphabetically or if the picklist is restricted.

multipicklist(name, picklistValues)

Returns a new column of data type `PICKLIST_MULTISELECT_TYPE` with the specified name and picklist values.

number(name, length, decimalPlaces)

Returns a new column of data type `NUMBER_TYPE`.

percent(name, length, decimalPlaces)

Returns a new column of data type `PERCENT_TYPE`.

phone(name)

Returns a new column of data type `PHONE_TYPE`.

picklist(name, picklistValues, isPicklistAlphabeticallySorted, isPicklistRestricted)

Returns a new column of data type `PICKLIST_TYPE` with the specified name and picklist values. You can also specify whether the picklist is sorted alphabetically or if the picklist is restricted.

picklist(name, picklistValues)

Returns a new column of data type `PICKLIST_TYPE` with the specified name and picklist values.

text(name, label, length)

Returns a new column of data type `STRING_SHORT_TYPE` or `STRING_LONG_TYPE`, with the specified name, label, and length.

text(name, length)
Returns a new column of data type `STRING_SHORT_TYPE` or `STRING_LONG_TYPE`, with the specified name and length.

text(name)
Returns a new column of data type `STRING_SHORT_TYPE` with the specified name and the length of 255 characters.

textarea(name)
Returns a new column of data type `STRING_LONG_TYPE` with the specified name and the length of 32,000 characters.

time(name)
Returns a new column of data type `Time` with the specified name.

url(name, length)
Returns a new column of data type `URL_TYPE` with the specified name and length.

url(name)
Returns a new column of data type `URL_TYPE` with the specified name and the length of 1,000 characters.

boolean(name)

Returns a new column of data type `BOOLEAN_TYPE`.

Signature

```
public static DataSource.Column boolean(String name)
```

Parameters

name
Type: String
Name of the column.

Return Value

Type: DataSource.Column

currency(name, length, decimalPlaces)

Returns a new column of data type `CURRENCY_TYPE`.

Signature

```
public static DataSource.Column currency(String name, Integer length, Integer
decimalPlaces)
```

Parameters

name
Type: String
Name of the column.

length
Type: Integer

Number of characters allowed in the column.

decimalPlaces
Type: Integer

Number of decimal places to the right of the decimal point.

Return Value

Type: DataSource.Column

date(name)

Returns a new column of data type DATE_TYPE.

Signature

```
public static DataSource.Column date(String name)
```

Parameters

name
Type: String

Name of the column.

Return Value

Type: DataSource.Column

datetime(name)

Returns a new column of data type DATETIME_TYPE.

Signature

```
public static DataSource.Column datetime(String name)
```

Parameters

name
Type: String

Name of the column.

Return Value

Type: DataSource.Column

email(name)

Returns a new column of data type EMAIL_TYPE.

Signature

```
public static DataSource.Column email(String name)
```

Parameters

name
Type: String

Name of the column.

Return Value

Type: DataSource.Column

externalLookup(name, domain)

Returns a new column of data type `EXTERNAL_LOOKUP_TYPE`.

Signature

```
public static DataSource.Column externalLookup(String name, String domain)
```

Parameters

name
Type: String

Name of the column.

domain
Type: String

API name of the parent object in the external lookup relationship.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.EXTERNAL_LOOKUP_TYPE
length	255

Property	Value
decimalPlaces	0
referenceTo	*domain*
referenceTargetField	null

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces, referenceTo, referenceTargetField, picklistValuesObj, isPicklistAlphabeticallySorted, isPicklistRestricted)

Returns a new column with the 13 specified `Column` property values.

Signature

```
public static DataSource.Column get(String name, String label, String description,
Boolean isSortable, Boolean isFilterable, DataSource.DataType type, Integer length,
Integer decimalPlaces, String referenceTo, String referenceTargetField, Object
picklistValuesObj, Boolean isPicklistAlphabeticallySorted, Boolean isPicklistRestricted)
```

Parameters

See Column Properties on page 2458 for information about each parameter.

name
Type: String

label
Type: String

description
Type: String

isSortable
Type: Boolean

isFilterable
Type: Boolean

type
Type: DataSource.DataType

length
Type: Integer

decimalPlaces
Type: Integer

referenceTo
Type: String

referenceTargetField
Type: String

picklistValuesObj
Type: Object

isPicklistAlphabeticallySorted
Type: Boolean

isPicklistRestricted
Type: Boolean

Return Value

Type: DataSource.Column

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces, referenceTo, referenceTargetField)

Returns a new column with the ten specified `Column` property values.

Signature

```
public static DataSource.Column get(String name, String label, String description,
Boolean isSortable, Boolean isFilterable, DataSource.DataType type, Integer length,
Integer decimalPlaces, String referenceTo, String referenceTargetField)
```

Parameters

See Column Properties on page 2458 for information about each parameter.

name
Type: String

label
Type: String

description
Type: String

isSortable
Type: Boolean

isFilterable
Type: Boolean

type
Type: DataSource.DataType

length
Type: Integer

decimalPlaces
Type: Integer

referenceTo
Type: String

referenceTargetField
Type: String

Return Value

Type: DataSource.Column

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces)

Returns a new column with the eight specified `Column` property values.

Signature

```
public static DataSource.Column get(String name, String label, String description,
Boolean isSortable, Boolean isFilterable, DataSource.DataType type, Integer length,
Integer decimalPlaces)
```

Parameters

See Column Properties on page 2458 for information about each parameter.

name
Type: String

label
Type: String

description
Type: String

isSortable
Type: Boolean

isFilterable
Type: Boolean

type
Type: DataSource.DataType

length
Type: Integer

decimalPlaces
Type: Integer

Return Value

Type: DataSource.Column

get(name, label, description, isSortable, isFilterable, type, length)

Returns a new column with the seven specified `Column` property values.

Signature

```
public static DataSource.Column get(String name, String label, String description,
Boolean isSortable, Boolean isFilterable, DataSource.DataType type, Integer length)
```

Parameters

See Column Properties on page 2458 for information about each parameter.

name
Type: String

label
Type: String

description
Type: String

isSortable
Type: Boolean

isFilterable
Type: Boolean

type
Type: DataSource.DataType

length
Type: Integer

Return Value

Type: DataSource.Column

indirectLookup(name, domain, targetField)

Returns a new column of data type `INDIRECT_LOOKUP_TYPE`.

Signature

```
public static DataSource.Column indirectLookup(String name, String domain, String targetField)
```

Parameters

name
Type: String

Name of the column.

domain
Type: String

API name of the parent object in the indirect lookup relationship.

targetField
Type: String

API name of the custom field on the parent object whose values are compared against this column's values. Matching values identify related records in an indirect lookup relationship.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.INDIRECT_LOOKUP_TYPE
length	255
decimalPlaces	0
referenceTo	*domain*
referenceTargetField	*targetField*

integer(name, length)

Returns a new numeric column with no decimal places using the specified name and length.

Signature

```
public static DataSource.Column integer(String name, Integer length)
```

Parameters

name
Type: String

The column name.

length
Type: Integer

The column length.

Return Value

Type: DataSource.Column

lookup(name, domain)

Returns a new column of data type `LOOKUP_TYPE`.

Signature

```
public static DataSource.Column lookup(String name, String domain)
```

Parameters

name
Type: String

Name of the column.

domain
Type: String

API name of the parent object in the lookup relationship.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.LOOKUP_TYPE
length	255
decimalPlaces	0
referenceTo	*domain*
referenceTargetField	null

multipicklist(name, picklistValues, isPicklistAlphabeticallySorted, isPicklistRestricted)

Returns a new column of data type `PICKLIST_MULTISELECT_TYPE` with the specified name and picklist values. You can also specify whether the picklist is sorted alphabetically or if the picklist is restricted.

Signature

```
public static DataSource.Column multipicklist(String name, List<Map<String,String>>
picklistValues, Boolean isPicklistAlphabeticallySorted, Boolean isPicklistRestricted)
```

Parameters

name
Type: String

Name of the column.

picklistValues
Type: List<Map<String,String>>

isPicklistAlphabeticallySorted
Indicates whether the picklist is sorted alphabetically.

isPicklistRestricted
Type: Boolean

Indicates whether the picklist is restricted.

Return Value

Type: DataSource.Column

multipicklist(name, picklistValues)

Returns a new column of data type `PICKLIST_MULTISELECT_TYPE` with the specified name and picklist values.

Signature

```
public static DataSource.Column multipicklist(String name, List<Map<String,String>>
picklistValues)
```

Parameters

name
Type: String

Name of the column.

picklistValues
Type: List<Map<String,String>>

List of picklist values.

Return Value

Type: DataSource.Column

number(name, length, decimalPlaces)

Returns a new column of data type `NUMBER_TYPE`.

Signature

```
public static DataSource.Column number(String name, Integer length, Integer
decimalPlaces)
```

Parameters

See Column Properties on page 2458 for information about each parameter.

name
Type: String

length
Type: Integer

decimalPlaces
Type: Integer

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.NUMBER_TYPE
length	*length*
decimalPlaces	*decimalPlaces*

percent(name, length, decimalPlaces)

Returns a new column of data type `PERCENT_TYPE`.

Signature

```
public static DataSource.Column percent(String name, Integer length, Integer
decimalPlaces)
```

Parameters

name
Type: String

Name of the column.

length
Type: Integer

Number of characters allowed in the column.

decimalPlaces
Type: Integer

Number of decimal places to the right of the decimal point.

Return Value

Type: DataSource.Column

phone(name)

Returns a new column of data type `PHONE_TYPE`.

Signature

```
public static DataSource.Column phone(String name)
```

Parameters

name
Type: String

Name of the column.

Return Value

Type: DataSource.Column

picklist(name, picklistValues, isPicklistAlphabeticallySorted, isPicklistRestricted)

Returns a new column of data type `PICKLIST_TYPE` with the specified name and picklist values. You can also specify whether the picklist is sorted alphabetically or if the picklist is restricted.

Signature

```
public static DataSource.Column picklist(String name, List<Map<String,String>>
picklistValues, Boolean isPicklistAlphabeticallySorted, Boolean isPicklistRestricted)
```

Parameters

name
Type: String

Name of the column.

picklistValues
Type: List<Map<String,String>>

List of picklist values.

isPicklistAlphabeticallySorted
Indicates whether the picklist is sorted alphabetically.

isPicklistRestricted
Type: Boolean

Indicates whether the picklist is restricted.

Return Value

Type: DataSource.Column

picklist(name, picklistValues)

Returns a new column of data type `PICKLIST_TYPE` with the specified name and picklist values.

Signature

```
public static DataSource.Column picklist(String name, List<Map<String,String>>
picklistValues)
```

Parameters

name
Type: String

Name of the column.

picklistValues
Type: List<Map<String,String>>

List of picklist values.

Return Value

Type: DataSource.Column

text(name, label, length)

Returns a new column of data type `STRING_SHORT_TYPE` or `STRING_LONG_TYPE`, with the specified name, label, and length.

Signature

```
public static DataSource.Column text(String name, String label, Integer length)
```

Parameters

name
Type: String

Name of the column.

label
Type: String

User-friendly name for the column that appears in the Salesforce user interface.

length
Type: Integer

Number of characters allowed in the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*label*
description	*label*
isSortable	true
isFilterable	true
type	DataSource.DataType.STRING_SHORT_TYPE if *length* is 255 or less DataSource.DataType.STRING_LONG_TYPE if *length* is greater than 255
length	*length*
decimalPlaces	0

text(name, length)

Returns a new column of data type `STRING_SHORT_TYPE` or `STRING_LONG_TYPE`, with the specified name and length.

Signature

```
public static DataSource.Column text(String name, Integer length)
```

Parameters

name
Type: String

Name of the column.

length
Type: Integer

Number of characters allowed in the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.STRING_SHORT_TYPE if *length* is 255 or less DataSource.DataType.STRING_LONG_TYPE if *length* is greater than 255
length	*length*
decimalPlaces	0

`text(name)`

Returns a new column of data type `STRING_SHORT_TYPE` with the specified name and the length of 255 characters.

Signature

```
public static DataSource.Column text(String name)
```

Parameters

name
Type: String

Name of the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.STRING_SHORT_TYPE

Property	Value
length	255
decimalPlaces	0

`textarea(name)`

Returns a new column of data type `STRING_LONG_TYPE` with the specified name and the length of 32,000 characters.

Signature

```
public static DataSource.Column textarea(String name)
```

Parameters

`name`
Type: String

Name of the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*`name`*
label	*`name`*
description	*`name`*
isSortable	true
isFilterable	true
type	DataSource.DataType.STRING_LONG_TYPE
length	32000
decimalPlaces	0

`time(name)`

Returns a new column of data type `Time` with the specified name.

Signature

```
public static DataSource.Column time(String name)
```

Parameters

name
Type: String

Name of the column.

Return Value

Type: DataSource.Column

url(name, length)

Returns a new column of data type `URL_TYPE` with the specified name and length.

Signature

```
public static DataSource.Column url(String name, Integer length)
```

Parameters

name
Type: String

Name of the column.

length
Type: Integer

Number of characters allowed in the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.URL_TYPE
length	*length*
decimalPlaces	0

`url(name)`

Returns a new column of data type `URL_TYPE` with the specified name and the length of 1,000 characters.

Signature

```
public static DataSource.Column url(String name)
```

Parameters

`name`
Type: String

Name of the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*`name`*
label	*`name`*
description	*`name`*
isSortable	true
isFilterable	true
type	DataSource.DataType.URL_TYPE
length	1000
decimalPlaces	0

ColumnSelection Class

Identifies the list of columns to return during a query or search.

Namespace

DataSource Namespace

Usage

This class is associated with the `SELECT` clause for a SOQL query, or the `RETURNING` clause for a SOSL query.

IN THIS SECTION:

ColumnSelection Properties

ColumnSelection Properties

The following are properties for `ColumnSelection`.

IN THIS SECTION:

aggregation
How to aggregate the column's data.

columnName
Name of the selected column.

tableName
Name of the column's table.

aggregation

How to aggregate the column's data.

Signature

```
public DataSource.QueryAggregation aggregation {get; set;}
```

Property Value

Type: DataSource.QueryAggregation

columnName

Name of the selected column.

Signature

```
public String columnName {get; set;}
```

Property Value

Type: String

tableName

Name of the column's table.

Signature

```
public String tableName {get; set;}
```

Property Value

Type: String

Connection Class

Extend this class to enable your Salesforce org to sync the external system's schema and to handle queries, searches, and write operations (upsert and delete) of the external data. This class extends the `DataSourceUtil` class and inherits its methods.

Namespace

DataSource

Usage

Your `DataSource.Connection` and `DataSource.Provider` classes compose a custom adapter for Salesforce Connect.

Changing the `sync` method on the `DataSource.Connection` class doesn't automatically resync any external objects.

Example

```
global class SampleDataSourceConnection extends DataSource.Connection {
    global SampleDataSourceConnection(DataSource.ConnectionParams connectionParams) {
    }

    override global List<DataSource.Table> sync() {
        List<DataSource.Table> tables = new List<DataSource.Table>();
        List<DataSource.Column> columns;
        columns = new List<DataSource.Column>();
        columns.add(DataSource.Column.text('Name', 255));
        columns.add(DataSource.Column.text('ExternalId', 255));
        columns.add(DataSource.Column.url('DisplayUrl'));
        tables.add(DataSource.Table.get('Sample', 'Title', columns));
        return tables;
    }

    override global DataSource.TableResult query(DataSource.QueryContext c) {
       return DataSource.TableResult.get(c, DataSource.QueryUtils.process(c, getRows()));

    }

    override global List<DataSource.TableResult> search(DataSource.SearchContext c) {

        List<DataSource.TableResult> results = new List<DataSource.TableResult>();
        for (DataSource.TableSelection tableSelection : c.tableSelections) {
            results.add(DataSource.TableResult.get(tableSelection, getRows()));
        }
        return results;
    }

    // Helper method to get record values from the external system for the Sample table.
    private List<Map<String, Object>> getRows () {
       // Get row field values for the Sample table from the external system via a callout.

        HttpResponse response = makeGetCallout();
        // Parse the JSON response and populate the rows.
        Map<String, Object> m = (Map<String, Object>)JSON.deserializeUntyped(
```

```
            response.getBody());
    Map<String, Object> error = (Map<String, Object>)m.get('error');
    if (error != null) {
        throwException(string.valueOf(error.get('message')));
    }
    List<Map<String,Object>> rows = new List<Map<String,Object>>();
    List<Object> jsonRows = (List<Object>)m.get('value');
    if (jsonRows == null) {
        rows.add(foundRow(m));
    } else {
        for (Object jsonRow : jsonRows) {
            Map<String,Object> row = (Map<String,Object>)jsonRow;
            rows.add(foundRow(row));
        }
    }
    return rows;
}

global override List<DataSource.UpsertResult> upsertRows(DataSource.UpsertContext
        context) {
   if (context.tableSelected == 'Sample') {
       List<DataSource.UpsertResult> results = new List<DataSource.UpsertResult>();
       List<Map<String, Object>> rows = context.rows;

       for (Map<String, Object> row : rows){
          // Make a callout to insert or update records in the external system.
          HttpResponse response;
          // Determine whether to insert or update a record.
          if (row.get('ExternalId') == null){
             // Send a POST HTTP request to insert new external record.
             // Make an Apex callout and get HttpResponse.
             response = makePostCallout(
                 '{"name":"' + row.get('Name') + '","ExternalId":"' +
                 row.get('ExternalId') + '"');
          }
          else {
             // Send a PUT HTTP request to update an existing external record.
             // Make an Apex callout and get HttpResponse.
             response = makePutCallout(
                 '{"name":"' + row.get('Name') + '","ExternalId":"' +
                 row.get('ExternalId') + '"',
                 String.valueOf(row.get('ExternalId')));
          }

          // Check the returned response.
          // First, deserialize it.
          Map<String, Object> m = (Map<String, Object>)JSON.deserializeUntyped(
                  response.getBody());
          if (response.getStatusCode() == 200){
              results.add(DataSource.UpsertResult.success(
                      String.valueOf(m.get('id'))));
          }
          else {
             results.add(DataSource.UpsertResult.failure(
```

```
                                String.valueOf(m.get('id')),
                    'The callout resulted in an error: ' +
                    response.getStatusCode()));
            }
        }
        return results;
    }
    return null;
}

global override List<DataSource.DeleteResult> deleteRows(DataSource.DeleteContext
        context) {
    if (context.tableSelected == 'Sample'){
        List<DataSource.DeleteResult> results = new List<DataSource.DeleteResult>();
        for (String externalId : context.externalIds){
            HttpResponse response = makeDeleteCallout(externalId);
            if (response.getStatusCode() == 200){
                results.add(DataSource.DeleteResult.success(externalId));
            }
            else {
                results.add(DataSource.DeleteResult.failure(externalId,
                            'Callout delete error:'
                            + response.getBody()));
            }
        }

Connection Methods

Connection Methods

The following are methods for `Connection`.

IN THIS SECTION:

deleteRows(deleteContext)
Invoked when external object records are deleted via the Salesforce user interface, APIs, or Apex.

query(queryContext)
Invoked by a SOQL query of an external object. A SOQL query is generated and executed when a user visits an external object's list view or record detail page in Salesforce. Returns the results of the query.

search(searchContext)
Invoked by a SOSL query of an external object or when a user performs a Salesforce global search that also searches external objects. Returns the results of the query.

sync()
Invoked when an administrator clicks **Validate and Sync** on the external data source detail page. Returns a list of tables that describe the external system's schema.

upsertRows(upsertContext)
Invoked when external object records are created or updated via the Salesforce user interface, APIs, or Apex.

`deleteRows(deleteContext)`

Invoked when external object records are deleted via the Salesforce user interface, APIs, or Apex.

Signature

```
public List<DataSource.DeleteResult> deleteRows(DataSource.DeleteContext deleteContext)
```

Parameters

deleteContext
Type: DataSource.DeleteContext

Contains context information about the delete request.

Return Value

Type: List<DataSource.DeleteResult>

The results of the delete operation.

query(queryContext)

Invoked by a SOQL query of an external object. A SOQL query is generated and executed when a user visits an external object's list view or record detail page in Salesforce. Returns the results of the query.

Signature

```
public DataSource.TableResult query(DataSource.QueryContext queryContext)
```

Parameters

queryContext
Type: DataSource.QueryContext

Represents the query to run against a data table.

Return Value

Type: DataSource.TableResult

search(searchContext)

Invoked by a SOSL query of an external object or when a user performs a Salesforce global search that also searches external objects. Returns the results of the query.

Signature

```
public List<DataSource.TableResult> search(DataSource.SearchContext searchContext)
```

Parameters

searchContext
Type: DataSource.SearchContext

Represents the query to run against an external data table.

Return Value

Type: List<DataSource.TableResult>

`sync()`

Invoked when an administrator clicks **Validate and Sync** on the external data source detail page. Returns a list of tables that describe the external system's schema.

Signature

```
public List<DataSource.Table> sync()
```

Return Value

Type: List<DataSource.Table>

Each returned table can be used to create an external object in Salesforce. On the Validate External Data Source page, the administrator views the list of returned tables and selects which tables to sync. When the administrator clicks **Sync**, an external object is created for each selected table. Each column within the selected tables also becomes a field in the external object.

`upsertRows(upsertContext)`

Invoked when external object records are created or updated via the Salesforce user interface, APIs, or Apex.

Signature

```
public List<DataSource.UpsertResult> upsertRows(DataSource.UpsertContext upsertContext)
```

Parameters

`upsertContext`
Type: DataSource.UpsertContext

Contains context information about the upsert request.

Return Value

Type: List<DataSource.UpsertResult>

The results of the upsert operation.

ConnectionParams Class

Contains the credentials for authenticating to the external system.

Namespace

DataSource

Usage

If your extension of the `DataSource.Provider` class returns `DataSource.AuthenticationCapability` values that indicate support for authentication, the `DataSource.Connection` class is instantiated with a `DataSource.ConnectionParams` instance in the constructor.

The authentication credentials in the `DataSource.ConnectionParams` instance depend on the `Identity Type` field of the external data source definition in Salesforce.

- If `Identity Type` is set to `Named Principal`, the credentials come from the external data source definition.
- If `Identity Type` is set to `Per User`:
  - For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user's authentication settings for the external system.
  - For administrative connections, such as syncing the external system's schema, the credentials come from the external data source definition.

The values in this class can appear in debug logs and can be accessed by users who have the "Author Apex" permission. If you require better security, we recommend that you specify named credentials instead of URLs as your Apex callout endpoints. Salesforce manages all authentication for Apex callouts that specify a named credential as the callout endpoint so that your code doesn't have to.

IN THIS SECTION:

ConnectionParams Properties

ConnectionParams Properties

The following are properties for `ConnectionParams`.

IN THIS SECTION:

certificateName
The name of the certificate for establishing each connection to the external system.

endpoint
The URL of the external system.

oauthToken
The OAuth token that's issued by the external system.

password
The password for authenticating to the external system.

principalType
An instance of DataSource.IdentityType, which determines which set of credentials to use to access the external system.

protocol
The type of protocol that's used to authenticate to the external system.

repository
Reserved for future use.

username
The username for authenticating to the external system.

certificateName

The name of the certificate for establishing each connection to the external system.

Signature

```
public String certificateName {get; set;}
```

Property Value

Type: String

The value comes from the external data source definition in Salesforce.

endpoint

The URL of the external system.

Signature

```
public String endpoint {get; set;}
```

Property Value

Type: String

The value comes from the external data source definition in Salesforce.

oauthToken

The OAuth token that's issued by the external system.

Signature

```
public String oauthToken {get; set;}
```

Property Value

Type: String

password

The password for authenticating to the external system.

Signature

```
public String password {get; set;}
```

Property Value

Type: String

The value depends on the `Identity Type` field of the external data source definition in Salesforce.

- If `Identity Type` is set to `Named Principal`, the credentials come from the external data source definition.
- If `Identity Type` is set to `Per User`:
  - For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user's authentication settings for the external system.
  - For administrative connections, such as syncing the external system's schema, the credentials come from the external data source definition.

`principalType`

An instance of DataSource.IdentityType, which determines which set of credentials to use to access the external system.

Signature

```
public DataSource.IdentityType principalType {get; set;}
```

Property Value

Type: DataSource.IdentityType

`protocol`

The type of protocol that's used to authenticate to the external system.

Signature

```
public DataSource.AuthenticationProtocol protocol {get; set;}
```

Property Value

Type: DataSource.AuthenticationProtocol

`repository`

Reserved for future use.

Signature

```
public String repository {get; set;}
```

Property Value

Type: String

Reserved for future use.

`username`

The username for authenticating to the external system.

Signature

```
public String username {get; set;}
```

Property Value

Type: String

The value depends on the `Identity Type` field of the external data source definition in Salesforce.

- If `Identity Type` is set to `Named Principal`, the credentials come from the external data source definition.
- If `Identity Type` is set to `Per User`:
  - For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user's authentication settings for the external system.
  - For administrative connections, such as syncing the external system's schema, the credentials come from the external data source definition.

DataSourceUtil Class

Parent class for the `DataSource.Provider`, `DataSource.Connection`, `DataSource.Table`, and `DataSource.Column` classes.

Namespace

DataSource

IN THIS SECTION:

DataSourceUtil Methods

DataSourceUtil Methods

The following are methods for `DataSourceUtil`.

IN THIS SECTION:

logWarning(message)
Logs the error message in the debug log.

throwException(message)
Throws a `DataSourceException` and displays the provided message to the user.

`logWarning(message)`

Logs the error message in the debug log.

Signature

```
public void logWarning(String message)
```

Parameters

message
Type: String

The error message.

Return Value

Type: void

`throwException(message)`

Throws a `DataSourceException` and displays the provided message to the user.

Signature

```
public void throwException(String message)
```

Parameters

message
Type: String

Error message to display to the user.

Return Value

Type: void

DataType Enum

Specifies the data types that are supported by the Apex Connector Framework.

Usage

The `DataSource.DataType` enum is referenced by the `type` property on the `DataSource.Column` class.

Enum Values

The following are the values of the `DataSource.DataType` enum.

Value	Description
`BOOLEAN_TYPE`	Boolean
`CURRENCY_TYPE`	Currency
`DATE_TYPE`	Date
`DATETIME_TYPE`	Date/Time
`EMAIL_TYPE`	Email

Value	Description
EXTERNAL_LOOKUP_TYPE	External lookup relationship
INDIRECT_LOOKUP_TYPE	Indirect lookup relationship
LOOKUP_TYPE	Lookup relationship
NUMBER_TYPE	Number
PERCENT_TYPE	Percent
PHONE_TYPE	Phone
PICKLIST_MULTISELECT_TYPE	Multi-select picklist
PICKLIST_TYPE	Picklist
STRING_LONG_TYPE	Long text area
STRING_SHORT_TYPE	Text area
TIME_TYPE	Time
URL_TYPE	URL

DeleteContext Class

An instance of `DeleteContext` is passed to the `deleteRows()` method on your `Database.Connection` class. The class provides context information about the delete request to the implementor of `deleteRows()`.

Namespace

DataSource

Usage

The Apex Connector Framework creates context for operations. Context is comprised of parameters about the operations, which other methods can use. An instance of the `DeleteContext` class packages these parameters into an object that can be used when a `deleteRows()` operation is initiated.

IN THIS SECTION:

DeleteContext Properties

DeleteContext Properties

The following are properties for `DeleteContext`.

IN THIS SECTION:

externalIds
The external IDs of the rows representing external object records to delete.

tableSelected
The name of the table to delete rows from.

externalIds

The external IDs of the rows representing external object records to delete.

Signature

```
public List<String> externalIds {get; set;}
```

Property Value

Type: List<String>

tableSelected

The name of the table to delete rows from.

Signature

```
public String tableSelected {get; set;}
```

Property Value

Type: String

DeleteResult Class

Represents the result of a delete operation on an sObject record. The result is returned by the `DataSource.deleteRows` method of the `DataSource.Connection` class.

Namespace

DataSource

Usage

A delete operation on external object records generates an array of objects of type `DataSource.DeleteResult`. Its methods create result records that indicate whether the delete operation succeeded or failed.

IN THIS SECTION:

DeleteResult Properties
DeleteResult Methods

DeleteResult Properties

The following are properties for `DeleteResult`.

IN THIS SECTION:

errorMessage
The error message that's generated by a failed delete operation. Recorded with a result of type `DataSource.DeleteResult`.

externalId
The unique identifier of a row that represents an external object record to delete.

success
Indicates whether a delete operation succeeded or failed.

errorMessage

The error message that's generated by a failed delete operation. Recorded with a result of type `DataSource.DeleteResult`.

Signature

```
public String errorMessage {get; set;}
```

Property Value

Type: String

externalId

The unique identifier of a row that represents an external object record to delete.

Signature

```
public String externalId {get; set;}
```

Property Value

Type: String

success

Indicates whether a delete operation succeeded or failed.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

DeleteResult Methods

The following are methods for `DeleteResult`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `DeleteResult` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals` method in Java.

failure(externalId, errorMessage)
Creates a delete result indicating the failure of a delete request for a given external ID.

hashCode()
Maintains the integrity of lists of type `DeleteResult` by determining the uniqueness of the external object records in a list.

success(externalId)
Creates a delete result indicating the successful completion of a delete request for a given external ID.

equals(obj)

Maintains the integrity of lists of type `DeleteResult` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals` method in Java.

Signature

```
public Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

For information about the `equals` method, see Using Custom Types in Map Keys and Sets.

Return Value

Type: Boolean

failure(externalId, errorMessage)

Creates a delete result indicating the failure of a delete request for a given external ID.

Signature

```
public static DataSource.DeleteResult failure(String externalId, String errorMessage)
```

Parameters

externalId
Type: String

The unique identifier of the sObject record to delete.

errorMessage
Type: String

The reason the delete operation failed.

Return Value

Type: DataSource.DeleteResult

Status result of the delete operation.

`hashCode()`

Maintains the integrity of lists of type `DeleteResult` by determining the uniqueness of the external object records in a list.

Signature

```
public Integer hashCode()
```

Return Value

Type: Integer

`success(externalId)`

Creates a delete result indicating the successful completion of a delete request for a given external ID.

Signature

```
public static DataSource.DeleteResult success(String externalId)
```

Parameters

`externalId`
Type: String

The unique identifier of the sObject record to delete.

Return Value

Type: DataSource.DeleteResult

Status result of the delete operation for the sObject with the given external ID.

Filter Class

Represents a `WHERE` clause in a SOSL or SOQL query.

Namespace

DataSource

Usage

Compound types require child filters. Specifically, the `subfilters` property can't be null if the `type` property is `NOT_`, `AND_`, or `OR_`.

IN THIS SECTION:

Filter Properties

Filter Properties

The following are properties for `Filter`.

IN THIS SECTION:

columnName
Name of the column that's being evaluated in a simple comparative type of filter.

columnValue
Value that the filter compares records against in a simple comparative type of filter.

subfilters
List of subfilters for compound filter types, such as `NOT_`, `AND_`, and `OR_`.

tableName
Name of the table whose column is being evaluated in a simple comparative type of filter.

type
Type of filter operation that limits the returned data.

`columnName`

Name of the column that's being evaluated in a simple comparative type of filter.

Signature

```
public String columnName {get; set;}
```

Property Value

Type: String

`columnValue`

Value that the filter compares records against in a simple comparative type of filter.

Signature

```
public Object columnValue {get; set;}
```

Property Value

Type: Object

`subfilters`

List of subfilters for compound filter types, such as `NOT_`, `AND_`, and `OR_`.

Signature

```
public List<DataSource.Filter> subfilters {get; set;}
```

Property Value

Type: List<DataSource.Filter>

`tableName`

Name of the table whose column is being evaluated in a simple comparative type of filter.

Signature

```
public String tableName {get; set;}
```

Property Value

Type: String

`type`

Type of filter operation that limits the returned data.

Signature

```
public DataSource.FilterType type {get; set;}
```

Property Value

Type: DataSource.FilterType

FilterType Enum

Referenced by the `type` property on a `DataSource.Filter`.

Usage

Determines how to limit the returned data.

Enum Values

The following are the values of the `DataSource.FilterType` enum.

Value	Description
`AND_`	This compound filter type returns all rows that match all the subfilters.
`CONTAINS`	Simple comparative filter type.
`ENDS_WITH`	Simple comparative filter type.

Value	Description
EQUALS	Simple comparative filter type.
GREATER_THAN	Simple comparative filter type.
GREATER_THAN_OR_EQUAL_TO	Simple comparative filter type.
LESS_THAN	Simple comparative filter type.
LESS_THAN_OR_EQUAL_TO	Simple comparative filter type.
LIKE_	Simple comparative filter type.
NOT_	This compound filter type returns the rows that don't match the subfilter.
NOT_EQUALS	Simple comparative filter type.
OR_	This compound filter type returns all rows that match any of the subfilters.
STARTS_WITH	Simple comparative filter type.

IdentityType Enum

Determines which set of credentials is used to authenticate to the external system.

Usage

The relevant credentials are passed to your `DataSource.Connection` class.

Enum Values

The following are the values of the `DataSource.IdentityType` enum.

Value	Description
ANONYMOUS	No credentials are used to authenticate to the external system.
NAMED_USER	The credentials in the external data source definition are used to authenticate to the external system, regardless of which user is accessing the external data from your organization.
PER_USER	For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user's authentication settings for the external system. For administrative connections, such as syncing the external system's schema, the credentials come from the external data source definition.

Order Class

Contains details about how to sort the rows in the result set. Equivalent to an `ORDER BY` statement in a SOQL query.

Namespace

DataSource

Usage

Used in the `order` property on the `DataSource.TableSelection` class.

IN THIS SECTION:

Order Properties

Order Methods

Order Properties

The following are properties for `Order`.

IN THIS SECTION:

columnName
Name of the column whose values are used to sort the rows in the result set.

direction
Direction for sorting rows based on column values.

tableName
Name of the table whose column values are used to sort the rows in the result set.

`columnName`

Name of the column whose values are used to sort the rows in the result set.

Signature

```
public String columnName {get; set;}
```

Property Value

Type: String

`direction`

Direction for sorting rows based on column values.

Signature

```
public DataSource.OrderDirection direction {get; set;}
```

Property Value

Type: DataSource.OrderDirection

tableName

Name of the table whose column values are used to sort the rows in the result set.

Signature

```
public String tableName {get; set;}
```

Property Value

Type: String

Order Methods

The following are methods for `Order`.

IN THIS SECTION:

get(tableName, columnName, direction)
Creates an instance of the DataSource.Order class.

get(tableName, columnName, direction)

Creates an instance of the DataSource.Order class.

Signature

```
public static DataSource.Order get(String tableName, String columnName,
DataSource.OrderDirection direction)
```

Parameters

tableName
Type: String

Name of the table whose column values are used to sort the rows in the result set.

columnName
Type: String

Name of the column whose values are used to sort the rows in the result set.

direction
Type: DataSource.OrderDirection

Direction for sorting rows based on column values.

Return Value

Type: DataSource.Order

OrderDirection Enum

Specifies the direction for sorting rows based on column values.

Usage

Used by the direction property on the DataSource.Order class.

Enum Values

The following are the values of the `DataSource.OrderDirection` enum.

Value	Description
`ASCENDING`	Sort rows in ascending order (A–Z).
`DESCENDING`	Sort rows in descending order (Z–A).

Provider Class

Extend this base class to create a custom adapter for Salesforce Connect. The class informs Salesforce of the functional and authentication capabilities that are supported by or required to connect to the external system. This class extends the `DataSourceUtil` class and inherits its methods.

Namespace

DataSource

Usage

Create an Apex class that extends `DataSource.Provider` to specify the following.

- The types of authentication that can be used to access the external system
- The features that are supported for the connection to the external system
- The Apex class that extends `DataSource.Connection` to sync the external system's schema and to handle the queries and searches of the external data

The values that are returned by the `DataSource.Provider` class determine which settings are available in the external data source definition in Salesforce. To access the external data source definition from Setup, enter *`External Data Sources`* in the `Quick Find` box, then select **External Data Sources**.

IN THIS SECTION:

Provider Methods

Provider Methods

The following are methods for `Provider`.

IN THIS SECTION:

getAuthenticationCapabilities()
Returns the types of authentication that can be used to access the external system.

getCapabilities()
Returns the functional operations that the external system supports and the required endpoint settings for the external data source definition in Salesforce.

getConnection(connectionParams)
Returns a connection that points to an instance of the external data source.

`getAuthenticationCapabilities()`

Returns the types of authentication that can be used to access the external system.

Signature

```
public List<DataSource.AuthenticationCapability> getAuthenticationCapabilities()
```

Return Value

Type: List<DataSource.AuthenticationCapability>

`getCapabilities()`

Returns the functional operations that the external system supports and the required endpoint settings for the external data source definition in Salesforce.

Signature

```
public List<DataSource.Capability> getCapabilities()
```

Return Value

Type: List<DataSource.Capability>

`getConnection(connectionParams)`

Returns a connection that points to an instance of the external data source.

Signature

```
public DataSource.Connection getConnection(DataSource.ConnectionParams connectionParams)
```

Parameters

`connectionParams`
Type: DataSource.ConnectionParams

Credentials for authenticating to the external system.

Return Value

Type: DataSource.Connection

QueryAggregation Enum

Specifies how to aggregate a column in a query.

Usage

Used by the aggregation property on the DataSource.ColumnSelection class.

Enum Values

The following are the values of the `DataSource.QueryAggregation` enum.

Value	Description
`AVG`	Reserved for future use.
`COUNT`	Returns the number of rows that meet the query criteria.
`MAX`	Reserved for future use.
`MIN`	Reserved for future use.
`NONE`	No aggregation.
`SUM`	Reserved for future use.

QueryContext Class

An instance of `QueryContext` is provided to the `query` method on your `DataSource.Connection` class. The instance corresponds to a SOQL request.

Namespace

DataSource

IN THIS SECTION:

QueryContext Properties

QueryContext Methods

QueryContext Properties

The following are properties for `QueryContext`.

IN THIS SECTION:

queryMoreToken
Query token that's used for server-driven paging to determine and fetch the subsequent batch of results.

tableSelection
Query details that represent the `FROM`, `ORDER BY`, `SELECT`, and `WHERE` clauses in a SOQL or SOSL query.

queryMoreToken

Query token that's used for server-driven paging to determine and fetch the subsequent batch of results.

Signature

```
public String queryMoreToken {get; set;}
```

Property Value

Type: String

tableSelection

Query details that represent the `FROM`, `ORDER BY`, `SELECT`, and `WHERE` clauses in a SOQL or SOSL query.

Signature

```
public DataSource.TableSelection tableSelection {get; set;}
```

Property Value

Type: DataSource.TableSelection

QueryContext Methods

The following are methods for `QueryContext`.

IN THIS SECTION:

get(metadata, offset, maxResults, tableSelection)
Creates an instance of the `QueryContext` class.

get(metadata, offset, maxResults, tableSelection)

Creates an instance of the `QueryContext` class.

Signature

```
public static DataSource.QueryContext get(List<DataSource.Table> metadata, Integer
offset, Integer maxResults, DataSource.TableSelection tableSelection)
```

Parameters

metadata
Type: List<DataSource.Table>

List of table metadata that describes the external system's tables to query.

offset
Type: Integer

Used for client-driven paging. Specifies the starting row offset into the query's result set.

maxResults
Type: Integer

Used for client-driven paging. Specifies the maximum number of rows to return in each batch.

tableSelection
Type: DataSource.TableSelection

Query details that represent the `FROM`, `ORDER BY`, `SELECT`, and `WHERE` clauses in a SOQL or SOSL query.

Return Value

Type: `DataSource.QueryContext`

QueryUtils Class

Contains helper methods to locally filter, sort, and apply limit and offset clauses to data rows. This helper class is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Namespace

DataSource

Usage

The `DataSource.QueryUtils` class and its helper methods can process query results locally within your Salesforce org. This class is provided for your convenience to simplify the development of your Salesforce Connect custom adapter for initial tests. However, the `DataSource.QueryUtils` class and its methods aren't supported for use in production environments that use callouts to retrieve data from external systems. Complete the filtering and sorting on the external system before sending the query results to Salesforce. When possible, use server-driven paging or another technique to have the external system determine the appropriate data subsets according to the limit and offset clauses in the query.

IN THIS SECTION:

QueryUtils Methods

QueryUtils Methods

The following are methods for `QueryUtils`.

IN THIS SECTION:

applyLimitAndOffset(queryContext, rows)
Returns a subset of data rows after locally applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

filter(queryContext, rows)
Returns a subset of data rows after locally ordering and applying filters from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

process(queryContext, rows)
Returns data rows after locally filtering, sorting, ordering, and applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

sort(queryContext, rows)
Returns data rows after locally sorting and applying the order from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

`applyLimitAndOffset(queryContext, rows)`

Returns a subset of data rows after locally applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Signature

```
public static List<Map<String,Object>> applyLimitAndOffset(DataSource.QueryContext
queryContext, List<Map<String,Object>> rows)
```

Parameters

queryContext
Type: DataSource.QueryContext

Represents the query to run against a data table.

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: List<Map<String, Object>>

`filter(queryContext, rows)`

Returns a subset of data rows after locally ordering and applying filters from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Signature

```
public static List<Map<String,object>> filter(DataSource.QueryContext queryContext,
List<Map<String,Object>> rows)
```

Parameters

queryContext
Type: DataSource.QueryContext

queryContext

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: List<Map<String, Object>>

process(queryContext, rows)

Returns data rows after locally filtering, sorting, ordering, and applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Signature

```
public static List<Map<String,object>> process(DataSource.QueryContext queryContext,
List<Map<String,Object>> rows)
```

Parameters

queryContext
Type: DataSource.QueryContext

Represents the query to run against a data table.

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: List<Map<String, Object>>

sort(queryContext, rows)

Returns data rows after locally sorting and applying the order from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Signature

```
public static List<Map<String,ject>> sort(DataSource.QueryContext queryContext,
List<Map<String,object>> rows)
```

Parameters

queryContext
Type: DataSource.QueryContext

Represents the query to run against a data table.

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: List<Map<String, Object>>

ReadContext Class

Abstract base class for the `QueryContext` and `SearchContext` classes.

Namespace

DataSource

IN THIS SECTION:

ReadContext Properties

ReadContext Properties

The following are properties for `ReadContext`.

IN THIS SECTION:

maxResults
Maximum number of rows that the query can return.

metadata
Describes the external system's tables to query.

offset
The starting row offset into the query's result set. Used for client-driven paging.

`maxResults`

Maximum number of rows that the query can return.

Signature

```
public Integer maxResults {get; set;}
```

Property Value

Type: Integer

`metadata`

Describes the external system's tables to query.

Signature

```
public List<DataSource.Table> metadata {get; set;}
```

Property Value

Type: List<DataSource.Table>

`offset`

The starting row offset into the query's result set. Used for client-driven paging.

Signature

```
public Integer offset {get; set;}
```

Property Value

Type: Integer

SearchContext Class

An instance of `SearchContext` is provided to the search method on your `DataSource.Connection` class. The instance corresponds to a search or SOSL request.

Namespace

DataSource

IN THIS SECTION:

SearchContext Constructors

SearchContext Properties

SearchContext Constructors

The following are constructors for `SearchContext`.

IN THIS SECTION:

SearchContext(metadata, offset, maxResults, tableSelections, searchPhrase)

Creates an instance of the `SearchContext` class with the specified parameter values.

SearchContext()

Creates an instance of the `SearchContext` class.

SearchContext(metadata, offset, maxResults, tableSelections, searchPhrase)

Creates an instance of the `SearchContext` class with the specified parameter values.

Signature

```
public SearchContext(List<DataSource.Table> metadata, Integer offset, Integer maxResults,
List<DataSource.TableSelection> tableSelections, String searchPhrase)
```

Parameters

metadata

Type: List<DataSource.Table>

List of table metadata that describes the external system's tables to query.

offset

Type: Integer

Specifies the starting row offset into the query's result set.

maxResults

Type: Integer

Specifies the maximum number of rows to return in each batch.

tableSelections

Type: List<DataSource.TableSelection>

List of queries and their details. The details represent the `FROM`, `ORDER BY`, `SELECT`, and `WHERE` clauses in each SOQL or SOSL query.

searchPhrase

Type: String

The user-entered search string as a case-sensitive single phrase, with all non-alphanumeric characters removed.

SearchContext()

Creates an instance of the `SearchContext` class.

Signature

```
public SearchContext()
```

SearchContext Properties

The following are properties for `SearchContext`.

IN THIS SECTION:

searchPhrase
The user-entered search string as a case-sensitive single phrase, with all non-alphanumeric characters removed.

tableSelections
List of queries and their details. The details represent the FROM, ORDER BY, SELECT, and WHERE clauses in each SOQL or SOSL query.

`searchPhrase`

The user-entered search string as a case-sensitive single phrase, with all non-alphanumeric characters removed.

Signature

```
public String searchPhrase {get; set;}
```

Property Value

Type: String

`tableSelections`

List of queries and their details. The details represent the FROM, ORDER BY, SELECT, and WHERE clauses in each SOQL or SOSL query.

Signature

```
public List<DataSource.TableSelection> tableSelections {get; set;}
```

Property Value

Type: List<DataSource.TableSelection>

SearchUtils Class

Helper class for implementing search on a custom adapter for Salesforce Connect.

Namespace

DataSource

Usage

We recommend that you develop your own search implementation that can search columns in addition to the designated name field.

IN THIS SECTION:

SearchUtils Methods

SearchUtils Methods

The following are methods for `SearchUtils`.

IN THIS SECTION:

searchByName(searchDetails, connection)
Queries all the tables and returns each row whose designated name field contains the search phrase.

`searchByName(searchDetails, connection)`

Queries all the tables and returns each row whose designated name field contains the search phrase.

Signature

```
public static List<DataSource.TableResult> searchByName(DataSource.SearchContext
searchDetails, DataSource.Connection connection)
```

Parameters

`searchDetails`
Type: DataSource.SearchContext

The `SearchContext` class that specifies which data to search and what to search for.

`connection`
Type: DataSource.Connection

The `DataSource.Connection` class that connects to the external system.

Return Value

Type: List<DataSource.TableResult>

Table Class

Describes a table on an external system that the Salesforce Connect custom adapter connects to. This class extends the `DataSourceUtil` class and inherits its methods.

Namespace

DataSource

Usage

A list of table metadata is provided by the `DataSource.Connection` class when the `sync()` method is invoked. Each table can become an external object in Salesforce.

The metadata is stored in Salesforce. Updating the Apex code to return new or updated values for the table metadata doesn't automatically update the stored metadata in Salesforce.

IN THIS SECTION:

Table Properties
Table Methods

Table Properties

The following are properties for `Table`.

IN THIS SECTION:

columns
List of table columns.

description
Description of what the table represents.

labelPlural
Plural form of the user-friendly name for the table. The `labelPlural` becomes the object's plural label in the Salesforce user interface.

labelSingular
Singular form of the user-friendly name for the table. The `labelSingular` becomes the object label in the Salesforce user interface. We recommend that you make object labels unique across all standard, custom, and external objects in the org.

name
Name of the table on the external system.

nameColumn
Name of the table column that becomes the name field of the external object when the administrator syncs the table.

`columns`

List of table columns.

Signature

```
public List<DataSource.Column> columns {get; set;}
```

Property Value

Type: List<DataSource.Column>

`description`

Description of what the table represents.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

`labelPlural`

Plural form of the user-friendly name for the table. The `labelPlural` becomes the object's plural label in the Salesforce user interface.

Signature

```
public String labelPlural {get; set;}
```

```
DataSource.Table, labelPlural
```

Property Value

Type: String

`labelSingular`

Singular form of the user-friendly name for the table. The `labelSingular` becomes the object label in the Salesforce user interface. We recommend that you make object labels unique across all standard, custom, and external objects in the org.

Signature

```
public String labelSingular {get; set;}
```

Property Value

Type: String

`name`

Name of the table on the external system.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

`nameColumn`

Name of the table column that becomes the name field of the external object when the administrator syncs the table.

Signature

```
public String nameColumn {get; set;}
```

Property Value

Type: String

Table Methods

The following are methods for `Table`.

IN THIS SECTION:

get(name, labelSingular, labelPlural, description, nameColumn, columns)
Returns the table metadata with the specified parameter values.

get(name, nameColumn, columns)
Returns the table metadata with the specified parameter values, using the name for the labels and description.

get(name, labelSingular, labelPlural, description, nameColumn, columns)

Returns the table metadata with the specified parameter values.

Signature

```
public static DataSource.Table get(String name, String labelSingular, String labelPlural,
String description, String nameColumn, List<DataSource.Column> columns)
```

Parameters

name
Type: String

Name of the external table.

labelSingular
Type: String

Singular form of the user-friendly name for the table. The `labelSingular` becomes the object label in the Salesforce user interface.

labelPlural
Type: String

Plural form of the user-friendly name for the table. The `labelPlural` becomes the object's plural label in the Salesforce user interface.

description
Type: String

Description of the external table.

nameColumn
Type: String

Name of the table column that becomes the name field of the external object when the administrator syncs the table.

columns
Type: List<DataSource.Column>

List of table columns.

Return Value

Type: DataSource.Table

get(name, nameColumn, columns)

Returns the table metadata with the specified parameter values, using the name for the labels and description.

Signature

```
public static DataSource.Table get(String name, String nameColumn,
List<DataSource.Column> columns)
```

```
DataSource.Table, get, [String, String, List<DataSource.Column>], DataSource.Table
```

Parameters

name
Type: String

Name of the external table.

nameColumn
Type: String

Name of the table column that becomes the name field of the external object when the administrator syncs the table.

columns
Type: List<DataSource.Column>

List of table columns.

Return Value

Type: DataSource.Table

The returned table metadata has these property values.

Property	Value
name	*name*
labelSingular	*name*
labelPlural	*name*
description	*name*
nameColumn	*nameColumn*
columns	*columns*

TableResult Class

Contains the results of a search or query.

Namespace

DataSource

IN THIS SECTION:

TableResult Properties

TableResult Methods

TableResult Properties

The following are properties for `TableResult`.

IN THIS SECTION:

errorMessage
errorMessage

queryMoreToken
Query token that's used for server-driven paging to determine and fetch the subsequent batch of results. This token is passed back to the Apex data source on subsequent queries in the `queryMoreToken` property on the `QueryContext`.

rows
Rows of data.

success
Whether the search or query was successful.

tableName
Name of the table that was queried.

totalSize
The total number of rows that meet the query criteria, even when the external system is requested to return a smaller batch size.

errorMessage

errorMessage

Signature

```
public String errorMessage {get; set;}
```

Property Value

Type: String

queryMoreToken

Query token that's used for server-driven paging to determine and fetch the subsequent batch of results. This token is passed back to the Apex data source on subsequent queries in the `queryMoreToken` property on the `QueryContext`.

Signature

```
public String queryMoreToken {get; set;}
```

Property Value

Type: String

rows

Rows of data.

Signature

```
public List<Map<String,Object>> rows {get; set;}
```

Property Value

Type: List<Map<String, Object>>

`success`

Whether the search or query was successful.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

`tableName`

Name of the table that was queried.

Signature

```
public String tableName {get; set;}
```

Property Value

Type: String

`totalSize`

The total number of rows that meet the query criteria, even when the external system is requested to return a smaller batch size.

Signature

```
public Integer totalSize {get; set;}
```

Property Value

Type: Integer

TableResult Methods

The following are methods for `TableResult`.

IN THIS SECTION:

error(errorMessage)
Returns failed search or query results with the provided error message.

get(success, errorMessage, tableName, rows, totalSize)
Returns a subset of data rows in a `TableResult` with the provided property values and the number of rows in the table.

get(success, errorMessage, tableName, rows)
Returns a subset of data rows in a `TableResult` with the provided property values.

get(queryContext, rows)
Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.

get(tableSelection, rows)
Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.

error(errorMessage)

Returns failed search or query results with the provided error message.

Signature

```
public static DataSource.TableResult error(String errorMessage)
```

Parameters

errorMessage
Type: String

errorMessage

Return Value

Type: DataSource.TableResult

The returned `TableResult` has these property values.

Property	Value
success	false
errorMessage	*errorMessage*
tableName	null
rows	null
rows.size()	0

get(success, errorMessage, tableName, rows, totalSize)

Returns a subset of data rows in a `TableResult` with the provided property values and the number of rows in the table.

Signature

```
public static DataSource.TableResult get(Boolean success, String errorMessage, String
tableName, List<Map<String,Object>> rows, Integer totalSize)
```

Parameters

success
Type: Boolean

Whether the search or query was successful.

errorMessage
Type: String

errorMessage

tableName
Type: String

Name of the table that was queried.

rows
Type: List<Map<String, Object>>

Rows of data.

totalSize
Type: Integer

The total number of rows that meet the query criteria, even when the external system is requested to return a smaller batch size.

Return Value

Type: DataSource.TableResult

get(success, errorMessage, tableName, rows)

Returns a subset of data rows in a `TableResult` with the provided property values.

Signature

```
public static DataSource.TableResult get(Boolean success, String errorMessage, String
tableName, List<Map<String,Object>> rows)
```

Parameters

success
Type: Boolean

Whether the search or query was successful.

errorMessage
Type: String

errorMessage

tableName
Type: String

Name of the table that was queried.

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: DataSource.TableResult

get(queryContext, rows)

Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.

Signature

```
public static DataSource.TableResult get(DataSource.QueryContext queryContext,
List<Map<String,Object>> rows)
```

Parameters

queryContext
Type: DataSource.QueryContext

Represents the query to run against a data table.

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: DataSource.TableResult

get(tableSelection, rows)

Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.

Signature

```
public static DataSource.TableResult get(DataSource.TableSelection tableSelection,
List<Map<String,Object>> rows)
```

Parameters

tableSelection
Type: DataSource.TableSelection

Query details that represent the `FROM`, `ORDER BY`, `SELECT`, and `WHERE` clauses in a SOQL or SOSL query.

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: DataSource.TableResult

TableSelection Class

Contains a breakdown of the SOQL or SOSL query. Its properties represent the FROM, ORDER BY, SELECT, and WHERE clauses in the query.

Namespace

DataSource

IN THIS SECTION:

TableSelection Properties

TableSelection Properties

The following are properties for `TableSelection`.

IN THIS SECTION:

columnsSelected
List of columns to query. Corresponds to the `SELECT` clause in a SOQL or SOSL query.

filter
Identifies the query filter, which can be a compound filter that has a list of subfilters. The filter corresponds to the `WHERE` clause in a SOQL or SOSL query.

order
Identifies the order for sorting the query results. Corresponds to the `ORDER BY` clause in a SOQL or SOSL query.

tableSelected
Name of the table to query. Corresponds to the `FROM` clause in a SOQL or SOSL query.

`columnsSelected`

List of columns to query. Corresponds to the `SELECT` clause in a SOQL or SOSL query.

Signature

```
public List<DataSource.ColumnSelection> columnsSelected {get; set;}
```

Property Value

Type: List<DataSource.ColumnSelection>

`filter`

Identifies the query filter, which can be a compound filter that has a list of subfilters. The filter corresponds to the `WHERE` clause in a SOQL or SOSL query.

Signature

```
public DataSource.Filter filter {get; set;}
```

Property Value

Type: DataSource.Filter

`order`

Identifies the order for sorting the query results. Corresponds to the `ORDER BY` clause in a SOQL or SOSL query.

Signature

```
public List<DataSource.Order> order {get; set;}
```

Property Value

Type: List<DataSource.Order>

`tableSelected`

Name of the table to query. Corresponds to the `FROM` clause in a SOQL or SOSL query.

Signature

```
public String tableSelected {get; set;}
```

Property Value

Type: String

UpsertContext Class

An instance of `UpsertContext` is passed to the `upsertRows()` method on your `Datasource.Connection` class. This class provides context information about the upsert request to the implementor of `upsertRows()`.

Namespace

DataSource

Usage

The Apex Connector Framework creates the contet for operations. Context is comprised of parameters about the operations, which other methods can use. An instance of the `UpsertContext` class packages these parameters into an object that can be used when an `upsertRows()` operation is initiated.

IN THIS SECTION:

UpsertContext Properties

UpsertContext Properties

The following are properties for `UpsertContext`.

IN THIS SECTION:

rows
List of rows corresponding to the external object records to upsert.
tableSelected
The name of the table to upsert rows in.

rows

List of rows corresponding to the external object records to upsert.

Signature

```
public List<Map<String,ANY>> rows {get; set;}
```

Property Value

Type: List<Map<String,Object>>

tableSelected

The name of the table to upsert rows in.

Signature

```
public String tableSelected {get; set;}
```

Property Value

Type: String

UpsertResult Class

Represents the result of an upsert operation on an external object record. The result is returned by the `upsertRows` method of the `DataSource.Connection` class.

Namespace

DataSource

Usage

An upsert operation on external object records generates an array of objects of type `DataSource.UpsertResult`. Its methods create result records that indicate whether the upsert operation succeeded or failed.

IN THIS SECTION:

UpsertResult Properties

UpsertResult Methods

UpsertResult Properties

The following are properties for `UpsertResult`.

IN THIS SECTION:

errorMessage
The error message that's generated by a failed upsert operation.

externalId
The unique identifier of a row that represents an external object record to upsert.

success
Indicates whether a delete operation succeeded or failed.

errorMessage

The error message that's generated by a failed upsert operation.

Signature

```
public String errorMessage {get; set;}
```

Property Value

Type: String

externalId

The unique identifier of a row that represents an external object record to upsert.

Signature

```
public String externalId {get; set;}
```

Property Value

Type: String

success

Indicates whether a delete operation succeeded or failed.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

UpsertResult Methods

The following are methods for `UpsertResult`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `UpsertResult` by determining the equality of external object records in a list. This method is dynamic and is based on the `equals` method in Java.

failure(externalId, errorMessage)
Creates an upsert result that indicates the failure of a delete request for a given external ID.

hashCode()
Maintains the integrity of lists of type `UpsertResult` by determining the uniqueness of the external object records in a list.

success(externalId)
Creates a delete result that indicates the successful completion of an upsert request for a given external ID.

`equals(obj)`

Maintains the integrity of lists of type `UpsertResult` by determining the equality of external object records in a list. This method is dynamic and is based on the `equals` method in Java.

Signature

```
public Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`failure(externalId, errorMessage)`

Creates an upsert result that indicates the failure of a delete request for a given external ID.

Signature

```
public static DataSource.UpsertResult failure(String externalId, String errorMessage)
```

Parameters

externalId
Type: String

The unique identifier of the external object record to upsert.

errorMessage
Type: String

The reason the upsert operation failed.

Return Value

Type: DataSource.UpsertResult

Status result for the upsert operation.

hashCode()

Maintains the integrity of lists of type `UpsertResult` by determining the uniqueness of the external object records in a list.

Signature

```
public Integer hashCode()
```

Return Value

Type: Integer

success(externalId)

Creates a delete result that indicates the successful completion of an upsert request for a given external ID.

Signature

```
public static DataSource.UpsertResult success(String externalId)
```

Parameters

externalId
Type: String

The unique identifier of the external object record to upsert.

Return Value

Type: DataSource.UpsertResult

Status result of the upsert operation for the external object record with the given external ID.

DataSource Exceptions

The `DataSource` namespace contains exception classes.

All exception classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions.

The `DataSource` namespace contains these exceptions.

Exception	Description	Methods
`DataSource.DataSourceException`	Throw this exception to indicate that an error occurred while communicating with an external data source.	To get the error message and write it to debug log, use the `String getMessage()`.
`DataSource.OAuthTokenExpiredException`	Throw this exception to indicate that an OAuth token has expired. The system then attempts to refresh the token automatically and restart the query, search, or sync operation.	To get the error message and write it to debug log, use the `String getMessage()`.

DataWeave Namespace

The DataWeave namespace provides classes and methods to support the invocation of DataWeave scripts from Apex.

DataWeave is the MuleSoft expression language for accessing, parsing, and transforming data that travels through a Mule application. For detailed information, see DataWeave Language.

These are the classes in the `DataWeave` namespace.

IN THIS SECTION:

Result Class
Contains methods to retrieve data that was transformed using Script class methods.

Script Class
Contains the `createScript()` method to load DataWeave scripts and the `execute()` method to obtain script output in a `DataWeave.Result` object.

SEE ALSO:

DataWeave in Apex

Result Class

Contains methods to retrieve data that was transformed using Script class methods.

Namespace

DataWeave

Example

See Script Class for an example to run a DataWeave script from Apex and retrieve the resulting script output.

IN THIS SECTION:

Result Methods

Result Methods

The following are methods for `Result`.

IN THIS SECTION:

getValue()
Returns the result of a DataWeave script execution as an object.

getValueAsString()
Returns the result of a DataWeave script execution as a string value.

`getValue()`

Returns the result of a DataWeave script execution as an object.

Signature

```
public Object getValue()
```

Return Value

Type: Object

`getValueAsString()`

Returns the result of a DataWeave script execution as a string value.

Signature

```
public String getValueAsString()
```

Return Value

Type: String

Script Class

Contains the `createScript()` method to load DataWeave scripts and the `execute()` method to obtain script output in a `DataWeave.Result` object.

Namespace

DataWeave

This example runs a DataWeave script from Apex and retrieves the resulting script output. First deploy the script to the org as `ContactsToJson.dwl`.

```
%dw 2.0
input records application/java
output application/json
---
{
  users: records map(record) -> {
    firstName: record.FirstName,
    lastName: record.LastName
  }
```

Then, execute the script from Apex.

```
List<Contact> data = [SELECT FirstName, LastName FROM Contact WHERE LastName LIMIT 5];
Map<String, Object> args = new Map<String, Object>{ 'records' => data };
DataWeave.Script script = DataWeave.Script.createScript('ContactsToJson');

DataWeave.Result result = script.execute(args);
string jsonOutput = result.getValueAsString();
```

IN THIS SECTION:

Script Methods

Script Methods

The following are methods for `Script`.

IN THIS SECTION:

createScript(scriptName)
Loads a DataWeave 2.0 script from the `.dwl` metadata file that is deployed in an org. The script can then be run using the `Script.execute` method.

createScript(namespace, scriptName)
Loads a DataWeave 2.0 script from a specified namespace. The script can then be run using the `Script.execute` method.

execute(parameters)
Executes the DataWeave script that is loaded using the `createScript()` method and returns the script output.

toString()
Returns the name of the script.

`createScript(scriptName)`

Loads a DataWeave 2.0 script from the `.dwl` metadata file that is deployed in an org. The script can then be run using the `Script.execute` method.

Signature

```
public static createScript(String scriptName)
```

Parameters

scriptName
Type: String

The name of the deployed metadata `.dwl` script (not including the file extension).

Return Value

Type: DataWeave.Script

DataWeave script that is used as a parameter in the `Script.execute()` method.

createScript(namespace, scriptName)

Loads a DataWeave 2.0 script from a specified namespace. The script can then be run using the `Script.execute` method.

Signature

```
public static dataweave.Script createScript(String namespace, String scriptName)
```

Parameters

namespace
Type: String

The namespace name for the deployed script. If the namespace name is null, the caller namespace is used. If the namespace name is empty, the org namespace is used.

scriptName
Type: String

The name of the deployed metadata `.dwl` script (not including the file extension).

Return Value

Type: DataWeave.Script

DataWeave script that is used as a parameter in the `Script.execute()` method.

execute(parameters)

Executes the DataWeave script that is loaded using the `createScript()` method and returns the script output.

Signature

```
public execute(Map<String,Object> parameters)
```

Parameters

parameters
Type: Map<String,Object>

Input to the DataWeave script. The keys correspond to the input directive names defined in the DataWeave header.

See Input Directive and DataWeave Header.

Return Value

Type: DataWeave.Result

The `DataWeave.Result` object contains the script output.

`toString()`

Returns the name of the script.

Signature

```
public String toString()
```

Return Value

Type: String

Dom Namespace

The `Dom` namespace provides classes and methods for parsing and creating XML content.

The following are the classes in the `Dom` namespace.

IN THIS SECTION:

Document Class
Use the `Document` class to process XML content. You can parse nested XML content that's up to 50 nodes deep.

XmlNode Class
Use the `XmlNode` class to work with a node in an XML document.

XmlNodeType Enum
Specifies the node type in an XML document.

Document Class

Use the `Document` class to process XML content. You can parse nested XML content that's up to 50 nodes deep.

Namespace

Dom

Usage

One common application is to use it to create the body of a request for HttpRequest or to parse a response accessed by HttpResponse.

IN THIS SECTION:

Document Constructors

Document Methods

SEE ALSO:

Reading and Writing XML Using the DOM

Document Constructors

The following are constructors for `Document`.

IN THIS SECTION:

Document()
Creates a new instance of the `Dom.Document` class.

`Document()`

Creates a new instance of the `Dom.Document` class.

Signature

```
public Document()
```

Document Methods

The following are methods for `Document`. All are instance methods.

IN THIS SECTION:

createRootElement(name, namespace, prefix)
Creates the top-level root element for a document.

getRootElement()
Returns the top-level root element node in the document. If this method returns `null`, the root element has not been created yet.

load(xml)
Parse the XML representation of the document specified in the *`xml`* argument and load it into a document.

toXmlString()
Returns the XML representation of the document as a String.

`createRootElement(name, namespace, prefix)`

Creates the top-level root element for a document.

Signature

```
public Dom.XmlNode createRootElement(String name, String namespace, String prefix)
```

Parameters

name
Type: String

namespace
Type: String

prefix
Type: String

Return Value

Type: Dom.XmlNode

Usage

For more information about namespaces, see Reading and Writing XML Using the DOM.

Calling this method more than once on a document generates an error as a document can have only one root element.

getRootElement()

Returns the top-level root element node in the document. If this method returns `null`, the root element has not been created yet.

Signature

```
public Dom.XmlNode getRootElement()
```

Return Value

Type: Dom.XmlNode

load(xml)

Parse the XML representation of the document specified in the *xml* argument and load it into a document.

Signature

```
public Void load(String xml)
```

Parameters

xml
Type: String

Return Value

Type: Void

Example

```
Dom.Document doc = new Dom.Document();
doc.load(xml);
```

`toXmlString()`

Returns the XML representation of the document as a String.

Signature

```
public String toXmlString()
```

Return Value

Type: String

XmlNode Class

Use the `XmlNode` class to work with a node in an XML document.

Namespace

Dom

XmlNode Methods

The following are methods for `XmlNode`. All are instance methods.

IN THIS SECTION:

addChildElement(name, namespace, prefix)
Creates a child element node for this node.

addCommentNode(text)
Creates a child comment node for this node.

addTextNode(text)
Creates a child text node for this node.

getAttribute(key, keyNamespace)
Returns *`namespacePrefix:attributeValue`* for the given key and key namespace.

getAttributeCount()
Returns the number of attributes for this node.

getAttributeKeyAt(index)
Returns the attribute key for the given index. Index values start at 0.

getAttributeKeyNsAt(index)
Returns the attribute key namespace for the given index.

getAttributeValue(key, keyNamespace)
Returns the attribute value for the given key and key namespace.

getAttributeValueNs(key, keyNamespace)
Returns the attribute value namespace for the given key and key namespace.

getChildElement(name, namespace)
Returns the child element node for the node with the given name and namespace.

getChildElements()
Returns the child element nodes for this node. This doesn't include child text or comment nodes.

getChildren()
Returns the child nodes for this node. This includes all node types.

getName()
Returns the element name.

getNamespace()
Returns the namespace of the element.

getNamespaceFor(prefix)
Returns the namespace of the element for the given prefix.

getNodeType()
Returns the node type.

getParent()
Returns the parent of this element.

getPrefixFor(namespace)
Returns the prefix of the given namespace.

getText()
Returns the text for this node.

insertBefore(newChild, refChild)
Inserts a new child node before the specified node.

removeAttribute(key, keyNamespace)
Removes the attribute with the given key and key namespace. Returns `true` if successful, `false` otherwise.

removeChild(childNode)
Removes the given child node.

setAttribute(key, value)
Sets the key attribute value.

setAttributeNs(key, value, keyNamespace, valueNamespace)
Sets the key attribute value.

setNamespace(prefix, namespace)
Sets the namespace for the given prefix.

addChildElement(name, namespace, prefix)

Creates a child element node for this node.

Signature

```
public Dom.XmlNode addChildElement(String name, String namespace, String prefix)
```

Parameters

name
Type: String

The *name* argument can't have a `null` value.

namespace
Type: String

prefix
Type: String

Return Value

Type: Dom.XmlNode

Usage

- If the *namespace* argument has a non-`null` value and the *prefix* argument is `null`, the namespace is set as the default namespace.
- If the *prefix* argument is `null`, Salesforce automatically assigns a prefix for the element. The format of the automatic prefix is `ns`***i***, where *i* is a number.If the *prefix* argument is `''`, the namespace is set as the default namespace.

addCommentNode(text)

Creates a child comment node for this node.

Signature

```
public Dom.XmlNode addCommentNode(String text)
```

Parameters

text
Type: String

The *text* argument can't have a `null` value.

Return Value

Type: Dom.XmlNode

addTextNode(text)

Creates a child text node for this node.

Signature

```
public Dom.XmlNode addTextNode(String text)
```

Parameters

text
Type: String

The *text* argument can't have a `null` value.

Return Value

Type: Dom.XmlNode

getAttribute(key, keyNamespace)

Returns *namespacePrefix:attributeValue* for the given key and key namespace.

Signature

```
public String getAttribute(String key, String keyNamespace)
```

Parameters

key
Type: String

keyNamespace
Type: String

Return Value

Type: String

Example

For example, for the `<xyz a:b="c:d" />` element:

- `getAttribute` returns `c:d`
- `getAttributeValue` returns `d`

getAttributeCount()

Returns the number of attributes for this node.

Signature

```
public Integer getAttributeCount()
```

Return Value

Type: Integer

getAttributeKeyAt(index)

Returns the attribute key for the given index. Index values start at 0.

Signature

```
public String getAttributeKeyAt(Integer index)
```

Parameters

index
Type: Integer

Return Value

Type: String

getAttributeKeyNsAt(index)

Returns the attribute key namespace for the given index.

Signature

```
public String getAttributeKeyNsAt(Integer index)
```

Parameters

index
Type: Integer

Return Value

Type: String

getAttributeValue(key, keyNamespace)

Returns the attribute value for the given key and key namespace.

Signature

```
public String getAttributeValue(String key, String keyNamespace)
```

Parameters

key
Type: String

keyNamespace
Type: String

Return Value

Type: String

Example

For example, for the `<xyz a:b="c:d" />` element:

- `getAttribute` returns `c:d`
- `getAttributeValue` returns `d`

getAttributeValueNs(key, keyNamespace)

Returns the attribute value namespace for the given key and key namespace.

Signature

```
public String getAttributeValueNs(String key, String keyNamespace)
```

Parameters

key
Type: String

keyNamespace
Type: String

Return Value

Type: String

getChildElement(name, namespace)

Returns the child element node for the node with the given name and namespace.

Signature

```
public Dom.XmlNode getChildElement(String name, String namespace)
```

Parameters

name
Type: String

namespace
Type: String

Return Value

Type: Dom.XmlNode

getChildElements()

Returns the child element nodes for this node. This doesn't include child text or comment nodes.

Signature

```
public Dom.XmlNode[] getChildElements()
```

Return Value

Type: Dom.XmlNode[]

getChildren()

Returns the child nodes for this node. This includes all node types.

Signature

```
public Dom.XmlNode[] getChildren()
```

Return Value

Type: Dom.XmlNode[]

getName()

Returns the element name.

Signature

```
public String getName()
```

Return Value

Type: String

getNamespace()

Returns the namespace of the element.

Signature

```
public String getNamespace()
```

Return Value

Type: String

getNamespaceFor(prefix)

Returns the namespace of the element for the given prefix.

Signature

```
public String getNamespaceFor(String prefix)
```

Parameters

prefix
Type: String

Return Value

Type: String

getNodeType()

Returns the node type.

Signature

```
public Dom.XmlNodeType getNodeType()
```

Return Value

Type: Dom.XmlNodeType

Uses `XmlNodeType` enum to return *COMMENT*, *ELEMENT*, or *TEXT* as the node type.

getParent()

Returns the parent of this element.

Signature

```
public Dom.XmlNode getParent()
```

Return Value

Type: Dom.XmlNode

getPrefixFor(namespace)

Returns the prefix of the given namespace.

Signature

```
public String getPrefixFor(String namespace)
```

Parameters

namespace
Type: String

The *namespace* argument can't have a `null` value.

Return Value

Type: String

getText()

Returns the text for this node.

Signature

```
public String getText()
```

Return Value

Type: String

insertBefore(newChild, refChild)

Inserts a new child node before the specified node.

Signature

```
public Dom.XmlNode insertBefore(Dom.XmlNode newChild, Dom.XmlNode refChild)
```

Parameters

newChild
Type: Dom.XmlNode

The node to insert.

refChild
Type: Dom.XmlNode

The node before the new node.

Return Value

Type: Dom.XmlNode

Usage

- If *refChild* is `null`, *newChild* is inserted at the end of the list.
- If *refChild* doesn't exist, an exception is thrown.

removeAttribute(key, keyNamespace)

Removes the attribute with the given key and key namespace. Returns `true` if successful, `false` otherwise.

Signature

```
public Boolean removeAttribute(String key, String keyNamespace)
```

Parameters

key
Type: String

keyNamespace
Type: String

Return Value

Type: Boolean

removeChild(childNode)

Removes the given child node.

Signature

```
public Boolean removeChild(Dom.XmlNode childNode)
```

Parameters

childNode
Type: Dom.XmlNode

Return Value

Type: Boolean

setAttribute(key, value)

Sets the key attribute value.

Signature

```
public Void setAttribute(String key, String value)
```

Parameters

key
Type: String

value
Type: String

Return Value

Type: Void

setAttributeNs(key, value, keyNamespace, valueNamespace)

Sets the key attribute value.

Signature

```
public Void setAttributeNs(String key, String value, String keyNamespace, String valueNamespace)
```

Parameters

key
Type: String

value
Type: String

keyNamespace
Type: String

valueNamespace
Type: String

Return Value

Type: Void

setNamespace(prefix, namespace)

Sets the namespace for the given prefix.

Signature

```
public Void setNamespace(String prefix, String namespace)
```

Parameters

prefix
Type: String

namespace
Type: String

Return Value

Type: Void

XmlNodeType Enum

Specifies the node type in an XML document.

Usage

Use `XMLNodeType` enum with the `getNodeType()` method in the `XmlNode` class.

Enum Values

The following are the values of the `Dom.XMLNodeType` enum.

Value	Description
`COMMENT`	Dom node of type comment.
`ELEMENT`	Dom node of type element.
`TEXT`	Dom node of type text.

EventBus Namespace

The `EventBus` namespace provides classes and methods for platform events and Change Data Capture events.

The following are the classes in the `EventBus` namespace.

IN THIS SECTION:

ChangeEventHeader Class

Contains header fields of Change Data Capture events.

EventPublishFailureCallback Interface

Implement this interface to track platform event messages that failed to publish. The `onFailure()` method in this interface is called when the final result of the asynchronous publish operation becomes available.

EventPublishSuccessCallback Interface

Implement this interface to track platform event messages that were published successfully. The `onSuccess()` method in this interface is called when the final result of the asynchronous publish operation becomes available.

FailureResult Interface

Contains the result of an Apex publish callback when the event publishing failed. This interface is used as a parameter in the `onFailure` method of the `EventPublishFailureCallback` interface.

SuccessResult Interface

Contains the result of an Apex publish callback when the event publishing succeeded. This interface is used as a parameter in the `onSuccess` method of the `EventPublishSuccessCallback` interface.

TestBroker Class

Contains methods that simulate the successful delivery or failed publishing of platform event or change event messages in an Apex test.

TriggerContext Class

Provides information about the platform event or change event trigger that's currently executing, such as how many times the trigger was retried due to the `EventBus.RetryableException`. Also, provides a method to resume trigger executions.

SEE ALSO:

Platform Events Developer Guide

ChangeEventHeader Class

Contains header fields of Change Data Capture events.

Namespace

EventBus

IN THIS SECTION:

ChangeEventHeader Properties

SEE ALSO:

Change Data Capture Developer Guide

ChangeEventHeader Properties

The following are properties for `ChangeEventHeader`.

IN THIS SECTION:

changedfields

A list of the fields that were changed in an update operation, including the `LastModifiedDate` system field. This field is empty for other operations, including record creation. This property is available in Apex saved using API version 47.0 or later.

changeorigin

Only populated for changes done by API apps or from Lightning Experience; empty otherwise. The Salesforce API and the API client ID that initiated the change, if set by the client. Use this field to detect whether your app initiated the change to not process the change again and potentially avoid a deep cycle of changes.

changetype

The operation that caused the change.

commitnumber

The system change number (SCN) of a committed transaction, which increases sequentially. This field is provided for diagnostic purposes. The field value is not guaranteed to be unique in Salesforce—it is unique only in a single database instance. If your Salesforce org migrates to another database instance, the commit number might not be unique or sequential.

committimestamp

The date and time when the change occurred, represented as the number of milliseconds since January 1, 1970 00:00:00 GMT.

commituser

The ID of the user that ran the change operation.

difffields

Contains the names of fields whose values are sent as a unified diff because they contain large text values.

entityname

The API name of the standard or custom object that the change pertains to. For example, Account or MyObject__c.

nulledfields

Contains the names of fields whose values were changed to null in an update operation. Use this field in Apex change event messages to determine if a field was changed to null in an update and isn't an unchanged field.

recordids

One or more record IDs for the changed records. Typically, this field contains one record ID. If in one transaction the same change occurred in multiple records of the same object type during one second, Salesforce merges the change notifications. In this case, Salesforce sends one change event for all affected records and the `recordIds` field contains the IDs for all records that have the same change.

sequencenumber

The sequence of the change within a transaction. The sequence number starts from 1.

transactionkey

A string that uniquely identifies each Salesforce transaction. You can use this key to identify and group all changes that were made in the same transaction.

changedfields

A list of the fields that were changed in an update operation, including the `LastModifiedDate` system field. This field is empty for other operations, including record creation. This property is available in Apex saved using API version 47.0 or later.

Signature

```
public List<String> changedfields {get; set;}
```

Property Value

Type: List<String>

changeorigin

Only populated for changes done by API apps or from Lightning Experience; empty otherwise. The Salesforce API and the API client ID that initiated the change, if set by the client. Use this field to detect whether your app initiated the change to not process the change again and potentially avoid a deep cycle of changes.

Signature

```
public String changeorigin {get; set;}
```

Property Value

Type: String

The format of the `changeOrigin` field value is:

```
com/salesforce/api/<API_Name>/<API_Version>;client=<Client_ID>
```

- `<API_Name>` is the name of the Salesforce API used to make the data change. It can take one of these values: soap, rest, bulkapi, xmlrpc, oldsoap, toolingsoap, toolingrest, apex, apexdebuggerrest.
- `<API_Version>` is the version of the API call that made the change and is in the format *XX.X*.
- `<Client_ID>` is a string that contains the client ID of the app that initiated the change. If the client ID is not set in the API call, `client=<Client_ID>` is not appended to the `changeOrigin` field.

Example:

```
com/salesforce/api/soap/49.0;client=Astro
```

The client ID is set in the Call Options header of an API call. For an example on how to set the Call Options header, see:

- REST API: Sforce-Call-Options Header. (Bulk API also uses the Sforce-Call-Options header.)
- SOAP API: CallOptions Header. (Apex API also uses the CallOptions element.)

changetype

The operation that caused the change.

Signature

```
public String changetype {get; set;}
```

Property Value

Type: String

Can be one of the following values:

- CREATE
- UPDATE
- DELETE
- UNDELETE
- SNAPSHOT (reserved for future use)

For gap events, the change type starts with the GAP_ prefix.

- GAP_CREATE
- GAP_UPDATE
- GAP_DELETE
- GAP_UNDELETE

For overflow events, the change type is GAP_OVERFLOW.

commitnumber

The system change number (SCN) of a committed transaction, which increases sequentially. This field is provided for diagnostic purposes. The field value is not guaranteed to be unique in Salesforce—it is unique only in a single database instance. If your Salesforce org migrates to another database instance, the commit number might not be unique or sequential.

Signature

```
public Long commitnumber {get; set;}
```

Property Value

Type: Long

committimestamp

The date and time when the change occurred, represented as the number of milliseconds since January 1, 1970 00:00:00 GMT.

Signature

```
public Long committimestamp {get; set;}
```

Property Value

Type: Long

commituser

The ID of the user that ran the change operation.

Signature

```
public String commituser {get; set;}
```

Property Value

Type: String

difffields

Contains the names of fields whose values are sent as a unified diff because they contain large text values.

Signature

```
public List<String> difffields {get; set;}
```

Property Value

Type: List<String>

SEE ALSO:

Change Data Capture Developer Guide: Sending Data Differences for Fields of Updated Records

entityname

The API name of the standard or custom object that the change pertains to. For example, Account or MyObject__c.

Signature

```
public String entityname {get; set;}
```

Property Value

Type: String

nulledfields

Contains the names of fields whose values were changed to null in an update operation. Use this field in Apex change event messages to determine if a field was changed to null in an update and isn't an unchanged field.

Signature

```
public List<String> nulledfields {get; set;}
```

Property Value

Type: List<String>

`recordids`

One or more record IDs for the changed records. Typically, this field contains one record ID. If in one transaction the same change occurred in multiple records of the same object type during one second, Salesforce merges the change notifications. In this case, Salesforce sends one change event for all affected records and the `recordIds` field contains the IDs for all records that have the same change.

Signature

```
public List<String> recordids {get; set;}
```

Property Value

Type: List<String>

Examples of operations with same changes are:

- Update of fieldA to valueA in Account records.
- Deletion of Account records.
- Renaming or replacing a picklist value that results in updating the field value in all affected records.

The `recordIds` field can contain a wildcard value when a change event message is generated for custom field type conversions that cause data loss. In this case, the `recordIds` value is the three-character prefix of the object, followed by the wildcard character `*`. For example, for accounts, the value is `001*`.

`sequencenumber`

The sequence of the change within a transaction. The sequence number starts from 1.

Signature

```
public Integer sequencenumber {get; set;}
```

Property Value

Type: Integer

A lead conversion is an example of a transaction that can have multiple changes. A lead conversion results in the following sequence of changes, all within the same transaction.

1. Create an account
2. Create a contact
3. Create an opportunity
4. Update a lead

`transactionkey`

A string that uniquely identifies each Salesforce transaction. You can use this key to identify and group all changes that were made in the same transaction.

Signature

```
public String transactionkey {get; set;}
```

Property Value

Type: String

EventPublishFailureCallback Interface

Implement this interface to track platform event messages that failed to publish. The `onFailure()` method in this interface is called when the final result of the asynchronous publish operation becomes available.

Namespace

EventBus

Usage

For more information, see Get the Result of Asynchronous Platform Event Publishing with Apex Publish Callbacks in the *Platform Events Developer Guide*.

IN THIS SECTION:

EventPublishFailureCallback Methods

EventPublishFailureCallback Example Implementation

EventPublishFailureCallback Methods

The following are methods for `EventPublishFailureCallback`.

IN THIS SECTION:

onFailure(result)
The system invokes this method when the final result of `EventBus.publish` is available and the publishing of the platform event message failed.

`onFailure(result)`

The system invokes this method when the final result of `EventBus.publish` is available and the publishing of the platform event message failed.

Signature

```
public void onFailure(eventbus.FailureResult result)
```

Parameters

result
Type: EventBus.FailureResult

The final result of `EventBus.publish`.

Return Value

Type: void

EventPublishFailureCallback Example Implementation

For an example implementation and a test class, see Get the Result of Asynchronous Platform Event Publishing with Apex Publish Callbacks in the *Platform Events Developer Guide*.

EventPublishSuccessCallback Interface

Implement this interface to track platform event messages that were published successfully. The `onSuccess()` method in this interface is called when the final result of the asynchronous publish operation becomes available.

Namespace

EventBus

Usage

For more information, see Get the Result of Asynchronous Platform Event Publishing with Apex Publish Callbacks in the *Platform Events Developer Guide*.

IN THIS SECTION:

EventPublishSuccessCallback Methods

EventPublishSuccessCallback Example Implementation

EventPublishSuccessCallback Methods

The following are methods for `EventPublishSuccessCallback`.

IN THIS SECTION:

onSuccess(result)
The system invokes this method when the final result of `EventBus.publish` is available and the publishing of the platform event message succeeded.

`onSuccess(result)`

The system invokes this method when the final result of `EventBus.publish` is available and the publishing of the platform event message succeeded.

Signature

```
public void onSuccess(eventbus.SuccessResult result)
```

Parameters

`result`
Type: EventBus.SuccessResult

The final result of `EventBus.publish`.

Return Value

Type: void

EventPublishSuccessCallback Example Implementation

For an example implementation and a test class, see Get the Result of Asynchronous Platform Event Publishing with Apex Publish Callbacks in the *Platform Events Developer Guide*.

FailureResult Interface

Contains the result of an Apex publish callback when the event publishing failed. This interface is used as a parameter in the `onFailure` method of the `EventPublishFailureCallback` interface.

Namespace

EventBus

IN THIS SECTION:

FailureResult Methods

FailureResult Methods

The following are methods for `FailureResult`.

IN THIS SECTION:

getEventUuids()
Returns a list of `EventUuid` field values of each platform event that is included in `EventBus.EventPublishFailureCallback`.

`getEventUuids()`

Returns a list of `EventUuid` field values of each platform event that is included in `EventBus.EventPublishFailureCallback`.

Signature

```
public List<String> getEventUuids()
```

Return Value

Type: List<String>

SuccessResult Interface

Contains the result of an Apex publish callback when the event publishing succeeded. This interface is used as a parameter in the `onSuccess` method of the `EventPublishSuccessCallback` interface.

Namespace

EventBus

IN THIS SECTION:

SuccessResult Methods

SuccessResult Methods

The following are methods for `SuccessResult`.

IN THIS SECTION:

getEventUuids()

Returns a list of `EventUuid` field values of each platform event that is included in the `EventBus.EventPublishSuccessCallback`.

`getEventUuids()`

Returns a list of `EventUuid` field values of each platform event that is included in the `EventBus.EventPublishSuccessCallback`.

Signature

```
public List<String> getEventUuids()
```

Return Value

Type: List<String>

TestBroker Class

Contains methods that simulate the successful delivery or failed publishing of platform event or change event messages in an Apex test.

Namespace

EventBus

IN THIS SECTION:

TestBroker Methods

TestBroker Methods

The following are methods for `TestBroker`.

IN THIS SECTION:

deliver()
Delivers platform event messages to the test event bus. Use this method to deliver test event messages multiple times and verify that event subscribers have processed the test events each step of the way.

fail()
Causes the publishing of platform event messages to fail in the test event bus. Use this method to test Apex publish callbacks.

`deliver()`

Delivers platform event messages to the test event bus. Use this method to deliver test event messages multiple times and verify that event subscribers have processed the test events each step of the way.

Signature

```
public void deliver()
```

Return Value

Type: void

Usage

Enclose `Test.getEventBus().deliver()` within the `Test.startTest()` and `Test.stopTest()` statement block.

```
Test.startTest();
// Create test events
// ...
// Publish test events with EventBus.publish()
// ...
// Deliver test events
Test.getEventBus().deliver();
// Perform validation
```

```
// ...
Test.stopTest();
```

SEE ALSO:

Platform Events Developer Guide

`fail()`

Causes the publishing of platform event messages to fail in the test event bus. Use this method to test Apex publish callbacks.

Signature

```
public void fail()
```

Return Value

Type: void

Usage

```
// Create test events
// ...
// Publish test events with EventBus.publish()
// ...
// Fail publishing of test events
Test.getEventBus().fail();
// Perform validation
// ...
```

For more information, see <link>Get the Result of Asynchronous Platform Event Publishing with Apex Publish Callbacks<link/> in the *Platform Events Developer Guide*.

TriggerContext Class

Provides information about the platform event or change event trigger that's currently executing, such as how many times the trigger was retried due to the `EventBus.RetryableException`. Also, provides a method to resume trigger executions.

Namespace

EventBus

IN THIS SECTION:

TriggerContext Properties

TriggerContext Methods

TriggerContext Properties

The following are properties for `TriggerContext`.

IN THIS SECTION:

lastError
Read-only. The error message that the last thrown `EventBus.RetryableException` contains.

retries
Read-only. The number of times the trigger was retried due to throwing the `EventBus.RetryableException`.

`lastError`

Read-only. The error message that the last thrown `EventBus.RetryableException` contains.

Signature

```
public String lastError {get;}
```

Property Value

Type: String

Usage

The error message that this property returns is the message that was passed in when creating the `EventBus.RetryableException` exception, as follows.

```
throw new EventBus.RetryableException(
             'Condition is not met, so retrying the trigger again.');
```

`retries`

Read-only. The number of times the trigger was retried due to throwing the `EventBus.RetryableException`.

Signature

```
public Integer retries {get;}
```

Property Value

Type: Integer

TriggerContext Methods

The following are methods for `TriggerContext`.

IN THIS SECTION:

currentContext()
Returns an instance of the `EventBus.TriggerContext` class containing information about the currently executing trigger.

getResumeCheckpoint()
Returns the replay ID that was set by `setResumeCheckpoint()`. The returned value is the replay ID of the event message after which trigger processing resumes in a new trigger invocation.

setResumeCheckpoint(resumeReplayId)
Sets a checkpoint in the event stream where the platform event trigger resumes execution in a new invocation. Use this method to recover from limit and uncaught exceptions, or to control the number of events processed in one trigger execution. When calling this method, pass in the replay ID of the last successfully processed event message. When the trigger stops execution before all events in `Trigger.New` are processed, either because of an uncaught exception or intentionally, the trigger is invoked again. The new execution starts with the event message in the stream after the one with the checkpointed Replay ID.

`currentContext()`

Returns an instance of the `EventBus.TriggerContext` class containing information about the currently executing trigger.

Signature

```
public static eventbus.TriggerContext currentContext()
```

Return Value

Type: EventBus.TriggerContext

Information about the currently executing trigger.

`getResumeCheckpoint()`

Returns the replay ID that was set by `setResumeCheckpoint()`. The returned value is the replay ID of the event message after which trigger processing resumes in a new trigger invocation.

Signature

```
public String getResumeCheckpoint()
```

Return Value

Type: String

`setResumeCheckpoint(resumeReplayId)`

Sets a checkpoint in the event stream where the platform event trigger resumes execution in a new invocation. Use this method to recover from limit and uncaught exceptions, or to control the number of events processed in one trigger execution. When calling this method, pass in the replay ID of the last successfully processed event message. When the trigger stops execution before all events in `Trigger.New` are processed, either because of an uncaught exception or intentionally, the trigger is invoked again. The new execution starts with the event message in the stream after the one with the checkpointed Replay ID.

Signature

```
public void setResumeCheckpoint(String resumeReplayId)
```

Parameters

resumeReplayId
Type: String

The replay ID of the last successfully processed platform event message, after which to resume processing in a new trigger execution context.

Return Value

Type: void

Usage

The method throws an `EventBus.InvalidReplayIdException` if the supplied Replay ID is not valid—the replay ID is not in the current trigger batch of events, in the `Trigger.new` list.

Example

This snippet shows how to call the method and pass in the replayId property of an event instance.

```
EventBus.TriggerContext.currentContext().setResumeCheckpoint(event.replayId);
```

ExternalService Namespace

The `ExternalService` namespace provides dynamically generated Apex service interfaces and Apex classes for complex object data types.

The `ExternalService` namespace doesn't define a fixed set of classes. The namespace reflects OpenAPI-compatible external service registrations with active operations for type-safe outbound calls. The object schema, in the API specification that is associated with the registered external service, maps to Apex types.

SEE ALSO:

Salesforce Help: Invoke External Service Callouts Using Apex

Flow Namespace

The `Flow` namespace provides a class for advanced access to flows from Apex such as from Visualforce controllers and asynchronous Apex.

The following is the class in the `Flow` namespace.

IN THIS SECTION:

Interview Class

The `Flow.Interview` class provides advanced controller access to flows and the ability to start a flow.

Interview Class

The `Flow.Interview` class provides advanced controller access to flows and the ability to start a flow.

Namespace

Flow

Usage

SOQL and DML limits apply during flow execution. See Per-Transaction Flow Limits in Salesforce Help.

To create an Interview object, you have two options.

Note: We recommend only using `createInterview()` if you must reuse your method or class. Using `createInterview()` has these drawbacks.

- If you package a class that uses `createInterview()`, you have to add the associated flow manually.
- If you delete a flow, Salesforce doesn't check if it's referenced with `createInterview()`.

- Create the object directly in your class by using:
  - No namespace: `Flow.Interview.flowName`
  - Namespace: `Flow.Interview.namespace.flowName`
- Create the object dynamically by using `createInterview()`

To enforce sharing rules, run the flow or Apex on API version 62.0 or later. The Apex class must be declared using the `with sharing` keyword. The flow runs more securely in the default context when an Apex class that's declared using the `with sharing` keyword launches an autolaunched flow. The flow enforces the sharing rules of the user that executes the Apex class. Data access is restricted to the sharing rules of the user that executed the Apex class. For example, a query can return fewer rows than it did in system context without sharing. An operation can fail because the user doesn't have the correct permissions.

Examples: Starting Flow Interviews

These examples are all sample controllers that start an interview for the flow from the Build a Discount Calculator project on Trailhead. Each shows a different permutation, based on:

- Whether the interview is created statically, with `Flow.Interview.myFlow`, or dynamically, with `createInterview()`.
- Whether the flow is managed or local.

Interview Created Statically for a Local Flow

```
{
  Map<String, Object> inputs = new Map<String, Object>();
  inputs.put('AccountID', myAccount);
  inputs.put('OpportunityID', myOppty);

  Flow.Interview.Calculate_discounts myFlow =
    new Flow.Interview.Calculate_discounts(inputs);
  myFlow.start();
}
```

Interview Created Dynamically for a Local Flow

```
public void callFlow(String flowName, Map <String, Object> inputs) {
  Flow.Interview myFlow = Flow.Interview.createInterview(flowName, inputs);
  myFlow.start();
}
```

Interview Created Statically for a Managed Flow

```
{
  Map<String, Object> inputs = new Map<String, Object>();
  inputs.put('AccountID', myAccount);
  inputs.put('OpportunityID', myOppty);

  Flow.Interview.myNamespace.Calculate_discounts myFlow =
    new Flow.Interview.myNamespace.Calculate_discounts(inputs);
  myFlow.start();
}
```

Interview Created Dynamically for a Managed Flow

```
public void callFlow(String namespace, String flowName, Map <String, Object> inputs) {
  Flow.Interview myFlow = Flow.Interview.createInterview(namespace, flowName, inputs);
  myFlow.start();
}
```

Example: Getting Variable Values

This sample uses the `getVariableValue` method to obtain breadcrumb (navigation) information from a flow. If that flow contains subflow elements, and each of the referenced flows also contains a *`vaBreadCrumb`* variable, you can provide users with breadcrumbs regardless of which flow the interview is running.

```
public class SampleController {

   //Instance of the flow
   public Flow.Interview.Flow_Template_Gallery myFlow {get; set;}

   public String getBreadCrumb() {
      String aBreadCrumb;
      if (myFlow==null) { return 'Home';}
      else aBreadCrumb = (String) myFlow.getVariableValue('vaBreadCrumb');

      return(aBreadCrumb==null ? 'Home': aBreadCrumb);

   }
}
```

Apex Developer Guide: Launch a Flow from Apex

Interview Methods

The following are instance methods for `Interview`.

`createInterview(namespace, flowName, inputVariables)`

Creates an interview for a namespaced flow.

Signature

```
public static Flow.Interview createInterview(String namespace, String flowName,
Map<String,ANY> inputVariables)
```

Parameters

`namespace`
Type: String

The flow's namespace.

`flowName`
Type: String

The flow's API name.

`inputVariables`
Type: Map<String,Object>

Initial values for the flow's input variables.

Return Value

Type: Flow.Interview

Usage

Use this method to dynamically create a Flow.Interview object for the `start()` method.

How you get output variable values from an interview depends on the type of the Apex variable where you're storing the interview.

- If the variable is cast to a specific flow, you can use *myFlow.myVar* to access a variable, where *myVar* is the name of the variable.

```
system.debug('My Output Variable: ' + myFlow.varName);
```

- If the variable is of type Flow.Interview but not cast to a specific flow, you must use getVariableValue() to access the flow's variables.

```
system.debug('My Output Variable: ' + myFlow.getVariableValue('varName'));
```

If the flow doesn't exist in the current org, a TypeException is thrown.

`createInterview(flowName, inputVariables)`

Creates an interview for a flow.

Signature

```
public static Flow.Interview createInterview(String flowName, Map<String,Object>
inputVariables)
```

Parameters

flowName
Type: String

The flow's API name.

inputVariables
Type: Map<String,Object>

Initial values for the flow's input variables.

Return Value

Type: Flow.Interview

Usage

Use this method to dynamically create a Flow.Interview object for the `start()` method.

How you get output variable values from an interview depends on the type of the Apex variable where you're storing the interview.

- If the variable is cast to a specific flow, you can use *myFlow.myVar* to access a variable, where *myVar* is the name of the variable.

```
system.debug('My Output Variable: ' + myFlow.varName);
```

- If the variable is of type Flow.Interview but not cast to a specific flow, you must use getVariableValue() to access the flow's variables.

```
system.debug('My Output Variable: ' + myFlow.getVariableValue('varName'));
```

If the flow doesn't exist in the current org, a TypeException is thrown.

`getVariableValue(variableName)`

Returns the value of the specified flow variable. The flow variable can be in the flow embedded in the Visualforce page, or in a separate flow that is called by a subflow element.

Signature

```
public Object getVariableValue(String variableName)
```

Parameters

variableName
Type: String

Specifies the unique name of the flow variable.

Return Value

Type: Object

Usage

The returned variable value comes from whichever flow the interview is running. If the specified variable can't be found in that flow, the method returns `null`.

This method checks for the existence of the variable at run time only, not at compile time.

`start()`

Starts an instance (interview) for an autolaunched or user provisioning flow.

Signature

```
public Void start()
```

Return Value

Type: Void

Usage

This method can be used only with flows that have one of these types.

- Autolaunched Flow
- User Provisioning Flow

For details, see "Flow Types" in Salesforce Help.

When a flow user invokes an autolaunched flow, the active flow version runs. If there's no active version, the latest version runs. When a flow admin invokes a flow, the latest version always runs.

FormulaEval Namespace

The FormulaEval namespace provides classes and methods to evaluate dynamic formulas for SObjects and Apex objects. Use the methods to avoid unnecessary DML statements to recalculate formula field values or evaluate dynamic formula expressions.

When using a formula against an SObject or Apex object as the context object, the class methods or properties referenced by the formula must be global.

```
Account myAcc = new Account(Name='123');
       FormulaEval.FormulaInstance ff = Formula.builder()
           .withType(Schema.Account.class)
           .withReturnType(FormulaEval.FormulaReturnType.STRING)
           .withFormula('name & " (" & website & ")"')
           .build();

//Use the list of field names returned by the getReferenced method to generate dynamic
soql
       String fieldNameList = String.join(ff.getReferencedFields(),',');
       String queryStr = 'select ' + fieldNameList + ' from Account LIMIT 1'; //select
name, website from Account
       Account s = Database.query(queryStr);
       system.debug(ff.evaluate(s));
```

The following are the classes and enums in the `FormulaEval` namespace.

IN THIS SECTION:

FormulaBuilder Class
Contains methods to build and validate user-defined formulas.

FormulaGlobal Enum
Specifies a global variable that references data in your organization in the `withGlobalVariables(formulaGlobals)` method.

FormulaInstance Class
Contains a method to evaluate the formula instance.

FormulaReturnType Enum
Specifies the return type for the `withReturnType(returnType)` method.

FormulaBuilder Class

Contains methods to build and validate user-defined formulas.

Namespace

FormulaEval

Usage

The context type that corresponds to the Apex class used in the builder `withType()` method must be a global, user-defined Apex class. Any fields or properties that the formula references must also be global.

IN THIS SECTION:

FormulaBuilder Methods

FormulaBuilder Methods

The following are methods for `FormulaBuilder`.

IN THIS SECTION:

build()
Validates and returns the formula instance created using the `FormulaBuilder` methods.

treatNumericNullAsZero(isNumericNullZero)
Optional. Indicates whether a null for a numeric data type is treated as zero while evaluating the formula with the `build()` method.

withFormula(formulaText)
Required. Sets the formula expression that the `build()` method uses to create the formula instance.

withGlobalVariables(formulaGlobals)
Optional. Sets the list of global variables that can be referenced in the formula expression created with the `build()` method.

withReturnType(returnType)
Required. Sets the formula output data type for the formula instance created with the `build()` method.

withType(contextType)
Sets the Apex type that corresponds to the Apex class used with the `build()` method.

withType(contextType)
Sets the Apex type that corresponds to the Apex class used with the `build()` method to SObject type.

build()

Validates and returns the formula instance created using the `FormulaBuilder` methods.

Signature

```
public FormulaEval.FormulaInstance build()
```

Return Value

Type: FormulaEval.FormulaInstance

Returns an instance of the `FormulaInstance` object. If the formula validation such as field references, functions, or syntax, fails, the method throws a `FormulaValidationException` exception.

treatNumericNullAsZero(isNumericNullZero)

Optional. Indicates whether a null for a numeric data type is treated as zero while evaluating the formula with the `build()` method.

Signature

```
public FormulaEval.FormulaBuilder treatNumericNullAsZero(Boolean isNumericNullZero)
```

Parameters

isNumericNullZero
Type: Boolean

If `true`, null for numeric is treated as zero. The default value is `false`.

Return Value

Type: FormulaEval.FormulaBuilder

withFormula(formulaText)

Required. Sets the formula expression that the `build()` method uses to create the formula instance.

Signature

```
public FormulaEval.FormulaBuilder withFormula(String formulaText)
```

Parameters

formulaText
Type: String

Return Value

Type: FormulaEval.FormulaBuilder

`withGlobalVariables(formulaGlobals)`

Optional. Sets the list of global variables that can be referenced in the formula expression created with the `build()` method.

Signature

```
public FormulaEval.FormulaBuilder withGlobalVariables(List<formulaeval.FormulaGlobal>
formulaGlobals)
```

Parameters

`formulaGlobals`
Type: List<FormulaEval.FormulaGlobal>

Uses values from the `FormulaGlobal` enum.

Return Value

Type: FormulaEval.FormulaBuilder

`withReturnType(returnType)`

Required. Sets the formula output data type for the formula instance created with the `build()` method.

Signature

```
public FormulaEval.FormulaBuilder withReturnType(formulaeval.FormulaReturnType
returnType)
```

Parameters

`returnType`
Type: FormulaEval.FormulaReturnType

Uses values from the `FormulaReturnType` enum.

Return Value

Type: FormulaEval.FormulaBuilder

`withType(contextType)`

Sets the Apex type that corresponds to the Apex class used with the `build()` method.

Signature

```
public formulaeval.FormulaBuilder withType(System.Type contextType)
```

Parameters

contextType
Type: System.Type

An instance of the Apex class type.

Return Value

Type: FormulaEval.FormulaBuilder

withType(contextType)

Sets the Apex type that corresponds to the Apex class used with the `build()` method to SObject type.

Signature

```
public formulaeval.FormulaBuilder withType(Schema.SObjectType contextSObjectType)
```

Parameters

contextSObjectType
Type: Schema.SObjectType

An instance of the SObject type.

Return Value

Type: FormulaEval.FormulaBuilder

Example

This example uses an SObject type as an input in the `withType()` method to build and evaluate a formula.

```
FormulaEval.FormulaInstance ff = Formula.builder()
    .withReturnType(FormulaEval.FormulaReturnType.Boolean)
    .withType(Account.SObjectType)
    .withFormula('ISBLANK(Site)')
    .build();

Boolean siteIsBlank = (Boolean)ff.evaluate(new Account(Site='Test'));
Assert.isFalse(siteIsBlank);
```

FormulaGlobal Enum

Specifies a global variable that references data in your organization in the `withGlobalVariables(formulaGlobals)` method.

Enum Values

The following are the values of the `FormulaEval.FormulaGlobal` enum.

Value	Description
`CUSTOMMETADATA`	A custom metadata record.
`LABEL`	A global variable to use when referencing a custom label.
`ORGANIZATION`	A global variable to use when referencing information about your company profile, such as organization's city, fax, ID, or other details.
`PERMISSION`	A global variable to use when referencing information about the current user's custom permission access.
`PROFILE`	A global variable to use when referencing information about the current user's profile, such as license type or name.
`SETUP`	A global variable to use when referencing a custom setting of type `hierarchy`.
`SYSTEM`	A global variable that exposes *`OriginDateTime`* and represents the literal value of 1900-01-01 00:00:00. Use this global variable when performing date/time offset calculations, or to assign a literal value to a date/time field.
`USER`	A global variable to use when referencing information about the current user, such as alias, title, and ID.
`USERROLE`	A global variable to use when referencing information about the current user's role, such as role name, description, and ID.

FormulaInstance Class

Contains a method to evaluate the formula instance.

Namespace

FormulaEval

Example

```
global class MotorYacht {
   global Integer lengthInYards;
   global Integer numOfGuestCabins;
   global String name;
   global Account owner;
}
```

```
MotorYacht aBoat = new MotorYacht();
aBoat.lengthInYards = 52;
aBoat.numOfGuestCabins = 4;
aBoat.name = 'RV Foo';
FormulaEval.FormulaInstance isItSuper = Formula.builder()
                            .withReturnType(FormulaEval.FormulaReturnType.STRING)
                            .withType(MotorYacht.class)
                            .withFormula('IF(lengthInYards < 100, "Not Super", "Super")')
```

```
                            .build();
isItSuper.evaluate(aBoat); //=> "Not Super"

aBoat.owner = new Account(Name='Acme Watercraft', Site='New York');
FormulaEval.FormulaInstance ownerDetails = Formula.builder()
                            .withReturnType(FormulaEval.FormulaReturnType.STRING)
                            .withType(MotorYacht.class)
                            .withFormula('owner.Name & " (" & owner.Site & ")"')
                            .build();
ownerDetails.evaluate(aBoat); //=> "Acme Watercraft (New York)"
```

Usage

The context type in the `withType` method must be a global, user-defined Apex class. Any fields or properties that the formula references must also be global.

IN THIS SECTION:

FormulaInstance Methods

FormulaInstance Methods

The following are methods for `FormulaInstance`.

IN THIS SECTION:

evaluate(contextObject)

Calculates the formula expression and returns the formula output.

getReferencedFields()

Returns a set of strings that denote the field names referenced in a formula.

`evaluate(contextObject)`

Calculates the formula expression and returns the formula output.

Signature

```
public Object evaluate(Object contextObject)
```

Parameters

`contextObject`

Type: Object

An instance of the Apex class as generated with the `FormulaBuilder.builder()` method.

Return Value

Type: Object

Apex type that corresponds to the Apex class as configured by the `withType()` method in the `FormulaBuilder` class.

`getReferencedFields()`

Returns a set of strings that denote the field names referenced in a formula.

Signature

```
public Set<String> getReferencedFields()
```

Return Value

Type: Set<String>

Usage

A formula is built and evaluated in the context of the current namespace of the subscriber org. If you package a formula that references fields, the fields must be fully qualified with the namespace name.

Example

```
FormulaEval.FormulaInstance ff = Formula.builder()
                                 .withType(Schema.Account.class)
                                 .withReturnType(FormulaEval.FormulaReturnType.STRING)
                                 .withFormula('name & website')
                                 .build();

// Returns the field names 'name', and 'website' required to process the formula
Set<String> fieldNames = ff.getReferencedFields();

// Use the list of field names to generate dynamic soql
String queryStr = 'select ' + string.join(fieldNames, ', ') + ' from Account limit 1';
List<sObject> accounts = Database.query(queryStr);
string formulaOutput = (string)ff.evaluate(accounts[0]);
System.debug(formulaOutput);
FormulaEval.FormulaInstance ff = Formula.builder()
```

FormulaReturnType Enum

Specifies the return type for the `withReturnType(returnType)` method.

Enum Values

The following are the values of the `FormulaEval.FormulaReturnType` enum.

Value	Description
`BOOLEAN`	A value that can only be assigned `true`, `false`, or `null`.
`DATE`	A value that indicates a particular day.
`DATETIME`	A value that indicates a particular day and time, such as a timestamp.

Value	Description
`DECIMAL`	A number that includes a decimal point. Decimal is an arbitrary precision number.
`DOUBLE`	A 64-bit number that includes a decimal point.
`ID`	Any valid 18-character Lightning Platform record identifier.
`INTEGER`	A 32-bit number that doesn't include a decimal point.
`LONG`	A 64-bit number that doesn't include a decimal point.
`STRING`	Any set of characters surrounded by single quotes.
`TIME`	A value that indicates a particular time.

fsccashflow Namespace

The `fsccashflow` namespace provides classes used in the FSCCashFlow Flexcards and its child Flexcards.

The `fsccashflow` namespace has these classes.

IN THIS SECTION:

FSCCashFlowUtil Class

Use the callable FSCCashFlowUtil class to manage and validate data for party income and expense entities by passing in the action and the corresponding arguments. This class provides utility methods used in FSCCashFlow Flexcard and its child Flexcards.

FSCCashFlowUtil Class

Use the callable FSCCashFlowUtil class to manage and validate data for party income and expense entities by passing in the action and the corresponding arguments. This class provides utility methods used in FSCCashFlow Flexcard and its child Flexcards.

Namespace

fsccashflow Namespace

Usage

The Financial Goals FlexCards use Integration Procedures that call the FSCHouseholdService class. These FlexCards display information about Financial Goals.

IN THIS SECTION:

FSCCashFlowUtil Methods

FSCCashFlowUtil Methods

The `FSCCashFlowUtil` has these methods.

IN THIS SECTION:

GetPartyIncomeFrequencyLabel
Returns the picklist values for the party income frequency field on the party income entity.

GetPartyIncomeTypeLabel
Returns the picklist values for the party income type field on the party income entity.

GetPartyIncomeStatusLabel
Returns the picklist values for the party income status field on the party income entity.

CalculateIncomeExpenseSummary
Calculates the monthly income, total income, average monthly income, monthly expense, total expense, average monthly expense from a list of income and expenses provided.

GetPartyExpenseFrequencyLabel
Returns the picklist values for the party expense frequency field on the party expense entity.

GetPartyExpenseTypeLabel
Returns the picklist values for the party expense type field on the party expense entity.

GetPartyExpenseStatusLabel
Returns the picklist values for the party expense status field on the party expense entity.

PerformIncomeValidation
Performs validations on Party Income records. Ensure that the start date is not earlier than the end date.

PerformExpenseValidation
Performs validations on Party Income records.

GetDurationDateRange
Returns the start and end date given a duration.For example, if you input the number 3 on the date 10/29/2024, it will return a start date of 7/1/2024 and an end date of 10/1/2024.

HandleUpsertError
Helper method that constructs the error response for upsert of a partyIncome or partyExpense record.

CheckReadAccess
Checks for read access on the partyIncome and partyExpense entities.

CheckCrudOnIncome
Checks create, update and delete access on partyIncome entity.

CheckCrudOnExpense
Checks create, update and delete access on partyExpense entity.

`GetPartyIncomeFrequencyLabel`

Returns the picklist values for the party income frequency field on the party income entity.

Signature

```
call(String action, Map<String, Object> args
```

Return Value

Returns a list of picklist labels for Party Income frequency.

GetPartyIncomeTypeLabel

Returns the picklist values for the party income type field on the party income entity.

Signature

```
call(String action, Map<String, Object> args
```

Return Value

Returns a list of picklist labels for Party Income type.

GetPartyIncomeStatusLabel

Returns the picklist values for the party income status field on the party income entity.

Signature

```
call(String action, Map<String, Object> args
```

Return Value

Returns a list of picklist labels for Party Income status.

CalculateIncomeExpenseSummary

Calculates the monthly income, total income, average monthly income, monthly expense, total expense, average monthly expense from a list of income and expenses provided.

Signature

```
call(String action, Map<String, Object> args
```

Return Value

Returns income and expense details.

Examples

Input and output JSON example of the actions are as follows.

Input format:

```
[
    {
        "Duration": "12",
        "PartyExpenseList": [
            {
                "Name": "PE-0000000004",
                "UsageType": "CashFlow",
                "RecurrenceInterval": "Monthly",
                "Type": "Child Care",
                "Id": "2n3SG000007dkzpYAA",
```

```
                "TotalAmount": 999.99,
                "PartyId": "001SG000004TCczYAG",
                "Status": "Active",
                "StartDate": "2024-01-29T08:00:00.000Z"
            }
        ],
        "PartyIncomeList": [
            {
                "Name": "PI-0000000003",
                "UsageType": "CashFlow",
                "IncomeFrequency": "Monthly",
                "IncomeType": "Salary",
                "Id": "2m3SG000007dkzpYAA",
                "IncomeAmount": 999.99,
                "PartyId": "001SG000004TCczYAG",
                "IncomeStatus": "Active",
                "StartDate": "2024-01-29T08:00:00.000Z"
            }
        ]
    }
]
```

Output format:

```
[
    {
        "MonthlyIncome": {
            "Nov 2023": 0,
            "Aug 2024": 999.99,
            "Oct 2023": 0,
            "Jan 2024": 96.7732258064516,
            "Mar 2024": 999.99,
            "Jul 2024": 999.99,
            "Apr 2024": 999.99,
            "Dec 2023": 0,
            "Jun 2024": 999.99,
            "Sep 2024": 999.99,
            "Feb 2024": 999.99,
            "May 2024": 999.99
        },
        "MonthlyExpense": {
            "Nov 2023": 0,
            "Aug 2024": 999.99,

            "Jan 2024": 96.7732258064516,
            "Mar 2024": 999.99,
            "Jul 2024": 999.99,
            "Apr 2024": 999.99,
            "Dec 2023": 0,
            "Jun 2024": 999.99,
            "Sep 2024": 999.99,
            "Feb 2024": 999.99,
            "May 2024": 999.99
        },
        "AvgMonthlyExpense": 674.72,
```

```
        "TotalIncome": 8096.69,
        "TotalSurplus": 0,
        "AvgMonthlyIncome": 674.72,
        "AvgMonthlySurplus": 0,
        "TotalExpense": 8096.69
    }
]
```

GetPartyExpenseFrequencyLabel

Returns the picklist values for the party expense frequency field on the party expense entity.

Signature

```
call(String action, Map<String, Object> args
```

Return Value

Returns a list of picklist labels for Party Expense frequency.

GetPartyExpenseTypeLabel

Returns the picklist values for the party expense type field on the party expense entity.

Signature

```
call(String action, Map<String, Object> args
```

Return Value

Returns a list of picklist labels for Party Expense type.

GetPartyExpenseStatusLabel

Returns the picklist values for the party expense status field on the party expense entity.

Signature

```
call(String action, Map<String, Object> args
```

Return Value

Returns a list of picklist labels for Party Expense status.

PerformIncomeValidation

Performs validations on Party Income records. Ensure that the start date is not earlier than the end date.

Signature

```
call(String action, Map<String, Object> args
```

Return Value

Returns a list of picklist labels for Party Income type.

Examples

Input and output JSON example of the actions are as follows.

Input format:

```
[
    {
        "IncomeFrequency": "Weekly",
        "IncomeFrequencyLabelObject": {
            "value": "Weekly",
            "label": "Weekly"
        },
        "MemberOptionsList": [
            {
                "value": "001OG00000xx6gAYAQ",
                "label": "Okee PA"
            },
            {
                "value": "id2",
                "label": "Name2"
            }
        ],
        "IsHousehold": true,
        "IncomeAmount": 100,
        "IncomeStatusOptions": [
            {
                "value": "Active",
                "label": "Active"
            },
            {
                "value": "Inactive",
                "label": "Inactive"
            }
        ],
        "PartyId": "001OG00000xx6gAYAQ",
        "IncomeStatus": "Active",
        "Party": {
            "Name": "Okee PA",
            "Id": "001OG00000xx6gAYAQ"
        },
        "IncomeTypeOptions": [

                "label": "Weekly"
            },
            {
                "value": "Monthly",
                "label": "Monthly"
            },
            {
                "value": "Yearly",
                "label": "Yearly"
            }
        ],
        "UsageType": "CashFlow",
```

```
        "IncomeId": "2m3OG000000009IYAQ",
        "IsPersonAccount": false,
        "IncomeTypeLabelObject": {
            "value": "Salary",
            "label": "Salary"
        }
    }
]
```

`PerformExpenseValidation`

Performs validations on Party Income records.

Signature

```
call(String action, Map<String, Object> args
```

Return Value

Returns a list of picklist labels for Party Income frequency.

Examples

Output JSON example of the actions are as follows.

Output format:

```
{
    "Required fields": "Expense Type, Member, Amount, Start Date, Frequency"
}
```

`GetDurationDateRange`

Returns the start and end date given a duration.For example, if you input the number 3 on the date 10/29/2024, it will return a start date of 7/1/2024 and an end date of 10/1/2024.

Signature

```
call(String action, Map<String, Object> args
```

Return Value

Returns the start and end date for a specified duration.

Examples

Output JSON example of the actions are as follows.

Output format:

```
{
          "DurationStartDate": "2024-02-02T00:00:00.000Z",
```

```
          "DurationEndDate": "2024-05-02T00:00:00.000Z"
        }
```

HandleUpsertError

Helper method that constructs the error response for upsert of a partyIncome or partyExpense record.

Signature

```
call(String action, Map<String, Object> args
```

Return Value

Returns a list of errors encountered while upserting the record in the database.

Examples

Input and output JSON example of the action are as follows.

Input format:

```
[
    {
        "Name": "PI-0000000003",
        "UsageType": "CashFlow",
        "IncomeFrequency": "Monthly",
        "IncomeType": "Salary",
        "Id": "2m3SG000007dkxxYAA",
        "IncomeAmount": 999.99,
        "PartyId": "001SG000004TCxxYAG",
        "IncomeStatus": "Active",
        "StartDate": "2024-01-29T08:00:00.000Z"
    }
]
```

Output format:

```
[ { "UpsertError‟: "Invalid Id‟ } ]
```

CheckReadAccess

Checks for read access on the partyIncome and partyExpense entities.

Signature

```
call(String action, Map<String, Object> args
```

Return Value

Returns True or False based on whether read access is granted or not.

Examples

Output JSON example of the action are as follows.

Output format:

```
{ "isAccessible" : "true" }
```

`CheckCrudOnIncome`

Checks create, update and delete access on partyIncome entity.

Signature

```
call(String action, Map<String, Object> args
```

Return Value

Returns True or False based on whether create, update and delete access on the partyIncome entity is given.

Examples

Output JSON example of the action are as follows.

Output format:

```
{ "isCreatable" : "true", "isUpdateable" : "true", "isDeletable": "true" }
```

`CheckCrudOnExpense`

Checks create, update and delete access on partyExpense entity.

Signature

```
call(String action, Map<String, Object> args
```

Return Value

Returns True or False based on whether create, update and delete access on the partyExpense entity is given.

Examples

Output JSON example of the action are as follows.

Output format:

```
{ "isCreatable" : "true", "isUpdateable" : "true", "isDeletable": "true" }
```

Functions Namespace

The Functions namespace provides classes and methods used to invoke and manage Salesforce Functions.

Salesforce Functions is your code, run on demand, in the Salesforce Functions trusted elastic compute cloud. Upload your complex business logic code, written using your preferred languages and frameworks, and Salesforce Functions takes care of everything else necessary to invoke your code in a secure, multi-tenant aware, and self-scaling environment. For more details on Salesforce Functions, see Salesforce Functions.

The following are the classes in the `functions` namespace.

IN THIS SECTION:

Function Class
Use the Function class to access deployed Salesforce Functions, and invoke them synchronously or asynchronously.

FunctionCallback Interface
Represents the callback Salesforce calls when an asynchronous, queued Function invocation has completed.

FunctionErrorType Enum
Represents the error type of FunctionInvocationError.

FunctionInvocation Interface
Use FunctionInvocation to get the status and results of a synchronous or asynchronous Function invocation.

FunctionInvocationError Interface
Use FunctionInvocationError to get detailed error information about a failed Function invocation.

FunctionInvocationStatus Enum
Represents the status of a Function invocation.

FunctionInvokeMock Interface
Use the `FunctionInvokeMock` interface to mock Salesforce Functions responses during testing.

MockFunctionInvocationFactory Class
Use the `MockFunctionInvocationFactory` methods to generate appropriate mock responses for testing Salesforce Functions.

Function Class

Use the Function class to access deployed Salesforce Functions, and invoke them synchronously or asynchronously.

Namespace

functions

Usage

The Function class represents an instance of a deployed Function you can invoke from your org. You can invoke Functions synchronously, or asynchronously using asynchronous Apex.

If your Function takes longer than 2 minutes to return, the request times out. To avoid timing out, consider using asynchronous invocation. Invoking a Function asynchronously doesn't count against asynchronous Apex limits, such as Apex Queueable limits.

Before synchronously invoking a Function, commit any pending data operations in Apex, otherwise you get a CalloutException. For asynchronous invocations, the queued invocation doesn't happen if the Apex transaction isn't committed. Any data operations that happen in the Function itself aren't considered part of the Apex transaction.

Functions can't be invoked in an Apex test. A "Function invocations from Apex tests are not supported" CalloutException is thrown if Apex determines that a Function is being invoked during a test. If you must run tests against code that invokes Functions, mock your Function invocations during the tests. See FunctionInvocation Example Implementation for an example of a mocked FunctionInvocation that you can use in testing.

Example

The following example synchronously invokes a deployed "accountfunction" Function:

```
functions.Function accountFunction = functions.Function.get('MyProject.accountfunction');
functions.FunctionInvocation invocation = accountFunction.invoke('{ "accountName" : "Acct",
 "contactName" : "MyContact", "opportunityName" : "Oppty" }');
String jsonResponse = invocation.getResponse();
```

The following example asynchronously invokes a deployed "AccountFunction" Function, using the provided callback:

```
functions.Function accountFunction = functions.Function.get('MyProject.accountfunction');
accountFunction.invoke('{ "accountName" : "Acct", "contactName" : "MyContact",
"opportunityName" : "Oppty" }', new MyCallback());

public class MyCallback
  implements functions.FunctionCallback {
    public void handleResponse(functions.FunctionInvocation result) {
      // Handle result of function invocation
      // ...
    }
}
```

IN THIS SECTION:

Function Methods

Function Methods

The following are methods for `Function`.

IN THIS SECTION:

get(functionName)

Returns the Function instance for the named Function and Project. The Function must be properly deployed and have appropriate permissions to work with the org running your Apex code.

get(namespace, functionName)

Returns the Function instance for the named Function, Project, and Namespace. The Function must be properly deployed and have appropriate permissions to work with the org running your Apex code.

invoke(payload, callback)

Invokes the Function asynchronously.

invoke(payload)

Invokes the Function synchronously.

`get(functionName)`

Returns the Function instance for the named Function and Project. The Function must be properly deployed and have appropriate permissions to work with the org running your Apex code.

Signature

```
public static functions.Function get(String functionName)
```

Parameters

`functionName`
Type: String

The name of the Salesforce Function and the Functions Project that the Function is part of. The format of the parameter string is "*`project name.function name`*". For example, to retrieve the `generatepdf` Function in the `Onboarding` Function Project, use `Onboarding.generatepdf`. The Function and Project must be deployed to a compute environment connected to the org.

Return Value

Type: functions.Function

Returns a Function instance that you can invoke.

Usage

The `Function.get()` method can throw the following exceptions:

- `InvalidParameterValueException` — The *`functionName`* parameter doesn't have the correct *`project name.function name`* format.
- `NoDataFoundException` — The project or Function name provided in the *`functionName`* parameter couldn't be found. Make sure the project and Function name are spelled correctly and that the project and Function have been properly deployed.

get(namespace, functionName)

Returns the Function instance for the named Function, Project, and Namespace. The Function must be properly deployed and have appropriate permissions to work with the org running your Apex code.

Signature

```
public static functions.Function get(String namespace, String functionName)
```

Parameters

`namespace`
Type: String

The name of the Namespace that both the Salesforce Function and the Functions Project are part of. The org the Function is in must be `global` to access across namespaces. Default value is the same org where the method is being called.

`functionName`
Type: String

The name of the Salesforce Function and the Functions Project that the Function is part of. The format of the parameter string is "*project name*.*function name*". For example, to retrieve the `generatepdf` Function in the `Onboarding` Function Project, use `Onboarding.generatepdf`. The Function and Project must be deployed to a compute environment connected to the org.

Return Value

Type: functions.Function

Returns a Function instance that you can invoke.

Usage

The `Function.get()` method can throw the following exceptions:

- `InvalidParameterValueException` — The *`functionName`* parameter doesn't have the correct *`project name.function name`* format.
- `NoDataFoundException` — The project or Function name provided in the *`functionName`* parameter couldn't be found. Make sure the project and Function name are spelled correctly and that the project and Function have been properly deployed.
- `RuntimeException` — The function is `public` yet references a function across namespaces. Make sure to retrieve references across namespaces only in a `global` org.

`invoke(payload, callback)`

Invokes the Function asynchronously.

Signature

```
public functions.FunctionInvocation invoke(String payload, functions.FunctionCallback callback)
```

Parameters

`payload`
Type: String

The payload data that gets passed to the Function. Specify your payload data in a JSON-format string.

`callback`
Type: functions.FunctionCallback

A FunctionCallback implementation that gets called when your Function is invoked asynchronously.

Return Value

Type: functions.FunctionInvocation

Returns a FunctionInvocation that contains information about the results of the invocation, such as the Function response, or error results.

Usage

The `Function.invoke(payload, callback)` method can throw the following exceptions:

- `CalloutException` — One of the following conditions causes this exception to be thrown:
  - Salesforce Functions isn't enabled on the current org. For more details on enabling Functions, see Configure Orgs for Functions in the Functions Developer Guide.
  - The Function is being invoked in an Apex test. Functions can't be invoked in tests.
  - The "Functions" permission set is missing or has incorrect permissions for `FunctionInvocationRequest`. For more details on the correct permissions for `FunctionInvocationRequest` see Function Permissions in the Functions Developer Guide.
  - The provided payload isn't valid JSON.
  - The Function hasn't completed deployment to a compute environment or invocation request returns a 404 HTTP error.
- `InvalidParameterValueException` — The *`callback`* parameter is null or references a class that doesn't implement `functions.FunctionCallback`.
- `NoDataFoundException` — A reference for the Function couldn't be found in the current org. Make sure the project and Function have been properly deployed.

`invoke(payload)`

Invokes the Function synchronously.

Signature

```
public functions.FunctionInvocation invoke(String payload)
```

Parameters

`payload`
Type: String

The payload data that gets passed to the Function. Specify your payload data in a JSON-format string.

Return Value

Type: functions.FunctionInvocation

Returns a FunctionInvocation that contains information about the results of the invocation, such as the Function response, or error results.

Usage

The `Function.invoke(payload)` method can throw the following exceptions:

- `CalloutException` — One of the following conditions causes this exception to be thrown:
  - Salesforce Functions isn't enabled on the current org. For more details on enabling Functions, see Configure Orgs for Functions in the Functions Developer Guide.
  - The Function is being invoked in an Apex test. Functions can't be invoked in tests.
  - The provided payload isn't valid JSON.
  - There are pending DML operations.
  - The Function is being synchronously invoked from an Apex trigger.
  - The Function hasn't completed deployment to a compute environment or invocation request returns a 404 HTTP error.

  - The Function request returns a 5xx HTTP error.
  - The Function invocation has exceeded the time limit for synchronous invocations. For details on the time limit and work-arounds, see Limits in the Functions Developer Guide.
- `NoDataFoundException` — A reference for the Function couldn't be found in the current org. Make sure the project and Function have been properly deployed.

FunctionCallback Interface

Represents the callback Salesforce calls when an asynchronous, queued Function invocation has completed.

Namespace

functions

Usage

When invoking Functions asynchronously via `Function.invoke(payload, callback)`, you provide your own class that implements FunctionCallback.

IN THIS SECTION:

FunctionCallback Methods

FunctionCallback Example Implementation

FunctionCallback Methods

The following are methods for `FunctionCallback`.

IN THIS SECTION:

handleResponse(var1)
Called when an asynchronous Function invocation has completed.

`handleResponse(var1)`

Called when an asynchronous Function invocation has completed.

Signature

```
public void handleResponse(functions.FunctionInvocation var1)
```

Parameters

`var1`

Type: functions.FunctionInvocation

The result parameter contains JSON response information and error information.

Return Value

Type: void

FunctionCallback Example Implementation

This is an example implementation of the `functions.FunctionCallback` interface.

```
public class MyCallback
  implements functions.FunctionCallback {
    public void handleResponse(functions.FunctionInvocation result) {
      // Handle result of function invocation
      String jsonResponse = result.getResponse();
      System.debug('Got response ' + jsonResponse);
      JSONParser parser = JSON.createParser(jsonResponse);
      // Process JSON using your own data class...
    }
}
```

The following example uses this implementation when invoking a Function asynchronously:

```
myFunction.invoke('{ "accountName" : "Acct", "contactName" : "MyContact", "opportunityName"
 : "Oppty" }', new MyCallback());
```

FunctionErrorType Enum

Represents the error type of FunctionInvocationError.

Enum Values

These are the values of the `functions.FunctionErrorType` enum.

Value	Description
`FUNCTION_EXCEPTION`	A known exception resulting from the Function logic itself. Examples include an exception thrown from the Function code, or an exception thrown from a library or framework the Function uses.
`RUNTIME_EXCEPTION`	A known exception resulting from the Salesforce Functions runtime. For example, a malformed payload passed to the Function when invoked results in this error type.
`UNEXPECTED_FUNCTION_EXCEPTION`	An unknown exception. For example, a network or system-level issue within the Salesforce Functions infrastructure results in this error type.

FunctionInvocation Interface

Use FunctionInvocation to get the status and results of a synchronous or asynchronous Function invocation.

Namespace

functions

Usage

The results of a Function invocation are passed back via FunctionInvocation. Use this instance to determine if the invocation was successful, and any results from the Function invocation.

You can also implement your own FunctionInvocation interface if you run Apex tests with your Function invocation code. Your test code can create and use your own FunctionInvocation instance in place of using the results from a call to `Function.invoke()`.

IN THIS SECTION:

FunctionInvocation Methods

FunctionInvocation Example Implementation

FunctionInvocation Methods

The following are methods for `FunctionInvocation`.

IN THIS SECTION:

getError()
Returns error information for a Function invocation.

getInvocationId()
Returns the invocation ID of the Function invocation.

getResponse()
Returns the response string of the Function invocation.

getStatus()
Returns the status of the Function invocation.

`getError()`

Returns error information for a Function invocation.

Signature

```
public functions.FunctionInvocationError getError()
```

Return Value

Type: functions.FunctionInvocationError

Contains a `FunctionInvocationError` instance that you can use to get information about any invocation errors. If the Function was invoked successfully, the returned instance is null.

`getInvocationId()`

Returns the invocation ID of the Function invocation.

Signature

```
public String getInvocationId()
```

Return Value

Type: String

This ID is available after a call to either the synchronous or asynchronous `Function.invoke()` methods. For asynchronous invocations, this ID can be used to check the status of the queued invocation.

`getResponse()`

Returns the response string of the Function invocation.

Signature

```
public String getResponse()
```

Return Value

Type: String

The response string is the raw request JSON response, which can be parsed using the JSONParser Class.

`getStatus()`

Returns the status of the Function invocation.

Signature

```
public functions.FunctionInvocationStatus getStatus()
```

Return Value

Type: functions.FunctionInvocationStatus

The result of the invocation, such as `FunctionInvocationStatus.SUCCESS` or `FunctionInvocationStatus.ERROR`.

FunctionInvocation Example Implementation

This is an example implementation of the `functions.FunctionInvocation` interface.

```
public class MyFunctionInvocationError
  implements functions.FunctionInvocationError {
    public String getMessage() {
      return 'Mock error message for testing';
    }
    public functions.FunctionErrorType getType() {
      return functions.FunctionErrorType.FUNCTION_EXCEPTION;
    }
}

public class MyFunctionInvocation
  implements functions.FunctionInvocation {
    public functions.FunctionInvocationStatus getStatus() {
      return functions.FunctionInvocationStatus.ERROR;
    }
```

```
    public String getResponse() {
      return 'Mock response for testing';
    }
    public String getInvocationId() {
      return 'MOCKTESTID';
    }
    public functions.FunctionInvocationError getError() {
      functions.FunctionInvocationError testError = new MyFunctionInvocationError();
      return testError;
    }
}
```

The following example tests the implementation:

```
functions.FunctionInvocation testInvocation = new MyFunctionInvocation();
if (testInvocation.getStatus() == functions.FunctionInvocationStatus.ERROR) {
    System.debug('Error: ' + (testInvocation.getError() != null ?
testInvocation.getError().getMessage() : 'UNKNOWN'));
    return;
}
```

FunctionInvocationError Interface

Use FunctionInvocationError to get detailed error information about a failed Function invocation.

Namespace

functions

Usage

FunctionInvocationError contains various error information such as the error message at the time of the error.

IN THIS SECTION:

FunctionInvocationError Methods

FunctionInvocationError Example Implementation

FunctionInvocationError Methods

The following are methods for `FunctionInvocationError`.

IN THIS SECTION:

getMessage()

Returns the error message from a Function invocation error.

getType()

Returns the error type for FunctionInvocationError.

`getMessage()`

Returns the error message from a Function invocation error.

Signature

```
public String getMessage()
```

Return Value

Type: String

`getType()`

Returns the error type for FunctionInvocationError.

Signature

```
public functions.FunctionErrorType getType()
```

Return Value

Type: functions.FunctionErrorType

FunctionInvocationError Example Implementation

This is an example implementation of the `functions.FunctionInvocationError` interface.

```
public class MyFunctionInvocationError
  implements functions.FunctionInvocationError {
      public String getMessage() {
          return 'Mock error message for testing';
      }
      public functions.FunctionErrorType getType() {
          return functions.FunctionErrorType.FUNCTION_EXCEPTION;
      }
}
```

This example tests the implementation.

```
functions.FunctionInvocationError testError = new MyFunctionInvocationError();
System.debug('Error: ' + testError.getMessage() + ' Type: ' + testError.getType());
```

FunctionInvocationStatus Enum

Represents the status of a Function invocation.

Enum Values

The following are the values of the `functions.FunctionInvocationStatus` enum.

Value	Description
`ERROR`	The invocation failed. Check the FunctionInvocation and FunctionInvocationError returned by the invoke call to debug the issue.
`PENDING`	The invocation is pending. If the Function is being invoked asynchronously, the invocation is still in the asynch queue.
`SUCCESS`	The invocation succeeded. Use `FunctionInvocation.getResponse()` with the FunctionInvocation instance returned by the invoke call to get any response returned by the Function.

FunctionInvokeMock Interface

Use the `FunctionInvokeMock` interface to mock Salesforce Functions responses during testing.

Namespace

functions

Usage

To mock Salesforce Functions testing, implement an appropriate mock response in the `respond(functionName,payload)` method of the `FunctionInvokeMock` interface. During mock testing of a Salesforce Functions, Apex runtime sends the response specified in the `respond()` method, rather than invoking the function itself. Appropriate success and error messages can be configured with the `createSuccessResponse(invocationId,message)` and `createErrorResponse(invocationId,functionsErrorType,errorMsg)` methods in `Functions.MockFunctionInvocationFactory`.

IN THIS SECTION:

FunctionInvokeMock Methods

FunctionInvokeMock Example Implementation

FunctionInvokeMock Methods

The following are methods for `FunctionInvokeMock`.

IN THIS SECTION:

respond(functionName, payload)

The mock response implemented in the `Functions.FunctionInvokeMock` interface. The response is sent by Apex runtime when the `Test.setMock()` method is called.

`respond(functionName, payload)`

The mock response implemented in the `Functions.FunctionInvokeMock` interface. The response is sent by Apex runtime when the `Test.setMock()` method is called.

Signature

```
public functions.FunctionInvocation respond(String functionName, String payload)
```

Parameters

functionName
Type: String

The name of the Salesforce Function and the Functions Project that the Function is part of. The format of the parameter string is "*project name.function name*".

payload
Type: String

The JSON-format payload data that is passed to the Function.

Return Value

Type: FunctionInvocation Interface

The result of the mock call to Salesforce Functions. Appropriate responses can be generated by using the `createSuccessResponse()` and `createErrorResponse()` methods in the `Functions.MockFunctionInvocationFactory` class.

FunctionInvokeMock Example Implementation

This is sample implementation of the `functions.FunctionInvokeMock` interface.

```
@isTest
public class FunctionsInvokeMockImpl implements functions.FunctionInvokeMock {
    public functions.FunctionInvocation respond(String functionName, String payload) {
       // return mock success response
       String invocationId = '000000000000000';
       String response = 'mockResponse';
       return functions.MockFunctionInvocationFactory.createSuccessResponse(invocationId,
 response);
    }
}
```

This example shows the minimal setup required for testing synchronous and asynchronous functions and is simplified to include both function invocations and the `FunctionCallback` class.

```
@isTest
public class FunctionTest {
    @isTest
    static void testSyncFunctionCall() {
            // Set mock class to respond to function invocations
        Test.setMock( functions.FunctionInvokeMock.class, new FunctionsInvokeMockInner());

          functions.Function mockedFunction = functions.Function.get('example.function');

            Test.startTest();
            // Synchronous function call
```

```
            functions.FunctionInvocation invokeResult = mockedFunction.invoke('{}');
            Test.stopTest();

            // Verify that the received response contains expected mock values
            System.assertEquals(functions.FunctionInvocationStatus.SUCCESS,
invokeResult.getStatus());
            System.assertEquals('mockResponse', invokeResult.getResponse());
            System.assertEquals('000000000000000', invokeResult.getInvocationId());

        }

        @isTest
        static void testAsyncFunctionCall() {
            // Set mock class to respond to function invocations
            Test.setMock( functions.FunctionInvokeMock.class, new
FunctionsInvokeMockInner());

          functions.Function mockedFunction = functions.Function.get('example.function2');

            Test.startTest();
            //Asynchronous function invocation with callback
            mockedFunction.invoke('{}', new DemoCallback());
            Test.stopTest();
            // Include assertions here about the expected callback processing
        }

         public class DemoCallback implements functions.FunctionCallback {
            public void handleResponse(functions.FunctionInvocation invokeResult) {
                // Handle result of function invocation
                // The callback is included in the example here for convenience
                // It would normally be defined in the classes being tested

                // Verify that the received response contains expected mock values
                System.assertEquals(invokeResult.getStatus(),
functions.FunctionInvocationStatus.ERROR);
                functions.FunctionInvocationError resultError = invokeResult.getError();
             System.assertEquals('bang', invokeResult.getError().getMessage());
             System.assertEquals('000000000000000', invokeResult.getInvocationId());

            }
        }

        public class FunctionsInvokeMockInner implements functions.FunctionInvokeMock {
          public functions.FunctionInvocation respond(String functionName, String payload)
 {
                // return mock success response
                String invocationId = '000000000000000';

                if(functionName == 'example.function2') {
                    return functions.MockFunctionInvocationFactory.createErrorResponse(
                        invocationId,
                        functions.FunctionErrorType.FUNCTION_EXCEPTION,
```

```
                        'bang');
                }

                String response = 'mockResponse';
                return
functions.MockFunctionInvocationFactory.createSuccessResponse(invocationId, response);

            }
        }

    }
```

MockFunctionInvocationFactory Class

Use the `MockFunctionInvocationFactory` methods to generate appropriate mock responses for testing Salesforce Functions.

Namespace

functions

Usage

To mock Salesforce Functions testing, implement an appropriate mock response in the `respond(functionName,payload)` method of the `FunctionInvokeMock` interface. During mock testing of a Salesforce Functions, the Apex runtime sends the response specified in the `respond()` method, rather than invoking the function itself. Appropriate success and error messages can be configured with the `createSuccessResponse(invocationId,message)` and `createErrorResponse(invocationId,functionsErrorType,errorMsg)` methods.

See FunctionInvokeMock Example Implementation.

IN THIS SECTION:

MockFunctionInvocationFactory Methods

MockFunctionInvocationFactory Methods

The following are methods for `MockFunctionInvocationFactory`.

IN THIS SECTION:

createErrorResponse(invocationId, functionsErrorType, errMsg)
Generate a response for an error condition during mock testing of Salesforce Functions.

createSuccessResponse(invocationId, response)
Generate a response for a successful mock test of Salesforce Functions.

`createErrorResponse(invocationId, functionsErrorType, errMsg)`

Generate a response for an error condition during mock testing of Salesforce Functions.

Signature

```
public static functions.FunctionInvocation createErrorResponse(String invocationId,
functions.FunctionErrorType functionsErrorType, String errMsg)
```

Parameters

invocationId
Type: String

The ID associated with a call to either the synchronous or asynchronous `Function.invoke()` method.

functionsErrorType
Type: FunctionErrorType Enum

The error type of `FunctionInvocationError`.

errMsg
Type: String

The error message.

Return Value

Type: FunctionInvocation Interface

createSuccessResponse(invocationId, response)

Generate a response for a successful mock test of Salesforce Functions.

Signature

```
public static functions.FunctionInvocation createSuccessResponse(String invocationId,
String response)
```

Parameters

invocationId
Type: String

The ID associated with a call to either the synchronous or asynchronous `Function.invoke()` method.

response
Type: String

The message indicating success.

Return Value

Type: FunctionInvocation Interface

industriesNlpSvc

Stores the objects used in Industries Einstein Natural Language Processing (NLP) services.

The industriesNlpSvc namespace contains these classes that are the outputs for the transformNlpActionResult Invocable action.

- `NlpResponse` — Stores the NLP Summarization result performed for an NLP Operation involving summarization use cases such as SurveyLongSummarization and SurveyShortSummarization.
- `NlpSummarizationResult` — Provides the summary obtained as result of NLP Operation.

IN THIS SECTION:

NlpResponse Class
Stores the result for an NLP Operation. NLP operation can be SurveyLongSummarization and SurveyShortSummarization.

NlpSummarizationResult Class
Provides the summary obtained as result of NLP Operation.

NlpResponse Class

Stores the result for an NLP Operation. NLP operation can be SurveyLongSummarization and SurveyShortSummarization.

Namespace

industriesNlpSvc

IN THIS SECTION:

NlpResponse Properties

NlpResponse Properties

The following are properties for `NlpResponse`.

IN THIS SECTION:

summarizationResult
Represents the property that stores the NLP Summarization result performed for an NLP Operation. NLP operation can be SurveyLongSummarization and SurveyShortSummarization.

errors
Represents the property to store errors that occurred as a result of the NLP Operation.

`summarizationResult`

Represents the property that stores the NLP Summarization result performed for an NLP Operation. NLP operation can be SurveyLongSummarization and SurveyShortSummarization.

Signature

```
public industriesNlpSvc.NlpSummarizationResult summarizationResult {get; set;}
```

Property Value

Type: List<industriesNlpSvc.NlpSummarizationResult on page 2604>

errors

Represents the property to store errors that occurred as a result of the NLP Operation.

Signature

```
public List<String> errors {get; set;}
```

Property Value

Type: List<String>

NlpSummarizationResult Class

Provides the summary obtained as result of NLP Operation.

Namespace

industriesNlpSvc

IN THIS SECTION:

NlpSummarizationResult Properties

NlpSummarizationResult Properties

The following are properties for `NlpSummarizationResult`:

IN THIS SECTION:

summary
Represents the field that captures the summary obtained as result of NLP Operation.

summary

Represents the field that captures the summary obtained as result of NLP Operation.

Signature

```
public String summary {get; set;}
```

Property Value

Type: List<String>

IndustriesDigitalLending Namespace

The `industriesDigitalLending` namespace provides classes used in the Digital Lending OmniScripts and Integration Procedures.

The industriesDigitalLending namespace contains these classes:

- `DigitalLendingIntakeRecordsWrapper` — Use the callable DigitalLendingIntakeRecordsWrapper class to call utility methods from OmniScripts used in Digital Lending application intake process.
- `DigitalLendingPostIntakeRecordsWrapper` — Use the callable DigitalLendingPostIntakeRecordsWrapper class to call utility methods from integration procedures used in Digital Lending post intake in FlexCards.
- `DigitalLendingProductsApi` — Use the callable DigitalLendingProductsApi class to call utility methods from integration procedures used in Digital Lending FlexCards.
- `DigitalLendingUtils` — Use the callable DigitalLendingUtils class to call utility methods from integration procedures used in Digital Lending PostIntake FlexCards.
- `PricingExecutionWrapper` — Use the callable PricingExecutionWrapper class to call utility methods from integration procedures used in Digital Lending FlexCards.

See industriesDigitalLending namespace for more information about the available classes and methods.

Invocable Namespace

The `Invocable` namespace provides classes for calling invocable actions from Apex.

These classes are in the `Invocable` namespace.

IN THIS SECTION:

Action Class
Contains methods to create, update, and retrieve information about invocable actions.

Action.Error Class
Contains methods to retrieve errors returned by invocable actions.

Action.Result Class
Contains methods to retrieve results from invocable actions called from Apex code.

Action Class

Contains methods to create, update, and retrieve information about invocable actions.

Namespace

Invocable

IN THIS SECTION:

Action Methods

SEE ALSO:

Apex Developer Guide: InvocableMethod Annotation

Salesforce Help: Launch a Flow from Apex

Action Methods

These methods are for `Action`.

IN THIS SECTION:

addInvocation()
Creates an empty invocation in preparation for calling an invocable action. After you create the invocation, you can add parameters to the invocation.

clearInvocations()
Clears the existing invocations from the action.

clone()
Creates a copy of the `Invocable.Action`.

createCustomAction(type, namespace, name)
Creates a wrapper for a custom invocable action in a specified package namespace.

createCustomAction(type, name)
Creates a wrapper for a custom invocable action.

createStandardAction(type)
Creates a wrapper for a standard invocable action.

getName()
Gets the name of an invocable action.

getNamespace()
Gets the namespace of a custom invocable action.

getType()
Gets the type of an invocable action.

invoke()
Invokes an invocable action from Apex code.

isStandard()
Determines whether an invocable action is a standard invocable action.

setInvocationParameter(parameterName, parameterValue)
Sets a value for an invocable action parameter.

setInvocations(invocations)
Initializes the invocations for an action from a pre-existing list of invocations.

`addInvocation()`

Creates an empty invocation in preparation for calling an invocable action. After you create the invocation, you can add parameters to the invocation.

Signature

```
public Invocable.Action addInvocation()
```

Return Value

Type: Invocable.Action on page 2605

clearInvocations()

Clears the existing invocations from the action.

Signature

```
public Invocable.Action clearInvocations()
```

Return Value

Type: Invocable.Action on page 2605

clone()

Creates a copy of the `Invocable.Action`.

Signature

```
public Object clone()
```

Return Value

Type: Object

createCustomAction(type, namespace, name)

Creates a wrapper for a custom invocable action in a specified package namespace.

Signature

```
public static Invocable.Action createCustomAction(String type, String namespace, String
name)
```

Parameters

type
Type: String

Type of invocable action.

namespace
Type: String

Namespace where the invocable action is located.

name
Type: String

Name for the custom invocable action.

Return Value

Type: Invocable.Action

createCustomAction(type, name)

Creates a wrapper for a custom invocable action.

Signature

```
public static Invocable.Action createCustomAction(String type, String name)
```

Parameters

type
Type: String

Type of invocable action.

name
Type: String

Name for the custom invocable action.

Return Value

Type: Invocable.Action

createStandardAction(type)

Creates a wrapper for a standard invocable action.

Signature

```
public static Invocable.Action createStandardAction(String type)
```

Parameters

type
Type: String

Type of invocable action.

Return Value

Type: Invocable.Action

getName()

Gets the name of an invocable action.

Signature

```
public String getName()
```

Return Value

Type: String

Name of the invocable action.

getNamespace()

Gets the namespace of a custom invocable action.

Signature

```
public String getNamespace()
```

Return Value

Type: String

Namespace of the custom invocable action.

getType()

Gets the type of an invocable action.

Signature

```
public String getType()
```

Return Value

Type: String

Type of invocable action.

invoke()

Invokes an invocable action from Apex code.

Signature

```
public List<Invocable.Action.Result> invoke()
```

Return Value

Type: List<Invocable.Action.Result>

isStandard()

Determines whether an invocable action is a standard invocable action.

Signature

```
public Boolean isStandard()
```

Return Value

Type: Boolean

This method returns `true` if the invocable action is a standard invocable action.

`setInvocationParameter(parameterName, parameterValue)`

Sets a value for an invocable action parameter.

Signature

```
public Invocable.Action setInvocationParameter(String parameterName, Object
parameterValue)
```

Parameters

parameterName
Type: String

Name of the invocable action parameter to set.

parameterValue
Type: Object

Value to set the invocable action parameter to.

Return Value

Type: Invocable.Action on page 2605

`setInvocations(invocations)`

Initializes the invocations for an action from a pre-existing list of invocations.

Signature

```
public Invocable.Action setInvocations(List<Map<String,ANY>> invocations)
```

Parameters

invocations
Type: List on page 3603<Map on page 3624<String on page 3833,ANY>>

List of invocations for the invocable action.

Return Value

Type: Invocable.Action on page 2605

Action.Error Class

Contains methods to retrieve errors returned by invocable actions.

Namespace

Invocable

IN THIS SECTION:

Action.Error Methods

Action.Error Methods

These methods are for `Action.Error`.

IN THIS SECTION:

clone()
Creates a copy of the `Invocable.Action.Error`.
getCode()
Gets the error code returned by an invocable action.
getMessage()
Gets the error message returned by an invocable action.

`clone()`

Creates a copy of the `Invocable.Action.Error`.

Signature

```
public Object clone()
```

Return Value

Type: Object

`getCode()`

Gets the error code returned by an invocable action.

Signature

```
public String getCode()
```

Return Value

Type: String

`getMessage()`

Gets the error message returned by an invocable action.

Signature

```
public String getMessage()
```

Return Value

Type: String

Action.Result Class

Contains methods to retrieve results from invocable actions called from Apex code.

Namespace

Invocable

IN THIS SECTION:

Action.Result Methods

Action.Result Methods

The methods are for `Action.Result`.

IN THIS SECTION:

clone()
Creates a copy of the `Invocable.Action.Result`.

getAction()
Gets the invocable action that was invoked and caused a result to be returned.

getErrors()
Gets a list of errors that were returned by an invocable action.

getInvocationParameters()
Gets a list of the parameter values set for an invocable action. This method returns a list that contains the input parameter values for each invocation of an action. Each map in the list contains a key for the name of each input parameter.

getOutputParameters()
Gets a list of the parameter values returned by an invocable action. This method returns a list that contains the result for each invocation of an action. Each map in the list contains a key for the name of each output parameter.

isSuccess()
Determines if an invocable action ran without errors.

`clone()`

Creates a copy of the `Invocable.Action.Result`.

Signature

```
public Object clone()
```

Return Value

Type: Object

`getAction()`

Gets the invocable action that was invoked and caused a result to be returned.

Signature

```
public Invocable.Action getAction()
```

Return Value

Type: Invocable.Action on page 2605

`getErrors()`

Gets a list of errors that were returned by an invocable action.

Signature

```
public List on page 3833<Invocable.Action.Error on page 2610> getErrors()
```

Return Value

Type: List on page 3833<Invocable.Action.Error on page 2610>

`getInvocationParameters()`

Gets a list of the parameter values set for an invocable action. This method returns a list that contains the input parameter values for each invocation of an action. Each map in the list contains a key for the name of each input parameter.

Signature

```
public Map<String,Object> getInvocationParameters()
```

Return Value

Type: Map on page 3624<String on page 3833,Object>

`getOutputParameters()`

Gets a list of the parameter values returned by an invocable action. This method returns a list that contains the result for each invocation of an action. Each map in the list contains a key for the name of each output parameter.

Signature

```
public Map<String,Object> getOutputParameters()
```

Return Value

Type: Map on page 3624<String on page 3833,Object>

`isSuccess()`

Determines if an invocable action ran without errors.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

This method returns `true` if the invocable action ran successfully.

IsvPartners Namespace

The `IsvPartners` namespace provides a class associated with Salesforce ISV partner use cases, such as optimizing code, providing great customer trial experiences, and driving feature adoption.

These are the classes in the `IsvPartners` namespace.

IN THIS SECTION:

AppAnalytics Class
Contains methods to help with AppExchange App Analytics use cases, such as minimizing subscriber attrition and obtaining product insights.

AppAnalytics Class

Contains methods to help with AppExchange App Analytics use cases, such as minimizing subscriber attrition and obtaining product insights.

Namespace

IsvPartners

Usage

Use `AppAnalytics` and its methods to log App Analytics custom interactions.

Example

```
public void submitClicked() {
        Id jobId = System.enqueueJob(new MyQueueable(colorValue));
        IsvPartners.AppAnalytics.logCustomInteraction(
             MyPageInteractions.SUBMIT_CLICKED, jobId);
```

IN THIS SECTION:

AppAnalytics Methods

AppAnalytics Methods

These are methods for `AppAnalytics`.

IN THIS SECTION:

logCustomInteraction(interactionLabel, interactionId)
Logs the custom interaction using a label that you provide as an enum value and an interaction ID.

logCustomInteraction(interactionLabel, interactionUuid)
Logs the custom interaction using a label that you provide as an enum value and an interaction ID that you provide as an Apex UUID.

logCustomInteraction(interactionLabel)
Logs the custom interaction using a label that you provide as an enum value.

`logCustomInteraction(interactionLabel, interactionId)`

Logs the custom interaction using a label that you provide as an enum value and an interaction ID.

Signature

```
public static void logCustomInteraction(Object interactionLabel, Id interactionId)
```

Parameters

`interactionLabel`
Type: Object

A value used to label the custom interaction. The value of *`interactionLabel`* must be an enum with the same namespace as the code that calls the `logCustomInteraction` method.

`interactionId`
Type: Id

An Apex ID that is associated with the custom interaction. The `interactionId` that you provide is hashed and tokenized before it's included in AppExchange App Analytics package usage logs.

Return Value

Type: Void

`logCustomInteraction(interactionLabel, interactionUuid)`

Logs the custom interaction using a label that you provide as an enum value and an interaction ID that you provide as an Apex UUID.

Signature

```
public static void logCustomInteraction(Object interactionLabel, System.UUID
interactionUuid)
```

Parameters

interactionLabel
Type: Object

A value used to label the custom interaction. The value of *interactionLabel* must be an enum with the same namespace as the code that calls the `logCustomInteraction` method.

interactionUuid
Type: System.UUID

An Apex UUID that is associated with the custom interaction. The `interactionId` that you provide is hashed and tokenized before being included in AppExchange App Analytics package usage logs.

Return Value

Type: Void

`logCustomInteraction(interactionLabel)`

Logs the custom interaction using a label that you provide as an enum value.

Signature

```
public static void logCustomInteraction(Object interactionLabel)
```

Parameters

interactionLabel
Type: Object

A value used to label the custom interaction. The value of *interactionLabel* must be an enum with the same namespace as the code that calls the `logCustomInteraction` method.

Return Value

Type: Void

KbManagement Namespace

The `KbManagement` namespace provides a class for managing knowledge articles.

The following is the class in the `KbManagement` namespace.

IN THIS SECTION:

PublishingService Class
Use the methods in the `KbManagement.PublishingService` class to manage the lifecycle of an article and its translations.

PublishingService Class

Use the methods in the `KbManagement.PublishingService` class to manage the lifecycle of an article and its translations.

Namespace

KbManagement

Usage

Use the methods in the `KbManagement.PublishingService` class to manage the following parts of the lifecycle of an article and its translations:

- Publishing
- Updating
- Retrieving
- Deleting
- Submitting for translation
- Setting a translation to complete or incomplete status
- Archiving
- Assigning review tasks for draft articles or translations

Note: Date values are based on GMT.

To use the methods in this class, you must enable Salesforce Knowledge. See Salesforce Knowledge Implementation Guide for more information on setting up Salesforce Knowledge.

PublishingService Methods

The following are methods for `PublishingService`. All methods are static.

IN THIS SECTION:

archiveOnlineArticle(articleId, scheduledDate)

Archives an online version of an article. If the specified scheduledDate is null, the article is archived immediately. Otherwise, it archives the article on the scheduled date.

assignDraftArticleTask(articleId, assigneeId, instructions, dueDate, sendEmailNotification)

Assigns a review task related to a draft article.

assignDraftTranslationTask(articleVersionId, assigneeId, instructions, dueDate, sendEmailNotification)

Assigns a review task related to a draft translation.

cancelScheduledArchivingOfArticle(articleId)

Cancels the scheduled archiving of an online article.

cancelScheduledPublicationOfArticle(articleId)

Cancels the scheduled publication of a draft article.

completeTranslation(articleVersionId)

Puts a translation in a completed state that is ready to publish.

deleteArchivedArticle(articleId)

Deletes an archived article.

deleteArchivedArticleVersion(articleId, versionNumber)

Deletes a specific archived version of a published article.

deleteDraftArticle(articleId)

Deletes a draft article.

deleteDraftTranslation(articleVersionId)

Deletes a draft translation.

editArchivedArticle(articleId)

Creates a draft article from the archived primary version and returns the new draft primary version ID of the article.

editOnlineArticle(articleId, unpublish)

Creates a draft article from the online version and returns the new draft primary version ID of the article. Also, unpublishes the online article, if *unpublish* is set to `true`.

editPublishedTranslation(articleId, language, unpublish)

Creates a draft version of the online translation for a specific language and returns the new draft primary version ID of the article. Also, unpublishes the article, if set to `true`.

publishArticle(articleId, flagAsNew)

Publishes an article. If *flagAsNew* is set to `true`, the article is published as a major version.

restoreOldVersion(articleId, versionNumber)

Creates a draft article from an existing online article based on the specified archived version of the article and returns the article version ID.

scheduleForPublication(articleId, scheduledDate)

Schedules the article for publication as a major version. If the specified date is null, the article is published immediately.

setTranslationToIncomplete(articleVersionId)

Sets a draft translation that is ready for publication back to "in progress" status.

submitForTranslation(articleId, language, assigneeId, dueDate)

Submits an article for translation to the specified language. Also assigns the specified user and due date to the submittal and returns new ID of the draft translation.

archiveOnlineArticle(articleId, scheduledDate)

Archives an online version of an article. If the specified scheduledDate is null, the article is archived immediately. Otherwise, it archives the article on the scheduled date.

Signature

```
public static Void archiveOnlineArticle(String articleId, Datetime scheduledDate)
```

Parameters

articleId
Type: String

scheduledDate
Type: Datetime

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
Datetime scheduledDate = Datetime.newInstanceGmt(2012, 12,1,13,30,0);
KbManagement.PublishingService.archiveOnlineArticle(articleId, scheduledDate);
```

assignDraftArticleTask(articleId, assigneeId, instructions, dueDate, sendEmailNotification)

Assigns a review task related to a draft article.

Signature

```
public static Void assignDraftArticleTask(String articleId, String assigneeId, String
instructions, Datetime dueDate, Boolean sendEmailNotification)
```

Parameters

articleId
Type: String

assigneeId
Type: String

instructions
Type: String

dueDate
Type: Datetime

sendEmailNotification
Type: Boolean

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
String assigneeId = '';
String instructions = 'Please review this draft.';
Datetime dueDate = Datetime.newInstanceGmt(2012, 12, 1);
KbManagement.PublishingService.assignDraftArticleTask(articleId, assigneeId, instructions,
 dueDate, true);
```

assignDraftTranslationTask(articleVersionId, assigneeId, instructions, dueDate, sendEmailNotification)

Assigns a review task related to a draft translation.

Signature

```
public static Void assignDraftTranslationTask(String articleVersionId, String assigneeId,
String instructions, Datetime dueDate, Boolean sendEmailNotification)
```

Parameters

articleVersionId
Type: String

assigneeId
Type: String

instructions
Type: String

dueDate
Type: Datetime

sendEmailNotification
Type: Boolean

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
String assigneeId = 'Insert assignee ID';
String instructions = 'Please review this draft.';
Datetime dueDate = Datetime.newInstanceGmt(2012, 12, 1);
KbManagement.PublishingService.assignDraftTranslationTask(articleId, assigneeId,
instructions, dueDate, true);
```

cancelScheduledArchivingOfArticle(articleId)

Cancels the scheduled archiving of an online article.

Signature

```
public static Void cancelScheduledArchivingOfArticle(String articleId)
```

Parameters

articleId
Type: String

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.cancelScheduledArchivingOfArticle (articleId);
```

cancelScheduledPublicationOfArticle(articleId)

Cancels the scheduled publication of a draft article.

Signature

```
public static Void cancelScheduledPublicationOfArticle(String articleId)
```

Parameters

articleId
Type: String

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.cancelScheduledPublicationOfArticle (articleId);
```

completeTranslation(articleVersionId)

Puts a translation in a completed state that is ready to publish.

Signature

```
public static Void completeTranslation(String articleVersionId)
```

Parameters

articleVersionId
Type: String

Return Value

Type: Void

Example

```
String articleVersionId = 'Insert article ID';
KbManagement.PublishingService.completeTranslation(articleVersionId);
```

deleteArchivedArticle(articleId)

Deletes an archived article.

Signature

```
public static Void deleteArchivedArticle(String articleId)
```

Parameters

articleId
Type: String

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.deleteArchivedArticle(articleId);
```

deleteArchivedArticleVersion(articleId, versionNumber)

Deletes a specific archived version of a published article.

Signature

```
public static Void deleteArchivedArticleVersion(String articleId, Integer versionNumber)
```

Parameters

articleId
Type: String

versionNumber
Type: Integer

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
Integer versionNumber = 1;
KbManagement.PublishingService.deleteArchivedArticleVersion(articleId, versionNumber);
```

deleteDraftArticle(articleId)

Deletes a draft article.

Signature

```
public static Void deleteDraftArticle(String articleId)
```

Parameters

articleId
Type: String

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.deleteDraftArticle(articleId);
```

deleteDraftTranslation(articleVersionId)

Deletes a draft translation.

Signature

```
public static Void deleteDraftTranslation(String articleVersionId)
```

Parameters

articleVersionId
Type: String

Return Value

Type: Void

Example

```
String articleVersionId = 'Insert article ID';
KbManagement.PublishingService.deleteDraftTranslation (articleVersionId);
```

editArchivedArticle(articleId)

Creates a draft article from the archived primary version and returns the new draft primary version ID of the article.

Signature

```
public static String editArchivedArticle(String articleId)
```

Parameters

articleId
Type: String

Return Value

Type: String

Example

```
String articleId = 'Insert article ID';
String id = KbManagement.PublishingService.editArchivedArticle(articleId);
```

editOnlineArticle(articleId, unpublish)

Creates a draft article from the online version and returns the new draft primary version ID of the article. Also, unpublishes the online article, if *unpublish* is set to `true`.

Signature

```
public static String editOnlineArticle(String articleId, Boolean unpublish)
```

Parameters

articleId
Type: String

unpublish
Type: Boolean

Return Value

Type: String

Example

```
String articleId = 'Insert article ID';
String id = KbManagement.PublishingService.editOnlineArticle (articleId, true);
```

editPublishedTranslation(articleId, language, unpublish)

Creates a draft version of the online translation for a specific language and returns the new draft primary version ID of the article. Also, unpublishes the article, if set to `true`.

Signature

```
public static String editPublishedTranslation(String articleId, String language, Boolean
unpublish)
```

Parameters

articleId
Type: String

language
Type: String

unpublish
Type: Boolean

Return Value

Type: String

Example

```
String articleId = 'Insert article ID';
String language = 'fr';
String id = KbManagement.PublishingService.editPublishedTranslation(articleId, language,
true);
```

publishArticle(articleId, flagAsNew)

Publishes an article. If *flagAsNew* is set to `true`, the article is published as a major version.

Signature

```
public static Void publishArticle(String articleId, Boolean flagAsNew)
```

Parameters

articleId
Type: String

flagAsNew
Type: Boolean

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.publishArticle(articleId, true);
```

restoreOldVersion(articleId, versionNumber)

Creates a draft article from an existing online article based on the specified archived version of the article and returns the article version ID.

Signature

```
public static String restoreOldVersion(String articleId, Integer versionNumber)
```

Parameters

articleId
Type: String

versionNumber
Type: Integer

Return Value

Type: String

Example

```
String articleId = 'Insert article ID';
String id = KbManagement.PublishingService.restoreOldVersion (articleId, 1);
```

scheduleForPublication(articleId, scheduledDate)

Schedules the article for publication as a major version. If the specified date is null, the article is published immediately.

Signature

```
public static Void scheduleForPublication(String articleId, Datetime scheduledDate)
```

Parameters

articleId
Type: String

scheduledDate
Type: Datetime

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
Datetime scheduledDate = Datetime.newInstanceGmt(2012, 12,1,13,30,0);
KbManagement.PublishingService.scheduleForPublication(articleId, scheduledDate);
```

setTranslationToIncomplete(articleVersionId)

Sets a draft translation that is ready for publication back to “in progress” status.

Signature

```
public static Void setTranslationToIncomplete(String articleVersionId)
```

Parameters

articleVersionId
Type: String

Return Value

Type: Void

Example

```
String articleVersionId = 'Insert article ID';
KbManagement.PublishingService.setTranslationToIncomplete(articleVersionId);
```

submitForTranslation(articleId, language, assigneeId, dueDate)

Submits an article for translation to the specified language. Also assigns the specified user and due date to the submittal and returns new ID of the draft translation.

Signature

```
public static String submitForTranslation(String articleId, String language, String
assigneeId, Datetime dueDate)
```

Parameters

articleId
Type: String

language
Type: String

assigneeId
Type: String

dueDate
Type: Datetime

Return Value

Type: String

Example

```
String articleId = 'Insert article ID';
String language = 'fr';
String assigneeId = 'Insert assignee ID';
Datetime dueDate = Datetime.newInstanceGmt(2012, 12,1);
```

```
String id = KbManagement.PublishingService.submitForTranslation(articleId, language,
assigneeId, dueDate);
```

LxScheduler Namespace

The `LxScheduler` namespace provides an interface and classes for integrating Salesforce Scheduler with external calendars.

The following are the classes and the interface in the `LxScheduler` namespace.

IN THIS SECTION:

GetAppointmentCandidatesInput Class
Contains information about the available service resources (appointment candidates) based on work type group and service territories.

GetAppointmentCandidatesInputBuilder Class
Contains methods to build an instance of the `lxscheduler.GetAppointmentCandidatesInput` class.

GetAppointmentSlotsInput Class
Contains information about the available appointment time slots for a resource based on given work type group and territories.

GetAppointmentSlotsInputBuilder Class
Contains methods to build an instance of the `lxscheduler.GetAppointmentSlotsInput` class.

SchedulerResources Class
Contains methods that holds the business logic to get resources availability.

SkillRequirement Class
Contains information about the set of skills that are required to complete a particular task for a work type.

SkillRequirementBuilder Class
Contains methods to build an instance of the `lxscheduler.SkillRequirement` class.

WorkType Class
Contains information about the type of work to be performed.

WorkTypeBuilder Class
Contains methods to build an instance of the `lxscheduler.WorkType` class.

ServiceResourceScheduleHandler Interface
Allows an implementing class to check external calendar events to find already booked time slots for the requested service resources. This interface is part of Salesforce Scheduler.

ServiceAppointmentRequestInfo Class
Represents the list of parameters that are passed to the ServiceResourceScheduleHandler interface. This class is implemented internally by Apex.

ServiceResourceInfo Class
Contains information about a service resource.

ServiceResourceSchedule Class
Use this class to pass results from your implemented Apex class to the ServiceResourceScheduleHandler interface methods.

UnavailableTimeslot Class

Use this class to pass the unavailable time slots to the lxscheduler.ServiceResourceSchedule class. Timezones that differ across operating hours are handled and results are always returned in UTC.

SEE ALSO:

Apex Interface Implementation Limitations and Error Codes

GetAppointmentCandidatesInput Class

Contains information about the available service resources (appointment candidates) based on work type group and service territories.

Set up Salesforce Scheduler before making requests. This setup includes creating or configuring Service Resources, Service Territory Members, Work Type Groups, Work Types, Work Type Group Members, and Service Territory Work Types. See Set Up Salesforce Scheduler for more information.

The appointment time slots are determined based on multiple factors, such as field values, scheduled appointments, absences, Scheduler Settings, and Scheduling Policies to determine available time slots. See How Salesforce Scheduler Determines Available Time Slots for more information.

The following factors are considered for returning start time and end time of resources.

Resource Availability
Determined using service territory member, service territory, work type, and account operating hours fields.

Resource Unavailability
Determined by resource absences, existing appointments that the resource is assigned to. The resource must be marked as a required resource for the appointment with a status that isn't in closed, canceled, or completed.

Appointment Start Time Interval in the Scheduling Policy
Appointment start time interval field in the Scheduling Policy is used to determine when the appointment can start. This interval can be 5, 10, 15, 20, 30, or 60. By default, it's set to 15.

Work Type Duration
The end time is calculated as start time + duration of the work type.

Note: If asset scheduling is enabled, the response also includes asset-based candidates.

Namespace

LxScheduler

Usage

The constructor for this class can't be called directly. Create an instance of this class using the GetAppointmentCandidatesInputBuilder.build() method.

This example shows how to get a list of available appointment candidates based on `workTypeGroupId`:

```
//Build input for GetAppointmentCandidates API
   lxscheduler.GetAppointmentCandidatesInput input = new
lxscheduler.GetAppointmentCandidatesInputBuilder()
     .setWorkTypeGroupId('0VSRM0000000ABc4AM')
     .setTerritoryIds(new List<String>{'0HhRM0000000FXd0AM'})
     .setStartTime(System.now().format('yyyy-MM-dd\'T\'HH:mm:ssZ','America/New_York'))
```

```
.setEndTime(System.now().addDays(5).format('yyyy-MM-dd\'T\'HH:mm:ssZ','America/New_York'))

     .setAccountId('001RM0000053iQgYAI')
     .setSchedulingPolicyId('0VrRM00000000Bx')
     .setApiVersion(Double.valueOf('50.0'))
     .build();

   String response = lxscheduler.SchedulerResources.getAppointmentCandidates(input);
```

This example shows how to get a list of available appointment candidates based on `workType`:

```
//Build WorkType
   lxscheduler.WorkType workType = new lxscheduler.WorkTypeBuilder()
     .setId('08qRM0000000G9RYAU')
     .build();

   lxscheduler.GetAppointmentCandidatesInput input = new
lxscheduler.GetAppointmentCandidatesInputBuilder()
     .setWorkType(workType)
     .setTerritoryIds(new List<String>{'0HhRM0000000FXd0AM'})
     .setStartTime(System.now().format('yyyy-MM-dd\'T\'HH:mm:ssZ','America/New_York'))

.setEndTime(System.now().addDays(5).format('yyyy-MM-dd\'T\'HH:mm:ssZ','America/New_York'))

     .setAccountId('001RM0000053iQgYAI')
     .setSchedulingPolicyId('0VrRM00000000Bx')
     .setApiVersion(Double.valueOf('50.0'))
     .build();

   String response = lxscheduler.SchedulerResources.getAppointmentCandidates(input);
```

This example shows how to get a list of available candidate appointments based on `durationInMinutes` and without the `workTypeGroupId` or `workType` fields:

Important: If you're using shifts, you must specify the `workTypeGroupId` or `workType` field.

```
//Build SkillRequirement
   lxscheduler.SkillRequirement skillReq = new lxscheduler.SkillRequirementBuilder()
     .setSkillId('0C5RM0000004EZS0A2')
     .setSkillLevel(90)
     .build();

//Build WorkType
   lxscheduler.WorkType workType = new lxscheduler.WorkTypeBuilder()
     .setDurationInMinutes(15)
     .setBlockTimeBeforeAppointmentInMinutes(5)
     .setBlockTimeAfterAppointmentInMinutes(5)
     .setTimeFrameStartInMinutes(10080)
     .setTimeFrameEndInMinutes(40320)
     .setOperatingHoursId('0OHRM0000000FmG4AU')
     .setSkillRequirements(new List<lxscheduler.SkillRequirement>{skillReq})
     .build();

   lxscheduler.GetAppointmentCandidatesInput input = new
```

```
lxscheduler.GetAppointmentCandidatesInputBuilder()
     .setWorkType(workType)
     .setTerritoryIds(new List<String>{'0HhRM0000000FXd0AM'})
     .setSchedulingPolicyId('0VrRM00000000Bx')
     .setApiVersion(Double.valueOf('50.0'))
     .build();

   String response = lxscheduler.SchedulerResources.getAppointmentCandidates(input);
```

This example shows a sample response of a list of available candidates:

```
[
   {
      "startTime": "2021-02-16T16:15:00.000+0000",
      "endTime": "2021-02-16T16:16:00.000+0000",
      "resources": [
         "0Hnxx0000004C9BCAU"
      ],
      "territoryId": "0Hhxx0000004C92CAE"
   },
   {
      "startTime": "2021-02-16T16:30:00.000+0000",
      "endTime": "2021-02-16T16:31:00.000+0000",
      "resources": [
        "0Hnxx0000004C9BCAU"
      ],
      "territoryId": "0Hhxx0000004C92CAE"
   },
]
```

GetAppointmentCandidatesInputBuilder Class

Contains methods to build an instance of the `lxscheduler.GetAppointmentCandidatesInput` class.

A Builder object is obtained by invoking one of the `GetAppointmentCandidatesInputBuilder` methods defined by the `GetAppointmentCandidatesInput` class.

Namespace

LxScheduler

IN THIS SECTION:

GetAppointmentCandidatesInputBuilder Methods

GetAppointmentCandidatesInputBuilder Methods

The following are methods for `GetAppointmentCandidatesInputBuilder`.

IN THIS SECTION:

build()
Returns an instance of the `lxscheduler.GetAppointmentCandidatesInput` object.

setAccountId(accountId)
Sets the ID of the associated account for which you want to create the appointments.

setAllowConcurrent(allowConcurrent)
Allows the scheduling of concurrent appointments.

setApiVersion(apiVersion)
Sets the API version of the business logic for the `getAppointmentCandidates` method.

setCorrelationId(correlationId)
Sets the correlation ID.

setEndTime(endTime)
Sets the scheduling end time.

setEngagementChannelTypeIds(engagementChannelTypeIds)
Sets an engagement channel type.

setFilterByResources(filterByResources)
Enables filtering resources using a comma-separated list of service resource IDs.

setResourceLimitApptDistribution(resourceLimitApptDistribution)
Sets the number of service resources to show during appointment scheduling.

setSchedulingPolicyId(schedulingPolicyId)
Sets the ID of the AppointmentSchedulingPolicy object.

setStartTime(startTime)
Sets the scheduling start time to the specified time.

setTerritoryIds(territoryIds)
Sets the service territory IDs.

setWorkType(workType)
Sets the type of work to be performed.

setWorkTypeGroupId(workTypeGroupId)
Sets the ID of the work type group.

`build()`

Returns an instance of the `lxscheduler.GetAppointmentCandidatesInput` object.

Signature

```
public lxscheduler.GetAppointmentCandidatesInput build()
```

Return Value

Type: lxscheduler.GetAppointmentCandidatesInput

`setAccountId(accountId)`

Sets the ID of the associated account for which you want to create the appointments.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setAccountId(String accountId)
```

Parameters

accountId
Type: String

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

`setAllowConcurrent(allowConcurrent)`

Allows the scheduling of concurrent appointments.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setAllowConcurrent(Boolean
allowConcurrent)
```

Parameters

allowConcurrent
Type: Boolean

If true, allows scheduling of concurrent appointments in a time slot. The default is false.

Available in API version 47.0 and later.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

`setApiVersion(apiVersion)`

Sets the API version of the business logic for the `getAppointmentCandidates` method.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setApiVersion(Double apiVersion)
```

Parameters

apiVersion
Type: Double

Usage

The specified parameter must use the correct API version. For example, if API version is set to 45.0 and `filterByResources` is set (which is available in API version 51.0 and later), then this field is ignored. If no API version or incorrect API version is passed in the request body, by default the latest version is used.

Note: The API is available since version 45.0.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

`setCorrelationId(correlationId)`

Sets the correlation ID.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setCorrelationId(String
correlationId)
```

Parameters

`correlationId`
Type: String

ID to pass custom information to the `ServiceResourceScheduleHandler` Apex interface. For example, you can use the correlation ID to identify the app, website, or any other external system that calls this Apex interface implementation. If you don't pass a custom value, a randomly generated identifier is passed. Available in API version 53.0 and later.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

`setEndTime(endTime)`

Sets the scheduling end time.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setEndTime(String endTime)
```

Parameters

`endTime`
Type: String

The latest time that a time slot can end (inclusive).

Note: If end time is not specified, it defaults to 31 days.

Usage

The specified string should use the standard date format "['yyyy-MM-dd\'T\'HH:mm:ssZ']" in the local time zone. Defaults to the user's time zone.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

`setEngagementChannelTypeIds(engagementChannelTypeIds)`

Sets an engagement channel type.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder
setEngagementChannelTypeIds(List<String> engagementChannelTypeIds)
```

Parameters

`engagementChannelTypeIds`
Type: List<String>

The ID of the engagement channel type record. The availability of service resources is filtered based on the engagement channel type selected. This field is available in API version 56.0 and later.

Note: This field supports only one engagement channel type ID.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

Usage

You can use engagement channel types only in these cases:

- The **Schedule Appointments Using Engagement Channels** setting is enabled in Salesforce Scheduler Settings in your Salesforce org.
- Shifts are defined in the scheduling policy. For more information on setting up shifts in scheduling policy, see Define Shift Rules in Scheduling Policy.

  Note: Engagement channel types are not supported with operating-hours rules in the scheduling policy.

`setFilterByResources(filterByResources)`

Enables filtering resources using a comma-separated list of service resource IDs.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setFilterByResources(List<String>
filterByResources)
```

Parameters

filterByResources
Type: List<String>

Gets only eligible resources that are both in the list and in the selected service territory sorted by the order in which the resource IDs are passed. This field is available in API version 51.0 and later.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

setResourceLimitApptDistribution(resourceLimitApptDistribution)

Sets the number of service resources to show during appointment scheduling.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder
setResourceLimitApptDistribution(Integer resourceLimitApptDistribution)
```

Parameters

resourceLimitApptDistribution
Type: Integer

Specify the maximum number of service resources that you want to show during appointment scheduling when appointment distribution is enabled. Available in API version 53.0 and later.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

setSchedulingPolicyId(schedulingPolicyId)

Sets the ID of the AppointmentSchedulingPolicy object.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setSchedulingPolicyId(String
schedulingPolicyId)
```

Parameters

schedulingPolicyId
Type: String

The ID of the `AppointmentSchedulingPolicy` object. If no scheduling policy is passed in the request body, the default configurations are used.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

`setStartTime(startTime)`

Sets the scheduling start time to the specified time.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setStartTime(String startTime)
```

Parameters

`startTime`
Type: String

The earliest time that a time slot can begin (inclusive). You can also use a time from the past.

Usage

The specified string should use the standard date format "['yyyy-MM-dd\'T\'HH:mm:ssZ']" in the local time zone. Defaults to the user's time zone.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

`setTerritoryIds(territoryIds)`

Sets the service territory IDs.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setTerritoryIds(List<String>
territoryIds)
```

Parameters

`territoryIds`
Type: List<String>

List of service territory IDs, where the work that is being requested is performed. This is a required field.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

`setWorkType(workType)`

Sets the type of work to be performed.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setWorkType(lxscheduler.WorkType
workType)
```

Parameters

workType
Type: lxscheduler.WorkType

This method takes input as an instance of the `lxscheduler.WorkType` class. Build the instance of the input class using the `lxscheduler.WorkTypeBuilder` class.

Required if *workTypeGroupId* is not given. If id of the *workType* is given, the rest of *workType* fields are optional.

Usage

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

`setWorkTypeGroupId(workTypeGroupId)`

Sets the ID of the work type group.

Signature

```
public lxscheduler.GetAppointmentCandidatesInputBuilder setWorkTypeGroupId(String
workTypeGroupId)
```

Parameters

workTypeGroupId
Type: String

The ID of the work type group containing the work types that are being performed. Required if *workType* is not given. If *workType* is given, then you must provide either *id* or *durationInMinutes*, but not both.

Return Value

Type: LxScheduler.GetAppointmentCandidatesInputBuilder

GetAppointmentSlotsInput Class

Contains information about the available appointment time slots for a resource based on given work type group and territories.

The appointment time slots are determined based on your Salesforce Scheduler data model configurations. Here are some prerequisites that you can consider while setting up data.

- Set up Salesforce Scheduler before making your requests. The setup includes creating or configuring Service Resources, Service Territory Members, Work Type Groups, Work Types, Work Type Group Members, and Service Territory Work Types. See Manage Business Information in Salesforce Scheduler for more information.
- Configure a work type mapped for each territory in the request body via Service Territory Work Type. Map the same work type to the work type group, via work type group member.

The following factors affect how time slots are calculated and returned.

- Timezones that differ across operating hours are handled and results are always returned in UTC.
- The resource must be marked as a required resource on the assigned resource object.

- The resource is considered unavailable If the status categories of the resource assigned to service appointments are other than `Canceled`, `Cannot Complete`, and `Completed`.
- Resource Absences of all types are considered unavailable from start to end.
- The following fields of Work Type records, if configured, are used to fine-tune time slot requirements. For more information, see Create Work Types in Salesforce Scheduler.

Parameter	Description
`Timeframe Start`	Time slots sooner than `current time + Timeframe Start` aren't returned.
`Timeframe End`	Time slots later than `current time + Timeframe End` aren't returned.
`Block Time Before Appointment`	The time period before the appointment is considered as unavailable.
`Block Time After Appointment`	The time period after the appointment is considered as unavailable.
`Operating Hours`	The overlap of all operating hours from the account, work type, service territory, and service territory member are considered while determining time slots. For more information, see Set Up Operating Hours in Salesforce Scheduler.

- Only the time slots within the period of 31 days from the start date are returned.
- Salesforce Scheduler uses multiple factors, such as field values, scheduled appointments, absences, Scheduler Settings, and Scheduling Policies to determine available time slots, including the earliest and latest appointment slots. See How Does Salesforce Scheduler Determine Available Time Slots.

> Note: If asset scheduling is enabled, you can provide an asset-based service resource in `requiredResourceIds` to retrieve available timeslots for the asset resource.

Namespace

LxScheduler

Usage

The constructor for this class can't be called directly. Create an instance of this class using the GetAppointmentSlotsInputBuilder.build() method.

This example shows how to get a list of available time slots based on `workTypeGroupId`:

```
//Build input for GetAppointmentSlots API
   lxscheduler.GetAppointmentSlotsInput input = new
lxscheduler.GetAppointmentSlotsInputBuilder()
      .setWorkTypeGroupId('0VSxx0000004C92GAE')
      .setTerritoryIds(new List<String>{'0Hhxx0000004C92CAE'})
      .setStartTime(System.now().format('yyyy-MM-dd\'T\'HH:mm:ssZ'))
      .setEndTime(System.now().addDays(1).format('yyyy-MM-dd\'T\'HH:mm:ssZ'))
      .setAccountId('001xx000003GYK0AAO')
      .setRequiredResourceIds(new List<String>{'0Hnxx0000004C92CAE'})
      .setSchedulingPolicyId('0Vrxx0000004CAe')
      .setApiVersion(Double.valueOf('48.0'))
```

```
      .build();

String response = lxscheduler.SchedulerResources.getAppointmentSlots(input);
```

This example shows how to get a list of available time slots based on `workType`:

```
//Build WorkType
   lxscheduler.WorkType workType = new lxscheduler.WorkTypeBuilder()
      .setId('08qxx0000004C92AAE')
      .build();

   lxscheduler.GetAppointmentSlotsInput input = new
lxscheduler.GetAppointmentSlotsInputBuilder()
      .setWorkType(workType)
      .setTerritoryIds(new List<String>{'0Hhxx0000004C92CAE'})
      .setStartTime(System.now().format('yyyy-MM-dd\'T\'HH:mm:ssZ'))
      .setEndTime(System.now().addDays(1).format('yyyy-MM-dd\'T\'HH:mm:ssZ'))
      .setAccountId('001xx000003GYK0AAO')
      .setRequiredResourceIds(new List<String>{'0Hnxx0000004C92CAE'})
      .setSchedulingPolicyId('0Vrxx0000004CAe')
      .setApiVersion(Double.valueOf('48.0'))
      .build();

String response = lxscheduler.SchedulerResources.getAppointmentSlots(input);
```

This example shows how to get a list of available time slots based on `durationInMinutes` and without `workTypeGroupId` or `workType` fields:

```
//Build WorkType
   lxscheduler.WorkType workType = new lxscheduler.WorkTypeBuilder()
      .setDurationInMinutes(60)
      .build();

   lxscheduler.GetAppointmentSlotsInput input = new
lxscheduler.GetAppointmentSlotsInputBuilder()
      .setWorkType(workType)
      .setTerritoryIds(new List<String>{'0Hhxx0000004C92CAE'})
      .setRequiredResourceIds(new List<String>{'0Hnxx0000004C92CAE'})
      .setApiVersion(Double.valueOf('48.0'))
      .build();

   String response = lxscheduler.SchedulerResources.getAppointmentSlots(input);
```

This example shows a sample response of a list of available time slots:

```
[
   {
     "territoryId": "0Hhxx0000004C92CAE",
     "startTime": "2021-02-10T16:00:00.000+0000",
     "endTime": "2021-02-10T16:15:00.000+0000",
     "remainingAppointments": 1
   },
   {
     "territoryId": "0Hhxx0000004C92CAE",
     "startTime": "2021-02-10T16:15:00.000+0000",
     "endTime": "2021-02-10T16:30:00.000+0000",
```

```
      "remainingAppointments": 1
    },
]
```

GetAppointmentSlotsInputBuilder Class

Contains methods to build an instance of the `lxscheduler.GetAppointmentSlotsInput` class.

A Builder object is obtained by invoking one of the `GetAppointmentSlotsInputBuilder` methods defined by the `GetAppointmentSlotsInput` class.

Namespace

LxScheduler

IN THIS SECTION:

GetAppointmentSlotsInputBuilder Methods

GetAppointmentSlotsInputBuilder Methods

The following are methods for `GetAppointmentSlotsInputBuilder`.

IN THIS SECTION:

build()
Returns an instance of the `lxscheduler.GetAppointmentSlotsInput` object.

setAccountId(accountId)
Sets the ID of the associated account for which you want to create appointments.

setAllowConcurrentScheduling(allowConcurrentScheduling)
Allows the scheduling of concurrent appointments.

setApiVersion(apiVersion)
Sets the API version of the business logic for the `getAppointmentSlots` method.

setCorrelationId(correlationId)
Sets the correlation ID.

setEndTime(endTime)
Sets the scheduling end time.

setEngagementChannelTypeIds(engagementChannelTypeIds)
Sets an engagement channel type.

setPrimaryResourceId(primaryResourceId)
Sets the ID of the primary resource.

setRequiredResourceIds(requiredResourceIds)
Sets the resource IDs.

setSchedulingPolicyId(schedulingPolicyId)
Sets the ID of the `AppointmentSchedulingPolicy` object.

setStartTime(startTime)
Sets the scheduling start time.

setTerritoryIds(territoryIds)
Sets the IDs of service territories.

setWorkType(workType)
Sets the type of work to be performed.

setWorkTypeGroupId(workTypeGroupId)
Sets the ID of the work type group.

build()

Returns an instance of the `lxscheduler.GetAppointmentSlotsInput` object.

Signature

```
public lxscheduler.GetAppointmentSlotsInput build()
```

Return Value

Type: lxscheduler.GetAppointmentSlotsInput

setAccountId(accountId)

Sets the ID of the associated account for which you want to create appointments.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setAccountId(String accountId)
```

Parameters

accountId
Type: String

The ID of the associated account.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

setAllowConcurrentScheduling(allowConcurrentScheduling)

Allows the scheduling of concurrent appointments.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setAllowConcurrentScheduling(Boolean
allowConcurrentScheduling)
```

Parameters

allowConcurrentScheduling
Type: Boolean

If true, allows scheduling of concurrent appointments in a time slot. If false, concurrent appointments are not allowed. The default is false. Available in API version 47.0 and later.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

setApiVersion(apiVersion)

Sets the API version of the business logic for the `getAppointmentSlots` method.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setApiVersion(Double apiVersion)
```

Parameters

apiVersion
Type: Double

Usage

The specified parameter must use the correct API version. For example, if API version is set to 45.0 and *primaryResourceId* is set (which is available in API version 48.0 and later), then this field is ignored. If no API version or incorrect API version is passed in the request body, by default the latest version is used.

Note: The API is available since version 45.0.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

setCorrelationId(correlationId)

Sets the correlation ID.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setCorrelationId(String correlationId)
```

Parameters

correlationId
Type: String

ID to pass custom information to the `ServiceResourceScheduleHandler` Apex interface. For example, you can use the correlation ID to identify the app, website, or any other external system that calls this Apex interface implementation. If you don't pass a custom value, a randomly generated identifier is passed. Available in API version 53.0 and later.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

`setEndTime(endTime)`

Sets the scheduling end time.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setEndTime(String endTime)
```

Parameters

`endTime`
Type: String

The latest time that a time slot can end (inclusive). If end time is not specified, it defaults to 31 days.

Usage

The specified string should use the standard date format "['yyyy-MM-dd\'T\'HH:mm:ssZ']" in the local time zone. Defaults to the user's time zone.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

`setEngagementChannelTypeIds(engagementChannelTypeIds)`

Sets an engagement channel type.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder
setEngagementChannelTypeIds(List<String> engagementChannelTypeIds)
```

Parameters

`engagementChannelTypeIds`
Type: List<String>

The ID of the engagement channel type record. The availability of time slots is filtered based on the engagement channel type selected. This field is available in API version 56.0 and later.

Note: This field supports only one engagement channel type ID.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

Usage

You can use engagement channel types only in these cases:

- The **Schedule Appointments Using Engagement Channels** setting is enabled in Salesforce Scheduler Settings in your Salesforce org.
- Shifts are defined in the scheduling policy. For more information on setting up shifts in scheduling policy, see Define Shift Rules in Scheduling Policy.

  Note: Engagement channel types are not supported with operating-hours rules in the scheduling policy.

`setPrimaryResourceId(primaryResourceId)`

Sets the ID of the primary resource.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setPrimaryResourceId(String
primaryResourceId)
```

Parameters

`primaryResourceId`
Type: String

The ID of the primary resource in multi-resource scheduling. Required only when multi-resource scheduling is enabled. Available in API version 48.0 and later.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

`setRequiredResourceIds(requiredResourceIds)`

Sets the resource IDs.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setRequiredResourceIds(List<String>
requiredResourceIds)
```

Parameters

`requiredResourceIds`
Type: List<String>

List of resource IDs that must be available during the time slot. This is a required field.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

`setSchedulingPolicyId(schedulingPolicyId)`

Sets the ID of the `AppointmentSchedulingPolicy` object.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setSchedulingPolicyId(String schedulingPolicyId)
```

Parameters

`schedulingPolicyId`
Type: String

If no scheduling policy is passed in the request body, the default configurations are used.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

`setStartTime(startTime)`

Sets the scheduling start time.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setStartTime(String startTime)
```

Parameters

`startTime`
Type: String

The earliest time that a time slot can begin (inclusive). Defaults to the current time of the request, if empty.

Usage

The specified string should use the standard date format "['yyyy-MM-dd\'T\'HH:mm:ssZ']" in the local time zone. Defaults to the user's time zone.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

`setTerritoryIds(territoryIds)`

Sets the IDs of service territories.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setTerritoryIds(List<String>
territoryIds)
```

Parameters

territoryIds
Type: List<String>

List of IDs of service territories, where the work that is being requested is performed. This is a required field.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

setWorkType(workType)

Sets the type of work to be performed.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setWorkType(lxscheduler.WorkType
workType)
```

Parameters

workType
Type: lxscheduler.WorkType

This method takes input as an instance of the `lxscheduler.WorkType` class. Build the instance of the input class using the `lxscheduler.WorkTypeBuilder` class.

Required if *workTypeGroupId* is not given.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

setWorkTypeGroupId(workTypeGroupId)

Sets the ID of the work type group.

Signature

```
public lxscheduler.GetAppointmentSlotsInputBuilder setWorkTypeGroupId(String
workTypeGroupId)
```

Parameters

workTypeGroupId
Type: String

The ID of the work type group containing the work types that are being performed.

Return Value

Type: lxscheduler.GetAppointmentSlotsInputBuilder

SchedulerResources Class

Contains methods that holds the business logic to get resources availability.

Namespace

LxScheduler

Implementation Considerations

Apex implementation of the methods in the `SchedulerResources` class should adhere to Apex Governor Limits. It includes synchronous heap size limit, synchronous CPU time limit, and synchronous concurrent transactions for long running transactions. To avoid governor limits, you must tune the input by reducing the time frame, limiting number of service resources, or limiting number or territories at a time. This will reduce the overall transaction time and response size of the implementation. For more information on standard Apex Governer Limits, see Salesforce Developer Limits and Allocations Quick Reference.

Example

To get list of available service resources (appointment candidates):

```
String response = lxscheduler.SchedulerResources.getAppointmentCandidates(input);
```

To get a list of available appointment time slots for a resource:

```
String response = lxscheduler.SchedulerResources.getAppointmentSlots(input);
```

IN THIS SECTION:

SchedulerResources Methods

SchedulerResources Methods

The following are methods for `SchedulerResources`.

IN THIS SECTION:

getAppointmentCandidates(getAppointmentCandidatesInput)
Returns a list of service resources based on work type group or work type and service territories.

getAppointmentSlots(getAppointmentSlotsInput)
Returns a list of available appointment time slots for a resource based on given work type group or work type and service territories.

setAppointmentCandidatesMock(expectedResponse)
Sets a mock object when running tests for the `getAppointmentCandidates` method.

setAppointmentSlotsMock(expectedResponse)

Sets a mock object when running tests for the `getAppointmentSlots` method.

`getAppointmentCandidates(getAppointmentCandidatesInput)`

Returns a list of service resources based on work type group or work type and service territories.

Set up Salesforce Scheduler before making requests. This setup includes creating or configuring Service Resources, Service Territory Members, Work Type Groups, Work Types, Work Type Group Members, and Service Territory Work Types. See Set Up Salesforce Scheduler for more information.

The appointment time slots are determined based on multiple factors, such as field values, scheduled appointments, absences, Scheduler Settings, and Scheduling Policies to determine available time slots. See How Salesforce Scheduler Determines Available Time Slots for more information.

The following factors are considered for returning start time and end time of resources.

Resource Availability

Determined using service territory member, service territory, work type, and account operating hours fields.

Resource Unavailability

Determined by resource absences, existing appointments that the resource is assigned to. The resource must be marked as a required resource for the appointment with a status that isn't in closed, canceled, or completed.

Appointment Start Time Interval in the Scheduling Policy

Appointment start time interval field in the Scheduling Policy is used to determine when the appointment can start. This interval can be 5, 10, 15, 20, 30, or 60. By default, it's set to 15.

Work Type Duration

The end time is calculated as start time + duration of the work type.

Note: If asset scheduling is enabled, the response also includes asset-based candidates.

Signature

```
public static String getAppointmentCandidates(lxscheduler.GetAppointmentCandidatesInput
getAppointmentCandidatesInput)
```

Parameters

`getAppointmentCandidatesInput`

Type: lxscheduler.GetAppointmentCandidatesInput

This method takes input as an instance of the `lxscheduler.GetAppointmentCandidatesInput` class. Build the instance of the input class using the `lxscheduler.GetAppointmentCandidatesInputBuilder` class.

Return Value

Type: String

`getAppointmentSlots(getAppointmentSlotsInput)`

Returns a list of available appointment time slots for a resource based on given work type group or work type and service territories.

The appointment time slots are determined based on your Salesforce Scheduler data model configurations. Here are some prerequisites that you can consider while setting up data.

- Set up Salesforce Scheduler before making your requests. The setup includes creating or configuring Service Resources, Service Territory Members, Work Type Groups, Work Types, Work Type Group Members, and Service Territory Work Types. See Manage Business Information in Salesforce Scheduler for more information.
- Configure a work type mapped for each territory in the request body via Service Territory Work Type. Map the same work type to the work type group, via work type group member.

The following factors affect how time slots are calculated and returned.

- Timezones that differ across operating hours are handled and results are always returned in UTC.
- The resource must be marked as a required resource on the assigned resource object.
- The resource is considered unavailable If the status categories of the resource assigned to service appointments are other than `Canceled`, `Cannot Complete`, and `Completed`.
- Resource Absences of all types are considered unavailable from start to end.
- The following fields of Work Type records, if configured, are used to fine-tune time slot requirements. For more information, see Create Work Types in Salesforce Scheduler.

Parameter	Description
`Timeframe Start`	Time slots sooner than `current time + Timeframe Start` aren't returned.
`Timeframe End`	Time slots later than `current time + Timeframe End` aren't returned.
`Block Time Before Appointment`	The time period before the appointment is considered as unavailable.
`Block Time After Appointment`	The time period after the appointment is considered as unavailable.
`Operating Hours`	The overlap of all operating hours from the account, work type, service territory, and service territory member are considered while determining time slots. For more information, see Set Up Operating Hours in Salesforce Scheduler.

- Only the time slots within the period of 31 days from the start date are returned.
- Salesforce Scheduler uses multiple factors, such as field values, scheduled appointments, absences, Scheduler Settings, and Scheduling Policies to determine available time slots, including the earliest and latest appointment slots. See How Does Salesforce Scheduler Determine Available Time Slots.

  Note: If asset scheduling is enabled, you can provide an asset-based service resource in `requiredResourceIds` to retrieve available timeslots for the asset resource.

Signature

```
public static String getAppointmentSlots(lxscheduler.GetAppointmentSlotsInput
getAppointmentSlotsInput)
```

Parameters

`getAppointmentSlotsInput`
Type: lxscheduler.GetAppointmentSlotsInput

This method takes input as an instance of the `lxscheduler.GetAppointmentSlotsInput` class. Build the instance of the input class using the `lxscheduler.GetAppointmentSlotsInputBuilder` class.

Return Value

Type: String

setAppointmentCandidatesMock(expectedResponse)

Sets a mock object when running tests for the `getAppointmentCandidates` method.

This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
public static void setAppointmentCandidatesMock(String expectedResponse)
```

Parameters

expectedResponse
Type: String

Return Value

Type: void

This example shows a sample implementation of the `GetAppointmentCandidates` class:

```
public class AppointmentCandidateService {
   //Instance members for parsing
   public String startTime;
   public String endTime;
   public List<String> resources;
   public String territoryId;
   public static List<AppointmentCandidateService> getAppointmentCandidates(){
      //Build input for GetAppointmentCandidates API
      lxscheduler.GetAppointmentCandidatesInput input = new
lxscheduler.GetAppointmentCandidatesInputBuilder()
         .setWorkTypeGroupId('0VSRM0000000AGT4A2')
         .setTerritoryIds(new List<String>{'0HhRM0000000G8W0AU'})
        .setStartTime(System.now().format('yyyy-MM-dd\'T\'HH:mm:ssZ','America/Los_Angeles'))

.setEndTime(System.now().addDays(2).format('yyyy-MM-dd\'T\'HH:mm:ssZ','America/Los_Angeles'))

         .setSchedulingPolicyId('0VrRM00000000D0')
         .setApiVersion(Double.valueOf('50.0'))
         .build();
      List<AppointmentCandidateService> vList =
parse(lxscheduler.SchedulerResources.getAppointmentCandidates(input));
      return vList;
   }
   private static List<AppointmentCandidateService> parse(String json) {
      return (List<AppointmentCandidateService>) System.JSON.deserialize(json,
List<AppointmentCandidateService>.class);
   }
}
```

This example shows how to set a sample mock using the `setAppointmentCandidatesMock` method:

```
@isTest
private class GetAppointmentCandidatesTest {
   static testMethod void getAppCandidatesTest() {
      String expectedResponse = '[' +
                                        '  {' +
                                       '    \"startTime\": \"2021-03-18T16:00:00.000+0000\",'
 +
                                        '    \"endTime\": \"2021-03-18T17:00:00.000+0000\",'
+
                                        '    \"resources\": [' +
                                        '      \"0HnRM0000000Fxv0AE\"' +
                                        '    ],' +
                                        '    \"territoryId\": \"0HhRM0000000G8W0AU\"' +
                                        '  },' +
                                        '  {' +
                                       '    \"startTime\": \"2021-03-18T19:00:00.000+0000\",'
 +
                                        '    \"endTime\": \"2021-03-18T20:00:00.000+0000\",'
+
                                        '    \"resources\": [' +
                                        '      \"0HnRM0000000Fxv0AE\"' +
                                        '    ],' +
                                        '    \"territoryId\": \"0HhRM0000000G8W0AU\"' +
                                        '  }' +
                                        ']';
      lxscheduler.SchedulerResources.setAppointmentCandidatesMock(expectedResponse);

      Test.startTest();
         List<AppointmentCandidateService> candidateList =
AppointmentCandidateService.getAppointmentCandidates();
         System.assertEquals(2, candidateList.size(), 'Should return only 2 records!');
      Test.stopTest();
   }
}
```

`setAppointmentSlotsMock(expectedResponse)`

Sets a mock object when running tests for the `getAppointmentSlots` method.

This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
public static void setAppointmentSlotsMock(String expectedResponse)
```

Parameters

`expectedResponse`
Type: String

Return Value

Type: void

SkillRequirement Class

Contains information about the set of skills that are required to complete a particular task for a work type.

Namespace

LxScheduler

Usage

The constructor for this class can't be called directly. Create an instance of this class using the SkillRequirementBuilder.build() method.

SkillRequirementBuilder Class

Contains methods to build an instance of the `lxscheduler.SkillRequirement` class.

A Builder object is obtained by invoking one of the `SkillRequirementBuilder` methods defined by the `SkillRequirement` class.

Namespace

LxScheduler

IN THIS SECTION:

SkillRequirementBuilder Methods

SkillRequirementBuilder Methods

The following are methods for `SkillRequirementBuilder`.

IN THIS SECTION:

build()
Returns an instance of the `lxscheduler.SkillRequirement` object.

setSkillId(skillId)
Sets the skill that is required to complete a particular task for a work type. This is a required field.

setSkillLevel(skillLevel)
Sets the level of the skill that is required to complete a particular task for a work type

`build()`

Returns an instance of the `lxscheduler.SkillRequirement` object.

Signature

```
public lxscheduler.SkillRequirement build()
```

Return Value

Type: lxscheduler.SkillRequirement

`setSkillId(skillId)`

Sets the skill that is required to complete a particular task for a work type. This is a required field.

Signature

```
public lxscheduler.SkillRequirementBuilder setSkillId(String skillId)
```

Parameters

`skillId`
Type: String

Return Value

Type: lxscheduler.SkillRequirementBuilder

`setSkillLevel(skillLevel)`

Sets the level of the skill that is required to complete a particular task for a work type

Signature

```
public lxscheduler.SkillRequirementBuilder setSkillLevel(Double skillLevel)
```

Parameters

`skillLevel`
Type: Double

The skill levels can range from zero to 99.99. Depending on your business needs, you might want the skill level to reflect years of experience, certification levels, or license classes.

Return Value

Type: lxscheduler.SkillRequirementBuilder

WorkType Class

Contains information about the type of work to be performed.

Namespace

LxScheduler

Usage

The constructor for this class can't be called directly. Create an instance of this class using the WorkTypeBuilder.build() method.

WorkTypeBuilder Class

Contains methods to build an instance of the `lxscheduler.WorkType` class.

A Builder object is obtained by invoking one of the `WorkTypeBuilder` methods defined by the `WorkType` class.

Namespace

LxScheduler

IN THIS SECTION:

WorkTypeBuilder Methods

WorkTypeBuilder Methods

The following are methods for `WorkTypeBuilder`.

IN THIS SECTION:

build()
Returns an instance of the `lxscheduler.WorkType` object.

setBlockTimeAfterAppointmentInMinutes(blockTimeAfterAppointmentInMinutes)
Sets the time period, in minutes.

setBlockTimeBeforeAppointmentInMinutes(blockTimeBeforeAppointmentInMinutes)
Sets the time period, in minutes.

setDurationInMinutes(durationInMinutes)
Sets the event length.

setId(id)
Sets the ID of the work type to the specified ID.

setOperatingHoursId(operatingHoursId)
Sets the overlap of operating hours.

setSkillRequirements(skillRequirements)
Sets the skills that are required to complete a particular task for a work type.

setTimeFrameEndInMinutes(timeFrameEndInMinutes)
Sets the end of the timeframe.

setTimeFrameStartInMinutes(timeFrameStartInMinutes)
Sets the beginning of the timeframe.

build()

Returns an instance of the `lxscheduler.WorkType` object.

Signature

```
public lxscheduler.WorkType build()
```

Return Value

Type: lxscheduler.WorkType

setBlockTimeAfterAppointmentInMinutes(blockTimeAfterAppointmentInMinutes)

Sets the time period, in minutes.

Signature

```
public lxscheduler.WorkTypeBuilder setBlockTimeAfterAppointmentInMinutes(Integer
blockTimeAfterAppointmentInMinutes)
```

Parameters

blockTimeAfterAppointmentInMinutes
Type: Integer

The time period after the appointment is considered unavailable.

Return Value

Type: lxscheduler.WorkTypeBuilder

setBlockTimeBeforeAppointmentInMinutes(blockTimeBeforeAppointmentInMinutes)

Sets the time period, in minutes.

Signature

```
public lxscheduler.WorkTypeBuilder setBlockTimeBeforeAppointmentInMinutes(Integer
blockTimeBeforeAppointmentInMinutes)
```

Parameters

blockTimeBeforeAppointmentInMinutes
Type: Integer

The time period before the appointment is considered as unavailable.

Return Value

Type: lxscheduler.WorkTypeBuilder

`setDurationInMinutes(durationInMinutes)`

Sets the event length.

Signature

```
public lxscheduler.WorkTypeBuilder setDurationInMinutes(Integer durationInMinutes)
```

Parameters

`durationInMinutes`
Type: Integer

Contains the event length, in minutes. Required if *`id`* is not given.

Return Value

Type: lxscheduler.WorkTypeBuilder

`setId(id)`

Sets the ID of the work type to the specified ID.

Signature

```
public lxscheduler.WorkTypeBuilder setId(String id)
```

Parameters

`id`
Type: String

The ID of the work type. Required if you're using shifts or if *`durationInMinutes`* is not given.

Return Value

Type: lxscheduler.WorkTypeBuilder

`setOperatingHoursId(operatingHoursId)`

Sets the overlap of operating hours.

Signature

```
public lxscheduler.WorkTypeBuilder setOperatingHoursId(String operatingHoursId)
```

Parameters

`operatingHoursId`
Type: String

The overlap of all operating hours from the account, work type, service territory, and service territory member are considered while determining time slots.

Return Value

Type: lxscheduler.WorkTypeBuilder

`setSkillRequirements(skillRequirements)`

Sets the skills that are required to complete a particular task for a work type.

Signature

```
public lxscheduler.WorkTypeBuilder
setSkillRequirements(List<lxscheduler.SkillRequirement> skillRequirements)
```

Parameters

`skillRequirements`
Type: List<lxscheduler.SkillRequirement>

This method takes input as an instance of the `lxscheduler.SkillRequirement` class. Build the instance of the input class using the `lxscheduler.SkillRequirementBuilder` class.

Return Value

Type: lxscheduler.WorkTypeBuilder

`setTimeFrameEndInMinutes(timeFrameEndInMinutes)`

Sets the end of the timeframe.

Signature

```
public lxscheduler.WorkTypeBuilder setTimeFrameEndInMinutes(Integer
timeFrameEndInMinutes)
```

Parameters

`timeFrameEndInMinutes`
Type: Integer

Return Value

Type: lxscheduler.WorkTypeBuilder

`setTimeFrameStartInMinutes(timeFrameStartInMinutes)`

Sets the beginning of the timeframe.

Signature

```
public lxscheduler.WorkTypeBuilder setTimeFrameStartInMinutes(Integer
timeFrameStartInMinutes)
```

Parameters

timeFrameStartInMinutes
Type: Integer

Return Value

Type: lxscheduler.WorkTypeBuilder

ServiceResourceScheduleHandler Interface

Allows an implementing class to check external calendar events to find already booked time slots for the requested service resources. This interface is part of Salesforce Scheduler.

Namespace

LxScheduler

Usage

The `lxscheduler.ServiceResourceScheduleHandler` interface is called by Salesforce Scheduler APIs.

To implement this interface, you must first declare a class with the `implements` keyword as follows:

```
public class ServiceResourceScheduleHandlerImpl implements
LxScheduler.ServiceResourceScheduleHandler{}
```

Next, your class must provide an implementation for the following method:

```
public static List<LxScheduler.ServiceResourceSchedule>
getUnavailableTimeslots(LxScheduler.ServiceAppointmentRequestInfo requestInfo){
      //Your code here
}
```

The implemented method must be declared as `global` or `public`.

IN THIS SECTION:

ServiceResourceScheduleHandler Methods

ServiceResourceScheduleHandler Example Implementation

ServiceResourceScheduleHandler Methods

The following are methods for `ServiceResourceScheduleHandler`.

IN THIS SECTION:

getUnavailableTimeslots(var1)

Passes the required information to get unavailable time slots from an external system. The implementation of this method returns the `lxscheduler.ServiceResourceSchedule` class.

`getUnavailableTimeslots(var1)`

Passes the required information to get unavailable time slots from an external system. The implementation of this method returns the `lxscheduler.ServiceResourceSchedule` class.

Signature

```
public List<lxscheduler.ServiceResourceSchedule>
getUnavailableTimeslots(lxscheduler.ServiceAppointmentRequestInfo var1)
```

Parameters

var1

Type: lxscheduler.ServiceAppointmentRequestInfo

Represents the list of parameters that are passed to the ServiceResourceScheduleHandler interface.

Return Value

Type: List<lxscheduler.ServiceResourceSchedule>

ServiceResourceScheduleHandler Example Implementation

This is an example implementation of the `lxscheduler.ServiceResourceScheduleHandler` interface.

```
/**
 * Implement interface lxscheduler.ServiceResourceScheduleHandler
 * This class is called when fetching service resources and time slots through Salesforce
 Scheduler API.*/
   Public class ServiceResourceScheduleHandlerImpl implements
lxscheduler.ServiceResourceScheduleHandler{

    // The main interface method.
    public static List<lxscheduler.ServiceResourceSchedule>
getUnavailableTimeslots(lxscheduler.ServiceAppointmentRequestInfo requestInfo){
        //Request info values.
        List<lxscheduler.ServiceResourceInfo>
serviceResources=requestInfo.getServiceResources();
        DateTime startDate=requestInfo.getStartDate();
        DateTime endDate=requestInfo.getEndDate();

        List<lxscheduler.ServiceResourceSchedule> resourceUnavailability = new
List<lxscheduler.ServiceResourceSchedule>();
        Set<lxscheduler.UnavailableTimeslot> unavailabilityIntervals = new
Set<lxscheduler.UnavailableTimeslot>();

        //This is a dummy response. Implement your own business logic to connect to your
internal or external systems.
        for (Integer i = 0; i < 5; i++) {
             //Set the unavailability intervals of a service resource.
            unavailabilityIntervals.add(new
lxscheduler.UnavailableTimeslot(startDate.addMinutes(15*i),startDate.addMinutes(15*(i+1))));
```

```
        }

       for (lxscheduler.ServiceResourceInfo ServiceResource:serviceResources) {
            //Set the unavailability of Service resource.
        resourceUnavailability.add(new
lxscheduler.ServiceResourceSchedule(serviceResource.getServiceResourceId(),unavailabilityIntervals));

       }

        return resourceUnavailability;
    }
}
```

This example shows how to set a sample test mock using the `lxscheduler.ServiceResourceScheduleHandler` interface.

```
@isTest
private class ServiceResourceScheduleHandlerImplTest {
   static testMethod void getUnavailableTimeslotsTest() {

      //Initializing the test execution with mock values. Change it according to the
implementation.
      //In case of non-test execution, the lxscheduler.ServiceAppointmentRequestInfo
instance will automatically initialize.

      //Mock values for lxscheduler.ServiceResourceInfo
      String userId = '005D2000000I1N6IAK';
      String userName = 'someuser@example.com';
      String email = 'someuser@example.com';
      String serviceResourceId = '0HnD20000004C9bKAE';
      List<String> territoryIds = new List<String>();
      String resourceType = 'T';
      lxscheduler.ServiceResourceInfo serviceResInfo = new
lxscheduler.ServiceResourceInfo(userId, userName, email,
                                                      serviceResourceId, territoryIds,
resourceType);

      //Mock values for lxscheduler.ServiceAppointmentRequestInfo
      DateTime startDate = System.now();
      DateTime endDate = System.now();
      List<lxscheduler.ServiceResourceInfo> serviceResources = new
List<lxscheduler.ServiceResourceInfo>();
      serviceResources.add(serviceResInfo);
      String schedulingPolicyId = '0VrD20000004C9S';
      String workTypeGroupId = '0VSD20000004C93OAE';
      String accountId = '001D2000002pkXwIAI';
      String primaryResourceId = '0HnD20000004C9bKAE';
      String workTypeId = '08qD20000004C9XIAU';
      String correlationId = 'SOME_ID';

      lxscheduler.ServiceAppointmentRequestInfo mockRequestInfo = new
lxscheduler.ServiceAppointmentRequestInfo(startDate, endDate, serviceResources,
                                                                  schedulingPolicyId,
workTypeGroupId, accountId,
```

```
                                                                    primaryResourceId,
workTypeId, correlationId);

      ServiceResourceScheduleHandlerImpl.getUnavailableTimeslots(mockRequestInfo);
   }
}
```

ServiceAppointmentRequestInfo Class

Represents the list of parameters that are passed to the ServiceResourceScheduleHandler interface. This class is implemented internally by Apex.

Namespace

LxScheduler

IN THIS SECTION:

ServiceAppointmentRequestInfo Constructors

ServiceAppointmentRequestInfo Methods

ServiceAppointmentRequestInfo Constructors

The following are constructors for `ServiceAppointmentRequestInfo`.

IN THIS SECTION:

ServiceAppointmentRequestInfo(startDate, endDate, ServiceResources, SchedulingPolicyId, workTypeGroupId, accountId, primaryResourceId, workTypeId, correlationId)

Creates a new instance of the `lxscheduler.ServiceAppointmentRequestInfo` class using the specified start date, end date, service resources, scheduling policy, work type group, account ID, primary resource, work type, and correlation.

`ServiceAppointmentRequestInfo(startDate, endDate, ServiceResources, SchedulingPolicyId, workTypeGroupId, accountId, primaryResourceId, workTypeId, correlationId)`

Creates a new instance of the `lxscheduler.ServiceAppointmentRequestInfo` class using the specified start date, end date, service resources, scheduling policy, work type group, account ID, primary resource, work type, and correlation.

Signature

```
public ServiceAppointmentRequestInfo(Datetime startDate, Datetime endDate,
List<lxscheduler.ServiceResourceInfo> ServiceResources, String SchedulingPolicyId,
String workTypeGroupId, String accountId, String primaryResourceId, String workTypeId,
String correlationId)
```

Parameters

startDate
Type: Datetime

The start date and time for which unavailable time slots are requested.

endDate
Type: Datetime

The end date and time for which unavailable time slots are requested.

ServiceResources
Type: List<lxscheduler.ServiceResourceInfo>

The list of requested service resources for the unavailable time slots.

SchedulingPolicyId
Type: String

The ID of the scheduling policy .

workTypeGroupId
Type: String

The work type group ID.

accountId
Type: String

The account ID of an existing user.

primaryResourceId
Type: String

The ID of the primary service resource.

workTypeId
Type: String

The work type ID.

correlationId
Type: String

A unique identifier for a service appointment request.

ServiceAppointmentRequestInfo Methods

The following are methods for `ServiceAppointmentRequestInfo`.

IN THIS SECTION:

getAccountId()
Returns the account ID of the customer if the API request contains one.

getCorrelationId()
Returns a unique identifier for a request.

getEndDate()
Returns the end date and time for which unavailable time slots are requested.

getPrimaryResourceId()
Returns the ID of the primary service resource.

getSchedulingPolicyId()
Returns the ID of the scheduling policy that the API request contains.

getServiceResources()
Returns the list of requested service resources for the unavailable time slots.

getStartDate()
Returns the start date and time for which unavailable time slots are requested.

getWorkTypeGroupId()
Returns the work type group ID if the API request contains one.

getWorkTypeId()
Returns the work type ID if the API request contains one.

`getAccountId()`

Returns the account ID of the customer if the API request contains one.

Signature

```
public String getAccountId()
```

Return Value

Type: String

`getCorrelationId()`

Returns a unique identifier for a request.

Signature

```
public String getCorrelationId()
```

Return Value

Type: String

`getEndDate()`

Returns the end date and time for which unavailable time slots are requested.

Signature

```
public Datetime getEndDate()
```

Return Value

Type: Datetime

getPrimaryResourceId()

Returns the ID of the primary service resource.

Signature

```
public String getPrimaryResourceId()
```

Return Value

Type: String

getSchedulingPolicyId()

Returns the ID of the scheduling policy that the API request contains.

Signature

```
public String getSchedulingPolicyId()
```

Return Value

Type: String

getServiceResources()

Returns the list of requested service resources for the unavailable time slots.

Signature

```
public List<lxscheduler.ServiceResourceInfo> getServiceResources()
```

Return Value

Type: List<lxscheduler.ServiceResourceInfo>

getStartDate()

Returns the start date and time for which unavailable time slots are requested.

Signature

```
public Datetime getStartDate()
```

Return Value

Type: Datetime

getWorkTypeGroupId()

Returns the work type group ID if the API request contains one.

Signature

```
public String getWorkTypeGroupId()
```

Return Value

Type: String

`getWorkTypeId()`

Returns the work type ID if the API request contains one.

Signature

```
public String getWorkTypeId()
```

Return Value

Type: String

ServiceResourceInfo Class

Contains information about a service resource.

Namespace

LxScheduler

IN THIS SECTION:

ServiceResourceInfo Constructors

ServiceResourceInfo Methods

ServiceResourceInfo Constructors

The following are constructors for `ServiceResourceInfo`.

IN THIS SECTION:

ServiceResourceInfo(userId, userName, email, serviceResourceId, territoryIds, resourceType)
Creates a new instance of the `lxscheduler.ServiceResourceInfo` class using the specified service resource details.

`ServiceResourceInfo(userId, userName, email, serviceResourceId, territoryIds, resourceType)`

Creates a new instance of the `lxscheduler.ServiceResourceInfo` class using the specified service resource details.

Signature

```
public ServiceResourceInfo(String userId, String userName, String email, String
serviceResourceId, List<String> territoryIds, String resourceType)
```

Parameters

userId
Type: String

The user ID of the service resource.

userName
Type: String

The user name of the service resource.

email
Type: String

The email ID of the service resource.

serviceResourceId
Type: String

The ID of the service resource.

territoryIds
Type: List<String>

A list of requested service territories for the service resource.

resourceType
Type: String

The type of the service resource such as Technician or Asset.

ServiceResourceInfo Methods

The following are methods for `ServiceResourceInfo`.

IN THIS SECTION:

getEmail()
Returns the email ID of the service resource.

getResourceType()
Returns the type of the service resource such as Technician or Asset.

getServiceResourceId()
Returns the ID of the service resource.

getTerritoryIds()
Returns a list of requested service territories for the service resource.

getUserId()
Returns the user ID of the service resource.

getUserName()
Returns the user name of the service resource.

getEmail()

Returns the email ID of the service resource.

Signature

```
public String getEmail()
```

Return Value

Type: String

getResourceType()

Returns the type of the service resource such as Technician or Asset.

Signature

```
public String getResourceType()
```

Return Value

Type: String

getServiceResourceId()

Returns the ID of the service resource.

Signature

```
public String getServiceResourceId()
```

Return Value

Type: String

getTerritoryIds()

Returns a list of requested service territories for the service resource.

Signature

```
public List<String> getTerritoryIds()
```

Return Value

Type: List<String>

getUserId()

Returns the user ID of the service resource.

Signature

```
public String getUserId()
```

Return Value

Type: String

`getUserName()`

Returns the user name of the service resource.

Signature

```
public String getUserName()
```

Return Value

Type: String

ServiceResourceSchedule Class

Use this class to pass results from your implemented Apex class to the ServiceResourceScheduleHandler interface methods.

Namespace

LxScheduler

IN THIS SECTION:

ServiceResourceSchedule Constructors

ServiceResourceSchedule Properties

ServiceResourceSchedule Constructors

The following are constructors for `ServiceResourceSchedule`.

IN THIS SECTION:

ServiceResourceSchedule(serviceResourceId, unavailableTimeslots)
Creates a new instance of lxscheduler.ServiceResourceSchedule class.

`ServiceResourceSchedule(serviceResourceId, unavailableTimeslots)`

Creates a new instance of lxscheduler.ServiceResourceSchedule class.

Signature

```
public ServiceResourceSchedule(String serviceResourceId,
Set<lxscheduler.UnavailableTimeslot> unavailableTimeslots)
```

Parameters

serviceResourceId
Type: String

Record ID of the service resource.

unavailableTimeslots
Type: Set<lxscheduler.UnavailableTimeslot>

An instance of lxscheduler.UnavailableTimeslot class.

ServiceResourceSchedule Properties

The following are properties for `ServiceResourceSchedule`.

IN THIS SECTION:

serviceResourceId
Record ID of the service resource.

unavailableTimeslots
An instance of lxscheduler.UnavailableTimeslot class.

serviceResourceId

Record ID of the service resource.

Signature

```
public String serviceResourceId {get; set;}
```

Property Value

Type: String

unavailableTimeslots

An instance of lxscheduler.UnavailableTimeslot class.

Signature

```
public Set<lxscheduler.UnavailableTimeslot> unavailableTimeslots {get; set;}
```

Property Value

Type: Set<lxscheduler.UnavailableTimeslot>

UnavailableTimeslot Class

Use this class to pass the unavailable time slots to the lxscheduler.ServiceResourceSchedule class. Timezones that differ across operating hours are handled and results are always returned in UTC.

Namespace

LxScheduler

IN THIS SECTION:

UnavailableTimeslot Constructors

UnavailableTimeslot Properties

UnavailableTimeslot Constructors

The following are constructors for `UnavailableTimeslot`.

IN THIS SECTION:

UnavailableTimeslot(timeMin, timeMax)
Creates an instance of lxscheduler.UnavailableTimeslot class.

`UnavailableTimeslot(timeMin, timeMax)`

Creates an instance of lxscheduler.UnavailableTimeslot class.

Signature

```
public UnavailableTimeslot(Datetime timeMin, Datetime timeMax)
```

Parameters

`timeMin`
Type: Datetime

Start time of an unavailable time slot.

`timeMax`
Type: Datetime

End time of an unavailable time slot.

UnavailableTimeslot Properties

The following are properties for `UnavailableTimeslot`.

IN THIS SECTION:

timeMax
End time of an unavailable time slot.

timeMin
Start time of an unavailable time slot.

timeMax

End time of an unavailable time slot.

Signature

```
public Datetime timeMax {get; set;}
```

Property Value

Type: Datetime

timeMin

Start time of an unavailable time slot.

Signature

```
public Datetime timeMin {get; set;}
```

Property Value

Type: Datetime

Messaging Namespace

The `Messaging` namespace provides classes and methods for Salesforce outbound and inbound email functionality.

The following are the classes in the `Messaging` namespace.

IN THIS SECTION:

AttachmentRetrievalOption Enum
Provides options for including attachment metadata only, attachment metadata and content, or excluding attachments.

Email Class (Base Email Methods)
Contains base email methods common to both single and mass email.

EmailFileAttachment Class
EmailFileAttachment is used in SingleEmailMessage to specify attachments passed in as part of the request, as opposed to existing documents in Salesforce.

InboundEmail Class
Represents an inbound email object.

InboundEmail.AuthenticationResult Class
Contains the authentication type and response for inbound emails.

InboundEmail.AuthenticationResultField Class
Contains field data from the authentication result response for inbound emails.

InboundEmail.BinaryAttachment Class
An InboundEmail object stores binary attachments in an InboundEmail.BinaryAttachment object.

InboundEmail.TextAttachment Class

An InboundEmail object stores text attachments in an InboundEmail.TextAttachment object.

InboundEmailResult Class

The InboundEmailResult object is used to return the result of the email service. If this object is null, the result is assumed to be successful.

InboundEnvelope Class

The InboundEnvelope object stores the envelope information associated with the inbound email, and has the following fields.

MassEmailMessage Class

Contains methods for sending mass email.

InboundEmail.Header Class

An InboundEmail object stores RFC 2822 email header information in an InboundEmail.Header object with the following properties.

PushNotification Class

`PushNotification` is used to configure push notifications and send them from an Apex trigger.

PushNotificationPayload Class

Contains methods to create the notification message payload for an Apple device.

CustomNotification Class

`CustomNotification` is used to create, configure, and send custom notifications from Apex code.

RenderEmailTemplateBodyResult Class

Contains the results for rendering email templates.

RenderEmailTemplateError Class

Represents an error that the `RenderEmailTemplateBodyResult` object can contain.

SendEmailError Class

Represents an error that the SendEmailResult object may contain.

SendEmailResult Class

Contains the result of sending an email message.

SingleEmailMessage Class

Contains methods for sending single email messages.

AttachmentRetrievalOption Enum

Provides options for including attachment metadata only, attachment metadata and content, or excluding attachments.

Namespace

Messaging

Usage

Use these enum values with the renderStoredEmailTemplate(templateId, whoId, whatId, attachmentRetrievalOption) method.

Enum Values

The following are the values of the `Messaging.AttachmentRetrievalOption` enum.

Value	Description
METADATA_ONLY	Includes only the file name, content type, and the object ID in the `fileAttachments` property of `Messaging.SingleEmailMessage`. Note: When the template is rendered from a Visualforce template (and not from a static file attached to the template), the object ID is not available.
METADATA_WITH_BODY	Includes the attachment content, in addition to the file name, content type, and the object ID in the `fileAttachments` property of `Messaging.SingleEmailMessage`.
NONE	Doesn't include any attachments in `Messaging.SingleEmailMessage`.

Email Class (Base Email Methods)

Contains base email methods common to both single and mass email.

Namespace

Messaging

Usage

Note: If templates are not being used, all email content must be in plain text, HTML, or both.Visualforce email templates cannot be used for mass email.

Email Methods

The following are methods for `Email`. All are instance methods.

IN THIS SECTION:

setBccSender(bcc)

Indicates whether the email sender receives a copy of the email that is sent. For a mass mail, the sender is only copied on the first email sent.

setReplyTo(replyAddress)

Optional. The email address that receives the message when a recipient replies.

setTemplateID(templateId)

The ID of the template to be merged to create this email. Specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

setSaveAsActivity(saveAsActivity)

Optional. The default value is `true`, meaning the email is saved as an activity. This argument only applies if the recipient list is based on `targetObjectId` or `targetObjectIds`. If HTML email tracking is enabled for the organization, you will be able to track open rates.

setSenderDisplayName(displayName)

Optional. The name that appears on the From line of the email. This cannot be set if the object associated with a `setOrgWideEmailAddressId` for a SingleEmailMessage has defined its `DisplayName` field.

setUseSignature(useSignature)

Indicates whether the email includes an email signature if the user has one configured. The default is `true`, meaning if the user has a signature it is included in the email unless you specify `false`.

`setBccSender(bcc)`

Indicates whether the email sender receives a copy of the email that is sent. For a mass mail, the sender is only copied on the first email sent.

Signature

```
public Void setBccSender(Boolean bcc)
```

Parameters

bcc
Type: Boolean

Return Value

Type: Void

Usage

Note: If the BCC compliance option is set at the organization level, the user cannot add BCC addresses on standard messages. The following error code is returned: `BCC_NOT_ALLOWED_IF_BCC_ COMPLIANCE_ENABLED`. Contact your Salesforce representative for information on BCC compliance.

`setReplyTo(replyAddress)`

Optional. The email address that receives the message when a recipient replies.

Signature

```
public Void setReplyTo(String replyAddress)
```

Parameters

replyAddress
Type: String

Return Value

Type: Void

setTemplateID(templateId)

The ID of the template to be merged to create this email. Specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

Signature

```
public Void setTemplateID(ID templateId)
```

Parameters

templateId
Type: ID

Return Value

Type: Void

Usage

Note: `setHtmlBody` and `setPlainTextBody` apply only to single email methods, not to mass email methods.

setSaveAsActivity(saveAsActivity)

Optional. The default value is `true`, meaning the email is saved as an activity. This argument only applies if the recipient list is based on `targetObjectId` or `targetObjectIds`. If HTML email tracking is enabled for the organization, you will be able to track open rates.

Signature

```
public Void setSaveAsActivity(Boolean saveAsActivity)
```

Parameters

saveAsActivity
Type: Boolean

Return Value

Type: Void

setSenderDisplayName(displayName)

Optional. The name that appears on the From line of the email. This cannot be set if the object associated with a `setOrgWideEmailAddressId` for a SingleEmailMessage has defined its `DisplayName` field.

Signature

```
public Void setSenderDisplayName(String displayName)
```

Parameters

displayName
Type: String

Return Value

Type: Void

setUseSignature(useSignature)

Indicates whether the email includes an email signature if the user has one configured. The default is `true`, meaning if the user has a signature it is included in the email unless you specify `false`.

Signature

```
public Void setUseSignature(Boolean useSignature)
```

Parameters

useSignature
Type: Boolean

Return Value

Type: Void

EmailFileAttachment Class

EmailFileAttachment is used in SingleEmailMessage to specify attachments passed in as part of the request, as opposed to existing documents in Salesforce.

Namespace

Messaging

IN THIS SECTION:

EmailFileAttachment Constructors

EmailFileAttachment Properties

EmailFileAttachment Constructors

The following are constructors for `EmailFileAttachment`.

IN THIS SECTION:

EmailFileAttachment()
Creates a new instance of the `Messaging.EmailFileAttachment` class.

`EmailFileAttachment()`

Creates a new instance of the `Messaging.EmailFileAttachment` class.

Signature

```
public EmailFileAttachment()
```

EmailFileAttachment Properties

The following are properties for `EmailFileAttachment`.

IN THIS SECTION:

body
Gets or sets the attachment itself.

contenttype
Gets or sets the attachment's Content-Type.

filename
Gets or sets the name of the file to attach.

id
Read-Only. Gets the attachment ID.

inline
Specifies a Content-Disposition of inline (`true`) or attachment (`false`).

`body`

Gets or sets the attachment itself.

Signature

```
public Blob body {get; set;}
```

Property Value

Type: Blob

`contenttype`

Gets or sets the attachment's Content-Type.

Signature

```
public String contenttype {get; set;}
```

Property Value

Type: String

filename

Gets or sets the name of the file to attach.

Signature

```
public String filename {get; set;}
```

Property Value

Type: String

id

Read-Only. Gets the attachment ID.

Signature

```
public Id id {get;}
```

Property Value

Type: Id

inline

Specifies a Content-Disposition of inline (`true`) or attachment (`false`).

Signature

```
public Boolean inline {get; set;}
```

Property Value

Type: Boolean

InboundEmail Class

Represents an inbound email object.

Namespace

Messaging

IN THIS SECTION:

InboundEmail Constructors

InboundEmail Properties

InboundEmail Constructors

The following are constructors for `InboundEmail`.

IN THIS SECTION:

InboundEmail()
Creates a new instance of the `Messaging.InboundEmail` class.

`InboundEmail()`

Creates a new instance of the `Messaging.InboundEmail` class.

Signature

```
public InboundEmail()
```

InboundEmail Properties

The following are properties for `InboundEmail`.

IN THIS SECTION:

authenticationResults
A list of authentication results received with the email, if any.

binaryAttachments
A list of binary attachments received with the email, if any.

ccAddresses
A list of carbon copy (CC) addresses, if any.

fromAddress
The email address that appears in the From field.

fromName
The name that appears in the From field, if any.

headers
A list of the RFC 2822 headers in the email.

htmlBody
The HTML version of the email, if specified by the sender.

htmlBodyIsTruncated
Indicates whether the HTML body text is truncated (`true`) or not (`false`.)

inReplyTo
The In-Reply-To field of the incoming email. Identifies the email or emails to which this one is a reply (parent emails). Contains the parent email or emails' message-IDs.

messageId
The Message-ID—the incoming email's unique identifier.

plainTextBody
The plain text version of the email, if specified by the sender.

plainTextBodyIsTruncated
Indicates whether the plain body text is truncated (`true`) or not (`false`.)

references
The References field of the incoming email. Identifies an email thread. Contains a list of the parent emails' References and message IDs, and possibly the In-Reply-To fields.

replyTo
The email address that appears in the reply-to header.

subject
The subject line of the email, if any.

textAttachments
A list of text attachments received with the email, if any.

toAddresses
The email address that appears in the `To` field.

`authenticationResults`

A list of authentication results received with the email, if any.

Signature

```
public InboundEmail.AuthenticationResult[] authenticationResults {get; set;}
```

Property Value

Type: InboundEmail.AuthenticationResult[]

Usage

Examples of authentication results include `dkim`, `dmarc`, and `spf`.

`binaryAttachments`

A list of binary attachments received with the email, if any.

Signature

```
public InboundEmail.BinaryAttachment[] binaryAttachments {get; set;}
```

Property Value

Type: InboundEmail.BinaryAttachment[]

Usage

Examples of binary attachments include image, audio, application, and video files.

ccAddresses

A list of carbon copy (CC) addresses, if any.

Signature

```
public String[] ccAddresses {get; set;}
```

Property Value

Type: String[]

fromAddress

The email address that appears in the From field.

Signature

```
public String fromAddress {get; set;}
```

Property Value

Type: String

fromName

The name that appears in the From field, if any.

Signature

```
public String fromName {get; set;}
```

Property Value

Type: String

headers

A list of the RFC 2822 headers in the email.

Signature

```
public InboundEmail.Header[] headers {get; set;}
```

Property Value

Type: InboundEmail.Header[]

Usage

The list of the RFC 2822 headers includes:

- Recieved from
- Custom headers
- Message-ID
- Date

htmlBody

The HTML version of the email, if specified by the sender.

Signature

```
public String htmlBody {get; set;}
```

Property Value

Type: String

htmlBodyIsTruncated

Indicates whether the HTML body text is truncated (`true`) or not (`false`.)

Signature

```
public Boolean htmlBodyIsTruncated {get; set;}
```

Property Value

Type: Boolean

inReplyTo

The In-Reply-To field of the incoming email. Identifies the email or emails to which this one is a reply (parent emails). Contains the parent email or emails' message-IDs.

Signature

```
public String inReplyTo {get; set;}
```

Property Value

Type: String

messageId

The Message-ID—the incoming email's unique identifier.

Signature

```
public String messageId {get; set;}
```

Property Value

Type: String

plainTextBody

The plain text version of the email, if specified by the sender.

Signature

```
public String plainTextBody {get; set;}
```

Property Value

Type: String

plainTextBodyIsTruncated

Indicates whether the plain body text is truncated (`true`) or not (`false`.)

Signature

```
public Boolean plainTextBodyIsTruncated {get; set;}
```

Property Value

Type: Boolean

references

The References field of the incoming email. Identifies an email thread. Contains a list of the parent emails' References and message IDs, and possibly the In-Reply-To fields.

Signature

```
public String[] references {get; set;}
```

Property Value

Type: String[]

replyTo

The email address that appears in the reply-to header.

Signature

```
public String replyTo {get; set;}
```

Property Value

Type: String

Usage

If there is no reply-to header, this field is identical to the `fromAddress` field.

subject

The subject line of the email, if any.

Signature

```
public String subject {get; set;}
```

Property Value

Type: String

textAttachments

A list of text attachments received with the email, if any.

Signature

```
public InboundEmail.TextAttachment[] textAttachments {get; set;}
```

Property Value

Type: InboundEmail.TextAttachment[]

Usage

The text attachments can be any of the following:

- Attachments with a Multipurpose Internet Mail Extension (MIME) type of `text`
- Attachments with a MIME type of `application/octet-stream` and a file name that ends with either a `.vcf` or `.vcs` extension. These are saved as `text/x-vcard` and `text/calendar` MIME types, respectively.

toAddresses

The email address that appears in the `To` field.

Signature

```
public String[] toAddresses {get; set;}
```

Property Value

Type: String[]

InboundEmail.AuthenticationResult Class

Contains the authentication type and response for inbound emails.

Namespace

Messaging

IN THIS SECTION:

InboundEmail.AuthenticationResult Constructors

InboundEmail.AuthenticationResult Properties

InboundEmail.AuthenticationResult Constructors

The following are constructors for `InboundEmail.AuthenticationResult`.

IN THIS SECTION:

InboundEmail.AuthenticationResult()
Creates a new instance of the `Messaging.InboundEmail.AuthenticationResult` class.

`InboundEmail.AuthenticationResult()`

Creates a new instance of the `Messaging.InboundEmail.AuthenticationResult` class.

Signature

```
public InboundEmail.AuthenticationResult()
```

InboundEmail.AuthenticationResult Properties

The following are properties for `InboundEmail.AuthenticationResult`.

IN THIS SECTION:

authenticationResultFields
Additional information in authentication result headers. Examples include: `name: smtp.mailfrom` and `value: example.com`.

method
The authentication method used for the security check. Possible values include `dkim`, `dmarc`, or `spf`.

result
The result of the authentication check. When the email service is configured to verify the legitimacy of the sending server before processing a message, possible values include `pass` or `fail`. Otherwise, the value returned is `none`.

`authenticationResultFields`

Additional information in authentication result headers. Examples include: `name: smtp.mailfrom` and `value: example.com`.

Signature

```
public InboundEmail.AuthenticationResultField[] authenticationResultFields {get; set;}
```

Property Value

Type: InboundEmail.AuthenticationResultField[]

`method`

The authentication method used for the security check. Possible values include `dkim`, `dmarc`, or `spf`.

Signature

```
public String method {get; set;}
```

Property Value

Type: String

`result`

The result of the authentication check. When the email service is configured to verify the legitimacy of the sending server before processing a message, possible values include `pass` or `fail`. Otherwise, the value returned is `none`.

Signature

```
public String result {get; set;}
```

Property Value

Type: String

InboundEmail.AuthenticationResultField Class

Contains field data from the authentication result response for inbound emails.

Namespace

Messaging

IN THIS SECTION:

InboundEmail.AuthenticationResultField Constructors

InboundEmail.AuthenticationResultField Properties

InboundEmail.AuthenticationResultField Constructors

The following are constructors for `InboundEmail.AuthenticationResultField`.

IN THIS SECTION:

InboundEmail.AuthenticationResultField()
Creates a new instance of the `Messaging.InboundEmail.AuthenticationResultField` class.

`InboundEmail.AuthenticationResultField()`

Creates a new instance of the `Messaging.InboundEmail.AuthenticationResultField` class.

Signature

```
public InboundEmail.AuthenticationResultField()
```

InboundEmail.AuthenticationResultField Properties

The following are properties for `InboundEmail.AuthenticationResultField`.

IN THIS SECTION:

name
The authentication result field name. For example: `smtp.mailfrom`.
value
The authentication result field value. For example: `example.com`.

`name`

The authentication result field name. For example: `smtp.mailfrom`.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

`value`

The authentication result field value. For example: `example.com`.

Signature

```
public String value {get; set;}
```

Property Value

Type: String

InboundEmail.BinaryAttachment Class

An InboundEmail object stores binary attachments in an InboundEmail.BinaryAttachment object.

Namespace

Messaging

Usage

Examples of binary attachments include image, audio, application, and video files.

IN THIS SECTION:

InboundEmail.BinaryAttachment Constructors

InboundEmail.BinaryAttachment Properties

InboundEmail.BinaryAttachment Constructors

The following are constructors for `InboundEmail.BinaryAttachment`.

IN THIS SECTION:

InboundEmail.BinaryAttachment()
Creates a new instance of the `Messaging.InboundEmail.BinaryAttachment` class.

`InboundEmail.BinaryAttachment()`

Creates a new instance of the `Messaging.InboundEmail.BinaryAttachment` class.

Signature

```
public InboundEmail.BinaryAttachment()
```

InboundEmail.BinaryAttachment Properties

The following are properties for `InboundEmail.BinaryAttachment`.

IN THIS SECTION:

body
The body of the attachment.

fileName
The name of the attached file.

headers
Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

mimeTypeSubType
The primary and sub MIME-type.

body

The body of the attachment.

Signature

```
public Blob body {get; set;}
```

Property Value

Type: Blob

fileName

The name of the attached file.

Signature

```
public String fileName {get; set;}
```

Property Value

Type: String

headers

Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

Signature

```
public List<Messaging.InboundEmail.Header> headers {get; set;}
```

Property Value

Type: List<Messaging.InboundEmail.Header>

mimeTypeSubType

The primary and sub MIME-type.

Signature

```
public String mimeTypeSubType {get; set;}
```

Property Value

Type: String

InboundEmail.TextAttachment Class

An InboundEmail object stores text attachments in an InboundEmail.TextAttachment object.

Namespace

Messaging

Usage

The text attachments can be any of the following:

- Attachments with a Multipurpose Internet Mail Extension (MIME) type of `text`
- Attachments with a MIME type of `application/octet-stream` and a file name that ends with either a `.vcf` or `.vcs` extension. These are saved as `text/x-vcard` and `text/calendar` MIME types, respectively.

IN THIS SECTION:

InboundEmail.TextAttachment()

Creates a new instance of the `Messaging.InboundEmail.TextAttachment` class.

`InboundEmail.TextAttachment()`

Creates a new instance of the `Messaging.InboundEmail.TextAttachment` class.

Signature

```
public InboundEmail.TextAttachment()
```

InboundEmail.TextAttachment Properties

The following are properties for `InboundEmail.TextAttachment`.

IN THIS SECTION:

body

The body of the attachment.

bodyIsTruncated

Indicates whether the attachment body text is truncated (`true`) or not (`false`.)

charset
The original character set of the body field. The body is re-encoded as UTF-8 as input to the Apex method.

fileName
The name of the attached file.

headers
Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

mimeTypeSubType
The primary and sub MIME-type.

body

The body of the attachment.

Signature

```
public String body {get; set;}
```

Property Value

Type: String

bodyIsTruncated

Indicates whether the attachment body text is truncated (`true`) or not (`false`.)

Signature

```
public Boolean bodyIsTruncated {get; set;}
```

Property Value

Type: Boolean

charset

The original character set of the body field. The body is re-encoded as UTF-8 as input to the Apex method.

Signature

```
public String charset {get; set;}
```

Property Value

Type: String

fileName

The name of the attached file.

Signature

```
public String fileName {get; set;}
```

Property Value

Type: String

`headers`

Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

Signature

```
public List<Messaging.InboundEmail.Header> headers {get; set;}
```

Property Value

Type: List<Messaging.InboundEmail.Header>

`mimeTypeSubType`

The primary and sub MIME-type.

Signature

```
public String mimeTypeSubType {get; set;}
```

Property Value

Type: String

InboundEmailResult Class

The InboundEmailResult object is used to return the result of the email service. If this object is null, the result is assumed to be successful.

Namespace

Messaging

InboundEmailResult Properties

The following are properties for `InboundEmailResult`.

IN THIS SECTION:

message
A message that Salesforce returns in the body of a reply email. This field can be populated with text irrespective of the value returned by the `Success` field.

success
A value that indicates whether the email was successfully processed.

message

A message that Salesforce returns in the body of a reply email. This field can be populated with text irrespective of the value returned by the `Success` field.

Signature

```
public String message {get; set;}
```

Property Value

Type: String

success

A value that indicates whether the email was successfully processed.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

Usage

If `false`, Salesforce rejects the inbound email and sends a reply email to the original sender containing the message specified in the `Message` field.

InboundEnvelope Class

The InboundEnvelope object stores the envelope information associated with the inbound email, and has the following fields.

Namespace

Messaging

InboundEnvelope Properties

The following are properties for `InboundEnvelope`.

IN THIS SECTION:

fromAddress
The name that appears in the `From` field of the envelope, if any.

toAddress
The name that appears in the `To` field of the envelope, if any.

`fromAddress`

The name that appears in the `From` field of the envelope, if any.

Signature

```
public String fromAddress {get; set;}
```

Property Value

Type: String

`toAddress`

The name that appears in the `To` field of the envelope, if any.

Signature

```
public String toAddress {get; set;}
```

Property Value

Type: String

MassEmailMessage Class

Contains methods for sending mass email.

Namespace

Messaging

Usage

MassEmailMessage extends Email and inherits all of its methods. All base email (`Email` class) methods are also available to the `MassEmailMessage` objects.

IN THIS SECTION:

MassEmailMessage Constructors

MassEmailMessage Methods

SEE ALSO:

Email Class (Base Email Methods)

MassEmailMessage Constructors

The following are constructors for `MassEmailMessage`.

IN THIS SECTION:

MassEmailMessage()
Creates a new instance of the `Messaging.MassEmailMessage` class.

`MassEmailMessage()`

Creates a new instance of the `Messaging.MassEmailMessage` class.

Signature

```
public MassEmailMessage()
```

MassEmailMessage Methods

The following are methods for `MassEmailMessage`. All are instance methods. All base email (`Email` class) methods are also available to the `MassEmailMessage` objects. These methods are described in Email Class (Base Email Methods).

IN THIS SECTION:

setDescription(description)
The description of the email.

setTargetObjectIds(targetObjectIds)
A list of IDs of the contacts, leads, or users to which the email will be sent. The IDs you specify set the context and ensure that merge fields in the template contain the correct data. The objects must be of the same type (all contacts, all leads, or all users).

setWhatIds(whatIds)
Optional. If you specify a list of contacts for the `targetObjectIds` field, you can specify a list of `whatIds` as well. This helps to further ensure that merge fields in the template contain the correct data.

`setDescription(description)`

The description of the email.

Signature

```
public Void setDescription(String description)
```

Parameters

`description`
Type: String

Return Value

Type: Void

setTargetObjectIds(targetObjectIds)

A list of IDs of the contacts, leads, or users to which the email will be sent. The IDs you specify set the context and ensure that merge fields in the template contain the correct data. The objects must be of the same type (all contacts, all leads, or all users).

Signature

```
public Void setTargetObjectIds(ID[] targetObjectIds)
```

Parameters

targetObjectIds
Type: ID[]

Return Value

Type: Void

Usage

You can list multiple IDs per email. If you specify a value for the `targetObjectIds` field, optionally specify a `whatId` as well to set the email context to a user, contact, or lead. This ensures that merge fields in the template contain the correct data. Each ID counts against the sending organization's daily mass email limit.

Do not specify the IDs of records that have the `Email Opt Out` option selected.

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

setWhatIds(whatIds)

Optional. If you specify a list of contacts for the `targetObjectIds` field, you can specify a list of `whatIds` as well. This helps to further ensure that merge fields in the template contain the correct data.

Signature

```
public Void setWhatIds(ID[] whatIds)
```

Parameters

whatIds
Type: ID[]

Return Value

Type: Void

Usage

The values must be one of the following types:

- Contract
- Case
- Opportunity
- Product

Note: If you specify `whatIds`, specify one for each `targetObjectId`; otherwise, you will receive an `INVALID_ID_FIELD` error.

InboundEmail.Header Class

An InboundEmail object stores RFC 2822 email header information in an InboundEmail.Header object with the following properties.

Namespace

Messaging

InboundEmail.Header Properties

The following are properties for `InboundEmail.Header`.

IN THIS SECTION:

name
The name of the header parameter, such as `Date` or `Message-ID`.

value
The value of the header.

`name`

The name of the header parameter, such as `Date` or `Message-ID`.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

`value`

The value of the header.

Signature

```
public String value {get; set;}
```

Property Value

Type: String

PushNotification Class

`PushNotification` is used to configure push notifications and send them from an Apex trigger.

Namespace

Messaging

Example

This sample Apex trigger sends push notifications to the connected app named *`Test_App`*, which corresponds to a mobile app on iOS mobile clients. The trigger fires after cases have been updated and sends the push notification to two users: the case owner and the user who last modified the case.

```
trigger caseAlert on Case (after update) {

    for(Case cs : Trigger.New)
    {
        // Instantiating a notification
        Messaging.PushNotification msg =
            new Messaging.PushNotification();

        // Assembling the necessary payload parameters for Apple.
        // Apple params are:
        // (<alert text>,<alert sound>,<badge count>,
        // <free-form data>)
        // This example doesn't use badge count or free-form data.
        // The number of notifications that haven't been acted
        // upon by the intended recipient is best calculated
        // at the time of the push. This timing helps
        // ensure accuracy across multiple target devices.
        Map<String, Object> payload =
            Messaging.PushNotificationPayload.apple(
                'Case ' + cs.CaseNumber + ' status changed to: '
                + cs.Status, '', null, null);

        // Adding the assembled payload to the notification
        msg.setPayload(payload);

        // Getting recipient users
        String userId1 = cs.OwnerId;
        String userId2 = cs.LastModifiedById;

        // Adding recipient users to list
        Set<String> users = new Set<String>();
        users.add(userId1);
        users.add(userId2);

        // Sending the notification to the specified app and users.
```

```
        // Here we specify the API name of the connected app.
        msg.send('Test_App', users);
    }
}
```

IN THIS SECTION:

PushNotification Constructors

PushNotification Methods

PushNotification Constructors

The following are the constructors for `PushNotification`.

IN THIS SECTION:

PushNotification()

Creates a new instance of the `Messaging.PushNotification` class.

PushNotification(payload)

Creates a new instance of the `Messaging.PushNotification` class using the specified payload parameters as key-value pairs. When you use this constructor, you don't need to call `setPayload` to set the payload.

`PushNotification()`

Creates a new instance of the `Messaging.PushNotification` class.

Signature

```
public PushNotification()
```

`PushNotification(payload)`

Creates a new instance of the `Messaging.PushNotification` class using the specified payload parameters as key-value pairs. When you use this constructor, you don't need to call `setPayload` to set the payload.

Signature

```
public PushNotification(Map<String,Object> payload)
```

Parameters

payload

Type:Map<String, Object>

The payload, expressed as a map of key-value pairs.

PushNotification Methods

The following are the methods for `PushNotification`. All are global methods.

IN THIS SECTION:

send(application, users)
Sends a push notification message to the specified users.

setPayload(payload)
Sets the payload of the push notification message.

setTtl(ttl)
Reserved for future use.

send(application, users)

Sends a push notification message to the specified users.

Signature

```
public void send(String application, Set<String> users)
```

Parameters

application
Type: String

The connected app API name. This corresponds to the mobile client app the notification should be sent to.

users
Type: Set

A set of user IDs that correspond to the users the notification should be sent to.

Example

See the Push Notification Example.

setPayload(payload)

Sets the payload of the push notification message.

Signature

```
public void setPayload(Map<String,Object> payload)
```

Parameters

payload
Type: Map<String, Object>

The payload, expressed as a map of key-value pairs.

Payload parameters can be different for each mobile OS vendor. For more information on Apple's payload parameters, search for "Apple Push Notification Service" at https://developer.apple.com/library/mac/documentation/.

To create the payload for an Apple device, see the PushNotificationPayload Class.

Example

See the Push Notification Example.

`setTtl(ttl)`

Reserved for future use.

Signature

```
public void setTtl(Integer ttl)
```

Parameters

`ttl`
Type: Integer

Reserved for future use.

`PushNotificationPayload Class`

Contains methods to create the notification message payload for an Apple device.

Namespace

Messaging

Usage

Apple has specific requirements for the notification payload. and this class has helper methods to create the payload. For more information on Apple's payload parameters, search for "Apple Push Notification Service" at https://developer.apple.com/library/mac/documentation/.

Example

See the Push Notification Example.

IN THIS SECTION:

PushNotificationPayload Methods

PushNotificationPayload Methods

The following are the methods for `PushNotificationPayload`. All are global static methods.

IN THIS SECTION:

apple(alert, sound, badgeCount, userData)
Helper method that creates a valid Apple payload from the specified arguments.

apple(alertBody, actionLocKey, locKey, locArgs, launchImage, sound, badgeCount, userData)
Helper method that creates a valid Apple payload from the specified arguments.

apple(alert, sound, badgeCount, userData)

Helper method that creates a valid Apple payload from the specified arguments.

Signature

```
public static Map<String,Object> apple(String alert, String sound, Integer badgeCount,
Map<String,Object> userData)
```

Parameters

alert
Type: String

Notification message to be sent to the mobile client.

sound
Type: String

Name of a sound file to be played as an alert. This sound file should be in the mobile application bundle.

badgeCount
Type: Integer

Number to display as the badge of the application icon.

userData
Type: Map<String, Object>

Map of key-value pairs that contains any additional data used to provide context for the notification. For example, it can contain IDs of the records that caused the notification to be sent. The mobile client app can use these IDs to display these records.

Return Value

Type:Map<String, Object>

Returns a formatted payload that includes all of the specified arguments.

Usage

To generate a valid payload, you must provide a value for at least one of the following parameters: `alert`, `sound`, `badgeCount`.

Example

See the Push Notification Example.

apple(alertBody, actionLocKey, locKey, locArgs, launchImage, sound, badgeCount, userData)

Helper method that creates a valid Apple payload from the specified arguments.

Signature

```
public static Map<String,Object> apple(String alertBody, String actionLocKey, String
locKey, String[] locArgs, String launchImage, String sound, Integer badgeCount,
Map<String,Object> userData)
```

Parameters

alertBody
Type: String

Text of the alert message.

actionLocKey
Type: String

If a value is specified for the *actionLocKey* argument, an alert with two buttons is displayed. The value is a key to get a localized string in a `Localizable.strings` file to use for the right button's title.

locKey
Type: String

Key to an alert-message string in a `Localizable.strings` file for the current localization.

locArgs
Type: List<String>

Variable string values to appear in place of the format specifiers in *locKey*.

launchImage
Type: String

File name of an image file in the application bundle.

sound
Type: String

Name of a sound file to be played as an alert. This sound file should be in the mobile application bundle.

badgeCount
Type: Integer

Number to display as the badge of the application icon.

userData
Type: Map<String, Object>

Map of key-value pairs that contains any additional data used to provide context for the notification. For example, it can contain IDs of the records that caused the notification to be sent. The mobile client app can use these IDs to display these records.

Return Value

Type: Map<String, Object>

Returns a formatted payload that includes all of the specified arguments.

Usage

To generate a valid payload, you must provide a value for at least one of the following parameters: `alert`, `sound`, `badgeCount`.

CustomNotification Class

`CustomNotification` is used to create, configure, and send custom notifications from Apex code.

Namespace

Messaging

Usage

`CustomNotification` allows two approaches to creating and configuring a custom notification.

- Create an instance with the default constructor, and then set notification attributes using the various setter methods.
- Create an instance and configure notification parameters at the same time using the parameterized constructor.

Once the custom notification is configured, call `send()` to send the notification.

Notification Target

The *notification target* is used by the receiving client application to navigate to an appropriate record or page when a user responds to a notification. For example, when a user is notified that a record was updated, responding to the notification can open the relevant record.

You must specify a target for a notification. The target can be specified using either the `targetID` or the `targetPageRef` attribute. Neither attribute is required, but if both are omitted, `send()` throws an exception. If there's no natural target for a notification, set the `targetID` to a dummy value, such as *`000000000000000AAA`*. A dummy value prevents the exception, and also prevents automatic navigation when responding to the notification in the client app.

You can set both `targetID` and `targetPageRef` in the same notification. The client app that receives the notification determines which target, if any, to use when responding to the notification.

Important: Before Winter '21 you could set only a target record (`targetID`) for a notification. Most client applications expect to find a `targetID` in the notification payload. If you can't update a client app to handle notifications that include only a `targetPageRef`, set the `targetID` to a dummy value.

Execution Context and Notification Permissions

By default Apex code executes in system mode, and doesn't require user permissions to send notifications with `CustomNotification`. However, if your Apex code runs in a user context—for example, by executing anonymous Apex in the Developer Console—the Send Custom Notifications user permission is checked, and `send()` fails if you don't have the required permission.

Example

This example Apex class provides a static method for sending a custom notification to a recipient list. Call this method from a trigger, flow, or wherever you want to send a custom notification from Apex.

```
public without sharing class CustomNotificationFromApex {

    public static void notifyUsers(Set<String> recipientsIds, String targetId) {

        // Get the Id for our custom notification type
        CustomNotificationType notificationType =
            [SELECT Id, DeveloperName
             FROM CustomNotificationType
             WHERE DeveloperName='Custom_Notification'];

        // Create a new custom notification
        Messaging.CustomNotification notification = new Messaging.CustomNotification();

        // Set the contents for the notification
```

```
        notification.setTitle('Apex Custom Notification');
        notification.setBody('The notifications are coming from INSIDE the Apex!');

        // Set the notification type and target
        notification.setNotificationTypeId(notificationType.Id);
        notification.setTargetId(targetId);

        // Actually send the notification
        try {
            notification.send(recipientsIds);
        }
        catch (Exception e) {
            System.debug('Problem sending notification: ' + e.getMessage());
        }
    }
}
```

Note: This example uses a custom notification type with the `DeveloperName` (API name) *`Custom_Notification`*. You can create a custom notification type using Notification Builder in Setup or Tooling API. Then, use your notification type's `DeveloperName` (API name) in the query to find the ID of the notification type.

`CustomNotification.send()` can throw an exception, which is handled minimally in this example. Add more substantial error handling to code you plan to use in production.

IN THIS SECTION:

CustomNotification Constructors

CustomNotification Methods

SEE ALSO:

Salesforce Help: Send Custom Notifications

Actions Developer Guide: Custom Notification Actions

Metadata API Developer Guide: CustomNotificationType

CustomNotification Constructors

The following are constructors for `CustomNotification`.

IN THIS SECTION:

CustomNotification()

Creates a new instance of the `Messaging.CustomNotification` class.

CustomNotification(typeId, sender, title, body, targetId, targetPageRef)

Creates an instance of the `Messaging.CustomNotification` class using the specified parameters. When you use this constructor, you don't need to call the various setter methods to define the custom notification attributes.

`CustomNotification()`

Creates a new instance of the `Messaging.CustomNotification` class.

Signature

```
public CustomNotification()
```

`CustomNotification(typeId, sender, title, body, targetId, targetPageRef)`

Creates an instance of the `Messaging.CustomNotification` class using the specified parameters. When you use this constructor, you don't need to call the various setter methods to define the custom notification attributes.

Signature

```
public CustomNotification(String typeId, String sender, String title, String body,
String targetId, String targetPageRef)
```

Parameters

typeId
Type: String

The ID of the Custom Notification Type being used for the notification.

sender
Type: String

The User ID of the sender of the notification.

title
Type: String

The title of the notification. Maximum characters: 250.

body
Type: String

The body of the notification. Maximum characters: 750.

targetId
Type: String

The Record ID for the target record of the notification.

You must specify either a `targetID` or a `targetPageRef`. See Custom Notification Usage.

targetPageRef
Type: String

The `PageReference` for the navigation target of the notification. To see how to specify the target using JSON, see pageReference Types.

You must specify either a `targetID` or a `targetPageRe`. See Custom Notification Usage.

Usage

A client may see a truncated notification title or body depending on the delivery channel or app, and how the Connect API notification parameters are configured. For more information on the `trimMessages` query parameter, see Notification .

CustomNotification Methods

The following are methods for `CustomNotification`.

IN THIS SECTION:

send(users)
Sends a custom notification to the specified users.

setNotificationTypeId(id)
Sets the type of the custom notification.

setTitle(title)
Sets the title of the custom notification.

setBody(body)
Sets the body of the custom notification.

setSenderId(id)
Sets the sender of the custom notification.

setTargetId(targetId)
Sets the target record of the custom notification.

setTargetPageRef(pageRef)
Sets the target page of the custom notification.

send(users)

Sends a custom notification to the specified users.

Signature

```
public void send(Set<String> users)
```

Parameters

users
Type: Set<String>

Required. A set of recipient IDs. Each recipient ID corresponds to a recipient or recipient type that the notification should be sent to. Valid recipient or recipient type values are:

- `UserId` — The notification is sent to this user, if this user is active.
- `AccountId` — The notification is sent to all active users who are members of this account's Account Team.

  Note: This recipient type is valid if account teams are enabled for your org.

- `OpportunityId` — The notification is sent to all active users who are members of this opportunity's Opportunity Team.

  Note: This recipient type is valid if team selling is enabled for your org.

- `GroupId` — The notification is sent to all active users who are members of this group.
- `QueueId` — The notification is sent to all active users who are members of this queue.

Values can be combined in a set, up to the maximum of 500 values.

Return Value

Type: void

Example

See the Custom Notification Example.

setNotificationTypeId(id)

Sets the type of the custom notification.

Signature

```
public void setNotificationTypeId(String id)
```

Parameters

id

Type: String

The ID of the Custom Notification Type being used for the notification.

A notification type is required to send a custom notification. See Custom Notification Usage.

Return Value

Type: void

Example

See the Custom Notification Example.

setTitle(title)

Sets the title of the custom notification.

Signature

```
public void setTitle(String title)
```

Parameters

title

Type: String

The title of the notification, as it will be seen by recipients. Maximum characters: 250.

A title is required to send a custom notification. See Custom Notification Usage.

Return Value

Type: void

Example

See the Custom Notification Example.

`setBody(body)`

Sets the body of the custom notification.

Signature

```
public void setBody(String body)
```

Parameters

body
Type: String

The body of the notification, as it will be seen by recipients. Maximum characters: 750.

A body is required to send a custom notification. See Custom Notification Usage.

Return Value

Type: void

Example

See the Custom Notification Example.

`setSenderId(id)`

Sets the sender of the custom notification.

Signature

```
public void setSenderId(String id)
```

Parameters

id
Type: String

The User ID of the sender of the notification.

Setting a sender is optional. See Custom Notification Usage.

Return Value

Type: void

Example

See the Custom Notification Example.

`setTargetId(targetId)`

Sets the target record of the custom notification.

Signature

```
public void setTargetId(String targetId)
```

Parameters

targetId
Type: String

The Record ID for the target record of the notification.

Either a `targetID` or a `targetPageRef` is required to send a custom notification. See Custom Notification Usage.

Return Value

Type: void

Example

See the Custom Notification Example.

`setTargetPageRef(pageRef)`

Sets the target page of the custom notification.

Signature

```
public void setTargetPageRef(String pageRef)
```

Parameters

pageRef
Type: String

The `PageReference` for the navigation target of the notification.

Either a `targetID` or a `targetPageRef` is required to send a custom notification. See Custom Notification Usage.

Return Value

Type: void

Example

See the Custom Notification Example.

RenderEmailTemplateBodyResult Class

Contains the results for rendering email templates.

Namespace

Messaging

IN THIS SECTION:

RenderEmailTemplateBodyResult Methods

RenderEmailTemplateBodyResult Methods

The following are methods for `RenderEmailTemplateBodyResult`.

IN THIS SECTION:

getErrors()
If an error occurred during the `renderEmailTemplate` method, a `RenderEmailTemplateError` object is returned.

getMergedBody()
Returns the rendered body text with merge field references replaced with the corresponding record data.

getSuccess()
Indicates whether the operation was successful.

`getErrors()`

If an error occurred during the `renderEmailTemplate` method, a `RenderEmailTemplateError` object is returned.

Signature

```
public List<Messaging.RenderEmailTemplateError> getErrors()
```

Return Value

Type: List<Messaging.RenderEmailTemplateError>

`getMergedBody()`

Returns the rendered body text with merge field references replaced with the corresponding record data.

Signature

```
public String getMergedBody()
```

Return Value

Type: String

`getSuccess()`

Indicates whether the operation was successful.

Signature

```
public Boolean getSuccess()
```

Return Value

Type: Boolean

RenderEmailTemplateError Class

Represents an error that the `RenderEmailTemplateBodyResult` object can contain.

Namespace

Messaging

IN THIS SECTION:

RenderEmailTemplateError Methods

RenderEmailTemplateError Methods

The following are methods for `RenderEmailTemplateError`.

IN THIS SECTION:

getFieldName()
Returns the name of the merge field in the error.

getMessage()
Returns a message describing the error.

getOffset()
Returns the offset within the supplied body text where the error was discovered. If the offset cannot be determined, -1 is returned.

getStatusCode()
Returns a Salesforce API status code.

`getFieldName()`

Returns the name of the merge field in the error.

Signature

```
public String getFieldName()
```

Return Value

Type: String

`getMessage()`

Returns a message describing the error.

Signature

```
public String getMessage()
```

Return Value

Type: String

`getOffset()`

Returns the offset within the supplied body text where the error was discovered. If the offset cannot be determined, -1 is returned.

Signature

```
public Integer getOffset()
```

Return Value

Type: Integer

`getStatusCode()`

Returns a Salesforce API status code.

Signature

```
public System.StatusCode getStatusCode()
```

Return Value

Type: System.StatusCode

SendEmailError Class

Represents an error that the SendEmailResult object may contain.

Namespace

Messaging

SendEmailError Methods

The following are methods for `SendEmailError`. All are instance methods.

IN THIS SECTION:

getFields()
A list of one or more field names. Identifies which fields in the object, if any, affected the error condition.

getMessage()
The text of the error message.

getStatusCode()
Returns a code that characterizes the error.

getTargetObjectId()
The ID of the target record for which the error occurred.

getFields()

A list of one or more field names. Identifies which fields in the object, if any, affected the error condition.

Signature

```
public String[] getFields()
```

Return Value

Type: String[]

getMessage()

The text of the error message.

Signature

```
public String getMessage()
```

Return Value

Type: String

getStatusCode()

Returns a code that characterizes the error.

Signature

```
public System.StatusCode getStatusCode()
```

Return Value

Type: System.StatusCode

Usage

The full list of status codes is available in the WSDL file for your organization. For more information about accessing the WSDL file for your organization, see *Downloading Salesforce WSDLs and Client Authentication Certificates* in the Salesforce online help.

getTargetObjectId()

The ID of the target record for which the error occurred.

Signature

```
public String getTargetObjectId()
```

Return Value

Type: String

SendEmailResult Class

Contains the result of sending an email message.

Namespace

Messaging

SendEmailResult Methods

The following are methods for `SendEmailResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred during the `sendEmail` method, a `SendEmailError` object is returned.

isSuccess()
Indicates whether the email was successfully submitted for delivery (`true`) or not (`false`). Even if `isSuccess` is true, it does not mean the intended recipients received the email, as there could have been a problem with the email address or it could have bounced or been blocked by a spam blocker.

`getErrors()`

If an error occurred during the `sendEmail` method, a `SendEmailError` object is returned.

Signature

```
public SendEmailError[] getErrors()
```

Return Value

Type: Messaging.SendEmailError[]

`isSuccess()`

Indicates whether the email was successfully submitted for delivery (`true`) or not (`false`). Even if `isSuccess` is true, it does not mean the intended recipients received the email, as there could have been a problem with the email address or it could have bounced or been blocked by a spam blocker.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

SingleEmailMessage Class

Contains methods for sending single email messages.

Namespace

Messaging

Usage

SingleEmailMessage extends Email and inherits all of its methods. All base email (`Email` class) methods are also available to the `SingleEmailMessage` objects. Emails sent via SingleEmailMessage count against the sending organization's daily single email limit.

Email properties are readable and writable. Each property has corresponding setter and getter methods. For example, the `toAddresses()` property is equivalent to the `setToAddresses()` and `getToAddresses()` methods. Only the setter methods are documented. However, the `getTemplateName()` method doesn't have an equivalent setter method; use `setTemplateId()` to specify a template name.

IN THIS SECTION:

SingleEmailMessage Constructors

SingleEmailMessage Methods

SEE ALSO:

Email Class (Base Email Methods)

SingleEmailMessage Constructors

The following are constructors for `SingleEmailMessage`.

IN THIS SECTION:

SingleEmailMessage()
Creates a new instance of the `Messaging.SingleEmailMessage` class.

`SingleEmailMessage()`

Creates a new instance of the `Messaging.SingleEmailMessage` class.

Signature

```
public SingleEmailMessage()
```

SingleEmailMessage Methods

The following are methods for `SingleEmailMessage`. All are instance methods. All base email (`Email` class) methods are also available to the `SingleEmailMessage` objects. These methods are described in Email Class (Base Email Methods).

IN THIS SECTION:

getOneClickPost()

Optional. Returns a boolean value based on the value set by the `setOneClickPost` method. Default is `false`.

getTemplateName()

The name of the template used to create the email.

setBccAddresses(bccAddresses)

Optional. A list of blind carbon copy (BCC) addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of `toAddresses`, `ccAddresses`, and `bccAddresses` per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

setCcAddresses(ccAddresses)

Optional. A list of carbon copy (CC) addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of `toAddresses`, `ccAddresses`, and `bccAddresses` per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

setCharset(characterSet)

Optional. The character set for the email. If this value is null, the user's default value is used.

setDocumentAttachments(documentIds)

(Deprecated. Use `setEntityAttachments()` instead.) Optional. A list containing the ID of each document object you want to attach to the email.

setEntityAttachments(ids)

Optional. Array of IDs of Document, ContentVersion, or Attachment items to attach to the email.

setFileAttachments(fileNames)

Optional. A list containing the file names of the binary and text files you want to attach to the email.

setHtmlBody(htmlBody)

Optional. The HTML version of the email, specified by the sender. The value is encoded according to the specification associated with the organization. Specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

setInReplyTo(parentMessageIds)

Sets the optional In-Reply-To field of the outgoing email. This field identifies the email or emails to which this email is a reply (parent emails).

setOneClickPost(oneClickPost)

Optional. If set to true, a List-Unsubscribe-Post header is added to an email with List-Unsubscribe=One-Click. Use this method to support unsubscribe functionality in email sent via Salesforce. You can provide additional instructions on how to send unsubscribe requests by using the header. This includes specifying the HTTP method and content type to use and provides a secure way to add more info to unsubscribe requests. Default is `false`.

setOptOutPolicy(emailOptOutPolicy)

Optional. If you added recipients by ID instead of email address and the `Email Opt Out` option is set, this method determines the behavior of the `sendEmail()` call. If you add recipients by their email addresses, the opt-out settings for those recipients aren't checked and those recipients always receive the email.

setPlainTextBody(plainTextBody)

Optional. The text version of the email, specified by the sender. Specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

setOrgWideEmailAddressId(emailAddressId)

Optional. The ID of the organization-wide email address associated with the outgoing email. If you're using Apex to send emails from the guest user, set the sender to the verified org-wide email address or the emails are blocked. The object's `DisplayName` field cannot be set if the `setSenderDisplayName` field is already set.

setReferences(references)

Optional. The References field of the outgoing email. Identifies an email thread. Contains the parent emails' References and message IDs, and possibly the In-Reply-To fields.

setSubject(subject)

Optional. The email subject line. If you are using an email template, the subject line of the template overrides this value.

setTargetObjectId(targetObjectId)

Required if using a template, optional otherwise. The ID of the contact, lead, or user to which the email will be sent. The ID you specify sets the context and ensures that merge fields in the template contain the correct data.

setTemplateId(templateId)

Required if using a template, optional otherwise. The ID of the template used to create the email.

setToAddresses(toAddresses)

Optional. A list of email addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of `toAddresses`, `ccAddresses`, and `bccAddresses` per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

setTreatBodiesAsTemplate(treatAsTemplate)

Optional. If set to `true`, the subject, plain text, and HTML text bodies of the email are treated as template data. The merge fields are resolved using the `renderEmailTemplate` method. Default is `false`.

setTreatTargetObjectAsRecipient(treatAsRecipient)

Optional. If set to `true`, the `targetObjectId` (a contact, lead, or user) is the recipient of the email. If set to `false`, the `targetObjectId` is supplied as the `WhoId` field for template rendering but isn't a recipient of the email. The default is `true`.

setUnsubscribeComment(unsubscribeComment)

Optional. Sets a comment in the List-Unsubscribe email header. This comment is ignored by email clients and systems that parse the header. The comments contain human-readable notes or context for developers, administrators, or other stakeholders managing the email system.

setUnsubscribeUrls(UnsubscribeUrls)

Optional. Sets a `mailto` URI and HTTP URL of a mechanism for unsubscribing a recipient from an email list. A list of all unsubscribe URLs passed through `setUnsubscribeUrls` is added to the `List-Unsubscribe` header. A minimum of one URL is required to use this method.

setWhatId(whatId)

If you specify a contact for the `targetObjectId` field, you can specify an optional `whatId` as well. This helps to further ensure that merge fields in the template contain the correct data.

`getOneClickPost()`

Optional. Returns a boolean value based on the value set by the `setOneClickPost` method. Default is `false`.

Signature

```
public Boolean getOneClickPost()
```

Parameters

Type: Boolean

Return Value

Type: Boolean

Usage

Invoke the `setOneClickPost`method before using `getOneClickPost`. The value of `getOneClickPost` will be false if the `setOneClickPost`method is set to true only after invoking the `setUnsubscribeUrls` method.

`getTemplateName()`

The name of the template used to create the email.

Signature

```
public STRING getTemplateName()
```

Return Value

Type: String

Usage

There is no equivalent setter method for `getTemplateName()`. If the email didn't use a template, `getTemplateName()` returns nothing. If you use `setTemplateId()`, and then call `getTemplateName()`, the template name associated to the template ID is returned.

`setBccAddresses(bccAddresses)`

Optional. A list of blind carbon copy (BCC) addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of `toAddresses`, `ccAddresses`, and `bccAddresses` per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

Signature

```
public Void setBccAddresses(String[] bccAddresses)
```

Parameters

`bccAddresses`
Type: String[]

Return Value

Type: Void

Usage

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

If the BCC compliance option is set at the organization level, the user cannot add BCC addresses on standard messages. The following error code is returned: `BCC_NOT_ALLOWED_IF_BCC_ COMPLIANCE_ENABLED`. Contact your Salesforce representative for information on BCC compliance.

`setCcAddresses(ccAddresses)`

Optional. A list of carbon copy (CC) addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of `toAddresses`, `ccAddresses`, and `bccAddresses` per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

Signature

```
public Void setCcAddresses(String[] ccAddresses)
```

Parameters

`ccAddresses`
Type: String[]

Return Value

Type: Void

Usage

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

`setCharset(characterSet)`

Optional. The character set for the email. If this value is null, the user's default value is used.

Signature

```
public Void setCharset(String characterSet)
```

Parameters

characterSet
Type: String

Return Value

Type: Void

setDocumentAttachments(documentIds)

(Deprecated. Use `setEntityAttachments()` **instead.)** Optional. A list containing the ID of each document object you want to attach to the email.

Signature

```
public Void setDocumentAttachments(ID[] documentIds)
```

Parameters

documentIds
Type: ID[]

Return Value

Type: Void

Usage

You can attach multiple documents as long as the total size of all attachments does not exceed 10 MB.

setEntityAttachments(ids)

Optional. Array of IDs of Document, ContentVersion, or Attachment items to attach to the email.

Signature

```
public void setEntityAttachments(List<String> ids)
```

Parameters

ids
Type: List<String>

Return Value

Type: void

`setFileAttachments(fileNames)`

Optional. A list containing the file names of the binary and text files you want to attach to the email.

Signature

```
public Void setFileAttachments(EmailFileAttachment[] fileNames)
```

Parameters

`fileNames`
Type: Messaging.EmailFileAttachment[]

Return Value

Type: Void

Usage

You can attach multiple files as long as the total size of all attachments does not exceed 10 MB.

`setHtmlBody(htmlBody)`

Optional. The HTML version of the email, specified by the sender. The value is encoded according to the specification associated with the organization. Specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

Signature

```
public Void setHtmlBody(String htmlBody)
```

Parameters

`htmlBody`
Type: String

Return Value

Type: Void

`setInReplyTo(parentMessageIds)`

Sets the optional In-Reply-To field of the outgoing email. This field identifies the email or emails to which this email is a reply (parent emails).

Signature

```
public Void setInReplyTo(String parentMessageIds)
```

Parameters

parentMessageIds
Type: String

Contains one or more parent email message IDs.

Return Value

Type: Void

setOneClickPost(oneClickPost)

Optional. If set to true, a List-Unsubscribe-Post header is added to an email with List-Unsubscribe=One-Click. Use this method to support unsubscribe functionality in email sent via Salesforce. You can provide additional instructions on how to send unsubscribe requests by using the header. This includes specifying the HTTP method and content type to use and provides a secure way to add more info to unsubscribe requests. Default is `false`.

Signature

```
public void setOneClickPost(Boolean oneClickPost)
```

Parameters

oneClickPost
Type: Boolean

Return Value

Type: void

Usage

You can set the `oneClickPost` method to true only after invoking the `setUnsubscribeUrls` method. If set to true, pass at least one HTTPS unsubscribe URL to unsubscribe.

Example

This example demonstrates how to send an email using Salesforce's `Messaging.SingleEmailMessage` class with enhanced unsubscribe functionality. It creates an email message with a recipient, subject, and body, and includes an unsubscribe URL. It also enables the `oneClickPost` feature, allowing for a simplified unsubscribe process. The email message is added to a list and sent using the `Messaging.sendEmail` method.

```
Messaging.SingleEmailMessage message = new Messaging.SingleEmailMessage();
// Set the recipient's email address
// Replace IDs with valid record IDs in your org.
message.toAddresses = new String[] { '003D000000QDexS' };
message.subject = 'Test Message';
message.plainTextBody = 'This is the message body.';

// Create a list to hold unsubscribe URLs
List<String> unsubscribeUrls = new List<String>();
```

```
unsubscribeUrls.add('https://example.com/unsubscribe.html?opaque=123456789');

// Assign the unsubscribe URLs to the email message
message.unsubscribeUrls = unsubscribeUrls;

// Enable the one-click unsubscribe feature
message.oneClickPost = true;

Messaging.SingleEmailMessage[] messages =
    new List<Messaging.SingleEmailMessage> {message};
Messaging.SendEmailResult[] results = Messaging.sendEmail(messages);

if (results[0].success) {
    System.debug('The email was sent successfully.');
} else {
    System.debug('The email failed to send: '
          + results[0].errors[0].message);
}
```

setOptOutPolicy(emailOptOutPolicy)

Optional. If you added recipients by ID instead of email address and the `Email Opt Out` option is set, this method determines the behavior of the `sendEmail()` call. If you add recipients by their email addresses, the opt-out settings for those recipients aren't checked and those recipients always receive the email.

Signature

```
public void setOptOutPolicy(String emailOptOutPolicy)
```

Parameters

`emailOptOutPolicy`
Type: String

Possible values of the *`emailOptOutPolicy`* parameter are:

- `SEND` (default)—The email is sent to all recipients. The recipients' `Email Opt Out` setting is ignored. The setting Enforce email privacy settings is ignored.
- `FILTER`—No email is sent to recipients that have the `Email Opt Out` option set. Emails are sent to the other recipients. The setting Enforce email privacy settings is ignored.
- `REJECT`—If any of the recipients have the `Email Opt Out` option set, `sendEmail()` throws an error and no email is sent. The setting Enforce email privacy settings is respected, as are the selections in the data privacy record based on the Individual object. If any of the recipients have Don't Market, Don't Process, or Forget This Individual selected, `sendEmail()` throws an error and no email is sent.

Return Value

Type: void

Example

This example shows how to send an email with the opt-out setting enforced. Recipients are specified by their IDs. The `FILTER` option causes the email to be sent only to recipients that haven't opted out from email. This example uses dot notation of the email properties, which is equivalent to using the set methods.

```
Messaging.SingleEmailMessage message = new Messaging.SingleEmailMessage();
// Set recipients to two contact IDs.
// Replace IDs with valid record IDs in your org.
message.toAddresses = new String[] { '003D000000QDexS', '003D000000QDfW5' };
message.optOutPolicy = 'FILTER';
message.subject = 'Opt Out Test Message';
message.plainTextBody = 'This is the message body.';
Messaging.SingleEmailMessage[] messages =
    new List<Messaging.SingleEmailMessage> {message};
        Messaging.SendEmailResult[] results = Messaging.sendEmail(messages);
if (results[0].success) {
    System.debug('The email was sent successfully.');
} else {
    System.debug('The email failed to send: '
          + results[0].errors[0].message);
}
```

setPlainTextBody(plainTextBody)

Optional. The text version of the email, specified by the sender. Specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

Signature

```
public Void setPlainTextBody(String plainTextBody)
```

Parameters

plainTextBody
Type: String

Return Value

Type: Void

setOrgWideEmailAddressId(emailAddressId)

Optional. The ID of the organization-wide email address associated with the outgoing email. If you're using Apex to send emails from the guest user, set the sender to the verified org-wide email address or the emails are blocked. The object's `DisplayName` field cannot be set if the `setSenderDisplayName` field is already set.

Signature

```
public Void setOrgWideEmailAddressId(ID emailAddressId)
```

Parameters

emailAddressId
Type: ID

Usage

After you create an org-wide email address, you're sent a confirmation email to verify it. Copy the Id from the URL and use the *setOrgWideEmailAddressId(Id)* method on your instance of *Messaging.SingleEmailMessage*.

To avoid hard-coding an ID, after creating your org-wide email address, you can query them.

```
OrgWideEmailAddress[] owea = [select Id from OrgWideEmailAddress where Address =
'doNotReply@<somedomain>.com'];
Messaging.SingleEmailMessage mail = new Messaging.SingleEmailMessage();
if ( owea.size() > 0 ) {
    mail.setOrgWideEmailAddressId(owea.get(0).Id);
}
```

Return Value

Type: Void

setReferences(references)

Optional. The References field of the outgoing email. Identifies an email thread. Contains the parent emails' References and message IDs, and possibly the In-Reply-To fields.

Signature

```
public Void setReferences(String references)
```

Parameters

references
Type: String

Return Value

Type: Void

setSubject(subject)

Optional. The email subject line. If you are using an email template, the subject line of the template overrides this value.

Signature

```
public Void setSubject(String subject)
```

Parameters

subject
Type: String

Return Value

Type: Void

setTargetObjectId(targetObjectId)

Required if using a template, optional otherwise. The ID of the contact, lead, or user to which the email will be sent. The ID you specify sets the context and ensures that merge fields in the template contain the correct data.

Signature

```
public Void setTargetObjectId(ID targetObjectId)
```

Parameters

targetObjectId
Type: ID

Return Value

Type: Void

Usage

Do not specify the IDs of records that have the `Email Opt Out` option selected.

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

setTemplateId(templateId)

Required if using a template, optional otherwise. The ID of the template used to create the email.

Signature

```
public Void setTemplateId(ID templateId)
```

Parameters

templateId
Type: ID

Return Value

Type: Void

setToAddresses(toAddresses)

Optional. A list of email addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum size for this field is 4,000 bytes. The maximum total of `toAddresses`, `ccAddresses`, and `bccAddresses` per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

Signature

```
public Void setToAddresses(String[] toAddresses)
```

Parameters

toAddresses
Type: String[]

Return Value

Type: Void

Usage

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

setTreatBodiesAsTemplate(treatAsTemplate)

Optional. If set to `true`, the subject, plain text, and HTML text bodies of the email are treated as template data. The merge fields are resolved using the `renderEmailTemplate` method. Default is `false`.

Signature

```
public void setTreatBodiesAsTemplate(Boolean treatAsTemplate)
```

Parameters

treatAsTemplate
Type: Boolean

Return Value

Type: void

setTreatTargetObjectAsRecipient(treatAsRecipient)

Optional. If set to `true`, the `targetObjectId` (a contact, lead, or user) is the recipient of the email. If set to `false`, the `targetObjectId` is supplied as the `WhoId` field for template rendering but isn't a recipient of the email. The default is `true`.

Signature

```
public void setTreatTargetObjectAsRecipient(Boolean treatAsRecipient)
```

Parameters

treatAsRecipient
Type: Boolean

Return Value

Type: void

Usage

Note: You can set TO, CC, and BCC addresses using the email messaging methods regardless of whether a template is used for the email or the target object is a recipient.

setUnsubscribeComment(unsubscribeComment)

Optional. Sets a comment in the List-Unsubscribe email header. This comment is ignored by email clients and systems that parse the header. The comments contain human-readable notes or context for developers, administrators, or other stakeholders managing the email system.

Signature

```
public void setUnsubscribeComment(String unsubscribeComment)
```

Parameters

unsubscribeComment
Type: String

Return Value

Type: void

Usage

Invoke the `setUnsubscribeUrls` method before using `setUnsubscribeComment`.

Example

This example demonstrates how to send an email using Salesforce's `Messaging.SingleEmailMessage` class with an option to include an unsubscribe link. It creates an email message with a recipient, subject, and body, and includes an unsubscribe URL that directs the recipient to send an unsubscribe request via email. Additionally, it sets an `unsubscribeComment` to provide context for the unsubscribe action.

```
Messaging.SingleEmailMessage message = new Messaging.SingleEmailMessage();
// Set the recipient's email address
// Replace IDs with valid record IDs in your org
message.toAddresses = new String[] { '003D000000QDexS' };
```

```
message.subject = 'Test Message';
message.plainTextBody = 'This is the message body.';

// Create a list to hold unsubscribe URLs
List<String> unsubscribeUrls = new List<String>();
unsubscribeUrls.add('mailto:listrequest@example.com?subject=unsubscribe');

// Assign the unsubscribe URLs to the email message
message.unsubscribeUrls = unsubscribeUrls;

// Set an unsubscribe comment to provide context for the unsubscribe action
message.unsubscribeComment = 'email unsubscribe support';

Messaging.SingleEmailMessage[] messages =
    new List<Messaging.SingleEmailMessage> {message};
Messaging.SendEmailResult[] results = Messaging.sendEmail(messages);

if (results[0].success) {
    System.debug('The email was sent successfully.');
} else {
    System.debug('The email failed to send: '
          + results[0].errors[0].message);
}
```

`setUnsubscribeUrls(UnsubscribeUrls)`

Optional. Sets a `mailto` URI and HTTP URL of a mechanism for unsubscribing a recipient from an email list. A list of all unsubscribe URLs passed through `setUnsubscribeUrls` is added to the `List-Unsubscribe` header. A minimum of one URL is required to use this method.

Signature

```
public void setUnsubscribeUrls(List<String> unsubscribeUrls)
```

Parameters

`UnsubscribeUrls`

Type: List<String>

Return Value

Type: void

Usage

Provide a list of URLs that support unsubscribe functionality by offering recipients multiple ways to opt-out of future communications. Each provided URL can use different protocols to allow for technical capacities of the recipient.

All `setUnsubscribeUrls` must have a value of one of these types:

- `Mailto`: Allows recipients to send an unsubscribe request via email.
  - Example: `mailto:listrequest@example.com?subject=unsubscribe`
- `HTTP`: Directs recipients to a web page where they can unsubscribe.
  - Example: `http://example.com/unsubscribe.html?opaque=123456789`
- `HTTPS`: Directs recipients to a secure web page to unsubscribe.
  - Example: `https://example.com/unsubscribe.html?opaque=123456789`

Example

This example demonstrates how to send an email using Salesforce's `Messaging.SingleEmailMessage` class that includes an option to include an unsubscribe link for a user to click. It creates an email message, sets the recipient's email address, subject, and body, and includes an unsubscribe URL. The email message is added to a list and sent using the `Messaging.sendEmail` method.

```
Messaging.SingleEmailMessage message = new Messaging.SingleEmailMessage();
// Set the recipient's email address
// Replace IDs with valid record IDs in your org.
message.toAddresses = new String[] { '003D000000QDexS' };
message.subject = 'Test Message';
message.plainTextBody = 'This is the message body.';

// Create a list to hold unsubscribe URLs
List<String> unsubscribeUrls = new List<String>();
unsubscribeUrls.add('https://example.com/unsubscribe.html?opaque=123456789');

// Assign the unsubscribe URLs to the email message
message.unsubscribeUrls = unsubscribeUrls;

Messaging.SingleEmailMessage[] messages =
    new List<Messaging.SingleEmailMessage> {message};
Messaging.SendEmailResult[] results = Messaging.sendEmail(messages);

if (results[0].success) {
    System.debug('The email was sent successfully.');
} else {
    System.debug('The email failed to send: '
          + results[0].errors[0].message);
}
```

`setWhatId(whatId)`

If you specify a contact for the `targetObjectId` field, you can specify an optional `whatId` as well. This helps to further ensure that merge fields in the template contain the correct data.

Signature

```
public Void setWhatId(ID whatId)
```

Parameters

whatId
Type: ID

Return Value

Type: Void

Usage

The value must be one of the following types:

- Account
- Asset
- Campaign
- Case
- Contract
- Opportunity
- Order
- Product
- Solution
- Custom

Metadata Namespace

The `Metadata` namespace provides classes and methods for working with custom metadata in Salesforce

Salesforce uses metadata types and components to represent org configuration and customization. Metadata is used for org settings that admins control or configuration information applied by installed apps and packages. Use the classes in the `Metadata` namespace to access metadata from within Apex code.

Metadata access in Apex is available for Apex classes using API version 40.0 and later.

For more information, see Metadata.

The following are the classes in the `Metadata` namespace.

IN THIS SECTION:

AnalyticsCloudComponentLayoutItem Class
Represents the settings for a Wave Analytics dashboard on a standard or custom page.

ConsoleComponent Class
Represents a custom console component on a section of a page layout.

Container Class
Represents a location and style in which to display more than one custom console component in the sidebars of the console.

CustomConsoleComponents Class
Represents custom console components (Visualforce pages, lookup fields, or related lists) on a page layout.

CustomMetadata Class

Represents records of custom metadata types.

CustomMetadataValue Class

Represents custom metadata values for a custom metadata component.

DeployCallback Interface

An interface for metadata deployment callback classes.

DeployCallbackContext Class

Represents context information for a deployment job.

DeployContainer Class

Represents a container for custom metadata components to be deployed.

DeployDetails Class

Contains detailed information on deployed components.

DeployMessage Class

Represents result information for the deployment of a metadata component.

DeployProblemType Enum

Describes the problem type for an unsuccessful component deploy.

DeployResult Class

Represents the results of a metadata deployment.

DeployStatus Enum

The result status of a deployment.

FeedItemTypeEnum Enum

The type of feed item in a feed-based page layout.

FeedLayout Class

Represents the values that define the feed view of a feed-based page layout. Feed-based layouts are available on Account, Case, Contact, Lead, Opportunity, custom, and external objects. They include a feed view and a detail view.

FeedLayoutComponent Class

Represents a component in the feed view of a feed-based page layout.

FeedLayoutComponentType Enum

Indicates the type of feed layout component.

FeedLayoutFilter Class

Represents a feed filter option in the feed view of a feed-based page layout. A filter can have only `standardFilter` or `feedItemType` set.

FeedLayoutFilterPosition Enum

Describes where the feed filters list is included in the layout.

FeedLayoutFilterType Enum

The type of feed layout filter.

Layout Class

Represents the metadata associated with a page layout.

LayoutColumn Class

Represents the items in a column within a layout section.

LayoutHeader Enum

Represents tagging types used for `Metadata.Layout.headers`

LayoutItem Class

Represents the valid values that define a layout item.

LayoutSection Class

Represents a section of a page layout, such as the Custom Links section.

LayoutSectionStyle Enum

Describes the possible styles for a layout section.

Metadata Class

An abstract base class that represents a custom metadata component.

MetadataType Enum

Represents the custom metadata components available in Apex.

MetadataValue Class

An abstract base class that represents a custom metadata component field.

MiniLayout Class

Represents a mini view of a record in the Console tab, hover details, and event overlays.

Operations Class

Represents a class to execute metadata operations, such as retrieving or deploying custom metadata.

PlatformActionList Class

Represents the list of actions, and their order, that display in the Salesforce mobile action bar for the layout.

PlatformActionListContextEnum Enum

Describes the different contexts of action lists.

PlatformActionListItem Class

Represents an action in the platform action list for a layout.

PlatformActionTypeEnum Enum

The type of action for a `PlatformActionListItem`.

PrimaryTabComponents Class

Represents custom console components on primary tabs in the Salesforce console.

QuickActionList Class

Represents the list of actions associated with the page layout.

QuickActionListItem Class

Represents an action in the `QuickActionList`.

RelatedContent Class

Represents the Mobile Cards section of the page layout.

RelatedContentItem Class

Represents an individual item in the `RelatedContent` list.

RelatedList Class

Represents related list custom components on the sidebars of the Salesforce console.

RelatedListItem Class

Represents an item in the related list in a page layout.

ReportChartComponentLayoutItem Class

Represents the settings for a report chart on a standard or custom page.

ReportChartComponentSize Enum

Describes the size of the displayed report chart component.

SidebarComponent Class

Represents a specific custom console component to display in a container that hosts multiple components in one of the sidebars of the Salesforce console.

SortOrder Enum

Describes the sort order of a related list.

StatusCode Enum

Describes the status code for an unsuccessful component deploy.

SubtabComponents Class

Represents custom console components on subtabs in the Salesforce console.

SummaryLayoutStyleEnum Enum

Describes the highlights panel style for a `SummaryLayout`.

SummaryLayout Class

Controls the appearance of the highlights panel, which summarizes key fields in a grid at the top of a page layout, when Case Feed is enabled.

SummaryLayoutItem Class

Controls the appearance of an individual field and its column and row position within the highlights panel grid, when Case Feed is enabled. You can have two fields per each grid in a highlights panel.

UiBehavior Enum

Describes the behavior for a layout item on a layout page.

AnalyticsCloudComponentLayoutItem Class

Represents the settings for a Wave Analytics dashboard on a standard or custom page.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "AnalyticsCloudComponentLayoutItem" in the *Metadata API Developer Guide*.

IN THIS SECTION:

AnalyticsCloudComponentLayoutItem Properties

AnalyticsCloudComponentLayoutItem Methods

AnalyticsCloudComponentLayoutItem Properties

The following are properties for `AnalyticsCloudComponentLayoutItem`.

IN THIS SECTION:

assetType
Specifies the type of Wave Analytics asset.

devName
Unique development name of the dashboard to add.

error
An error string that is populated only when an error occurred in the underlying dashboard.

filter
Dashboard filters for mapping data fields in the dashboard to the object's fields.

height
Specifies the height of the dashboard, in pixels.

hideOnError
Controls whether users see a dashboard that has an error.

showHeader
If `true`, includes the dashboard's header bar. If `false`, the dashboard appears without a header bar.

showSharing
If set to true, and the dashboard is shareable the dashboard shows the Share icon. If set to false, the dashboard doesn't show the Share icon.

showTitle
If true, includes the dashboard's title above the dashboard. If false, the dashboard appears without a title.

width
Specifies the width of the dashboard, in pixels or percentage.

assetType

Specifies the type of Wave Analytics asset.

Signature

```
public String assetType {get; set;}
```

Property Value

Type: String

devName

Unique development name of the dashboard to add.

Signature

```
public String devName {get; set;}
```

Property Value

Type: String

error

An error string that is populated only when an error occurred in the underlying dashboard.

Signature

```
public String error {get; set;}
```

Property Value

Type: String

filter

Dashboard filters for mapping data fields in the dashboard to the object's fields.

Signature

```
public String filter {get; set;}
```

Property Value

Type: String

height

Specifies the height of the dashboard, in pixels.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: Integer

hideOnError

Controls whether users see a dashboard that has an error.

Signature

```
public Boolean hideOnError {get; set;}
```

Property Value

Type: Boolean

showHeader

If `true`, includes the dashboard's header bar. If `false`, the dashboard appears without a header bar.

Signature

```
public Boolean showHeader {get; set;}
```

Property Value

Type: Boolean

showSharing

If set to true, and the dashboard is shareable the dashboard shows the Share icon. If set to false, the dashboard doesn't show the Share icon.

Signature

```
public Boolean showSharing {get; set;}
```

Property Value

Type: Boolean

showTitle

If true, includes the dashboard's title above the dashboard. If false, the dashboard appears without a title.

Signature

```
public Boolean showTitle {get; set;}
```

Property Value

Type: Boolean

width

Specifies the width of the dashboard, in pixels or percentage.

Signature

```
public String width {get; set;}
```

Property Value

Type: String

AnalyticsCloudComponentLayoutItem Methods

The following are methods for `AnalyticsCloudComponentLayoutItem`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.AnalyticsCloudComponentLayoutItem`.

`clone()`

Makes a duplicate copy of the `Metadata.AnalyticsCloudComponentLayoutItem`.

Signature

```
public Object clone()
```

Return Value

Type: Object

ConsoleComponent Class

Represents a custom console component on a section of a page layout.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "ConsoleComponent" in the *Metadata API Developer Guide*.

IN THIS SECTION:

ConsoleComponent Properties

ConsoleComponent Methods

ConsoleComponent Properties

The following are properties for `ConsoleComponent`.

IN THIS SECTION:

height
The height of the custom console component in pixels.

location
The location of the custom console component on the page layout. Valid values are right, left, top, and bottom.

visualforcePage
The unique name of the custom console component.

width
The width of the custom console component in pixels.

height

The height of the custom console component in pixels.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: Integer

location

The location of the custom console component on the page layout. Valid values are right, left, top, and bottom.

Signature

```
public String location {get; set;}
```

Property Value

Type: String

visualforcePage

The unique name of the custom console component.

Signature

```
public String visualforcePage {get; set;}
```

Property Value

Type: String

width

The width of the custom console component in pixels.

Signature

```
public Integer width {get; set;}
```

Property Value

Type: Integer

ConsoleComponent Methods

The following are methods for `ConsoleComponent`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.ConsoleComponent`.

`clone()`

Makes a duplicate copy of the `Metadata.ConsoleComponent`.

Signature

```
public Object clone()
```

Return Value

Type: Object

Container Class

Represents a location and style in which to display more than one custom console component in the sidebars of the console.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "Container" in the *Metadata API Developer Guide*.

IN THIS SECTION:

Container Properties

Container Methods

Container Properties

The following are properties for `Container`.

IN THIS SECTION:

height
The height of the component's container. The `unit` property determines the unit of measurement, in pixels or percent.

isContainerAutoSizeEnabled
If set to true, stacked console components in the sidebars autosize vertically.

region
The location of the component's container (right, left, bottom, top).

sidebarComponents
Represents a specific custom console component to display in the components' container.

style
The style of the container in which to display multiple components (stack, tab, accordion).

unit
The unit of measurement, in pixels or percent, for the height or width of the components' container.

width
The width of the component's container. The `unit` property determines the unit of measurement, in pixels or percent.

`height`

The height of the component's container. The `unit` property determines the unit of measurement, in pixels or percent.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: Integer

`isContainerAutoSizeEnabled`

If set to true, stacked console components in the sidebars autosize vertically.

Signature

```
public Boolean isContainerAutoSizeEnabled {get; set;}
```

Property Value

Type: Boolean

`region`

The location of the component's container (right, left, bottom, top).

Signature

```
public String region {get; set;}
```

Property Value

Type: String

`sidebarComponents`

Represents a specific custom console component to display in the components' container.

Signature

```
public List<Metadata.SidebarComponent> sidebarComponents {get; set;}
```

Property Value

Type: List<Metadata.SidebarComponent>

`style`

The style of the container in which to display multiple components (stack, tab, accordion).

Signature

```
public String style {get; set;}
```

Property Value

Type: String

`unit`

The unit of measurement, in pixels or percent, for the height or width of the components' container.

Signature

```
public String unit {get; set;}
```

Property Value

Type: String

`width`

The width of the component's container. The `unit` property determines the unit of measurement, in pixels or percent.

Signature

```
public Integer width {get; set;}
```

Property Value

Type: Integer

Container Methods

The following are methods for `Container`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.Container`.

`clone()`

Makes a duplicate copy of the `Metadata.Container`.

Signature

```
public Object clone()
```

Return Value

Type: Object

CustomConsoleComponents Class

Represents custom console components (Visualforce pages, lookup fields, or related lists) on a page layout.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "CustomConsoleComponents" in the *Metadata API Developer Guide*.

IN THIS SECTION:

CustomConsoleComponents Properties

CustomConsoleComponents Methods

CustomConsoleComponents Properties

The following are properties for `CustomConsoleComponents`.

IN THIS SECTION:

primaryTabComponents
Represents custom console components on primary tabs in the Salesforce console.

subtabComponents
Represents custom console components on subtabs in the Salesforce console.

primaryTabComponents

Represents custom console components on primary tabs in the Salesforce console.

Signature

```
public Metadata.PrimaryTabComponents primaryTabComponents {get; set;}
```

Property Value

Type: Metadata.PrimaryTabComponents

subtabComponents

Represents custom console components on subtabs in the Salesforce console.

Signature

```
public Metadata.SubtabComponents subtabComponents {get; set;}
```

Property Value

Type: Metadata.SubtabComponents

CustomConsoleComponents Methods

The following are methods for `CustomConsoleComponents`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.CustomConsoleComponents`.

clone()

Makes a duplicate copy of the `Metadata.CustomConsoleComponents`.

Signature

```
public Object clone()
```

Return Value

Type: Object

CustomMetadata Class

Represents records of custom metadata types.

Warning: Protected custom metadata types behave like public custom metadata types when they are outside of a managed package. Public custom metadata types are readable for all profiles, including the guest user. Do not store secrets, personally identifying information, or any private data in these records. Use protected custom metadata types only in managed packages. Outside of a managed package, use named credentials or encrypted custom fields to store secrets like OAuth tokens, passwords, and other confidential material.

Namespace

Metadata

Usage

Use `Metadata.CustomMetadata` to represent records of custom metadata types in Apex. For more information, see Custom Metadata Types in the *Metadata API Developer Guide*.

Example

```
// Set up custom metadata to be created in the subscriber org.
    Metadata.CustomMetadata customMetadata =  new Metadata.CustomMetadata();
    customMetadata.fullName = 'ISVNamespace__MetadataTypeName.MetadataRecordName';

    Metadata.CustomMetadataValue customField = new Metadata.CustomMetadataValue();
    customField.field = 'customField__c';
    customField.value = 'New value';

    customMetadata.values.add(customField);
```

Note: When you assign namespaces to records, provide full, qualified record names to the app. If both the type and the record are in *Namespace*, use something like: `customMetadata.fullName = '`***`Namespace`***`__MetadataTypeName.`***`Namespace`***`__MetadataRecordName'`

IN THIS SECTION:

- CustomMetadata Properties
- CustomMetadata Methods

CustomMetadata Properties

The following are properties for `CustomMetadata`.

IN THIS SECTION:

description
The description of the custom metadata.

label
The label of the custom metadata record.

protected_x
Property that describes whether the custom metadata record is a protected component.

values
A list of custom metadata values, such as custom fields, for the custom metadata record.

description

The description of the custom metadata.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

label

The label of the custom metadata record.

Signature

```
public String label {get; set;}
```

Property Value

Type: String

protected_x

Property that describes whether the custom metadata record is a protected component.

Signature

```
public Boolean protected_x {get; set;}
```

Property Value

Type: Boolean

values

A list of custom metadata values, such as custom fields, for the custom metadata record.

Signature

```
public List<Metadata.CustomMetadataValue> values {get; set;}
```

Property Value

Type: List<Metadata.CustomMetadataValue>

CustomMetadata Methods

The following are methods for `CustomMetadata`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.CustomMetadata`.

`clone()`

Makes a duplicate copy of the `Metadata.CustomMetadata`.

Signature

```
public Object clone()
```

Return Value

Type: Object

CustomMetadataValue Class

Represents custom metadata values for a custom metadata component.

Namespace

Metadata

Usage

Use `Metadata.CustomMetadataValue` to access values for custom fields of custom metadata records.

Supported Apex primitive types are:

- Boolean
- Date
- DateTime
- Decimal
- Double
- Integer
- Long

- String

Example

```
// Set a custom field value for a custom metadata record
Metadata.CustomMetadataValue customField = new Metadata.CustomMetadataValue();
customField.field = 'CustomField1__c';
customField.value = 'New Value';
customMetadata.values.add(customField);
```

IN THIS SECTION:

CustomMetadataValue Properties

CustomMetadataValue Methods

CustomMetadataValue Properties

The following are properties for `CustomMetadataValue`.

IN THIS SECTION:

field
The field name for the custom metadata value.

value
The field value for the custom metadata value.

field

The field name for the custom metadata value.

Signature

```
public String field {get; set;}
```

Property Value

Type: String

value

The field value for the custom metadata value.

Signature

```
public Object value {get; set;}
```

Property Value

Type: Object

Supported Apex primitive types are:

- Boolean
- Date
- DateTime
- Decimal
- Double
- Integer
- Long
- String

When setting the value for relationship fields, use the qualified API name of the related metadata, not the ID.

For more information, see Primitive Data Types.

CustomMetadataValue Methods

The following are methods for `CustomMetadataValue`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.CustomMetadataValue`.

`clone()`

Makes a duplicate copy of the `Metadata.CustomMetadataValue`.

Signature

```
public Object clone()
```

Return Value

Type: Object

DeployCallback Interface

An interface for metadata deployment callback classes.

Namespace

Metadata

Usage

You must provide a callback class for the asynchronous deployment of custom metadata through Apex. This class must implement the `Metadata.DeployCallback` interface.

Salesforce calls your `DeployCallback.handleResult()` method asynchronously once the queued deployment completes. Because the callback is called as asynchronous Apex after deployment, there may be a brief period where the deploy has completed, but your callback has not been called yet.

IN THIS SECTION:

DeployCallback Methods

DeployCallback Example Implementation

DeployCallback Methods

The following are methods for `DeployCallback`.

IN THIS SECTION:

handleResult(var1, var2)
Method that is called when the asynchronous deployment of custom metadata completes.

`handleResult(var1, var2)`

Method that is called when the asynchronous deployment of custom metadata completes.

Signature

```
public void handleResult(Metadata.DeployResult var1, Metadata.DeployCallbackContext
var2)
```

Parameters

var1
Type: Metadata.DeployResult

The results of the asynchronous deployment.

var2
Type: Metadata.DeployCallbackContext

The context for the queued asynchronous deployment job.

Return Value

Type: void

DeployCallback Example Implementation

This is an example implementation of the `Metadata.DeployCallback` interface.

```
public class MyCallback implements Metadata.DeployCallback {
    public void handleResult(Metadata.DeployResult result,
                             Metadata.DeployCallbackContext context) {
        if (result.status == Metadata.DeployStatus.Succeeded) {
            // Deployment was successful
```

```
        } else {
            // Deployment was not successful
        }
    }
}
```

The following example uses this implementation for a deployment.

```
// Setup callback and deploy
MyCallback callback = new MyCallback();
Metadata.Operations.enqueueDeployment(mdContainer, callback);
```

DeployCallbackContext Class

Represents context information for a deployment job.

Namespace

Metadata

Usage

After an asynchronous metadata deployment finishes, Salesforce provides an instance of`Metadata.DeployCallbackContext` in an asynchronous call to your implementation of `handleResult()` in your `Metadata.DeployCallback` class.

Example

```
public void handleResult(Metadata.DeployResult result,
                         Metadata.DeployCallbackContext context) {
  // Check the callback job ID for the deployment
  Id jobId = context.getCallbackJobId();
  // ...process the results...
}
```

IN THIS SECTION:

DeployCallbackContext Methods

DeployCallbackContext Methods

The following are methods for `DeployCallbackContext`.

IN THIS SECTION:

clone()

Makes a duplicate copy of the `Metadata.DeployCallbackContext`.

getCallbackJobId()

Gets the asynchronous Apex job ID for the callback job.

`clone()`

Makes a duplicate copy of the `Metadata.DeployCallbackContext`.

Signature

```
public Object clone()
```

Return Value

Type: Object

`getCallbackJobId()`

Gets the asynchronous Apex job ID for the callback job.

Signature

```
public Id getCallbackJobId()
```

Return Value

Type: Id

DeployContainer Class

Represents a container for custom metadata components to be deployed.

Namespace

Metadata

Usage

Use `Metadata.DeployContainer` to manage custom metadata components for deployment. A container must have one or more components before being deployed.

Example

```
// Use DeployContainer for deployment
Metadata.DeployContainer mdContainer = new Metadata.DeployContainer();
mdContainer.addMetadata(customMetadata);

...

// Enqueue deploy
Metadata.Operations.enqueueDeployment(mdContainer, callback);
```

IN THIS SECTION:

DeployContainer Methods

DeployContainer Methods

The following are methods for `DeployContainer`.

IN THIS SECTION:

addMetadata(md)
Add a custom metadata component to the container.

clone()
Makes a duplicate copy of the `Metadata.DeployContainer`.

getMetadata()
Retrieves a list of custom metadata components from the container.

removeMetadata(md)
Removes a metadata component from the container.

removeMetadataByFullName(fullName)
Removes a metadata component from the container using the component's full name.

`addMetadata(md)`

Add a custom metadata component to the container.

Signature

```
public void addMetadata(Metadata.Metadata md)
```

Parameters

md

Type: Metadata.Metadata

A custom metadata component class that derives from `Metadata.Metadata`. Avoid adding components to a `Metadata.DeployContainer`that have the same `Metadata.Metadata.fullName` because it causes deployment errors.

Return Value

Type: void

`clone()`

Makes a duplicate copy of the `Metadata.DeployContainer`.

Signature

```
public Object clone()
```

Return Value

Type: Object

`getMetadata()`

Retrieves a list of custom metadata components from the container.

Signature

```
public List<Metadata.Metadata> getMetadata()
```

Return Value

Type: List<Metadata.Metadata>

`removeMetadata(md)`

Removes a metadata component from the container.

Signature

```
public Boolean removeMetadata(Metadata.Metadata md)
```

Parameters

md
Type: Metadata.Metadata

Metadata component to remove.

Return Value

Type: Boolean

Returns `true` if the container changed as a result of the call.

`removeMetadataByFullName(fullName)`

Removes a metadata component from the container using the component's full name.

Signature

```
public Boolean removeMetadataByFullName(String fullName)
```

Parameters

fullName
Type: String

Full name of the component to remove.

Return Value

Type: Boolean

Returns `true` if the container changed as a result of the call.

DeployDetails Class

Contains detailed information on deployed components.

Namespace

Metadata

Usage

Use this class to obtain a list of the successfully and unsuccessfully deployed components after a completed deployment by Salesforce in your `Metadata.DeployCallback` results.

IN THIS SECTION:

DeployDetails Properties

DeployDetails Methods

DeployDetails Properties

The following are properties for `DeployDetails`.

IN THIS SECTION:

componentFailures
Contains a list of information about components that failed to deploy.

componentSuccesses
Contains a list of information about components that deployed successfully.

`componentFailures`

Contains a list of information about components that failed to deploy.

Signature

```
public List<Metadata.DeployMessage> componentFailures {get; set;}
```

Property Value

Type: List<Metadata.DeployMessage>

`componentSuccesses`

Contains a list of information about components that deployed successfully.

Signature

```
public List<Metadata.DeployMessage> componentSuccesses {get; set;}
```

Property Value

Type: List<Metadata.DeployMessage>

DeployDetails Methods

The following are methods for `DeployDetails`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.DeployDetails`.

`clone()`

Makes a duplicate copy of the `Metadata.DeployDetails`.

Signature

```
public Object clone()
```

Return Value

Type: Object

DeployMessage Class

Represents result information for the deployment of a metadata component.

Namespace

Metadata

Usage

Use `DeployMessage` to access detailed information about component deployments. Salesforce provides a list of `DeployMessages` for a completed deployment via the `DeployDetails` and `DeployResults` instances sent in the `DeployCallback.handleResult()` callback.

IN THIS SECTION:

DeployMessage Properties
DeployMessage Methods

DeployMessage Properties

The following are properties for `DeployMessage`.

IN THIS SECTION:

changed

Determines whether the component was changed after deployment. If true, the component was changed as a result of the deployment. If false, the deployed component was the same as the corresponding component already in the org.

columnNumber

Each component is represented by a text file. If an error occurs during deployment, this property represents the column of the text file where the error occurred.

componentType

The metadata type of the component in the deployment.

created

If true, the component was created as a result of the deployment. If false, the component was modified as a result of the deployment.

createdDate

The date and time when the component was created as a result of the deployment.

deleted

If true, the component was deleted as a result of the deployment. If false, the component was either new or modified as result of the deployment.

fileName

The name of the file in the metadata archive used to deploy the component.

fullName

Full name for the custom metadata component.

id

ID of the component that was deployed.

lineNumber

Each component is represented by a text file. If an error occurs during deployment, this field represents the line number of the text file where the error occurred.

problem

If an error or warning occurred, this field contains a description of the problem that caused the deployment to fail.

problemType

Indicates the problem type, for example, an error or warning.

success

Indicates whether the component was successfully deployed (true) or not (false).

changed

Determines whether the component was changed after deployment. If true, the component was changed as a result of the deployment. If false, the deployed component was the same as the corresponding component already in the org.

Signature

```
public Boolean changed {get; set;}
```

Property Value

Type: Boolean

columnNumber

Each component is represented by a text file. If an error occurs during deployment, this property represents the column of the text file where the error occurred.

Signature

```
public Integer columnNumber {get; set;}
```

Property Value

Type: Integer

componentType

The metadata type of the component in the deployment.

Signature

```
public String componentType {get; set;}
```

Property Value

Type: String

created

If true, the component was created as a result of the deployment. If false, the component was modified as a result of the deployment.

Signature

```
public Boolean created {get; set;}
```

Property Value

Type: Boolean

createdDate

The date and time when the component was created as a result of the deployment.

Signature

```
public Datetime createdDate {get; set;}
```

Property Value

Type: Datetime

`deleted`

If true, the component was deleted as a result of the deployment. If false, the component was either new or modified as result of the deployment.

Signature

```
public Boolean deleted {get; set;}
```

Property Value

Type: Boolean

`fileName`

The name of the file in the metadata archive used to deploy the component.

Signature

```
public String fileName {get; set;}
```

Property Value

Type: String

`fullName`

Full name for the custom metadata component.

Signature

```
public String fullName {get; set;}
```

Property Value

Type: String

`id`

ID of the component that was deployed.

Signature

```
public Id id {get; set;}
```

Property Value

Type: Id

`lineNumber`

Each component is represented by a text file. If an error occurs during deployment, this field represents the line number of the text file where the error occurred.

Signature

```
public Integer lineNumber {get; set;}
```

Property Value

Type: Integer

`problem`

If an error or warning occurred, this field contains a description of the problem that caused the deployment to fail.

Signature

```
public String problem {get; set;}
```

Property Value

Type: String

`problemType`

Indicates the problem type, for example, an error or warning.

Signature

```
public Metadata.DeployProblemType problemType {get; set;}
```

Property Value

Type: Metadata.DeployProblemType

`success`

Indicates whether the component was successfully deployed (true) or not (false).

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

DeployMessage Methods

The following are methods for `DeployMessage`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.DeployMessage`.

`clone()`

Makes a duplicate copy of the `Metadata.DeployMessage`.

Signature

```
public Object clone()
```

Return Value

Type: Object

DeployProblemType Enum

Describes the problem type for an unsuccessful component deploy.

Enum Values

The following are the values of the `Metadata.DeployProblemType` enum.

Value	Description
`Error`	The deploy problem is an error.
`Info`	The deploy problem is of type “Info”.
`Warning`	The deploy problem is a warning.

SEE ALSO:

StatusCode Enum

DeployResult Class

Represents the results of a metadata deployment.

Namespace

Metadata

Usage

After an asynchronous metadata deployment finishes, Salesforce provides an instance of `Metadata.DeployResult` in a call to your implementation of `handleResult()` in your `Metadata.DeployCallback` class.

Example

```
public void handleResult(Metadata.DeployResult result,
                         Metadata.DeployCallbackContext context) {
    if (result.status == Metadata.DeployStatus.Succeeded) {
        // Deployment was successful
    } else {
        // Deployment was not successful
    }
}
```

IN THIS SECTION:

DeployResult Properties

DeployResult Methods

DeployResult Properties

The following are properties for `DeployResult`.

IN THIS SECTION:

canceledBy

ID of the user who canceled the queued deployment.

canceledByName

Full name of the user who canceled the queued deployment.

checkOnly

Indicates whether the deployment checked only the validity of the deployed files without making changes in the org. A check-only deployment does not deploy components or change the org in any way.

completedDate

Date and time for when the deployment process ended.

createdBy

ID of the user who created the deployment job.

createdByName

Full name of the user who created the deployment job.

createdDate

Date and time the deployment job was first queued.

details

Provides the details for components in a completed deployment.

done

Indicates whether Salesforce finished processing the deployment.

errorMessage

Message corresponding to the values in the `errorStatusCode` property, if any.

errorStatusCode

If an error occurs during deployment, a status code is returned. The message corresponding to the status code is returned in the `errorMessagefield` property.

id

ID of the deployment job.

ignoreWarnings

Specifies whether a deployment continues, even if the deployment generates warnings.

lastModifiedDate

Date and time of the last update for the deployment process.

messages

A list of all the detail messages for a deployment.

numberComponentErrors

The number of components that generated errors during the deployment.

numberComponentsDeployed

The number of components deployed in the deployment process. Use this value with the `numberComponentsTotal` property to get an estimate of the deployment's progress.

numberComponentsTotal

The total number of components in the deployment. Use this value with the `numberComponentsDeployed` property to get an estimate of the deployment's progress.

rollbackOnError

Indicates whether any failure causes a complete rollback (true) or not (false) of the deployment.

startDate

Date and time the deployment process began.

stateDetail

Indicates which component is being deployed.

status

Indicates the current state of the deployment.

success

Indicates whether the deployment was successful (true) or not (false).

canceledBy

ID of the user who canceled the queued deployment.

Signature

```
public String canceledBy {get; set;}
```

Property Value

Type: String

canceledByName

Full name of the user who canceled the queued deployment.

Signature

```
public String canceledByName {get; set;}
```

Property Value

Type: String

checkOnly

Indicates whether the deployment checked only the validity of the deployed files without making changes in the org. A check-only deployment does not deploy components or change the org in any way.

Signature

```
public Boolean checkOnly {get; set;}
```

Property Value

Type: Boolean

completedDate

Date and time for when the deployment process ended.

Signature

```
public Datetime completedDate {get; set;}
```

Property Value

Type: Datetime

createdBy

ID of the user who created the deployment job.

Signature

```
public String createdBy {get; set;}
```

Property Value

Type: String

createdByName

Full name of the user who created the deployment job.

Signature

```
public String createdByName {get; set;}
```

Property Value

Type: String

createdDate

Date and time the deployment job was first queued.

Signature

```
public Datetime createdDate {get; set;}
```

Property Value

Type: Datetime

details

Provides the details for components in a completed deployment.

Signature

```
public Metadata.DeployDetails details {get; set;}
```

Property Value

Type: Metadata.DeployDetails

done

Indicates whether Salesforce finished processing the deployment.

Signature

```
public Boolean done {get; set;}
```

Property Value

Type: Boolean

errorMessage

Message corresponding to the values in the `errorStatusCode` property, if any.

Signature

```
public String errorMessage {get; set;}
```

Property Value

Type: String

errorStatusCode

If an error occurs during deployment, a status code is returned. The message corresponding to the status code is returned in the `errorMessagefield` property.

Signature

```
public String errorStatusCode {get; set;}
```

Property Value

Type: String

For a description of each status code value, see Core Data Types Used in API Calls in the *SOAP API Developer Guide*.

id

ID of the deployment job.

Signature

```
public Id id {get; set;}
```

Property Value

Type: Id

ignoreWarnings

Specifies whether a deployment continues, even if the deployment generates warnings.

Signature

```
public Boolean ignoreWarnings {get; set;}
```

Property Value

Type: Boolean

`lastModifiedDate`

Date and time of the last update for the deployment process.

Signature

```
public Datetime lastModifiedDate {get; set;}
```

Property Value

Type: Datetime

`messages`

A list of all the detail messages for a deployment.

Note: Removed in API version 29.0 and later.

Signature

```
public List<Metadata.DeployMessage> messages {get; set;}
```

Property Value

Type: List<Metadata.DeployMessage>

`numberComponentErrors`

The number of components that generated errors during the deployment.

Signature

```
public Integer numberComponentErrors {get; set;}
```

Property Value

Type: Integer

`numberComponentsDeployed`

The number of components deployed in the deployment process. Use this value with the `numberComponentsTotal` property to get an estimate of the deployment's progress.

Signature

```
public Integer numberComponentsDeployed {get; set;}
```

Property Value

Type: Integer

`numberComponentsTotal`

The total number of components in the deployment. Use this value with the `numberComponentsDeployed` property to get an estimate of the deployment's progress.

Signature

```
public Integer numberComponentsTotal {get; set;}
```

Property Value

Type: Integer

`rollbackOnError`

Indicates whether any failure causes a complete rollback (true) or not (false) of the deployment.

Signature

```
public Boolean rollbackOnError {get; set;}
```

Property Value

Type: Boolean

`startDate`

Date and time the deployment process began.

Signature

```
public Datetime startDate {get; set;}
```

Property Value

Type: Datetime

`stateDetail`

Indicates which component is being deployed.

Signature

```
public String stateDetail {get; set;}
```

Property Value

Type: String

`status`

Indicates the current state of the deployment.

Signature

```
public Metadata.DeployStatus status {get; set;}
```

Property Value

Type: Metadata.DeployStatus

`success`

Indicates whether the deployment was successful (true) or not (false).

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

DeployResult Methods

The following are methods for `DeployResult`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.DeployResult`.

`clone()`

Makes a duplicate copy of the `Metadata.DeployResult`.

Signature

```
public Object clone()
```

Return Value

Type: Object

DeployStatus Enum

The result status of a deployment.

Usage

`Metadata.DeployResult.status` uses this enum to describe the results of the deployment.

Enum Values

The following are the values of the `Metadata.DeployStatus` enum.

Value	Description
`Canceled`	The queued deployment was canceled.
`Canceling`	The queued deployment is being canceled.
`Failed`	The deployment failed.
`InProgress`	The deployment has been started and is in progress.
`Pending`	The deployment has been queued but not started.
`Succeeded`	The deployment succeeded.
`SucceededPartial`	The deployment succeeded, but some components might not have been successfully deployed. Check `Metadata.DeployResult` for more details.

FeedItemTypeEnum Enum

The type of feed item in a feed-based page layout.

Enum Values

The following are the values of the `Metadata.FeedItemTypeEnum` enum.

Value	Description
`ActivityEvent`	Activity on tasks and events associated with a case. Available only on Case layouts.
`AdvancedTextPost`	Group announcements posted on a feed.
`AnnouncementPost`	Not used.
`ApprovalPost`	Approvals submitted on a feed.
`AttachArticleEvent`	Activity related to attaching articles to cases.

Value	Description
`BasicTemplateFeedItem`	Activity from the Log a Call action. Available only on layouts for objects that support Activities (tasks and events).
`CallLogPost`	Activity from the Log a Call action. Available only on layouts for objects that support Activities (tasks and events).
`CanvasPost`	Posts a canvas app makes on a feed.
`CaseCommentPost`	Activity from the Case Note action. Available only on Case layouts.
`ChangeStatusPost`	Activity from the Change Status action. Available only on Case layouts.
`ChatTranscriptPost`	Activity related to attaching Chat transcripts to cases. Available only on Case layouts.
`CollaborationGroupCreated`	Creating a public group.
`CollaborationGroupUnarchived`	Not used.
`ContentPost`	Attaching a file to a post.
`CreateRecordEvent`	Creating a record from the publisher.
`DashboardComponentAlert`	Not used.
`DashboardComponentSnapshot`	Posting a dashboard snapshot on a feed.
`EmailMessageEvent`	Activity from the Email action. Available only on Case layouts.
`FacebookPost`	Not used.
`LinkPost`	Attaching a URL to a post.
`MilestoneEvent`	Changing the milestone status on a case. Available only on Case layouts.
`PollPost`	Posting a poll on a feed.
`ProfileSkillPost`	Adding skills to a user's Chatter profile.
`QuestionPost`	Posting a question on a feed.
`ReplyPost`	Activity from the Portal action. Available only on Case layouts.
`RypplePost`	Creating a Thanks badge in WDC.
`SocialPost`	Activity on Twitter from the Social Post action.
`TestItem`	Creating a text post from the publisher.
`TextPost`	Making a change or group of changes to a tracked field.
`TrackedChange`	Not used.
`Undefined`	Undefined feed item.
`UserStatus`	Not used.

FeedLayout Class

Represents the values that define the feed view of a feed-based page layout. Feed-based layouts are available on Account, Case, Contact, Lead, Opportunity, custom, and external objects. They include a feed view and a detail view.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "FeedLayout" in the *Metadata API Developer Guide*.

IN THIS SECTION:

FeedLayout Properties

FeedLayout Methods

FeedLayout Properties

The following are properties for `FeedLayout`.

IN THIS SECTION:

autocollapsePublisher

Specifies whether the publisher is collapsed when the page loads (true) or not (false).

compactFeed

Specifies whether the feed-based page layout uses a compact feed (true) or not (false). If set to true, feed items on the page are collapsed by default, and the feed view has an updated design.

feedFilterPosition

Indicates where the feed filters list is included in the layout.

feedFilters

The individual filters displayed in the feed filters list.

fullWidthFeed

Specifies whether the feed expands horizontally to take up all available space on the page (`true`) or not (`false`).

hideSidebar

Specifies whether the sidebar is hidden (`true`) or not (`false`).

highlightExternalFeedItems

Controls whether to highlight external feed items (true) or not (false).

leftComponents

The individual components displayed in the left column of the feed view.

rightComponents

Lists the individual components displayed in the right column of the feed view.

useInlineFiltersInConsole
Indicates whether to use inline filters in the Salesforce console.

autocollapsePublisher

Specifies whether the publisher is collapsed when the page loads (true) or not (false).

Signature

```
public Boolean autocollapsePublisher {get; set;}
```

Property Value

Type: Boolean

compactFeed

Specifies whether the feed-based page layout uses a compact feed (true) or not (false). If set to true, feed items on the page are collapsed by default, and the feed view has an updated design.

Signature

```
public Boolean compactFeed {get; set;}
```

Property Value

Type: Boolean

feedFilterPosition

Indicates where the feed filters list is included in the layout.

Signature

```
public Metadata.FeedLayoutFilterPosition feedFilterPosition {get; set;}
```

Property Value

Type: FeedLayoutFilterPosition Enum

feedFilters

The individual filters displayed in the feed filters list.

Signature

```
public List<Metadata.FeedLayoutFilter> feedFilters {get; set;}
```

Property Value

Type: List<FeedLayoutFilter Class>.

`fullWidthFeed`

Specifies whether the feed expands horizontally to take up all available space on the page (`true`) or not (`false`).

Signature

```
public Boolean fullWidthFeed {get; set;}
```

Property Value

Type: Boolean

`hideSidebar`

Specifies whether the sidebar is hidden (`true`) or not (`false`).

Signature

```
public Boolean hideSidebar {get; set;}
```

Property Value

Type: Boolean

`highlightExternalFeedItems`

Controls whether to highlight external feed items (true) or not (false).

Signature

```
public Boolean highlightExternalFeedItems {get; set;}
```

Property Value

Type: Boolean

`leftComponents`

The individual components displayed in the left column of the feed view.

Signature

```
public List<Metadata.FeedLayoutComponent> leftComponents {get; set;}
```

Property Value

Type: List<FeedLayoutComponent Class>

`rightComponents`

Lists the individual components displayed in the right column of the feed view.

Signature

```
public List<Metadata.FeedLayoutComponent> rightComponents {get; set;}
```

Property Value

Type: List<FeedLayoutComponent Class>

`useInlineFiltersInConsole`

Indicates whether to use inline filters in the Salesforce console.

Signature

```
public Boolean useInlineFiltersInConsole {get; set;}
```

Property Value

Type: Boolean

FeedLayout Methods

The following are methods for `FeedLayout`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.FeedLayout`.

`clone()`

Makes a duplicate copy of the `Metadata.FeedLayout`.

Signature

```
public Object clone()
```

Return Value

Type: Object

FeedLayoutComponent Class

Represents a component in the feed view of a feed-based page layout.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "FeedLayoutComponent" in the *Metadata API Developer Guide*.

IN THIS SECTION:

FeedLayoutComponent Properties

FeedLayoutComponent Methods

FeedLayoutComponent Properties

The following are properties for `FeedLayoutComponent`.

See `FeedLayoutComponent` in the *Metadata API Developer Guide*

IN THIS SECTION:

componentType
Represents a component in the feed view of a feed-based page layout. The type of component is required.

height
The height, in pixels, of the component. Doesn't apply to `standardComponents`

page_x
The name of the Visualforce page used as a custom component.

`componentType`

Represents a component in the feed view of a feed-based page layout. The type of component is required.

Signature

```
public Metadata.FeedLayoutComponentType componentType {get; set;}
```

Property Value

Type: Metadata.FeedLayoutComponentType on page 2779

`height`

The height, in pixels, of the component. Doesn't apply to `standardComponents`

Signature

```
public Integer height {get; set;}
```

Property Value

Type: Integer

page_x

The name of the Visualforce page used as a custom component.

Signature

```
public String page_x {get; set;}
```

Property Value

Type: String

FeedLayoutComponent Methods

The following are methods for `FeedLayoutComponent`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.FeedLayoutComponent`.

clone()

Makes a duplicate copy of the `Metadata.FeedLayoutComponent`.

Signature

```
public Object clone()
```

Return Value

Type: Object

FeedLayoutComponentType Enum

Indicates the type of feed layout component.

Enum Values

The following are the values of the `Metadata.FeedLayoutComponentType` enum.

Value	Description
`CaseExperts`	List of case experts.
`CaseUnifiedFiles`	List of all files attached to the case.
`CustomButtons`	Custom button.
`CustomLinks`	Custom link.
`Followers`	List of followers.

Value	Description
`Following`	Icon that toggles between a Follow button (if the user viewing a record doesn't already follow it) and a Following indicator (if the user viewing a record does follow it).
`HelpAndToolLinks`	Icons that link to the help topic for the page, the page layout, and, the printable view of the page. Available only on Case layouts.
`Milestones`	Milestone tracker, which lets users see the status of a milestone on a case. Available only on Case layouts.
`SimilarCases`	List of similar cases.
`Topics`	List of topics related to the record.
`Visualforce`	Custom Visualforce component.

FeedLayoutFilter Class

Represents a feed filter option in the feed view of a feed-based page layout. A filter can have only `standardFilter` or `feedItemType` set.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "FeedLayoutFilter" in the *Metadata API Developer Guide*.

IN THIS SECTION:

- FeedLayoutFilter Properties
- FeedLayoutFilter Methods

FeedLayoutFilter Properties

The following are properties for `FeedLayoutFilter`.

IN THIS SECTION:

feedFilterName
The name of a `CustomFeedFilter` component. Names are prefixed with the name of the parent object. For example, `Case.MyCustomFeedFilter`.

feedFilterType
The type of filter.

feedItemType
The type of feed item to display.

feedFilterName

The name of a `CustomFeedFilter` component. Names are prefixed with the name of the parent object. For example, `Case.MyCustomFeedFilter`.

Signature

```
public String feedFilterName {get; set;}
```

Property Value

Type: String

feedFilterType

The type of filter.

Signature

```
public Metadata.FeedLayoutFilterType feedFilterType {get; set;}
```

Property Value

Type: FeedLayoutFilterType Enum

feedItemType

The type of feed item to display.

Signature

```
public Metadata.FeedItemTypeEnum feedItemType {get; set;}
```

Property Value

Type: FeedItemTypeEnum Enum

FeedLayoutFilter Methods

The following are methods for `FeedLayoutFilter`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.FeedLayoutFilter`.

`clone()`

Makes a duplicate copy of the `Metadata.FeedLayoutFilter`.

Signature

```
public Object clone()
```

Return Value

Type: Object

FeedLayoutFilterPosition Enum

Describes where the feed filters list is included in the layout.

Enum Values

The following are the values of the `Metadata.FeedLayoutFilterPosition` enum.

Value	Description
`CenterDropDown`	As a drop-down list in the center column.
`LeftFixed`	As a fixed list in the left column.
`LeftFloat`	As a floating list in the left column.

FeedLayoutFilterType Enum

The type of feed layout filter.

Enum Values

The following are the values of the `Metadata.FeedLayoutFilterType` enum.

Value	Description
`AllUpdates`	Shows all feed items on a record.
`Custom`	Shows custom feed items.
`FeedItemType`	Shows feed items only for a particular type of activity on the record.

Layout Class

Represents the metadata associated with a page layout.

Namespace

Metadata

Usage

Use this class to access layout metadata components. For more information, see Layout in the *Metadata API Developer Guide*.

IN THIS SECTION:

Layout Properties

Layout Methods

Layout Properties

The following are properties for `Layout`.

IN THIS SECTION:

customButtons
The custom buttons for this layout.

customConsoleComponents
Represents custom console components (Visualforce pages, lookup fields, or related lists) on a page layout.

emailDefault
Default value for the email checkbox. Only relevant if the `showEmailCheckbox` property is set.

excludeButtons
List of standard buttons to exclude from this layout.

feedLayout
Represents the values that define the feed view of a feed-based page layout.

headers
Represents the layout headers used for tagging.

layoutSections
The main sections of the layout containing fields, s-controls, and custom links. The order here determines the layout order.

miniLayout
Represents a minilayout, which is used in the mini view of a record in the Console tab, hover details, and event overlays.

multilineLayoutFields
Fields for special multiline layout fields which appear in OpportunityProduct layouts.

platformActionList
The list of actions, and their order, that display in the Salesforce mobile action bar for the layout.

quickActionList
The list of quick actions that display in the full Salesforce site for the page layout.

relatedContent
The Related Content section of the page layout.

relatedLists
The related lists for the layout, listed in the order they appear in the user interface.

relatedObjects
The list of related objects that appears in the mini view of the console.

runAssignmentRulesDefault
Default value for the "run assignment rules" checkbox. Only relevant if the `showRunAssignmentRulesCheckbox` property is set.

showEmailCheckbox
Controls whether to show the email checkbox. Only allowed on Case, CaseClose, and Task layouts. The default state of checkbox is controlled by the `emailDefault` property.

showHighlightsPanel
If set, the highlights panel displays on pages in the Salesforce console.

showInteractionLogPanel
If set, the interaction log displays on pages in the Salesforce console.

showKnowledgeComponent
Only allowed on Case layouts. If set, the Knowledge sidebar displays on cases in the Salesforce console.

showRunAssignmentRulesCheckbox
Controls whether to show the Run Assignment Rules checkbox. Only allowed on Lead and Case layouts. The default state of checkbox is controlled by the `runAssignmentRulesDefault` property.

showSolutionSection
Only allowed on CaseClose layout. If set, the built-in solution information section shows up on the page.

showSubmitAndAttachButton
For Cast layouts only. If set, the Submit & Add Attachment button displays on case edit pages to portal users in the Customer Portal.

summaryLayout
The summary layout for this layout.

customButtons

The custom buttons for this layout.

Signature

```
public List<String> customButtons {get; set;}
```

Property Value

Type: List<String>

customConsoleComponents

Represents custom console components (Visualforce pages, lookup fields, or related lists) on a page layout.

Signature

```
public Metadata.CustomConsoleComponents customConsoleComponents {get; set;}
```

Property Value

Type: CustomConsoleComponents Class

`emailDefault`

Default value for the email checkbox. Only relevant if the `showEmailCheckbox` property is set.

Signature

```
public Boolean emailDefault {get; set;}
```

Property Value

Type: Boolean

`excludeButtons`

List of standard buttons to exclude from this layout.

Signature

```
public List<String> excludeButtons {get; set;}
```

Property Value

Type: List<String>

`feedLayout`

Represents the values that define the feed view of a feed-based page layout.

Signature

```
public Metadata.FeedLayout feedLayout {get; set;}
```

Property Value

Type: Metadata.FeedLayout

`headers`

Represents the layout headers used for tagging.

Signature

```
public List<Metadata.LayoutHeader> headers {get; set;}
```

Property Value

Type: List<Metadata.LayoutHeader>

layoutSections

The main sections of the layout containing fields, s-controls, and custom links. The order here determines the layout order.

Signature

```
public List<Metadata.LayoutSection> layoutSections {get; set;}
```

Property Value

Type: List<Metadata.LayoutSection>

miniLayout

Represents a minilayout, which is used in the mini view of a record in the Console tab, hover details, and event overlays.

Signature

```
public Metadata.MiniLayout miniLayout {get; set;}
```

Property Value

Type: Metadata.MiniLayout

multilineLayoutFields

Fields for special multiline layout fields which appear in OpportunityProduct layouts.

Signature

```
public List<String> multilineLayoutFields {get; set;}
```

Property Value

Type: List<String>

platformActionList

The list of actions, and their order, that display in the Salesforce mobile action bar for the layout.

Signature

```
public Metadata.PlatformActionList platformActionList {get; set;}
```

Property Value

Type: Metadata.PlatformActionList

quickActionList

The list of quick actions that display in the full Salesforce site for the page layout.

Signature

```
public Metadata.QuickActionList quickActionList {get; set;}
```

Property Value

Type: Meatadata.QuickActionL.

`relatedContent`

The Related Content section of the page layout.

Signature

```
public Metadata.RelatedContent relatedContent {get; set;}
```

Property Value

Type: Metadata.RelatedContent

`relatedLists`

The related lists for the layout, listed in the order they appear in the user interface.

Signature

```
public List<Metadata.RelatedListItem> relatedLists {get; set;}
```

Property Value

Type: List<Metadata.RelatedListItem>

`relatedObjects`

The list of related objects that appears in the mini view of the console.

Signature

```
public List<String> relatedObjects {get; set;}
```

Property Value

Type: List<String>

`runAssignmentRulesDefault`

Default value for the “run assignment rules” checkbox. Only relevant if the `showRunAssignmentRulesCheckbox` property is set.

Signature

```
public Boolean runAssignmentRulesDefault {get; set;}
```

Property Value

Type: Boolean

`showEmailCheckbox`

Controls whether to show the email checkbox. Only allowed on Case, CaseClose, and Task layouts. The default state of checkbox is controlled by the `emailDefault` property.

Signature

```
public Boolean showEmailCheckbox {get; set;}
```

Property Value

Type: Boolean

`showHighlightsPanel`

If set, the highlights panel displays on pages in the Salesforce console.

Signature

```
public Boolean showHighlightsPanel {get; set;}
```

Property Value

Type: Boolean

`showInteractionLogPanel`

If set, the interaction log displays on pages in the Salesforce console.

Signature

```
public Boolean showInteractionLogPanel {get; set;}
```

Property Value

Type: Boolean

`showKnowledgeComponent`

Only allowed on Case layouts. If set, the Knowledge sidebar displays on cases in the Salesforce console.

Signature

```
public Boolean showKnowledgeComponent {get; set;}
```

Property Value

Type: Boolean

showRunAssignmentRulesCheckbox

Controls whether to show the Run Assignment Rules checkbox. Only allowed on Lead and Case layouts. The default state of checkbox is controlled by the `runAssignmentRulesDefault` property.

Signature

```
public Boolean showRunAssignmentRulesCheckbox {get; set;}
```

Property Value

Type: Boolean

showSolutionSection

Only allowed on CaseClose layout. If set, the built-in solution information section shows up on the page.

Signature

```
public Boolean showSolutionSection {get; set;}
```

Property Value

Type: Boolean

showSubmitAndAttachButton

For Cast layouts only. If set, the Submit & Add Attachment button displays on case edit pages to portal users in the Customer Portal.

Signature

```
public Boolean showSubmitAndAttachButton {get; set;}
```

Property Value

Type: Boolean

summaryLayout

The summary layout for this layout.

Signature

```
public Metadata.SummaryLayout summaryLayout {get; set;}
```

Property Value

Type: Metadata.SummaryLayout

Layout Methods

The following are methods for `Layout`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.Layout`.

`clone()`

Makes a duplicate copy of the `Metadata.Layout`.

Signature

```
public Object clone()
```

Return Value

Type: Object

LayoutColumn Class

Represents the items in a column within a layout section.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "LayoutColumn" in the *Metadata API Developer Guide*.

IN THIS SECTION:

LayoutColumn Properties
LayoutColumn Methods

LayoutColumn Properties

The following are properties for `LayoutColumn`.

IN THIS SECTION:

layoutItems
The individual items within a column (ordered from top to bottom).

reserved
This field is reserved for Salesforce.

`layoutItems`

The individual items within a column (ordered from top to bottom).

Signature

```
public List<Metadata.LayoutItem> layoutItems {get; set;}
```

Property Value

Type: List<Metadata.LayoutItem>

`reserved`

This field is reserved for Salesforce.

Signature

```
public String reserved {get; set;}
```

Property Value

Type: String

LayoutColumn Methods

The following are methods for `LayoutColumn`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.LayoutColumn`.

`clone()`

Makes a duplicate copy of the `Metadata.LayoutColumn`.

Signature

```
public Object clone()
```

Return Value

Type: Object

LayoutHeader Enum

Represents tagging types used for `Metadata.Layout.headers`

Enum Values

The following are the values of the `Metadata.LayoutHeader` enum.

Value	Description
`PersonalTagging`	Tag is set to private user.
`PublicTagging`	Tag is viewable to any user who can access the record.

LayoutItem Class

Represents the valid values that define a layout item.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "LayoutItem" in the *Metadata API Developer Guide*.

IN THIS SECTION:

LayoutItem Properties

LayoutItem Methods

LayoutItem Properties

The following are properties for `LayoutItem`.

IN THIS SECTION:

analyticsCloudComponent

A Wave Analytics dashboard component on a page.

behavior
Determines the field behavior.

canvas
References a canvas app.

component
References a component.

customLink
The custom link reference.

emptySpace
Controls if this layout item is a blank space.

field
The field name reference, relative to the layout, for example “Description” or “MyField__c”.

height
For s-controls and pages only, the height in pixels.

page_x
Reference to a Visualforce page.

reportChartComponent
Refers to a report chart that you can add to a standard or custom object page.

scontrol
Reference to an s-control.

showLabel
For s-control and pages only, whether to show the label.

showScrollbars
For s-control and pages only, whether to show scrollbars.

width
For s-control and pages only, the width in pixels or percent. Pixel values are simply the number of pixels, for example, 500. Percentage values must include the percent sign, for example, 20%.

`analyticsCloudComponent`

A Wave Analytics dashboard component on a page.

Signature

```
public Metadata.AnalyticsCloudComponentLayoutItem analyticsCloudComponent {get; set;}
```

Property Value

Type: Metadata.AnalyticsCloudComponentLayoutItem

`behavior`

Determines the field behavior.

Signature

```
public Metadata.UiBehavior behavior {get; set;}
```

Property Value

Type: Metadata.UiBehavior

`canvas`

References a canvas app.

Signature

```
public String canvas {get; set;}
```

Property Value

Type: String

`component`

References a component.

Signature

```
public String component {get; set;}
```

Property Value

Type: String

`customLink`

The custom link reference.

Signature

```
public String customLink {get; set;}
```

Property Value

Type: String

`emptySpace`

Controls if this layout item is a blank space.

Signature

```
public Boolean emptySpace {get; set;}
```

Property Value

Type: Boolean

field

The field name reference, relative to the layout, for example “Description” or “MyField__c”.

Signature

```
public String field {get; set;}
```

Property Value

Type: String

height

For s-controls and pages only, the height in pixels.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: Integer

page_x

Reference to a Visualforce page.

Signature

```
public String page_x {get; set;}
```

Property Value

Type: String

reportChartComponent

Refers to a report chart that you can add to a standard or custom object page.

Signature

```
public Metadata.ReportChartComponentLayoutItem reportChartComponent {get; set;}
```

Property Value

Type: Metadata.ReportChartComponentLayoutItem

scontrol

Reference to an s-control.

Signature

```
public String scontrol {get; set;}
```

Property Value

Type: String

showLabel

For s-control and pages only, whether to show the label.

Signature

```
public Boolean showLabel {get; set;}
```

Property Value

Type: Boolean

showScrollbars

For s-control and pages only, whether to show scrollbars.

Signature

```
public Boolean showScrollbars {get; set;}
```

Property Value

Type: Boolean

width

For s-control and pages only, the width in pixels or percent. Pixel values are simply the number of pixels, for example, 500. Percentage values must include the percent sign, for example, 20%.

Signature

```
public String width {get; set;}
```

Property Value

Type: String

LayoutItem Methods

The following are methods for `LayoutItem`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.LayoutItem`.

`clone()`

Makes a duplicate copy of the `Metadata.LayoutItem`.

Signature

```
public Object clone()
```

Return Value

Type: Object

LayoutSection Class

Represents a section of a page layout, such as the Custom Links section.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "LayoutSection" in the *Metadata API Developer Guide*.

IN THIS SECTION:

LayoutSection Properties

LayoutSection Methods

LayoutSection Properties

The following are properties for `LayoutSection`.

IN THIS SECTION:

customLabel
Indicates if this section's label is custom or standard (built-in).

detailHeading
Controls whether this heading appears on the detail page.

editHeading
Controls whether this heading appears on the edit page.

label
The label; either standard or custom, based on the customLabel property.

layoutColumns
Lists the layout columns. You can have one, two, or three columns, ordered left to right, are possible.

style
The style of the layout for this section.

customLabel

Indicates if this section's label is custom or standard (built-in).

Signature

```
public Boolean customLabel {get; set;}
```

Property Value

Type: Boolean

detailHeading

Controls whether this heading appears on the detail page.

Signature

```
public Boolean detailHeading {get; set;}
```

Property Value

Type: Boolean

editHeading

Controls whether this heading appears on the edit page.

Signature

```
public Boolean editHeading {get; set;}
```

Property Value

Type: Boolean

label

The label; either standard or custom, based on the customLabel property.

Signature

```
public String label {get; set;}
```

Property Value

Type: String

`layoutColumns`

Lists the layout columns. You can have one, two, or three columns, ordered left to right, are possible.

Signature

```
public List<Metadata.LayoutColumn> layoutColumns {get; set;}
```

Property Value

Type: List<Metadata.LayoutColumn>

`style`

The style of the layout for this section.

Signature

```
public Metadata.LayoutSectionStyle style {get; set;}
```

Property Value

Type: Metadata.LayoutSectionStyle

LayoutSection Methods

The following are methods for `LayoutSection`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.LayoutSection`.

`clone()`

Makes a duplicate copy of the `Metadata.LayoutSection`.

Signature

```
public Object clone()
```

Return Value

Type: Object

LayoutSectionStyle Enum

Describes the possible styles for a layout section.

Enum Values

The following are the values of the `Metadata.LayoutSectionStyle` enum.

Value	Description
`CustomLinks`	Contains custom links only
`OneColumn`	One column
`TwoColumnsLeftToRight`	Two columns, tab goes left to right
`TwoColumnsTopToBottom`	Two columns, tab goes top to bottom

Metadata Class

An abstract base class that represents a custom metadata component.

Namespace

Metadata

Usage

You can't create instances of this abstract class. Instead, create an instance of a specific custom metadata component class that derives from `Metadata.Metadata`, such as `Metadata.CustomMetadata`. For more information, see Metadata in the *Metadata API Developer Guide*.

IN THIS SECTION:

Metadata Properties

Metadata Methods

Metadata Properties

The following are properties for `Metadata`.

IN THIS SECTION:

fullName

The full name of the custom metadata, which can include the namespace, type, and component name.

`fullName`

The full name of the custom metadata, which can include the namespace, type, and component name.

Signature

```
public String fullName {get; set;}
```

Property Value

Type: String

The format of the full name can include the namespace, metadata type, and metadata component name. If you're updating components in a namespace, you also need to qualify the namespace for the component in the full name. For example, the full name for a custom metadata "MDType1__mdt" component named "Component1" that is contained in the "myPackage" namespace is "myPackage__MDType1__mdt.myPackage__Component1". For more information on full name formats for different metadata types, see reference documentation on the metadata types in the *Metadata API Developer Guide*.

Metadata Methods

The following are methods for `Metadata`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.Metadata`.

`clone()`

Makes a duplicate copy of the `Metadata.Metadata`.

Signature

```
public Object clone()
```

Return Value

Type: Object

MetadataType Enum

Represents the custom metadata components available in Apex.

Enum Values

The following are the values of the `Metadata.MetadataType` enum.

Value	Description
`CustomMetadata`	Records of custom metadata types

Value	Description
`Layout`	Layouts

MetadataValue Class

An abstract base class that represents a custom metadata component field.

Namespace

Metadata

Usage

You can't create instances of this abstract class. Instead, create an instance of a specific custom metadata component value class that derives from `Metadata.MetadataValue`, such as `Metadata.CustomMetadataValue`.

IN THIS SECTION:

MetadataValue Methods

MetadataValue Methods

The following are methods for `MetadataValue`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.MetadataValue`.

`clone()`

Makes a duplicate copy of the `Metadata.MetadataValue`.

Signature

```
public Object clone()
```

Return Value

Type: Object

MiniLayout Class

Represents a mini view of a record in the Console tab, hover details, and event overlays.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "MiniLayout" in the *Metadata API Developer Guide*.

IN THIS SECTION:

MiniLayout Properties

MiniLayout Methods

MiniLayout Properties

The following are properties for `MiniLayout`.

IN THIS SECTION:

fields

The fields for the mini-layout, listed in the order they appear in the UI. Fields that appear in the mini-layout must appear in the main layout.

relatedLists

The mini related lists, listed in the order they appear in the UI. You cannot set sorting on mini related lists. Fields that appear in the mini related lists must appear in the main layout.

`fields`

The fields for the mini-layout, listed in the order they appear in the UI. Fields that appear in the mini-layout must appear in the main layout.

Signature

```
public List<String> fields {get; set;}
```

Property Value

Type: List<String>

`relatedLists`

The mini related lists, listed in the order they appear in the UI. You cannot set sorting on mini related lists. Fields that appear in the mini related lists must appear in the main layout.

Signature

```
public List<Metadata.RelatedListItem> relatedLists {get; set;}
```

Property Value

Type: List<Metadata.RelatedListItem>

MiniLayout Methods

The following are methods for `MiniLayout`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `Metadata.MiniLayout`.

`clone()`

Makes a duplicate copy of the `Metadata.MiniLayout`.

Signature

```
public Object clone()
```

Return Value

Type: Object

Operations Class

Represents a class to execute metadata operations, such as retrieving or deploying custom metadata.

Namespace

Metadata

Usage

Use the `Metadata.Operations` class to execute metadata operations. For more information on use cases and restrictions of metadata operations in Apex, see Metadata.

Example: Retrieve Metadata

The following example retrieves the "MyTestCustomMDType" custom metadata record from the subscriber org, and inspects the custom fields.

```
public class ReadMetadata {
  public void retrieveMetadata () {
    // List fullnames of components we want to retrieve
    List<String> componentNameList =
new List<String>{'ISVNamespace__TestCustomMDType.MyTestCustomMDType'};

    // Retrieve components that are records of custom metadata types
```

```
    // based on name
    List<Metadata.Metadata> components = Metadata.Operations.retrieve(
Metadata.MetadataType.CustomMetadata, componentNameList);
    Metadata.CustomMetadata customMetadataRecord = (Metadata.CustomMetadata)
components.get(0);

    // Check fields of retrieved component
    List<Metadata.CustomMetadataValue> values = customMetadataRecord.values;
    for (integer i = 0; i < values.size(); i++) {
      if (values.get(i).field == 'testField__c' &&
          values.get(i).value == 'desired value') {
        // ...process accordingly...
      }
    }
  }
}
```

Example: Deploy Metadata

The following example uses the Metadata API in Apex to update the customField custom field value of the MetadataRecordName custom metadata record and deploy this change into the subscriber org. Because the deployment is asynchronous, you must provide a callback class that implements the `Metadata.DeployCallback` interface, which is then used when the queued deployment completes.

```
public class CreateMetadata{
  public void updateAndDeployMetadata() {
    // Setup custom metadata to be created in the subscriber org.
    Metadata.CustomMetadata customMetadata =  new Metadata.CustomMetadata();
    customMetadata.fullName = 'ISVNamespace__MetadataTypeName.MetadataRecordName';

    Metadata.CustomMetadataValue customField = new Metadata.CustomMetadataValue();
    customField.field = 'customField__c';
    customField.value = 'New value';

    customMetadata.values.add(customField);

    Metadata.DeployContainer mdContainer = new Metadata.DeployContainer();
    mdContainer.addMetadata(customMetadata);

    // Setup deploy callback, MyDeployCallback implements
    // the Metadata.DeployCallback interface (code for
    // this class not shown in this example)
    MyDeployCallback callback = new MyDeployCallback();

    // Enqueue custom metadata deployment
    Id jobId = Metadata.Operations.enqueueDeployment(mdContainer, callback);
  }
}
```

Example: Create Two Metadata Records Synchronously

Create a metadata record along with another one that references it in the same transaction. If the parent record was installed with a namespace, prefix the developer name with *recordNs*__.

Note: No custom metadata relationship can relate records of the same type to each other.

```
public class CreateMetadata {

    public Id doCreate(
        String parentRecDevName,
        String parentRecLabel,
        String childRecDevName,
        String childRecLabel) {

        Metadata.DeployContainer mdContainer = new Metadata.DeployContainer();

        Metadata.CustomMetadata parentRecord = new Metadata.CustomMetadata();
        parentRecord.fullName = 'ParentType.' + parentRecDevName;
        parentRecord.label = parentRecLabel;
        mdContainer.addMetadata(parentRecord);

        Metadata.CustomMetadata childRecord = new Metadata.CustomMetadata();
        childRecord.fullName = 'ChildType.' + childRecDevName;
        childRecord.label = childRecLabel;
        Metadata.CustomMetadataValue relValue = new Metadata.CustomMetadataValue();
        relValue.field = 'Parent__c';
        relValue.value = parentRecDevName;
        childRecord.values.add(relValue);
        mdContainer.addMetadata(childRecord);

        Id jobId = Metadata.Operations.enqueueDeployment(mdContainer, null);
        return jobId;
    }

}
```

IN THIS SECTION:

Operations Methods

Operations Methods

The following are methods for `Operations`.

IN THIS SECTION:

clone()

Makes a duplicate copy of the `Metadata.Operations`.

enqueueDeployment(container, callback)

Deploys custom metadata components asynchronously.

retrieve(type, fullNames)

Retrieves a list of custom metadata components.

clone()

Makes a duplicate copy of the `Metadata.Operations`.

Signature

```
public Object clone()
```

Return Value

Type: Object

enqueueDeployment(container, callback)

Deploys custom metadata components asynchronously.

Signature

To preserve service function, we limit the number of Metadata API deployments originating from Apex that can be enqueued at a time. See Limit on Enqueued Deployments from Apex.

```
public static Id enqueueDeployment(Metadata.DeployContainer container,
Metadata.DeployCallback callback)
```

Parameters

container
: Type: Metadata.DeployContainer

  Container that contains the set of metadata components to deploy.

callback
: Type: Metadata.DeployCallback

  A class that implements the `Metadata.DeployCallback` interface. Used by Salesforce to return information about the deployment results.

Return Value

Type: Id

ID of deployment request.

retrieve(type, fullNames)

Retrieves a list of custom metadata components.

Signature

```
public static List<Metadata.Metadata> retrieve(Metadata.MetadataType type, List<String>
fullNames)
```

Parameters

type
Type: Metadata.MetadataType

The metadata component type.

fullNames
Type: List<String>

A list of component names to retrieve. For information on component name formats, see Metadata.fullName().

Return Value

Type: List<Metadata.Metadata>

PlatformActionList Class

Represents the list of actions, and their order, that display in the Salesforce mobile action bar for the layout.

Namespace

Metadata

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "PlatformActionList" in the *Metadata API Developer Guide*.

IN THIS SECTION:

PlatformActionList Properties

PlatformActionList Methods

PlatformActionList Properties

The following are properties for `PlatformActionList`.

IN THIS SECTION:

actionListContext
The context of the action list.

platformActionListItems
The actions in the platform action list.

relatedSourceEntity
When the `actionListContext` property is "RelatedList" or" "RelatedListRecord", this field represents the API name of the related list to which the action belongs.

actionListContext

The context of the action list.

Signature

```
public Metadata.PlatformActionListContextEnum actionListContext {get; set;}
```

Property Value

Type: Metadata.PlatformActionListContextEnum

platformActionListItems

The actions in the platform action list.

Signature

```
