# Connect REST API Developer Guide

Version 65.0, Winter '26

## Winter '26

# CONTENTS

|                                                       |    |
|-------------------------------------------------------|----|
| <a href="#">Connect REST API Developer Guide</a>      | 1  |
| Introduction                                          | 1  |
| When to Use Connect REST API                          | 3  |
| Connect REST API Architecture                         | 3  |
| Connect REST API Limits                               | 5  |
| Build the Resource URL                                | 6  |
| Send HTTP Requests                                    | 7  |
| HTTP Request Flow and a Response Body                 | 7  |
| Inputs and Binary File Upload Examples                | 11 |
| Wildcards                                             | 24 |
| Specify Response Sizes                                | 25 |
| Response Body Encoding                                | 30 |
| Status Codes and Error Responses                      | 31 |
| OAuth and Connect REST API                            | 32 |
| Perform Cross-Origin Requests from Web Browsers       | 43 |
| Connect REST API Release Notes                        | 43 |
| API End-of-Life Policy                                | 44 |
| Quick Start                                           | 44 |
| Prerequisites                                         | 44 |
| Step One: Sign up for Salesforce Developer Edition    | 45 |
| Step Two: Set Up Authorization                        | 45 |
| Step Three: Connect to Connect REST API Using OAuth   | 45 |
| Connect to Experience Cloud Sites                     | 46 |
| Send a Request Using Postman                          | 47 |
| Work with Features                                    | 48 |
| Action Links                                          | 49 |
| Customer Asset Lifecycle Management                   | 57 |
| Experience Cloud Sites                                | 64 |
| Feeds and Feed Elements                               | 67 |
| Recommendations                                       | 73 |
| Salesforce Files                                      | 75 |
| Examples                                              | 77 |
| Filter a Response Body                                | 80 |
| Make a Request in an Experience Cloud Site            | 81 |
| Get My News Feed                                      | 81 |
| Get Another User's Feed                               | 81 |
| Get a Group Feed                                      | 82 |
| Post a Feed Item                                      | 82 |
| Post a Feed Element and Include Files from Salesforce | 83 |

|                                                                |     |
|----------------------------------------------------------------|-----|
| Post a Poll                                                    | 84  |
| Post a Rich-Text Feed Element                                  | 84  |
| Post a Feed Element with a Code Block                          | 86  |
| Post a Feed Element with an Inline Image                       | 87  |
| Post a Comment                                                 | 88  |
| Post a Comment and Include a File from Salesforce              | 88  |
| Post a Rich-Text Comment                                       | 89  |
| Post a Comment with a Code Block                               | 90  |
| Post a Comment with an Inline Image                            | 91  |
| Post a Binary File                                             | 92  |
| Post an @Mention                                               | 92  |
| Post Multiple @Mentions                                        | 93  |
| Get a List of @Mention Proposals                               | 95  |
| Define Action Links and Post with a Feed Element               | 95  |
| Define Action Links in a Template and Post with a Feed Element | 98  |
| Update the Status of an Action Link or Invoke an Action Link   | 102 |
| Edit a Feed Post                                               | 103 |
| Edit a Comment                                                 | 104 |
| Edit a Question Title and Post                                 | 104 |
| Move a Feed Post from one Public Group to Another              | 105 |
| Like a Feed Item                                               | 106 |
| Like a Feed Item and Return the Total Number of Likes          | 106 |
| Share a Feed Item                                              | 107 |
| Send a Direct Message                                          | 108 |
| Get Feed Elements Updated Since Last Request                   | 108 |
| Get a Feed with Internal Feed Items Only                       | 109 |
| Search a Feed                                                  | 109 |
| Get a List of Records a User Follows                           | 110 |
| Get Chatter Activity Statistics for a User                     | 110 |
| Get Recommendations of Users to Follow                         | 110 |
| Create and Schedule Custom Recommendations with Audiences      | 111 |
| Create a Group                                                 | 113 |
| Update and Crop a Group Photo                                  | 114 |
| Join a Group                                                   | 114 |
| Request to Join a Private Group                                | 115 |
| Approve or Reject a Request to Join a Private Group            | 115 |
| Post to a Group                                                | 116 |
| Follow a Record                                                | 117 |
| Stop Following a Record                                        | 117 |
| Get a Record Feed                                              | 117 |
| Update a User Profile                                          | 118 |
| Update and Crop a User Photo                                   | 118 |
| Send a Private Message                                         | 119 |
| Get User Information for Multiple Users                        | 119 |

# CONNECT REST API DEVELOPER GUIDE

Integrate mobile apps, intranet sites, and third-party web applications with Salesforce using Connect REST API. Responses are localized, structured for presentation, and can be filtered to contain only what the app needs.

Connect REST API provides programmatic access to B2B Commerce, CMS managed content, Experience Cloud sites, files, notifications, topics, and more. Use Connect REST API to display Chatter feeds, users, and groups, especially in mobile applications.

 **Note:** Many Connect REST API resource actions are exposed as static methods on Apex classes in the `ConnectApi` namespace. These classes are called Connect in Apex. Use [Connect in Apex](#) to create custom experiences in Salesforce. Connect in Apex is available in all organizations and editions that have Apex enabled.

## EDITIONS

Available in: All editions except **Personal** Edition. In addition, some features require Chatter to be enabled for the organization.

## IN THIS SECTION:

### [Connect REST API Introduction](#)

Consider the Connect REST API architecture, rate limits, and how the resources, requests, and responses work.

### [Connect REST API Quick Start](#)

Connect to Salesforce and authenticate, then make a request to Connect REST API and look at the response.

### [Connect REST API Features](#)

Find the resources to work with Connect REST API features.

### [Connect REST API Examples](#)

Use Connect REST API examples to perform tasks.

### [Connect REST API Resources](#)

Connect REST API resources are sometimes called *endpoints*.

### [Chatter REST API Resources](#)

These REST API resources require Chatter and can have different rate limit allocations.

### [Connect REST API Request Bodies](#)

To perform a POST, PATCH, or PUT request, pass query parameters or create a request body formatted in either XML or JSON. This chapter lists the request bodies. The query parameters are listed with each resource.

### [Connect REST API Response Bodies](#)

The successful execution of a request to a Connect REST API resource can return a response body in either JSON or XML format.

### [Connect REST API Appendices](#)

Use these appendices when working with action link buttons, personalization audience criteria, or personalization targets. You can also find retired resources, request bodies, and response bodies here.

## Connect REST API Introduction

Consider the Connect REST API architecture, rate limits, and how the resources, requests, and responses work.

## IN THIS SECTION:

[When to Use Connect REST API](#)

Is Connect REST API the right API for you?

[Connect REST API Architecture](#)

To use Connect REST API, understand a few characteristics of its architecture, like how to authenticate, and which data formats it supports.

[Connect REST API Limits](#)

Connect REST API requests are subject to rate limits. Connect REST API has a different rate limit than other Salesforce APIs. Connect REST API has a per user, per application, per hour rate limit. When you exceed the rate limit, Connect REST API resources return a 503 Service Unavailable error code.

[Build the Resource URL](#)

Access Connect REST API resources by using the URI for your company's instance, combined with version and Experience Cloud site information, and the URI for the resource.

[Send HTTP Requests](#)

Connect REST API uses HTTP methods to send and receive JSON and XML content, so it's easy to build client applications using the tool or the language of your choice.

[HTTP Request Flow and a Response Body](#)

Review the process flow for Connect REST API, including resource and response examples.

[Inputs and Binary File Upload Examples](#)

Make HTTP POST, PATCH, and PUT requests using inputs and learn more about uploading binary files.

[Wildcards](#)

Use wildcard characters to match text patterns in Connect REST API and Connect in Apex searches.

[Specify Response Sizes](#)

Use filter parameters to return only the data the application needs. To specify the response size by group (big, medium, or small), use `filterGroup` as a request parameter or in a request body. In addition, to exclude or include specific properties, use either `exclude` or `include` as a request parameter or in a request body.

[Response Body Encoding](#)

Responses are minimally HTML entity-encoded by default.

[Status Codes and Error Responses](#)

The response header contains an HTTP status code. If the response isn't successful, the response body contains an error message, and if appropriate, information about the field or object where the error occurred.

[OAuth and Connect REST API](#)

Connect REST API uses OAuth to securely identify your application before connecting to Salesforce.

[Perform Cross-Origin Requests from Web Browsers](#)

Cross-Origin Resource Sharing (CORS) allows web browsers to request resources from other origins. For example, using CORS, the JavaScript for a web application at `https://www.example.com` can request a resource from `https://www.salesforce.com`. To allow access to supported Salesforce APIs, Apex REST resources, and Lightning Out from JavaScript code in a web browser, add the requesting origin to your Salesforce CORS allowlist.

[Connect REST API Release Notes](#)

Use the Salesforce Release Notes to learn about the most recent updates and changes to Connect REST API.

[API End-of-Life Policy](#)

Salesforce is committed to supporting each API version for a minimum of three years from the date of first release. In order to mature and improve the quality and performance of the API, versions that are more than three years old sometimes are no longer supported.

## When to Use Connect REST API

Is Connect REST API the right API for you?

Use Connect REST API to:

- Build a mobile app.
- Integrate a third-party web application with Salesforce so it can notify groups of users about events.
- Display a feed on an external system, such as an intranet site, after users are authenticated.
- Make feeds actionable and integrated with third-party sites. For example, an app that posts a Chatter item to X (formerly Twitter) whenever the post includes #tweet hashtag.
- Create simple games that interact with the feed for notifications.
- Creating a custom, branded skin for Chatter for your organization.

## How Is Connect REST API Different from Other Salesforce APIs?

Connect REST API differs from REST API in multiple ways, including:

- Data is structured for rendering on websites and mobile devices.
- Returned information is localized to the user's time zone and language.
- Changed values that are tracked in a feed are returned as value-pair representations.
- Rate limiting for Connect REST API is per user, per application, per hour. Rate limiting for Salesforce Platform APIs is per 24-hour period, per org.

**Note:** For migrated orgs and orgs created in Summer '24 and later, only requests to [Chatter REST API resources](#) are subject to the per user, per application, per hour rate limit. The documentation for every Chatter resource specifies that Chatter is required. Requests to resources that don't require Chatter count toward the [Salesforce Platform total API request allocations](#), which are per org and span a 24-hour period.

If needed, extract an ID from REST API and use it in requests to Connect REST API.

## Connect in Apex

Many Connect REST API resource actions are exposed as static methods on Apex classes in the `ConnectApi` namespace. This namespace is also referred to as *Connect in Apex*. Use Connect in Apex to develop applications on the Lightning Platform without using HTTP callouts from Apex.

The documentation for Connect in Apex is available in the *Apex Developer Guide* and the *Apex Reference Guide*.

SEE ALSO:

[Connect REST API Limits](#)

## Connect REST API Architecture

To use Connect REST API, understand a few characteristics of its architecture, like how to authenticate, and which data formats it supports.

## Authentication

Connect REST API uses [OAuth 2.0](#).

Salesforce is accessed securely using HTTPS.

## CORS (Cross-Origin Resource Scripting)

Cross-Origin Resource Sharing (CORS) allows web browsers to request resources from other origins. For example, using CORS, the JavaScript for a web application at `https://www.example.com` can request a resource from `https://www.salesforce.com`. To allow access to supported Salesforce APIs, Apex REST resources, and Lightning Out from JavaScript code in a web browser, add the requesting origin to your Salesforce CORS allowlist. See [Perform Cross-Origin Requests from Web Browsers](#).

## Default HTML entity encoding

Responses are minimally HTML entity-encoded by default.

Clients can request raw (unencoded) output. Set the `X-Chatter-Entity-Encoding` HTTP header in a request to `false`.

For more information, see [Response Body Encoding](#).

## JSON and XML support

The JavaScript Object Notation (JSON) format is supported with UTF-8. Date-time information is in [ISO 8601](#) format.

XML serialization is similar to SOAP API. XML requests are supported in UTF-8 and UTF-16, and XML responses are provided in UTF-8.

Responses are in JSON format by default. To specify XML, use the HTTP header `Accept: application/xml`. (To specify JSON, use `Accept: application/json`.)

You can append either `.json` or `.xml` to the URI of any resource to specify how the return is formatted. For example, `/chatter/feeds/filter/me/001/feed-elements.xml`.

**Note:** Not all features support XML.

## Localized names and times

Connect REST API localizes both the names and datetimes to the locale setting of the user. Users set their locale in their personal information. If the user hasn't set their locale, Connect REST API uses the default locale for the organization.

Clients can use any locale available in the organization to override the default locale. To override the locale for any API request, use the `Accept-Language` HTTP header.

For orgs created in Summer '23 and later, the language specified in the `Accept-Language` HTTP header must be the same as specified in a `language` query parameter.

**Note:** ISO 8601 dates are always in GMT.

## Salesforce ID length

Salesforce IDs in response bodies are always 18-character IDs. In request bodies, you can use either 15-character IDs or 18-character IDs.

## UI Themes

Clients can use the `X-Connect-Theme` HTTP header to specify a UI theme for any API request. There are two themes, each with their own set of motifs: `Classic` and `Salesforce1`. Theme names are case-sensitive.

## Method overriding

To override an HTTP method if you use an HTTP library that doesn't allow overriding or setting an arbitrary HTTP method name, use the request parameter `__HttpMethod`.

```
POST https://instance_name/services/data/v65.0/chatter/  
/chatter/users/me/conversations/03MD0000000008KMAQ  
?__HttpMethod=PATCH&read=true
```

**Note:** The `_HttpMethod` parameter is case-sensitive. Use the correct case for all values.

## Connect REST API Limits

Connect REST API requests are subject to rate limits. Connect REST API has a different rate limit than other Salesforce APIs. Connect REST API has a per user, per application, per hour rate limit. When you exceed the rate limit, Connect REST API resources return a 503 Service Unavailable error code.

### Rate Limits

For migrated orgs and orgs created in Summer '24 and later, only requests to [Chatter REST API resources](#) are subject to the per user, per application, per hour rate limit. The documentation for every Chatter resource specifies that Chatter is required. Requests to resources that don't require Chatter count toward the [Salesforce Platform total API request allocations](#), which are per org and span a 24-hour period.

**Note:** Load, performance, and other system issues can prevent some limits from being reached. Limits can change without notice. Ensure that your applications make efficient use of available requests and gracefully handle the 503 error code.

For applications using a session ID from Salesforce, the rate limit is per user, per hour—there isn't a separate bucket for applications. All applications the user accesses with a session ID use this general quota. To take advantage of the per user, per application, per hour limit, use OAuth tokens.

To build apps that don't hit the rate limit, use these guidelines.

- If you hit limits when running tests, use multiple users to simulate a real-world scenario.
- When polling for feed updates, don't exceed 1 poll per minute (60 polls per hour). To return more results in one request, increase the page size.
- When polling for private messages, don't exceed 60 polls per hour.
- To avoid making multiple requests, cache metered static assets such as file and dashboard renditions (group and user profile pictures are not metered).
- Set up two connected apps: one for automated testing and one for manual testing and development. Don't share connected apps with other developers.
- Use a unique connected app for the production environment.
- Don't share connected apps between applications.

**Important:** To extract data, use REST API or SOAP API to operate on sObjects. Do not use Connect REST API to extract data.

Salesforce Platform REST API rate limits and query language work better for these use cases.

- Migrate or synchronize user profiles between systems.
- Create analytic applications.
- Write queries that return records and fields.

## Integer Limits

Connect REST API supports most 64-bit integers. Integers greater than  $2^{31}-1$  and less than  $10^{18}$  must be in quotes. Integers larger than  $10^{18}$  aren't supported.

SEE ALSO:

[When to Use Connect REST API](#)

## Build the Resource URL

Access Connect REST API resources by using the URI for your company's instance, combined with version and Experience Cloud site information, and the URI for the resource.

For example, building a URL without Experience Cloud sites, your instance is:

```
https://instance_name
```

And the version information is:

```
/services/data/v65.0
```

And the resource is:

```
/chatter/feeds/news/me/feed-elements
```

Put together, the full URL is:

```
https://instance_name/services/data/v65.0/chatter/  
feeds/news/me/feed-elements
```

To access resources that are part of an Experience Cloud site, use this path after the version information and before the resource:

```
/connect/communities/communityId
```

For example, the following full URL accesses a news feed resource in a site:

```
https://instance_name/services/data/v65.0/connect  
/communities/communityId/chatter/feeds/news/me/feed-elements
```

To access resources in the default Experience Cloud site, use the `internal` shortcut as the site ID:

```
/connect/communities/internal
```

You can use the `internal` shortcut even if digital experiences isn't enabled. For example, if you're developing an application for multiple orgs, not all of which use Experience Cloud sites, you can use this shortcut.

The response bodies include URLs with `/connect/communities/internal`. This format enables you to perform string interpolation when referencing Experience Cloud sites.

To access resources in the default Experience Cloud site, you can also use the `/chatter` resources directly (without `/connect/communities/internal`). The response bodies don't include URLs with `/connect/communities/internal`.

In addition, you can use your org's URL for an Experience Cloud site to access resources in it. For example:

```
https://MyDomainName.my.site.com/sitepath/services/data/v65.0/connect  
/communities/communityId/chatter/feeds/news/me/feed-elements
```

 **Note:** To query resources from your Salesforce org where Experience Cloud sites have same-named objects, such as Groups, you must make the request from your Experience Cloud site. My Domain name or site-specific resources are returned.

## Send HTTP Requests

Connect REST API uses HTTP methods to send and receive JSON and XML content, so it's easy to build client applications using the tool or the language of your choice.

HTTP requests to a Connect REST API resource contain the following information.

- An HTTP method (such as GET, POST, PATCH, or DELETE).
- An OAuth 2.0 access token used to authenticate the request. For information on how to retrieve the token, see [Connect REST API Quick Start](#).
- The Connect REST API resource URL.
- Request parameters or a request body containing information needed for requests, such as information to update a record.

The request body can contain JSON or XML. If you pass resource-specific request parameters and a request body, the request parameters are ignored. Request parameters that aren't specific to a resource, such as parameters in a bearer token URL and the `_httpMethod` parameter, are processed along with the request body. Use bearer token parameters as they are. Don't add or remove parameters.

The HTTP methods are used to indicate the desired action, such as retrieving information, as well as creating, updating, and deleting records.

- GET is used to retrieve information, such as basic resource summary information.
- POST is used to create a new item, such as a feed item or a comment or like, or subscribe to a group.
- PATCH is used for partial updates to an item, for example, renaming a file.
- PUT is used for whole updates to an item, for example, marking a conversation as read.
- DELETE is used to delete an item, such as a feed element, or to unsubscribe from a group.
- HEAD is used to retrieve resource metadata. It's similar to using GET but doesn't return a response body. You can use HEAD to test the availability of a resource.

## HTTP Request Flow and a Response Body

Review the process flow for Connect REST API, including resource and response examples.

The general process flow for using Connect REST API is:

1. Send an HTTP request to Salesforce.
2. The system authenticates the user and client app.
3. Request Connect REST API resources using an HTTP request.
4. The system returns an HTTP return code. Additional information (such as a Connect REST API response body) is optionally included in the response.

Each resource in Connect REST API is a URI used with an HTTP method (such as GET, POST, DELETE, or HEAD). Each resource represents something in Salesforce, such as a user's news feed, or the comments on a post.

Many of the resources use either a specified user ID or the keyword `me` to indicate the current, context user. For example, to return the user-profile information for the current, context user, use this resource.

```
/chatter/users/me
```

You could also specify a particular user by user ID.

```
/chatter/users/005D0000001GLoh
```

When you successfully access a resource, a response body is returned in JSON or XML. By default, JSON is returned. Each response body can contain one or more response bodies. For example, the following is the response body of the user resource. It includes other response bodies as well, such as address, current status, and phone numbers.

| Property          | Type                              | Description                                                                                                                                              | Filter Group and Version | Available Version |
|-------------------|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|-------------------|
| aboutMe           | String                            | Text from user's profile.                                                                                                                                | Big, 29.0                | 23.0              |
| additionalLabel   | String                            | If one exists, an extra label for the user, for example, "Customer," "Partner," or "Acme Corporation."                                                   | Small, 30.0              | 30.0              |
| address           | <a href="#">Address</a>           | User's address.                                                                                                                                          | Big, 29.0                | 23.0              |
| bannerPhoto       | <a href="#">Banner Photo</a>      | User's banner photo.                                                                                                                                     | Big, 36.0                | 36.0              |
| chatterActivity   | <a href="#">Chatter Activity</a>  | Chatter activity statistics.                                                                                                                             | Big, 29.0                | 23.0              |
| chatterInfluence  | <a href="#">Chatter Influence</a> | User's influence rank.                                                                                                                                   | Big, 29.0                | 23.0              |
| communityNickname | String                            | User's nickname in the site.                                                                                                                             | Medium, 32.0             | 32.0              |
| companyName       | String                            | Company name.                                                                                                                                            | Small, 29.0              | 23.0              |
| currentStatus     | <a href="#">User Status</a>       | User's current status.                                                                                                                                   |                          | 23.0–25.0         |
| displayName       | String                            | User's name that is displayed in the site. If nicknames are enabled, the nickname is displayed. If nicknames aren't enabled, the full name is displayed. | Small, 32.0              | 32.0              |
| email             | String                            | User's email address.                                                                                                                                    | Medium, 29.0             | 23.0              |
| firstName         | String                            | User's first name. In version 39.0 and later, if nicknames are enabled, <code>firstName</code> is <code>null</code> .                                    | Small, 29.0              | 23.0              |
| followersCount    | Integer                           | Number of users following this user.                                                                                                                     | Big, 29.0                | 23.0              |
| followingCounts   | <a href="#">Following Counts</a>  | Information about items the user is following.                                                                                                           | Big, 29.0                | 23.0              |
| groupCount        | Integer                           | Number of groups user is following.                                                                                                                      | Big, 29.0                | 23.0              |
| hasChatter        | Boolean                           | <code>true</code> if user has access to Chatter; <code>false</code> otherwise.                                                                           | Small, 31.0              | 31.0              |
| id                | String                            | 18-character ID of the user.                                                                                                                             | Small, 29.0              | 23.0              |
| isActive          | Boolean                           | <code>true</code> if user is active, <code>false</code> otherwise.                                                                                       | Small, 29.0              | 23.0              |
| isChatterGuest    | Boolean                           | <code>true</code> if user is a Chatter customer, <code>false</code> otherwise.<br>In version 26.0 and later, use the <code>userType</code> property.     |                          | 23.0–25.0         |
| isInThisCommunity | Boolean                           | <code>true</code> if the user is in the same Experience Cloud site as the context user; <code>false</code> otherwise. Can be <code>false</code>          | Small, 29.0              | 28.0              |

| Property       | Type           | Description                                                                                                                                                                                                                 | Filter Group and Version | Available Version |
|----------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|-------------------|
|                |                | for record feed @mentions on posts with the scope "All Users."                                                                                                                                                              |                          |                   |
| lastName       | String         | User's last name. In version 39.0 and later, if nicknames are enabled, <code>lastName</code> is <code>null</code> .                                                                                                         | Small, 29.0              | 23.0              |
| managerId      | String         | 18-character ID of the user's manager.                                                                                                                                                                                      | Big, 29.0                | 23.0              |
| managerName    | String         | Locale-based concatenation of manager's first and last names.                                                                                                                                                               | Big, 29.0                | 23.0              |
| motif          | Motif          | Small, medium, and large icons indicating that the object is a user. The motif can also contain the object's base color.<br><br>The motif icon is not the user's profile picture.                                           | Small, 29.0              | 27.0              |
| mySubscription | Reference      | If the context user is following this user, contains information about the subscription, otherwise <code>null</code> .                                                                                                      | Medium, 29.0             | 23.0              |
| name           | String         | Locale-based concatenation of first and last names. In version 39.0 and later, if nicknames are enabled, <code>name</code> is the nickname.                                                                                 | Small, 29.0              | 23.0              |
| outOfOffice    | Out of Office  | If one exists, extra out-of-office message for the user.                                                                                                                                                                    | Small, 40.0              | 40.0              |
| phoneNumbers   | Phone Number[] | Collection of user's phone numbers.                                                                                                                                                                                         | Big, 29.0                | 23.0              |
| photo          | Photo          | Information about the user's photos.                                                                                                                                                                                        | Small, 29.0              | 23.0              |
| reputation     | Reputation     | Reputation of the user in the site, which is determined by the number of points earned from events and actions performed in the site.                                                                                       | Big, 32.0                | 32.0              |
| stamps         | Stamp[]        | Collection of the user's stamps.<br><br>In version 44.0 and later, use SOQL to get a user's stamps.                                                                                                                         | Small, 39.0              | 39.0–43.0         |
| thanksReceived | Integer        | Number of thanks the user has received.                                                                                                                                                                                     | Big, 29.0                | 29.0              |
| title          | String         | Title of the user.                                                                                                                                                                                                          | Small, 29.0              | 23.0              |
| type           | String         | Value is <code>User</code> .                                                                                                                                                                                                | Small, 29.0              | 23.0              |
| url            | String         | URL to the user's Chatter profile.                                                                                                                                                                                          | Small, 29.0              | 23.0              |
| username       | String         | User name of the user, such as <i>Admin@mycompany.com</i> .                                                                                                                                                                 | Small, 29.0              | 24.0              |
| userType       | String         | Type of user. Valid values are: <ul style="list-style-type: none"> <li><code>ChatterGuest</code>—User is an external user in a private group.</li> <li><code>ChatterOnly</code>—User is a Chatter Free customer.</li> </ul> | Medium, 29.0             | 26.0              |

| Property | Type | Description                                                                                                                                                                                                                                                                                                                                                                   | Filter Group and Version | Available Version |
|----------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|-------------------|
|          |      | <ul style="list-style-type: none"> <li>• <b>Guest</b>—User is unauthenticated.</li> <li>• <b>Internal</b>—User is a standard org member.</li> <li>• <b>Portal</b>—User is an external user in an Experience Cloud site.</li> <li>• <b>System</b>—User is Chatter Expert or a system user.</li> <li>• <b>Undefined</b>—User is a user type that is a custom object.</li> </ul> |                          |                   |

In JSON format, the output is:

```

```

**Note:** Salesforce runs on multiple server instances. The examples in this guide use *instance\_name* to indicate the instance.

Some of the items in a response body have a fully qualified URL, however, most of the returned URLs are relative. If the URL is relative, prepend it with the instance given to the client app when the item is authenticated.

## Inputs and Binary File Upload Examples

Make HTTP POST, PATCH, and PUT requests using inputs and learn more about uploading binary files.

### Using POST, PATCH, or PUT for Input

When you make a request using the HTTP POST, PATCH, and PUT methods, you can use request parameters or a request body. The request body can contain JSON or XML. If you pass resource-specific request parameters and a request body, the request parameters are ignored. Request parameters that aren't specific to a resource, such as parameters in a bearer token URL and the `_HttpMethod` parameter, are processed along with the request body. Use bearer token parameters as they are. Don't add or remove parameters.

To submit a request using request parameters, use a `Content-Type` header field with the value `application/x-www-form-urlencoded`.

To submit a request using a request body, use one of these values in a `Content-Type` header field and in an `Accept` header field.

- `application/json`
- `application/xml`

## Uploading Binary Files

To upload a binary file up to 2 GB (including headers), up to 75 MB for an external repository, or up to 512 MB for bulk conversations, send it as a body part in a multipart/form-data request. You can send the text of a comment (but not a post) as a JSON or XML rich input body part in the same multipart/form-data request. Alternately, you can choose to send that information in request parameters. If you pass both a rich input request body and request parameters, the request parameters are ignored.

To upload multiple binary files in the same call, see [Batch Resource](#).

 **Important:** In version 36.0 and later, you can't create a feed post and upload a binary file in the same request. [Upload files to Salesforce](#) first, and then use the file IDs to attach one or more files to a feed post.

To create a multipart/form-data request, in the head of the request, set the `Content-Type` HTTP header to `multipart/form-data`.

For information about HTTP headers, see [W3C Form content types](#), and [RFC 2388](#), which defines the multipart/form-data internet media type.

This table describes the HTTP headers and parameters required in the rich input body part of a multipart/form-data request.

| HTTP Headers for Rich Input Body Part | Header Value and Parameters                  | Description                                                                                                                            |
|---------------------------------------|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Content-Disposition                   | <code>form-data; name="json"</code>          | The request body for a post or comment.                                                                                                |
|                                       | <code>form-data; name="xml"</code>           | For JSON, the value of <code>name</code> use <code>"json"</code> .<br>For XML, the value of <code>name</code> use <code>"xml"</code> . |
| Content-Type                          | <code>application/json; charset=UTF-8</code> | The data format and character set of the request body.                                                                                 |
|                                       | <code>application/xml; charset=UTF-8</code>  | For JSON, the value must be <code>application/json</code> .<br>For XML, the value must be <code>application/xml</code> .               |

 **Tip:** Web browsers are typically incapable of making multipart requests when the non-binary parts, such as rich input bodies, have their own `Content-Type`. To work around this issue, specify a certain `Content-Disposition` name and Salesforce can read the `Content-Type` of the rich input part. (You don't have to specify a `Content-Type` for the rich input body.)

This table describes the HTTP headers and parameters required in the rich input body part of a multipart/form-data request from a web browser.

| HTTP Headers for Rich Input Body Part from Web Browser | Header Value and Parameters                       | Description                                                                                                       |
|--------------------------------------------------------|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Content-Disposition                                    | form-data; name="feedElement"                     | To post a feed element with a binary file (in version 35.0 and earlier), the value of name must be "feedElement". |
|                                                        | form-data; name="comment"                         | To post a comment with a binary file, the value of name must be "comment".                                        |

|                                                        | form-data; name="file"                            | To upload a file to the Files home or an external repository, the value of name must be "file".                   |
|                                                        | form-data; name="folderItem"                      | To upload a file to a folder, the value of name must be "folderItem".                                             |
|                                                        | form-data; name="ManagedContentInputParam"        | To upload a piece of managed content, the value of name must be "ManagedContentInputParam".                       |
|                                                        | form-data; name="ManagedContentVariantInputParam" | To update a managed content variant, the value of name must be "ManagedContentVariantInputParam".                 |

This table describes the HTTP headers and parameters required in the binary upload body part of a multipart/form-data request.

| HTTP Headers for Binary Upload Body Part | Header Value and Parameters                                      | Description                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------|------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Disposition                      | form-data; name="feedElementFileUpload"; filename= <b>string</b> | To <a href="#">post a feed element with a binary file</a> (in version 35.0 and earlier), the value of name must be "feedElementFileUpload".<br>To <a href="#">post a comment with a binary file</a> , the value of name must be "feedElementFileUpload".                                                                                                       |
|                                          | form-data; name="fileUpload" filename= <b>string</b>             | To <a href="#">upload a user or group photo</a> , the value of name must be "fileUpload".                                                                                                                                                                                                                                                                      |
|                                          | form-data; name="fileData" filename= <b>string</b>               | To <a href="#">upload a file to the Files home</a> or to <a href="#">upload a file to an external repository</a> , the value of name must be "fileData".                                                                                                                                                                                                       |
|                                          |                                                                  |  <b>Note:</b> Specify a filename parameter and value. However, Salesforce uses the value of the title property of the <a href="#">File Input</a> or the metadata of the <a href="#">Files Connect Item Input</a> as the file name, not the value of the filename parameter. |

| HTTP Headers for Binary Upload Body Part | Header Value and Parameters                             | Description                                                                                                                                                                  |
|------------------------------------------|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                          | form-data; name="audioFileData" filename= <b>string</b> | To <a href="#">upload an audio file</a> , the value of name must be "audioFileData". If you specify this value, don't specify recordingURL or name or the request will fail. |
|                                          | form-data; name="contentData" filename= <b>string</b>   | To <a href="#">upload a piece of managed content</a> or <a href="#">update a managed content variant</a> , the value of name must be "contentData".                          |
| Content-Type                             | application/octet-stream; charset=ISO-8859-1            | The media type and character set of the binary file.                                                                                                                         |

**Note:** Spacing and carriage returns and line feeds (CRLF) are important. For example, this line requires spaces:  
 Content-Disposition: form-data; name="feedItemFileUpload"; title="2012\_q1\_review.ppt".  
 If you used CRLF instead of spaces, you would receive an error.

## Post a feed element with a binary file (version 35.0 and earlier)

This example uses the [/chatter/feed-elements](#) resource to post a new feed item (which is a type of feed element), upload a binary file, and attach it to the new feed item. This example uses cURL.

```
curl -H "X-PrettyPrint: 1" -F 'json={ "body":{ "messageSegments":[ { "type":"Text",
"text":"Please accept this receipt." } ] },
"capabilities":{ "content":{ "description":"Receipt for expenses", "title":"receipt.pdf"
} }, "feedElementType":"FeedItem", "subjectId":"005RR000000DmOb" }';
type=application/json' -F "feedElementFileUpload=@receipt.pdf;type=application/octet-stream"

-X POST https://instance_name/services/data/v35.0/chatter/feed-elements
-H 'Authorization: OAuth 00DRR0000000N0g!...' --insecure
```

Here is the same example in a different format so you can see the request body parts.

```
POST /services/data/v35.0/chatter/feed-elements HTTP/1.1
Authorization: OAuth 00DRR0000000N0g!...
User-Agent: Jakarta Commons-HttpClient/3.0.1
Host: instance_name
Content-Length: 845
Content-Type: multipart/form-data; boundary=a7V4kRcFA8E79pivMuV2tukQ85cmNKeoEgJgq
Accept: application/json

--a7V4kRcFA8E79pivMuV2tukQ85cmNKeoEgJgq
Content-Disposition: form-data; name="json"
Content-Type: application/json; charset=UTF-8

{
  "body": {
    "messageSegments": [
      {
        "type": "Text",
```

```

        "text": "Please accept this receipt."
    }
}
},
"capabilities": {
    "content": {
        "description": "Receipt for expenses",
        "title": "receipt.pdf"
    }
},
"feedElementType": "FeedItem",
"subjectId": "005RR000000DmOb"
}

--a7V4kRcFA8E79pivMuV2tukQ85cmNKeoEgJgq
Content-Disposition: form-data; name="feedElementFileUpload"; filename="receipt.pdf"
Content-Type: application/octet-stream; charset=ISO-8859-1

...contents of receipt.pdf...

--a7V4kRcFA8E79pivMuV2tukQ85cmNKeoEgJgq--

```

## Post a batch of feed elements with binary files (version 35.0 and earlier)

This example uses the [/chatter/feed-elements/batch](#) resource to post a batch of feed elements, upload two binary files, and attach them to the feed elements in the batch. Include the information about the binary parts in the request body. This example uses cURL.

```

curl -H "X-PrettyPrint: 1" -F 'json={"inputs":[{"binaryPartNames":["bin1"],
"richInput":{"subjectId":"me","body":{"
"messageSegments":[{"type":"Text","text":"Please accept this receipt"}]},
"capabilities":{
{"content": {"description": "Receipt for expenses",
"title":"receipt.pdf"}},
"feedElementType":"FeedItem"}]},
{"binaryPartNames":["bin2"],"richInput":{"subjectId":"me","body":{"messageSegments":[{"type":"Text","text":"Post
Number 2"}]}},
"capabilities": {"content": {"description": "Receipt for expenses",
"title":"receipt2.pdf"}},
"feedElementType":"FeedItem"}]}];type=application/json'
-F "bin1=@/Users/jsmith/Desktop/receipt.pdf;type=application/octet-stream" -F
"bin2=@/Users/jsmith/Desktop/receipt2.pdf;type=application/octet-stream"
-X POST https://instance_name/services/data/v35.0/chatter/feed-elements/batch
-H 'Authorization: OAuth 00DD00000007HoR44QATPNzhzYEJBfU' --insecure

```

Here is the same example formatted to show the request body parts.

```

POST /services/data/v35.0/chatter/feed-elements/batch HTTP/1.1
Authorization: OAuth 00DRR0000000N0g!...
User-Agent: Jakarta Commons-HttpClient/3.0.1
Host: instance_name
Content-Length: 845
Content-Type: multipart/form-data; boundary=a7V4kRcFA8E79pivMuV2tukQ85cmNKeoEgJgq
Accept: application/json

--a7V4kRcFA8E79pivMuV2tukQ85cmNKeoEgJgq
Content-Disposition: form-data; name="json"

```

```

Content-Type: application/json; charset=UTF-8

{
  "inputs": [
    {
      "binaryPartNames": [
        "bin1"
      ],
      "richInput": {
        "subjectId": "me",
        "body": {
          "messageSegments": [
            {
              "type": "Text",
              "text": "Please accept this receipt"
            }
          ]
        },
        "capabilities": {
          "content": {
            "description": "Receipt for expenses",
            "title": "receipt.pdf"
          }
        },
        "feedElementType": "FeedItem"
      }
    },
    {
      "binaryPartNames": [
        "bin2"
      ],
      "richInput": {
        "subjectId": "me",
        "body": {
          "messageSegments": [
            {
              "type": "Text",
              "text": "Post Number 2"
            }
          ]
        },
        "capabilities": {
          "content": {
            "description": "Receipt for expenses",
            "title": "receipt2.pdf"
          }
        },
        "feedElementType": "FeedItem"
      }
    }
  ]
}

--a7V4kRcFA8E79pivMuV2tukQ85cmNKeoEgJgq

```

```
Content-Disposition: form-data; name="bin1"; filename="receipt.pdf"
Content-Type: application/octet-stream; charset=ISO-8859-1

...contents of receipt.pdf...

--a7V4kRcFA8E79pivMuV2tukQ85cmNKeoEgJgq
Content-Disposition: form-data; name="bin2"; filename="receipt2.pdf"
Content-Type: application/octet-stream; charset=ISO-8859-1

...contents of receipt2.pdf...

--a7V4kRcFA8E79pivMuV2tukQ85cmNKeoEgJgq--
```

**Note:** The binary part names in the `binaryPartNames` properties must match the binary part names in the `name` properties of the binary request parts.

## Post a comment with a binary file

This example uses the `/chatter/feed-elements/feedElementId/capabilities/comments/items` resource to post a comment to a feed item and upload a binary attachment using cURL.

```
curl -H "X-PrettyPrint: 1" -F 'json={ "body":{ "messageSegments":[ { "type":"Text",
"text":"Here's another receipt." } ] }, "capabilities":{ "content":{ "title":"receipt2" }
} }';
type=application/json' -F "feedElementFileUpload=@receipt2.txt;type=application/octet-stream"

-X POST
https://instance_name/services/data/v65.0/chatter/feed-elements/0D5RR0000004Grx/capabilities/comments/items

-H 'Authorization: OAuth 00DRR0000000N0g!ARoAQB...' --insecure
```

Here is the sample example formatted to see the request body parts.

```
POST /services/data/v65.0/chatter/feed-elements/0D5RR0000004Grx/capabilities/comments/items
HTTP/1.1
Authorization: OAuth 00DD0000000Jhd2!AQIAQC.1h4qTQcBhOPm4TZom5IaOOZLVPVK4wI_rPYJvME8r2VW8XA.

## Post multiple comments with binary files

This example is a generic batch request to [/connect/batch](#) that contains two subrequests. Each subrequest comments on a feed item and uploads a binary file to the comment.

Include the request body of each subrequest in the `richInput` properties.

Also include information about the binary parts in the `binaryPartName` and `binaryPartNameAlias` properties.

Here is the cURL example.

```

curl -H "X-PrettyPrint: 1" -F 'json={ "haltOnError":true, "batchRequests":[ {
"url":"/v33.0/chat/elements/0D5D000000YG0N/capabilities/comments/items",
"method":"Post", "binaryPartName":"binaryPart1",
"binaryPartNameAlias":"feedElementFileUpload", "richInput":{"body":{"messageSegments":[
{ "type":"Text", "text":"Check out this file, it may help." } ] },
"capabilities":{"content":{"title":"Presentation1.txt" } } } }, {
"url":"/v33.0/chat/elements/0D5D000000YG0M/capabilities/comments/items",
"method":"Post", "binaryPartName":"binaryPart2",
"binaryPartNameAlias":"feedElementFileUpload", "richInput":{"body":{"messageSegments":[
{ "type":"Text", "text":"Check out this file, it may help." } ] },
"capabilities":{"content":{"title":"Presentation2.txt" } } } } ] };type=application/json'
-F "binaryPart1=@/Users/jbleyle/Desktop/Presentation1.txt;type=application/octet-stream"

-F "binaryPart2=@/Users/jbleyle/Desktop/Presentation2.txt;type=application/octet-stream"
-X POST https://instance_name/services/data/v65.0/connect/batch
-H 'Authorization: OAuth 00DD00000007HoR!...' --insecure

```

Here is the multipart/form-data request body.

```

https://instance_name/services/data/v65.0/connect/batch

Authorization: OAuth 00DD0000000Jhd2!...
Accept: application/json
Host: instance_name
Content-Type: multipart/form-data; boundary=123123

```

```
--123123

## Upload a file to the Files home

This example uses the [/connect/files/users/\*\*userId\*\*](#) resource to upload a file to the Files home using cURL.

```
curl -H "X-PrettyPrint: 1" -F 'json={"title":"BoatPrices"};type=application/json'
-F "fileData=@BoatPrices.pdf;type=application/octet-stream"
-X POST https://instance_name/services/data/v65.0/connect/files/users/me
-H 'Authorization: OAuth 00DRR0000000N0g!...' --insecure
```

Here is the same example formatted to see the request body parts.

```
POST /services/data/v65.0/connect/files/users/me

## Upload an audio file

This example uses the `/voicecalls/voiceCallId/audio_upload` resource to upload an audio file using cURL.

```
curl --location --request POST
'https://instance_name/services/data/v65.0/voicecalls/0LQB00000001BqU/audio_upload' \
--header 'Authorization: Bearer
00DR0000000H1C0!ARYAQ21bJjcfU6PMnH.cFInsqFQvFkqDlnzQTUEUgjPJ6_gVHo7ZdGCFhFTYt3AWuKLFz2ahVdsdlpS9ENozHfrONLI_EQa'
\
--form 'audioFileData=@/Users/v.dodeja/Desktop/recordingservlet.mp3'
```

## Upload an audio file from a third-party vendor

This example uses the `/voicecalls/voiceCallId/audio_upload` resource to upload an audio file using cURL.

```
curl --location --request POST
'https://instance_name/services/data/v65.0/voicecalls/0LQB00000001BqU/audio_upload' \
--header 'Authorization: Bearer
00DR0000000H1C0!ARYAQ21bJjcFU6PMnH.cFIInsqFQvFkqDlnzQTUEUgjPJ6_gvHo7ZdGCFhFTYt3AWuKLFz2ahVdsdlpS9ENozHfrONLI_EQa'
\
--form 'recordingURL=@/restapi/v1.0/account/401452676008/recording/401786818008/content'
'name=@namedCredential'
```

## Upload a piece of managed content

This example uses the `/connect/cms/contents` resource to upload a piece of managed content. This resource is available only for enhanced CMS workspaces.

```
POST /connect/cms/contents/
Content-Type: multipart/form-data; boundary=FILE

--FILE
Content-Disposition: form-data; name="ManagedContentInputParam";
Content-Type: application/json; charset=UTF-8

{
  "contentSpaceOrFolderId": "0Zuxx00000003M5CAI",
  "title": "title",
  "contentType": "sfmc_cms__image",
  "urlName": "testUrl",
  "contentBody" : {
    "sfmc_cms:media": {
      "source": {
        "type": "file"      }
    }
  }
}

--FILE
Content-Disposition: form-data; name="contentData"; fileName="Image.jpg"
Content-Type: application/octet-stream; charset=ISO-8859-1

<Binary File Data>

\n
--FILE--
```

## Update a managed content variant

This example uses the `/connect/cms/contents/variants/variantId` resource to update a managed content variant. This resource is available only for enhanced CMS workspaces.

```
PUT /connect/cms/contents/variants/9Psxx00000004WsCAI
Content-Type: multipart/form-data; boundary=FILE
```

```
--FILE
Content-Disposition: form-data; name="ManagedContentVariantInputParam";
Content-Type: application/json; charset=UTF-8

{
  "title": "title",
  "urlName": "testUrl",
  "contentBody" : {
    "sfdc_cms:media": {
      "source": {
        "type": "file"    }
    }
  }
}

--FILE
Content-Disposition: form-data; name="contentData"; fileName="Image.jpg"
Content-Type: application/octet-stream; charset=ISO-8859-1

<Binary File Data>

\n
--FILE--
```

## Wildcards

Use wildcard characters to match text patterns in Connect REST API and Connect in Apex searches.

A common use for wildcards is searching a feed. Pass a search string and wildcards in the `q` parameter. This example is a Connect REST API request:

```
/chatter/feed-elements?q=chat*
```

This example is a Connect in Apex method call:

```
ConnectApi.ChatterFeeds.searchFeedElements(null, 'chat*');
```

You can specify the following wildcard characters to match text patterns in your search:

| Wildcard | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| *        | <p>Asterisks match zero or more characters at the middle or end of your search term. For example, a search for <i>john*</i> finds items that start with <i>john</i>, such as, <i>john</i>, <i>johnson</i>, or <i>johnny</i>. A search for <i>mi* meyers</i> finds items with <i>mike meyers</i> or <i>michael meyers</i>.</p> <p>If you are searching for a literal asterisk in a word or phrase, then escape the asterisk (precede it with the <code>\</code> character).</p> |
| ?        | <p>Question marks match only one character in the middle or end of your search term. For example, a search for <i>jo?n</i> finds items with the term <i>john</i> or <i>joan</i> but not <i>jon</i> or <i>johan</i>. You can't use a <code>?</code> in a lookup search.</p>                                                                                                                                                                                                     |

When using wildcards, consider the following notes:

- The more focused your wildcard search, the faster the search results are returned, and the more likely the results will reflect your intention. For example, to search for all occurrences of the word `prospect` (or `prospects`, the plural form), it is more efficient

to specify `prospect*` in the search string than to specify a less restrictive wildcard search (such as `prosp*`) that could return extraneous matches (such as `prosperity`).

- Tailor your searches to find all variations of a word. For example, to find `property` and `properties`, you would specify `proPERT*`.
- Punctuation is indexed. To find `*` or `?` inside a phrase, you must enclose your search string in quotation marks and you must escape the special character. For example, `"where are you\?"` finds the phrase `where are you?`. The escape character (`\`) is required in order for this search to work correctly.

## Specify Response Sizes

Use filter parameters to return only the data the application needs. To specify the response size by group (big, medium, or small), use `filterGroup` as a request parameter or in a request body. In addition, to exclude or include specific properties, use either `exclude` or `include` as a request parameter or in a request body.

-  **Important:** To exclude or include properties, use a path to select a node. To find the path, make a request to the resource and ask for an XML response instead of JSON. The XML includes node names and JSON doesn't. To request an XML response, append `.xml` to the resource, for example `/services/data/v44.0/chatter/feeds/record/a07B000000079vKZiAY/feed-elements.xml`. Copy the XML into a file and open it in a browser or an IDE that generates an XML tree. Identify the path to the node you want to include or exclude and use it in your request:
- `/services/data/v44.0/chatter/feeds/record/a07B000000079vKZiAY/feed-elements.xml?exclude=/elements/feedElement/actor`

### IN THIS SECTION:

#### `filterGroup`

Use the `filterGroup` parameter in a request URL or in a request body to specify whether to return a small, medium, or big group of properties. The `filterGroup` property is available in API version 29.0 and later.

#### `exclude`

To exclude specific properties from a response body, use the `exclude` request parameter. The `exclude` parameter is available in API version 27.0 and later.

#### `include`

To limit the response body to specific properties, use the `include` query string parameter.

## `filterGroup`

Use the `filterGroup` parameter in a request URL or in a request body to specify whether to return a small, medium, or big group of properties. The `filterGroup` property is available in API version 29.0 and later.

-  **Note:** The `filterGroup` parameter is supported for JSON only.

Every property in every response body is assigned a group size.

- **Big**—The default size. Includes every property in a response body, including those marked **Big**, **Medium**, and **Small**.
- **Medium**—Includes properties marked **Medium** and **Small**.
- **Small**—The smallest response size. Includes only properties marked **Small**.

-  **Note:** The size assignments are visible only in the documentation. They aren't visible in the response bodies.

When a request includes a `filterGroup`, the response body only includes properties that are part of the specified group.

Things to know about using filter groups:

- The default `filterGroup` size is `Big`.
- Each filter group size assigned to a property has an API version. In future API versions properties may move to different filter groups.
- Filter groups affect all HTTP verbs except DELETE and HEAD.
- You can use a `filterGroup` parameter on any request URL, including subrequests in a batch request body, unless otherwise stated.
- You can use a `filterGroup` parameter in conjunction with either an `include` or an `exclude` filter parameter to change the set of properties returned. The resulting set is a union of the two sets.

### Using a `filterGroup` parameter with an `include` or `exclude` parameter

Requests can contain a `filterGroup` parameter and group size value, and either an `include` or an `exclude` filter parameter and value on the URL. This is also true for subrequests in a [generic batch request](#).

When a request (or a subrequest) contains both a `filterGroup` parameter and an `include` parameter, the response always includes the properties specified by the `include` parameter.

When a request (or a subrequest) contains both a `filterGroup` parameter and an `exclude` parameter, the response always excludes the properties specified by the `exclude` parameter.

In this table, read a row from left to right to see whether the property is included in the response.

| <code>include</code> Filter<br>Provided in<br>Request | Property<br>Provided in<br><code>include</code><br>Filter in<br>Request | <code>exclude</code> Filter<br>Provided in<br>Request | Property<br>Provided in<br><code>exclude</code><br>Filter in<br>Request | <code>filterGroup</code><br>Provided in<br>Request | Property<br>Provided in<br><code>filterGroup</code><br>in Request | Property<br>Included In<br>Response |
|-------------------------------------------------------|-------------------------------------------------------------------------|-------------------------------------------------------|-------------------------------------------------------------------------|----------------------------------------------------|-------------------------------------------------------------------|-------------------------------------|
| Yes                                                   | No                                                                      | No                                                    | No                                                                      | No                                                 | No                                                                | <b>No</b>                           |

### `exclude`

To exclude specific properties from a response body, use the `exclude` request parameter. The `exclude` parameter is available in API version 27.0 and later.

The value for the `exclude` query is a list of properties separated by bars ( | ). You must URL encode the bars as `%7C`. You must include a forward slash before each property name.

The following request excludes both the `aboutMe` and `address` properties from a response body:

```
/chatter/users/me?exclude=/aboutMe%7C/address
```

The following table lists rules for using the `exclude` query parameter, as well as additional examples.

| Description                                                                                                | Original Output                                                                                                                                                                           | Exclude Value                        | Filtered Output                                                                                                                                            |

| Identify an item in a list by its property name.<br>This example uses XML.  | <pre>&lt;foo&gt;   &lt;bar&gt;bar valu&lt;/bar&gt;   &lt;baz&gt;baz value&lt;/baz&gt;   &lt;someList&gt;     &lt;item&gt;       &lt;id&gt;1&lt;/id&gt;     &lt;/item&gt;     &lt;item&gt;       &lt;id&gt;2&lt;/id&gt;     &lt;/item&gt;     &lt;item&gt;       &lt;id&gt;3&lt;/id&gt;     &lt;/item&gt;   &lt;/someList&gt; &lt;/foo&gt;</pre> | exclude=/someList/item/id | <pre>&lt;foo&gt;   &lt;bar&gt;bar value &lt;/bar&gt;   &lt;baz&gt;baz value &lt;/baz&gt;   &lt;someList&gt;     &lt;item/&gt;     &lt;item/&gt;     &lt;item/&gt;   &lt;/someList&gt; &lt;/foo&gt;</pre> |
| Identify an item in a list by its property name.<br>This example uses JSON. | <pre>{   "bar" : "bar value",   "baz" : "baz value",   "someList" : [     {       "id" : "1"     },     {       "id" : "2"     },     {       "id" : "3"     }   ] }</pre>                                                                                                                                                                      | exclude=/someList/item/id | <pre>{   "bar" : "bar value",   "baz" : "baz value",   "someList" : [     {},     {},     {}   ] }</pre>                                                                                                 |

## include

To limit the response body to specific properties, use the `include` query string parameter.

The value for the `include` query string parameter is a list of properties separated by bars (|). You must URL encode the bars as %7C. Include a forward slash before every property name.

The following request includes only the `aboutMe` property and the `address` property in a response body:

```
/chatter/users/me?include=/aboutMe%7C/address
```

The following table lists rules for using the `include` query parameter.

| Description                                 | Original Output                     | Include Value | Filtered Output                                   |
|---------------------------------------------|-------------------------------------|---------------|---------------------------------------------------|
| Include a forward slash (/) before property | <pre>{   "bar" : "bar value",</pre> | include=bar   | 400 error with error code<br>INVALID_FILTER_VALUE |

| Description                                                                                                | Original Output                                                                                                                                                                                 | Include Value             | Filtered Output                                                                                                                                                           |
|------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| names or the request returns an error.                                                                     | <pre>"baz" : "baz value" }</pre>                                                                                                                                                                |                           |                                                                                                                                                                           |

| To filter a property nested in a response body, include the parent response body name as a filter segment. | <pre>&lt;foo&gt;   &lt;bar&gt;bar value&lt;/bar&gt;   &lt;baz&gt;baz value&lt;/baz&gt;   &lt;someObject&gt;     &lt;sub&gt;sub value&lt;/sub&gt;   &lt;/someObject&gt; &lt;/foo&gt;</pre>       | include=/someObject/sub   | <pre>&lt;foo&gt;   &lt;someObject&gt;     &lt;sub&gt;sub 1     &lt;/sub&gt;   &lt;/someObject&gt; &lt;/foo&gt;</pre>                                                      |
| Identify an item in a list by its property name. This example uses XML.                                    | <pre>&lt;foo&gt;   &lt;bar&gt;bar valu&lt;/bar&gt;   &lt;baz&gt;baz value&lt;/baz&gt;   &lt;someList&gt;     &lt;item&gt;       &lt;id&gt;1&lt;/id&gt;     &lt;/item&gt;     &lt;item&gt;</pre> | include=/someList/item/id | <pre>&lt;foo&gt;   &lt;someList&gt;     &lt;item&gt;       &lt;id&gt;1&lt;/id&gt;     &lt;/item&gt;     &lt;item&gt;       &lt;id&gt;2&lt;/id&gt;     &lt;/item&gt;</pre> |

| Description                                                              | Original Output                                                                                                                                                              | Include Value             | Filtered Output                                                                                                                |
|--------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|--------------------------------------------------------------------------------------------------------------------------------|
|                                                                          | <pre>       &lt;id&gt;2&lt;/id&gt;     &lt;/item&gt;     &lt;item&gt;       &lt;id&gt;3&lt;/id&gt;     &lt;/item&gt;   &lt;/someList&gt; &lt;/foo&gt; </pre>                 |                           | <pre>     &lt;item&gt;       &lt;id&gt;3&lt;/id&gt;     &lt;/item&gt;   &lt;/someList&gt; &lt;/foo&gt; </pre>                  |
| Identify an item in a list by its property name. This example uses JSON. | <pre> {   "bar" : "bar value",   "baz" : "baz value",   "someList" : [     {       "id" : "1"     },     {       "id" : "2"     },     {       "id" : "3"     }   ] } </pre> | include=/someList/item/id | <pre> {   "someList" : [     {       "id" : "1"     },     {       "id" : "2"     },     {       "id" : "3"     }   ] } </pre> |

## Response Body Encoding

Responses are minimally HTML entity-encoded by default.

These characters are escaped in all strings.

| Character | Escaped as |
|-----------|------------|
| <         | &lt;       |
| >         | &gt;       |
| "         | &quot;     |
| '         | &#39;      |
| \         | &#92;      |
| &         | &amp;      |

URL values included in response payloads have special encoding. The main part of the URL is URL-encoded as per [RFC2396](#), and the query string is HTML-form encoded. This encoding cannot be turned off.

**Warning:** User-submitted content may not be filtered at input and can come from many sources including third-party mobile and web applications. Process API output for the context in which your app uses the output. Failing to process output can expose

applications and users to Cross Site Scripting (XSS) exploits and other problems. These problems can result in data loss, application failure, and exposure of company information.

API output can be used in many contexts. Don't assume that the default entity encoding is appropriate for all contexts. Using API output inside HTML attribute values, inside URLs, with JavaScript, inside `<script>` tags, and inside CSS all require different encoding. See [the Open Web Application Security Project](#) for information on how to handle API output in different contexts.

Clients can request raw (unencoded) output. Set the `X-Header-Entity-Encoding` HTTP header in a request to `false`.

## Status Codes and Error Responses

The response header contains an HTTP status code. If the response isn't successful, the response body contains an error message, and if appropriate, information about the field or object where the error occurred.

| HTTP Status Code | Description                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 200              | A request succeeded. The information returned with the response depends on the method of the request.                                                                                                                           |
| 201              | A request succeeded, and a new resource was created.                                                                                                                                                                            |
| 202              | A request was accepted for processing, but processing isn't complete.                                                                                                                                                           |
| 204              | A request succeeded, and there isn't content to send in the response, such as with a DELETE request.                                                                                                                            |
| 400              | The request isn't understood, usually because the ID isn't valid for the particular resource. For example, if you use a <code>userId</code> where a <code>groupId</code> is required, the request returns 400.                  |
| 401              | The session ID or OAuth token expired or is invalid. Or, if the request is made by a guest user, the resource isn't accessible to guest users. The response body contains the <code>message</code> and <code>errorCode</code> . |
| 403              | The request is refused. Verify that the context user has the appropriate permissions to access the requested data, or that the context user is not an external user.                                                            |
| 404              | Either the specified resource isn't found, or the resource is deleted.                                                                                                                                                          |
| 409              | A conflict occurred. For example, an attempt to update a request to join a group results in a conflict when that request was already approved or rejected.                                                                      |
| 410              | The requested resource is retired or removed. Delete or update references to the resource.                                                                                                                                      |
| 412              | A precondition failed. For example, in a batch request, if <code>haltOnError</code> is <code>true</code> and a subrequest fails, subsequent subrequests return 412.                                                             |
| 422              | The request couldn't be processed because it contains invalid data.                                                                                                                                                             |
| 429              | Too many requests in a 24-hour period.                                                                                                                                                                                          |
| 500              | An error occurred within Salesforce, so the request couldn't complete.                                                                                                                                                          |
| 503              | Too many requests in an hour, or the server is down for maintenance.                                                                                                                                                            |

## Example

This request requires a comment ID, but it uses a feed item ID instead.

```
GET /chatter/comments/0D5D0000000XZoHKAw
```

The response body is:

```
HTTP/1.1 400 Bad Request
Date: Fri, 22 May 2015 17:32:10 GMT
Set-Cookie: BrowserId=D_3feNw7RYmP4DA; Path=/; Domain=.salesforce.com; Expires=Tue, 21-Jul-2015 17:32:10 GMT
Expires: Thu, 01 Jan 1970 00:00:00 GMT
Content-Type: application/json; charset=UTF-8
Transfer-Encoding: chunked

[ {
  "errorCode" : "INVALID_ID_FIELD",
  "message" : "Invalid identifier: 0D5D0000000XZoHKAU"
} ]
```

## OAuth and Connect REST API

Connect REST API uses OAuth to securely identify your application before connecting to Salesforce.

OAuth is an open protocol that allows secure authentication for access to a user's data, without handing out the user's username and password. It's often described as the valet key of software access. A valet key only allows access to certain features of your car. For example, you can't open the trunk or glove compartment using a valet key.

When you use OAuth, you avoid storing login credentials in your application. Instead, your application prompts the user to log in using a standard Salesforce page, which returns an access token to your application. Your application uses this token to access Connect REST API web services. Use OAuth in mobile apps and from a web page.

Connect REST API uses [OAuth 2.0](#).

## Connected Apps

To use Connect REST API, create a REST entry point in your organization. Salesforce defines this entry point as a connected app definition.

For an example of creating a connected app definition, see [Step Two: Set Up Authorization](#).

Consider these items when creating and using a connected app.

- This table maps the labels used in the connected app definition to OAuth terms.

| Connected App Label | OAuth Term    | Description                                                                                                                                                                                                                                                                             |
|---------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Consumer Key        | client_id     | A unique identifier that identifies your application to Salesforce.                                                                                                                                                                                                                     |
| Consumer Secret     | client_secret | A secret key associated with your application.                                                                                                                                                                                                                                          |
| Callback URL        | redirect_uri  | A URL associated with your client application. In some contexts, the URL must be a real URL that the client's web browser is redirected to. In others, the URL isn't used. However, between your client application and the server (the connected app definition) the value must be the |

| Connected App Label | OAuth Term | Description                                                                                                     |
|---------------------|------------|-----------------------------------------------------------------------------------------------------------------|
|                     |            | same. We suggest using a value that identifies the application, such as <code>http://mycomponent.myapp</code> . |

- If you're developing a mobile app, use the following value for the `Callback URL (redirect_uri)` to avoid setting up an application server of your own.

```
https://login.instance_name/services/oauth2/success
```

Don't use this value when developing a web application.

- Your connected app doesn't have to reside in the same org as your users. Use the connected app you create to sign in to any org.
- We recommend creating more than one connected app definition—one for testing and one for production. If you create only one, you must change the value of the `Callback URL` to reflect the location of your application code. In addition, we suggest creating more than one connected app if you're developing for different platforms, such as iOS and Android.

## OAuth Basics

- OAuth grants access by client applications to resources owned by resource owners. In terms of OAuth, a resource is anything that you must keep secure. For Connect REST API, the resource we're concerned about protecting is all the data accessible through the API.
- It's up to a resource owner to grant access to resources. In our context, the resource owner is a combination of the admin (who administers users and the connected app) and the users (who log in and grant access to third-party applications).
- When an application wants to access a resource, it requests authorization from the resource owner. OAuth outlines various ways to grant an application ccess to a resource. These ways are referred to as grant types or flows. Different flows are suitable for different contexts.
- After a client application is authorized to access a resource, the client application receives an access token and a refresh token. The authorized client application must include the access token in any subsequent web service requests to identify itself. Access tokens have a limited lifetime. When an access token expires, the authorized client application can make a special request using the refresh token to obtain a new access token.

## OAuth Flows

A user must be authenticated before accessing Salesforce. OAuth has multiple authentication flows. There are several steps in each authentication flow, as dictated by the OAuth standard and the type of application trying to access Salesforce. On successful authorization, the client application receives access and refresh tokens.

Salesforce supports these flows for use with Connect REST API.

- [Web server flow](#)
- [User-agent flow](#)

In addition, you can use the [refresh token](#) to get a new access token after your application has been authorized for access.

For detailed information about using OAuth with digital experiences, see Salesforce Help.

## Revoke Access

After users have been granted access to a client application, they can revoke access by clicking **Revoke** in the Connected Apps section of their Personal Information page.

## More Resources

Connect REST API shares some infrastructure with REST API. This information on authentication also applies to Connect REST API.

- *REST API Developer Guide:* [Authorization Through Connected Apps and OAuth 2.0](#)
- *Salesforce Help:* [OAuth Authorization Flows](#)
- *Salesforce Help:* [Authorize Apps with OAuth](#)

The authentication part of REST API is shared with Connect REST API. We suggest this library that supports REST API.

- [JavaScript REST Toolkit](#)

OAuth is a popular authentication standard. Client libraries for OAuth help smooth the development process for client applications. We suggest these client programming libraries.

- Ruby on Rails: [OmniAuth](#)
- Java: [Apache Amber](#)

### IN THIS SECTION:

#### [Web Server OAuth Authentication Flow](#)

Typically this flow is used by web applications that can confidentially store the client secret. A critical aspect of the web server flow is that the application must be able to protect the consumer secret.

#### [User-Agent OAuth Authentication Flow](#)

Typically this flow is used by mobile apps or applications that directly access the Connect REST API from JavaScript. In this flow, it's assumed that the client application can't be trusted to store client credentials, nor the user login credentials.

#### [Tokens](#)

As part of both authentication flows, you work with access tokens and refresh tokens.

#### [Request Static Assets and Post Forms Directly from HTML](#)

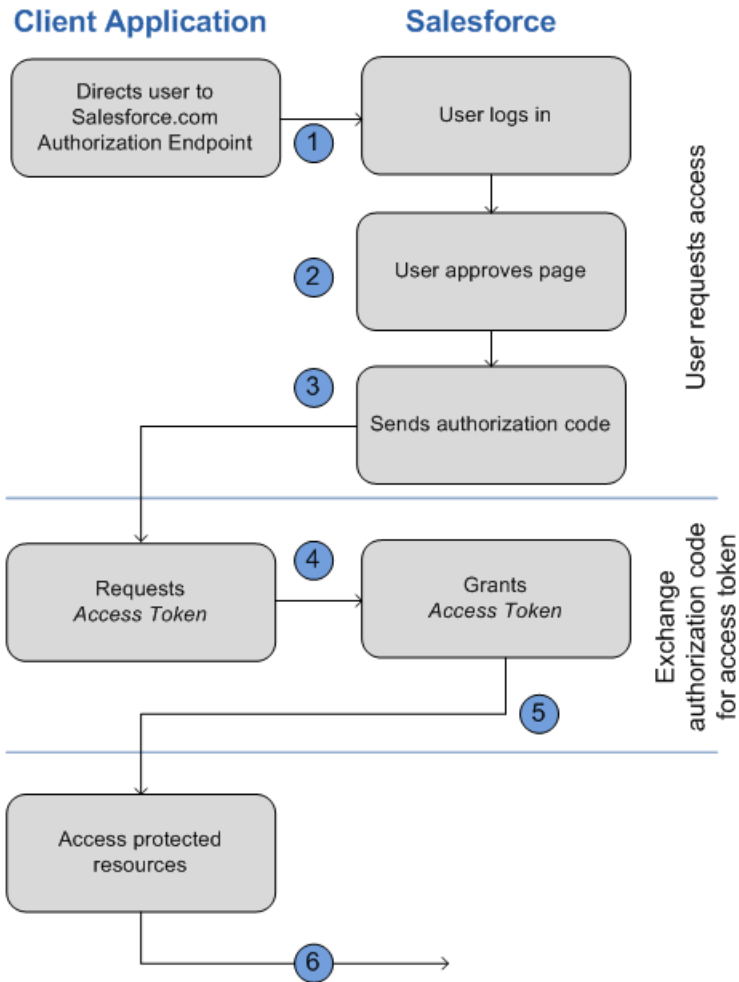

HTML pages that aren't hosted on Salesforce have had difficulty displaying user and group images and posting file attachments in forms. The reason is that URLs for these assets require authentication, which is provided with a session cookie when pages are hosted on Salesforce. Pages not hosted on Salesforce don't have access to the session cookie. Also, it isn't possible to pass an OAuth token from the HTML contexts `<img>`, `<a>`, and `<form>`.

## Web Server OAuth Authentication Flow

Typically this flow is used by web applications that can confidentially store the client secret. A critical aspect of the web server flow is that the application must be able to protect the consumer secret.

The following is the general flow. The individual step descriptions follow.

The following is a general description of the OAuth web-server flow.

1. To request authorization for a resource, the client application redirects the end user's browser to a web page hosted on the resource owner's authorization server. In this case, it is the Salesforce login page.
2. End users log in to Salesforce to authenticate themselves. Because the resource owner (Salesforce) hosts this web page and the end user interacts directly with the web page, the client web application never finds out the user's login credentials. The end user also grants authorization to the client application.
3. Salesforce sends the authorization code back to the client application using the specified callback URL.
4. After obtaining the authorization code, the client application passes back the authorization code to obtain an access token.
5. After validating the authorization code, Salesforce passes back a response token. If there was no error, the response token includes an access code, a refresh token, and additional information.
6. The protected resources are Connect REST API endpoints.

## Using the Web Server Flow with Connect REST API and Salesforce

The following provides specific details for the OAuth Web-server flow when used with Salesforce and Connect REST API.

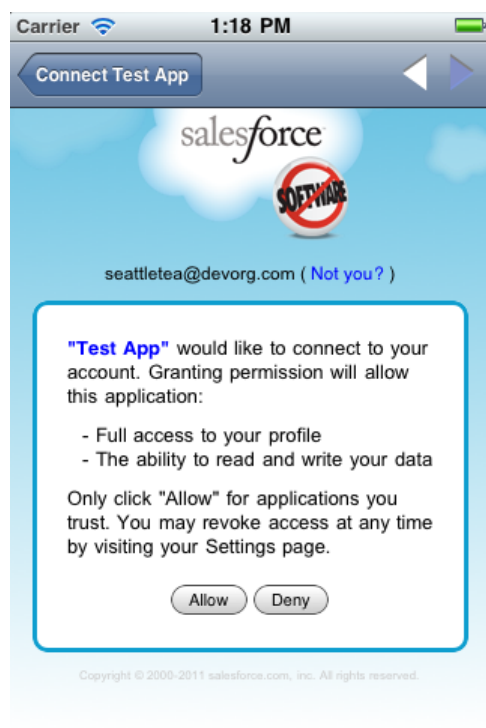

1. Direct the client's web browser to the page `https://login.instance_name/services/oauth2/authorize`, with the following request parameters.

| Parameter                  | Description                                                                             |
|----------------------------|-----------------------------------------------------------------------------------------|
| <code>response_type</code> | Must be <code>code</code> for this authentication flow                                  |
| <code>client_id</code>     | The <code>Consumer Key</code> value from the connected app defined for this application |
| <code>redirect_uri</code>  | The <code>Callback URL</code> value from the connected app defined for this application |

You can also include the following optional request parameters.

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>state</code>     | Specifies URL-encoded state data to be returned in the callback URL after approval.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>immediate</code> | Determines whether the user is prompted for login and approval. Values are either <code>true</code> or <code>false</code> . Default is <code>false</code> . <ul style="list-style-type: none"><li>• If set to <code>true</code>, and if the user is logged in and has previously approved the application, the approval step is skipped.</li><li>• If set to <code>true</code> and the user is not logged in or has not previously approved the application, the session is immediately terminated with the <code>immediate_unsuccessful</code> error code.</li></ul> |
| <code>display</code>   | Indicates the type of web pages that is provided. Valid values are: <ul style="list-style-type: none"><li>• <code>page</code>—Full-page authorization screen. This is the default value if none is specified.</li><li>• <code>popup</code>—Compact dialog optimized for modern web browser popup windows.</li><li>• <code>touch</code>—mobile-optimized dialog designed for modern smartphones such as Android and iPhone.</li><li>• <code>mobile</code>—mobile optimized dialog designed for less capable smartphones such as BlackBerry OS 5.</li></ul>             |

2. After successfully being logged in, the user is asked to authorize the application.

If the user has already authorized the application, this step is skipped.

3. After Salesforce confirms that the client application is authorized, the end user's web browser is redirected to the callback URL. The `redirect_uri` parameter, appended with the following values in its query string, specifies the callback URL.

| Parameter          | Description                                                                       |
|--------------------|-----------------------------------------------------------------------------------|
| <code>code</code>  | The authorization code that is passed to get the access and refresh tokens        |
| <code>state</code> | The state value that was passed in as part of the initial request, if applicable. |

It is expected that the client application server hosts the `redirect_uri` web page.

4. The client application server must extract the authorization code and pass it in a request to Salesforce for an access token, using POST against this URL: `https://login.instance_name/services/oauth2/token` with the following query parameters.

| Parameter                  | Description                                                                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>grant_type</code>    | Value must be <code>authorization_code</code> for this flow.                                                                                                                                                |
| <code>client_id</code>     | Consumer key from the connected app definition.                                                                                                                                                             |
| <code>client_secret</code> | Consumer secret from the connected app definition. If a <code>client_secret</code> isn't required, and the connected app sends it in the authorization request, Salesforce attempts to validate it, anyway. |

| Parameter                 | Description                                                                                                                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>redirect_uri</code> | URI to redirect the user to after approval. This URI must match the value in the <code>callback URL</code> field in the connected app definition exactly, and is the same value sent by the initial redirect.                           |
| <code>code</code>         | Authorization code obtained from the callback after approval.                                                                                                                                                                           |
| <code>format</code>       | Expected return format. This parameter is optional. The default is <code>json</code> . Values are: <ul style="list-style-type: none"> <li>• <code>urlencoded</code></li> <li>• <code>json</code></li> <li>• <code>xml</code></li> </ul> |

5. If this request is successful, the server returns a response body holding the following.

| Parameters                 | Description                                                                                                                                                                                                                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>access_token</code>  | Session ID that you can use for making Connect REST API requests. This session ID cannot be used in the user interface. Treat this session ID like a user's session and diligently protect it.                                                                                                      |
| <code>token_type</code>    | Value is <code>Bearer</code> for all responses that include an access token.                                                                                                                                                                                                                        |
| <code>refresh_token</code> | Token that can be used in the future to obtain new access tokens (sessions). <div>  <b>Warning:</b> This value is a secret. Treat it like the user's password and use appropriate measures to protect it. </div> |
| <code>instance_url</code>  | URL indicating the instance of the user's organization, for example, <code>https://instance_name</code> .                                                                                                                                                                                           |
| <code>id</code>            | Identity URL that can be used to both identify the user and query for more information about the user. Can be used in an HTTP request to get more information about the end user.                                                                                                                   |
| <code>signature</code>     | Base64-encoded HMAC-SHA256 signature signed with the <code>client_secret</code> (private key) containing the concatenated ID and <code>issued_at</code> . This signature can be used to verify that the identity URL was not modified since the server sent it.                                     |
| <code>issued_at</code>     | When the signature was created.                                                                                                                                                                                                                                                                     |

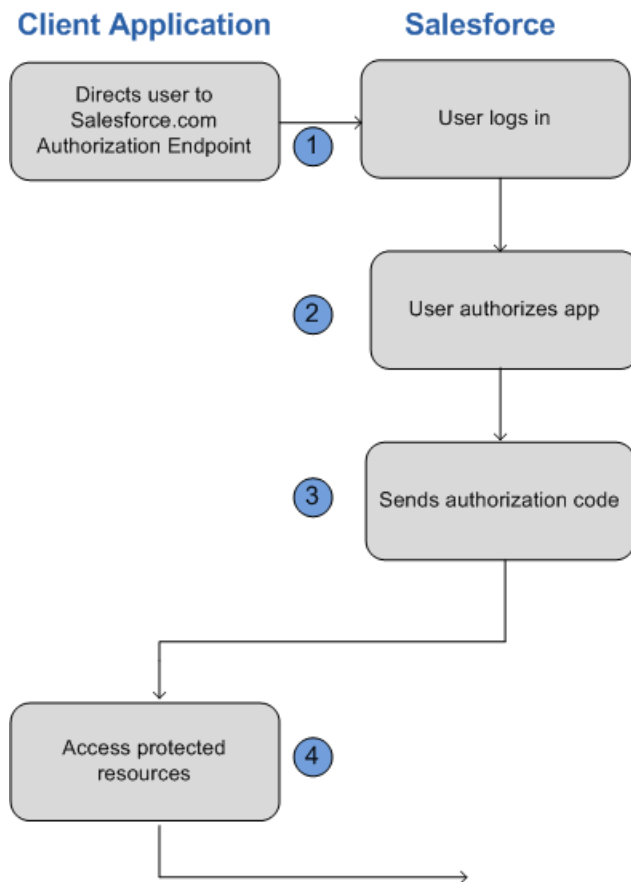

## User-Agent OAuth Authentication Flow

Typically this flow is used by mobile apps or applications that directly access the Connect REST API from JavaScript. In this flow, it's assumed that the client application can't be trusted to store client credentials, nor the user login credentials.

 **Warning:** Because the access token is encoded into the redirection URI, it might be exposed to the end-user and other applications residing on the computer or device.

If you are authenticating using JavaScript, we recommend calling `window.location.replace()` to remove the callback from the browser's history.

The following is the general flow. The individual step descriptions follow.

The following is a general description of the OAuth user-agent flow.

1. To request authorization for a resource, the client application redirects the end user's browser to a web page hosted on the resource owner's authorization server. In this case, it's the Salesforce login page.
2. The end user logs in to Salesforce to authenticate themselves. Because the resource owner (Salesforce) hosts and the end user interacts directly with this web page, the client web application never finds out the user's login credentials.  
If the client application is running in the browser already, the browser can be redirected. If the client application is a mobile app, a browser must be opened (such as an `UIWebView` in iOS). The end user uses this web page to authenticate themselves and then grant authorization to the client application.
3. After authorization is granted, the authorization server redirects the end user's web browser to a redirection URL. The client application can use this URL to retrieve the access and refresh tokens.
4. The protected resources are Connect REST API resources.

## Using the User-Agent Flow with Connect REST API and Salesforce

The following provides specific details for the OAuth user-agent flow when used with Salesforce and Connect REST API.

1. Direct the client's web browser to the page `https://login.instance_name/services/oauth2/authorize`, with these request parameters.

| Parameter                  | Description                                                                             |
|----------------------------|-----------------------------------------------------------------------------------------|
| <code>response_type</code> | Must be <code>token</code> for this authentication flow                                 |
| <code>client_id</code>     | The <code>Consumer Key</code> value from the connected app defined for this application |
| <code>redirect_uri</code>  | The <code>Callback URL</code> value from the connected app defined for this application |

You can also include these optional request parameters.

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>display</code> | Indicates the type of web page that's provided. Valid values are: <ul style="list-style-type: none"> <li>• <code>page</code>—Full-page authorization screen. This is the default value if none is specified.</li> <li>• <code>popup</code>—Compact dialog optimized for modern web browser popup windows.</li> <li>• <code>touch</code>—mobile-optimized dialog designed for modern smartphones such as Android and iPhone.</li> <li>• <code>mobile</code>—mobile optimized dialog designed for older smartphones such as BlackBerry OS 5.</li> </ul> |
| <code>scope</code>   | Specifies what data your app can access. You do not have to specify any value to access Connect REST API. If you specify any values, you must include the <code> chatter_api </code> value.                                                                                                                                                                                                                                                                                                                                                           |
| <code>state</code>   | Specifies URL-encoded state data to be returned in the callback URL after approval.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

2. After successfully logging in, the user is asked to authorize the application. If the user has already authorized the application, this step is skipped.
3. After Salesforce confirms that the client application is authorized, the end user's web browser is redirected to the callback URL specified by the `redirect_uri` parameter, appended with the following values after the hash sign (`#`). This is not a query string.

| Parameters                | Description                                                                                                                                                                       |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>access_token</code> | Session ID that you can use for making Connect REST API requests. This session ID cannot be used in the user interface. Treat it like a user's session and diligently protect it. |

| Parameters                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>expires_in</code>    | Amount of time the access token is valid, in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>refresh_token</code> | <p>Token that can be used in the future to obtain new access tokens (sessions).</p> <p> <b>Warning:</b> This value is a secret. Treat it like the user's password and use appropriate measures to protect it.</p> <p>The refresh token is only returned if the redirect URI is <code>https://login.<i>instance_name</i>/services/oauth2/success</code> or used with a custom protocol that is not HTTPS.</p> |

These additional parameters are returned; however, they aren't used with this flow and Connect REST API.

- `instance_url`
- `id`
- `signature`
- `issued_at`

4. If the client application is a web app, the redirection web page that it uses may include JavaScript that the client application can manipulate to retrieve the access and refresh tokens.

Alternatively, a client application (native or web) may use the page

`https://login.instance_name/services/oauth2/success` as their callback URL. Instead of actually loading the page on redirect, they should intercept the redirection URI and extract the parameters values. The `refresh_token` parameter values are only provided if the redirection URI is this URI or if the redirection URI uses a custom protocol.

Once the client application has retrieved the access and refresh tokens, it can use them to make requests to Connect REST API.

## Tokens

As part of both authentication flows, you work with access tokens and refresh tokens.

### Using Access Tokens

To make a successful Connect REST API request, you must include a valid access token in the request. Use the HTTP Authorization header.

```
Authorization: OAuth <access token>
```

If the request yields an error response due to an expired token, the refresh token can be used to get a new access token. The session timeout value in Setup governs the expiration of access tokens. To change the timeout value, go to Setup, in the Quick Find box, enter *Session Settings*, and then select **Session Settings**.

If the request yields an error because an access token has been revoked, the client application must be re-authorized by the user in order to gain access.

### Using Refresh Tokens

If the client application has a refresh token, it can use it to send a request for a new access token.

To ask for a new access token, the client application sends a POST request to `https://login.instance_name/services/oauth2/token` with the following query parameters.

| Parameters                 | Description                                                |
|----------------------------|------------------------------------------------------------|
| <code>grant_type</code>    | Value must be <code>refresh_token</code> for this flow.    |
| <code>refresh_token</code> | The refresh token the client application already received. |
| <code>client_id</code>     | Consumer key from the connected app definition.            |

You can also include the following optional parameters.

| Parameters                 | Description                                                                                                                                                                                           |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>client_secret</code> | Consumer secret from the connected app definition.                                                                                                                                                    |
| <code>format</code>        | Expected return format. The default is <code>json</code> . Values are: <ul style="list-style-type: none"> <li><code>urlencoded</code></li> <li><code>json</code></li> <li><code>xml</code></li> </ul> |

If this request is successful, the server returns a payload holding the `access_token`.

The following additional parameters are also returned, however, they aren't used with this flow and Connect REST API.

- `instance_url`
- `id`
- `signature`
- `issued_at`

## Request Static Assets and Post Forms Directly from HTML

HTML pages that aren't hosted on Salesforce have had difficulty displaying user and group images and posting file attachments in forms. The reason is that URLs for these assets require authentication, which is provided with a session cookie when pages are hosted on Salesforce. Pages not hosted on Salesforce don't have access to the session cookie. Also, it isn't possible to pass an OAuth token from the HTML contexts `<img>`, `<a>`, and `<form>`.

To solve this problem, request self-authenticating *bearer token URLs*. A bearer token URL is a Connect REST API resource with an appended bearer token that provides access to the resource. Use bearer token URLs as they are. Don't add or remove parameters or you receive an error. Use bearer token URLs in `<img>`, `<a>`, and `<form>` tags to do the following:

- Request static Connect REST API assets such as Chatter user profile images, files, and file and dashboard previews.
- Post form requests to Connect REST API when files are attached, for example, feed items or comments with a file attachment, or user profile photo updates.

To request static assets or post form requests, request a resource that returns a bearer token URL. Then request the resource using the bearer token URL.

- Request a resource with a response body property that contains a bearer token URL.
  - Banner Photo—`bannerPhotoUrl, url*`

- Comment Page—`currentPageUrl*`
- Content Capability—`downloadUrl`, `externalDocumentUrl`, `renditionUrl`, `repositoryFileUrl`
- Feed—`feedElementPostUrl*`, `feedElementsUrl*`, `feedItemsUrl*`
- Feed Item—`photoUrl`
- Feed Item Attachment: Content—`downloadUrl`, `externalDocumentUrl`, `renditionUrl`, `repositoryFileUrl`
- Feed Item Attachment: Dashboard—`fullSizeImageUrl`, `thumbnailUrl`
- File Detail—`downloadUrl`, `externalDocumentUrl`, `renditionUrl`, `renditionUrl240By180`, `renditionUrl720By480`, `repositoryFileUrl`
- File Preview URL—`previewUrl`
- File Summary—`downloadUrl`, `externalDocumentUrl`, `renditionUrl`, `renditionUrl240By180`, `renditionUrl720By480`, `repositoryFileUrl`
- File Summary Page—`currentPageUrl*`
- Icon—`url`
- Mention Completion—`photoUrl`
- Message Segment: Inline Image—`url*`
- Photo—`largePhotoUrl`, `smallPhotoUrl`, `url*`
- Repository File Detail—`downloadUrl`
- Repository File Summary—`downloadUrl`

\*Use to POST or PUT new items that include binary files: for example, a feed item or comment with a file attachment.

2. Pass the `X-Connect-Bearer-Urls` request header with a value of `true`.

```
X-Connect-Bearer-Urls: true
```

3. Parse the bearer token URL from the response body. Use it in an HTML tag to request a static asset or to post a form request. Bearer token URLs have the following characteristics.
  - The bearer token is good for the given URL only. Adding or reordering query parameters invalidates the URL.
  - The bearer token has a time-to-live (TTL) of 20 minutes. If the token expires, request it again.
  - The request to the bearer token URL authenticates as the user who requested the resource that returned the bearer token URL.

## Perform Cross-Origin Requests from Web Browsers

Cross-Origin Resource Sharing (CORS) allows web browsers to request resources from other origins. For example, using CORS, the JavaScript for a web application at `https://www.example.com` can request a resource from `https://www.salesforce.com`. To allow access to supported Salesforce APIs, Apex REST resources, and Lightning Out from JavaScript code in a web browser, add the requesting origin to your Salesforce CORS allowlist.

For more information, see [Perform Cross-Origin Requests from Web Browsers](#) in Salesforce Help.

## Connect REST API Release Notes

Use the Salesforce Release Notes to learn about the most recent updates and changes to Connect REST API.

For new and changed Connect REST APIs, see [Connect REST API](#) in the Salesforce Release Notes.

## API End-of-Life Policy

Salesforce is committed to supporting each API version for a minimum of three years from the date of first release. In order to mature and improve the quality and performance of the API, versions that are more than three years old sometimes are no longer supported.

Salesforce notifies customers who use an API version scheduled for deprecation at least one year before support for the version ends.

| Salesforce API Versions    | Version Support Status                                        | Version Retirement Info                                                       |
|----------------------------|---------------------------------------------------------------|-------------------------------------------------------------------------------|
| Versions 31.0 through 65.0 | Supported.                                                    |                                                                               |
| Versions 21.0 through 30.0 | As of Summer '25, these versions are retired and unavailable. | <a href="#">Salesforce Platform API Versions 21.0 through 30.0 Retirement</a> |
| Versions 7.0 through 20.0  | As of Summer '22, these versions are retired and unavailable. | <a href="#">Salesforce Platform API Versions 7.0 through 20.0 Retirement</a>  |

If you request any resource or use an operation from a retired API version, REST API returns the 410 : GONE error code.

To identify requests made from old or unsupported API versions, use the free [API Total Usage](#) event type.

## Connect REST API Quick Start

Connect to Salesforce and authenticate, then make a request to Connect REST API and look at the response.

### IN THIS SECTION:

1. [Prerequisites](#)  
Complete these prerequisites before you begin the quick start.
2. [Step One: Sign up for Salesforce Developer Edition](#)  
Developer Edition provides a free and easy solution so that you can use Salesforce for testing and development.
3. [Step Two: Set Up Authorization](#)  
Create a connected app in a Salesforce organization and enable OAuth. The client application uses the connected app to connect to Salesforce.
4. [Step Three: Connect to Connect REST API Using OAuth](#)  
Use OAuth to connect to Salesforce and get an access token. Pass the access token in requests to Connect REST API.
5. [Connect to Experience Cloud Sites](#)  
To use OAuth to connect to an Experience Cloud site, use the full path to the site URL.
6. [Send a Request Using Postman](#)  
With Postman, you can explore and test your API calls across multiple orgs with full control on headers, parameters, and content type.

## Prerequisites

Complete these prerequisites before you begin the quick start.

Become familiar with:

- cURL, which is a command-line tool the quick start uses as the client application that makes HTTP requests to Salesforce. cURL is pre-installed on many Linux, Mac, and Windows systems. If cURL isn't pre-installed on Windows, users can download a version at [curl.haxx.se/](https://curl.haxx.se/). When using HTTPS on Windows, ensure that your system meets the cURL requirements for SSL.
-  **Note:** cURL is an open-source tool and isn't supported by Salesforce.
- JavaScript Object Notation (JSON), which is the data format returned in this quick start.
- OAuth 2.0, which is the framework Salesforce uses for authentication. The quick start provides the steps, but it would be helpful to familiarize yourself with OAuth terms and concepts.

## Step One: Sign up for Salesforce Developer Edition

Developer Edition provides a free and easy solution so that you can use Salesforce for testing and development.

To sign up for a Developer Edition account, go to [developer.salesforce.com/signup](https://developer.salesforce.com/signup).

 **Note:** The Developer Edition data storage maximum is 5 MB. This limit doesn't prevent you from working with these examples.

If you have a development sandbox, you can use it with these examples.

Before you begin, verify that your user profile has the API Enabled permission by following the instructions in [User Permissions](#) in *Salesforce Help*.

## Step Two: Set Up Authorization

Create a connected app in a Salesforce organization and enable OAuth. The client application uses the connected app to connect to Salesforce.

SEE ALSO:

[Salesforce Help: Configure a Connected App for the OAuth 2.0 Client Credentials Flow](#)

## Step Three: Connect to Connect REST API Using OAuth

Use OAuth to connect to Salesforce and get an access token. Pass the access token in requests to Connect REST API.

Complete [Step Two: Set Up Authorization](#) and create a connected app before starting this task.

This table maps the terms used in the connected app you created to the OAuth properties and values used in the examples. The OAuth 2.0 specification uses the word "client" instead of "consumer."

| Connected App Application Label | Example Label | Example Value                                                               |
|---------------------------------|---------------|-----------------------------------------------------------------------------|
| Consumer Key                    | client_id     | 3MVG9wZxw3bQjE6m21CG2hSS4WCGNbZCtKeQxH7218ns6OLCnHMKnZFTZWkt2qwSFqt2aMt5mcr |
| Consumer Secret                 | client_secret | 8A4BE698BCA216718ECB0B1DCA294C69732EAD9472A1790F8FED38DD2E02B5FA            |

To make a request to Salesforce, substitute values from your org and connected app into these examples.

1. Generate the access token.

This cURL command generates an access token.

```
curl -X POST https://instance_name.my.salesforce.com/services/oauth2/token -d
'grant_type=client_credentials' -d
'client_id=3MVG9VwZxxW3bBQjhE6m21CG2nSS4WC.GNbZCtKeQxXH7218ns6xOLCnNJVKnZFTZWKzt2qwSFqt2taMt5mcr'
-d 'client_secret=8A4BE698BCA216718ECB0B1DCA294C69732EAD9472A1790F8FED38DD2E02B5FA'
```

The value of `grant_type` depends on the OAuth authentication flow you're using. For the user agent flow, use `client_credentials`. The response includes the server instance and the access token.

```
{
  "access_token":
  "00DS7000000oxzo!AR8AQFPAhJNveaXDdPzbtXqPykdVxExtbLycpiyPmKyJm0Ku8gKZtulObJldhJU8Jt9W8k7FySsPAkvCnsadT_AbJTSW5T",
  "signature": "nUFHwtfIGLKDTHcLWmDBG8frv0t+HQGl/iCZFIQUarE=",
  "token_format": "opaque",
  "instance_url": "https://instance_name.my.salesforce.com"
  "id": "https://login.salesforce.com/id/00Dd000000XXXXXXX/005d000000XXXXXX",
  "token_type": "Bearer",
  "issued_at": "1678833535086"
}
```

2. To request a Connect REST API resource, use the returned `instance_url` as the server instance. Pass the returned `access_token` as a Bearer token in the Authorization request header.

```
curl -X GET https://instance_name.my.salesforce.com/services/data/v65.0/chatter/users/me
-H 'Authorization: Bearer
00DS7000000oxzo!AR8AQFPAhJNveaXDdPzbtXqPykdVxExtbLycpiyPmKyJm0Ku8gKZtulObJldhJU8Jt9W8k7FySsPAkvCnsadT_AbJTSW5T'
```

If you get an `unsupported_grant_type` error, check the syntax of your cURL command. If you're using Windows Command Prompt, replace single quotes (') in the examples with double quotes ("). For additional information about OAuth errors, see [OAuth 2.0 Authorization Errors](#).

## Connect to Experience Cloud Sites

To use OAuth to connect to an Experience Cloud site, use the full path to the site URL.

To connect to an Experience Cloud site, use the OAuth [web server](#) and [user-agent](#) workflows.

To authenticate a user using the authorize URL, replace the **MyDomainName**.my.salesforce.com host name with the full path to the site URL. This URL example is the non-site URL.

```
https://MyDomainName.my.salesforce.com/services/oauth2/authorize?
response_type=token&client_id=your_app_id&redirect_uri=your_redirect_uris
```

This URL example is the site URL.

```
https://MyDomainName.my.site.com/services/oauth2/authorize?
response_type=token&client_id=your_app_id&redirect_uri=your_redirect_uri
```

When implemented successfully, this URL directs users to your app's branded login page. After they authorize the app, set a user access token and a refresh token for future authentication. In requests for the token endpoint, replace the host with the site.

```
https://MyDomainName.my.site.com/services/oauth2/token
```

To request a Connect REST API resource, use the site URL and specify the site ID.

```
https://MyDomainName.my.site.com/services/data/v29.0/connect
/communities/communityId/chatter/feeds/news/me/feed-elements
```

Alternately, you can replace the host name with the full path to the site URL.

```
https://MyDomainName.my.site.com/sitpath/services/data/v29.0/connect
/communities/communityId/chatter/feeds/news/me/feed-elements
```

## Send a Request Using Postman

With Postman, you can explore and test your API calls across multiple orgs with full control on headers, parameters, and content type.

Before you send a request using Postman, make sure you have a Developer Edition org and complete [Step Two: Set Up Authorization](#).

 **Note:** Postman supports API requests using different authentication flows, such as the SOAP login flow, OAuth flow, or the JWT bearer token flow. See the [Salesforce Developers' Blog: Explore the Salesforce APIs with a Postman Collection](#).

This quick start uses the Postman desktop app. [Install the postman app and fork the Salesforce APIs](#). You can then [authenticate with Salesforce](#) by getting a new access token on the Postman app. Alternatively, you can [connect the Postman web app to Salesforce using the Trailhead quick start](#), which requires a CORS configuration in Salesforce.

To make a request to your org using Postman:

1. Open the Postman desktop app.
2. Expand the Salesforce APIs collection and select **Connect (Chatter) > User Resources > User Photo**.
3. Check that the POST URL lists `{{_endpoint}}/services/data/v{{version}}/connect/user-profiles/me/photo`. Click **Send**.

The Body tab shows the response body.

If your call isn't successful, check that your endpoint and version values are correct in the [environment settings](#).

GET Get ( ● ) POST {{\_e}} ● POST Acc ● POST Use ● Salesforce + ... Salesforce Production

| Salesforce Production |                                       |                                       |
|-----------------------|---------------------------------------|---------------------------------------|
| VARIABLE              | INITIAL VALUE                         | CURRENT VALUE                         |
| url                   | https://[redacted].my.salesforce.com/ | https://[redacted].my.salesforce.com/ |
| version               | 56.0                                  | 56.0                                  |
| username              | dwidjaja@[redacted]                   | dwidjaja@[redacted]                   |
| password              | .....                                 | .....                                 |
| _endpoint             | [redacted].my.salesforce.com/         | [redacted].my.salesforce.com/         |

Additionally, you can edit the request body, including the parameters for your request. In the above example, the request parameters are included in the **Body > form-data** tab as a JSON value of `{"cropY": "0", "cropX": "0", "cropSize": "200"}`.

# Connect REST API Features

Find the resources to work with Connect REST API features.

## IN THIS SECTION:

### [Action Links](#)

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can drive productivity and accelerate innovation.

### [Customer Asset Lifecycle Management](#)

Use Customer Asset Lifecycle Management resources to make lifecycle-managed asset data available for sales and account reps to view in Lightning Experience.

### [Experience Cloud Sites](#)

Salesforce Experience Cloud lets you create branded digital experiences to share information and collaborate with people who are key to your business processes, such as customers, partners, or employees. Whether you call it a portal, help forum, support community, or something else, an Experience Cloud site is a great place to connect with the important folks in your life.

### [Feeds and Feed Elements](#)

A feed is a container of feed elements. Feed elements can be feed items, such as specific posts, or generic feed elements, such as bundled posts or recommendations in the feed.

### [Recommendations](#)

Salesforce provides several types of recommendations, and Connect REST API supports Einstein Next Best Action, custom recommendations for Experience Cloud sites, and Chatter recommendations.

### [Salesforce Files](#)

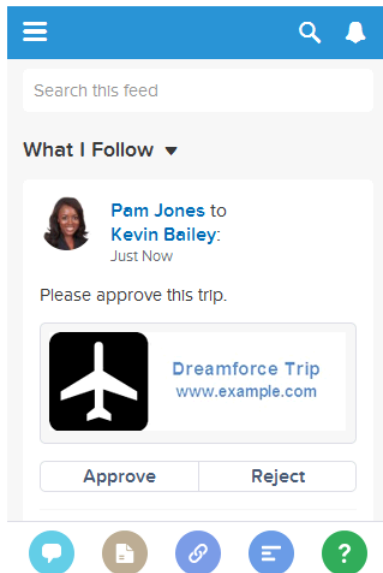

Use Connect REST API to work with Salesforce Files.

## Action Links

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can drive productivity and accelerate innovation.

## Workflow

This feed item contains one action link group with two action links: **Approve** and **Reject**.

The workflow to create and post action links with a feed element:

1. (Optional) Create an [action link template](#).
2. Make a request to [/connect/action-link-group-definitions](#) to define an action link group or to instantiate an action link group from a template. An action link group contains at least one action link.
3. Make a request to [/chatter/feed-elements](#) to post a feed element and associate the action link with it.

## Action Links Resources

Use these resources to work with action links.

| Resource                                                                        | HTTP Method | Task                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/connect/action-link-group-definitions</a>                          | POST        | Create an action link group definition. To associate an action link with a feed element, first create an action link group definition. Then post a feed element with an associated actions capability.                                                                                                                                                                                                            |
| <a href="#">/chatter/feed-elements</a>                                          | POST        | Post a feed element with an associated actions capability. Associate up to 10 action link groups with a feed element.                                                                                                                                                                                                                                                                                             |
| <a href="#">/connect/action-links/<b>actionLinkId</b></a>                       | GET, PATCH  | Get information about or update the <code>status</code> of an action link. The <code>status</code> of the action link in combination with the <code>labelKey</code> property of the Action Link Definition Input determines the text that displays in the UI. To trigger the API request for <code>Api</code> and <code>ApiAsync</code> action links, set the <code>status</code> to <code>PendingStatus</code> . |
| <a href="#">/connect/action-link-group-definitions/<b>actionLinkGroupId</b></a> | GET, DELETE | Get information about or delete an action link group definition. Deleting an action link group definition removes all references to it from feed elements. To get or delete the action link group definition, the client must be the same connected app that created the definition and                                                                                                                           |

| Resource                                                                                                                                                                      | HTTP Method | Task                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                                               |             | the user must either be the user who created the definition or have View all Data permission.                                                                                  |
| <a href="#">/connect/action-link-groups</a><br><a href="#">/<b>actionLinkGroupId</b></a>                                                                                      | GET         | Get information about an action link group including state for the context user.                                                                                               |
| <a href="#">/connect/action-links/<b>actionLinkId</b></a><br><a href="#">/diagnostic-info</a>                                                                                 | GET         | Get diagnostic information returned when an action link executes. Diagnostic information is given only for users who can access the action link.                               |
| <a href="#">/chatter/feed-elements/<b>feedElementId</b></a><br><a href="#">/capabilities/associated-actions</a>                                                               | GET         | Get all the platform actions associated with a feed element. Action links are a type of platform action.                                                                       |
| <a href="#">Feeds Resources</a><br><a href="#">/chatter/feeds/<b>feedType</b>/<b>userId</b>/feed-elements</a><br><a href="#">/chatter/feeds/<b>feedType</b>/feed-elements</a> | GET         | Get the feed elements of a specified feed type. If a feed element has action links associated with it, the action links data is returned in the associated actions capability. |

[Define Action Links in a Template and Post with a Feed Element](#)

## Action Links Use Cases

Use action links to integrate Salesforce and third-party services with a feed. An action link can make an HTTP request to a Salesforce or third-party API. An action link can also download a file or open a web page. This topic contains two use case examples.

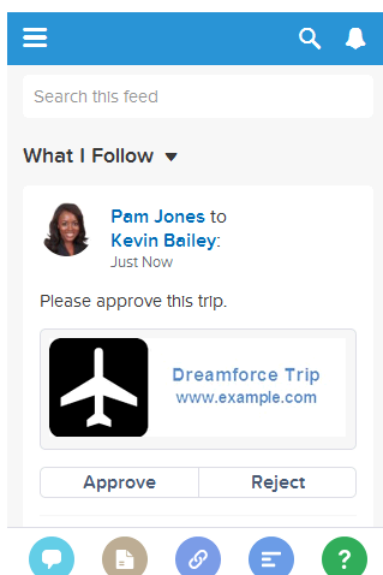

### Download Instructions and Order a Part from the Feed

Let's imagine that a fictional 3D print shop called "BuildIt" creates an AppExchange app that uses action links to integrate with Salesforce. If a BuildIt customer has the app installed, they can go to the BuildIt website, create an account, and send posts containing action links to Salesforce that invite certain users to order parts from BuildIt. In this sample feed element posted from BuildIt customer Pam Jones to her report Jin Chang, clicking the **Download** action link downloads a file with parts information from the BuildIt website. Clicking the **Order** action link takes Jin Chang to a page on the BuildIt website to order a part.

## Approve or Reject an Itinerary from the Feed

Suppose that you work as a developer for a fictional company called “Travel Example.” You create an app for AppExchange called “Travel Example for Salesforce.” Company A has “Travel Example for Salesforce” installed. Let’s imagine that someone from Company A goes to the Travel Example website and books an itinerary. Your Travel Example server-side code makes a Connect REST API request to post a feed item in Company A’s Salesforce org with the body text **Please approve this trip..** The feed item also has action links with the labels **Approve** and **Reject**. The action links make HTTP requests to a REST resource on the Travel Example server to approve or reject the trip.

To create the “Travel Example for Salesforce” app, you created action link templates in Setup that define these action links and the action link group they’re associated with. Your server-side code makes a Connect REST API request to instantiate the action link group from the template. It makes another Connect REST API request to associate the action link group with a feed item and post it.

The `Action URL`, `HTTP Headers`, and `HTTP Request Body` template fields can contain *context variables* and *binding variables*.

You include a `{!userId}` context variable in the `Action URL` so that when a user clicks the action link in the feed, Salesforce sends the user's ID to your server-side code to tell it who clicked the action link. Action links support a predefined set of context variables. See [Use Context Variables in Design Action Link Templates](#) for more information.

You can create any binding variables you need in the action link template to make your code future-proof and dynamic. See [Define Binding Variables in Design Action Link Templates](#) for more information. Your server-side code sets the binding variable values when it instantiates the action link group. You decide to use `{!Bindings.apiVersion}` so that you can release a new API version without having to update your package. You also use `{!Bindings.tripId}` so that clicking the action link approves or rejects the trip the user created.

You set the `User Visibility` field so that only one user can see the action links. You enter a value in the `Custom User Alias` field that is also a binding variable whose value your server-side code sets to the ID of the user's manager when it instantiates the action link group.

Here's the action link template for the **Approve** action link.

**Action Link Template Edit** [Save] [Save & New] [Cancel]

**Information** ! = Required Information

Action Link Group Template: Trip Example

Action Type: API

Action URL: https://www.example.com/{!Bindings.apiVersion}/trips/{!Bindings.tripId}?status=approved&salesforceUserId={!userId}

Label Key: Approve

HTTP Method: GET

User Visibility: Only custom user can see

Custom User Alias: ApprovalManager

HTTP Request Body:

HTTP Headers: Content-Type: application/json

Confirmation Required: ☐

Default Link in Group: ☐

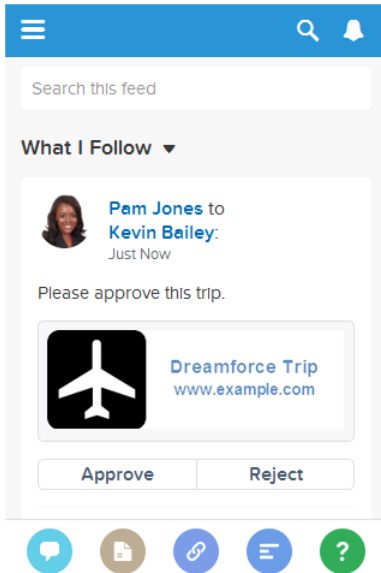

[Save] [Save & New] [Cancel]

## Action Links Overview, Authentication, and Security

Learn about Connect REST API action links security, authentication, labels, and errors.

### Workflow

This feed item contains one action link group with two action links: **Approve** and **Reject**.

The workflow to create and post action links with a feed element:

1. (Optional) Create an [action link template](#).
2. Make a request to [/connect/action-link-group-definitions](#) to define an action link group or to instantiate an action link group from a template. An action link group contains at least one action link.
3. Make a request to [/chatter/feed-elements](#) to post a feed element and associate the action link with it.

## Action Link Templates

Create action link templates in Setup to instantiate action link groups with common properties. You can package templates and distribute them to other Salesforce organizations.

Specify binding variables in the template and set the values of the variables when you instantiate the action link group. For example, use a binding variable for the API version number, a user ID, or an OAuth token.

You can also specify context variables in the templates. When a user executes the action link, Salesforce provides values for these variables, such as who executed the link and in which organization.

To instantiate the action link group, make a request to the [/connect/action-link-group-definitions](#) resource. Specify the template ID and the values for any binding variables defined in the template.

See [Design Action Link Templates](#).

## Type of Action Links

Specify the action link type in the `actionType` property when you define an action link.

There are four types of action links.

- **Api**—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server.
- **ApiAsync**—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to `/connect/action-links/actionLinkId` to set the status to `SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete.
- **Download**—The action link downloads a file from the action URL.

- `url`—The action link takes the user to a web page at the action URL.

Different types of action links have different workflows to set the status of an action link (to `Pending`, `Successful`, or `Failed`). See [/connect/action-links/`actionLinkId`](#) for more information.

## Authentication

When you define an action link, specify a URL (`actionUrl`) and the HTTP headers (`headers`) required to make a request to that URL.

If an external resource requires authentication, include the information wherever the resource requires.

If a Salesforce resource requires authentication, you can include OAuth information in the HTTP headers or you can include a bearer token in the URL.

Salesforce automatically authenticates these resources.

- Relative URLs in templates
- Relative URLs beginning with `/services/apexrest` when the action link group is instantiated from Apex

Don't use these resources for sensitive operations.

## Security

### HTTPS

The action URL in an action link must begin with `https://` or be a relative URL that matches one of the rules in the previous Authentication section.

### Encryption

API details are stored with encryption, and obfuscated for clients.

The `actionUrl`, `headers`, and `requestBody` data for action links that are not instantiated from a template are encrypted with the organization's encryption key. The `Action URL`, `HTTP Headers`, and `HTTP Request Body` for an action link template are not encrypted. The binding values used when instantiating an action link group from a template are encrypted with the organization's encryption key.

### Action Link Templates

Only users with Customize Application user permission can create, edit, delete, and package action link templates in Setup.

Don't store sensitive information in templates. Use binding variables to add sensitive information when you instantiate the action link group. After the action link group is instantiated, the values are stored in an encrypted format. See [Define Binding Variables in Design Action Link Templates](#).

### Connected Apps

When creating action links via a connected app, it's a good idea to use a connected app with a consumer key that never leaves your control. The connected app is used for server-to-server communication and is not compiled into mobile apps that could be decompiled.

### Expiration Date

When you define an action link group, specify an expiration date (`expirationDate`). After that date, the action links in the group can't be executed and disappear from the feed. If your action link group definition includes an OAuth token, set the group's expiration date to the same value as the expiration date of the OAuth token.

Action link templates use a slightly different mechanism for excluding a user. See [Set the Action Link Group Expiration Time in Design Action Link Templates](#).

### Exclude a User or Specify a User

Use the `excludeUserId` property of the action link definition input to exclude a single user from executing an action.

Use the `userId` property of the action link definition input to specify the ID of a user who alone can execute the action. If you don't specify a `userId` property or if you pass `null`, any user can execute the action. You can't specify both `excludeUserId` and `userId` for an action link.

Action link templates use a slightly different mechanism for excluding a user. See [Set Who Can See the Action Link in Design Action Link Templates](#).

### Read, Modify, or Delete an Action Link Group Definition

There are two views of an action link and an action link group: the definition, and the context user's view. The definition includes potentially sensitive information, such as authentication information. The context user's view is filtered by visibility options and the values reflect the state of the context user.

Action link group definitions can contain sensitive information (such as OAuth tokens). For this reason, to read, modify, or delete a definition, the user must have created the definition or have View All Data permission. In addition, in Connect REST API, the request must be made via the same connected app that created the definition. In Apex, the call must be made from the same namespace that created the definition.

## Context Variables

Use context variables to pass information about the user who executed the action link and the context in which it was invoked into the HTTP request made by invoking an action link. You can use context variables in the `actionUrl`, `headers`, and `requestBody` properties of the Action Link Definition Input request body or `ConnectApi.ActionLinkDefinitionInput` object. You can also use context variables in the `Action URL`, `HTTP Request Body`, and `HTTP Headers` fields of action link templates. You can edit these fields, including adding and removing context variables, after a template is published.

The context variables are:

| Context Variable                  | Description                                                                                                                                         |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>{!actionLinkId}</code>      | The ID of the action link the user executed.                                                                                                        |
| <code>{!actionLinkGroupId}</code> | The ID of the action link group containing the action link the user executed.                                                                       |
| <code>{!communityId}</code>       | The ID of the site in which the user executed the action link. The value for your internal org is the empty key <code>"000000000000000000"</code> . |
| <code>{!communityUrl}</code>      | The URL of the site in which the user executed the action link. The value for your internal org is empty string <code>""</code> .                   |
| <code>{!orgId}</code>             | The ID of the org in which the user executed the action link.                                                                                       |
| <code>{!userId}</code>            | The ID of the user that executed the action link.                                                                                                   |

## Versioning

To avoid issues due to upgrades or changing functionality in your API, we recommend using versioning when defining action links. For example, the `actionUrl` property in the [Action Link Definition Input](#) looks like `https://www.example.com/api/v1/exampleResource`.

You can use templates to change the values of the `actionUrl`, `headers`, or `requestBody` properties, even after a template is distributed in a package. For example, if you release a new API version that requires new inputs, an admin can change the inputs in the

action link template. Even action links already associated with a feed element use the new inputs. However, you can't add new binding variables to a published action link template.

If your API isn't versioned, you can use the `expirationDate` property of the Action Link Group Definition Input to avoid issues due to upgrades or changing functionality in your API. See Set the Action Link Group Expiration Time in [Design Action Link Templates](#).

## Errors

Use the Action Link Diagnostic Information resource (`/connect/action-links/actionLinkId/diagnostic-info`) to return status codes and errors from executing `Api` and `AsyncApi` action links. Diagnostic info is given only for users who can access the action link.

## Localized Labels

Action links use a predefined set of localized labels specified in the `labelKey` property of the [Action Link Definition Input](#) request body and the `Label Key` field of an action link template.

For a list of labels, see [Action Links Labels](#).

**Note:** If none of the label key values make sense for your action link, specify a custom label in the `Label` field of an action link template and set `Label Key` to `None`. However, custom labels aren't localized.

# Customer Asset Lifecycle Management

Use Customer Asset Lifecycle Management resources to make lifecycle-managed asset data available for sales and account reps to view in Lightning Experience.

## Permissions

To use Customer Asset Lifecycle Management APIs, you must have the **Access Customer Asset Lifecycle Management APIs** and **API Enabled** permissions and Read access to the Asset, Asset Action, Asset Action Source, and Asset State Period objects.

## Usage

- Set the seconds in the start time of each asset state period to `00` (for example, `2020-01-17T12:30:00+00:00`) and in the end time to `59` (for example, `2020-01-18T12:29:59+00:00`).
- The start date of the earliest asset state period that you create during a `generate` call can't be changed after the call is completed.
- When you change an asset, all subsequent asset state periods are deleted.
- Customer Asset Lifecycle Management stores date and time data in Coordinated Universal Time (UTC).

## Assets and Lifecycle-Managed Assets

An asset is a lifecycle-managed asset when the `HasLifecycleManagement` field is set to `True`. Each lifecycle-managed asset must be related to an account and a product.

## Asset State Periods

An asset state period represents a product's amount, quantity, and monthly recurring revenue for a defined period. Each asset state period must start one second after the previous period's end date, and it must span 24-hour increments.

## IN THIS SECTION:

## Generate a Lifecycle-Managed Asset

Review examples of using Connect REST API to create an asset and start tracking its quantity, amount, and monthly recurring revenue over its lifecycle.

**Example:** Your sales rep sold a collection of mobile device management subscriptions to a local school district. The order product for the sale has the following values.

**Order Product**

ID: 1234

Date of Sale: 09/05/19 4:00:00pm PST

Start Date: 01/01/20 9:00:00am PST

End Date: 12/31/20 8:59:59am PST

Amount: \$1,200

Quantity: 10

Build an integration that calls the Generate Asset API to generate an asset, asset action source, asset action, and asset state period.

**Endpoint**

`/services/data/v50.0/asset-management/assets/actions/generate`

**Input**

```
{
  "accountId": "001B000001KDI7BIAX",
  "assetName": "MDM Subscription",
  "productId": "01tB0000000q2FFIAY",
  "currencyIsoCode": "USD",

  "assetStatePeriods": [ {
    "startDate": "2020-01-01T09:00:00-08:00",
    "endDate": "2020-12-31T08:59:59-08:00",
    "quantity": 10.0,
    "mrr": 100.00,
    "amount": 1200.00
  } ],

  "assetAction": {
```

```

    "category": "Initial Sale",
    "actionDate": "2019-09-05T16:00:00-08:00",
    "quantityChange": 10.0,
    "mrrChange": 100.00,
    "amount": 1200.00
  },
  "assetActionSources": [{
    "transactionDate": "2019-09-05T16:00:00-08:00",
    "startDate": "2020-01-01T09:00:00-08:00",
    "endDate": "2020-12-31T08:59:59-08:00",
    "quantity": 10.0,
    "productAmount": 1200.00,
    "referenceEntityItem": "1WLB00000003geJOAQ"
  }]
}

```

### Output

```

asset
├── id: 02iB00000007bYhIAI
assetAction
├── id: 4nLB00000004C9cMAE
assetActionSources
├── [Item 1]
│   └── id: 4nMB00000004C9cMAE
assetStatePeriods
├── [Item 1]
│   └── id: 4nKB00000004C9SMAU

```

**Example:** Your sales rep sold a ramped deal for mobile device management subscriptions. The customer has 10 licenses for 01/01 through 06/30 and 20 licenses for 07/01 through 12/31. You want to recognize all the transactions as one asset.

### Order Product

ID: 1234

Date of Sale: 09/05/19 4:00:00pm PST

Start Date: 01/01/20 9:00:00am PST

End Date: 06/30/20 8:59:59am PST

Amount: \$600

Quantity: 10

### Order Product 2

ID: 1235

Date of Sale: 09/05/19 4:00:00pm PST

Start Date: 07/01/20 9:00:00am PST

End Date: 12/31/20 8:59:59am PST

Amount: \$1,200

Quantity: 20

In this case, you make one Generate Asset API call that passes in data for two asset state periods. The first asset state period represents the period from 01/01 through 06/30, with a quantity of 10. The second asset state period represents the period from 07/01 through 12/31, with a quantity of 20.

### Endpoint

/services/data/v50.0/asset-management/assets/actions/generate

## Change a Lifecycle-Managed Asset

Review an example of using Connect REST API to amend an asset after a new lifecycle event.

**Example:** On 10/01, your customer wants to increase number of licenses by 10 from October through December. They make an amendment order that creates the following order product.

**Order Product**

ID: 1237

Date of Sale: 10/01/20 2:00:00pm PST

Start Date: 10/01/20 9:00:00am PST

End Date: 12/31/20 8:59:59am PST

Amount: \$600

Quantity: 10

Build an integration that calls the Change Asset resource and passes an asset action source, asset action, and two asset state periods. The first asset state period represents the period from 07/01 through 09/30, with a license quantity of 20. The second asset state period represents the period from 10/01 through 12/31, with a license quantity of 25. The asset action provides information on what type of change took place, when the change occurred, and the change in quantity, amount, and/or monthly recurring revenue.

**Endpoint**

/services/data/v50.0/asset-management/assets/02iB00000007bZ6IAI/actions/change

**Input**

```

{
  "assetStatePeriods": [ {
    "startDate": "2020-07-01T09:00:00+08:00",
    "endDate": "2020-09-30T08:59:59+08:00",
    "quantity": 20.0,
    "mrr": 200.00,
    "amount": 600.00
  },
  {

```

```

    "startDate": "2020-10-01T09:00:00+08:00",
    "endDate": "2020-12-31T08:59:59+08:00",
    "quantity": 25.0,
    "mrr": 250.00,
    "amount": 750.00
  }],

  "assetAction": {
    "category": "Upsells",
    "actionDate": "2020-10-01T14:00:00+08:00",
    "quantityChange": 5.0,
    "mrrChange": 50.00,
    "amount": 150.00
  },

  "assetActionSources": [{
    "transactionDate": "2020-10-01T14:00:00+08:00",
    "startDate": "2020-10-01T09:00:00+08:00",
    "endDate": "2020-12-31T08:59:59+08:00",
    "quantity": 5.0,
    "productAmount": 150.00,
    "referenceEntityItem": "1WLB00000003geJOAQ"
  }]
}

```

#### Output

```

## Cancel a Lifecycle-Managed Asset

Review an example of using Connect REST API to cancel an asset to reflect an early cancellation.

**Note:** A lifecycle-managed asset must have at least one asset state period at least 24 hours long.

**Example:** On 12/01, your customer wants to cancel all 25 of their licenses for the rest of the year. The cancel order results in the following order product.

#### Order Product

ID: 1250

Date of Cancellation: 12/01/20 9:00:00am PST

Start Date: 12/01/20 9:00:00am PST

End Date: 12/31/20 8:59:59am PST

Amount: -\$250

Quantity: -25

To represent the cancellation, create an asset state period running from 10/01 through 11/30, but use the same quantity, monthly recurring revenue, and amount as the period that originally ended on 12/31. Because the latest period now runs through 11/30, Customer Asset Lifecycle Management removes all 25 licenses in December from the asset's total amount. The asset's `Amount` field reflects the -\$250 in canceled licenses.

#### Endpoint

`/services/data/v50.0/asset-management/assets/02iB00000007bZ6IAI/actions/cancel`

#### Input

```
{
  "assetStatePeriod": {
    "startDate": "2020-10-01T09:00:00+08:00",
    "endDate": "2020-11-30T08:59:59+08:00",
    "quantity": 25.0,
    "mrr": 250.00,
    "amount": 500.00
  },
  "assetAction": {
    "category": "Cancellations",
    "actionDate": "2020-12-01T09:00:00+08:00",
    "quantityChange": 5.0,
    "mrrChange": 50.00,
    "amount": 150.00
  },
  "assetActionSources": [{
    "transactionDate": "2020-10-01T09:00:00+08:00",
    "startDate": "2020-10-01T09:00:00+08:00",
    "endDate": "2020-12-31T08:59:59+08:00",
    "quantity": -25.0,
    "productAmount": -250.00,
    "referenceEntityItem": "1WLB00000003geJOAQ"
  }]
}
```

**Output**

```

asset
  id: 02iB00000007bZQIAY
assetAction
  id: 4nLB00000004CAfMAM

## Experience Cloud Sites

Salesforce Experience Cloud lets you create branded digital experiences to share information and collaborate with people who are key to your business processes, such as customers, partners, or employees. Whether you call it a portal, help forum, support community, or something else, an Experience Cloud site is a great place to connect with the important folks in your life.

You can request many Connect REST API resources within a specific Experience Cloud site. For example, you can make requests to CMS and Chatter resources within a specific site. If a resource is available in a site, its documentation includes a resource that starts with `/connect/communities/communityId` or `/connect/sites/siteId`.

Some Connect REST API resources are available only within a site. These include resources for flagging and moderating content, using managed topics, and getting information about a user's reputation. Resources that are available in sites are available whether you allow access without logging in or not.

The resources that are available only within a site are listed in this table.

| Resource                                                                                    | HTTP Methods | Tasks                                                                                                    |
|---------------------------------------------------------------------------------------------|--------------|----------------------------------------------------------------------------------------------------------|
| <a href="#">/connect/communities</a>                                                        | GET, POST    | Get a list of all Experience Cloud sites available to the context user. Create an Experience Cloud site. |
| <a href="#">/connect/communities/<b>communityId</b></a>                                     | GET          | Get information about an Experience Cloud site.                                                          |
| <a href="#">/connect/communities/<b>communityId</b>/publish</a>                             | POST         | Publish an Experience Cloud site.                                                                        |
| <a href="#">/connect/communities/templates</a>                                              | GET          | Get the Experience Builder templates available to the context user.                                      |
| <a href="#">/connect/communities/<b>communityId</b>/external-managed-accounts</a>           | GET          | Get externally managed accounts available to the context user across all Experience Cloud sites.         |
| <a href="#">/connect/communities/<b>communityId</b>/data-category/network-data-category</a> | GET, PUT     | Get or update the network data category tree for an Experience Cloud site.                               |

| Resource                                                                                                                               | HTTP Methods         | Tasks                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------------------------------------------------------------------------------------------------------|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>/connect/communities/<b>communityId</b><br/>/network-data-category/<b>networkDataCategoryId</b></code>                           | PATCH                | Update the network data category record in an Experience Cloud site.                                                                                                                                                                                                                                                                          |
| <code>/connect/communities/<b>communityId</b><br/>/network-data-category/<b>networkDataCategoryId</b><br/>/child-category</code>       | GET                  | Retrieve child categories of a network data category in an Experience Cloud site.                                                                                                                                                                                                                                                             |
| <code>/connect/communities/<b>communityId</b><br/>/network-data-category/<b>networkDataCategoryId</b><br/>/parent-path</code>          | GET                  | Retrieve the hierarchy of the network data categories in an Experience Cloud site. This API returns the network data category path from the parent category to the specified category.                                                                                                                                                        |
| <code>/connect/communities/<b>communityId</b><br/>/category-network/<b>categoryNetworkId</b>/knowledge-article</code>                  | GET                  | Get articles for a network data category in an Experience Cloud site.                                                                                                                                                                                                                                                                         |
| <code>/connect/communities/<b>communityId</b><br/>/chatter/comments/<b>commentId</b>/<br/>moderation-flags</code>                      | GET, POST,<br>DELETE | <p>If the context user is a moderator, get the number of times members flagged a comment. Also flag a comment for moderation and delete all flags on a comment.</p> <p>If the context user isn't a moderator, returns whether the user flagged a comment. Also flag a comment for moderation and remove a flag the user previously added.</p> |

## Feeds and Feed Elements

A feed is a container of feed elements. Feed elements can be feed items, such as specific posts, or generic feed elements, such as bundled posts or recommendations in the feed.

**Note:** Salesforce Help refers to feed items as posts and bundles as bundled posts.

## Capabilities

As part of the effort to diversify the feed, pieces of functionality found in feed elements have been broken out into capabilities. Capabilities provide a consistent way to interact with the feed. Don't inspect the feed element type to determine which functionality is available for a feed element. Inspect the capability, which tells you explicitly what's available. Check for the presence of a capability to determine what a client can do to a feed element.

All feed elements have a `capabilities` property, which holds a [Feed Element Capabilities](#) response body. The Feed Element Capabilities response body can have one or more properties, each holding a capability of the feed element.

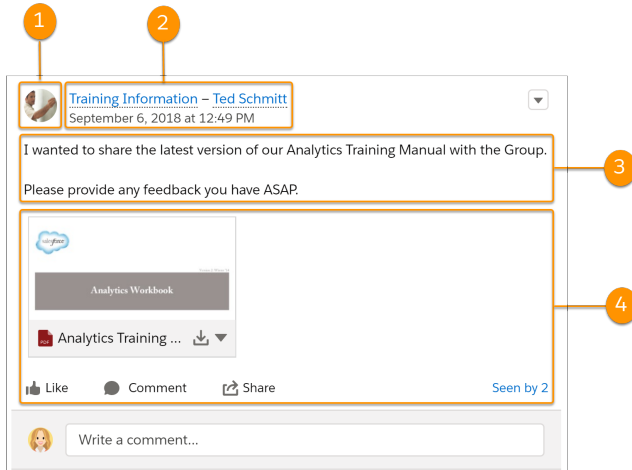

A capability includes both an indication that a feature is possible and data associated with that feature. If a capability exists on a feed element, that capability is available, even if there isn't any data associated with the capability yet. For example, if the `chatterLikes` capability property exists on a feed element, the context user can like that feed element. If the capability property doesn't exist on a feed element, it isn't possible to like that feed element.

## How the Salesforce UI Displays Feed Items

A client can use the `capabilities` property to determine what it can do with a feed element and how to render a feed element. For all feed elements other than feed item, the client doesn't have to know the type of feed element. Instead, the client can look at the

capabilities. Feed items do have capabilities, but they also have a few properties, such as `actor`, that aren't exposed as capabilities. For this reason, feed items must be handled a bit differently than other feed elements.

The Salesforce UI uses one layout to display every feed item. This layout gives customers a consistent view of feed items and gives developers an easy way to create UI. The layout always contains the same pieces, and the pieces are always in the same position. Only the content of the layout pieces changes.

The feed item layout elements are:

1. Actor (`actor` property of Feed Item response body)—A photo or icon of the creator of the feed item.
2. Header (`header` property of Feed Item response body)—Context for the feed item. The same feed item can have a different header depending on who posted it and where it was posted. In this example, Ted posted the feed item to a group.  
Timestamp (`relativeCreatedDate` property of Feed Item response body)—The date and time when the feed item was posted. If the feed item is less than two days old, the date and time are formatted as a relative, localized string, such as “17m ago”. Otherwise, the date and time are formatted as an absolute, localized string.
3. Body (`body` property of Feed Item response body)—All feed items have a body. The body can be `null`, which is the case when the user doesn't provide text for the feed item. Because the body can be `null`, you can't use it as the default case for rendering text. Instead, use the `text` property of the feed item's header, which always contains a value.
4. Auxiliary Body (`capabilities` property of Feed Item response body)—The visualization of the capabilities of a feed item. See [Capabilities](#).

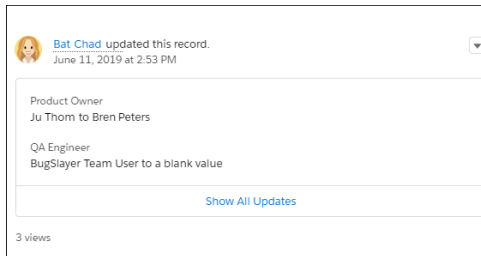

## How the Salesforce UI Displays Bundles

**Note:** Bundled posts contain feed-tracked changes and are in record feeds only.

A client can use the `capabilities` property to determine what it can do with a feed element and how to render the feed element. This section uses bundles as an example of how to render a feed element, but these properties are available for every feed element.

To give customers a clean, organized feed, feed-tracked change feed items can be aggregated into a bundle. To see individual feed items, click the bundle.

A bundle is a generic feed element with a bundle capability. Bundle layout elements include:

- Header (`header` property of the Generic Feed Element response body)—For feed-tracked change bundles, this text is “*User Name* updated this record.”
- Timestamp (`relativeCreatedDate` property of the Generic Feed Element response body)—The date and time when the feed-tracked changes were made. If the changes are less than two days old, the date and time are formatted as a relative, localized string, such as “17m ago”. Otherwise, the date and time are formatted as an absolute, localized string.
- Auxiliary Body (`capabilities.bundle.changes` property of the Generic Feed Element response body)—The bundle displays the `fieldName` and the `oldValue` and `newValue` properties for the first two feed-tracked changes in the bundle. If there are more than two feed-tracked changes, the bundle displays a “Show All Updates” link.

## Feed Element Visibility

The feed elements a user sees depend on how the administrator has configured feed tracking, sharing rules, and field-level security. For example, if a user doesn’t have access to a record, they don’t see updates for that record. If a user can see the parent of the feed element, the user can see the feed element. Typically, a user sees feed updates for:

- Feed elements that @mention the user (if the user can access the feed element’s parent)
- Feed elements that @mention groups the user is a member of
- Record field changes on records whose parent is a record the user can see, including User, Group, and File records
- Feed elements posted to the user
- Feed elements posted to groups that the user owns or is a member of
- Feed elements for standard and custom records, for example, tasks, events, leads, accounts, files

## Feed Types

There are many types of feeds. Each feed type defines a collection of feed elements.

**Important:** The collection of feed elements can change between releases.

The feed types are exposed in these resources.

```
/chatter/feeds/feedType
/chatter/feeds/feedType/subjectId
/connect/communities/communityId/chatter/feeds/feedType
```

For example, the resources for a company, topics, and home feed are:

```
/chatter/feeds/company
/chatter/feeds/topics/subjectId
/connect/communities/communityId/chatter/feeds/home
```

Here are the feed types and their descriptions.

- **Bookmarks**—Contains all feed items saved as bookmarks by the context user.
- **Company**—Contains all feed items except feed items of type `TrackedChange`. To see the feed item, the user must have sharing access to its parent.
- **DirectMessageModeration**—Contains all direct messages that are flagged for moderation. The Direct Message Moderation feed is available only to users with Moderate Experiences Chatter Messages permissions.
- **DirectMessages**—Contains all feed items of the context user's direct messages.
- **Draft**—Contains all the feed items that the context user drafted.
- **Files**—Contains all feed items that contain files posted by people or groups that the context user follows.
- **Filter**—Contains the news feed filtered to contain feed items whose parent is a specified object type.
- **Groups**—Contains all feed items from all groups the context user either owns or is a member of.
- **Home**—Contains all feed items associated with any managed topic in an Experience Cloud site.
- **Isolated**—Contains all the feed items and comments that are isolated.
- **Landing**—Contains all feed items that best drive user engagement when the feed is requested. Allows clients to avoid an empty feed when there aren't many personalized feed items.
- **Moderation**—Contains all feed items that are flagged for moderation, except direct messages. The moderation feed is available only to users with Moderate Experiences Feeds permissions.
- **Mute**—Contains all feed items that the context user muted.
- **News**—Contains all updates for people the context user follows, groups the user is a member of, and files and records the user is following. Contains all updates for records whose parent is the context user.
- **PendingReview**—Contains all feed items and comments that are pending review.
- **People**—Contains all feed items posted by all people the context user follows.
- **Record**—Contains all feed items whose parent is a specified record, which could be a group, user, object, file, or any other standard or custom object. When the record is a group, the feed also contains feed items that mention the group. When the record is a user, the feed contains only feed items on that user. You can get another user's record feed.
- **Streams**—Contains all feed items for any combination of up to 25 feed-enabled entities that the context user subscribes to in a stream. Examples of feed-enabled entities include people, groups, and records,
- **To**—Contains all feed items with mentions of the context user. Contains feed items the context user commented on and feed items created by the context user that are commented on.
- **Topics**—Contains all feed items that include the specified topic.
- **UserProfile**—Contains feed items created when a user changes records that can be tracked in a feed. Contains feed items whose parent is the user and feed items that @mention the user. This feed is different than the news feed, which returns more feed items, including group updates. You can get another user's user profile feed.
- **Favorites**—Contains favorites saved by the context user. Favorites are feed searches, list views, and topics.

## Post a Feed Item Using `/chatter/feed-elements`

**Tip:** The `/chatter/feed-elements` resource is the simplest, most efficient way to post feed items because it doesn't require you to pass a feed type. Feed items are the only feed element type you can post.

Use this resource to post feed items:

```
POST /chatter/feed-elements
```

When you post a feed item, you create a child of a standard or custom object. Specify the parent object in the `subjectId` request parameter or in the `subjectId` property of the Feed Item Input request body.

The `parent` property of the posted feed item contains information about the parent object.

### Post to your user profile

This example uses request parameters to post a text post to the context user's user profile:

```
POST /chatter/feed-elements?feedElementType=FeedItem&subjectId=me&text=Test
```

The `subjectId`, specifies the alias `me`. You can also specify the user ID of the context user.

The `parent` property of the newly posted feed item contains the User Summary response body of the context user.

### Post to another user

This example uses a request body to post to another user. The `subjectId` property specifies that user's ID.

```
POST /chatter/feed-elements

{
  "feedElementType": "FeedItem",
  "subjectId": "005RR000000DmOg",
  "body" : {
    "messageSegments" : [
      {
        "type" : "Text",
        "text" : "When should we meet for release planning?"
      }
    ]
  }
}
```

The `parent` property of the newly posted feed item contains the User Summary response body of the target user.

### Post to a group

This example uses a request body to post to a group. The `subjectId` property specifies the group ID.

```
POST /chatter/feed-elements

{
  "feedElementType": "FeedItem",
  "subjectId": "0F9RR0000004CPw",
  "body" : {
    "messageSegments" : [
      {
        "type" : "Text",
        "text" : "When should we meet for release planning?"
      }
    ]
  }
}
```

The `parent` property of the newly posted feed item contains the Group response body of the specified group.

### Post to a record (such as a file or an account)

This example uses a request body to mention a user on a record feed. The `subjectId` property specifies the record ID.

```
POST /chatter/feed-elements
```

```
{
  "feedElementType" : "FeedItem",
  "subjectId" : "001RR000002G4Y0",
  "body" : {
    "messageSegments" : [
      {
        "type" : "Mention",
        "id" : "005RR000000DmOg"
      },
      {
        "type" : "Text",
        "text" : " Have you checked on this account recently?"
      }
    ]
  }
}
```

The `parent` property of the new feed item depends on the record type specified. If the record type is File, the parent is the File Summary response body. If the record type is Group, the parent is a Group response body. If the record type is User, the parent is a User Summary response body. For all other record types, the parent is a Record Summary response body.

## Get Feed Elements from a Feed

 **Tip:** To return a feed that includes feed elements, use these resources. Feed element types include feed item, bundle, and recommendation.

Getting feed elements from a feed is similar, but not identical, for each feed type.

To get the feed elements from the feed types in this table, don't specify a subject ID. Replace the ***feedType*** to specify different feeds.

| Feed Type                                                | Resource                                                                                                                                                                                                   |
|----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Company, Direct Messages, Draft, Landing, Pending Review | /chatter/feeds/ <b><i>feedType</i></b> /feed-elements<br>For example: /chatter/feeds/company/feed-elements                                                                                                 |
| Direct Message Moderation, Home, Moderation              | /connect/communities/ <b><i>communityId</i></b> /chatter/feeds/ <b><i>feedType</i></b> /feed-elements<br>For example:<br>/connect/communities/ <b><i>communityId</i></b> /chatter/feeds/home/feed-elements |

To get the feed elements from all other feed types, specify a subject ID. Replace the ***feedType*** to specify a different feed. For most of the feed types in this table, the ***subjectId*** must be the ID of the context user or the alias `me`. For the record feed, the ***subjectId*** is a record ID. For the streams feed, the ***subjectId*** is a stream ID. For the topics feed, the ***subjectId*** is a topic ID. For the user profile feed, the ***subjectId*** is a user ID or the alias `me`.

 **Tip:** For the record feed, the ***recordId*** can be a record of any type that supports feeds, including group. The feed on the group page in the Salesforce UI is a record feed.

| Feed Type                                                                               | Resource                                                                                                                                     |
|-----------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Bookmarks, Files, Groups, Mute, News, People, Record, Streams, To, Topics, User Profile | <code>/chatter/feeds/<b>feedType</b>/<b>subjectId</b>/feed-elements</code><br>For example: <code>/chatter/feeds/news/me/feed-elements</code> |

To get the feed elements from the favorites and filter feeds, specify a **favoriteId** or a **keyPrefix**. The **keyPrefix** indicates the object type and is the first three characters of the object ID. For these feeds, the **subjectId** must be the ID of the context user or the alias `me`.

| Feed Type | Resource                                                                               |
|-----------|----------------------------------------------------------------------------------------|
| Favorites | <code>/chatter/feeds/favorites/<b>subjectId</b>/<b>favoriteId</b>/feed-elements</code> |
| Filter    | <code>/chatter/feeds/filter/<b>subjectId</b>/<b>keyPrefix</b>/feed-elements</code>     |

## Recommendations

Salesforce provides several types of recommendations, and Connect REST API supports Einstein Next Best Action, custom recommendations for Experience Cloud sites, and Chatter recommendations.

### Einstein Next Best Action

Einstein Next Best Action lets you use strategies to recommend actions and offers. You can deliver the right recommendation at the right moment to the right person. Integrate business rules, predictive models, and data—both inside and outside of Salesforce—to create unique strategies for all your use cases.

Available resources for Einstein Next Best Action recommendations:

| Resource                                                                            | HTTP Methods | Tasks                                             |
|-------------------------------------------------------------------------------------|--------------|---------------------------------------------------|
| <code>/connect/recommendations/<b>recommendationId</b></code>                       | GET          | Get a recommendation.                             |
| <code>/connect/recommendation-strategies/<b>strategyName</b>/recommendations</code> | POST         | Execute a strategy.                               |
| <code>/connect/recommendation-strategies/reactions</code>                           | GET, POST    | Get and record user reactions to recommendations. |
| <code>/connect/recommendation-strategies/reactions/<b>reactionId</b></code>         | GET, DELETE  | Get and delete a recommendation reaction.         |

### Custom Recommendations for Experience Cloud Sites

Create custom recommendations that appear in Experience Cloud sites, encouraging users to watch videos, take training, and more. Target specific audiences and use channels to specify locations for the recommendations.

These recommendations appear by default on the Customer Service template. They appear on the home and question detail pages and in the feed in Salesforce mobile web. They also appear anywhere community managers add recommendations using Experience Builder in the Customer Service template.

So that users don't see the same recommendations all the time, Salesforce periodically removes and brings back custom recommendations that haven't been accepted or dismissed.

Available resources for custom recommendations in Experience Cloud sites:

| Resource                                                                                    | HTTP Methods       | Tasks                                                                                              |
|---------------------------------------------------------------------------------------------|--------------------|----------------------------------------------------------------------------------------------------|
| <a href="#">/connect/recommendation-definitions</a>                                         | GET, POST          | Get a list of custom recommendation definitions or create a custom recommendation definition.      |
| <a href="#">/connect/recommendation-definitions/<b>recommendationDefinitionId</b></a>       | GET, PATCH, DELETE | Get information about, modify, or delete a custom recommendation definition.                       |
| <a href="#">/connect/recommendation-definitions/<b>recommendationDefinitionId</b>/photo</a> | GET, PUT, DELETE   | Get information about, upload, modify, or delete the photo for a custom recommendation definition. |
| <a href="#">/connect/recommendation-audiences</a>                                           | GET, POST          | Get a list of custom recommendation audiences and create a custom recommendation audience.         |
| <a href="#">/connect/recommendation-audiences/<b>recommendationAudienceId</b></a>           | GET, PATCH, DELETE | Get information about, update, and delete a custom recommendation audience.                        |
| <a href="#">/connect/recommendation-audiences/<b>recommendationAudienceId</b>/members</a>   | GET                | Get the members of a custom recommendation audience.                                               |
| <a href="#">/connect/scheduled-recommendations</a>                                          | GET, POST          | Get a list of scheduled custom recommendations or create a scheduled custom recommendation.        |
| <a href="#">/connect/scheduled-recommendations/<b>scheduledRecommendationId</b></a>         | GET, PATCH, DELETE | Get information about, update, or delete a scheduled custom recommendation.                        |

## Chatter Recommendations

Chatter provides recommendations to help your users identify the people, groups, files, and records that closely relate to their job and interests.

Available resources for Chatter recommendations:

| Resource                                                                       | HTTP Methods | Tasks                                                                                                                                                                                          |
|--------------------------------------------------------------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/chatter/users/me/recommendations</a>                              | GET          | Get the Chatter recommendations, such as user, group, file, record, topic, and article recommendations, for the context user. Also get custom and static recommendations for the context user. |
| <a href="#">/chatter/users/me/recommendations/<b>action</b></a>                | GET          | Get the Chatter, custom, and static recommendations for the specified action for the context user.                                                                                             |
| <a href="#">/chatter/users/me/recommendations/<b>action/objectCategory</b></a> | GET          | Get the Chatter, custom, and static recommendations for the specified action and object category for the context user.                                                                         |

| Resource                                                                                     | HTTP Methods | Tasks                                                                                                                                                  |
|----------------------------------------------------------------------------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/chatter/users/me/recommendations/<b>action</b>/<b>idPrefix</b></a>              | GET          | Get the Chatter, custom, and static recommendations for the specified action and key prefix for the context user.                                      |
| <a href="#">/chatter/users/me/recommendations/<b>action</b>/<b>objectID</b></a>              | GET, DELETE  | Get the Chatter, custom, and static recommendations for the specified action and object ID for the context user. Also used to delete a recommendation. |
| <a href="#">/chatter/users/<b>userId</b>/recommendations/<b>action</b>/<b>objectEnum</b></a> | GET, DELETE  | Get the static Chatter recommendation for the specified action and object type for the context user. Also used to delete a static recommendation.      |

## Salesforce Files

Use Connect REST API to work with Salesforce Files.

Use Salesforce Files to upload, store, find, follow, share, and collaborate on files in the cloud.

| Resource                                                                | HTTP Methods             | Tasks                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/chatter/feed-elements</a>                                  | GET, POST                | Post feed elements and search all feed elements in an organization.                                                                                                                                                                                                                                                                                                                          |
| <a href="#">/chatter/feeds/files/me/feed-elements</a>                   | GET                      | Returns all feed elements posted with files by people or groups that the context user follows.                                                                                                                                                                                                                                                                                               |
| <a href="#">/chatter/feeds/news/me/feed-elements</a>                    | GET                      | All feed elements from all groups the context user either owns or is a member of, as well as all files, records, and users the context user follows. Use this resource to get information about feed elements and to post feed elements.                                                                                                                                                     |
| <a href="#">/chatter/feeds/record/<b>recordId</b>/feed-elements</a>     | GET                      | Returns the feed elements for all the records the context user is following, or all the feed elements of the specified <i>recordId</i> . Use this resource to search a feed or to get the feed elements for a specific feed, including another user's feed. To use this resource to get the feed elements for a group, specify the group ID as the <i>recordId</i> .                         |
| <a href="#">/chatter/feeds/user-profile/<b>userId</b>/feed-elements</a> | GET                      | Returns feed elements created by the user, parented by the user, and where the user is mentioned. In Experience Cloud sites only, this feed also contains feed elements on which the user commented. This feed is different than the news feed, which returns more feed items, including group updates. You can post to the user-profile feed. You can get another user's user profile feed. |
| <a href="#">/connect/files/<b>fileId</b></a>                            | GET, POST, PATCH, DELETE | Get information about a specified file, including references to external files. Upload a new version of an existing file, including references to external files. Rename a file, move a file to a different folder, and delete a file.                                                                                                                                                       |

| Resource                                                         | HTTP Methods       | Tasks                                                                                                                                                                                                                         |
|------------------------------------------------------------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| /connect/files/ <b>fileId</b> /asset                             | POST               | Create an asset file.                                                                                                                                                                                                         |
| /connect/file-assets/ <b>assetId</b>                             | GET, PATCH         | Get information about an asset file or change the visibility of an asset file for unauthenticated users.                                                                                                                      |
| /connect/file-assets/ <b>fullyQualifiedName</b><br>/content      | GET                | Get the streamed content of an asset file.                                                                                                                                                                                    |
| /connect/file-assets/ <b>fullyQualifiedName</b><br>/rendition    | GET                | Get up to 25 streamed renditions of an asset file. A rendition is a binary preview of the file.                                                                                                                               |
| /connect/file-assets/batch/ <b>assetIds</b>                      | GET                | Get information about a comma-separated list of up to 100 asset files.                                                                                                                                                        |
| /connect/files/ <b>fileId</b> /content                           | GET                | Returns the content of the file, including references to external files. The content is streamed as the body of the response.                                                                                                 |
| /connect/files/ <b>fileId</b> /file-shares                       | GET, POST          | Get the users, groups, or records with which a file has been shared. Share a file with users.                                                                                                                                 |
| /connect/files/ <b>fileId</b> /image                             | GET                | Get information about a file image.                                                                                                                                                                                           |
| /connect/files/ <b>fileId</b> /file-shares/link                  | GET, PUT, DELETE   | Get, create, and delete a file's share link.                                                                                                                                                                                  |
| /connect/files/ <b>fileId</b> /previews                          | GET, PATCH         | Get information about a file's supported previews and generate up to 500 pages in a file preview.                                                                                                                             |
| /connect/files/ <b>fileId</b> /previews/<br><b>previewFormat</b> | GET                | Get up to 500 pages in a file preview or get a specific page in a preview.                                                                                                                                                    |
| /connect/files/ <b>fileId</b> /rendition                         | GET                | A rendition of the file. A rendition is a binary preview of the file. The format of the binary depends on the format specified in the request.                                                                                |
| /connect/files/batch/ <b>fileIds</b>                             | GET, DELETE        | Information about a list of files, specified by file IDs. Get information about a list of files and delete a list of files.                                                                                                   |
| /connect/folders/ <b>folderId</b>                                | GET, PATCH, DELETE | Get information about the specified folder. Move, rename, and delete a folder.                                                                                                                                                |
| /connect/folders/ <b>folderId</b> /items                         | GET, POST          | Get information about the contents of a folder. Add a file to a folder and create a folder.                                                                                                                                   |
| /chatter/groups/ <b>groupId</b> /files                           | GET                | Get information about the files posted to the specified group.                                                                                                                                                                |
| /connect/topics/ <b>topicId</b> /files                           | GET                | Returns information about the five files most recently posted to the specified topic.                                                                                                                                         |
| /connect/files/users/ <b>userId</b>                              | GET, POST          | Upload a file, including references to external files, to the Files home or get information about files a user owns. These files don't include files shared with a user, files a user follows, or general organization files. |

| Resource                                                      | HTTP Methods | Tasks                                                                                |
|---------------------------------------------------------------|--------------|--------------------------------------------------------------------------------------|
| <a href="#">/connect/files/users/me/filter/groups</a>         | GET          | Get information about files posted to groups that the specified user is a member of. |
| <a href="#">/connect/files/users/me/filter/shared-with-me</a> | GET          | Get information about files that have been shared with the specified user.           |

 **Note:** You can replace the alias `me` with the user ID of the context user.

To work with repository files, see [Files Connect Repository Resources](#).

## Connect REST API Examples

Use Connect REST API examples to perform tasks.

While using the Connect REST API, remember these request parameter and request body tips.

- Request parameters may be included as part of the Connect REST API resource URL, for example, `/chatter/users?q=searchtext`. A request body is a rich input which may be included as part of the request. When accessing a resource, you can use either a request body or request parameters. You cannot use both.
- With a request body, use `Content-Type: application/json` or `Content-Type: application/xml`.
- With request parameters, use `Content-Type: application/x-www-form-urlencoded`.

For more information on request bodies, see [Using POST, PATCH, or PUT for Input](#).

For examples of how to upload a binary file, see [Uploading Binary Files](#).

### IN THIS SECTION:

#### [Filter a Response Body](#)

Filter response bodies in Connect REST API.

#### [Make a Request in an Experience Cloud Site](#)

Make a request in an Experience Cloud site.

#### [Get My News Feed](#)

Get my news feed.

#### [Get Another User's Feed](#)

Get another user's Chatter feed.

#### [Get a Group Feed](#)

Get a Chatter group feed.

#### [Post a Feed Item](#)

Post a feed item in Chatter.

#### [Post a Feed Element and Include Files from Salesforce](#)

Post a feed element with Salesforce files in Chatter.

#### [Post a Poll](#)

Post a poll feed element in Chatter.

[Post a Rich-Text Feed Element](#)

Post a rich-text feed element in Chatter.

[Post a Feed Element with a Code Block](#)

Post a feed element with a code block in Chatter.

[Post a Feed Element with an Inline Image](#)

Post a feed element with an inline image in Chatter.

[Post a Comment](#)

Post a comment in Chatter.

[Post a Comment and Include a File from Salesforce](#)

Post a comment with a Salesforce file in Chatter.

[Post a Rich-Text Comment](#)

Post a rich-text comment in Chatter.

[Post a Comment with a Code Block](#)

Post a Chatter comment with a code block.

[Post a Comment with an Inline Image](#)

Post a Chatter comment with an inline image.

[Post a Binary File](#)

Post a binary file.

[Post an @Mention](#)

Post an @mention in a Chatter feed item or comment.

[Post Multiple @Mentions](#)

Post up to 25 mentions in a Chatter feed item or comment.

[Get a List of @Mention Proposals](#)

Get a list of @mention proposals in Chatter.

[Define Action Links and Post with a Feed Element](#)

Define actions links and post with a feed element.

[Define Action Links in a Template and Post with a Feed Element](#)

Define action links in a template and post with a feed element.

[Update the Status of an Action Link or Invoke an Action Link](#)

Update the status of an action link or invoke an action link.

[Edit a Feed Post](#)

Edit a feed post in Chatter.

[Edit a Comment](#)

Edit a comment in Chatter.

[Edit a Question Title and Post](#)

Edit a question title and post.

[Move a Feed Post from one Public Group to Another](#)

Move a Chatter feed post from one public group to another.

[Like a Feed Item](#)

Like a feed item.

[Like a Feed Item and Return the Total Number of Likes](#)

Like a feed item and get the total number of likes.

[Share a Feed Item](#)

Share a Chatter feed item.

[Send a Direct Message](#)

Send a direct message.

[Get Feed Elements Updated Since Last Request](#)

Get the feed elements updated since the last request.

[Get a Feed with Internal Feed Items Only](#)

Get a feed with internal feed items only.

[Search a Feed](#)

Search a feed.

[Get a List of Records a User Follows](#)

Get a list of records that a user follows.

[Get Chatter Activity Statistics for a User](#)

Get the Chatter activity statistics for a user.

[Get Recommendations of Users to Follow](#)

Get recommendations of users to follow.

[Create and Schedule Custom Recommendations with Audiences](#)

Create and schedule custom recommendations with audiences.

[Create a Group](#)

Create a Chatter group.

[Update and Crop a Group Photo](#)

Update and crop a Chatter group photo.

[Join a Group](#)

Join a Chatter group.

[Request to Join a Private Group](#)

Make a request to join a private Chatter group.

[Approve or Reject a Request to Join a Private Group](#)

Approve or reject a request to join a private group in Chatter.

[Post to a Group](#)

Post to a Chatter group.

[Follow a Record](#)

Follow a record in Chatter.

[Stop Following a Record](#)

Stop following a record.

[Get a Record Feed](#)

Get a record feed.

[Update a User Profile](#)

Update a user profile.

[Update and Crop a User Photo](#)

Update and crop a user photo.

[Send a Private Message](#)

Send a private message.

[Get User Information for Multiple Users](#)

Get user information for multiple users with a single call.

[Create a Topic Hierarchy in Experience Cloud Sites](#)

Create a topic hierarchy in Experience Cloud sites.

[Get Answers From Data Cloud Sources](#)

Search a data model object using a natural language query and return an answer.

## Filter a Response Body

Filter response bodies in Connect REST API.

### Resource

All

### HTTP method

GET

### Request parameters

`exclude`, `include`, and `filterGroup`

Use the `exclude` and `include` query parameters to filter a response body when making a request. The query value is a bar (|) delimited list of properties. URL encode the bar as %7C. Use a forward slash (/) before each property name.

Use the `filterGroup` query parameter to specify whether to return a `Big`, `Medium`, or `Small` response body. Every property in every response body is assigned one of these group sizes.

### Request parameter example

This News Feed URL resource:

```
/chatter/users/me?include=/aboutMe%7C/address
```

For a detailed list of rules and examples, see [Specify Response Sizes](#).

### Returns

A filtered response body

The request parameter example above returns this for the Feed response body:

```
{
  "aboutMe": "Salesforce Administrator and Citizen Developer",
  "address": {
    "city": "San Francisco",
    "country": "US",
    "formattedAddress": "1 Market St\nSan Francisco, CA 94105\nUS",
    "state": "CA",
    "street": "1 Market St",
    "zip": "94105"
  }
}
```

## Make a Request in an Experience Cloud Site

Make a request in an Experience Cloud site.

### Resource

A resource supports Experience Cloud sites unless the documentation states that it doesn't.

### HTTP method

Various

### Example

To make a request to a specific site, prefix the resource with `/connect/communities/communityId`. For example, this resource gets the feed items from a news feed in a specific site:

```
/connect/communities/communityId/chatter/feeds/news/me/feed-elements
```

For more information, see [Build the Resource URL](#) and [Connect to Experience Cloud Sites](#).

### Returns

Various

## Get My News Feed

Get my news feed.

### Resource

```
/chatter/feeds/news/me/feed-elements
```

### HTTP method

GET

### Example

```
/services/data/v65.0/chatter/feeds/news/me/feed-elements
```

### Returns

[Feed Element Page](#)

## Get Another User's Feed

Get another user's Chatter feed.

### Resource

```
/chatter/feeds/user-profile/userId/feed-elements
```

or

```
/chatter/feeds/record/userId/feed-elements
```

### HTTP method

GET

### Example

```
/services/data/v65.0/chatter/feeds/user-profile/005R0000000HwMA/feed-elements
```

or

```
/services/data/v65.0/chatter/feeds/record/005R0000000HwMA/feed-elements
```

**Returns**[Feed Element Page](#)

## Get a Group Feed

Get a Chatter group feed.

**Resource**

[/chatter/feeds/record/\*\*recordId\*\*/feed-elements](#)

Substitute **recordId** with the group ID.

**HTTP method**

GET

**Example**

```
/services/data/v65.0/chatter/feeds/record/0F9D00000000I40/feed-elements
```

**Returns**[Feed Element Page](#)

## Post a Feed Item

Post a feed item in Chatter.

**Resource**

[/chatter/feed-elements](#)

**HTTP method**

POST

**Request body**[Feed Item Input](#)

This Feed Item Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that has one [Message Segment Input: Text](#) request body and one [Message Segment Input: Mention](#) request body.

**Request body example**

In the `subjectId`, specify the user, group, or record that will parent the feed item.

```
{
  "body" : {
    "messageSegments" : [
      {
        "type" : "Text",
        "text" : "When should we meet for release planning? "
      },
      {
        "type" : "Mention",
        "id" : "005D00000016Qxp"
      }
    ]
  },
  "feedElementType" : "FeedItem",
  "subjectId" : "0F9B000000000W2"
}
```

**Request parameters**

feedElementType, subjectId, text

**Request parameter example**

```
/services/data/v65.0/chatter/feed-elements?feedElementType=FeedItem&subjectId=0F9B000000000W2&text=New+post
```

**Returns**

[Feed Item](#)

## Post a Feed Element and Include Files from Salesforce

Post a feed element with Salesforce files in Chatter.

This example posts a feed element with more than one file, all of which have been uploaded to Salesforce.

**Important:** In version 36.0 and later, you can't create a feed post and upload a binary file in the same request. [Upload files to Salesforce](#) first, and then use the file IDs to attach one or more files to a feed post.

**Resource**

[/chatter/feed-elements](#)

**HTTP method**

POST

**Request body**

[Feed Item Input](#)

This Feed Item Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that has one [Message Segment Input: Text](#) request body.

This Feed Item Input request body also includes a `capabilities` property that is a [Feed Element Capabilities Input](#) request body. In this example, the Feed Element Capabilities Input includes a `files` property that is a [Files Capability Input](#) request body. The Files Capability Input request body includes an `items` property that is a collection of [File ID Input](#) request bodies.

**Request body example**

```
{
  "body": {
    "messageSegments": [
      {
        "type": "Text",
        "text": "Please take a look at these files."
      }
    ]
  },
  "capabilities": {
    "files": {
      "items": [
        { "id": "069D000000001IOh" },
        { "id": "069D000000002IOg" }
      ]
    }
  },
  "subjectId": "me",
  "feedElementType": "FeedItem"
}
```

**Returns**[Feed Item](#)

## Post a Poll

Post a poll feed element in Chatter.

This example posts a poll feed element with two choices.

**Resource**[/chatter/feed-elements](#)**HTTP method**

POST

**Request body**[Feed Item Input](#)

This Feed Item Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that includes the text of the poll.

This Feed Item Input request body also includes a `capabilities` property that is a [Feed Element Capabilities Input](#) request body. In this example, the Feed Element Capabilities Input includes a `poll` property that is a [Poll Capability Input](#) request body. The Poll Capability Input request body includes a `choices` property that indicates the poll choices.

**Request body example**

```
{
  "body": {
    "messageSegments": [
      {
        "type": "Text",
        "text": "When should we meet for release planning?"
      }
    ]
  },
  "capabilities": {
    "poll": {
      "choices": [
        "Monday",
        "Tuesday"
      ]
    }
  },
  "feedElementType": "FeedItem",
  "subjectId": "me"
}
```

**Returns**[Feed Item](#)

## Post a Rich-Text Feed Element

Post a rich-text feed element in Chatter.

This example posts a feed element that includes two paragraphs, one in bold, and an extra line break between them.

**Resource**[/chatter/feed-elements](#)**HTTP method**

POST

**Request body**[Feed Item Input](#)

This Feed Item Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that has three [Message Segment Input: Text](#) request bodies, four [Message Segment Input: Markup Begin](#) request bodies, and four [Message Segment Input: Markup End](#) request bodies.

**Request body example**

```
{
  "body": {
    "messageSegments": [
      {
        "markupType" : "Paragraph",
        "type" : "MarkupBegin"
      },
      {
        "markupType" : "Bold",
        "type" : "MarkupBegin"
      },
      {
        "text" : "First line of text.",
        "type" : "Text"
      },
      {
        "markupType" : "Bold",
        "type" : "MarkupEnd"
      },
      {
        "markupType" : "Paragraph",
        "type" : "MarkupEnd"
      },
      {
        "markupType" : "Paragraph",
        "type" : "MarkupBegin"
      },
      {
        "text" : "&nbsp;",
        "type" : "Text"
      },
      {
        "markupType" : "Paragraph",
        "type" : "MarkupEnd"
      },
      {
        "markupType" : "Paragraph",
        "type" : "MarkupBegin"
      },
      {
        "text" : "Second line of text.",
```

```

        "type" : "Text"
      },
      {
        "markupType" : "Paragraph",
        "type" : "MarkupEnd"
      }
    ]
  },
  "subjectId": "me",
  "feedElementType": "FeedItem"
}

```

**Returns**[Feed Item](#)

## Post a Feed Element with a Code Block

Post a feed element with a code block in Chatter.

This example posts a feed element that includes a code block.

**Resource**</chatter/feed-elements>**HTTP method**

POST

**Request body**[Feed Item Input](#)

This Feed Item Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that has one [Message Segment Input: Markup Begin](#) request body, one [Message Segment Input: Text](#) request body, and one [Message Segment Input: Markup End](#) request body.

**Request body example**

```

{
  "body": {
    "messageSegments": [
      {
        "markupType" : "Code",
        "type" : "MarkupBegin"
      },
      {
        "text" : "<script>var i, t = 0;\nfor (i = 0; i < 5; i++) {\n    t +=\n      i;\n}\n\n</script>",
        "type" : "Text"
      },
      {
        "markupType" : "Code",
        "type" : "MarkupEnd"
      }
    ]
  },
  "subjectId": "me",
}

```

```
    "feedElementType": "FeedItem"
  }
```

**Returns**[Feed Item](#)

## Post a Feed Element with an Inline Image

Post a feed element with an inline image in Chatter.

This example posts a feed element with an inline image that has been uploaded to Salesforce. To upload a new file, see [Uploading Binary Files](#).

**Resource**[/chatter/feed-elements](#)**HTTP method**

POST

**Request body**[Feed Item Input](#)

This Feed Item Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that has two [Message Segment Input: Text](#) request bodies and two [Message Segment Input: Inline Image](#) request bodies.

**Request body example**

```
{
  "body": {
    "messageSegments": [
      {
        "type": "Text",
        "text": "Please take a look at this file."
      },
      {
        "type": "InlineImage",
        "fileId": "069xx00000000QO",
        "altText": "API Spec"
      },
      {
        "type": "Text",
        "text": "And this one."
      },
      {
        "type": "InlineImage",
        "fileId": "069xx00000000QT",
        "altText": "REST API Spec"
      }
    ]
  },
  "subjectId": "me",
  "feedElementType": "FeedItem"
}
```

**Returns**[Feed Item](#)

## Post a Comment

Post a comment in Chatter.

### Resource

[/chatter/feed-elements/\*feedElementId\*/capabilities/comments/items](#)

### HTTP method

POST

### Request body

[Comment Input](#)

This Comment Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that has one [Message Segment Input: Text](#) request body.

### Request parameter

`text`

### Request body example

```
{
  "body": {
    "messageSegments": [
      {
        "type": "Text",
        "text": "New comment"
      }
    ]
  }
}
```

### Request parameter example

[/services/data/v65.0/chatter/feed-elements/\*feedElementId\*/capabilities/comments/items?text=New+comment](#)

### Returns

[Comment](#)

## Post a Comment and Include a File from Salesforce

Post a comment with a Salesforce file in Chatter.

This example posts a comment with a file that has already been uploaded to Salesforce. To upload a new file, see [Uploading Binary Files](#).

### Resource

[/chatter/feed-elements/\*feedElementId\*/capabilities/comments/items](#)

### HTTP method

POST

### Request body

[Comment Input](#)

This Comment Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that has one [Message Segment Input: Text](#) request body.

This Comment Input request body also includes a `capabilities` property that is a [Comment Capabilities Input](#) request body. In this example, the Comment Capabilities Input includes a `content` property that is a [Content Capability Input](#) request body.

**Request parameter**

text

**Request body example**

```
{
  "body": {
    "messageSegments": [
      {
        "type": "Text",
        "text": "Please take a look at this file."
      }
    ]
  },
  "capabilities": {
    "content": {
      "contentDocumentId": "069D00000001pyS"
    }
  }
}
```

**Returns**[Comment](#)

## Post a Rich-Text Comment

Post a rich-text comment in Chatter.

This example posts a comment that includes two paragraphs, one in bold, and an extra line break between them.

**Resource**

[/chatter/feed-elements/\*feedElementId\*/capabilities/comments/items](#)

**HTTP method**

POST

**Request body**[Comment Input](#)

This Comment Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that has three [Message Segment Input: Text](#) request bodies, four [Message Segment Input: Markup Begin](#) request bodies, and four [Message Segment Input: Markup End](#) request bodies.

**Request body example**

```
{
  "body": {
    "messageSegments": [
      {
        "markupType" : "Paragraph",
        "type" : "MarkupBegin"
      },
      {
        "markupType" : "Bold",
        "type" : "MarkupBegin"
      },
      {

```

```

        "text" : "First line of text.",
        "type" : "Text"
    },
    {
        "markupType" : "Bold",
        "type" : "MarkupEnd"
    },
    {
        "markupType" : "Paragraph",
        "type" : "MarkupEnd"
    },
    {
        "markupType" : "Paragraph",
        "type" : "MarkupBegin"
    },
    {
        "text" : "&nbsp;",
        "type" : "Text"
    },
    {
        "markupType" : "Paragraph",
        "type" : "MarkupEnd"
    },
    {
        "markupType" : "Paragraph",
        "type" : "MarkupBegin"
    },
    {
        "text" : "Second line of text.",
        "type" : "Text"
    },
    {
        "markupType" : "Paragraph",
        "type" : "MarkupEnd"
    }
]
}

```

**Returns**[Comment](#)

## Post a Comment with a Code Block

Post a Chatter comment with a code block.

This example posts a feed element that includes a code block.

**Resource**

[/chatter/feed-elements/\*feedElementId\*/capabilities/comments/items](#)

**HTTP method**

POST

**Request body**

[Comment Input](#)

This Comment Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that has one [Message Segment Input: Markup Begin](#) request body, one [Message Segment Input: Text](#) request body, and one [Message Segment Input: Markup End](#) request body.

#### Request body example

```
{
  "body": {
    "messageSegments": [
      {
        "markupType" : "Code",
        "type" : "MarkupBegin"
      },
      {
        "text" : "<script>var i, t = 0;\nfor (i = 0; i < 5; i++) {\n  t +=\ni;\n}\n</script>",
        "type" : "Text"
      },
      {
        "markupType" : "Code",
        "type" : "MarkupEnd"
      }
    ]
  }
}
```

#### Returns

[Comment](#)

## Post a Comment with an Inline Image

Post a Chatter comment with an inline image.

This example posts a comment with an inline image that has been uploaded to Salesforce. To upload a new file, see [Uploading Binary Files](#).

#### Resource

[/chatter/feed-elements/\*\*feedElementId\*\*/capabilities/comments/items](#)

#### HTTP method

POST

#### Request body

[Comment Input](#)

This Comment Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that has two [Message Segment Input: Text](#) request bodies and two [Message Segment Input: Inline Image](#) request bodies.

#### Request body example

```
{
  "body": {
    "messageSegments": [
      {
        "type": "Text",
        "text": "Please take a look at this file."

```

```

    },
    {
      "type": "InlineImage",
      "fileId": "069xx00000000QO",
      "altText": "API Spec"
    },
    {
      "type": "Text",
      "text": "And this one."
    },
    {
      "type": "InlineImage",
      "fileId": "069xx00000000QT",
      "altText": "REST API Spec"
    }
  ]
}

```

**Returns**[Comment](#)

## Post a Binary File

Post a binary file.

For detailed information about uploading and posting binary files, see [Inputs and Binary File Upload Examples](#), which includes examples for:

- [Post a comment with a binary file](#)
- [Post a batch of comments with binary files](#)
- [Upload and crop a user photo](#)
- [Upload a binary file to the Files home](#)
- [Upload a file to an external repository](#)

 **Important:** In version 36.0 and later, you can't create a feed post and upload a binary file in the same request. [Upload files to Salesforce](#) first, and then use the file IDs to attach one or more files to a feed post.

- [Post a feed element with a binary file](#) (version 35.0 and earlier)
- [Post a batch of feed elements with binary files](#) (version 35.0 and earlier)

## Post an @Mention

Post an @mention in a Chatter feed item or comment.

**Resource**

To post a feed item with a mention, use [/chatter/feed-elements](#).

To post a comment with a mention, use

[/chatter/feed-elements/\*\*feedElementId\*\*/capabilities/comments/items](#).

**HTTP method**

POST

**Request body**

For a feed item, use [Feed Item Input](#)

For a comment, use [Comment Input](#)

Both of these input request bodies include a `body` property that is a [Message Body Input](#) request body. In these examples, the Message Body Input request body includes a `messageSegments` property that has one [Message Segment Input: Text](#) request body and one [Message Segment Input: Mention](#) request body.

**Request body example**

This example is for a feed item:

```
{
  "body" : {
    "messageSegments" : [
      {
        "type" : "Text",
        "text" : "When should we meet for release planning? "
      },
      {
        "type" : "Mention",
        "id" : "005T0000000mzCy"
      }
    ]
  },
  "feedElementType" : "FeedItem",
  "subjectId" : "005D00000016Qxp"
}
```

This example is for a comment:

```
{ "body" :
  {
    "messageSegments" : [
      {
        "type": "mention",
        "id" : "005D0000001GpHp"
      },
      {
        "type": "text",
        "text" : " Did you see the new plans?"
      }
    ]
  }
}
```

**Note:** Include a space in the text message segment because spaces aren't added automatically before or after a mention.

**Returns**

[Feed Item](#)

[Comment](#)

## Post Multiple @Mentions

Post up to 25 mentions in a Chatter feed item or comment.

**Resource**

To post a feed item with up to 25 mentions, use [/chatter/feed-elements](#).

To post a comment with up to 25 mentions, use

[/chatter/feed-elements/\*\*feedElementId\*\*/capabilities/comments/items](#).

**HTTP method**

POST

**Request body**

For a feed item, use [Feed Item Input](#)

For a comment, use [Comment Input](#)

Both of these input request bodies include a `body` property that is a [Message Body Input](#) request body. In these examples, the Message Body Input request body includes a `messageSegments` property that has two [Message Segment Input: Text](#) request bodies and two [Message Segment Input: Mention](#) request bodies.

**Request body example**

This example is for a feed item:

```
{
  "body" : {
    "messageSegments" : [
      {
        "type" : "Text",
        "text" : "When should we meet for release planning? "
      },
      {
        "type" : "Mention",
        "id" : "005T0000000mzCy"
      },
      {
        "type" : "Text",
        "text" : " "
      },
      {
        "type" : "Mention",
        "id" : "005B0000000Ek1S"
      }
    ]
  },
  "feedElementType" : "FeedItem",
  "subjectId" : "005D00000016Qxp"
}
```

This example is for a comment:

```
{ "body" :
  {
    "messageSegments" : [
      {
        "type": "mention",
        "id": "005D0000001LL8YIAW"
      },
      {
        "type" : "Text",
```

```

        "text" : " "
      },
      {
        "type": "mention",
        "id": "005D0000001LL8sIAG"
      },
      {
        "type": "text",
        "text": " Did you see the new plans?"
      }
    ]
  }
}

```

**Note:** Include spaces where you need them because spaces aren't added automatically before or after a mention.

### Returns

[Feed Item](#)

[Comment](#)

## Get a List of @Mention Proposals

Get a list of @mention proposals in Chatter.

### Resource

Use the Mentions Completions resource to get a list of mention proposals: [/chatter/mentions/completions](#). Use the Mentions Validations resource to determine which of those proposals are valid for the context user:

[/chatter/mentions/validations](#).

### HTTP method

GET

### Request parameters

contextId, page, pageSize, q, type

### Returns

[Mention Completion Page](#)

[Mention Validations](#)

## Define Action Links and Post with a Feed Element

Define actions links and post with a feed element.

### Step 1: Define the Action Link Group

Just like radio buttons, action links must be nested in a group. Action links within a group share the properties of the group and are mutually exclusive (you can click only one action link within a group). Even if you define only one action link, it must be part of an action link group.

Think of an action link as a button on a feed item. Like a button, an action link includes a label (`labelKey`). An action link definition also includes other properties like a URL (`actionUrl`), an HTTP method (`method`), and an optional request body (`requestBody`) and HTTP headers (`headers`).

When a user clicks this action link, an HTTP POST request is made to a Connect REST API resource, which posts a feed item to Chatter. The `requestBody` property holds the request body for the `actionUrl` resource, including the text of the new feed item. In this example, the new feed item includes only text, but it could include other capabilities such as a file attachment, a poll, or even action links.

### Resource

[/connect/action-link-group-definitions](#)

### HTTP method

POST

### Request body

[Action Link Group Definition Input](#)

This request body includes an `actionLinks` property that holds a collection of [Action Link Definition Input](#) request bodies. This example has one action link.

### Request body example

```
POST /services/data/v65.0/connect/action-link-group-definitions
{
  "executionsAllowed": "OncePerUser",
  "expirationDate": "2015-05-20T19:32:10+0000",
  "category": "Primary",
  "actionLinks": [
    {
      "actionType": "Api",
      "actionUrl": "/services/data/v65.0/chatter/feed-elements",
      "labelKey": "Post",
      "method": "HttpPost",
      "requiresConfirmation": "false",
      "requestBody": "{ \"subjectId\": \"me\", \"feedElementType\": \"FeedItem\", \"body\": \"This post was created via an API action link.\" } }",
      "headers": [
        {
          "name": "Content-Type",
          "value": "application/json"
        },
        {
          "name": "Authorization",
          "value": "OAuth 00DD00000007WNP!ARsAQHhIdgwbihG7e8ga"
        }
      ]
    }
  ]
}
```

### Request example using cURL

To use [cURL](#) to make the request, enter the following and substitute your Developer Edition instance name, and OAuth information.

```
curl -H "X-PrettyPrint: 1" -H "Content-Type: application/json"
-d '{ "executionsAllowed": "OncePerUser", "expirationDate": "2015-09-20T19:32:10+0000",
"category": "Primary",
"actionLinks": [ { "actionType": "Api",
"actionUrl": "/services/data/v65.0/chatter/feed-elements",
```

```
"groupDefault": "true", "labelKey": "Post", "method": "HttpPost",
"requiresConfirmation": "true",
"requestBody": "{ \"subjectId\": \"me\", \"feedElementType\": \"FeedItem\", \"body\":
{ \"messageSegments\": [ { \"type\": \"Text\", \"text\": \"This is a test post created via
an API action link.\" } ] } }",
"headers": [ { "name": "Content-Type", "value": "application/json" }, {
"name": "Authorization", "value": "OAuth 00DD00000007WNP!ARsAQHhIdgwbihG7e8ga" } ] }'
-X POST "https://instance_name/services/data/v65.0/connect/action-link-group-definitions"

-H 'Authorization: OAuth 00DRR0000000N0g!RWaPj9406yOD.1fjB9LqMk' --insecure
```

**Response body**[Action Link Group Definition](#)

## Step 2: Associate the Action Link Group with a Feed Item and Post It

You can associate up to 10 action link groups with a feed element.

**Resource**[/chatter/feed-elements](#)**HTTP method**

POST

**Request body**[Feed Item Input](#)

This Feed Item Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that has one [Message Segment Input: Text](#) request body.

This Feed Item Input request body also includes a `capabilities` property that is a [Feed Element Capabilities Input](#) request body. In this example, the Feed Element Capabilities Input includes an `associatedActions` property that is a [Associated Actions Capability Input](#) request body.

**Request body example**

Grab the action link group ID from the `id` property of the Action Link Group Definition response from step 1.

```
POST /services/data/v65.0/chatter/feed-elements

{
  "body": {
    "messageSegments": [
      {
        "type": "Text",
        "text": "Click to post a feed item."
      }
    ]
  },
  "subjectId": "me",
  "feedElementType": "feedItem",
  "capabilities": {
    "associatedActions": {
      "actionLinkGroupIds": ["0AgRR0000004CTr0AM"]
    }
  }
}
```

```
}
}
```

**Request example using cURL**

To use [cURL](#) to make the request, enter the following and substitute the action link group ID returned in step 1, your Developer Edition instance name, and your OAuth information.

```
curl -H "X-PrettyPrint: 1" -H "Content-Type: application/json" -d '{ "body": {
  "messageSegments":
  [ { "type": "Text", "text": "Click to post a feed item." } ] }, "subjectId": "me",
  "feedElementType": "feedItem", "capabilities":
  { "associatedActions": { "actionLinkGroupIds": ["0AgRR0000004CTr0AM"] } } }'
-X POST "https://instance_name/services/data/v65.0/chatter/feed-elements"
-H 'Authorization: OAuth OOARoAQETAKEIddnMWXh462dprYAgRWaPj9406yOD' --insecure
```

**Response body**

[Feed Item](#)

**SEE ALSO:**

[Salesforce Help: Action Link Templates](#)

[Define Action Links in a Template and Post with a Feed Element](#)

[Define Action Links in a Template and Post with a Feed Element](#)

## Define Action Links in a Template and Post with a Feed Element

Define action links in a template and post with a feed element.

### Step 1: Create the Action Link Templates

Just like radio buttons, action links must be nested in a group. Action links within a group share the properties of the group and are mutually exclusive (you can click only one action link within a group). Even if you define only one action link, it must be part of an action link group. The same is true for action link templates and action link group templates.

This example uses one action link in an action link group. When a user clicks the action link, an HTTP POST request is made to a Connect REST API resource, which posts a feed item to Chatter. The `HTTP Request Body` field holds the request body for the `Action URL` resource, including the text of the new feed item. In this example, the new feed item includes only text, but it could include other capabilities such as a file attachment, a poll, or even action links.

1. From Setup, enter *Action Link Templates* in the *Quick Find* box, then select **Action Link Templates**.
2. Use these values in a new Action Link Group Template:

| Field          | Value          |
|----------------|----------------|
| Name           | Doc Example    |
| Developer Name | Doc_Example    |
| Category       | Primary action |

| Field              | Value         |
|--------------------|---------------|
| Executions Allowed | Once per User |

3. Use these values in a new Action Link Template:

| Field                      | Value                                                                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action Link Group Template | Doc Example                                                                                                                                                |
| Action Type                | Api                                                                                                                                                        |
| Action URL                 | /services/data/{!Bindings.ApiVersion}/chatter/feed-elements                                                                                                |
| User Visibility            | Everyone can see                                                                                                                                           |
| HTTP Request Body          | { "subjectId": "{!Bindings.SubjectId}", "feedElementType": "FeedItem", "body": { "messageSegments": [ { "type": "Text", "text": "{!Bindings.Text}" } ] } } |
| HTTP Headers               | Content-Type: application/json                                                                                                                             |
| Position                   | 0                                                                                                                                                          |
| Label Key                  | Post                                                                                                                                                       |
| HTTP Method                | POST                                                                                                                                                       |

4. Go back to the Action Link Group Template and select `Published`. Click **Save**.

Make a note of the Action Link Group Template ID and skip to Step 3.

## Step 2: Get the Action Link Group Template ID

If you have access to the action link group template in Setup, you can get the Action Link Group Template ID and skip to Step 3.

### Resource

```
/services/data/v33.0/query
```

### HTTP method

GET

### Request parameters

`q`—A SOQL query string.

### Request parameters example

```
GET
/services/data/v65.0/query?q=SELECT+id+FROM+ActionLinkGroupTemplate+WHERE+DeveloperName='Doc_Example'
```

**cURL example**

```
curl
https://instance_name/services/data/v65.0/query?q=SELECT+id+FROM+ActionLinkGroupTemplate+
WHERE+DeveloperName='Doc_Example' -H "Authorization: Bearer token"
```

**Response body**

An array of query result records.

```
{
  "totalSize":1,
  "done":true,
  "records":[
    {
      "attributes":{
        "type":"ActionLinkGroupTemplate",

"url":"/services/data/v65.0/subjects/ActionLinkGroupTemplate/07gD00000004CEhIAM"
      },
      "Id":"07gD00000004CEhIAM"
    }
  ]
}
```

## Step 3: Instantiate the Action Link Group

**Resource**

[/connect/action-link-group-definitions](#)

**HTTP method**

POST

**Request body**

[Action Link Group Definition Input](#)

This Action Link Group Definition Input request body includes a `templateBindings` property that is a collection of [Action Link Template Binding Input](#) request bodies. In this example, the Action Link Template Binding Input request body includes three template bindings.

**Request body example**

```
POST /services/data/v65.0/connect/action-link-group-definitions
{
  "templateId":"07gD00000004CEhIAM",
  "templateBindings" : [
    {
      "key":"ApiVersion",
      "value":"v33.0"
    },
    {
      "key":"Text",
      "value":"This post was created by an API Action Link!"
    },
    {
      "key":"SubjectId",
      "value":"me"
    }
  ]
}
```

```

    }
  ]
}

```

**Request example using cURL**

To use [cURL](#) to make the request, enter the following and substitute your Developer Edition instance name, and OAuth information.

```

curl -H "X-PrettyPrint: 1" -H "Content-Type: application/json" -d '{
  "templateId": "07gD00000004CEhIAM",
  "templateBindings" : [ { "key": "ApiVersion", "value": "v65.0" },
  { "key": "Text", "value": "This post was created by an API Action Link!" }, {
  "key": "SubjectId", "value": "me" } ] }'
-X POST
"https://instance_name/services/data/v65.0/connect/action-link-group-definitions"
-H 'Authorization: OAuth 00DRR0000000N0g!RWaPj9406yOD.1fjB9LqMk' --insecure

```

**Response body**

[Action Link Group Definition](#)

## Step 4: Associate the Action Link Group with a Feed Element and Post It

You can associate up to 10 action link groups with a feed element.

**Resource**

[/chatter/feed-elements](#)

**HTTP method**

POST

**Request body**

[Feed Item Input](#)

This Feed Item Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that has one [Message Segment Input: Text](#) request body.

This Feed Item Input request body also includes a `capabilities` property that is a [Feed Element Capabilities Input](#) request body. In this example, the Feed Element Capabilities Input includes an `associatedActions` property that is a [Associated Actions Capability Input](#) request body.

**Request body example**

Grab the action link group ID from the `id` property of the Action Link Group Definition response from step 3.

```

POST /services/data/v65.0/chatter/feed-elements

{
  "body": {
    "messageSegments": [
      {
        "type": "Text",
        "text": "Click to post a feed item."
      }
    ]
  },
  "subjectId": "me",
  "feedElementType": "feedItem",

```

```

    "capabilities": {
      "associatedActions": {
        "actionLinkGroupIds": ["0AgRR0000004CTr0AM"]
      }
    }
  }
}

```

### Request example using cURL

To use [cURL](#) to make the request, enter the following and substitute the action link group ID returned in step 2, your Developer Edition instance name, and your OAuth information.

```

curl -H "X-PrettyPrint: 1" -H "Content-Type: application/json" -d '{ "body": {
"messageSegments": [ { "type": "Text", "text": "Click to post a feed item." } ] },
"subjectId": "me", "feedElementType": "feedItem", "capabilities": { "associatedActions":
{ "actionLinkGroupIds": ["0AgRR0000004CTr0AM"] } } }' -X POST
"https://instance_name/services/data/v65.0/chatter/feed-elements" -H 'Authorization:
OAuth OOARoAQETAKEIddnMWXh462dprYAgRWaPj9406yOD' --insecure

```

### Response body

[Feed Item](#)

[Define Action Links and Post with a Feed Element](#)

## Update the Status of an Action Link or Invoke an Action Link

Update the status of an action link or invoke an action link.

### Usage

Use this resource to update the `status` property of an action link. To invoke an `Api` or an `ApiAsync` action link, set the status to `PendingStatus`. The `status` of the action link in combination with the `labelKey` property of the Action Link Definition Input determines the text that displays in the UI.

Different types of action links have different `status` workflows.

#### **Api**

To invoke an `Api` action link from an app, make a PATCH request to mark the link `PendingStatus`. Salesforce handles the call out to the `actionUrl` that was provided in the Action Link Definition Input. For an `Api` action link, Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server.

#### **ApiAsync**

To invoke this action from an app, make a PATCH request to mark the link `PendingStatus`. Salesforce handles the call out to the `actionUrl` that was provided in the Action Link Definition Input. For an `ApiAsync` action link, the callout starts an asynchronous operation on your server. Salesforce sets `status` to `PendingStatus` unless the call returned an error status code, in which case it sets `status` to `FailedStatus`. When your server has finished the asynchronous processing it should call back and PATCH the action link to `SuccessfulStatus` or `FailedStatus`.

**Download and Ui**

Direct the user to download or visit the UI from the link in the `actionUrl` of the Platform Action response body. Your application must decide when to make a PATCH request to set `status` to `SuccessfulStatus` or `FailedStatus`.

**Note:** You can't PATCH the `status` of an action link:

- Back to `NewStatus` from a different `status`.
- From a terminal `status` (`FailedStatus` or `SuccessfulStatus`) to `NewStatus` or `PendingStatus`.
- When the action link belongs to an action link group whose `executionsAllowed` property is `Unlimited`.
- For an `Api` or `ApiAsync` action link whose `executionsAllowed` property is `Once`, when a user PATCHes the `status` to `PendingStatus` for the first time, the callout is made to the action link. If the same user PATCHes it to `PendingStatus` again, Salesforce returns the current action link information. However, if another user PATCHes the `status` to `PendingStatus`, Salesforce throws an error. In both cases, the callout to the action link is not resent.

**Resource**

`/connect/action-links/actionLinkId`

**HTTP method**

PATCH

**Request body**

Action Link Input

**Request body example**

```
{ "status": "SuccessfulStatus" }
```

**Request parameter**

`status`

**Request parameter example**

```
/services/data/v65.0/connect/action-links/actionLinkId?status=SuccessfulStatus
```

**Returns**

Platform Action

## Edit a Feed Post

Edit a feed post in Chatter.

**Resource**

`/chatter/feed-elements/feedElementId`

**HTTP method**

PATCH

**Request body**

Feed Item Input

This Feed Item Input request body includes a `body` property that is a Message Body Input request body. In this example, the Message Body Input request body includes a `messageSegments` property that has one Message Segment Input: Text request body.

**Request body example**

```
{
  "body": {
    "messageSegments": [
      {
        "type": "Text",
        "text": "Check out the latest API documentation on developer.salesforce.com."
      }
    ]
  }
}
```

**Returns**[Feed Item](#)

## Edit a Comment

Edit a comment in Chatter.

**Resource**</chatter/comments/{commentId}>**HTTP method**

PATCH

**Request body**[Comment Input](#)

This Comment Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that has one [Message Segment Input: Text](#) request body.

**Request body example**

```
{
  "body": {
    "messageSegments": [
      {
        "type": "Text",
        "text": "I am definitely going to check that out."
      }
    ]
  }
}
```

**Returns**[Comment](#)

## Edit a Question Title and Post

Edit a question title and post.

**Resource**</chatter/feed-elements/{feedElementId}>

**HTTP method**

PATCH

**Request body**[Feed Item Input](#)

This Feed Item Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that has one [Message Segment Input: Text](#) request body.

This Feed Item Input request body also includes a `capabilities` property that is a [Feed Element Capabilities Input](#) request body. In this example, the Feed Element Capabilities Input includes a `questionAndAnswers` property that is a [Question and Answers Capability Input](#) request body.

**Request body example**

```
{
  "body": {
    "messageSegments": [
      {
        "type": "Text",
        "text": "The latest public versions are on developer.salesforce.com."
      }
    ]
  },
  "capabilities": {
    "questionAndAnswers": {
      "questionTitle": "Where can I find API documentation"
    }
  }
}
```

**Returns**[Feed Item](#)

## Move a Feed Post from one Public Group to Another

Move a Chatter feed post from one public group to another.

**Resource**[/chatter/feed-elements/\*feedElementId\*](#)**HTTP method**

PATCH

**Request body**[Feed Item Input](#)**Request body example**

```
{
  "subjectId": "0F9xx00000000CM"
}
```

**Returns**[Feed Item](#)

## Like a Feed Item

Like a feed item.

### Resource

[/chatter/feed-elements/\*feedElementId\*/capabilities/chatter-likes/items](#)

### HTTP method

POST

**Note:** POST doesn't take request parameters or a request body.

### Example

```
/services/data/v65.0/chatter/feed-elements/005B0000000GPo4/capabilities/chatter-likes/items
```

### Returns

[Like](#)

## Like a Feed Item and Return the Total Number of Likes

Like a feed item and get the total number of likes.

### Resource

[/connect/batch/](#)

### HTTP method

POST

### Request body

[Generic Batch Collection Input](#)

This Generic Batch Collection Input request body includes a `batchRequests` property that is a collection of [Batch Input](#) request bodies.

### Request body example

```
{
  "batchRequests" : [
    {
      "method" : "Post",
      "url" :
"/v65.0/chatter/feed-elements/feedElementId/capabilities/chatter-likes/items"
    },
    {
      "method" : "Get",
      "url" :
"/v65.0/chatter/feed-elements/feedElementId/capabilities/chatter-likes/items"
    }
  ],
  "haltOnError" : "false"
}
```

### Returns

[Batch Results](#)

# Share a Feed Item

Share a Chatter feed item.

## Resource

[/chatter/feed-elements](#)

## HTTP method

POST

## Request body

[Feed Item Input](#)

This Feed Item Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that has one [Message Segment Input: Text](#) request body and one [Message Segment Input: Mention](#) request body.

This Feed Item Input request body also includes a `capabilities` property that is a [Feed Element Capabilities Input](#) request body. In this example, the Feed Element Capabilities Input request body includes a `feedEntityShare` property that is a [Feed Entity Share Capability Input](#) request body.

## Request body example

```
{
  "body" : {
    "messageSegments" : [
      {
        "type" : "Text",
        "text" : "When should we meet for release planning? "
      },
      {
        "type" : "Mention",
        "id" : "005D00000016Qxp"
      }
    ]
  },
  "capabilities" : {
    "feedEntityShare" : {
      "feedEntityId" : "0D5B000000Py41t"
    }
  },
  "feedElementType" : "FeedItem",
  "subjectId" : "0F9B000000000W2"
}
```

## Request parameters

**Note:** The `originalFeedElementId` request parameter isn't supported in version 39.0 and later. Use the request body to share a feed item in version 39.0 and later.

`originalFeedElementId`, `subjectId`

## Request parameter example

```
/services/data/v38.0/chatter/feed-elements?originalFeedElementId=0D5D0000000DaZBKA0&subjectId=me
```

## Returns

[Feed Item](#)

## Send a Direct Message

Send a direct message.

This example sends a direct message to two people.

### Resource

[/chatter/feed-elements](#)

### HTTP method

POST

### Request body

[Feed Item Input](#)

This Feed Item Input request body includes a `body` property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a `messageSegments` property that has one [Message Segment Input: Text](#) request body.

This Feed Item Input request body also includes a `capabilities` property that is a [Feed Element Capabilities Input](#) request body. In this example, the Feed Element Capabilities Input request body includes a `directMessage` property that is a [Direct Message Capability Input](#) request body.

### Request body example

```
{
  "body": {
    "messageSegments": [
      {
        "type": "Text",
        "text": "Thanks for attending my presentation test run this morning. Send me any feedback."
      }
    ]
  },
  "capabilities": {
    "directMessage": {
      "membersToAdd": ["005R0000000I2X4", "005R0000000I23Y"],
      "subject": "Thank you!"
    }
  },
  "subjectId": "me",
  "feedElementType": "FeedItem"
}
```

### Returns

[Feed Item](#)

## Get Feed Elements Updated Since Last Request

Get the feed elements updated since the last request.

### Resource

To get feed elements that were updated since the last call to a feeds resource, make a request to the value of the `updatesUrl` property of the Feed Element Page response body. Feed elements that are updated in the same second as the request aren't returned.

These feeds return an `updatesUrl` property.

- Company—[/chatter/feeds/company/feed-elements](#)

- Files—</chatter/feeds/files/me/feed-elements>
- Filter—[/chatter/feeds/filter/me/\*\*filterId\*\*/feed-elements](/chatter/feeds/filter/me/<b>filterId</b>/feed-elements)
- Groups—</chatter/feeds/groups/me/feed-elements>
- News—</chatter/feeds/news/me/feed-elements>
- People—</chatter/feeds/people/me/feed-elements>
- Record—[/chatter/feeds/record/\*\*recordId\*\*/feed-elements](/chatter/feeds/record/<b>recordId</b>/feed-elements)

This excerpt from the Feed Elements Page response body shows a sample value for the `updatesUrl` property:

```
{
  ...
  ..."updatesUrl" : "/services/data/v65.0/chatter/feeds
    /news/005D0000001LL8OIAW/feed-elements?updatedSince=2:1384811809000"
  ...
}
```

A feed element is considered to be updated if it was created since the last feed request, or if `sort=LastModifiedDateDesc` and a comment was added to the feed element since the last feed request. Adding likes and topics doesn't update a feed element.

**HTTP method**

GET

**Returns**

[Feed Element Page](#)

## Get a Feed with Internal Feed Items Only

Get a feed with internal feed items only.

**Resource**

[/chatter/feeds/record/\*\*recordId\*\*/feed-elements](/chatter/feeds/record/<b>recordId</b>/feed-elements)

**HTTP method**

GET

**Request parameter**

`showInternalOnly`

**Example**

```
/services/data/v65.0/chatter/feeds/record/0F9D00000000I40/feed-elements?showInternalOnly=true
```

**Returns**

[Feed Element Page](#)

## Search a Feed

Search a feed.

**Resource**

[/chatter/feed-elements?q=\*\*searchString\*\*](/chatter/feed-elements?q=<b>searchString</b>)

The search string can contain wildcards and must contain at least two characters that aren't wildcards.

**HTTP method**

GET

**Request parameter**

q

**Request parameter example**

```
/services/data/v65.0/chatter/feed-elements?q=track
```

**Returns**[Feed Element Page](#)

## Get a List of Records a User Follows

Get a list of records that a user follows.

**Resource**[/chatter/users/\*userId\*/following](#)**HTTP method**

GET

**Request parameter**

page (optional)

**Request parameter example**

```
/services/data/v65.0/chatter/users/005D0000001GLowIAB/following?page=1
```

**Returns**[Subscription Page](#)

## Get Chatter Activity Statistics for a User

Get the Chatter activity statistics for a user.

**Resource**[/chatter/users/\*userId\*](#)**HTTP method**

GET

**Example**

```
/services/data/v65.0/chatter/users/005D0000001GLowIAB?include=/chatterActivity
```

**Returns**[User Detail](#)

## Get Recommendations of Users to Follow

Get recommendations of users to follow.

**Resource**[/chatter/users/me/recommendations/follow/users](#)**HTTP method**

GET

**Example**

```
/services/data/v65.0/chatter/users/me/recommendations/follow/users
```

**Returns**

[Chatter Recommendations](#)

## Create and Schedule Custom Recommendations with Audiences

Create and schedule custom recommendations with audiences.

Community managers can access, create, and delete audiences, definitions, and schedules for custom recommendations. (Community managers are users with the Create and Set Up Experiences or Manage Experiences permission.) Users with the Modify All Data permission can also access, create, and delete custom recommendation audiences, custom recommendation definitions, and scheduled custom recommendations.

These recommendations appear by default on the Customer Service template. They appear on the home and question detail pages and in the feed in Salesforce mobile web. They also appear anywhere community managers add recommendations using Experience Builder in the Customer Service template.

So that users don't see the same recommendations all the time, Salesforce periodically removes and brings back custom recommendations that haven't been accepted or dismissed.

### Step 1: Define the Custom Recommendation

**Resource**

</connect/communities/{communityId}/recommendation-definitions>

**HTTP method**

POST

**Request body**

[Custom Recommendation Definition Input](#)

**Request body example**

```
{
  "name": "Corporate Training Project",
  "title": "Want to learn more about the Corporate Training Project?",
  "explanation": "Click this link to learn more!",
  "actionUrl": "https://www.example.com",
  "actionUrlName": "Launch"
}
```

**Response body**

[Custom Recommendation Definition](#)

### Step 2: Add an Image to the Custom Recommendation

This example adds an image file that has been uploaded to Salesforce. To upload a new image file, see [Uploading Binary Files](#).

**Resource**

</connect/recommendation-definitions/{recommendationDefinitionId}/photo>

Use the *recommendationDefinitionId* returned in the Recommendation Definition response body in Step 1.

**HTTP method**

PUT

**Request body**[Photo Input](#)**Request body example**

```
{
  "cropSize" : "120",
  "cropX" : "0",
  "cropY" : "0",
  "fileId" : "069D00000001IOh"
}
```

**Response body**[Photo](#)

## Step 3: Create a Recommendation Audience

**Resource**[/connect/communities/\*\*communityId\*\*/recommendation-audiences](/connect/communities/<b>communityId</b>/recommendation-audiences)**HTTP method**

POST

**Request body**[Custom Recommendation Audience Input](#)**Request body example**

```
{
  "name" : "Custom App Users"
}
```

**Response body**[Custom Recommendation Audience](#)

## Step 4: Add Members to the Recommendation Audience

**Resource**[/connect/communities/\*\*communityId\*\*/recommendation-audiences/\*\*recommendationAudienceId\*\*](/connect/communities/<b>communityId</b>/recommendation-audiences/<b>recommendationAudienceId</b>)Use the *recommendationAudienceId* returned in the Recommendation Audience response body in Step 3.**HTTP method**

PATCH

**Request body**[Custom Recommendation Audience Input](#)

In this example, this Recommendation Audience Input request body includes a *criteria* property that is a [Custom List Audience Criteria Input](#) request body. The Custom List Audience Criteria Input request body includes a *members* property that is a [User ID Collection Input](#) request body.

**Request body example**

```
{
  "criteria" : {
    "memberOperationType" : "Add",
    "members" : {
      "userIds" : [
        "005B0000000Ge16",
        "005D0000001GpHp"
      ]
    },
    "type" : "CustomList"
  }
}
```

**Response body**

[Custom Recommendation Audience](#)

## Step 5: Schedule the Custom Recommendation with the Audience

**Resource**

[/connect/communities/\*\*communityId\*\*/scheduled-recommendations](/connect/communities/<b>communityId</b>/scheduled-recommendations)

**HTTP method**

POST

**Request body**

[Scheduled Custom Recommendation Input](#)

**Request body example**

```
{
  "recommendationDefinitionId" : "0RDD00000004CEhOAM",
  "recommendationAudienceId": "02JD00000008SfdMAE"
}
```

**Response body**

[Scheduled Custom Recommendation](#)

## Create a Group

Create a Chatter group.

**Resource**

</chatter/groups>

**HTTP method**

POST

**Request body**

[Group Input](#)

**Request body example**

```
{
  "name" : "Chatter API",
}
```

```
{
  "visibility" : "PublicAccess"
}
```

**Request parameters (required)**

name, visibility

**Request parameter example**

```
/services/data/v65.0/chatter/groups?name=Chatter+API&visibility=PublicAccess
```

**Returns**

[Group Detail](#)

## Update and Crop a Group Photo

Update and crop a Chatter group photo.

This example crops an existing photo (a photo that has already been uploaded). You can also upload and crop a photo. To upload a new photo, use a multipart/form-data request. See [Uploading Binary Files](#).

**Resource**

[/chatter/groups/\*\*groupId\*\*/photo](#)

**HTTP method**

POST

**Request body**

[Photo Input](#)

**Request body example**

```
{
  "cropSize" : "240",
  "cropX" : "20",
  "cropY" : "20",
  "fileId" : "069D00000001IOh"
}
```

**Request parameters**

cropSize, cropX, cropY, fileId

**Request parameter example**

```
/services/data/v65.0/chatter/groups/0F9300000008ORJ
/photo?cropSize=240&cropX=20&cropY=20&fileId=069D00000001IOh
```

**Returns**

[Photo](#)

**SEE ALSO:**

[Update and Crop a User Photo](#)

## Join a Group

Join a Chatter group.

**Resource**

[/chatter/groups/\*\*groupId\*\*/members](#)

**HTTP method**

POST

**Request body**[Group Member Input](#)**Request body example**

```
{ "userId": "005D0000001GpHp" }
```

**Request parameter**

userId

**Request parameter example**

```
/services/data/v65.0/chatter/groups/0F9D000000006bOKAQ  
/members?userId=005D0000001GpHp
```

**Returns**[Group Member](#)

## Request to Join a Private Group

Make a request to join a private Chatter group.

**Resource**[/chatter/groups/\*\*groupId\*\*/members/requests](#)**HTTP method**

POST

**Note:** POST doesn't take request parameters or a request body.**Example**

```
/services/data/v65.0/chatter/groups/0F9D000000006bOKAQ/members/requests
```

**Returns**[Group Membership Request](#)

## Approve or Reject a Request to Join a Private Group

Approve or reject a request to join a private group in Chatter.

**Resource**[/chatter/group-memberships-requests/\*\*requestId\*\*](#)**HTTP method**

PATCH

**Request body**[Group Membership Request Update](#)**Request body example**

```
{ "status " : "Accepted" }
```

**Request parameters**

status and responseMessage

The responseMessage parameter is used only if the value of status is Declined.

**Request parameter example**

```
/services/data/v65.0/chatter/group-membership-requests/0I5D000000002fwKAA?status=Accepted
```

**Returns**

[Group Membership Request](#)

## Post to a Group

Post to a Chatter group.

**Resource**

[/chatter/feed-elements](#)

**HTTP method**

POST

**Request body**

[Feed Item Input](#)

This Feed Item Input request body includes a body property that is a [Message Body Input](#) request body. In this example, the Message Body Input request body includes a messageSegments property that has one [Message Segment Input: Text](#) request body and one [Message Segment Input: Mention](#) request body.

**Request body example**

Specify the group in the subjectId.

```
{
  "body" : {
    "messageSegments" : [
      {
        "type" : "Text",
        "text" : "When should we meet for release planning?"
      },
      {
        "type" : "Mention",
        "id" : "005D00000016Qxp"
      }
    ]
  },
  "feedElementType" : "FeedItem",
  "subjectId" : "0F9B000000000W2"
}
```

**Request parameters**

feedElementType, subjectId, text

**Request parameter example**

```
/services/data/v65.0/chatter
/feed-elements?feedElementType=FeedItem&subjectId=0F9B000000000W2&text=New+post
```

**Returns**

[Feed Item](#)

## Follow a Record

Follow a record in Chatter.

### Resource

[/chatter/users/me/following](#)

### HTTP method

POST

### Request body

[Following Input](#)

### Request body example

```
{ "subjectId" : "001D000000Iyu2p" }
```

### Request parameter

subjectId

The `subjectId` is the ID of the item you want to follow. In versions 29.0 and above, the `subjectId` can be a topic ID.

### Request parameter example

```
/services/data/v65.0/chatter/users/me/following?subjectId=001D000000Iyu2p
```

### Returns

[Subscription](#)

## Stop Following a Record

Stop following a record.

### Resource

[/chatter/subscriptions/\*subscriptionId\*](#)

### HTTP method

DELETE

### Example

```
/services/data/v65.0/chatter/subscriptions/0E8D00000001JkFKAU
```

### Returns

[204: Successful Delete](#)

A complete structured response body is not returned, just a return code.

## Get a Record Feed

Get a record feed.

### Resource

[/chatter/feeds/record/\*recordId\*/feed-elements](#)

### HTTP method

GET

**Example**

```
/services/data/v65.0/chatter/feeds/record/005x0000001oXx9AAE  
/feed-elements
```

**Returns**

[Feed Element Page](#)

## Update a User Profile

Update a user profile.

**Resource**

[/chatter/users/](#)*userId*

**HTTP method**

PATCH

**Request body**

[User Input](#)

**Request body example**

```
{  "aboutMe": "Writer at Salesforce"}
```

**Request parameter**

aboutMe

**Request parameter example**

```
/services/data/v65.0/chatter/users/me?aboutMe=Writer+at+Salesforce
```

**Returns**

[User Detail](#)

## Update and Crop a User Photo

Update and crop a user photo.

This example crops an existing photo (a photo that has already been uploaded). You can also upload and crop a photo. To upload a new photo, use a multipart/form-data request. See [Uploading Binary Files](#).

**Resource**

[/connect/user-profiles/](#)*userId*/photo

**HTTP method**

POST

**Request body**

[Photo Input](#)

**Request body example**

```
{  "cropSize" : "240",  
  "cropX"   : "20",  
  "cropY"   : "20",  
  "fileId"  : "069D00000001IOh"  
}
```

**Request parameters**

cropSize, cropX, cropY, fileId

**Request parameter example**

```
/services/data/v65.0/connect/user-profiles  
/me/photo?cropSize=240&cropX=20&cropY=20&fileId=069D00000001IOh
```

**Returns**

[Photo](#)

SEE ALSO:

[Update and Crop a Group Photo](#)

## Send a Private Message

Send a private message.

**Resource**

[/chatter/users/me/messages/](#)

**HTTP method**

POST

**Request body**

[User Message](#)

**Request body example**

```
{ "body" : "Are we ready for next week's customer meeting?",  
  "recipients" : ["005D0000001GOYpIAO", "005D0000001GbdHIAS"]  
}
```

**Request parameter**

recipients OR inReplyTo

text

**Request parameter example**

```
/services/data/v65.0/chatter/users/me/messages?recipients=  
005D0000001GOYpIAO,005D0000001GbdHIAS&text=Are+we+ready+for+next+week's+customer+meeting?
```

**Returns**

[Message](#)

## Get User Information for Multiple Users

Get user information for multiple users with a single call.

**Resource**

[/chatter/users/batch/user\\_list](#) where *user\_list* is a list of user Ids. Your app may need to call Connect REST API twice: once to get the feed items and user Ids, the second time to call this resource with the list of user Ids.

**HTTP method**

GET

**Example**

```
/services/data/v65.0/chatter/users  
/batch/005D0000001K16xIAC,005D0000005J3D4HVB, . . .
```

**Returns**[Batch Results](#)

## Create a Topic Hierarchy in Experience Cloud Sites

Create a topic hierarchy in Experience Cloud sites.

### Example 1: Create a Hierarchy with Managed Topics

**Step 1: Identify or Create the Parent Topic**

The parent topic must be a navigational managed topic.

**Resource**

[/connect/communities/\*communityId\*/managed-topics](/connect/communities/<i>communityId</i>/managed-topics)

**HTTP method**

**GET** to retrieve a list of navigational managed topics to identify the parent topic.

**POST** to create a parent topic. Community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

**Response body for GET**

[Managed Topic Collection](#)

Make a note of the ID of the navigational managed topic you want to be the parent topic. It has a prefix of 0mt.

**Request body for POST**

[Managed Topic Input](#)

**Request body example for POST**

```
{  
  "name": "Parent Topic",  
  "managedTopicType": "Navigational"  
}
```

**Response body for POST**

[Managed Topic](#)

Make a note of the ID of the parent topic you created. It has a prefix of 0mt.

**Step 2: Create the Child Topic and Link to the Parent in a Hierarchy**

In this step, create a managed child topic and link it to its parent in one step.

**Resource**

[/connect/communities/\*communityId\*/managed-topics](/connect/communities/<i>communityId</i>/managed-topics)

**HTTP method**

POST

Community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

**Request body**[Managed Topic Input](#)**Request body example**

Use the navigational managed topic ID from Step 1 as the *parentId*.

```
{
  "name": "Child Topic",
  "managedTopicType": "Navigational",
  "parentId": "0mtR000000001KLIAY"
}
```

**Response body for POST**[Managed Topic](#)

## See the Hierarchy

By default, the managed topic response body shows only the top level of a hierarchy. You can have up to three levels in your topic hierarchy. To see all the levels, use this resource and these parameters:

```
/connect/communities/communityId/managed-topics?depth=3&managedTopicType=Navigational
```

## Example 2: Create a Hierarchy with Managed and Standard Topics

It's also possible to use a standard topic, instead of a managed topic, to be the child topic, but this requires an additional step.

**Step 1: Identify or Create the Parent Topic**

The parent topic must be a navigational managed topic.

**Resource**[/connect/communities/\*\*communityId\*\*/managed-topics](/connect/communities/<b>communityId</b>/managed-topics)**HTTP method**

**GET** to retrieve a list of navigational managed topics to identify the parent topic.

**POST** to create a parent topic. Community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create managed topics.

**Response body for GET**[Managed Topic Collection](#)

Make a note of the ID of the navigational managed topic you want to be the parent topic. It has a prefix of 0mt.

**Request body for POST**[Managed Topic Input](#)**Request body example for POST**

```
{
  "name": "Parent Topic",
  "managedTopicType": "Navigational"
}
```

**Response body for POST**[Managed Topic](#)

Make a note of the ID of the parent topic you created. It has a prefix of 0mt.

## Step 2: Identify or Create the Child Topic

In this example, identify or create a standard topic, instead of a managed topic, to be the child topic.

### Resource

[/connect/communities/\*communityId\*/topics](/connect/communities/<i>communityId</i>/topics)

### HTTP method

**GET** to retrieve a list of topics to identify the child topic.

**POST** to create a child topic. Users with the Create Topics permission can create topics.

### Response body for GET

[Topic Collection](#)

Make a note of the ID of the topic you want to be the child topic. It has a prefix of 0TO.

### Request body for POST

[Topic Input](#)

### Request body example for POST

```
{
  "description": "This topic will be a child topic of Parent Topic.",
  "name": "Child Topic"
}
```

### Response body for POST

[Topic](#)

Make a note of the ID of the child topic you created. It has a prefix of 0TO.

## Step 3: Link the Child and Parent Topic in a Hierarchy

### Resource

[/connect/communities/\*communityId\*/managed-topics](/connect/communities/<i>communityId</i>/managed-topics)

### HTTP method

POST

### Request body

[Managed Topic Input](#)

### Request body example

Use the managed topic ID from Example 2, Step 1 as the *parentId* and the topic ID from Example 2, Step 2 as the *recordId*.

```
{
  "managedTopicType": "Navigational",
  "parentId": "0mtR000000001KLIAY",
  "recordId": "0TOD000000000cwk"
}
```

### Response body

[Managed Topic](#)

## Get Answers From Data Cloud Sources

Search a data model object using a natural language query and return an answer.

### Resource

[/connect/search/subjects/\*objectApiName\*/answer](/connect/search/subjects/<i>objectApiName</i>/answer)

**HTTP method**

GET

**Example**

```
/services/data/v63.0/connect/search/subjects/ssot__KnowledgeArticleVersion__dlm/answer?q=How
can I setup the labs field service dashboards &htmlEncode=false
```

**Response Body**

```
{
  "content": "<p>To set up the <b>Salesforce Labs Field Service Dashboards</b>, you can
download a free package from the Salesforce Labs AppExchange. This package includes
three standard dashboards that help track key metrics and performance in your field
service operations. These dashboards can be customized to meet your specific needs. Key
metrics tracked include:</p><ul><li>Number of completed appointments by a
resource</li><li>Management by territory and utility</li><li>Total hours worked by
resource</li><li>Number of maintenance plan check-ins</li><li>Resource capacity by
territory</li><li>Upcoming priority appointments</li><li>Total number of completed
appointments by week</li><li>Products consumed by work orders</li><li>Average appointment
and travel times</li></ul><p>The dashboards available are:</p><ul><li><b>System
Administrator Dashboard</b>: Displays metrics such as products needed and consumed, and
overall performance for each type of work.</li><li><b>Inventory Manager Dashboard</b>:
Shows how products are consumed and used by work order types.</li><li><b>Service Manager
Dashboard</b>: Focuses on work performance of resources and additional work order
metrics.</li></ul><p>To download the dashboards, click 'Get It Now' on the Field Service
Dashboards page on AppExchange.</p>",

## Connect REST API Resources

---

Connect REST API resources are sometimes called *endpoints*.

For Chatter REST API resources, see [Chatter REST API Resources](#).

**IN THIS SECTION:**[Action Links Resources](#)

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can drive productivity and accelerate innovation.

[Activity Reminders Resources](#)

Get upcoming activity reminders in Salesforce Classic. Get, update, or delete an activity reminder in Salesforce Classic.

[Application for Program](#)

Create an application for a program.

[Batch Resource](#)

Create a request body with a batch of up to 25 subrequests and send them to the server in a single request to improve your application's performance. The response bodies and HTTP statuses for each subrequest in the batch are returned within a single response body. Each subrequest counts against rate limits.

[Bot Version Activation Resource](#)

Get and change the activation information of a bot version.

[Briefcase Priming Records Resource](#)

Get a list of records related to an offline briefcase.

[Call Coaching Resources](#)

Einstein Conversation Insights is available to provide insights about customer calls and offer call coaching for sales and service users. Get the current status of Einstein Conversation Insights. Post metadata about a new voice call and recording. Upload an audio recording of a voice call.

[Clean Resources](#)

Get information about active data integration rules, including data services, update metrics, and the statuses of rules for a record.

### [CMS Managed Content Resources](#)

Get published managed content versions for an Experience Cloud site or a channel. Search managed content in an Experience Cloud site or channel. Get managed content delivery channels for the context user. Get published managed content versions for a channel. Search managed content in a channel. Get the binary stream of published managed content. Get or update the searchable status for managed content types in a channel. Get a piece of managed content. Get a managed content folder.

### [Commerce B2B and D2C Resources](#)

Get, create, update, and delete your commerce data. Work with address management, carts, checkouts, orders, products, promotions, taxes, wishlists, and search settings.

### [Commerce Einstein Webstore Resources](#)

Get the status of a Commerce Einstein deployment. Get the Commerce Einstein configuration. Export and purge Commerce Einstein activity. Get Commerce Einstein product recommendations.

### [Connect Resources](#)

Information about the context user's org and settings, and information about the Experience Cloud sites the context user is a member of.

### [Content Taxonomy Resources](#)

Create, get, update, delete, and search content taxonomy terms.

### [Content Workspace Permissions Resource](#)

Get a user's permissions for a content workspace.

### [Conversation Application Definition Resource](#)

Get information about an integration's conversation application definition and the associated bot.

### [Conversations Resources](#)

Get and update conversation entries. Upload bulk conversations and get the statuses of the uploads.

### [Custom Domain Resources](#)

Get information about the custom domains in your org. A custom domain is a domain that you own, such as `https://www.example.com`, that serves content from your Experience Cloud sites or Salesforce Sites.

### [Customer Asset Lifecycle Management Resources](#)

Generate, cancel, and change lifecycle-managed assets for sales and account reps to view in Lightning Experience.

### [Data Cloud Resources](#)

Get metadata and query data. Get, create, update, run, and delete calculated insights. Look up objects by source ID. Get, create, update, and delete segments. Get, create, run, update, and delete identity resolution rulesets.

### [Data Integration Resources](#)

Get external object names, and use those names to get contract credit information.

### [Duplicate Resources](#)

Get a directory of duplicate resources, job definitions, and jobs. Update a job status, run a job, and delete job results.

### [Einstein Prediction Service Resources](#)

Einstein Prediction Service resources enable you to programmatically get predictions from deployed models, work with prediction definitions and models, and manage model refresh and bulk prediction scoring jobs.

### [Prompt Templates Resources](#)

Get prompt template data and generate LLM responses using prompt templates.

### [Einstein Recommendation Resources](#)

Get runtime metrics for Einstein Article and Einstein Reply Recommendations.

### [Email Merge Field Services Resource](#)

See a list of merge fields for a specific object. A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

### [Employee Profiles Resources](#)

Get, upload and crop, and delete an employee photo or banner photo.

### [Enhanced CMS Workspaces Resources](#)

Get managed content channels. Create a managed content channel. Get, update, or delete a managed content channel. Get managed content delivery channels. Get collection items for a channel or Experience Cloud site. Get a collection of published contents for a channel or Experience Cloud site. Get a piece of published content for a channel or Experience Cloud site. Search for content in a channel or Experience Cloud site. Get the binary stream of a media node of published content in a channel. Get or update the searchable status for managed content types in a channel. Get search indexes or trigger search indexing for a channel. Create managed content. Get a version of a piece of content. Clone a piece of managed content. Get, add, or remove taxonomy term associations from managed content. Get digital asset management (DAM) providers. Create or delete a DAM provider instance. Publish and unpublish content. Create, update, get, or delete a managed content variant. Get a managed content folder. Get targets that a managed content space folder can be shared with. Get or update the targets that a managed content space folder is shared with. Search for managed content items, including variants and folders, in spaces and folders. Get managed content spaces. Create, get, or update a managed content space. Get channels for a managed content space. Add or remove channels from a managed content space.

### [Environment Hub Resources](#)

Use Environment Hub resources to create new orgs and connect existing orgs to the hub.

### [Experience Cloud CMS Content Search Resource](#)

Search an Experience Cloud site.

### [Experience Cloud Microsites Resources](#)

Get, save, and submit marketing integration forms for an Experience Cloud site.

### [Experience Cloud Sites Knowledge Resources](#)

Get trending articles for an Experience Cloud site. Get trending and top-viewed articles for a topic in an Experience Cloud site. Increase article view counts.

### [Experience Cloud Sites Moderation Resources](#)

Get information about whether a user has flagged a file as inappropriate. Delete flags on files. Get audit statistics for a user in an Experience Cloud site.

### [Experience Cloud Sites Resources](#)

Get information about Experience Cloud sites, create a site, and publish a site. Get the Experience Builder templates available to the context user. Get externally managed accounts for sites.

### [Experience Model Resources](#)

Get experience model property types.

### [External Email Services Resource](#)

Get information about the external email services available to the context user.

### [Field Service Recordset Filter Criteria Resource](#)

Filter records on recordset filter criteria.

### [Field Service Shifts from Pattern Resource](#)

Preview and create up to 2,000 shifts from a pattern.

### [Files Connect Repository Resources](#)

A Files Connect repository is an external content repository that's connected to Salesforce. Use these resources to get a list of repositories, to get information about a repository or a repository file, and to get the content of a repository file. Also use these resources to get information about the files and folders in a repository folder. Use these resources to get a repository's directory entries, permissions, and permission types. Also use these resources to update a repository's permissions.

### [Files Resources](#)

Get the file upload config. Get information about files, including content, rendered version, and sharing. Get information about asset files, including content and rendition.

### [Folders Resources](#)

Get information about a folder or the contents of a folder. Modify, delete, and add items to folders.

### [Forecasts Resources](#)

Get information about forecast users, managers, and the forecast hierarchy.

### [Knowledge Article View Stat Resource](#)

Increase the view count of a knowledge article by one.

### [List Share Resources](#)

Share list views with different groups in your org and use sharing to limit who is able to see a list view.

### [Managed Topics Resources](#)

Managed topics for an Experience Cloud site. Get a list of managed topics. Create a managed topic hierarchy. Create, delete, or reorder managed topics.

### [Messaging Channels Resource](#)

Manage Messaging channels. You can get Messaging channels using the GET method. If a channel doesn't already have an ID, you can add and register it by taking the data from the GET method and passing it to the POST method.

### [Microbatching Resources](#)

Ingest microbatching records. Get and delete microbatching errors and resubmit microbatching error records.

### [Motifs Resources](#)

Returns URLs for sets of small, medium, and large motif icons. Records have different sets of motif icons depending on the record type. The motif can also include the record type's base color.

### [Named Credentials Resources](#)

Get, create, refresh, replace, update, and delete a credential. Get the URL for the OAuth token flow for an external credential. Get, create, update, and delete external credentials. Get, create, update, and delete named credentials. Get, create, update, and delete external auth identity providers.

### [Navigation Menu Items Resource](#)

Get navigation menu items for an Experience Cloud site.

### [Network Data Category Resources](#)

Get or update the network data category tree. Get articles for a network data category. Get catalog items for a network data category. Get category groups.

### [Next Best Action Resources](#)

Get a recommendation, execute a recommendation strategy, and manage reactions to recommendations.

### [Notification Settings Resources](#)

Get, set, and reset notification settings and notification app settings.

### [Notifications Resources](#)

Get or update notifications. Get the status of notifications.

### [OAuth Credentials Resources](#)

Find information about OAuth credentials.

### [OAuth Usage Resources](#)

Find information about OAuth Usage.

### [Orchestration Resources](#)

Get orchestration instances or details about an orchestration instance.

### [Pardot Business Unit Context Resource](#)

Get the Pardot business units the context user has access to.

### [Personalization Resources](#)

Get a list of assigned audiences that match the user context. Get audience information for a batch of audience IDs. Create, get, update, and delete an audience. Get a list of targets that match the user context, based on the assigned audiences that include the user. Create and update targets. Get target information for a batch of target IDs. Get and delete a target.

### [Private Connect Resources](#)

Get the inbound and outbound network topologies for a private connection type. Provision, sync, or tear down an inbound or outbound connection.

### [Push Notifications Resource](#)

Send a mobile push notification to connected apps on users' devices. This resource is only accessible when the session is established with a connected app that is developed in the same organization or installed in the same package as the recipient's connected app.

### [Quick Text Resource](#)

Get the body of a quick text.

### [Quip Related Records Resource](#)

Get records related to a Quip document.

### [Salesforce Omnichannel Inventory Resources](#)

Manage inventory across locations. Available in Salesforce Omnichannel Inventory.

### [Salesforce Order Management Resources](#)

Manage orders and the order fulfillment process. Available in Salesforce Order Management orgs.

### [Salesforce Payments Resources](#)

Information about Salesforce Payments, including content, rendered version, and sharing.

### [Salesforce Scheduler Resources](#)

Get service territories and create service appointments using Salesforce Scheduler resources.

### [Search Resources](#)

Search objects using keywords or questions.

### [Share Captured Activity Resource](#)

Share an email or event that was captured by Automated Activity Capture, which is a feature of Sales Cloud Einstein and Inbox. You can share with no one, everyone, or selected groups.

### [Surveys Resources](#)

Understand customer feedback as it evolves over time by engaging customers and users with relevant, personalized surveys. Incorporate survey data into your feedback management process and gain actionable insights at every stage of the customer lifecycle.

### [Topics Resources](#)

Get, update, merge, and delete topics. Assign and unassign topics from articles. Get, create, and reassign topic and article assignment rules. Get suggested topics for a string of text, feed item, or record. Get trending topics. Get the files posted recently to a topic. Get topics related to another topic. Get top viewed articles for a topic.

[Topics on Records Resource](#)

Get information about topics assigned to a record or feed item and add, remove, and replace topics on a record or feed item. Optionally, suggest a list of topics to assign to a record or feed item to improve future topic suggestions. Only users with the Assign Topics permission can remove topics from records or feed items and add existing topics to records or feed items. Only users with the Create Topics permission can add new topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

[Type System Resources](#)

Use Type System resources to retrieve information about the types available in your org.

[User Files Resources](#)

Get information about a user's files. Upload a file.

[Voice Resources](#)

Update the email address of the AWS root user that's associated with the Voice account. These resources apply to the *Service Cloud Voice with Amazon Connect* partner telephony model.

## Action Links Resources

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can drive productivity and accelerate innovation.

There are two views of an action link and an action link group: the definition, and the context user's view. The definition includes potentially sensitive information, such as authentication information. The context user's view is filtered by visibility options and the values reflect the state of the context user.

Available resources:

| Resource                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/connect/action-link-group-definitions</a>                          | Create an action link group definition. To associate an action link with a feed element, first create an action link group definition. Then post a feed element with an associated actions capability.                                                                                                                                                                                                            |
| <a href="#">/connect/action-link-group-definitions/<b>actionLinkGroupId</b></a> | Get information about or delete an action link group definition. Deleting an action link group definition removes all references to it from feed elements. To get or delete the action link group definition, the client must be the same connected app that created the definition and the user must either be the user who created the definition or have View all Data permission.                             |
| <a href="#">/connect/action-link-groups/<b>actionLinkGroupId</b></a>            | Get information about an action link group including state for the context user.                                                                                                                                                                                                                                                                                                                                  |
| <a href="#">/connect/action-links/<b>actionLinkId</b></a>                       | Get information about or update the <code>status</code> of an action link. The <code>status</code> of the action link in combination with the <code>labelKey</code> property of the Action Link Definition Input determines the text that displays in the UI. To trigger the API request for <code>Api</code> and <code>ApiAsync</code> action links, set the <code>status</code> to <code>PendingStatus</code> . |

| Resource                                                                                | Description                                                                                                                                      |
|-----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>/connect/action-links/<i>actionLinkId</i></code><br><code>/diagnostic-info</code> | Get diagnostic information returned when an action link executes. Diagnostic information is given only for users who can access the action link. |

SEE ALSO:

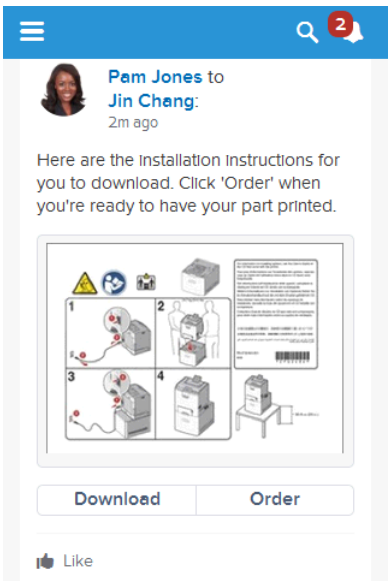

- Action Links
- Define Action Links and Post with a Feed Element

## Action Link Group Definitions

Create an action link group definition. To associate an action link with a feed element, first create an action link group definition. Then post a feed element with an associated actions capability.

All action links must belong to a group. Action links in a group are mutually exclusive and share some properties. Define standalone actions in their own action group.

This image shows a feed element with one action link group containing two action links, **Download** and

Order. Like

### Resource

```
/connect/action-link-group-definitions
```

```
/connect/communities/communityId/action-link-group-definitions
```

### Available since release

33.0

### HTTP methods

POST

The Action Link Group Definitions resource doesn't support query parameters for POST. You must use an Action Link Group Definition Input request body.

**Request body for POST**[Action Link Group Definition Input](#)**Response body for POST**[Action Link Group Definition](#)**Example for POST**

To associate an action link group with a feed item, first create an action link group definition:

 **Note:** An `actionUrl` to a Salesforce resource can be relative. All others must be absolute and start with `https://`.

POST /connect/action-link-group-definitions

```
{
  "actionLinks": [
    {
      "actionType" : "Api",

}

```

Next, associate the action link group with the feed item and post the feed item. Grab the action link group ID from the `/connect/action-link-group-definitions` response and pass it in a POST request to `/chatter/feed-elements`.

POST `/chatter/feed-elements`

```

{
  "body": {
    "messageSegments": [
      {
        "type": "Text",
        "text": "Please confirm or deny this item. You can also click Review to provide
more feedback."
      }
    ]
  },
  "subjectId": "me",
  "feedElementType": "FeedItem",
  "capabilities": {
    "associatedActions": {
      "actionLinkGroupIds": ["0AgRR0000004CTr0AM"]
    }
  }
}

```

Different types of action links have different workflows to set their `status` property, whose value displays in the UI. See `/connect/action-links/actionLinkId` for more information.

**Note:** This example doesn't include other capabilities, but feed items with action links do support other capabilities, such as content, polls, and links.

## Action Link Group Definition

Get information about or delete an action link group definition. Deleting an action link group definition removes all references to it from feed elements. To get or delete the action link group definition, the client must be the same connected app that created the definition and the user must either be the user who created the definition or have View all Data permission.

## Action Link Group

Get information about an action link group including state for the context user.

All action links must belong to a group. Action links in a group are mutually exclusive and share some properties. Note that action link groups are accessible by clients, unlike [action link group definitions](#).

## Action Link

Get information about or update the `status` of an action link. The `status` of the action link in combination with the `labelKey` property of the Action Link Definition Input determines the text that displays in the UI. To trigger the API request for `Api` and `ApiAsync` action links, set the `status` to `PendingStatus`.

This image shows two action links. In this image, the `status` of both action links is `NewStatus`.

If Pam Smith clicks **Confirm**, the action link `status` is set to `SuccessfulStatus` and results in the feed item shown in this image.

Different types of action links have different `status` workflows.

### Api

To invoke an `Api` action link from an app, make a PATCH request to mark the link `PendingStatus`. Salesforce handles the call out to the `actionUrl` that was provided in the Action Link Definition Input. For an `Api` action link, Salesforce sets the `status` to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server.

**ApiAsync**

To invoke this action from an app, make a PATCH request to mark the link `PendingStatus`. Salesforce handles the call out to the `actionUrl` that was provided in the Action Link Definition Input. For an `ApiAsync` action link, the callout starts an asynchronous operation on your server. Salesforce sets `status` to `PendingStatus` unless the call returned an error status code, in which case it sets `status` to `FailedStatus`. When your server has finished the asynchronous processing it should call back and PATCH the action link to `SuccessfulStatus` or `FailedStatus`.

**Download and Ui**

Direct the user to download or visit the UI from the link in the `actionUrl` of the Platform Action response body. Your application must decide when to make a PATCH request to set `status` to `SuccessfulStatus` or `FailedStatus`.

**Note:** You can't PATCH the `status` of an action link:

- Back to `NewStatus` from a different `status`.
- From a terminal `status` (`FailedStatus` or `SuccessfulStatus`) to `NewStatus` or `PendingStatus`.
- When the action link belongs to an action link group whose `executionsAllowed` property is `Unlimited`.
- For an `Api` or `ApiAsync` action link whose `executionsAllowed` property is `Once`, when a user PATCHes the `status` to `PendingStatus` for the first time, the callout is made to the action link. If the same user PATCHes it to `PendingStatus` again, Salesforce returns the current action link information. However, if another user PATCHes the `status` to `PendingStatus`, Salesforce throws an error. In both cases, the callout to the action link is not resent.

### Response body for POST

[Program Application Output](#)

## Batch Resource

Create a request body with a batch of up to 25 subrequests and send them to the server in a single request to improve your application's performance. The response bodies and HTTP statuses for each subrequest in the batch are returned within a single response body. Each subrequest counts against rate limits.

Use this resource to minimize the number of round-trips between the client and the server. For example, in a mobile app, when a user taps the button to like a feed item, the response body includes information about the like, but it doesn't include the total number of likes on the feed item. To like the feed item, POST a request to

/chatter/feed-elements/**feedElementId**/capabilities/chatter-likes/items. To get the like total, GET

the feed item information from

/chatter/feed-elements/**feedElementId**/capabilities/chatter-likes/items.

Add both requests to a [Generic Batch Collection Input](#) request body and send them both in a single POST request to /connect/batch:

```
{
  "batchRequests" : [
    {
      "method" : "Post",
      "url" : "/v65.0/chatter/feed-elements/feedElementId/capabilities/chatter-likes/items"
    },
    {
      "method" : "Get",
      "url" : "/v65.0/chatter/feed-elements/feedElementId/capabilities/chatter-likes/items"
    }
  ],
  "haltOnError" : "false"
}
```

The requests in a batch are called *subrequests*. All subrequests are executed in the context of the same user. Subrequests are independent and information can't be passed between them. Subrequests execute serially in their order in the request body. When a subrequest executes successfully, it commits its data. Commits are reflected in the output of later subrequests (as in the previous example which liked a feed item then got the total number of likes). If a subrequest fails, commits made by previous subrequests are not rolled back.

| <code>haltOnError</code>   | Boolean                               | <p>Controls whether Salesforce stops processing subrequests if a subrequest fails. The default value is <code>false</code>.</p> <p>If the value is <code>false</code> and a subrequest in the batch does not complete, Salesforce attempts to execute subsequent subrequests in the batch.</p> <p>If the value is <code>true</code> and a subrequest in the batch doesn't complete due to an HTTP response in the 400 or 500 range, Salesforce halts execution. It doesn't attempt to execute subsequent subrequests in the batch. It returns an HTTP 412 status code and a <code>BATCH_PROCESSING_HALTED</code> error message for each subsequent subrequest indicating that a previous request was unsuccessful. The top-level request to <code>/connect/batch</code> returns HTTP 200, and the <code>hasErrors</code> property in the response is set to <code>true</code>.</p> <p> <b>Note:</b> Before subrequests are executed, Salesforce verifies that the entire request, including subrequests, is formed properly. If it isn't, Salesforce returns an HTTP 400 Bad Request and doesn't execute subrequests, regardless of the value of <code>haltOnError</code>. Examples of a bad request are a subrequest using the wrong method or having an error in its URL.</p> | 28.0              |

**Request parameters**

None.

**Response**[Batch Results](#)

**Example**

This example is a POST request made to `https://instance_name/services/data/v65.0/connect/batch` that includes the following request body containing two subrequests:

```
{
  "batchRequests" : [
    {
      "method" : "Get",
      "url" : "/v65.0/chatter/feeds/user-profile/me"
    },
    {
      "method" : "Get",
      "url" : "/v65.0/chatter/feeds/news/me"
    }
  ]
}
```

The Batch Results response body includes a Batch Result Item response body for each subrequest:

```
{
  "hasErrors": false,
  "results": [
    {
      "result": {
        "feedElementPostUrl": "/services/data/v65.0/chatter/feed-elements",
        "feedElementsUrl": "/services/data/v65.0/chatter/feeds
/user-profile/005D0000001LL80IAW/feed-elements",
        "isModifiedUrl": null
      },
      "statusCode": 200
    },
    {
      "result": {
        "feedElementPostUrl": "/services/data/v65.0/chatter/feed-elements",
        "feedElementsUrl": "/services/data/v65.0/chatter/feeds
/news/005D0000001LL80IAW/feed-elements",
        "isModifiedUrl": null
      },
      "statusCode": 200
    }
  ]
}
```

**Example: `haltOnError` is `true`**

This example is the same as the previous example but it includes an error in the first subrequest and `haltOnError` is set to `true`. Note that the first subrequest contains a typo.

```
{
  "batchRequests" : [
    {
      "method" : "Get",
      "url" : "/v65.0/chatter/feeds/user-profile/men"
    },
    {
      "method" : "Get",
```

```

        "url" : "/v65.0/chatter/feeds/news/me"
    }
],
"haltOnError" : "true"
}

```

The Batch Results response body includes a Batch Result Item response body for each subrequest. The top-level request to `/connect/batch` returns an HTTP 200, but the first subrequest returns an HTTP 404 because the resource can't be found. Because `haltOnError` is `true`, the next subrequest returns an HTTP 412. Also note that `hasErrors` is `true`.

```

{
  "hasErrors": true,
  "results": [
    {
      "result": [{
        "errorCode": "NOT_FOUND",
        "message": "The requested resource does not exist"
      }],
      "statusCode": 404
    },
    {
      "result": [{
        "errorCode": "BATCH_PROCESSING_HALTED",
        "message": "Batch processing halted per request"
      }],
      "statusCode": 412
    }
  ]
}

```

## Post multiple comments with binary files

This example is a generic batch request to `/connect/batch` that contains two subrequests. Each subrequest comments on a feed item and uploads a binary file to the comment.

Include the request body of each subrequest in the `richInput` properties.

Also include information about the binary parts in the `binaryPartName` and `binaryPartNameAlias` properties.

Here is the cURL example.

```

curl -H "X-PrettyPrint: 1" -F 'json={ "haltOnError":true, "batchRequests":[ {
"url":"/v33.0/chatter/feed-elements/0D5D000000YG0N/capabilities/comments/items",
"method":"Post", "binaryPartName":"binaryPart1",
"binaryPartNameAlias":"feedElementFileUpload", "richInput":{"body":{"messageSegments":[
{ "type":"Text", "text":"Check out this file, it may help." } ] },
"capabilities":{"content":{"title":"Presentation1.txt" } } } }, {
"url":"/v33.0/chatter/feed-elements/0D5D000000YG0M/capabilities/comments/items",
"method":"Post", "binaryPartName":"binaryPart2",
"binaryPartNameAlias":"feedElementFileUpload", "richInput":{"body":{"messageSegments":[
{ "type":"Text", "text":"Check out this file, it may help." } ] },
"capabilities":{"content":{"title":"Presentation2.txt" } } } } ]};type=application/json'
-F "binaryPart1=@/Users/jbleyle/Desktop/Presentation1.txt;type=application/octet-stream"
-F "binaryPart2=@/Users/jbleyle/Desktop/Presentation2.txt;type=application/octet-stream"

```

```
-X POST https://instance_name/services/data/v65.0/connect/batch
-H 'Authorization: OAuth 00DD00000007HoR!...' --insecure
```

Here is the multipart/form-data request body.

```
https://instance_name/services/data/v65.0/connect/batch

Authorization: OAuth 00DD0000000Jhd2!...
Accept: application/json
Host: instance_name
Content-Type: multipart/form-data; boundary=123123

--123123
Content-Disposition: form-data; name="json"

## Briefcase Priming Records Resource

Get a list of records related to an offline briefcase.

A connected app only gets records from briefcases that are assigned to it.

To ensure a reasonable response time, the priming API limits the single request processing time and the number of records returned in a single response.

Briefcase rules are processed sequentially. When either the processing time or limit is reached, the processing stops, and a response is returned to the client that includes the records for the rules processed. If the non-null `relayToken` in the response indicates that not all the rules were processed, then the client must continue making requests until the `relayToken` returns a null value.

**Resource**

## Voice Call Audio Upload

Upload an audio recording of a voice call.

To upload an audio binary file that resides locally, send it in a multipart/form-data request with the `audioFileData` header parameter in the binary upload body part of the request. To upload an audio file that resides on a third-party vendor's system, use the `recordingURL` and `name` request parameters for the URL and named credential, respectively.

For information about how to create the multipart/form-data message, see [Inputs and Binary File Upload Examples](#).

## Managed Content Delivery, Experience Cloud Site

Get published managed content versions for an Experience Cloud site.

### Resource

```
/connect/communities/communityId/managed-content/delivery
```

### Available version

47.0

### HTTP methods

GET

### Request parameters for GET

| Parameter Name     | Type     | Description                                                                                                                                                                                                                                                                                   | Required or Optional | Available Version |
|--------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| contentKeys        | String[] | List of up to 50 content keys for the managed content. A content key is a universally unique identifier (UUID) such as MCA4CCV5QS2BAB5H7YRCRPTCWGZQ.<br><br>Specify either <code>contentKeys</code> or <code>managedContentIds</code> .                                                       | Optional             | 51.0              |
| language           | String   | Language locale for the managed content, for example, <code>en_US</code> . If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language. | Optional             | 47.0              |
| managedContentIds  | String[] | Comma-separated list of managed content IDs. HTTP/2 clients support up to 200 IDs. HTTP/1.1 clients don't.<br><br>Specify either <code>contentKeys</code> or <code>managedContentIds</code> .                                                                                                 | Optional             | 47.0              |
| managedContentType | String   | Developer name of the content type, such as <code>cms_document</code> or <code>cms_image</code> .                                                                                                                                                                                             | Optional             | 47.0              |
| page               | Integer  | Number of the page you want returned. Starts at 0. If you don't specify a value or if you specify 0, the first page is returned.                                                                                                                                                              | Optional             | 47.0              |
| pageSize           | Integer  | Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you don't specify a value, the default size is 25.                                                                                          | Optional             | 47.0              |

| Parameter Name  | Type     | Description                                                                                                                                                       | Required or Optional | Available Version |
|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| showAbsoluteUrl | Boolean  | Specifies whether to show absolute URLs in the response body ( <b>true</b> ) or not ( <b>false</b> ). If you don't specify a value, the default is <b>false</b> . | Optional             | 50.0              |
| topics          | String[] | Comma-separated list of up to 15 content topic names.                                                                                                             | Optional             | 47.0              |

| <code>endDate</code>            | String   | Publish end date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.                                                                                                                                                                                                                   | Optional             | 48.0              |
| <code>includeMetadata</code>    | Boolean  | Specifies whether to include metadata in the response ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .                                                                                                                                          | Optional             | 48.0              |
| <code>language</code>           | String   | Language locale for the managed content, for example, <code>en_US</code> . If the requested translation isn't available, the language defaults to the context user's language. If the context user's language isn't available, the language defaults to the content type's original language. | Optional             | 48.0              |
| <code>managedContentIds</code>  | String[] | Comma-separated list of managed content IDs. HTTP/2 clients support up to 200 IDs. HTTP/1.1 clients don't.<br><br>Specify either <code>contentKeys</code> or <code>managedContentIds</code> .                                                                                                 | Optional             | 48.0              |
| <code>managedContentType</code> | String   | Developer name of the content type, such as <code>cms_document</code> or <code>cms_image</code> .                                                                                                                                                                                             | Optional             | 48.0              |
| <code>page</code>               | Integer  | Number of the page you want returned. Starts at 0. If you don't specify a value or if you specify 0, the first page is returned.                                                                                                                                                              | Optional             | 48.0              |
| <code>pageSize</code>           | Integer  | Specifies the number of items per page. Valid values are from 1 through 250. For performance reasons, we recommend 25 or fewer items per page. If you don't specify a value, the default size is 25.                                                                                          | Optional             | 48.0              |
| <code>showAbsoluteUrl</code>    | Boolean  | Specifies whether to show absolute URLs in the response body ( <code>true</code> ) or not ( <code>false</code> ). If you don't specify a value, the default is <code>false</code> .                                                                                                           | Optional             | 50.0              |
| <code>startDate</code>          | String   | Publish start date in ISO 8601 format, for example, 2011-02-25T18:24:31.000Z.                                                                                                                                                                                                                 | Optional             | 48.0              |

## CMS Delivery Content, Channel

Get the binary stream of a media node of published content in a channel.

### Resource

```
/connect/cms/delivery/channels/channelId/media/mediaGUID/content
```

The *mediaGUID* parameter uniquely identifies the media node.

### Available version

49.0

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Required or Optional | Available Version |
|----------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| language       | String | Language locale for the managed content, for example, <code>en_US</code> . To get content for a channel in the specified language, that language must be added to the channel. If you don't specify a language or if the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space. | Optional             | 54.0              |

**Response body for GET**

Binary stream of the content

## CMS Searchable Content Types, Channel

Get or update the searchable status for managed content types in a channel.

## Commerce B2B and D2C Resources

Get, create, update, and delete your commerce data. Work with address management, carts, checkouts, orders, products, promotions, taxes, wishlists, and search settings.

Available resources are:

### Address Management

For a detailed overview of Commerce Address Management resources and a sample use case, refer to the [Salesforce Commerce Address Management APIs](#).

| Resource                                                                                                   | Description                                                                                                     |
|------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <a href="#">/commerce/webstores/<b>webstoreId</b>/accounts/<b>accountId</b>/addresses</a>                  | Create a Commerce account address for a webstore, or retrieve a collection of addresses for a webstore account. |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/accounts/<b>accountId</b>/addresses/<b>addressId</b></a> | Update or delete an address for a Commerce account associated with a webstore.                                  |

### Cart

For a detailed overview of Commerce Cart resources and a sample use case, refer to the [Salesforce Commerce Cart APIs](#).

| Resource                                                                                                      | Description                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts</a>                                                   | Create a cart.                                                                                                                                                                                                                                                                  |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/compact-summary</a>                                   | Get a compact cart summary for an existing cart. The compact cart summary includes a subset of fields from the cart summary, including the total and unique product counts.                                                                                                     |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>activeCartId</b>/actions/calculate</a>             | Perform a complete cart calculation based on the cart status. Possible calculations include computing prices, evaluating promotions, checking the inventory, computing shipping costs, evaluating shipping promotions, applying post shipping adjustments, and computing taxes. |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>activeCartId</b>/actions/evaluate-shipping</a>     | Evaluate the shipping costs for a cart.                                                                                                                                                                                                                                         |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>activeCartId</b>/actions/evaluate-taxes</a>        | Evaluate taxes for a cart.                                                                                                                                                                                                                                                      |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b></a>                              | Get a cart. Delete a cart. Create an active cart, if one doesn't exist.                                                                                                                                                                                                         |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/actions/add-cart-to-wishlist</a> | Copy the products from a cart to a wishlist.                                                                                                                                                                                                                                    |

| Resource                                                                                                                | Description                                                                                                                                                                          |
|-------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/actions/clone</a>                          | Clones an existing cart to create a secondary, read-only cart to support Pay Now functionality. Sets the guest cart status to PendingDelete in a B2B store or Closed in a D2C store. |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/actions/make-primary</a>                   | Make a secondary cart a primary cart.                                                                                                                                                |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/actions/preserve</a>                       | Preserve cart contents when a guest logs in as an authenticated customer.                                                                                                            |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/cart-coupons</a>                           | Get coupons associated with a cart, and apply a coupon code to a cart.                                                                                                               |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/cart-coupons/<b>cartCouponId</b></a>       | Delete a coupon from a cart.                                                                                                                                                         |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/messages/actions/set-visibility</a>        | Set the visibility for cart messages.                                                                                                                                                |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/products</a>                               | Get the items in a cart, sorted by product ID.                                                                                                                                       |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/products/<b>productId</b></a>              | Get cart items of a specific product.                                                                                                                                                |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/promotions</a>                             | Get promotions associated with a cart.                                                                                                                                               |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/cart-items</a>                             | Get the items in a cart. Add an item to a cart.                                                                                                                                      |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/cart-items/batch</a>                       | Add a batch of up to 100 items to a cart.                                                                                                                                            |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/cart-items/<b>cartItemId</b></a>           | Update or delete an item in a cart.                                                                                                                                                  |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/cart-items/promotions</a>                  | Get promotions associated with items in a cart.                                                                                                                                      |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/delivery-groups/actions/arrange-items</a>  | Arrange cart items into delivery groups.                                                                                                                                             |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/delivery-groups</a>                        | Get or create a collection of delivery groups in a cart.                                                                                                                             |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/carts/<b>cartStateOrId</b>/delivery-groups/<b>deliveryGroupId</b></a> | Get, delete, or update a delivery group in the cart.                                                                                                                                 |

## Checkout

For a detailed overview of Commerce Cart resources and a sample use case, refer to the [Salesforce Commerce Checkout APIs](#).

**Note:** You can opt in to use synchronous checkout. However, if your implementation includes any customizations, such as custom calculators, thoroughly test the transition to synchronous checkout in a sandbox environment before deploying to production. To opt in for synchronous checkout, contact Salesforce Customer Support.

| Resource                                                                                                              | Description                                                            |
|-----------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| <a href="#">/commerce/webstores/<b>webstoreId</b>/checkouts/<b>activeOrCheckoutId</b></a>                             | Get, delete, or update a Commerce store checkout.                      |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/checkouts/<b>activeOrCheckoutId</b>/payments</a>                    | Payment for a Commerce store checkout.                                 |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/checkouts/<b>activeOrCheckoutId</b>/orders</a>                      | Place an order for a Commerce store checkout.                          |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/checkouts</a>                                                       | Start a Commerce store checkout.                                       |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/payments/token</a>                                                  | Tokenize a payment for a Commerce store checkout.                      |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/checkouts/<b>activeOrCheckoutId</b>/coupons</a>                     | Apply a coupon code to a checkout.                                     |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/checkouts/<b>activeOrCheckoutId</b>/coupons/<b>cartCouponId</b></a> | Delete a coupon from a checkout.                                       |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/buyers/registrations</a>                                            | Allows a guest user to register an account at a store during checkout. |

## Context

| Resource                                                                  | Description                                               |
|---------------------------------------------------------------------------|-----------------------------------------------------------|
| <a href="#">/commerce/webstores/<b>webstoreId</b>/application-context</a> | Get application context information for a Commerce store. |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/session-context</a>     | Get session context information for a Commerce store.     |

## Commerce Analytics

Commerce Analytics resources enable you to gain actionable insights into revenue, product performance, and customer behavior through comprehensive dashboards. See [Set Up the Commerce Analytics Dashboards](#).

| Resource                                                   | Description                                                                                     |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| <a href="#">/commerce/intelligence/kpis</a>                | Retrieve a list of key performance indicators (KPIs) along with the insights each KPI supports. |
| <a href="#">/commerce/intelligence/kpis/<b>kpiName</b></a> | Retrieve information about a specified key performance indicator.                               |

## Commerce Subscriptions

| Resource                                                                                                        | Description                                                                       |
|-----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| <a href="#">/commerce/webstores/<b>webstoreId</b>/subscriptions</a>                                             | Retrieve a collection of Commerce subscriptions.                                  |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/subscriptions/actions/initiate-cancellation</a>               | Cancel an active Commerce subscription.                                           |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/subscriptions/actions/initiate-amendment</a>                  | Amend an active Commerce subscription.                                            |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/subscriptions/actions/initiate-renewal</a>                    | Renew an active Commerce subscription.                                            |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/subscriptions/<b>subscriptionId</b>/saved-payment-methods</a> | Update the saved payment method associated with a specific Commerce subscription. |

## Externally Managed Accounts

| Resource                                                                        | Description                                      |
|---------------------------------------------------------------------------------|--------------------------------------------------|
| <a href="#">/commerce/webstores/<b>webstoreId</b>/external-managed-accounts</a> | Get a collection of externally managed accounts. |

## Extensions

| Resource                                                        | Description                                                                                     |
|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| <a href="#">/commerce/extension/extensions</a>                  | Get a collection of Commerce extensions available for your org.                                 |
| <a href="#">/commerce/extension/providers</a>                   | Get Commerce extension providers or register a Commerce extension provider.                     |
| <a href="#">/commerce/extension/providers/<b>providerId</b></a> | Get, delete, or modify a Commerce extension provider.                                           |
| <a href="#">/commerce/extension/mappings</a>                    | Get and set extension provider mappings, which associate an extension provider with a webstore. |
| <a href="#">/commerce/extension/mappings/<b>mappingId</b></a>   | Delete, get, or modify a Commerce extension mapping.                                            |

## Goals and Actions

| Resource                                                     | Description                                                                  |
|--------------------------------------------------------------|------------------------------------------------------------------------------|
| <a href="#">/connect/business-objectives</a>                 | Get business objective (goal) information                                    |
| <a href="#">/connect/business-objectives/recommendations</a> | Get, create, and update recommended actions for business objectives (goals). |

## Import

| Resource                                                               | Description                                                                                       |
|------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| <a href="#">/commerce/management/import/category/jobs</a>              | Create a job to asynchronously import category data using a .csv file.                            |
| <a href="#">/commerce/management/import/category/jobs/<b>jobId</b></a> | Cancel or get the status of a job to asynchronously import category data using a .csv file.       |
| <a href="#">/commerce/management/import/product/jobs</a>               | Create a job to asynchronously import product data using a .csv file.                             |
| <a href="#">/commerce/management/import/product/jobs/<b>jobId</b></a>  | Cancel or get the status of a job to asynchronously import global product data using a .csv file. |

## My Profile

For a detailed overview of Commerce My Profile resources and a sample use case, refer to the [Salesforce Commerce My Profile API](#).

| Resource                                                                        | Description                                                                          |
|---------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| <a href="#">/commerce/webstores/\${<b>webstoreId</b>}/myprofile</a>             | Retrieve the buyer's account details. Update buyer account details.                  |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/myprofile/actions/initOTP</a> | Initiate the one-time password (OTP) via the specified method, such as SMS or Email. |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/myprofile/actions/verify</a>  | Validate the one-time-password (OTP) provided by the buyer.                          |

## Order Summary

For a detailed overview of Commerce Order Summary resources and a sample use case, refer to the [Salesforce Commerce Order Summary APIs](#).

| Resource                                                                                                    | Description                                                                                                    |
|-------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <a href="#">/commerce/webstores/<b>webstoreId</b>/order-summaries</a>                                       | Get order summaries.                                                                                           |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/order-summaries/actions/add-order-to-cart</a>             | Add an order summary to an active or a current cart. This API is available to both registered and guest users. |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/order-summaries/<b>orderSummaryId</b></a>                 | Get an order summary.                                                                                          |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/order-summaries/<b>orderSummaryId</b>/delivery-groups</a> | Get order delivery groups.                                                                                     |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/order-summaries/<b>orderSummaryId</b>/items</a>           | Get order items.                                                                                               |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/order-summaries/<b>orderSummaryId</b>/shipments</a>       | Get order shipments.                                                                                           |

| Resource                                                                                                  | Description                                                                                                                                                   |
|-----------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/commerce/webstores/<b>webstoreId</b>/order-summaries/async-actions/adjustment-aggregates</a> | Submit a job to calculate adjustment aggregates for a list of order summary IDs.                                                                              |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/order-summaries/actions/lookup</a>                      | Look up details about an order summary, including its line items and relevant order amount fields.                                                            |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/order-summaries/actions/authorize</a>                   | Authorize guest users by verifying their personally identifiable information to access the requested order summary. This API is specifically for guest users. |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/shipments/<b>shipmentId</b>/items</a>                   | Get shipment items.                                                                                                                                           |

## Composite Products, Products, Product Categories, Product Searches

| Resource                                                                                                                | Description                                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/commerce/management/webstore/\${<b>webstoreId</b>}/composite-products</a>                                  | Add a product to your store and associate it with the specified category and media records.                              |
| <a href="#">/commerce/management/webstore/\${<b>webstoreId</b>}/composite-products/\${<b>productId</b>}</a>             | Update an existing product record with the specified category and media records.                                         |
| <a href="#">/commerce/management/webstore/\${<b>webstoreId</b>}/composite-variations</a>                                | Create variation products with media and pricing details for a given parent product.                                     |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/category-menu-items</a>                                               | Retrieve product category menu items for the given parent item and store.                                                |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/products</a>                                                          | Get fields and default images for a list of products.                                                                    |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/products/<b>productId</b></a>                                         | Get a product.                                                                                                           |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/products/<b>productId</b>/featured-products</a>                       | Retrieve a collection of feature products for a specific product.                                                        |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/products/<b>productId</b>/children</a>                                | Get a collection of child products related to a parent product.                                                          |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/product-categories/children</a>                                       | Get product categories for a specific parent product category or get all the top-level product categories for the store. |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/product-categories/<b>productCategoryId</b></a>                       | Get a product category.                                                                                                  |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/product-category-path/product-categories/<b>productCategoryId</b></a> | Get the product category path from the root category to the current category.                                            |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/search/products</a>                                                   | Search products by search term or category in a webstore.                                                                |

| Resource                                                                    | Description                           |
|-----------------------------------------------------------------------------|---------------------------------------|
| <a href="#">/commerce/webstores/<b>webstoreId</b>/search/product-search</a> | Search products.                      |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/search/sort-rules</a>     | Get sort rules for the live index.    |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/search/suggestions</a>    | Get suggestions for product searches. |

## Product Prices, Promotions

For a detailed overview of Commerce Pricing and Promotions resources and a sample use case, refer to the [Salesforce Commerce Pricing and Promotions APIs](#).

| Resource                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/commerce/webstores/<b>webstoreId</b>/pricing/products/<b>productId</b></a> | Get the list and buyer price for a product.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/pricing/products</a>                  | Get the prices for multiple products.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <a href="#">/commerce/promotions/composite-promotions</a>                               | Create a new promotion and all of the associated objects, including segments, qualifiers, targets, and translations. The API returns the ID of the created promotion. Retrieve the details of a specified promotion.                                                                                                                                                                                                                                                                                                                                                             |
| <a href="#">/commerce/promotions/actions/evaluate</a>                                   | Determine which promotions the customer is eligible for based on the store and buyer group, and compute the applicable price adjustments based on the coupons and the items in the cart. This API evaluates only the first 50 active manual promotions and first 50 active automatic promotions, based on priority. This API computes and returns applicable price adjustments, but it does not apply those adjustments to the webcart record. If you want to enable promotions based on shipping, contact Salesforce Customer Support.                                          |
| <a href="#">/commerce/promotions/actions/evaluate-products</a>                          | Determine which promotions apply to a product or set of products, and compute the applicable price adjustments. This API evaluates discrete products, including product variants and independent products but not parent products. Domain dependent and independent use cases are both supported. For example, a domain dependent call uses <code>webstoreId</code> and <code>effectiveAccountId</code> to evaluate products in a cart based on internal products or product categories. A domain independent call uses an external dataset based on SKUs or product categories. |
| <a href="#">/commerce/promotions/actions/decrease-use/coupon-codes</a>                  | Get coupon code redemption usage to revert a previously redeemed coupon code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Resource                                                               | Description                                           |
|------------------------------------------------------------------------|-------------------------------------------------------|
| <a href="#">/commerce/promotions/actions/increase-use/coupon-codes</a> | Get coupon code redemption addition (increase) usage. |

## Taxes

For a detailed overview of Commerce Taxes resources and a sample use case, refer to the [Salesforce Commerce Tax APIs](#).

| Resource                                                                              | Description                                                                                        |
|---------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <a href="#">/commerce/webstores/<b>webstoreId</b>/taxes/actions/calculate-taxes</a>   | Calculate taxes for a Commerce webstore.                                                           |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/taxes/products/<b>productId</b></a> | Get taxes for a product based on the store, state, country, and buyer account or guest profile ID. |

## Wishlists

For a detailed overview of Commerce Wishlists resources and a sample use case, refer to the [Salesforce Commerce Wishlists APIs](#).

| Resource                                                                                                               | Description                                      |
|------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|
| <a href="#">/commerce/webstores/<b>webstoreId</b>/wishlists</a>                                                        | Get wishlists and create a wishlist.             |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/wishlists/<b>wishlistId</b></a>                                      | Get, update the name of, and delete a wishlist.  |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/wishlists/<b>wishlistId</b>/actions/add-wishlist-to-cart</a>         | Add a wishlist to a cart.                        |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/wishlists/<b>wishlistId</b>/wishlist-items</a>                       | Get wishlist items or add items to the wishlist. |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/wishlists/<b>wishlistId</b>/wishlist-items/<b>wishlistItemId</b></a> | Delete a wishlist item.                          |

## Search Settings

For a detailed overview of Commerce Search Settings resources and a sample use case, refer to the [Salesforce Commerce Search Settings APIs](#).

| Resource                                                                                                    | Description                          |
|-------------------------------------------------------------------------------------------------------------|--------------------------------------|
| <a href="#">/commerce/management/webstores/<b>webstoreId</b>/search/attribute-settings/facetable-fields</a> | Get and update facetable attributes. |

| Resource                                                                                                     | Description                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/commerce/management/webstores/<b>webstoreId</b>/search/attribute-settings/searchable-fields</a> | Get and update searchable attributes.                                                                                                                                                                                                                                         |
| <a href="#">/commerce/management/webstores/<b>webstoreId</b>/search/boost-bury-rules</a>                     | Get all boost and bury rules for a webstore. Create a boost and bury rule. You can create up to 25 boost and bury rules for a webstore, and each boost and bury rule supports a limit of 100 products. You can use up to 500 unique products across all boost and bury rules. |
| <a href="#">/commerce/management/webstores/<b>webstoreId</b>/search/boost-bury-rules/<b>ruleId</b></a>       | Get a boost and bury rule. Delete a boost and bury rule.                                                                                                                                                                                                                      |
| <a href="#">/commerce/management/webstores/<b>webstoreId</b>/search/indexes</a>                              | Get indexes and create an index of a product catalog.                                                                                                                                                                                                                         |
| <a href="#">/commerce/management/webstores/<b>webstoreId</b>/search/indexes/<b>indexId</b></a>               | Get a search index.                                                                                                                                                                                                                                                           |
| <a href="#">/commerce/management/webstores/<b>webstoreId</b>/search/index-logs</a>                           | Get search index logs for a webstore.                                                                                                                                                                                                                                         |
| <a href="#">/commerce/management/webstores/<b>webstoreId</b>/search/product-settings</a>                     | Get and update product search settings.                                                                                                                                                                                                                                       |
| <a href="#">/commerce/management/webstores/<b>webstoreId</b>/search/results-rules</a>                        | Create or retrieve search include rules for a webstore. You can create up to 25 rules for a webstore. Search include rules are not configurable in the UI.                                                                                                                    |
| <a href="#">/commerce/management/webstores/<b>webstoreId</b>/search/sort-rules</a>                           | Create or retrieve sort rules for a webstore.                                                                                                                                                                                                                                 |

**JSON example**

```
{
  "webstoreId": "0ZExx000000003FGAQ",
  "providerName": "UltimateInventory"
}
```

**Properties**

| Name         | Type   | Description                                                                                                                                                       | Required or Optional | Available Version |
|--------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| id           | String | Mapping ID.                                                                                                                                                       | Optional             | 59.0              |
| webstoreId   | String | ID of the webstore.                                                                                                                                               | Required             | 59.0              |
| providerName | String | Unique name of the extension provider.                                                                                                                            | Required             | 59.0              |
| epn          | String | Extension point name (unique identifier for an extension). For valid values, see the <a href="#">RegisteredExternalService</a> object's ExtensionPointName field. | Optional             | 59.0              |

**Request parameters for PUT**

| Parameter Name             | Type   | Description                                                                                                                                                                                                                   | Required or Optional | Available Version |
|----------------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| mappingInputRepresentation | Object | An <a href="#">Commerce Extension Provider Mapping Input</a> object, which describes information used to map an extension provider to a webstore. You can provide this information in the request body or as a URL parameter. | Optional             | 58.0              |
| providerName               | String | Unique name of the extension provider.                                                                                                                                                                                        | Optional             | 58.0              |
| webstoreId                 | String | ID of the webstore.                                                                                                                                                                                                           | Optional             | 58.0              |

## Commerce Extension Mappings

Get and set extension provider mappings, which associate an extension provider with a webstore.

**Resource**

```
/commerce/extension/mappings
```

**Available version**

58.0

**Requires Chatter**

No

**HTTP methods**

GET, POST

**Request parameters for GET**

| Parameter Name | Type   | Description                                                                                                                                                                                                                                                                                                                 | Required or Optional | Available Version |
|----------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| epn            | String | Extension point name. For valid values, see the <a href="#">RegisteredExternalService</a> object's ExtensionPointName field. If you omit the extension point name, the system gets all extension mappings for the webstore. If you specify an extension point name, the system gets mappings only for that extension point. | Optional             | 58.0              |
| webstoreId     | String | ID of the webstore.                                                                                                                                                                                                                                                                                                         |                      | 58.0              |

## Invoice Creation (POST)

Create an invoice for an account, order, or a list of billing schedules.

This API request creates billing period items for the matching billing schedules. The billing period items are created for the period between the next charge date of the billing schedule and the specified target date. Invoice lines are created by processing these billing period items. These invoice lines are then grouped into invoices based on the defined grouping criteria on the billing schedule.

### Special Access Rules

You need the Generate Invoices From Billing Schedule API, Billing Operations User, or Billing Customer Service permission set to use this API. Commerce B2B and D2C customers can call this API if Commerce Subscriptions is enabled.

### Resource

```
/commerce/invoicing/invoices/collection/actions/generate
```

### Resource example

```
https://yourInstance.salesforce.com/services/data/v65.0/commerce/invoicing/invoices/collection/actions/generate
```

### Available version

62.0

### HTTP methods

POST

### Request body for POST

**Note:** The `billingTransactionId` property takes precedence over the `accountId` property followed by the `billingScheduleIds` property when values for these properties are specified in the input request.

### JSON example

```
{
  "accountId": "001SG00000mYtRWYA0",
  "action": "Posted",
  "billingScheduleIds": [
    "44bSG000000CVeMYAW"
  ],
  "billingTransactionId": "801SG00000mYtaXYAS",
  "correlationId": null,
  "invoiceDate": "2024-01-12",
  "targetDate": "2024-01-12"
}
```

**Properties**

## Commerce Webstore Application Context

Get application context information for a Commerce store.

**Resource**

```
/commerce/webstores/webstoreId/application-context
```

**Example**

```
https://yourInstance.salesforce.com/services/data/v65.0/commerce/webstores/0ZESG000002PLXz4AO/application-context
```

**Available version**

54.0

**HTTP methods**

GET

**Response body for GET**[Application Context](#)

## Commerce Webstore Buyer Registration

Lets a guest shopper register an account with a merchant. This resource is for use with one-click checkout with Salesforce Payments and Salesforce Commerce. Before the shopper completes their order, they can choose to save their payment and shipping information for future use. This resource creates a Person account, user record, and a contact point address for saving shipping information.

To use this API, complete these store configurations:

- Enable Person Accounts

- Configure self-registration
- Enable guest user access to the webstore

## Resource

```
/commerce/webstores/webstoreId/buyers/registrations
```

## Available version

61.0

## HTTP methods

POST

## Request body for POST

## Commerce Webstore Carts Compact Summary

Get a compact cart summary for an existing cart. The compact cart summary includes a subset of fields from the cart summary, including the total and unique product counts.

**Resource**

```
/commerce/webstores/${webstoreId}/carts/compact-summary
```

**Available version**

64.0

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name     | Type   | Description                                                                                                                                 | Required or Optional | Available Version |
|--------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| currencyIsoCode    | String | Currency ISO code of the cart.                                                                                                              | Optional             | 64.0              |
| effectiveAccountId | String | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context. | Optional             | 64.0              |

**Response body for GET**[Cart Compact Summary](#)

## Commerce Webstore Cart

Get a cart. Delete a cart. Create an active cart, if one doesn't exist.

Buyers with read access to carts can create and delete carts.

**Resource**

```
/commerce/webstores/webstoreId/carts/cartStateOrId
```

Values for *cartStateOrId* are:

- **cartId**—ID of the cart.
- **active**—Active cart. This value should only be used for authenticated users.
- **current**—Cart that isn't closed or pending deletion. Available in version 50.0 and later.

**Available version**

49.0

**HTTP methods**

GET, PUT, DELETE

In API version 63.0 and later, if you use GET with `/commerce/webstores/webstoreId/carts/current` and there isn't a current cart, it returns an empty cart with a null `cartId` and a 200 status.

If you use GET with `/commerce/webstores/webstoreId/carts/active` and there isn't an active cart, you get an error.

Use PUT with `/commerce/webstores/webstoreId/carts/active` to create an active cart if one doesn't exist.

**Note:** PUT doesn't require parameters nor a request body.

**Request parameters for GET, PUT, and DELETE**

| Parameter Name  | Type   | Description                    | Required or Optional | Available Version |
|-----------------|--------|--------------------------------|----------------------|-------------------|
| currencyIsoCode | String | Currency ISO code of the cart. | Optional             | 57.0              |

| Parameter Name         | Type   | Description                                                                                                                                 | Required or Optional | Available Version |
|------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| effective<br>AccountId | String | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context. | Optional             | 47.0              |

### Response body for GET and PUT

#### [Cart Summary](#)

During asynchronous cart processing, if enabled, GET response headers include `Location` and `Retry-After`. While the cart is processing, GET requests return a 202 status and may include stale, null, or 0 pricing data. When cart processing is complete, requests return a 200 status with up-to-date pricing data.

### Response for DELETE

#### [204: Successful Delete](#)

## Commerce Webstore Cart, Add to Wishlist

Copy the products from a cart to a wishlist.

### Resource

```
/commerce/webstores/webstoreId/carts/cartStateOrId/actions/add-cart-to-wishlist
```

Values for *cartStateOrId* are:

- **cartId**—ID of the cart.
- **active**—Active cart. This value should only be used for authenticated users.
- **current**—Cart that isn't closed or pending deletion. Available in version 50.0 and later.

### Available version

50.0

### HTTP methods

POST

### Request body for POST

#### Root XML tag

```
<cartToWishlist>
```

#### JSON example

## Commerce Webstore Cart, Arrange Items

Arrange cart items into delivery groups.

**Resource**

```
/commerce/webstores/webStoreId/carts/cartStateOrId/delivery-groups/actions/arrange-items
```

Values for *cartStateOrId* are:

- **cartId**—ID of the cart.
- **active**—Active cart. This value should only be used for authenticated users.
- **current**—Cart that isn't closed or pending deletion. Available in version 50.0 and later.

**Available version**

60.0

**HTTP methods**

POST

In API version 63.0 and later, if your store has [simplified cart cleanup](#) enabled, a POST request can arrange cart items into delivery groups without canceling checkout.

**Request parameters for POST**

| Parameter Name                | Type    | Description                                                                                                                                                                  | Required or Optional | Available Version |
|-------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| deleteEmpty<br>DeliveryGroups | Boolean | Specifies whether to delete delivery groups with no cart items ( <code>true</code> ) or not ( <code>false</code> ). If unspecified, the default value is <code>true</code> . | Required             | 63.0              |

**Request body for POST****Root XML tag**

```
<cart>
```

**JSON example**

```
{  
  "arrangements": [  

```

```

    {
      "deliveryGroupId": "0a7xx000000004rAAA",
      "cartItemId": "0a9xx000000004rAAA",
      "quantity": "5"
    }
    {
      "deliveryGroupId": "0a7xx000000007dAAY",
      "cartItemId": "0a9xx000000005yAAY",
      "quantity": "0"
    }
  ]
}

```

#### Properties

| Name         | Type                                 | Description                                                     | Required or Optional | Available Version |
|--------------|--------------------------------------|-----------------------------------------------------------------|----------------------|-------------------|
| arrangements | <a href="#">Item Arrange Input[]</a> | Set of instructions to arrange cart items into delivery groups. | Optional             | 59.0              |

#### Response body for POST

[Delivery Group Collection](#)

Successful POST requests return a [202 status](#).

## Commerce Webstore Cart, Calculate

Perform a complete cart calculation based on the cart status. Possible calculations include computing prices, evaluating promotions, checking the inventory, computing shipping costs, evaluating shipping promotions, applying post shipping adjustments, and computing taxes.

#### Resource

```

## Commerce Webstore Cart, Clone

Clones an existing cart to create a secondary, read-only cart to support Pay Now functionality. Sets the guest cart status to `PendingDelete` in a B2B store or `Closed` in a D2C store.

#### Resource

```
/commerce/webstores/webstoreId/carts/cartStateOrId/actions/clone
```

Values for `cartStateOrId` are:

- **cartId**—ID of the cart.
- **active**—Active cart. This value should only be used for authenticated users.
- **current**—Cart that isn't closed or pending deletion. Available in version 50.0 and later.

#### Available version

60.0

## Commerce Webstore Cart, Preserve

Preserve cart contents when a guest logs in as an authenticated customer.

To use this API, pass the guest session cookies in the request as part of the authenticated user session. For more information, see [Set Up Guest Checkout for Headless Commerce Stores](#).

The authenticated user session must be within the context of an Experience Cloud site. For more information, see [Configure Headless Identity API Flows](#) and [Connect to Experience Cloud Sites](#).

When a guest adds products to their cart and logs into a store, this API creates a new authorized cart and transfers the contents and coupons of the guest cart to the authorized cart. The API doesn't transfer delivery or tax calculation details, or custom fields.

After the guest cart contents are successfully preserved, the guest cart is deleted. If the customer previously added items to their cart while logged in, the new authorized cart becomes the primary cart, and the previous cart becomes a secondary cart.

If the Preserve Guest Carts feature is turned off, if the guest cart is empty, or if the guest cart belongs to a different browser than the one the customer uses to log in, the API results in no operation and returns an empty response. Preserve Guest Carts is enabled by default in stores created after the Spring '24 release.

**Resource**

## Commerce Webstore Cart Coupons

Get coupons associated with a cart, and apply a coupon code to a cart.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper's locale and returns the appropriate values.

**Resource**

```
/commerce/webstores/webstoreId/carts/cartStateOrId/cart-coupons
```

Values for *cartStateOrId* are:

- **cartId**—ID of the cart.
- **active**—Active cart. This value should only be used for authenticated users.
- **current**—Cart that isn't closed or pending deletion. Available in version 50.0 and later.

**Available version**

54.0

**HTTP methods**

GET, POST

In API version 63.0 and later, if your store has [simplified cart cleanup](#) enabled, a POST request can apply a coupon to a cart without canceling checkout.

**Request parameters for GET and POST**

| Parameter Name     | Type   | Description                                                                                                                                 | Required or Optional | Available Version |
|--------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| currencyIsoCode    | String | Currency ISO code of the cart.                                                                                                              | Optional             | 57.0              |
| effectiveAccountId | String | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context. | Optional             | 54.0              |

**Request body for POST****Root XML tag**

```
<cartCouponInput>
```

**JSON example**

```
{
  "couponCode": "COUP10",
  "customFields": [
    {
      "attributes": {
        "type": "WebCartAdjustmentBasis"
      },
      "Test__C": "test@salesforce.com"
    }
  ]
}
```

**Properties**

| Name         | Type                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Required or Optional | Available Version |
|--------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| couponCode   | String                                     | Coupon code.                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Required             | 54.0              |
| customFields | <a href="#">sObject Attributes Input[]</a> | An array of sObjects and their associated custom fields. Standard fields are ignored. The custom fields must already be defined for the sObject. Currently, only the WebCart and WebCartAdjustmentBasis sObjects is supported. Field-level security rules configured by the web store admin in the <a href="#">shopper profile</a> shopper profile are applied to the custom fields. The rules are applied for registered shoppers and for the guest shopper profile. | Optional             | 63.0              |

**Response body for GET and POST**[Cart Coupon Collection](#)

## Commerce Webstore Cart Coupon

Delete a coupon from a cart.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper's locale and returns the appropriate values.

**Resource**

```
/commerce/webstores/webstoreId/carts/cartStateOrId/cart-coupons/cartCouponId
```

Values for *cartStateOrId* are:

- **cartId**—ID of the cart.
- **active**—Active cart. This value should only be used for authenticated users.
- **current**—Cart that isn't closed or pending deletion. Available in version 50.0 and later.

**Available version**

54.0

**HTTP methods**

DELETE

In API version 63.0 and later, if your store has [simplified cart cleanup](#) enabled, a DELETE request can remove a coupon from a cart without canceling checkout.

**Request parameters for DELETE**

| Parameter Name     | Type   | Description                                                                                                                                 | Required or Optional | Available Version |
|--------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| currencyIsoCode    | String | Currency ISO code of the cart.                                                                                                              | Optional             | 57.0              |
| effectiveAccountId | String | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context. | Optional             | 54.0              |

## Commerce Webstore Cart Delivery Group

Get, delete, or update a delivery group in the cart.

**Resource**

```
/commerce/webstores/webstoreId/carts/cartStateOrId/delivery-groups/deliveryGroupId
```

Values for *cartStateOrId* are:

- **cartId**—ID of the cart.
- **active**—Active cart. This value should only be used for authenticated users.
- **current**—Cart that isn't closed or pending deletion. Available in version 50.0 and later.

**Available version**

59.0

**HTTP methods**

DELETE, GET, PATCH

In API version 63.0 and later, if your store has [simplified cart cleanup](#) enabled, a PATCH or DELETE request can update or delete a delivery group in a cart without canceling checkout.

**Request parameters for DELETE**

| Parameter Name     | Type    | Description                                                                                                                    | Required or Optional | Available Version |
|--------------------|---------|--------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| deleteCartItems    | Boolean | Indicates whether to delete cart items associated with the delivery group ( <code>True</code> ) or not ( <code>False</code> ). | Optional             | 59.0              |
| effectiveAccountId | String  | ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user.              | Optional             | 59.0              |

**Response body for DELETE**

In API version 63.0 and later, if your store has [simplified cart cleanup](#) enabled, a successful DELETE request returns [202](#). Without simplified cart cleanup, successful DELETE requests return [204: Successful Delete](#).

**Request parameters for GET**

| Parameter Name     | Type    | Description                                                                                                                                                                                                                                      | Required or Optional | Available Version |
|--------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| effectiveAccountId | String  | ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user.                                                                                                                                | Optional             | 59.0              |
| page               | String  | Specifies the page token to use to view a page of information. Page tokens are returned as part of the response, such as <code>currentPageToken</code> or <code>nextPageToken</code> . If you don't specify a value, the first page is returned. | Optional             | 59.0              |
| pageSize           | Integer | Specifies the number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 25.                                                                                                               | Optional             | 59.0              |
| sort               | String  | Sort order for items in a cart. <ul style="list-style-type: none"><li>• <code>CreatedDateAsc</code>—Sorts by oldest creation date.</li><li>• <code>CreatedDateDesc</code>—Sorts by most recent creation date.</li></ul>                          | Optional             | 59.0              |

| Parameter Name | Type | Description                                                                                                                                                                                                                                                                                                                         | Required or Optional | Available Version |
|----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|

Response body for PATCH

Delivery Group

Commerce Webstore Cart Delivery Groups

Get or create a collection of delivery groups in a cart.

Resource

```
/commerce/webstores/webStoreId/carts/cartStateOrId/delivery-groups
```

Values for *cartStateOrId* are:

- **cartId**—ID of the cart.
- **active**—Active cart. This value should only be used for authenticated users.
- **current**—Cart that isn't closed or pending deletion. Available in version 59.0 and later.

Available version

59.0

HTTP methods

GET, POST

In API version 63.0 and later, if your store has [simplified cart cleanup](#) enabled, a POST request can create a collection of delivery groups in a cart without canceling checkout.

Request parameters for GET

| Parameter Name     | Type    | Description                                                                                                                                                                                                                                      | Required or Optional | Available Version |
|--------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| cartItemLimit      | Integer | Limit of items in a cart.                                                                                                                                                                                                                        | Optional             | 59.0              |
| effectiveAccountId | String  | ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user.                                                                                                                                | Optional             | 59.0              |
| page               | String  | Specifies the page token to use to view a page of information. Page tokens are returned as part of the response, such as <code>currentPageToken</code> or <code>nextPageToken</code> . If you don't specify a value, the first page is returned. | Optional             | 59.0              |
| pageSize           | Integer | Specifies the number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 25.                                                                                                               | Optional             | 59.0              |
| sort               | String  | Sort order for items in a cart. <ul style="list-style-type: none"><li>• <code>CreatedDateAsc</code>—Sorts by oldest creation date.</li><li>• <code>CreatedDateDesc</code>—Sorts by most recent creation date.</li></ul>                          | Optional             | 59.0              |

| Parameter Name | Type | Description                                                                                                                                                                                                                                                                                                                         | Required or Optional | Available Version |
|----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
|                |      | <ul style="list-style-type: none"> <li>NameAsc—Sorts by name in ascending alphabetical order (A–Z).</li> <li>NameDesc—Sorts by name in descending alphabetical order (Z–A).</li> <li>SalesPriceAsc—Sorts from lowest to highest negotiated price.</li> <li>SalesPriceDesc—Sorts from highest to lowest negotiated price.</li> </ul> |                      |                   |

## Commerce Webstore Cart Inventory Reservations

Create, update, or delete an inventory reservation from the cart.

To use this resource, you must have the required permission. Contact Salesforce Customer Support for more help.

**Resource**

```
/commerce/webstores/webstoreId/carts/cartStateOrId/inventory-reservations
```

Values for *cartStateOrId* are:

- **cartId**—ID of the cart.
- **active**—Active cart. This value should only be used for authenticated users.
- **current**—Cart that isn't closed or pending deletion. Available in version 50.0 and later.

**Available version**

58.0–63.0

**HTTP methods**

DELETE, PUT

Use PUT to create and update a reservation.

**Request parameters for DELETE**

| Parameter Name     | Type   | Description                                                                                                                                 | Required or Optional | Available Version |
|--------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| effectiveAccountId | String | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context. | Optional             | 58.0              |

**Response body for DELETE**[204 Successful Delete](#)**Request body for PUT****Root XML tag**

```
<cartInventoryReservationInput>
```

**JSON example**

```
{
  "durationInSeconds":100
}
```

**Properties**

| Name              | Type    | Description                      | Required or Optional | Available Version |
|-------------------|---------|----------------------------------|----------------------|-------------------|
| durationInSeconds | Integer | Reservation duration in seconds. | Required             | 58.0              |

**Request parameters for PUT**

| Parameter Name     | Type   | Description                                                                                                                                 | Required or Optional | Available Version |
|--------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| effectiveAccountId | String | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context. | Optional             | 58.0              |

## Commerce Webstore Cart Messages, Set Visibility

Set the visibility for cart messages.

**Resource**

```
/commerce/webstores/webstoreId/carts/cartStateOrId/messages/actions/set-visibility
```

Values for *cartStateOrId* are:

- **cartId**—ID of the cart.
- **active**—Active cart. This value should only be used for authenticated users.
- **current**—Cart that isn't closed or pending deletion. Available in version 50.0 and later.

**Available version**

50.0

**HTTP methods**

POST

**Request body for POST****Root XML tag**

```
<messageVisibility>
```

**JSON example**

```
{
  "visibility": "true"
}
```

**Properties**

| Name       | Type    | Description                                                                                | Required or Optional | Available Version |
|------------|---------|--------------------------------------------------------------------------------------------|----------------------|-------------------|
| visibility | Boolean | Specifies whether to set cart messages as visible ( <b>true</b> ) or not ( <b>false</b> ). | Required             | 50.0              |

**Request parameters for POST**

| Parameter Name         | Type   | Description                                                                                                                                 | Required or Optional | Available Version |
|------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| effective<br>AccountId | String | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context. | Optional             | 50.0              |

## Commerce Webstore Cart Promotions

Get promotions associated with a cart.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper's locale and returns the appropriate values.

**Resource**

```
/commerce/webstores/webstoreId/carts/cartStateOrId/promotions
```

Values for *cartStateOrId* are:

- **cartId**—ID of the cart.
- **active**—Active cart. This value should only be used for authenticated users.
- **current**—Cart that isn't closed or pending deletion. Available in version 50.0 and later.

**Available version**

53.0

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name         | Type   | Description                                                                      | Required or Optional | Available Version |
|------------------------|--------|----------------------------------------------------------------------------------|----------------------|-------------------|
| currencyIsoCode        | String | Currency ISO code of the cart.                                                   | Optional             | 57.0              |
| effective<br>AccountId |        | ID of the buyer account or guest buyer profile for which the request is made. If | Optional             | 53.0              |

| Parameter Name | Type | Description                                                | Required or Optional | Available Version |
|----------------|------|------------------------------------------------------------|----------------------|-------------------|
|                |      | unspecified, the default value is determined from context. |                      |                   |

[Cart Promotion Collection](#)

## Commerce Webstore Cart Items

Get the items in a cart. Add an item to a cart.

Buyers with read access to carts can add, update, and delete items in carts.

Adding items to a cart respects buyer View Product entitlements and only users entitled to view product data can access it.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper's locale and returns the appropriate values.

### Resource

```
/commerce/webstores/webstoreId/carts/cartStateOrId/cart-items
```

Values for *cartStateOrId* are:

- **cartId**—ID of the cart.
- **active**—Active cart. This value should only be used for authenticated users.
- **current**—Cart that isn't closed or pending deletion. Available in version 50.0 and later.

### Available version

49.0

### HTTP methods

GET, POST

In API version 63.0 and later, if you use GET with `/commerce/webstores/webstoreId/carts/current/cart-items` and there isn't a current cart, it returns an empty cart.

In API version 63.0 and later, if your store has [simplified cart cleanup](#) enabled, a POST request can add an item to cart without canceling checkout.

### Request parameters for GET

| Name                   | Type    | Description                                                                                                                                 | Required or Optional | Available Version |
|------------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| currencyIsoCode        | String  | Currency ISO code of the cart.                                                                                                              | Optional             | 57.0              |
| effective<br>AccountId | String  | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context. | Optional             | 49.0              |
| includeCoupons         | Boolean | Indicates whether to include coupons (True) or not (False).                                                                                 | Optional             | 59.0              |

| Name                           | Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Required or Optional | Available Version |
|--------------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>includePromotions</code> | Boolean  | Indicates whether to include promotions ( <code>True</code> ) or not ( <code>False</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Optional             | 59.0              |
| <code>page</code>              | String   | Specifies the page token to use to view a page of information. Page tokens are returned as part of the response, such as <code>currentPageToken</code> or <code>nextPageToken</code> . If you don't specify a value, the first page is returned.                                                                                                                                                                                                                                                                                                                                                                                                            | Optional             | 49.0              |
| <code>pageNumber</code>        | Integer  | Specifies the requested page number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Optional             | 60.0              |
| <code>pageSize</code>          | Integer  | Specifies the number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 25.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Optional             | 49.0              |
| <code>productFields</code>     | String[] | Comma-separated list of up to 15 product fields. Results include fields that you have access to. Some product fields (such as <code>productName</code> and <code>sku</code> ) are returned even when not included in the <code>productFields</code> parameter.                                                                                                                                                                                                                                                                                                                                                                                              | Optional             | 49.0              |
| <code>sort</code>              | String   | Sort order for items in a cart. Values are: <ul style="list-style-type: none"> <li>• <code>CreatedDateAsc</code>—Sorts by oldest creation date.</li> <li>• <code>CreatedDateDesc</code>—Sorts by most recent creation date.</li> <li>• <code>NameAsc</code>—Sorts by name in ascending alphabetical order (A–Z).</li> <li>• <code>NameDesc</code>—Sorts by name in descending alphabetical order (Z–A).</li> <li>• <code>SalesPriceAsc</code>—Sorts from lowest to highest negotiated price.</li> <li>• <code>SalesPriceDesc</code>—Sorts from highest to lowest negotiated price.</li> </ul> If unspecified, the default is <code>CreatedDateDesc</code> . | Optional             | 49.0              |

## Response body for GET

### [Cart Item Collection](#)

During asynchronous cart processing, if enabled, GET response headers include `Location` and `Retry-After`. While the cart is processing, GET requests return a 202 status and may include stale, null, or 0 pricing data. When cart processing is complete, requests return a 200 status with up-to-date pricing data.

| Name                      | Type                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Required or Optional                                                                                       | Available Version |
|---------------------------|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|-------------------|
| cartDelivery<br>GroupId   | String                                     | ID of the cart delivery group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Optional                                                                                                   | 59.0              |
| customFields              | <a href="#">sObject Attributes Input[]</a> | Array of sObjects and custom fields for the sObjects. Standard fields are ignored. The custom fields must already be defined for the sObject. Currently, only the CartItem sObject is supported. Field-level security rules from the <a href="#">shopper profile</a> are applied to the custom fields. The rules are applied for registered shoppers and for the guest shopper profile. The custom fields can be of type Checkbox, Currency, Date, Email, LongTextArea, Number, Percent, Phone, Text, TextArea, Url, Address, or Location. The customFields property isn't supported in stores built on an Aura template. | Optional                                                                                                   | 61.0              |
| productId                 | String                                     | ID of the product.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Required when adding an item to a cart (POST)<br><br>Not supported when updating an item in a cart (PATCH) | 49.0              |
| productSelling<br>ModelId | String                                     | The ID of the product selling model associated with Product2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Optional                                                                                                   | 59.0              |
| quantity                  | String                                     | Quantity of the cart item. Use a value that can be converted to BigDecimal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Required                                                                                                   | 49.0              |

| Name             | Type    | Description                                                                                                                                            | Required or Optional                                                                                       | Available Version |
|------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|-------------------|
| subscriptionTerm | Integer | The total number of terms in the subscription period.                                                                                                  | Optional                                                                                                   | 59.0              |
| subType          | String  | Subtype of item in a cart. | type             | String  | Type of item in a cart. Value is <code>Product</code> .                                                                                                | Required when adding an item to a cart (POST)<br><br>Not supported when updating an item in a cart (PATCH) | 49.0              |

#### Request parameters for POST

| Parameter Name         | Type     | Description                                                                                                                                                                                                                                                                                                                                                        | Required or Optional | Available Version |
|------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| currencyIsoCode        | String   | Currency ISO code of the cart.                                                                                                                                                                                                                                                                                                                                     | Optional             | 57.0              |
| effective<br>AccountId | String   | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.                                                                                                                                                                                                                        | Optional             | 49.0              |
| includeCartData        | Boolean  | Specifies whether to return a collection of cart items in the response ( <code>true</code> ) or not ( <code>false</code> ). If unspecified, the default value is <code>false</code> . This parameter is supported for D2C stores with Faster Add-to-Cart disabled. The cart must also have fewer than 25 items. If the cart is larger, make a GET request instead. | Optional             | 64.0              |
| pageNumber             | Integer  | Specifies the page number for the response.                                                                                                                                                                                                                                                                                                                        | Optional             | 64.0              |
| pageSize               | Integer  | Specifies the number of items per page for the response.                                                                                                                                                                                                                                                                                                           | Optional             | 64.0              |
| productFields          | String[] | Comma-separated list of up to 15 product fields. Results include fields that you have access to.                                                                                                                                                                                                                                                                   | Optional             | 49.0              |

| Parameter Name | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Required or Optional | Available Version |

**Response body for POST**[Cart Item](#)

## Commerce Webstore Cart Items, Batch

Add a batch of up to 100 items to a cart.

Buyers with read access to carts can add, update, and delete items in carts.

Adding items to a cart respects buyer View Product entitlements and only users entitled to view product data can access it.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper's locale and returns the appropriate values.

**Resource**

```
/commerce/webstores/webstoreId/carts/cartStateOrId/cart-items/batch
```

Values for *cartStateOrId* are:

- **cartId**—ID of the cart.
- **active**—Active cart. This value should only be used for authenticated users.
- **current**—Cart that isn't closed or pending deletion. Available in version 50.0 and later.

**Available version**

49.0

**HTTP methods**

POST

**Request parameters for POST**

| Parameter Name                  | Type   | Description                                                                                                                                 | Required or Optional | Available Version |
|---------------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>currencyIsoCode</code>    | String | Currency ISO code of the cart.                                                                                                              | Optional             | 57.0              |
| <code>effectiveAccountId</code> | String | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context. | Optional             | 49.0              |

**Request body for POST**

[Batch Collection Input](#)

The rich input for this batch collection is a [Cart Item Input](#).

**Response body for POST**

[Batch Results](#)

The Batch Results response body contains [Cart Item](#) response bodies corresponding to each of the request bodies. The Cart Item response bodies are returned in the same order as the request bodies.

## Commerce Webstore Cart Item

Update or delete an item in a cart.

Buyers with read access to carts can add, update, and delete items in carts.

Updating items in a cart respects buyer View Product entitlements and only users entitled to view product data can access it.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper's locale and returns the appropriate values.

**Resource**

```
/commerce/webstores/webstoreId/carts/cartStateOrId/cart-items/cartItemId
```

Values for `cartStateOrId` are:

- **cartId**—ID of the cart.
- **active**—Active cart. This value should only be used for authenticated users.
- **current**—Cart that isn't closed or pending deletion. Available in version 50.0 and later.

**Available version**

49.0

**HTTP methods**

DELETE, PATCH

In API version 63.0 and later, if your store has [simplified cart cleanup](#) enabled, a PATCH or DELETE request can update or delete an item in a cart without canceling checkout.

**Request parameters for DELETE**

| Parameter Name         | Type   | Description                                                                                                                                 | Required or Optional | Available Version |
|------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| effective<br>AccountId | String | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context. | Optional             | 49.0              |

**Response for DELETE**

[204: Successful Delete](#)

**Request body for PATCH****Root XML tag**

```
<cartItem>
```

**JSON example for updating an item in a cart**

```
{
  "quantity": "7"
}
```

**Properties**

| Name                    | Type                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Required or Optional | Available Version |
|-------------------------|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| cartDelivery<br>GroupId | String                                     | ID of the cart delivery group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Optional             | 59.0              |
| customFields            | <a href="#">sObject Attributes Input[]</a> | Array of sObjects and custom fields for the sObjects. Standard fields are ignored. The custom fields must already be defined for the sObject. Currently, only the CartItem sObject is supported. Field-level security rules from the <a href="#">shopper profile</a> are applied to the custom fields. The rules are applied for registered shoppers and for the guest shopper profile. The custom fields can be of type Checkbox, Currency, Date, Email, LongTextArea, Number, Percent, Phone, Text, TextArea, Url, Address, or Location. The customFields property isn't supported in stores built on an Aura template. | Optional             | 61.0              |

| Name                  | Type    | Description                                                                                                                                                              | Required or Optional                                                                                   | Available Version |
|-----------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|-------------------|
| productId             | String  | ID of the product.                                                                                                                                                       | Required when adding an item to a cart (POST)<br>Not supported when updating an item in a cart (PATCH) | 49.0              |
| productSellingModelId | String  | The ID of the product selling model associated with Product2.                                                                                                            | Optional                                                                                               | 59.0              |
| quantity              | String  | Quantity of the cart item. Use a value that can be converted to BigDecimal.                                                                                              | Required                                                                                               | 49.0              |
| subscriptionTerm      | Integer | The total number of terms in the subscription period.                                                                                                                    | Optional                                                                                               | 59.0              |
| subType               | String  | Subtype of item in a cart. Possible values are: <ul style="list-style-type: none"> <li>• <b>Bonus</b>—A bonus product.</li> <li>• <b>Gift</b>—A gift product.</li> </ul> | Optional                                                                                               | 64.0              |
| type                  | String  | Type of item in a cart. Value is <code>Product</code> .                                                                                                                  | Required when adding an item to a cart (POST)<br>Not supported when updating an item in a cart (PATCH) | 49.0              |

#### Request parameters for PATCH

| Parameter Name     | Type    | Description                                                                                                                                                                                                           | Required or Optional | Available Version |
|--------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| currencyIsoCode    | String  | Currency ISO code of the cart.                                                                                                                                                                                        | Optional             | 57.0              |
| effectiveAccountId | String  | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.                                                                           | Optional             | 49.0              |
| includeCartData    | Boolean | Specifies whether to return a collection of cart items in the response ( <code>true</code> ) or not ( <code>false</code> ). If unspecified, the default value is <code>false</code> . This parameter is supported for | Optional             | 64.0              |

| Parameter Name | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Required or Optional | Available Version |
|----------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
|                |         | D2C stores with Faster Add-to-Cart disabled. The cart must also have fewer than 25 items. If the cart is larger, make a GET request to <a href="#">Commerce Webstore Cart Items</a> instead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                      |                   |
| pageNumber     | Integer | Specifies the page number for the response.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Optional             | 64.0              |
| pageSize       | Integer | Specifies the number of items per page for the response.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Optional             | 64.0              |
| sort           | String  | Sort order for items in a cart. Values are: <ul style="list-style-type: none"> <li>• <code>CreatedDateAsc</code>—Sorts by oldest creation date.</li> <li>• <code>CreatedDateDesc</code>—Sorts by most recent creation date.</li> <li>• <code>NameAsc</code>—Sorts by name in ascending alphabetical order (A–Z).</li> <li>• <code>NameDesc</code>—Sorts by name in descending alphabetical order (Z–A).</li> <li>• <code>SalesPriceAsc</code>—Sorts from lowest to highest negotiated price.</li> <li>• <code>SalesPriceDesc</code>—Sorts from highest to lowest negotiated price.</li> </ul> If unspecified, the default is <code>CreatedDateDesc</code> . | Optional             | 64.0              |

**Response body for PATCH**[Cart Item](#)

## Commerce Webstore Cart Items Promotions

Get promotions associated with items in a cart.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper's locale and returns the appropriate values.

**Resource**

```
/commerce/webstores/webstoreId/carts/cartStateOrId/cart-items/promotions
```

Values for `cartStateOrId` are:

- **cartId**—ID of the cart.
- **active**—Active cart. This value should only be used for authenticated users.
- **current**—Cart that isn't closed or pending deletion. Available in version 50.0 and later.

**Available version**

53.0

**HTTP methods**

POST

POST methods typically create an item, but for this resource POST is used to retrieve information. GET calls can be cached.

**Request body for POST****Root XML tag**

```
<cartItemPromotionCollectionInput>
```

**JSON example**

```
{
  "items": [
    {
      "cartItemId": "0a9xx000000000GAAQ"
    },
    {
      "cartItemId": "0a9xx000000000GBCQ"
    }
  ]
}
```

**Properties**

| Name  | Type                                         | Description                                          | Required or Optional | Available Version |
|-------|----------------------------------------------|------------------------------------------------------|----------------------|-------------------|
| items | <a href="#">Cart Item Promotion Input</a> [] | List of cart items to get the associated promotions. | Required             | 53.0              |

**Request parameters for POST**

| Parameter Name     | Type   | Description                                                                                                                                 | Required or Optional | Available Version |
|--------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| currencyIsoCode    | String | Currency ISO code of the cart.                                                                                                              | Optional             | 57.0              |
| effectiveAccountId | String | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context. | Optional             | 53.0              |

## Commerce Webstore Category Menu Items

Retrieve product category menu items for the given parent item and store.

**Resource**

```
/commerce/webstores/webstoreId/category-menu-items
```

**Available version**

64.0

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name  | Type    | Description                                                                   | Required or Optional | Available Version |
|-----------------|---------|-------------------------------------------------------------------------------|----------------------|-------------------|
| addHomeMenuItem | Boolean | Indicates if a home menu item should be included. The default value is false. | Optional             | 64.0              |

| Parameter Name                  | Type    | Description                                                                                                                                 | Required or Optional | Available Version |
|---------------------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>effectiveAccountId</code> | String  | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context. | Optional             | 64.0              |
| <code>includeImageUrl</code>    | Boolean | Indicates if the image URL should be included for root items.                                                                               | Optional             | 64.0              |
| <code>maxItems</code>           | Integer | Maximum number of category items to be retrieved.                                                                                           | Optional             | 64.0              |
| <code>maxLevels</code>          | Integer | Maximum number of hierarchical levels to be retrieved.                                                                                      | Optional             | 64.0              |
| <code>publishStatus</code>      | String  | Publish status of the storefront.                                                                                                           | Optional             | 64.0              |

**Response body for GET**

[Navigation Menu Item Collection](#) on page 1803

## Commerce Webstore Checkout

Get, delete, or update a Commerce store checkout.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper's locale and returns the appropriate values.

**Resource**

```
/commerce/webstores/webstoreId/checkouts/activeOrCheckoutId
```

Values for *activeOrCheckoutId* are:

- **checkoutId**—ID of the checkout.
- **active**—Active checkout.

**Available version**

55.0

If you want to use this resource with a WebStore of type B2CE, open a case with Salesforce Support and provide this information:

- Salesforce organization ID
- Tenant ID (You can find this ID on the Manage Cloud-to-Cloud Connections page in Setup)
- B2C Commerce Business Manager login URL
- B2C Commerce site IDs

**HTTP methods**

DELETE, GET, PATCH

**Note:** During the checkout process, you must make a GET request to

`/commerce/webstores/webstoreId/checkouts/activeOrCheckoutId` or

`/commerce/webstores/webstoreId/checkouts/checkoutId` at least once after making a PATCH request

to `/commerce/webstores/webstoreId/checkouts`. We recommend continuously polling the GET request until the API returns a 200 OK status, indicating that the response is ready for consumption.

To resolve a 409 error returned on a PATCH or DELETE request, retry your request until it returns a 2xx status with updated data. To avoid returning a 409 error on PATCH or DELETE requests, make sure that you don't have any custom code that modifies the cart or a checkout session while calling PATCH or DELETE.

### Request parameters for GET

| Parameter Name         | Type   | Description                                                                                                       | Required or Optional | Available Version |
|------------------------|--------|-------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| effective<br>AccountId | String | ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user. | Optional             | 51.0              |

### Response for DELETE

204: Successful Delete

### Request body for PATCH

Keep these considerations in mind when you use the PATCH API:

- Must include data for only one sub-resource in a single call, such as contact information (`contactInfo`), shipping information (`deliveryAddress`, `desiredDeliveryDate`, and `shippingInstructions`), or delivery method (`deliveryMethodId`). The request fails if the request includes any of the following combinations:
  - `deliveryAddress` and `deliveryMethodId`
  - `desiredDeliveryDate` and `deliveryMethodId`
  - `shippingInstructions` and `deliveryMethodId`
  - `desiredDeliveryDate` and `contactInfo`
  - `shippingInstructions` and `contactInfo`
  - `deliveryMethodId` and `contactInfo`
- The PATCH request triggers Cart Calculate API (CCA) when updates are made using the `deliveryAddress`, `desiredDeliveryDate`, `deliveryMethod`, or custom fields. CCA then performs cart calculations by executing the following default services: promotions, post-shipping, shipping, and taxes. For more details, see CCA. [See Cart Calculate API](#).

### Root XML tag

`<checkout>`

### JSON examples

Here's an example of a request including contact information and Cart custom fields:

**Note:** The PATCH request fails if it includes contact information with Cart Delivery Group custom fields or with both Cart and Cart Delivery Group custom fields.

```
{
  "contactInfo": {
    "firstName": "Alan",
    "lastName": "Johnson",
    "email": "al**@jo*****.com",
    "phoneNumber": "*****3944"
  },
}
```

```

"customFields": [
  {
    "attributes": {
      "type": "WebCart"
    },
    "Id": "0a6xx0000000000",
    "MyCustomTextField__c": "Foo",
    "MyCustomNumberField__c": 12.34,
    "MyCustomPercentField__c": 0.2345,
    "MyCustomGeolocationField__c": {
      "latitude": 33.345,
      "longitude": 45.567
    }
  }
]
}

```

Here's an example of a request including delivery method and custom fields:

```

{
  "deliveryMethodId": "7cdLT000000EzA5YAK",
  "customFields": [
    {
      "attributes": {
        "type": "WebCart"
      },
      "Id": "0a6xx0000000000",
      "MyCustomTextField__c": "Foo",
      "MyCustomNumberField__c": 12.34,
      "MyCustomPercentField__c": 0.2345,
      "MyCustomGeolocationField__c": {
        "latitude": 33.345,
        "longitude": 45.567
      }
    },
    {
      "attributes": {
        "type": "CartDeliveryGroup"
      },
      "Id": "0a7SB000000oBujYAE",
      "MyCustomTextField__c": "Bar",
      "MyCustomNumberField__c": 4.55,
      "MyCustomPhoneField__c": "*****1212",
      "MyCustomAddressField__c": {
        "street": "100 Folsom Street",
        "city": "San Francisco",
        "state": "California", //This field isn't currently supported in custom fields.

        "stateCode": "US_CA",
        "postalCode": "93555",
        "country": "United States", //This field isn't currently supported in custom fields.
        "countryCode": "US",
        "geocodeAccuracy": "City",
        "latitude": 34,

```

```

        "longitude": 85.9
    }
}
]
}

```

Here's an example of a request including shipping information (`deliveryAddress`, `desiredDeliveryDate`, and `shippingInstructions`) and custom fields:

 **Note:** The PATCH request fails if it includes only shipping instructions along with custom fields for either Cart or Cart Delivery Group.

```

{
  "deliveryAddress": {
    "name": "Alan Johnson",
    "firstName": "Alan",
    "lastName": "Johnson",
    "region": "CA",
    "country": "US",
    "city": "San Francisco",
    "street": "415 Mission St",
    "postalCode": "94105"
  },
  "desiredDeliveryDate": "2021-05-28T16:41:41.090Z",
  "shippingInstructions": "type code 1234 on gate keypad",
  "customFields": [
    {
      "attributes": {
        "type": "WebCart"
      },
      "Id": "0a6xx0000000000",
      "MyCustomTextField__c": "Foo",
      "MyCustomNumberField__c": 12.34,
      "MyCustomPercentField__c": 0.2345,
      "MyCustomGeolocationField__c": {
        "latitude": 33.345,
        "longitude": 45.567
      }
    },
    {
      "attributes": {
        "type": "CartDeliveryGroup"
      },
      "Id": "0a7SB0000000oBujYAE",
      "MyCustomTextField__c": "Bar",
      "MyCustomNumberField__c": 4.55,
      "MyCustomPhoneField__c": "*****1212",
      "MyCustomAddressField__c": {
        "street": "100 Folsom Street",
        "city": "San Francisco",
        "state": "California", //This field isn't currently supported in custom fields.

        "stateCode": "US_CA",
        "postalCode": "93555",
        "country": "United States", //This field isn't currently supported in custom

```

```
fields.  
  "countryCode": "US",  
  "geocodeAccuracy": "City",  
  "latitude": 34,  
  "longitude": 85.9  
}  
}  
]  
}
```

Here's an example of a request including shipping information (`deliveryAddress`, `desiredDeliveryDate`, and `shippingInstructions`) without custom fields:

 **Note:** Any combination of these three sub-resources is valid if custom fields aren't included in the request.

```
{  
  "deliveryAddress": {  
    "name": "Alan Johnson",  
    "firstName": "Alan",  
    "lastName": "Johnson",  
    "region": "CA",  
    "country": "US",  
    "city": "San Francisco",  
    "street": "415 Mission St",  
    "postalCode": "94105"  
  },  
  "desiredDeliveryDate": "2021-05-28T16:41:41.090Z",  
  "shippingInstructions": "type code 1234 on gate keypad"  
}
```

Here's an example of a request for a guest user, including contact information and delivery address:

```
{  
  "contactInfo": {  
    "firstName": "Alan",  
    "lastName": "Johnson",  
    "email": "al**@jo*****.com",  
    "phoneNumber": "*****3944"  
  },  
  "deliveryAddress": {  
    "name": "Alan Johnson",  
    "firstName": "Alan",  
    "lastName": "Johnson",  
    "region": "CA",  
    "country": "US",  
    "city": "San Francisco",  
    "street": "415 Mission St",  
    "postalCode": "94105"  
  }  
}
```

**Properties**

| Name         | Type                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Required or Optional | Available Version |

| contactInfo  | <a href="#">Contact Information Input</a>  | Contact information for the checkout.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Optional             | 55.0              |
| customFields | <a href="#">sObject Attributes Input[]</a> | <p>Array of sObjects with respective custom fields. Currently, custom fields are supported on <a href="#">WebCart</a> and <a href="#">CartDeliveryGroup</a> entities. You can specify up to 21 sObjects in the array: one WebCart and multiple CartDeliveryGroups.</p> <p>Field-level security rules from the <a href="#">shopper profile</a> are applied to the custom fields. The rules are applied for registered shoppers and for the guest shopper profile.</p> <p>You can specify this property only if you specify at least one other property. For example, you can set custom fields in PATCH checkouts when you specify the guest contact information or a delivery method (in addition to setting the delivery address).</p> <p>The custom fields can be of type Checkbox, Currency, Date, Email, LongTextArea, Number, Percent, Phone, Text, TextArea, Url, Address, or Location. We currently don't support updating the country and state fields through customFields as part of the address update using request. Instead, specify the countryCode and stateCode.</p> <p>Use the <i>yyyy-MM-dd</i> format to specify date fields.</p> <p>Use the <i>yyyy-MM-ddTHH:mm:ss.SSS+/-HH:mm</i> or <i>yyyy-MM-ddTHH:mm:ss.SSSZ</i> formats to specify dateTime fields. When a timezone is added to a UTC dateTime, the result is the date and time in that timezone.</p> <p>Use the <i>HH:mm:ss.SSS</i> or <i>HH:mm:ss.SSSZ</i> formats to specify</p> | Optional             | 60.0              |

| shipping Instructions | String                                 | Special shipping instructions for the checkout.                                                                                                                                                  | Optional             | 55.0              |

**Response body for GET and PATCH**[Checkout](#)

## Commerce Webstore Checkouts

Start a Commerce store checkout.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper's locale and returns the appropriate values.

**Resource**

```
/commerce/webstores/webstoreId/checkouts
```

**Available version**

55.0

**HTTP methods**

POST, PUT

PUT is supported in version 57.0 and later.

**Note:** During the checkout process, you must make a GET request to

/commerce/webstores/**webstoreId**/checkouts/**activeOrCheckoutId** or

/commerce/webstores/**webstoreId**/checkouts/**checkoutId** at least once after making a POST request to

/commerce/webstores/**webstoreId**/checkouts. We recommend continuously polling the GET request until the API returns a 200 OK status, indicating that the response is ready for consumption.

To resolve a [409](#) error returned on a POST or PUT request, retry your request until it returns a 2xx status with updated data. To avoid returning a 409 error on POST or PUT requests, make sure that you don't have any custom code that modifies the cart or a checkout session while calling POST or PUT.

### Request parameters

| Parameter Name     | Type   | Description                                                                                                                                 | Required or Optional | Available Version |
|--------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| effectiveAccountId | String | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context. | Optional             | 55.0              |

### Request body for POST and PUT

#### Root XML tag

```
<checkoutStart>
```

#### JSON example

```
{
  "cartId": "0a6456789012345AAA",
  "customFields": [
    {
      "attributes": {
        "type": "WebCart"
      },
      "CartCustomNumberField__c": 1,
      "CartCustomTextField__c": "Text1"
    },
    {
      "attributes": {
        "type": "CartDeliveryGroup"
      },
      "CdgDistrict__c": "District1",
    },
    {
      "attributes": {
        "type": "CartDeliveryGroup"
      },
      "id": "0a7xx000000006TAAQ",
      "CdgWardField__c": 8
    }
  ]
}
```

## Properties

| Name         | Type                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Required or Optional | Available Version |

| cartId       | String                                   | ID of a cart, or the value <code>active</code> , which indicates that the checkout operation should use the active cart.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Required             | 55.0              |
| customFields | <a href="#">sObject Attributes Input</a> | <p>Array of sObjects with their respective custom fields. Currently, custom fields are supported on the <a href="#">WebCart</a> and <a href="#">CartDeliveryGroup</a> entities. You can specify up to 21 sObjects in the array: one WebCart and multiple CartDeliveryGroups.</p> <p>Field-level security rules from the <a href="#">shopper profile</a> are applied to the custom fields. The rules are applied for registered shoppers and for the guest shopper profile.</p> <p>The custom fields can be of type Checkbox, Currency, Date, Email, LongTextArea, Number, Percent, Phone, Text, TextArea, Url, Address, or Location. We currently don't support updating the <code>country</code> and <code>state</code> fields through <code>customFields</code> as part of the address update using request. Instead, specify the <code>countryCode</code> and <code>stateCode</code>.</p> <p>Use the <code>yyyy-MM-dd</code> format to specify date fields.</p> <p>Use the <code>yyyy-MM-ddTHH:mm:ss.SSS+/-HH:mm</code> or <code>yyyy-MM-ddTHH:mm:ss.SSSZ</code> formats to specify <code>dateTime</code> fields. When a timezone is added to a UTC <code>dateTime</code>, the result is the date and time in that timezone.</p> <p>Use the <code>HH:mm:ss.SSS</code> or <code>HH:mm:ss.SSSZ</code> formats to specify <code>time</code> fields. When a timezone is added to a UTC time, the result is the time in that timezone.</p> <p>The <code>customFields</code> property isn't supported in stores built on an Aura template.</p> | Optional             | 62.0              |

## Commerce Webstore Checkout Coupons

Apply a coupon code to a checkout.

To use the Commerce Webstore Checkout Coupon resources, your store must have the Cart Calculate API enabled. See [Enable and Disable the Cart Calculate API for a Webstore](#).

**Resource**

```
/commerce/webstores/{webstoreId}/checkouts/{activeOrCheckoutId}/coupons
```

**Available version**

61.0 - 62.0

**Important:** In version 63.0 and later, use [Commerce Webstore Cart Coupons](#) instead.

**HTTP methods**

POST

**Request parameters for POST**

| Parameter Name     | Type                                              | Description                                                                                                                                 | Required or Optional | Available Version |
|--------------------|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| couponCodes        | <a href="#">Checkout Coupon</a><br>on page 1058[] | A list of coupons associated with the checkout. Only a single coupon code is supported.                                                     | Required             | 61.0              |
| effectiveAccountId | String                                            | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context. | Optional             | 61.0              |

## Commerce Webstore Checkout Orders

Place an order for a Commerce store checkout.

### Resource

```
/commerce/webstores/webstoreId/checkouts/activeOrCheckoutId/orders
```

Values for *activeOrCheckoutId* are:

- **checkoutId**—ID of the checkout.
- **active**—Active checkout.

### Available version

55.0

### HTTP methods

POST

**Note:** POST doesn't take request parameters or a request body.

### Response body for POST

[Checkout Order](#)

### Error responses

An invalid POST request to [Commerce Webstore Checkout Orders](#) can return several HTTP response codes depending upon the type of error.

- [409](#) indicates that you have custom code that's modifying the cart after a payment-authorization request. To resolve the error, make sure that you don't have custom code that modifies the cart or a checkout session while calling POST.
- In version 63.0 and later, [412](#) indicates that there's an issue with a precondition, such as incomplete contact information or an inventory reservation error. To resolve the error, make sure that all required contact information is provided and that inventory reservations are correctly processed before calling POST.
- In version 63.0 and later, [422](#) indicates a validation error such as an unauthorized payment method or missing delivery method. For 422 errors, a localized error message is included in the Checkout Order response body. To resolve the error, address the provided error message. For example, verify that the payment method is authorized or ensure that an order delivery method is provided during the checkout process.

## Commerce Webstore Checkout, Place Order Action

Place an order for a Commerce store checkout.

### Resource

```
/commerce/webstores/${webstoreId}/checkouts/${activeOrCheckoutId}/orders/actions
```

Values for *activeOrCheckoutId* are:

- **checkoutId**—ID of the checkout.
- **active**—Active checkout.

64.0

HTTP methods

POST

Request parameters for POST

| Parameter Name     | Type   | Description                                                                                                            | Required or Optional | Available Version |
|--------------------|--------|------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| effectiveAccountId | String | ID of the account for which the request is made. If not specified, it defaults to the account ID for the context user. | Optional             | 64.0              |

Request body for POST

Root XML tag

checkoutPlaceOrderActionList

JSON example

Example request for the prepare action in a place order request:

```
{  
  "actions": [  
    {  
      "action": "prepare"  
    }  
  ]  
}
```

Example request for the submit action in a place order request:

```
{  
  "actions": [  
    {  
      "action": "submit"  
    }  
  ]  
}
```

**Properties**

| Name    | Type                                        | Description                                                       | Required or Optional | Available Version |

| actions | <a href="#">Checkout Order Action Input</a> | Details of the action to be performed on the place order request. | Required             | 64.0              |

**Response body for POST**[Checkout Order Action Collection](#)

## Commerce Webstore Checkout Payments

Payment for a Commerce store checkout.

To access this resource, you need a B2B or D2C Commerce license and the system permissions included in either the Buyer (B2B stores only) or Shopper (D2C stores only) [preconfigured permission set](#).

In API version 63.0 and later, the Commerce Webstore Checkout Payments API is reenterable. If a payment already exists for a cart, a POST request handles the existing payment as follows.

- If the payment is a PaymentAuthorization, the authorization is reversed.
- If the payment is captured, a refund is issued.
- If the payment is a simple purchase order, the purchase order number is replaced. Reentrance for simple purchase orders is supported in API version 64.0 and later.

You can update the billing address with a reentrant request. However, you can't change the payment type. For example, if a payment authorization or capture was performed, you can't make a new request with a `requestType` of `SimplePurchaseOrder`.

**Resource**

```
/commerce/webstores/webstoreId/checkouts/activeOrCheckoutId/payments
```

Values for *activeOrCheckoutId* are:

- **checkoutId**—ID of the checkout.
- **active**—Active checkout.

**Available version**

55.0

**HTTP methods**

POST

**Request body for POST****Root XML tag**

```
<checkoutPaymentInput>
```

**Response body for POST**[Checkout Payment](#)

## Commerce Webstore Composite Products, Create

Add a product to your store and associate it with the specified category and media records.

When a store is created, these default records are automatically created: `DefaultBuyerGroupId` (maps to: [BuyerGroup](#)), `DefaultEntitlementPolicyId` (maps to: `CommerceEntitlementPolicy`), `DefaultManagedContentSpaceId` (maps to: [ManagedContentSpace](#)), `DefaultPriceBookId` (maps to: [PriceBook2](#)), `DefaultProductCatalogId` (maps to: [ProductCatalog](#)), and `DefaultStrikeThroughPricebookId` (maps to: [PriceBook2](#)).

This API works within the store's context, so when you make a create request, it automatically associates the product to default buyer group, entitlement policy, and price book records created during store setup, along with the current store's catalog. It also associates the specified category and media in the request. This streamlines product creation and enhances the efficiency of your online retail tasks.

If the API faces a problem associating the product to any store default records, it won't add the product with incomplete default store records. Instead, it cancels the product addition and rollbacks the creation request.

 **Note:** Currently, you can't modify the default association of the product with these default records created during the store's setup.

## Commerce Webstore Composite Products, Update

Update an existing product record with the specified category and media records.

When updating a product record, you need to include both the existing category and media records that are already linked to it, along with any new ones you want to add. For example, if a product record has two categories and three media records associated with it, the API will delete and then reinsert all the category and media records. If you don't specify the existing associated category and media records, the API removes their association with the product.

## Commerce Webstore My Profile

Retrieve the buyer's account details. Update buyer account details. The API retrieves or updates the registered buyer's details by identifying the buyer user's ID within the logged-in context.

The Commerce Webstore My Profile Initiate OTP and Commerce Webstore My Profile Verify OTP APIs integrate with the myprofile API to securely manage updates to a buyer's profile information—specifically their email and phone number. These APIs enforce re-authentication before any changes are made, ensuring that only authorized users can modify contact details and that the new information is verified as belonging to the buyer.

### Resource

```
/commerce/webstores/${webstoreId}/myprofile
```

### Resource example

```

## Commerce Webstore My Profile Verify OTP

Validate the one-time-password (OTP) provided by the buyer.

The OTP is initiated through the [Commerce Webstore My Profile Initiate OTP](#) API, which is triggered when there is a change in the buyer's email or phone number.

This API must be called before updating the buyer's email and phone number using the [Commerce Webstore My Profile](#) PATCH method. Upon successful verification, the buyer's email or phone number is updated, and the corresponding verification fields, including `hasUserVerifiedEmail` or `hasUserVerifiedPhoneNumber` are set to true in the API response.

| Parameter Name     | Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Required or Optional | Available Version |
|--------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| earliestDate       | String   | Oldest created or ordered date, depending on the <code>sortOrder</code> value, for order summaries to return. Results include any orders on and after this date. The supported date format is <code>yyyy-MM-dd'T'HH:mm:ss.SSSZ</code> . For example, <code>2001-07-04T12:08:56.235-0700</code> , <code>2001-07-04T12:08:56.235+0700</code> , or <code>2001-07-04T12:08:56.235-0000</code> (UTC). See <a href="#">Valid Date and DateTime Formats</a> .                                                                                    | Optional             | 51.0              |
| effectiveAccountId | String   | ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user.                                                                                                                                                                                                                                                                                                                                                                                                                         | Optional             | 51.0              |
| fields             | String[] | List of up to 35 additional order summary fields to display in the UI in each item row. For example, <code>fields=orderNumber, status, orderLifeCycleType</code> . These order summary fields are returned regardless of fields specified. <ul style="list-style-type: none"> <li>• <code>createdDate</code></li> <li>• <code>orderSummaryId</code></li> <li>• <code>orderNumber</code></li> <li>• <code>orderedDate</code></li> <li>• <code>ownerId</code></li> <li>• <code>status</code></li> <li>• <code>totalAmount</code></li> </ul> | Optional             | 51.0              |

| Parameter Name                        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Required or Optional | Available Version |
|---------------------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>includeAdjustmentDetails</code> | Boolean | Specifies whether to fetch price adjustment details based on their type ( <code>true</code> ). If unspecified, defaults to <code>false</code> .                                                                                                                                                                                                                                                                                                                 | Optional             | 56.0              |
| <code>includeProducts</code>          | Boolean | Specifies whether to include product media in order summaries ( <code>true</code> ) or not ( <code>false</code> ). If unspecified, defaults to <code>false</code> .                                                                                                                                                                                                                                                                                             | Optional             | 61.0              |
| <code>latestDate</code>               | String  | Most recent created or ordered date, depending on the <code>sortOrder</code> value, for order summaries to return. Results include any orders before this date. The supported date format is <code>yyyy-MM-dd'T'HH:mm:ss.SSSZ</code> . For example, <code>2001-07-04T12:08:56.235-0700</code> , <code>2001-07-04T12:08:56.235+0700</code> , or <code>2001-07-04T12:08:56.235-0000</code> (UTC). See <a href="#">Valid Date and DateTime Formats</a> .           | Optional             | 51.0              |
| <code>ownerScoped</code>              | Boolean | Specifies whether the results are scoped to orders owned by the context user ( <code>true</code> ) or to orders owned by and shared with the context user ( <code>false</code> ). If unspecified, defaults to <code>true</code> .                                                                                                                                                                                                                               | Optional             | 51.0              |
| <code>pageSize</code>                 | Integer | Specifies the number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 25.                                                                                                                                                                                                                                                                                                                              | Optional             | 51.0              |
| <code>pageToken</code>                | String  | Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.                                                                                                                                                                                                                                                                                                                          | Optional             | 51.0              |
| <code>sortOrder</code>                | String  | Sort order for order summaries. Values are: <ul style="list-style-type: none"> <li>• <code>CreatedDateAsc</code>—Sorts by the oldest created date.</li> <li>• <code>CreatedDateDesc</code>—Sorts by the most recent created date.</li> <li>• <code>OrderedDateAsc</code>—Sorts by the oldest ordered date.</li> <li>• <code>OrderedDateDesc</code>—Sorts by the most recent ordered date.</li> </ul> If unspecified, defaults to <code>OrderedDateDesc</code> . | Optional             | 51.0              |

| Parameter Name | Type | Description                                                                                                                                                                  | Required or Optional | Available Version |
|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
|                |      | If you're sorting by ordered date, make sure the ordered date is populated on your order summary records. A <code>null</code> value isn't supported and results in an error. |                      |                   |

**Response body for GET**[Order Summary](#)

## Commerce Webstore Add Order Summaries to Cart

Add an order summary to an active or a current cart. The API includes products from the existing order summary, with the same quantity and configuration details, such as the product selling model.

This API is available to both registered and guest users. For registered users, this API uses the webstore's order summary ID or reference number. For guest users, provide an order summary reference number.

This API authorizes guest users using either a session cookie, an access token generated via the [Commerce Webstore Order Summary Authorization](#) API, or a `verification` object (email, last name, or phone). If both an access token and verification input are provided along with the session cookie, the API authorizes using whichever one is valid.

**Note:** Session cookie authorization is only available on Salesforce-hosted stores.

If the existing order summary includes a gift-wrap item, this API only adds the other items to the cart, ignoring the gift-wrap item. For example, if you have eight order item summaries and a gift-wrap item summary in an order summary, only these eight products are added to the cart when you reorder. However, buyers can choose to add gift wrap for the new order during checkout.

**Note:** Gift wrap applies to the entire order summary with a single delivery address and isn't for a specific order item summary.

| effectiveAccountId | String | ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user. | Optional<br>This field is required only for | 59.0              |

| Parameter Name | Type | Description | Required or Optional                  | Available Version |
|----------------|------|-------------|---------------------------------------|-------------------|
|                |      |             | authenticated or registered shoppers. |                   |

### Request body for POST

#### Root XML tag

addOrderToCartInput

#### JSON example

Here's a sample request for a registered user:

```
{
  "cartStateOrId": "active",
  "orderSummaryIdOrRefNumber": "Oder_Summary_ID"
}
```

Here's a sample request with verification for a guest user:

```
{
  "cartStateOrId": "active",
  "orderSummaryIdOrRefNumber": "GJA4C-MUVBN-6ZT4P-V6CSB",
  "verification": {
    "email": "Ma*****@vi*****.info",
    "lastName": "Strosin",
    "phoneNumber": "*****7740"
  }
}
```

Here's a sample request with access token for a guest user:

```
{
  "cartStateOrId": "active",
  "orderSummaryIdOrRefNumber": "GJA4C-MUVBN-6ZT4P-V6CSB",
  "accessToken": "U2FsdGVkX1+kpld8aQKHsqJv1shF8Jx4Nc0kOdN+L5gViQa/sZtU5NHMDpIUEhz"
}
```

### Properties

| Name        | Type   | Description                                                                                                                                                                           | Required or Optional                                                                                                       | Available Version |

## Commerce Webstore Order Summary Authorization

Authorize guest users by verifying their personally identifiable information to access the requested order summary. This API is specifically for guest users.

This API is used to authorize a guest user and retrieve an access token, which can then be used as input for the Commerce Webstore Order Summary Lookup GET API to retrieve the requested order summary record. The access token is valid for 60 minutes.

### Resource

```
/commerce/webstores/webstoreId/order-summaries/actions/authorize
```

### Example example

```
https://yourInstance.salesforce.com/services/data/v64.0/commerce/webstores/0ZExx000000005rCA/order-summaries/actions/authorize
```

### Available version

64.0

### HTTP methods

POST

### Request body for POST

#### Root XML tag

orderSummaryAuthorizationInput

#### JSON example

```
{
  "email": "Ma*****@vi*****.info",
  "lastName": "Strosin",
  "orderSummaryRefNumber": "GJA4C-MUVBN-6ZT4P-V6CSB",
  "phoneNumber": "*****7740"
}
```

### Properties

| Name                  | Type   | Description                                                     | Required or Optional | Available Version |
|-----------------------|--------|-----------------------------------------------------------------|----------------------|-------------------|
| email                 | String | An email address of the guest user.                             | Required             | 64.0              |
| lastName              | String | The last name of the guest user.                                | Optional             | 64.0              |
| orderSummaryRefNumber | String | The order summary reference number of the order summary record. | Required             | 64.0              |
| phoneNumber           | String | The phone number of the guest user.                             | Required             | 64.0              |

&excludeParameters=Adjustments,DeliveryGroups
```

### Available version

58.0

### HTTP methods

GET, POST

GET is supported in API version 64.0 and later.

POST methods usually create records, but for this resource, POST is used to retrieve the requested order summary record. Both POST and GET methods retrieve the same information.

POST calls use either a valid session cookie or a `verification` object (email, last name, or phone) to authorize guest users. GET calls authorize guest users using either a valid session cookie or an access token generated via the [Commerce Webstore Order Summary Authorization](#) API.

**Note:** Session cookie authorization is only available on Salesforce-hosted stores.

### Request parameters for GET

| Parameter Name  | Type   | Description                                                                                                                                                                            | Required or Optional                                                                                    | Available Version |
|-----------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|-------------------|
| accessToken     | String | Encrypted access token, retrieved from the Commerce Webstore Order Summary Authorization API after successful verification for guest users. Get order delivery groups. This API is available only to registered users.

**Note:** We recommend using the enhanced [Commerce Webstore Order Summary Lookup](#) API, which is accessible to both registered and guest users.

**Resource**

```
/commerce/webstores/webstoreId/order-summaries/orderSummaryId/delivery-groups
```

**Available version**

51.0

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name     | Type     | Description                                                                                                                                                                                                                                                                    | Required or Optional | Available Version |
|--------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| effectiveAccountId | String   | ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user.                                                                                                                                                              | Optional             | 51.0              |
| fields             | String[] | List of up to 15 order delivery group summary or order delivery method fields to display in the UI in each item row. For example, <code>fields=OrderDeliveryGroupSummary.DeliveryAddress,OrderDeliveryMethod.Name</code> .                                                     | Optional             | 51.0              |
| page               | String   | Specifies the page token to use to view a page of information. Page tokens are returned as part of the response, such as <code>currentPageToken</code> or <code>nextPageToken</code> . If you don't specify a value, the first page is returned.                               | Optional             | 51.0              |
| pageSize           | Integer  | Specifies the number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 25.                                                                                                                                             | Optional             | 51.0              |
| sort               | String   | Sort order for order delivery group summaries. Values are: <ul style="list-style-type: none"><li>• <code>IdAsc</code>—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).</li><li>• <code>IdDesc</code>—Sorts by ID in descending alphanumeric order (Z–A, 9–0).</li></ul> | Optional             | 51.0              |

| Parameter Name | Type | Description                                                   | Required or Optional | Available Version |
|----------------|------|---------------------------------------------------------------|----------------------|-------------------|
|                |      | If unspecified, <code>IdAsc</code> is the default sort order. |                      |                   |

## Commerce Webstore Order Items, Adjustments

Get adjustments for order items.

**Resource**`/commerce/webstores/webstoreId/order-summaries/orderSummaryId/items/adjustments`**Available version**

53.0

**HTTP methods**

POST

POST methods typically create an item, but for this resource POST is used to retrieve information. GET calls can be cached.

**Request body for POST****Root XML tag**`<orderItemSummaryCollectionInput>`**JSON example**

```
{
  "orderItemSummaries": [{
    "orderItemSummaryId": "10uxx00000000W0001"
  },
  {
    "orderItemSummaryId": "10uxx00000000W0054"
  }
]
```

```

    ]
  }

```

**Properties**

| Name                | Type                                                  | Description                   | Required or Optional | Available Version |
|---------------------|-------------------------------------------------------|-------------------------------|----------------------|-------------------|
| orderItem Summaries | <a href="#">Order Item Summary Adjustment Input[]</a> | List of order item summaries. | Required             | 53.0              |

**Request parameters for POST**

| Parameter Name     | Type   | Description                                                                                                       | Required or Optional | Available Version |
|--------------------|--------|-------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| effectiveAccountId | String | ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user. | Optional             | 53.0              |

| pageToken          | String   | Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned.                                                                                                                                                                                                                                                                  | Optional             | 52.0              |
| sortOrder          | String   | Sort order for shipments. Values are: <ul style="list-style-type: none"><li>ExpectedDeliveryDateAsc—Sorts by the oldest expected delivery date.</li><li>ExpectedDeliveryDateDesc—Sorts by the most recent expected delivery date.</li><li>ShipmentNumberAsc—Sorts by shipment number in ascending order (0–9).</li><li>ShipmentNumberDesc—Sorts by shipment number in descending order (9–0).</li></ul> | Optional             | 52.0              |

| Parameter Name | Type | Description                                                                                                                                                                                                                                                     | Required or Optional | Available Version |
|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
|                |      | If unspecified, defaults to <code>ShipmentNumberAsc</code> .<br><br>If you're sorting by expected delivery date, make sure the expected delivery date is populated on your shipment records. A <code>null</code> value isn't supported and results in an error. |                      |                   |

**Response body for GET**[Order Shipment Collection](#)

## Commerce Webstore Shipment Items

Get shipment items.

**Resource**

```
/commerce/webstores/webstoreId/shipments/shipmentId/items
```

**Available version**

52.0

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name                  | Type     | Description                                                                                                                                                                                                                  | Required or Optional | Available Version |
|---------------------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>effectiveAccountId</code> | String   | ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user.                                                                                                            | Optional             | 52.0              |
| <code>fields</code>             | String[] | List of up to 15 additional shipment items, order item summary, and product fields to display in the UI in each item row. For example,<br><code>fields=ShipmentItems.Status,Product2.Name,OrderItemSummary.UnitPrice.</code> | Optional             | 52.0              |
| <code>pageSize</code>           | Integer  | Specifies the number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 25.                                                                                           | Optional             | 52.0              |
| <code>pageToken</code>          | String   | Specifies the base64 encoded page token. Page tokens are returned as part of the                                                                                                                                             | Optional             | 52.0              |

| Parameter Name | Type   | Description                                                                                                                                                                                                                                                                | Required or Optional | Available Version |
|----------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
|                |        | response. If unspecified, the first page is returned.                                                                                                                                                                                                                      |                      |                   |
| sortOrder      | String | Sort order for the shipment items. Values are: <ul style="list-style-type: none"> <li>IdAsc—Sorts by ID in ascending alphanumeric order (A–Z, 0–9).</li> <li>IdDesc—Sorts by ID in descending alphanumeric order (Z–A, 9–0).</li> </ul> If unspecified, defaults to IdAsc. | Optional             | 52.0              |

**Response body for GET**[Order Shipment Item Collection](#)

## Commerce Webstore Payments Token

Tokenize a payment for a Commerce store checkout.

To access this resource, you need a B2B or D2C Commerce license and the system permissions included in either the Buyer (B2B stores only) or Shopper (D2C stores only) [preconfigured permission set](#).

**Resource**

```
/commerce/webstores/webstoreId/payments/token
```

**Available version**

55.0

**HTTP methods**

POST

**Request body for POST****Root XML tag**

```
<paymentTokenRequest>
```

**JSON example**

```
{
  "cardPaymentMethod": {
    "cardHolderName": "John Doe",
    "cardNumber": "4242424242424242",
    "expiryMonth": "12",
    "expiryYear": "24",
    "cvv": "141",
    "cardType": "Visa"
  }
}
```

**Properties**

| Name              | Type                                                   | Description                             | Required or Optional | Available Version |
|-------------------|--------------------------------------------------------|-----------------------------------------|----------------------|-------------------|
| cardPaymentMethod | <a href="#">Card Payment Method Tokenization Input</a> | Credit card payment method to tokenize. | Required             | 55.0              |

**Response body for POST**[Payment Token](#)

## Commerce Webstore Products

Get fields and default images for a list of products.

**Note:** Dynamic bundles are supported only in Commerce B2B stores. The Commerce Webstore Products API doesn't support them in D2C stores.

**Resource**

```
/commerce/webstores/webstoreId/products

| Parameter Name                    | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                            | Required or Optional | Available Version |
|-----------------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| effective<br>AccountId            | String  | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.                                                                                                                                                                                                                                                            | Optional             | 49.0              |
| exclude<br>AttributeSet<br>Info   | Boolean | Specifies whether the attribute set information for the product is returned ( <code>false</code> ) or not ( <code>true</code> ). If unspecified, defaults to <code>false</code> .                                                                                                                                                                                                                      | Optional             | 50.0              |
| exclude<br>Entitlement<br>Details | Boolean | Specifies whether the entitlement details of the product are returned ( <code>false</code> ) or not ( <code>true</code> ). If unspecified, defaults to <code>false</code> .                                                                                                                                                                                                                            | Optional             | 49.0–56.0         |
| excludeFields                     | Boolean | Specifies whether the fields are returned ( <code>false</code> ) or not ( <code>true</code> ). If unspecified, defaults to <code>false</code> .                                                                                                                                                                                                                                                        | Optional             | 49.0              |
| excludeMedia                      | Boolean | Specifies whether the media groups and default images of the product are returned ( <code>false</code> ) or not ( <code>true</code> ). If unspecified, defaults to <code>false</code> .                                                                                                                                                                                                                | Optional             | 49.0              |
| excludePrimary<br>ProductCategory | Boolean | Specifies whether the primary category path of the product is returned ( <code>false</code> ) or not ( <code>true</code> ). If unspecified, defaults to <code>false</code> .                                                                                                                                                                                                                           | Optional             | 49.0              |
| excludeProduct<br>SellingModels   | Boolean | Specifies whether product selling models are returned or not. The behavior of this parameter depends on whether you turn on the CommerceSubscription permission. If the permission is on, and if you set the parameter to <code>false</code> (or if you omit the parameter), product selling models are returned. If the permission is on, and if you set the parameter to <code>true</code> , product | Optional             | 56.0              |

| Parameter Name                    | Type     | Description                                                                                                                                                                                                                                                                                                                                                                                 | Required or Optional | Available Version |
|-----------------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
|                                   |          | selling models are not returned. If the permission is off, product selling models are not returned, regardless of whether you omit the parameter or provide a value.                                                                                                                                                                                                                        |                      |                   |
| <code>excludeQuantityRule</code>  | Boolean  | Specifies whether the quantity rule information for the product is returned ( <code>false</code> ) or not ( <code>true</code> ). If unspecified, defaults to <code>false</code> .                                                                                                                                                                                                           | Optional             | 52.0              |
| <code>excludeVariationInfo</code> | Boolean  | Specifies whether the variation information for the product is returned ( <code>false</code> ) or not ( <code>true</code> ). If unspecified, defaults to <code>false</code> .                                                                                                                                                                                                               | Optional             | 50.0              |
| <code>fields</code>               | String[] | Comma-separated list of field names.<br><br>If this list is unspecified, all fields are returned. There is no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If <code>excludeFields</code> and <code>fields</code> are specified, the <code>excludeFields</code> parameter takes precedence. | Optional             | 49.0              |
| <code>mediaGroups</code>          | String[] | Comma-separated list of developer names of media group records.<br><br>If this list is empty or unspecified, all media groups are returned. If <code>excludeMedia</code> and <code>mediaGroups</code> are specified, the <code>excludeMedia</code> parameter takes precedence.                                                                                                              | Optional             | 49.0              |

## Commerce Webstore Product Children

Get a collection of child products related to a parent product.

This resource respects buyer View Product entitlements, allowing access only to users authorized to view product data. It supports bundle and set products but is not available for simple, variation, or variation-parent products.

 **Note:** Dynamic bundles are supported only in Commerce B2B stores. The Commerce Webstore Product Children API doesn't support them in D2C stores.

### Request parameters for GET

| Parameter Name     | Type   | Description                                                                                                                                 | Required or Optional | Available Version |
|--------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| effectiveAccountId | String | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context. | Optional             | 57.0              |

| Parameter Name                           | Type       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Required or Optional | Available Version |
|------------------------------------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>excludeAttributeSetInfo</code>     | Boolean    | Specifies whether the attribute set information for the product is returned ( <code>false</code> ) or not ( <code>true</code> ). If unspecified, defaults to <code>false</code> .                                                                                                                                                                                                                                                                                                                                                        | Optional             | 57.0              |
| <code>excludeFields</code>               | Boolean    | Specifies whether the fields are returned ( <code>false</code> ) or not ( <code>true</code> ). If unspecified, defaults to <code>false</code> .                                                                                                                                                                                                                                                                                                                                                                                          | Optional             | 57.0              |
| <code>excludeMedia</code>                | Boolean    | Specifies whether the media groups and default images of the product are returned ( <code>false</code> ) or not ( <code>true</code> ). If unspecified, defaults to <code>false</code> .                                                                                                                                                                                                                                                                                                                                                  | Optional             | 57.0              |
| <code>excludeQuantityRule</code>         | Boolean    | Specifies whether the quantity rule information for the product is returned ( <code>false</code> ) or not ( <code>true</code> ). If unspecified, defaults to <code>false</code> .                                                                                                                                                                                                                                                                                                                                                        | Optional             | 57.0              |
| <code>fields</code>                      | StringList | Comma-separated list of field names.<br><br>If this list is empty or unspecified, all fields are returned. There's no limit to the number of fields you can specify. The number of fields and number of characters in the field name may affect the URL size limit. If <code>excludeFields</code> and <code>fields</code> are specified, the <code>excludeFields</code> parameter takes precedence.                                                                                                                                      | Optional             | 57.0              |
| <code>includeProductSellingModels</code> | Boolean    | Indicates whether product selling model options are returned ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> .                                                                                                                                                                                                                                                                                                                                                                                  | Optional             | 63.0              |
| <code>mediaGroups</code>                 | StringList | Comma-separated list of developer names of media group records. Possible values: <ul style="list-style-type: none"> <li>• <code>Attachment</code></li> <li>• <code>productDetailImage</code></li> <li>• <code>productListImage</code></li> </ul> If this list is empty or unspecified, all media groups are returned. If <code>excludeMedia</code> and <code>mediaGroups</code> are specified, the <code>excludeMedia</code> parameter takes precedence.<br><br>For product bundles, only the <code>productListImage</code> is returned. | Optional             | 57.0              |

| Parameter Name | Type    | Description                                                                                                                            | Required or Optional | Available Version |
|----------------|---------|----------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| pageSize       | Integer | Specifies the number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 20.     | Optional             | 57.0              |
| pageToken      | String  | Specifies the base64 encoded page token. Page tokens are returned as part of the response. If unspecified, the first page is returned. | Optional             | 57.0              |

**Response body for GET**[Product Child Collection](#)

## Commerce Webstore Product Featured Products

Retrieve a collection of feature products for a specific product. Featured products include complementary items, promotional products, best-sellers, new arrivals, or limited-time offers. For example, if a customer buys a shirt, the featured products list suggests shoes, pants, and accessories to complete the outfit.

**Request parameters for GET**

| Parameter Name     | Type    | Description                                                                                                                                             | Required or Optional | Available Version |
|--------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| effectiveAccountId | String  | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.             | Optional             | 64.0              |
| excludeFields      | Boolean | Indicates whether the product fields are returned ( <code>false</code> ) or not ( <code>true</code> ). If unspecified, defaults to <code>false</code> . | Optional             | 64.0              |

| Parameter Name                            | Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Required or Optional | Available Version |
|-------------------------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>fields</code>                       | String[] | Comma-separated list of product field names.<br><br>If this list is empty or unspecified, all fields are returned. There is no limit to the number of fields you can specify.                                                                                                                                                                                                                                                                                      | Optional             | 64.0              |
| <code>includeAttributeSetInfo</code>      | Boolean  | Indicates whether to include attribute set information for a variation parent product ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> .                                                                                                                                                                                                                                                                                   | Optional             | 64.0              |
| <code>includeMediaGroups</code>           | Boolean  | Indicates whether media groups are returned ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> .                                                                                                                                                                                                                                                                                                                             | Optional             | 64.0              |
| <code>includeProductSellingModel</code>   | Boolean  | Indicates whether product selling model options are returned ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> .                                                                                                                                                                                                                                                                                                            | Optional             | 64.0              |
| <code>includePurchaseQuantityRules</code> | Boolean  | Indicates whether purchase quantity rules are returned ( <code>true</code> ) or not ( <code>false</code> ). Default value is <code>false</code> .                                                                                                                                                                                                                                                                                                                  | Optional             | 64.0              |
| <code>mediaGroups</code>                  | String[] | Comma-separated list of developer names of media group records. Possible media groups are: <ul style="list-style-type: none"> <li>• <code>Attachment</code></li> <li>• <code>ProductDetailImage</code></li> <li>• <code>ProductListImage</code></li> </ul> If this list is empty or unspecified, all media groups are returned. If <code>excludeMedia</code> and <code>mediaGroups</code> are specified, the <code>excludeMedia</code> parameter takes precedence. | Optional             | 64.0              |
| <code>relationshipTypes</code>            | String[] | Comma-separated list of developer names of relationship type records. This defines how the featured product is related to a product. The field is a dynamic enum.<br><br>If no <code>relationshipTypes</code> are specified, the API response returns all available relationship types.                                                                                                                                                                            | Optional             | 64.0              |

**Response body for GET**

Featured Products Output

## Commerce Webstore Pricing Products

Get the prices for multiple products.

Getting prices for products respects buyer entitlements and only users entitled to view product and price data can access it.

To get price information, the context store and account must have 25 or fewer price books associated with them. To reduce the number of active price books for the account within the store, you can change the active status, modify valid dates, or remove assignments of price books.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper's locale and returns the appropriate values.

## Commerce Webstore Pricing Product

Get the list and buyer price for a product.

Getting prices for products respects buyer entitlements and only users entitled to view product and price data can access it.

To get price information, the context store and account must have 25 or fewer price books associated with them. To reduce the number of active price books for the account within the store, you can change the active status, modify valid dates, or remove assignments of price books.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper's locale and returns the appropriate values.

## Commerce Webstore Search Boost and Bury Rules, Create

Get all boost and bury rules for a webstore. Create a boost and bury rule. You can create up to 25 boost and bury rules for a webstore, and each boost and bury rule supports a limit of 100 products. You can use up to 500 unique products across all boost and bury rules.

Keep these considerations in mind when using boost and bury rules to influence search results.

- Boost and bury rules aren't intended for precise control over ranking products in your search results.
- Boost and bury rules influence how products are ranked in search results, but they don't override them.
- A product being boosted appears earlier and is ranked higher in the search results relative to its ranking without the rule and not relative to other products.
- Boost and bury rules don't guarantee that products with a higher boost value appear before products with a lower boost value.
- Boost and bury rules only apply when the Best Match sort rule uses a relevance score to rank products.

If unspecified, the default is the value specified in <b>Search &gt; Results Display Settings &gt; Results Grouping</b> . Values are: <ul style="list-style-type: none"> <li><code>NoGrouping</code>—Search results aren't grouped.</li> <li><code>VariationParent</code>—Search results are grouped by the variation parent.</li> </ul> | Optional                                            | 58.0              |
| includeProductVariationInfo | Boolean  | Specifies whether to include product variation information in search results                                                                                                                                                                                                                                                                                                 | Optional                                            | 63.0              |

| Parameter Name                   | Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                   | Required or Optional                                | Available Version |
|----------------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|-------------------|
|                                  |          | ( <code>true</code> ) or not ( <code>false</code> ). If unspecified, defaults to <code>false</code> .                                                                                                                                                                                                                                                                                                                         |                                                     |                   |
| <code>includeQuantityRule</code> | Boolean  | Specifies whether to include purchase quantity rule information for products in search results ( <code>true</code> ) or not ( <code>false</code> ). If unspecified, defaults to <code>false</code> .                                                                                                                                                                                                                          | Optional                                            | 58.0              |
| <code>page</code>                | Integer  | Number of the page you want returned. Starts at 0. If you don't specify a value or if you specify 0, the first page is returned.                                                                                                                                                                                                                                                                                              | Optional                                            | 58.0              |
| <code>pageSize</code>            | Integer  | Specifies the number of items per page. Valid values are from 1 through 200. If unspecified, defaults to 20.<br><br>When multiplying the <code>page</code> and <code>pageSize</code> property values together, they can't exceed 5000. For example, for a <code>pageSize</code> of 20, you can specify a <code>page</code> value up to 250.                                                                                   | Optional                                            | 58.0              |
| <code>refinements</code>         | String   | List up to nine refinements (facets) for search results. Buyers or shoppers can select up to 20 values for each distinct value refinement, as well as minimum or maximum values for a range refinement. The <code>refinements</code> parameter is encoded as a Base64 string from the JSON representation of the <a href="#">Distinct Value Refinement Input</a> or <a href="#">Range Refinement Input</a> .                  | Optional                                            | 58.0              |
| <code>searchFields</code>        | String[] | The subset of searchable fields to search. Only the fields specified in this parameter are searched. If you don't specify this parameter, or if the fields specified are invalid, all searchable fields are searched. To use the <code>searchFields</code> parameter, you must also specify the <code>searchTerm</code> parameter. The variation attribute field is not supported by the <code>searchFields</code> parameter. | Optional                                            | 62.0              |
| <code>searchTerm</code>          | String   | List of up to 32 space-separated search terms.                                                                                                                                                                                                                                                                                                                                                                                | Required if <code>categoryId</code> isn't specified | 58.0              |

| Parameter Name | Type   | Description                                                                                                                         | Required or Optional | Available Version |
|----------------|--------|-------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| sortRuleId     | String | ID of the sort rule that specifies the order of products in the search results. If unspecified, the default sort type is relevancy. | Optional             | 58.0              |

### Response body for GET

[Commerce Product Search Results](#)

## Commerce Webstore Product Search

Search products.

Searching products respects buyer View Product entitlements and only users entitled to view product data can access this resource.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper's locale and returns the appropriate values.

### Resource

```
/commerce/webstores/webstoreId/search/product-search
```

### Available version

49.0

**Note:** In API version 58.0, this resource was superseded by the [Commerce Webstore Search Products](#) on page 285 GET endpoint. To access the latest API features past version 58.0, we recommend using the GET endpoint. For example, only the GET endpoint can return product variation information or query a subset of searchable fields.

### HTTP methods

POST

POST methods typically create an item, but for this resource POST is used to retrieve information. GET calls can be cached.

### Request body for POST

#### JSON example

```
{
  "searchTerm": "lightweight",
  "categoryId": "0ZGxx000000006TGAQ", //categoryId for women's running shoes
  "refinements": [
    {
      "attributeType": "Custom",
      "nameOrId": "Color__c",
      "values": ["red", "blue"],
      "type": "DistinctValue"
    },
    {
      "attributeType": "Custom",
      "nameOrId": "Size__c",
      "values": ["5"],
      "type": "DistinctValue"
    }
  ]
}
```

```

    }
  ],
  "fields": ["Name", "Description", "StockKeepingUnit", "Size__c", "Arch__c"],
  "grouping": {
    "groupingOption": "VariationParent"
  },
  "page" : 0,
  "pageSize" : 25}

```

### Properties

| Name                 | Type                                          | Description                                                                                                                                                                                                                                                                                   | Required or Optional                                | Available Version |
|----------------------|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|-------------------|
| categoryId           | String                                        | Category ID returns results for products in this category or its subcategories. If you omit <code>categoryId</code> from the request, all categories are searched. If you specify <code>categoryId</code> and <code>searchTerm</code> , only products in the specified category are searched. | Required if <code>searchTerm</code> isn't specified | 49.0              |
| fields               | String[]                                      | Product fields to return in search results. Search results include fields you have access to. If unspecified, returns the <code>Name</code> , <code>Description</code> , <code>StockKeepingUnit</code> , <code>ProductCode</code> , and <code>Family</code> fields.                           | Optional                                            | 49.0              |
| grouping             | <a href="#">Product Search Grouping Input</a> | Specifies whether to group products in search results and how to group them. If unspecified, the default is the value specified in <b>Search &gt; Results Display Settings &gt; Results Grouping</b> .                                                                                        | Optional                                            | 51.0              |
| includePrices        | Boolean                                       | Specifies whether to include prices for products in search results ( <code>true</code> ) or not ( <code>false</code> ). If unspecified, defaults to <code>false</code> .                                                                                                                      | Optional                                            | 49.0              |
| includeQuantity Rule | Boolean                                       | Specifies whether to include purchase quantity rule information for products in search results ( <code>true</code> ) or not ( <code>false</code> ). If unspecified, defaults to <code>false</code> .                                                                                          | Optional                                            | 52.0              |
| page                 | Integer                                       | Number of the page you want returned. Starts at 0. If you don't specify a value or if you specify 0, the first page is returned.<br><br>When multiplying the <code>page</code> and <code>pageSize</code> property values together, they can't exceed 5000. For example, for                   | Optional                                            | 49.0              |

| Name                     | Type                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                         | Required or Optional                                | Available Version |

**Request parameters for GET**

| Parameter Name                         | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Required or Optional | Available Version |
|----------------------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>effectiveAccountId</code>        | String  | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.                                                                                                                                                                                                                                                                                                                                                         | Optional             | 52.0              |
| <code>includeSuggestedProducts</code>  | Boolean | Specifies whether a search term returns product suggestions ( <code>true</code> ) or not ( <code>false</code> ). If unspecified, defaults to <code>false</code> . If <code>true</code> , the service returns the suggested product IDs.                                                                                                                                                                                                                                                             | Optional             | 58.0              |
| <code>includeSuggestedTerms</code>     | Boolean | Specifies whether a request returns search term suggestions ( <code>true</code> ) or not ( <code>false</code> ). If unspecified, defaults to <code>true</code> . The value returned can include recent or popular term suggestions. At least one of <code>includeSuggestedTerms</code> or <code>includeSuggestedProducts</code> must be set to <code>true</code> .                                                                                                                                  | Optional             | 64.0              |
| <code>maxResults</code>                | Integer | Maximum number of suggestions. Values are from 1 through 10. If unspecified, defaults to 10.                                                                                                                                                                                                                                                                                                                                                                                                        | Optional             | 52.0              |
| <code>maxSuggestedProducts</code>      | Integer | Maximum number of product suggestions. Values are from 1 through 10. If unspecified, defaults to 6.                                                                                                                                                                                                                                                                                                                                                                                                 | Optional             | 58.0              |
| <code>popularProductsCategoryId</code> | String  | ID of the category that identifies a store's popular products. This category can be configured on the search input component. If <code>popularProductsCategoryId</code> is populated, the search term for a request is empty, and <code>includeSuggestedProducts</code> is <code>true</code> , product suggestions are returned from the specified category. If a search term is specified, <code>popularProductsCategoryId</code> is ignored and suggestions are based on the search term instead. | Optional             | 64.0              |

| Parameter Name | Type   | Description                                                                                                                                                                                                         | Required or Optional | Available Version |
|----------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| searchTerm     | String | Search term with up to 100 characters. If specified, the service returns autocomplete suggestions from the user's recent searches. If unspecified, the service returns suggestions from the user's recent searches. | Optional             | 52.0              |

## Commerce Webstore Promotions, Evaluate Action

Determine which promotions the customer is eligible for based on the store and buyer group, and compute the applicable price adjustments based on the coupons and the items in the cart. This API evaluates only the first 50 active manual promotions and first 50 active automatic promotions, based on priority. This API computes and returns applicable price adjustments, but it does not apply those adjustments to the webcart record. If you want to enable promotions based on shipping, contact Salesforce Customer Support.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper's locale and returns the appropriate values.

## Commerce Webstore Promotions, Evaluate Products Action

Determine which promotions apply to a product or set of products, and compute the applicable price adjustments. This API evaluates discrete products, including product variants and independent products but not parent products. Domain dependent and independent use cases are both supported. For example, a domain dependent call uses `webstoreId` and `effectiveAccountId` to evaluate products in a cart based on internal products or product categories. A domain independent call uses an external dataset based on SKUs or product categories.

## Commerce Subscriptions

Retrieve a collection of Commerce subscriptions. This API is available only to registered shoppers.

This API retrieves Commerce subscriptions based on the account ID specified in the `effectiveAccountId` parameter. If no account ID is provided as a query parameter, the API defaults to the user's context and returns subscriptions relevant to them.

[Commerce Subscription Collection](#)

## Commerce Subscription Cancellation

Cancel an active Commerce subscription. This API is available only to registered shoppers.

This API cancels a Commerce subscription for a registered shopper using the account ID specified in the `effectiveAccountId` parameter. If no account ID is provided as a query parameter, the API defaults to the user's context to cancel the specified subscription.

When using this resource, keep the following considerations in mind:

- A subscription cancellation takes effect only on the subscription's next billing date.
- A subscription that has been amended or renewed cannot be canceled before the amendment or renewal start date. To cancel such a subscription, you must first revert the amendment or renewal using the [Initiate Rollback on Last Action](#). Once the rollback is complete, you can cancel the subscription using the Commerce Webstore Subscription Cancellation API. For example, if you amend your current subscription by increasing its quantity from 5 to 10 and later decide to cancel the subscription, you can't cancel it directly. Instead, first initiate a rollback to revert the amendment, and then proceed with the cancellation using the API.

## Commerce Subscription Renewal Initiation

Renew an active Commerce subscription. This API is available only to registered shoppers.

When using this resource, keep the following considerations in mind:

- Subscription renewal takes effect after the end date of subscription. You can renew only once before the subscription term ends. After the term ends, you can renew again.
- Default pricing for renewals is based on the current list price of the digital product subscription.

- An amended subscription can't be renewed before its amendment start date.

[Commerce Subscription Renew](#)

## Commerce Subscription Amendment Initiation

Amend an active Commerce subscription. This API is available only to registered shoppers.

Amendments allow you to modify the digital product quantity of an active subscription. When a customer needs quantity changes to their subscription, you can apply them through an amendment.

When using this resource, keep the following considerations in mind:

- For positive amendments, changes can be done anytime before the next billing date. By default, pricing is based on the current list price of the digital product subscription.
- For negative amendments, changes are allowed only on the next billing date. By default, pricing is based on the last transaction price of the digital product subscription.
- A renewed subscription can't be amended before its renewal start date.

| Parameter Name     | Type   | Description                                                                                                                                                                                                                          | Required or Optional | Available Version |
|--------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| countryIsoCode     | String | ISO code of the country. Must match one of the valid ISO codes defined within the org’s State-Country picklist. For example, US for United States.<br><br>If unspecified, the default value is the default country for the webstore. | Required             | 56.0              |
| effectiveAccountId | String | ID of the buyer account or guest buyer profile for which the request is made. If unspecified, the default value is determined from context.                                                                                          | Required             | 56.0              |
| stateIsoCode       | String | ISO code of the state. Must match one of the valid ISO codes defined within the org’s State picklist. For example, CA for California state.                                                                                          | Optional             | 56.0              |

### Response body for GET

[Store Taxes Info](#)

## Commerce Webstore Wishlists

Get wishlists and create a wishlist.

If a store is segmented into markets, this API looks at the language parameter appended to the URL to determine the shopper's locale and returns the appropriate values.

### Resource

```
/commerce/webstores/webstoreId/wishlists
```

### Available version

49.0

### HTTP methods

GET, POST

### Request parameters for GET

| Parameter Name           | Type    | Description                                                                                                                                                                                                                                                                                                                                                                        | Required or Optional | Available Version |
|--------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| effective<br>AccountId   | String  | ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user.                                                                                                                                                                                                                                                                  | Optional             | 49.0              |
| include<br>DisplayedList | Boolean | Specifies whether to include the displayed list ( <b>true</b> ) or not ( <b>false</b> ). If unspecified, defaults to <b>false</b> .                                                                                                                                                                                                                                                | Optional             | 49.0              |
| pageSize                 | Integer | Specifies the number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 25.                                                                                                                                                                                                                                                 | Optional             | 51.0              |
| productFields            | String  | Comma-separated list of custom product fields. Fields aren't case-sensitive. For example, <b>ProductCode</b> and <b>productcode</b> return the same results.<br><br>If <b>includeDisplayedList</b> is unspecified or <b>false</b> , <b>productFields</b> is ignored.                                                                                                               | Optional             | 51.0              |
| sortItemsBy              | String  | Sort order for wishlist items. Values are: <ul style="list-style-type: none"> <li>• <b>CreatedDateAsc</b>—Sorts by oldest creation date.</li> <li>• <b>CreatedDateDesc</b>—Sorts by most recent creation date.</li> </ul> The default sort order is <b>CreatedDateDesc</b> .<br><br>If <b>includeDisplayedList</b> is unspecified or <b>false</b> , <b>sortItemsBy</b> is ignored. | Optional             | 51.0              |
| wishlistId               | String  | ID of the wishlist. If unspecified, all the wishlist summaries are returned.                                                                                                                                                                                                                                                                                                       | Optional             | 49.0              |

## Commerce Management Webstore Search, Facetable Attributes

Get and update facetable attributes.

### Resource

```
/commerce/management/webstores/webstoreId/search/attribute-settings/facetable-fields
```

### Available version

49.0

### HTTP methods

GET, PUT

### Request body for PUT

#### JSON example

```
{
  "facetableAttributeSettings" : [
    {
      "type" : "ProductCategory",
      "nameOrId" : "Id",
      "displayRank" : "1",
      "displayType" : "CategoryTree"
    },
    {
      "type" : "Standard",
      "nameOrId" : "Family",
      "displayRank" : "2",
      "displayType" : "MultiSelect"
    }
  ]
}
```

```
    },
    {
      "type" : "Custom",
      "nameOrId" : "color__c",
      "displayRank" : "3",
      "displayType" : "MultiSelect"
    }
  ]
}
```

Properties

| Name                         | Type                                        | Description                                | Required or Optional | Available Version |
|------------------------------|---------------------------------------------|--------------------------------------------|----------------------|-------------------|
| facetable Attribute Settings | <a href="#">Facetable Attribute Input[]</a> | Collection of up to 50 facetable settings. | Required             | 49.0              |

Response body for GET and PUT  
[Facetable Attributes Collection](#)

# Commerce Management Webstore Search, Searchable Attributes

Get and update searchable attributes.

Resource

```
/commerce/management/webstores/webstoreId/search/attribute-settings/searchable-fields
```

Available version  
49.0

HTTP methods  
GET, PATCH

Request body for PATCH

JSON example

```
{
  "searchableAttributeSettings" : [
    {
      "type" : "Standard",
      "nameOrId" : "Description",
      "isSearchable" : true
    },
    {
      "type" : "Custom",
      "nameOrId" : "brand__c"
    }
  ]
}
```

**Properties**

| Name                          | Type                                         | Description                                   | Required or Optional | Available Version |
|-------------------------------|----------------------------------------------|-----------------------------------------------|----------------------|-------------------|
| searchable Attribute Settings | <a href="#">Searchable Attribute Input[]</a> | Collection of up to 25 searchable attributes. | Required             | 49.0              |

**Response body for GET and PATCH**[Searchable Attributes Collection](#)

## Commerce Management Webstore Search, Indexes

Get indexes and create an index of a product catalog.

**Resource**

```
/commerce/management/webstores/webstoreId/search/indexes
```

**Available version**

49.0

**HTTP methods**

GET, POST

**Note:** POST doesn't take request parameters or a request body.

POST creates a live index that replaces the current live index. Any indexes that are in progress are removed when you manually create an index with POST.

**Response body for GET**[Commerce Search Index Collection](#)**Response body for POST**[Commerce Search Index](#)

## Commerce Management Webstore Search, Index

Get a search index.

**Resource**

```
/commerce/management/webstores/webstoreId/search/indexes/indexId
```

**Available version**

49.0

**HTTP methods**

GET

**Response body for GET**[Commerce Search Index](#)

## Commerce Management Webstore Search, Index Logs

Get search index logs for a webstore.

### Resource

```
/commerce/management/webstores/webstoreId/search/index-logs
```

### Available version

57.0

### HTTP methods

GET

### Request parameters for GET

| Parameter Name | Type    | Description                                                                                                                | Required or Optional | Available Version |
|----------------|---------|----------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| pageSize       | Integer | Number of log records returned. Valid values are from 1 through 100. If you don't specify a value, the default size is 25. | Optional             | 57.0              |

### Response body for GET

[Commerce Search Index Log Collection](#)

## Commerce Management Webstore Search, Product Settings

Get and update product search settings.

### Resource

```
/commerce/management/webstores/webstoreId/search/product-settings
```

### Available version

49.0

### HTTP methods

GET, PATCH

### Request parameters for GET

| Parameter Name | Type   | Description                                                 | Required or Optional | Available Version |
|----------------|--------|-------------------------------------------------------------|----------------------|-------------------|
| ids            | String | Comma-separated list of up to 250 18-character product IDs. | Required             | 49.0              |

### Request body for PATCH

#### Root XML tag

```
<searchProductSettings>
```

**JSON example**

```
{
  "searchProductSettings": [
    {
      "id": "productId1",
      "searchable": true
    },
    {
      "id": "productId2",
      "searchable": false
    }
  ]
}
```

**Properties**

| Name                   | Type                                           | Description                                                                                                                                                                                                     | Required or Optional | Available Version |
|------------------------|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| searchProduct Settings | <a href="#">Search Product Setting Input[]</a> | Up to 200 product search settings to update.<br> <b>Note:</b> Products of class <code>VariationParent</code> can't be updated. | Required             | 49.0              |

## Commerce Management Webstore Search, Include Rules

Create or retrieve search include rules for a webstore. You can create up to 25 rules for a webstore. Search include rules are not configurable in the UI.

**Resource**

```
/commerce/management/webstores/webstoreId/search/results-rules
```

**Available version**

58.0

**HTTP methods**

GET, PUT

**Response body for GET**[Include Search Rules Collection](#)**Request body for PUT****Root XML tag**

&lt;searchResultsRules&gt;

JSON example

```
{
  "searchResultsRules" : [
    {
      "type" : "Include",
      "ruleDefinition" : ["decaffeinated", "decaf"],
      "locales" : ["en_US"]
    },
    {
      "type" : "Include",
      "ruleDefinition" : ["dog", "puppy"],
      "locales" : ["en_US"]
    },
    {
      "type" : "Include",
      "ruleDefinition" : ["wintercoat", "jacket", "coat"],
      "locales" : ["en_US"]
    }
  ]
}
```

Properties

| Name               | Type                                        | Description                                 | Required or Optional | Available Version |
|--------------------|---------------------------------------------|---------------------------------------------|----------------------|-------------------|
| searchResultsRules | <a href="#">Include Search Rule Input[]</a> | A collection of include search rule inputs. | Required             | 58.0              |

Response body for PUT

[Include Search Rules Collection](#)

Commerce Management Webstore Search, Sort Rules

Create or retrieve sort rules for a webstore.

Resource

```
/commerce/management/webstores/webstoreId/search/sort-rules
```

Available version

54.0

HTTP methods

GET, PUT

Response body for GET

[Sort Rules Collection](#)

### Request body for PUT

#### Root XML tag

```
<sortRules>
```

#### JSON example

```
{
  "sortRules" : [
    {
      "type" : "ProductBased",
      "sortStandardField" : "Stock_Keeping_Unit",
      "direction" : "Ascending",
      "labelSuffix": "Asc",      "sortOrder" : "1"
    }
  ]
}
```

#### Properties

| Name      | Type                              | Description                        | Required or Optional | Available Version |
|-----------|-----------------------------------|------------------------------------|----------------------|-------------------|
| sortRules | <a href="#">Sort Rule Input[]</a> | A collection of sort rules inputs. | Required             | 54.0              |

## Commerce Webstore Session Context

Get session context information for a Commerce store.

### Resource

```
/commerce/webstores/webstoreId/session-context
```

### Resource example

```
https://yourInstance.salesforce.com/services/data/v62.0/commerce/webstores/webstoreId/session-context
```

### Available version

54.0

### HTTP methods

GET

### Response body for GET

[Session Context](#)

## Shipping Profiles

Retrieve a list of native shipping profiles for a webstore.

Currently, this API returns only one shipping profile, which is the default shipping profile of a webstore.

**Resource**

```
/commerce/webstores/webstoreId/shipping-profiles
```

**Resource example**

```
https://yourInstance.salesforce.com/services/data/v65.0/commerce/webstores/0ZESG000001E9aj4AC/shipping-profiles
```

**Available version**

62.0

**HTTP methods**

GET

**Response body for GET**[Shipping Profile Collection](#)

## Commerce Webstore Payments Token

Tokenize a payment for a Commerce store checkout.

To access this resource, you need a B2B or D2C Commerce license and the system permissions included in either the Buyer (B2B stores only) or Shopper (D2C stores only) [preconfigured permission set](#).

**Resource**

```
/commerce/webstores/webstoreId/payments/token
```

**Available version**

55.0

**HTTP methods**

POST

**Request body for POST****Root XML tag**

```
<paymentTokenRequest>
```

**JSON example**

```
{
  "cardPaymentMethod": {
    "cardHolderName": "John Doe",
    "cardNumber": "4242424242424242",
    "expiryMonth": "12",
    "expiryYear": "24",
    "cvv": "141",
    "cardType": "Visa"
  }
}
```

**Properties**

| Name              | Type                                                   | Description                             | Required or Optional | Available Version |
|-------------------|--------------------------------------------------------|-----------------------------------------|----------------------|-------------------|
| cardPaymentMethod | <a href="#">Card Payment Method Tokenization Input</a> | Credit card payment method to tokenize. | Required             | 55.0              |

**Response body for POST**[Payment Token](#)

## Commerce Einstein Webstore Resources

Get the status of a Commerce Einstein deployment. Get the Commerce Einstein configuration. Export and purge Commerce Einstein activity. Get Commerce Einstein product recommendations.

Available resources are:

GET

Request parameters for GET

| Parameter Name  | Type    | Description                                                                                                                             | Required or Optional | Available Version |
|-----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| depth           | Integer | Number of levels of the tree to retrieve. If you specify 0, you get the details for the specified initial terms or the root terms only. | Required             | 63.0              |
| includeMetadata | Boolean | Specifies whether to include metadata, such as created date, last modified date,                                                        | Optional             | 63.0              |

| Parameter Name            | Type     | Description                                                                                                                                             | Required or Optional | Available Version |
|---------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
|                           |          | and description, in the results ( <code>true</code> ) or not ( <code>false</code> ). If unspecified, defaults to ( <code>false</code> ).                |                      |                   |
| <code>includePaths</code> | Boolean  | Specifies whether to include paths in the results ( <code>true</code> ) or not ( <code>false</code> ). If unspecified, defaults to <code>false</code> . | Optional             | 63.0              |
| <code>initialTerms</code> | String[] | List of IDs of terms to get, with child terms to the specified depth. If unspecified, defaults to the root terms.                                       | Optional             | 63.0              |
| <code>taxonomyId</code>   | String   | ID of the content taxonomy.                                                                                                                             | Required             | 63.0              |

**Response body for GET**[Content Taxonomy Term Collection](#)

## Content Taxonomy, Search Terms

Search content taxonomy terms for specified query text.

**Resource**

```
/connect/content-taxonomy/terms/search
```

**Available version**

63.0

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name               | Type    | Description                                                                                                                                                                                                               | Required or Optional | Available Version |
|------------------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>includeMetadata</code> | Boolean | Specifies whether to include metadata, such as created date, last modified date, and description, in the results ( <code>true</code> ) or not ( <code>false</code> ). If unspecified, defaults to ( <code>false</code> ). | Optional             | 63.0              |
| <code>page</code>            | Integer | Number of the page you want returned. Starts at 0. If you don't specify a value or if you specify 0, the first page is returned.                                                                                          | Optional             | 63.0              |
| <code>pageSize</code>        | Integer | Specifies the number of items per page. Valid values are from 1 through 250. If you don't specify a value, the default size is 25.                                                                                        | Optional             | 63.0              |

| Parameter Name | Type     | Description                                                                                         | Required or Optional | Available Version |
|----------------|----------|-----------------------------------------------------------------------------------------------------|----------------------|-------------------|
| queryText      | String   | Word or phrase to find in the content taxonomy term labels. Only “starts with” search is supported. | Required             | 63.0              |
| taxonomyIds    | String[] | List of IDs of the content taxonomies to search for the query text.                                 | Required             | 63.0              |

**Response body for GET**[Content Taxonomy Term Collection](#)

## Content Taxonomy, Create a Term

Create a term within a content taxonomy.

**Resource**

```
/connect/content-taxonomy/taxonomyId/terms
```

**Available version**

63.0

**HTTP methods**

POST

**Request body for POST****Root XML tag**

&lt;term&gt;

**JSON example**

```
{
  "label" : "Fruit",
  "description" : "The seed-bearing part of a flowering plant.",
  "parentTermId" : ""
}
```

**Properties**

| Name        | Type   | Description              | Required or Optional                                           | Available Version |
|-------------|--------|--------------------------|----------------------------------------------------------------|-------------------|
| description | String | Description of the term. | Required when creating a term<br>Optional when updating a term | 63.0              |
| label       | String | Label of the term.       | Required when creating a term<br>Optional when updating a term | 63.0              |

| Name         | Type   | Description                                                                                                                                | Required or Optional | Available Version |
|--------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| parentTermId | String | ID of the parent term. If unspecified when creating a term, creates a root term. If unspecified when updating a term, no changes are made. | Optional             | 63.0              |

**Response body for POST**[Content Taxonomy Term](#)

## Content Taxonomy, Term

Get, update, or delete a term within a content taxonomy.

**Resource**

```
/connect/content-taxonomy/taxonomyId/terms/termId
```

**Available version**

63.0

**HTTP methods**

GET, PATCH, DELETE

**Response body for GET**[Content Taxonomy Term](#)**Request body for PATCH****Root XML tag**

```
<term>
```

**JSON example**

```
{
  "label" : "Fruit",
  "description" : "The seed-bearing part of a flowering plant.",
  "parentTermId" : ""
}
```

**Properties**

| Name        | Type   | Description              | Required or Optional                                               | Available Version |
|-------------|--------|--------------------------|--------------------------------------------------------------------|-------------------|
| description | String | Description of the term. | Required when creating a term<br><br>Optional when updating a term | 63.0              |

| Name         | Type   | Description                                                                                                                                | Required or Optional                                               | Available Version |
|--------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|-------------------|
| label        | String | Label of the term.                                                                                                                         | Required when creating a term<br><br>Optional when updating a term | 63.0              |
| parentTermId | String | ID of the parent term. If unspecified when creating a term, creates a root term. If unspecified when updating a term, no changes are made. | Optional                                                           | 63.0              |

**Response body for PATCH**[Content Taxonomy Term](#)**Request parameters for DELETE**

| Parameter Name | Type    | Description                                                                                                                                                                                                  | Required or Optional | Available Version |
|----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| deleteChildren | Boolean | Specifies whether to delete the child terms of the term ( <code>true</code> ) or not ( <code>false</code> ).                                                                                                 | Required             | 63.0              |
| newParentTerm  | String  | ID of the term that becomes the parent term if <code>deleteChildren</code> is <code>false</code> . If unspecified and <code>deleteChildren</code> is <code>false</code> , the child terms become root terms. | Optional             | 63.0              |

**Response for DELETE**[204: Successful Delete](#)

## Content Workspace Permissions Resource

Get a user's permissions for a content workspace.

**Resource**

```
/connect/content/workspace/workspaceId/permissions/userId
```

**Available version**

39.0

**HTTP methods**

GET

**Response body for GET**[Workspace Permission](#)

## Conversation Application Definition Resource

Get information about an integration's conversation application definition and the associated bot.

### Resource

```
/connect/conversation-application
```

### Available version

54.0

### HTTP methods

GET

### Request parameters for GET

| Parameter Name  | Type   | Description                           | Required or Optional | Available Version |
|-----------------|--------|---------------------------------------|----------------------|-------------------|
| integrationName | String | Name of the conversation application. | Required             | 54.0              |

### Response body for GET

[Conversation Application Definition Detail](#)

## Conversations Resources

Get and update conversation entries. Upload bulk conversations and get the statuses of the uploads.

Available resources are:

| Resource                                                                    | Description                                                    |
|-----------------------------------------------------------------------------|----------------------------------------------------------------|
| <a href="#">/connect/conversations/upload</a>                               | Upload bulk conversations and get the statuses of the uploads. |
| <a href="#">/connect/conversation/<b>conversationIdentifier</b>/entries</a> | Get and update conversation entries.                           |

## Conversations, Bulk Upload and Statuses

Upload bulk conversations and get the statuses of the uploads.

### Resource

```
/connect/conversations/upload
```

### Available version

51.0

### HTTP methods

GET, POST

### Request parameters for GET

Use GET to get the statuses of bulk conversation uploads.

| Parameter Name | Type     | Description                                   | Required or Optional | Available Version |
|----------------|----------|-----------------------------------------------|----------------------|-------------------|
| uploadIds      | String[] | Comma-separated list of up to 100 upload IDs. | Required             | 51.0              |

#### Response body for GET

[Conversation Bulk Upload Statuses](#)

#### Request parameters for POST

Use POST to bulk upload conversations up to 512 MB.

To upload a binary file, you must send it in a multipart/form-data request. For information about how to create the multipart/form-data message, see [Uploading Binary Files](#)

For a detailed example of bulk conversation upload, see [Upload and Update Transcripts with Connect REST API](#).

#### Response body for POST

[Conversation Bulk Uploads](#)

## Conversation Entries

Get and update conversation entries.

**Note:** The Conversation Entries resource is designed to retrieve individual conversations or small batches of transcripts, not for bulk data export or large-scale data analysis. This API has a different hourly rate limit than standard Salesforce APIs and bulk usage will likely cause you to hit that limit quickly. Each API call marks the conversation as active, counting against [your org's concurrent active session limit](#). Exceeding this limit can result in errors or dropped messages. For better options to export or analyze conversation data, see [Accessing Messaging and Voice Conversation Data](#).

#### Resource

```
/connect/conversation/conversationIdentifier/entries
```

#### Available version

51.0

#### HTTP methods

GET, PATCH

#### Request parameters for GET

| Parameter Name | Type   | Description                                                                                                                                           | Required or Optional | Available Version |
|----------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| endTimeStamp   | Long   | End timestamp, in milliseconds, for the conversation. For example, 1600788018.                                                                        | Optional             | 51.0              |
| queryDirection | String | Direction of the query. Values are: <ul style="list-style-type: none"><li>FromEnd</li><li>FromStart</li></ul> If unspecified, the default is FromEnd. | Optional             | 51.0              |

| Parameter Name | Type    | Description                                                                                              | Required or Optional | Available Version |
|----------------|---------|----------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| recordLimit    | Integer | Maximum number of entries to return. Valid values are from 1 to 1000. If unspecified, the default is 25. | Optional             | 51.0              |
| startTimestamp | Long    | Start timestamp, in milliseconds, for the conversation. If unspecified, the default is 0.                | Optional             | 51.0              |

**Response body for GET**[Conversation Entries](#)**Request body for PATCH****JSON example**

```
{
  "conversationEntriesUpdates": [
    {
      "identifier": "36b0f4d9-7c14-43dc-bb9e-7713a4930df0",
      "messageText": "The credit card I used was xxxx-xxxx-xxxx-4321."
    },
    {
      "identifier": "46b0f5d9-7c14-43dc-bb9e-b713a4930df1",
      "messageText": "My ssn is: XXXXX."
    }
  ]
}
```

**Properties**

| Name                       | Type                                              | Description                         | Required or Optional | Available Version |
|----------------------------|---------------------------------------------------|-------------------------------------|----------------------|-------------------|
| conversationEntriesUpdates | <a href="#">Conversation Entry Update Input[]</a> | List of conversation entry updates. | Required             | 51.0              |

## Custom Domain Resources

Get information about the custom domains in your org. A custom domain is a domain that you own, such as <https://www.example.com>, that serves content from your Experience Cloud sites or Salesforce Sites.

Available resources are:

| Resource                                                                                       | Description                                                                                                      |
|------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <a href="#">/connect/custom-domain/domains/<b>domainName</b>/domainId</a>                      | Get the ID for the custom domain associated with a domain name.                                                  |
| <a href="#">/connect/custom-domain/domains/<b>domainName</b>/expected-cdn-validation-cname</a> | Get values for the canonical name (CNAME) record that's required for custom domains that use the Salesforce CDN. |
| <a href="#">/connect/custom-domain/domains/<b>domainName</b>/expected-cname</a>                | Get values for the canonical name (CNAME) record that's used to verify ownership of a custom domain.             |
| <a href="#">/connect/custom-domain/domains</a>                                                 | Get a list of the custom domains for the org.                                                                    |
| <a href="#">/connect/custom-domain/domains/<b>domainId</b></a>                                 | Get information about a specified custom domain.                                                                 |
| <a href="#">/connect/custom-domain/domains/<b>domainId</b>/custom-urls</a>                     | Get a list of custom URLs for a custom domain.                                                                   |
| <a href="#">/connect/custom-domain/domains/<b>domainId</b>/custom-urls/<b>customUrlId</b></a>  | Get information about a specified custom URL.                                                                    |
| <a href="#">/connect/custom-domain/domains/sites/<b>storeOrSiteId</b>/custom-urls</a>          | Get a list of custom URLs for a custom domain associated with a site or store.                                   |

## Custom Domain Expected CNAME

Get values for the canonical name (CNAME) record that's used to verify ownership of a custom domain.

### Resource

```
/connect/custom-domain/domains/domainName/expected-cname
```

### Available version

63.0

### HTTP methods

GET

### Response body for GET

[Custom Domain CNAME for Domain Verification](#)

## Custom Domain Expected CDN CNAME

Get values for the canonical name (CNAME) record that's required for custom domains that use the Salesforce CDN.

### Resource

```
/connect/custom-domain/domains/domainName/expected-cdn-validation-cname
```

### Available version

63.0

### HTTP methods

GET

### Response body for GET

[Custom Domain CNAME for the Salesforce CDN](#)

## Custom Domain ID

Get the ID for the custom domain associated with a domain name.

### Resource

```
/connect/custom-domain/domains/domainName/domainId
```

### Available version

63.0

### HTTP methods

GET

### Response body for GET

[Custom Domain ID](#)

## Custom Domains

Get a list of the custom domains for the org. A custom domain is a domain that you own, such as `https://www.example.com`, that serves content from your Experience Cloud sites or Salesforce Sites.

### Resource

```
/connect/custom-domain/domains

## Customer Asset Lifecycle Management Resources

Generate, cancel, and change lifecycle-managed assets for sales and account reps to view in Lightning Experience.

Available resources are:

| Resource                                                  | Description        |
|-----------------------------------------------------------|--------------------|
| <a href="#">/asset/management/assets/actions/generate</a> | Generate an asset. |

| Resource                                                               | Description      |
|------------------------------------------------------------------------|------------------|
| <a href="#">/asset/management/assets/<b>assetId</b>/actions/cancel</a> | Cancel an asset. |
| <a href="#">/asset/management/assets/<b>assetId</b>/actions/change</a> | Change an asset. |

**IN THIS SECTION:**[Generate Asset](#)

Create a lifecycle-managed asset.

[Change Asset](#)

Amend or renew a lifecycle-managed asset.

[Cancel Asset](#)

Cancel a lifecycle-managed asset.

## Generate Asset

Create a lifecycle-managed asset.

**Resource**

```
/asset-management/assets/actions/generate
```

**Available version**

50.0

**HTTP methods**

POST

**Limits**

- Asset: 1 per call
- Asset state period: 10 per call
- Asset action: 1 per call
- Asset action source: 10 per asset action

**Request body for POST****JSON example**

## Data Cloud Resources

Get metadata and query data. Get, create, update, run, and delete calculated insights. Look up objects by source ID. Get, create, update, and delete segments. Get, create, run, update, and delete identity resolution rulesets.

**Note:** Salesforce Data Cloud Connect REST API resources, request bodies, and response bodies moved to the [Data Cloud Connect REST API Guide](#). Top-level request and response bodies are found on the same page as the resources that use them in the Endpoints section of the new guide. All request and response bodies, including those referenced in top-level bodies, are found in the Types section of the new guide.

## Data Integration Resources

Get external object names, and use those names to get contract credit information.

Available resources:

| Resource                                                                                       | Description                                                      |
|------------------------------------------------------------------------------------------------|------------------------------------------------------------------|
| <a href="#">/data-integration/licensed-objects</a>                                             | Get external object names of active packages for credit details. |
| <a href="#">/data-integration/licensed-objects/<b>externalObjectName</b>/contracts/current</a> | Get credit details for a contract.                               |

### Data Integration Licensed Objects

Get external object names of active packages for credit details.

#### Resource

## Get Prompt Templates

Get a list of prompt templates based on specified filters.

**Resource**

```
/einstein/prompt-templates
```

**Available version**

62.0

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name | Type     | Description                                                                                                                                                          | Required or Optional | Available Version |
|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| fields         | String[] | Comma-separated list of prompt template record fields to return, such as <code>createdDate</code> . If unspecified, all fields are returned.                         | Optional             | 62.0              |
| isActive       | Boolean  | Specifies whether to return active prompt templates only. The default is <code>false</code> .                                                                        | Optional             | 62.0              |
| offset         | Integer  | Used for pagination. Number of rows to skip between returned prompt template records. The default value is <code>0</code> .                                          | Optional             | 62.0              |
| pageLimit      | Integer  | Used for pagination. Maximum number of prompt template records returned per page. The default value is <code>50</code> .                                             | Optional             | 62.0              |
| query          | String   | User-entered search string. If unspecified, all prompt template records are returned.                                                                                | Optional             | 62.0              |
| relatedEntity  | String   | Related entity to filter records by, such as <code>Contact</code> . If unspecified, all records with all related entities are returned.                              | Optional             | 62.0              |
| sortBy         | String   | Field to sort order the returned prompt template records by, such as <code>createdDate</code> . If unspecified, records are returned in the order they're retrieved. | Optional             | 62.0              |
| type           | String   | Prompt template type to filter records by, such as <code>einstein_gpt__salesEmail</code> . If unspecified, records of all types are returned.                        | Optional             | 62.0              |

```
{
  "cropHeight" : "120",
  "cropWidth" : "240",
  "fileId" : "069D00000001IOh"
}
```

**Properties**

| Name          | Type    | Description                                                                                                                                                                                                                                                                                                                             | Required or Optional             | Available Version |
|---------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|-------------------|
| cropHeight    | Integer | Height of the crop rectangle in pixels.                                                                                                                                                                                                                                                                                                 | Optional                         | 36.0              |
| cropWidth     | Integer | Width of the crop rectangle in pixels.                                                                                                                                                                                                                                                                                                  | Optional                         | 36.0              |
| cropX         | Integer | X position of the crop rectangle from the left edge of the image in pixels. Top left is position (0,0).                                                                                                                                                                                                                                 | Optional                         | 36.0              |
| cropY         | Integer | Y position of the crop rectangle from the top edge of the image in pixels. Top left is position (0,0).                                                                                                                                                                                                                                  | Optional                         | 36.0              |
| fileId        | String  | 18 character ID of an existing file. The key prefix must be 069 and the file must be an image and be smaller than 2 GB.<br><br> <b>Note:</b> Images uploaded on the Group page and on the User page don't have file IDs and therefore can't be used. | Required to use an existing file | 36.0              |
| versionNumber | Integer | Version number of an existing file. If not provided, the latest version is used.                                                                                                                                                                                                                                                        | Optional                         | 36.0              |

**Request parameters for POST**

| Parameter Name | Type    | Description                             | Required or Optional | Available Version |
|----------------|---------|-----------------------------------------|----------------------|-------------------|
| cropHeight     | Integer | Height of the crop rectangle in pixels. | Optional             | 51.0              |
| cropWidth      | Integer | Width of the crop rectangle in pixels.  | Optional             | 51.0              |

| Parameter Name | Type    | Description                                                                                                             | Required or Optional             | Available Version |
|----------------|---------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------|-------------------|
| cropX          | Integer | X position of the crop rectangle from the left edge of the image in pixels. Top left is position (0,0).                 | Optional                         | 51.0              |
| cropY          | Integer | Y position of the crop rectangle from the top edge of the image in pixels. Top left is position (0,0).                  | Optional                         | 51.0              |
| fileId         | String  | 18 character ID of an existing file. The key prefix must be 069 and the file must be an image and be smaller than 2 GB. | Required to use an existing file | 51.0              |
| versionNumber  | Integer | Version number of an existing file. If not provided, the latest version is used.                                        | Optional                         | 51.0              |

**Note:** Photos are processed asynchronously and may not be visible right away.

### Response body for GET and POST

[Banner Photo](#)

### Response for DELETE

[204: Successful Delete](#)

## Employee Photo

Get, upload and crop, and delete an employee photo.

To use an image from the Files page as the employee photo, pass the file ID in the request body or the request parameters.

To upload a binary file as the employee photo, send it in a multipart/form-data message. For information about how to create the multipart/form-data message, see [Uploading Binary Files](#).

To display employee profile photos in a feed, cache the employee photos. Then use the `photoVersionId` property of the Photo response body to determine when to update a photo. This technique helps you avoid running over limits and may improve mobile client performance.

### Resource

```
/connect/employee-profiles/employeeId/photo
```

### Available version

  "fileId" : "069D00000001IOh"
}
```

**Properties**

| Name          | Type    | Description                                                                                                                                                                                                                                                                                                                             | Required or Optional                                   | Available Version |
|---------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|-------------------|
| cropSize      | Integer | The length, in pixels, of any edge of the crop square.                                                                                                                                                                                                                                                                                  | Required to crop an uploaded file or an existing file. | 29.0              |
| cropX         | Integer | The position X, in pixels, from the left edge of the image to the start of the crop square. Top left is position (0,0).                                                                                                                                                                                                                 | Required to crop an uploaded file or an existing file. | 29.0              |
| cropY         | Integer | The position Y, in pixels, from the top edge of the image to the start of the crop square. Top left is position (0,0).                                                                                                                                                                                                                  | Required to crop an uploaded file or an existing file. | 29.0              |
| fileId        | String  | 18 character ID of an existing file. The key prefix must be 069 and the file must be an image and be smaller than 2 GB.<br><br> <b>Note:</b> Images uploaded on the Group page and on the User page don't have file IDs and therefore can't be used. | Required to choose an existing file.                   | 25.0              |
| versionNumber | Integer | Version number of an existing file. If not provided, the latest version is used.                                                                                                                                                                                                                                                        | Optional                                               | 25.0              |

**Request parameters for POST**

| Parameter Name | Type    | Description                                                                                                             | Required or Optional                                   | Available Version |
|----------------|---------|-------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|-------------------|
| cropSize       | Integer | The length, in pixels, of any edge of the crop square.                                                                  | Required to crop an uploaded file or an existing file. | 51.0              |
| cropX          | Integer | The position X, in pixels, from the left edge of the image to the start of the crop square. Top left is position (0,0). | Required to crop an uploaded file or an existing file. | 51.0              |

| Parameter Name | Type    | Description                                                                                                            | Required or Optional                                   | Available Version |

### HTTP methods

GET, POST

### Request parameters for GET

| Parameter Name | Type    | Description                                                                                                                                                                                              | Required or Optional | Available Version |
|----------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| page           | Integer | Number of the page you want returned. Starts at 0. If you don't specify a value or if you specify 0, the first page is returned.                                                                         | Optional             | 62.0              |
| pageSize       | Integer | Specifies the number of items per page. Valid values are from 1 through 250. If you don't specify a value, the default size is 25.                                                                       | Optional             | 62.0              |
| showDetails    | Boolean | Specifies whether to show the channels' detailed information ( <code>true</code> ) or summary information only ( <code>false</code> ). If you don't specify a value, the default is <code>false</code> . | Optional             | 62.0              |

### Response body for GET

[Managed Content Channels](#)

**Request body for POST**[Managed Content Channel Create](#)**Root XML tag**

&lt;ManagedContentChannelCreateRepresentation&gt;

**JSON example**

```
{
  "name": "New Channel",
  "targetId": "0DBxx0000004ExEGAU",
  "type": "Community"
}
```

**Properties**

| Name                           | Type    | Description                                                                                                                                                                                                                                                           | Required or Optional                                                | Available Version |
|--------------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------|-------------------|
| cacheControl<br>MaxAge         | Long    | Cache control max age value in seconds.                                                                                                                                                                                                                               | Optional                                                            | 62.0              |
| domain                         | String  | ID or name of the domain assigned to the public channel.                                                                                                                                                                                                              | Optional                                                            | 62.0              |
| isDedicated<br>ContentDelivery | Boolean | Specifies whether the channel has off-core dedicated content delivery enabled ( <b>true</b> ) or not ( <b>false</b> ). Orgs hosted on Hyperforce use off-core dedicated content delivery to deliver content in public channels with high performance and low latency. | Optional                                                            | 63.0              |
| isDomainLocked                 | Boolean | Specifies whether the domain is locked and can't be changed ( <b>true</b> ) or not ( <b>false</b> ).                                                                                                                                                                  | Optional                                                            | 62.0              |
| isSearchable                   | Boolean | Specifies whether the text contents of the channel are searchable ( <b>true</b> ) or not ( <b>false</b> ).                                                                                                                                                            | Optional                                                            | 62.0              |
| mediaCache<br>ControlMaxAge    | Long    | Media cache control max age value in seconds.                                                                                                                                                                                                                         | Optional                                                            | 62.0              |
| name                           | String  | Name of the managed content channel.                                                                                                                                                                                                                                  | Required                                                            | 62.0              |
| targetId                       | String  | ID of the target associated with the managed content channel.                                                                                                                                                                                                         | Required for all channel types except <b>Public Unauthenticated</b> | 62.0              |
| type                           | String  | Type of managed content channel. Values are: <ul style="list-style-type: none"> <li>• <b>CloudToCloud</b>—Cloud-to-Cloud integrated channel.</li> </ul>                                                                                                               | Required                                                            | 62.0              |

| Name | Type | Description                                                                                                                                                                                                                                                                                                                                                                          | Required or Optional | Available Version |
|------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
|      |      | <ul style="list-style-type: none"> <li>Community—Experience Cloud site channel.</li> <li>ConnectedApp—Channel served by a connected app.</li> <li>PublicUnauthenticated—Public channel. | Parameter Name | Type    | Description                                                                                                                                                                                                                                                                                                                                   | Required or Optional | Available Version |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| language       | String  | Language locale for the managed content, for example, en_US. If you don't specify a language or if the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space. | Optional             | 56.0              |
| pageSize       | Integer | Number of items per page. Valid values are from 1 through 250. If you don't specify a value, the default size is 50.                                                                                                                                                                                                                          | Optional             | 63.0              |
| pageToken      | Integer | Integer specifying a page token of items. If you don't specify a value, the default value is 0, which returns the first page token.                                                                                                                                                                                                           | Optional             | 63.0              |

**Request parameters for GET**

| Parameter Name     | Type     | Description                                                                                                                                                                                                                                                                                                                           | Required or Optional | Available Version |
|--------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| contentKeys        | String[] | Comma-separated list of up to 50 content keys. Specify either managed content IDs or content keys.                                                                                                                                                                                                                                    | Optional             | 55.0              |
| contentTypeFQN     | String   | Fully qualified name of the managed content type.                                                                                                                                                                                                                                                                                     | Optional             | 55.0              |
| expandReferences   | Boolean  | Specifies whether to include details of references ( <code>true</code> ) or summaries of references ( <code>false</code> ) in the response body. If unspecified, the default value is <code>false</code> .                                                                                                                            | Optional             | 55.0              |
| includeContentBody | Boolean  | Specifies whether to return the content body ( <code>true</code> ) or the content summary ( <code>false</code> ). If unspecified, the default value is <code>false</code> .                                                                                                                                                           | Optional             | 55.0              |
| language           | String   | Language locale for the managed content, for example, <code>en_US</code> . If the requested translation isn't available, the language defaults to the configured fallback language or the channel's default language. If the content isn't available in the fallback language and the channel's default language, we return an error. | Optional             | 55.0              |
| managedContentIds  | String[] | Comma-separated list of up to 100 managed content IDs. Specify either managed content IDs or content keys.                                                                                                                                                                                                                            | Optional             | 55.0              |
| page               | Integer  | Number of the page you want returned. Starts at 0. If you don't specify a value or if you specify 0, the first page is returned.                                                                                                                                                                                                      | Optional             | 55.0              |
| pageSize           | Integer  | Specifies the number of items per page. Valid values are from 1 through 250. If unspecified, the default size is 25. If you specify <code>true</code> for <code>expandReferences</code> or <code>includeContentBody</code> , the maximum page size you can specify is 25.                                                             | Optional             | 55.0              |
| publishEndDate     | String   | ISO 8601 formatted publish end date.                                                                                                                                                                                                                                                                                                  | Optional             | 55.0              |

| Parameter Name                | Type    | Description                                                                                                                                                                                                                                                                                                                                                                     | Required or Optional | Available Version |
|-------------------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>publishStartDate</code> | String  | ISO 8601 formatted publish start date.                                                                                                                                                                                                                                                                                                                                          | Optional             | 55.0              |
| <code>referenceDepth</code>   | Integer | An integer 0–3 specifying the depth of references. If you specify 0, the <code>references</code> property of the Managed Content Delivery Document Collection response body is null. If unspecified, the default value is 0.                                                                                                                                                    | Optional             | 55.0              |
| <code>referencesAsList</code> | Boolean | Specifies whether to return the references as a list in the <code>referencesList</code> property of the Managed Content Delivery Document Collection response body ( <code>true</code> ). If you specify <code>false</code> , the references are returned as key value pairs in the <code>references</code> property. If unspecified, the default value is <code>false</code> . | Optional             | 55.0              |
| <code>showAbsoluteUrl</code>  | Boolean | Specifies whether to show absolute URLs in the response body ( <code>true</code> ) or not ( <code>false</code> ). If you don't specify a value, the default is <code>false</code> .                                                                                                                                                                                             | Optional             | 58.0              |

| Parameter Name   | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Required or Optional | Available Version |
|------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
|                  |         | references ( <code>false</code> ) in the response body. If unspecified, the default value is <code>false</code> .                                                                                                                                                                                                                                                                                                                                               |                      |                   |
| language         | String  | Language locale for the managed content, for example, <code>en_US</code> . To get content for a channel in the specified language, that language must be added to the channel. If you don't specify a language or if the requested translation isn't available, the language defaults to the channel or site's default language. If the channel or site's default language isn't available, the language defaults to the primary language of the content space. | Optional             | 54.0              |
| referenceDepth   | Integer | An integer 0–3 specifying the depth of references. If you specify 0, the <code>references</code> property of the Managed Content Delivery Document response body is null. If unspecified, the default value is 0.                                                                                                                                                                                                                                               | Optional             | 54.0              |
| referencesAsList | Boolean | Specifies whether to return the references as a list in the <code>referencesList</code> property of the Managed Content Delivery Document response body ( <code>true</code> ). If you specify <code>false</code> , the references are returned as key value pairs in the <code>references</code> property. If unspecified, the default value is <code>false</code> .                                                                                            | Optional             | 54.0              |
| showAbsoluteUrl  | Boolean | For public channels only, specifies whether to return the absolute <code>unauthenticatedUrl</code> in the response body. If you don't specify a value, the default is <code>false</code> .                                                                                                                                                                                                                                                                      | Optional             | 54.0              |

## CMS Channel Search Indexes

Get the latest live and non-live search indexes or trigger incremental or full search indexing for a channel.

### Resource

```
/connect/cms/channels/channelId/search/indexes
```

### Available version

54.0

### HTTP methods

GET, POST

### Response body for GET

[Managed Content Search Index Collection](#)

### Request parameters for POST

| Parameter Name       | Type    | Description                                                                                                                                                                                                                                                                                                | Required or Optional | Available Version |
|----------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| fallbackToFull Index | Boolean | Specifies whether to perform a full index in cases where incremental indexes aren't possible ( <code>true</code> ) or not ( <code>false</code> ). If unspecified, defaults to <code>true</code> . This parameter has no effect if <code>isIncremental</code> is unspecified or set to <code>false</code> . | Optional             | 59.0              |
| isIncremental        | Boolean | Specifies whether to update the index only with changes that have happened since the last full index was performed ( <code>true</code> ) or perform a full index ( <code>false</code> ). If unspecified, the default is <code>false</code> .                                                               | Optional             | 59.0              |

### Response body for POST

[Managed Content Search Index](#)

After you index your content, use the [Experience Cloud CMS Content Search Resource](#) to search your site.

## CMS Contents

Create managed content.

### Resource

```
/connect/cms/contents
```

### Available version

54.0

### HTTP methods

POST

In version 56.0 and later, you can upload binary files to create managed content. To upload a binary file, you must send it in a multipart/form-data request. For information about how to create the multipart/form-data message, see [Uploading Binary Files](#).

Request body for POST

Root XML tag

<ManagedContentInputRepresentation>

JSON example for version 60.0 and later

```
{
  "contentSpaceOrFolderId": "0Zuxx00000003M5CAI",
  "title": "Title of Document",
  "contentType": "sfdc_cms__news",
  "urlName": "test-url",
  "contentBody": {

## CMS Content

Get a piece of managed content. In enhanced CMS workspaces, get a version of a piece of managed content.

**Resource**

```
/connect/cms/contents/contentKeyOrId
```

**Available version**

57.0

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Required or Optional | Available Version |
|----------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| language       | String | Language locale of the managed content, for example, <code>en_US</code> . If you don't specify a version or if you specify a version corresponding to the latest version, the document is returned in the fallback language, if available, or in the primary language of the workspace. If you specify a version which isn't the latest version and isn't available for the language, an error is returned. If you don't specify a language, the document is returned in the primary language of the workspace. | Optional             | 57.0              |
| version        | String | In non-enhanced workspaces, the 18-character ID of the content version. In enhanced workspaces, the version number ID.                                                                                                                                                                                                                                                                                                                                                                                          | Optional             | 57.0              |

**Response body for GET**[Managed Content Document](#)

## CMS Content Clone

Clone a piece of managed content.

**Resource**

```
/connect/cms/contents/contentKeyOrId/clone
```

**Available version**

61.0

**HTTP methods**

POST

**Request body for POST****Root XML tag**

```
<ManagedContentDocumentCloneInputRepresentation>
```

**JSON example**

```
{
  "includeVariants": true,
  "contentSpaceOrFolderId": "9Puxx0000004M92CAE",
  "title": "Cloned Content",
  "apiName": "new_api_name"
}
```

**Properties**

| Name                   | Type    | Description                                                                                                                                                         | Required or Optional | Available Version |
|------------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| apiName                | String  | API name of the cloned content.                                                                                                                                     | Optional             | 61.0              |
| contentSpaceOrFolderId | String  | ID of the target folder for the cloned content. If unspecified, defaults to the folder of the source content.                                                       | Optional             | 61.0              |
| includeVariants        | Boolean | Specifies whether to include variants ( <code>true</code> ) or not ( <code>false</code> ) when cloning the content. If unspecified, default is <code>false</code> . | Optional             | 61.0              |
| title                  | String  | Title of the cloned content. If unspecified, "clone of" is appended to the source content's title.                                                                  | Optional             | 61.0              |

## CMS Content Taxonomy Terms

Get taxonomy terms that are associated with managed content. Add or remove taxonomy term associations from managed content.

Content admins use this resource to work with taxonomy term associations with CMS managed content. Content taxonomists use [Content Taxonomy Term Resources](#) to create, get, update, delete, and search content taxonomy terms.

**Resource**

```
/connect/cms/contents/contentKeyOrId/taxonomy-terms
```

**Available version**

63.0

**HTTP methods**

GET, PATCH

**Request body for PATCH****Root XML tag**

```
<taxonomyTermsUpdates>
```

**JSON example**

```
{
  "termsToAdd" : [
    "15dxx000001X8UzBBJ",
    "15dxx000001X8UzBBJ",
    "15dxx000001X8UzDBK"
  ],
  "termsToRemove" : [
    "15dxx000001X8UzBCI"
  ]
}
```

```
    ]
  }
```

**Properties**

| Name          | Type     | Description                                                                         | Required or Optional                                   | Available Version |
|---------------|----------|-------------------------------------------------------------------------------------|--------------------------------------------------------|-------------------|
| termsToAdd    | String[] | List of IDs of the taxonomy terms to associate with managed content.                | Required if <code>termsToRemove</code> isn't specified | 63.0              |
| termsToRemove | String[] | List of IDs of the taxonomy terms to remove their association with managed content. | Required if <code>termsToAdd</code> isn't specified    | 63.0              |

**Request parameters for PATCH**

| Parameter Name | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             | Required or Optional | Available Version |
|----------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| publish        | Boolean | Specifies whether to publish the taxonomy term associations ( <code>true</code> ) or not ( <code>false</code> ). If unspecified, defaults to <code>false</code> .<br><br>If content is published and has no outstanding changes, setting <code>true</code> publishes the taxonomy term association changes. Setting <code>false</code> saves the taxonomy term association changes and those changes are published along with the next content publish. | Optional             | 63.0              |

To get the root folder ID of a space, use the <a href="#">CMS Space</a> resource. | Required if unshareWith isn't specified | 63.0              |
| unshareWith | String[]                                 | Comma-separated list of target IDs to unshare the managed content space folder with.                                                                                                                                    | Required if shareWith isn't specified   | 63.0              |

**Response body for GET and PATCH**[MCS Folder Share Collection](#)

## CMS Folder Share Targets

Get targets that a managed content space folder can be shared with.

To get targets that a managed content space folder is shared with, use [CMS Folder Shares](#).

**Resource**

```
/connect/cms/folders/folderId/share-targets
```

**Available version**

63.0

**HTTP methods**

GET

**Response body for GET**[MCS Folder Share Target Collection](#)

## CMS Search

Search for managed content items, including variants, in spaces and folders.

**Resource**

```
/connect/cms/items/search
```

**Available version**

57.0

**HTTP methods**

GET

## Request parameters for GET

| Parameter Name          | Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Required or Optional | Available Version |
|-------------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| contentSpaceOrFolderIds | String   | IDs of managed content spaces (key prefix 0Zu) and folders (key prefix 9Pu) in which to search. In version 57.0, exactly one space is required and one folder in that space is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                | Required             | 57.0              |
| contentTypeFQN          | String   | Fully qualified name of the content type used to restrict the search.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Optional             | 57.0              |
| page                    | Integer  | Number of the page you want returned. Starts at 0. If you don't specify a value or if you specify 0, the first page is returned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Optional             | 57.0              |
| languages               | String[] | <p>List of up to 10 languages or <code>A11</code> to search for all languages. Specify each language as a language only, such as <code>en</code>, or as a language and locale, such as <code>en_US</code>. Search returns only exact matches and only languages that are supported by the workspace. If unspecified, the workspace default language is used.</p> <p> <b>Note:</b> In version 57.0, search returns all languages by default. In version 58.0 and later, use <code>languages=A11</code> to get all the languages.</p> | Optional             | 58.0              |
| pageSize                | Integer  | Specifies the number of items per page. Valid values are from 1 through 250. If you don't specify a value, the default size is 25.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Optional             | 57.0              |
| queryTerm               | String   | List of up to 50 space separated search terms. The search terms must contain at least two characters that aren't <a href="#">wildcards</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Required             | 57.0              |
| scope                   | String   | <p>Text search scope for items. Values are:</p> <ul style="list-style-type: none"> <li><code>A11</code></li> <li><code>TitleOnly</code></li> </ul> <p>If unspecified, defaults to <code>A11</code>.</p> <p> <b>Note:</b> If you specify a folder ID, you can't restrict the search scope.</p>                                                                                                                                                                                                                                       | Optional             | 57.0              |

## Environment Hub Resources

Use Environment Hub resources to create new orgs and connect existing orgs to the hub.

Available resources:

| Resource                                                                                                                                | Description                                                                                                                                                                                                             |
|-----------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="/connect/environment-hub/my-domain-validation/{myDomain}">/connect/environment-hub/my-domain-validation/{myDomain}</a>         | Validates that the specified My Domain name is available, valid, and unique. Your My Domain name determines the URLs used when you enable single sign-on or connect existing organizations to Environment Hub.          |
| <a href="/connect/environment-hub/oauth-url-generator/{username}">/connect/environment-hub/oauth-url-generator/{username}</a>           | Generates the URL used to initiate the OAuth workflow that connects an org to the Environment Hub.                                                                                                                      |
| <a href="/connect/environment-hub/signup-member-validation/{username}">/connect/environment-hub/signup-member-validation/{username}</a> | Validates the input parameters used to initiate an org sign-up in the Environment Hub.                                                                                                                                  |
| <a href="/connect/environment-hub/sso-user-mappings/{hubMemberId}">/connect/environment-hub/sso-user-mappings/{hubMemberId}</a>         | Creates an SSO mapping between an Environment Hub user and a user in a hub member org. An SSO user mapping lets the Environment Hub user log in as the mapped user in the member org without having to re-authenticate. |

## Environment Hub My Domain Validation

Validates that the specified My Domain name is available, valid, and unique. Your My Domain name determines the URLs used when you enable single sign-on or connect existing organizations to Environment Hub.

### Resource

```
/connect/environment-hub/my-domain-validation/myDomainName
```

*myDomainName* is the subdomain to use for My Domain.

### Available version

36.0

### HTTP methods

GET

### Request parameters for GET

| Parameter Name | Type   | Description                                                                                                                                                                                                                                                                                                                  | Required or Optional | Available Version |
|----------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| orgEdition     | String | The edition of the org to validate. Possible values are: <ul style="list-style-type: none"><li>• Personal Edition</li><li>• Contact Manager Edition</li><li>• Team Edition (for Group Edition)</li><li>• Professional Edition</li><li>• Enterprise Edition</li><li>• Unlimited Edition</li><li>• Developer Edition</li></ul> | Optional             | 36.0              |

### Response body for GET

[Environment Hub My Domain Validation](#)

## Environment Hub Sign-up Member Validation

Validates the input parameters used to initiate an org sign-up in the Environment Hub.

### Resource

```
/connect/environment-hub/signup-member-validation/username
```

*username* is the admin username for the org being connected to the Environment Hub.

### Available version

36.0

### HTTP methods

GET

**Request parameters for GET**

| Parameter Name | Type   | Description                  | Required or Optional | Available Version |
|----------------|--------|------------------------------|----------------------|-------------------|
| edition        | String | The edition to validate.     | Optional             | 36.0              |
| templateId     | String | The template ID to validate. | Optional             | 36.0              |

You must specify at least one parameter when you make your request.

**Response body for GET**

[Environment Hub Sign-up Member Validation](#)

## Environment Hub OAuth URL Generator

Generates the URL used to initiate the OAuth workflow that connects an org to the Environment Hub.

**Resource**

```
/connect/environment-hub/oauth-url-generator/username
```

**username** is the admin username for the org being connected to the Environment Hub.

**Available version**

36.0

**HTTP methods**

GET

**Response body for GET**

[Environment Hub OAuth URL](#)

## Environment Hub SSO User Mapping Generator

Creates an SSO mapping between an Environment Hub user and a user in a hub member org. An SSO user mapping lets the Environment Hub user log in as the mapped user in the member org without having to re-authenticate.

User mappings can be many-to-one but not one-to-many. In other words, you can associate multiple users in the hub org with the same user in a member org.

**Resource**

```
/connect/environment-hub/sso-user-mappings/hubMemberId
```

**Available version**

36.0

**HTTP methods**

POST

**Request body for POST****Root XML tag**

```
<ssoUserMapping>
```

**JSON example**

```
{
  "hubUserId": "005B0000000F6SNIA0",
  "memberUsername": "jeanSmith"
}
```

**Properties**

| Name           | Type   | Description                                                       | Required or Optional | Available Version |
|----------------|--------|-------------------------------------------------------------------|----------------------|-------------------|
| hubUserId      | String | The ID of a user in an Environment Hub organization.              | Required             | 36.0              |
| memberUsername | String | The username of a user in an Environment Hub member organization. | Required             | 36.0              |

**Request parameters for POST**

| Parameter Name | Type   | Description                                                       | Required or Optional | Available Version |
|----------------|--------|-------------------------------------------------------------------|----------------------|-------------------|
| hubUserId      | String | The ID of a user in an Environment Hub organization.              | Required             | 36.0              |
| memberUsername | String | The username of a user in an Environment Hub member organization. | Required             | 36.0              |

## Experience Cloud Microsites Resources

Get, save, and submit marketing integration forms for an Experience Cloud site.

Experience Cloud Microsites resources make calls to the Marketing Cloud Engagement REST API to create, query, and insert data to the data extension object. If the API returns errors, Connect REST API error messages include the [error code and message](#) from Marketing Cloud Engagement.

Available resources are:

| Resource                                                                            | Description                                                       |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| <a href="#">/sites/<b>siteId</b>/marketing-integration/forms</a>                    | Save a marketing integration form for an Experience Cloud site.   |
| <a href="#">/sites/<b>siteId</b>/marketing-integration/forms/<b>formId</b></a>      | Get a marketing integration form for an Experience Cloud site.    |
| <a href="#">/sites/<b>siteId</b>/marketing-integration/forms/<b>formId</b>/data</a> | Submit a marketing integration form for an Experience Cloud site. |

## Microsites Marketing Integration Forms

Save a marketing integration form for an Experience Cloud site.

This API attempts to create a read-only data extension in Marketing Cloud Engagement. A Marketing Cloud Engagement admin can change the read-only setting. We recommend keeping the data extension as read-only to maintain schema consistency with the form.

|               |        | <ul style="list-style-type: none"> <li>"AuthenticationType": "UNAUTHENTICATED"<br/>(version 52.0–55.0)</li> <li>"AuthenticationType": "AUTHENTICATED_WITH_PUBLIC_ACCESS"</li> <li>"CreateStoreDefaults": "ALL"</li> <li>"CreateStoreDefaults": "NONE"</li> <li>"WebstoreId": "<b>WebstoreId</b>"</li> </ul> <p>AuthenticationType values are valid when creating an Experience Cloud site using the Build Your Own (LWR) template.</p> <p>CreateStoreDefaults values are valid when creating an Experience Cloud site using the B2B or D2C store template.</p> <p>The WebstoreId value is valid when creating an Experience Cloud site using the B2B Aura, B2B LWR, and D2C templates. The store can't already be associated to a site, and the store type field must match the template. The B2B store type can be used with the B2B Aura and B2B LWR templates, and the D2C store type can be used with the D2C template.</p> |                                                                       |                   |
| urlPathPrefix | String | URL prefix for the site. For example, in the site URL <i>MyDomainName.my.site.com/customers</i> , customers is the UrlPathPrefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Required if you already have a site that doesn't have a urlPathPrefix | 46.0              |

**Response body for POST**[Community Create](#)**Experience Cloud Site**

Get information about an Experience Cloud site.

**Resource**

```
/connect/communities/communityId
```

To access resources that are part of a site, insert this segment into the URL after the version information and before the resource you want to access. For more information, see [Build the Resource URL](#).

**Available version**

26.0

**HTTP methods**

GET

**Response body for GET**[Community](#)

## Experience Cloud Site, Publish

Publish an Experience Cloud site.

**Resource**

```
/connect/communities/communityId/publish
```

**Available version**

46.0

**HTTP methods**

POST

**Note:** POST doesn't take request parameters or a request body.

**Response body for POST**[Community Publish](#)

## Experience Builder Templates

Get the Experience Builder templates available to the context user.

**Resource**

```
/connect/communities/templates
```

**Available version**

46.0

**HTTP methods**

GET

**Response body for GET**[Community Template Collection](#)

## Experience Cloud Sites Externally Managed Accounts

Get externally managed accounts available to the context user across all Experience Cloud sites.

**Resource**

```
/connect/communities/communityId/external-managed-accounts
```

**Note:** Regardless of the ID specified, this resource returns all the externally managed accounts available to the context user across all sites.

**Available version**

50.0

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name   | Type    | Description                                                                                                                         | Required or Optional | Available Version |
|------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| includeMyAccount | Boolean | Specifies whether to return the context user's account ( <b>true</b> ) or not ( <b>false</b> ). The default value is <b>false</b> . | Optional             | 53.0              |

**Response body for GET**[External Managed Account Collection Output](#)

## Experience Cloud Site Preview URL

Get a preview URL for an Experience Cloud site page.

**Resource**

```
/connect/communities/communityId/preview-url/pages/pageApiName
```

The *pageApiName* is the API name of a page, such as `Product_Detail` or `Home`.

**Available version**

61.0

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name | Type   | Description                                                                                                                 | Required or Optional                     | Available Version |
|----------------|--------|-----------------------------------------------------------------------------------------------------------------------------|------------------------------------------|-------------------|
| urlParameters  | String | URL-encoded string of key-value pairs, such as <code>recordName%3Example-record-name%26recordId%3D01txx0000006i7IAAQ</code> | Optional unless required by the page URL | 61.0              |

**Response body for GET**[Community Preview URL](#)

## Experience Model Resources

Get experience model property types.

Available resources are:

## Files Connect Repository Resources

A Files Connect repository is an external content repository that's connected to Salesforce. Use these resources to get a list of repositories, to get information about a repository or a repository file, and to get the content of a repository file. Also use these resources to get information about the files and folders in a repository folder. Use these resources to get a repository's directory entries, permissions, and permission types. Also use these resources to update a repository's permissions.

Available resources:

| Resource                                                                                                                                                                                                        | Description                                                                                                           |

|------------------------------------------------------|----------------------------------------------------------------------------------------|
| <a href="#">/connect/files/<b>fileId</b></a>         | Get information about or update the version of an existing reference.                  |
| <a href="#">/connect/files/<b>fileId</b>/content</a> | Get the content of the reference. The content is streamed as the body of the response. |
| <a href="#">/connect/files/users/me</a>              | Create a reference.                                                                    |

## Files Connect Repository List

Get a list of Files Connect repositories.

### Resource

```
/connect/content-hub/repositories
```

```
/connect/communities/communityId/content-hub/repositories
```

### Available version

32.0

The communities resource is available in version 35.0 and later.

### HTTP methods

GET

### Request parameters for GET

| Parameter Name | Type    | Description                                        | Required or Optional | Available Version |
|----------------|---------|----------------------------------------------------|----------------------|-------------------|
| canBrowseOnly  | Boolean | Retrieves only repositories that support browsing. | Optional             | 32.0              |

| Parameter Name | Type    | Description                                                                                                                       | Required or Optional | Available Version |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| canSearchOnly  | Boolean | Retrieves only repositories that support searching.                                                                               | Optional             | 32.0              |
| page           | Integer | An integer specifying a page of items. The default value is 0, which returns the first page.                                      | Optional             | 32.0              |
| pageSize       | Integer | Specifies the number of items per page. Valid values are between 1 and 100. If you pass in <code>null</code> , the default is 25. | Optional             | 32.0              |

**Response body for GET and PATCH**[Repository File Detail](#)

## Files Connect Repository File Content

Get the content of the repository file from the external system. The content is streamed as the body of the response.

**Resource**

```
/connect/content-hub/repositories/repositoryId/files/repositoryFileId/content
```

```
/connect/communities/communityId/content-hub/repositories/repositoryId/files/repositoryFileId/content
```

**Available version**

32.0

The communities resource is available in version 35.0 and later.

**HTTP methods**

GET, HEAD

**Response body**

Binary stream of the file content.

## Files Connect Repository File Previews

Get information about a repository file's supported previews.

File previews are supported only for Google Drive.

**Resource**

```
/connect/content-hub/repositories/repositoryId/files/repositoryFileId/previews
```

```
/connect/communities/communityId/content-hub/repositories/repositoryId/files/repositoryFileId/previews
```

**Available version**

36.0

**HTTP methods**

GET, HEAD

**Response body for GET**[File Preview Collection](#)

## Files Connect Repository File Preview

Get a repository file preview or a specific page in a preview.

File previews are supported only for Google Drive.

**Resource**

```
/connect/content-hub/repositories/repositoryId/files/repositoryFileId/previews/formatType
```

```
/connect/communities/communityId/content-hub/repositories/repositoryId/files/repositoryFileId/previews/formatType
```

Supported values for *previewFormat*:

- `jpg`—Preview format is JPG.

If you're concerned that feature-rich SVG previews don't work in your org, choose alternative file previews. To use JPG file previews, enter *general* in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.

- `pdf`—Preview format is PDF.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. If you need a PDF preview for files of type PDF, call the download version using the [File Content](#) resource.

- `svg`—Preview format is SVG.

SVG files are generated on demand. Alternatively, you can generate an SVG preview by making a PATCH request to [/connect/files/\*\*fileId\*\*/previews](#).

**Note:** Hyperforce doesn't support the SVG file preview format. Any org hosted on Hyperforce defaults to JPG file preview format regardless of the org preference in Setup.

- `thumbnail`—Preview format is 240 x 180 PNG.
- `big-thumbnail`—Preview format is 720 x 480 PNG.
- `tiny-thumbnail`—Preview format is 120 x 90 PNG.

**Available version**

36.0

**HTTP methods**

GET, HEAD

**Request parameters for GET**

| Parameter Name  | Type    | Description                                                 | Required or Optional | Available Version |
|-----------------|---------|-------------------------------------------------------------|----------------------|-------------------|
| endPageNumber   | Integer | The ending page number in the range of file preview URLs.   | Optional             | 36.0              |
| startPageNumber | Integer | The starting page number in the range of file preview URLs. | Optional             | 36.0              |

**Response body for GET**[File Preview](#)

## Files Connect Repository Folder

Get information about a repository folder.

**Resource**

```
/connect/content-hub/repositories/repositoryId/folders/repositoryFolderId
```

```
/connect/communities/communityId/content-hub/repositories/repositoryId/folders/repositoryFolderId
```

**Available version**

38.0

**HTTP methods**

GET, HEAD

**Response body for GET**[Repository Folder Detail](#)

## Files Connect Repository Folder Allowed Item Types

Returns item types that are allowed to be created in the repository folder.

To get information about a specific item type, make a GET request to

```
/connect/content-hub/repositories/repositoryId/item-types/repositoryItemTypeId
```

**Resource**

```
/connect/content-hub/repositories/repositoryId/folders/repositoryFolderId/allowed-item-types
```

```
/connect/communities/communityId/content-hub/repositories/repositoryId/folders/repositoryFolderId/allowed-item-types
```

**Available version**

35.0

**HTTP methods**

GET, HEAD

**Request parameters for GET**

| Parameter Name      | Type   | Description                                                                                                                                                                                                                                                                                            | Required or Optional | Available Version |
|---------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>filter</code> | String | Specifies the item types. Values are: <ul style="list-style-type: none"><li>• <code>Any</code>—Includes files and folders.</li><li>• <code>FilesOnly</code>—Includes files only.</li><li>• <code>FoldersOnly</code>—Includes folders only.</li></ul> In version 35.0, specify <code>FilesOnly</code> . | Optional             | 35.0              |

**Response body for GET**

[Files Connect Allowed Item Type Collection](#)

## Files Connect Repository Folder Items

Get information about the files and folders in a repository folder. Create a file in a repository folder.

To upload a file, send it in a multipart/form-data request. You can include metadata for the file in the multipart/form-data request as a JSON or XML request body. For information about how to create the multipart/form-data message, see [Uploading Binary Files](#).

**Resource**

```
/connect/content-hub/repositories/repositoryId/folders/repositoryFolderId/items
```

```
/connect/communities/communityId/content-hub/repositories/repositoryId/folders/repositoryFolderId/items
```

**Available version**

32.0

The communities resource is available in version 35.0 and later.

**HTTP methods**

GET, HEAD, POST

POST is supported in version 35.0 and later.

**Request parameters for GET**

| Parameter Name        | Type    | Description                                                                                                                       | Required or Optional | Available Version |
|-----------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>page</code>     | Integer | An integer specifying a page of items. The default value is 0, which returns the first page.                                      | Optional             | 32.0              |
| <code>pageSize</code> | Integer | Specifies the number of items per page. Valid values are between 1 and 100. If you pass in <code>null</code> , the default is 25. | Optional             | 32.0              |

Response body for GET

[Repository Folder Items Collection](#)

Request body for POST

Uploads to repositories are limited to 75 MB.

Before you create an item in a repository folder, check to see which item types you’re allowed to create. Make a GET request to [/connect/content-hub/repositories/\*\*repositoryId\*\*/folders/\*\*repositoryFolderId\*\*/allowed-item-types](#).

Response body for POST

[Repository Folder Item](#)

**Example POST request**

This example creates a file and uploads it to an external repository. The example shows the body parts in a multipart/form-data request. The first body part is a Files Connect Item Input request body. The second is the content of the file. For more information, see [Uploading Binary Files](#).

```

**Files Connect Repository Item Type**

Returns information about an item type associated with a repository.

**Resource**

```
/connect/content-hub/repositories/repositoryId/item-types/repositoryItemId
```

```
/connect/communities/communityId/content-hub/repositories/repositoryId/item-types/repositoryItemId
```

**Available version**

35.0

**HTTP methods**

GET, HEAD

**Response body for GET**[Files Connect Item Type Detail](#)

## Files Connect Repository Permissions

Get or update the permissions of a repository file.

Managing external file permissions is supported for Google Drive, SharePoint Online, and OneDrive for Business.

**Resource**

```
/connect/content-hub/repositories/repositoryId/items/repositoryItemId/permissions
```

```
/connect/communities/communityId/content-hub/repositories/repositoryId/items/repositoryItemId/permissions
```

The *repositoryItemId* must be a file ID.

**Available version**

35.0

**HTTP methods**

GET, HEAD, PATCH

**Response body for GET**[Files Connect Permission Collection](#)**Request body for PATCH****Root XML tag**

```
<contentHubPermissions>
```

**JSON example**

```
{
  "permissionsToApply": [
    {
      "directoryEntryId" : "Anyone",
      "permissionTypesIds" : ["CanView"]
    }
  ],
  "permissionsToRemove": [
    {
      "directoryEntryId" : "AnyoneInMyDomain",
      "permissionTypesIds" : ["CanDelete","CanEdit"]
    }
  ]
}
```

**Properties**

| Name                    | Type                                             | Description                                  | Required or Optional                             | Available Version |

| <a href="#">/connect/files/<b>fileId</b></a>                                  | Get information about a specified file, including references to external files. Upload a new version of an existing file, including references to external files. Rename a file, move a file to a different folder, and delete a file. |
| <a href="#">/connect/files/<b>fileId</b>/asset</a>                            | Create an asset file.                                                                                                                                                                                                                  |
| <a href="#">/connect/file-assets/<b>assetId</b></a>                           | Get information about an asset file or change the visibility of an asset file for unauthenticated users.                                                                                                                               |
| <a href="#">/connect/file-assets/<b>fullyQualifiedName</b><br/>/content</a>   | Get the streamed content of an asset file.                                                                                                                                                                                             |
| <a href="#">/connect/file-assets/<b>fullyQualifiedName</b><br/>/rendition</a> | Get up to 25 streamed renditions of an asset file. A rendition is a binary preview of the file.                                                                                                                                        |
| <a href="#">/connect/file-assets/batch/<b>assetIds</b></a>                    | Get information about a comma-separated list of up to 100 asset files.                                                                                                                                                                 |
| <a href="#">/connect/files/<b>fileId</b>/content</a>                          | Returns the content of the file, including references to external files. The content is streamed as the body of the response.                                                                                                          |
| <a href="#">/connect/files/<b>fileId</b>/file-shares</a>                      | Get the users, groups, or records with which a file has been shared. Share a file with users.                                                                                                                                          |
| <a href="#">/connect/files/<b>fileId</b>/file-shares/link</a>                 | Get, create, and delete a file's share link.                                                                                                                                                                                           |
| <a href="#">/connect/files/<b>fileId</b>/image</a>                            | Get information about a file image.                                                                                                                                                                                                    |
| <a href="#">/connect/files/<b>fileId</b>/previews</a>                         | Get information about a file's supported previews and generate up to 500 pages in a file preview.                                                                                                                                      |
| <a href="#">/connect/files/<b>fileId</b>/previews/<b>previewFormat</b></a>    | Get up to 500 pages in a file preview or get a specific page in a preview.                                                                                                                                                             |
| <a href="#">/connect/files/<b>fileId</b>/rendition</a>                        | A rendition of the file. A rendition is a binary preview of the file. The format of the binary depends on the format specified in the request.                                                                                         |

| Resource                                            | Description                                                                                                                 |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/connect/files/batch/<i>fileIds</i></a> | Information about a list of files, specified by file IDs. Get information about a list of files and delete a list of files. |

## File Upload Config

Get the file upload config.

### Resource

```
/connect/file/upload/config
```

### Available version

62.0

### HTTP methods

GET

### Response body for GET

[File Upload Config](#)

## File Information

Get information about a specified file, including references to external files. Upload a new version of an existing file, including references to external files. Rename a file, move a file to a different folder, and delete a file.

To upload a new version of an existing file, make a POST request. Upload the new version as a binary part in a multipart/form-data request. See [Uploading Binary Files](#). To upload a new file to the Files home, use [/connect/files/users/me](#).

### Resource

```
/connect/files/fileId
```

```
/connect/communities/communityId/files/fileId
```

### Available since version

36.0

In versions 24.0–35.0, use `/chatter/files/fileId` and

`/connect/communities/communityId/chatter/files/fileId`, which require Chatter.

### HTTP methods

GET, POST, PATCH, and DELETE

**Note:** POST, PATCH, and DELETE available since version 26.0.

### Request body for POST

#### Root XML tag

```
<fileInput>
```

#### JSON

```
{
  "desc" : "Employee Survey Results",
```

```

    "title" : "emp_surv_results"
  }

```

### Properties

| title          | String  | Title of the file.                                                                                                                                                                                                                                      | 26.0              |

**Request parameters for GET**

Get information about the specified file.

| Name          | Type    | Description                                                                                        | Available Version |
|---------------|---------|----------------------------------------------------------------------------------------------------|-------------------|
| versionNumber | Integer | Specify an existing version number for the file. If not specified, the latest version is returned. | 23.0              |

**Request parameters for PATCH**

Update the title of a file or move a file to a different folder.

| Name                        | Type    | Description                                                                                                                                                                                                                                                | Available Version |
|-----------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <code>desc</code>           | String  | A new description for the file                                                                                                                                                                                                                             | 32.0              |
| <code>title</code>          | String  | A new title for the file                                                                                                                                                                                                                                   | 26.0              |
| <code>isInMyFileSync</code> | Boolean | <code>true</code> if the file is synced with Salesforce Files Sync; <code>false</code> otherwise.<br><br> <b>Note:</b> Salesforce Files Sync was retired on May 25, 2018. | 31.0              |
| <code>parentFolderId</code> | String  | ID of the containing folder                                                                                                                                                                                                                                | 31.0              |
| <code>sharingOption</code>  | String  | Sharing option of the file. Values are: <ul style="list-style-type: none"> <li><code>Allowed</code>—Resharing of the file is allowed.</li> <li><code>Restricted</code>—Resharing of the file is restricted.</li> </ul>                                     | 35.0              |
| <code>sharingPrivacy</code> | String  | Sharing privacy of a file. Values are: <ul style="list-style-type: none"> <li><code>None</code>—File is visible to anyone with record access.</li> <li><code>PrivateOnRecords</code>—File is private on records.</li> </ul>                                | 41.0              |

**Response body for GET, POST, and PATCH**

[File Detail](#)

**Response body for DELETE**

Returns a status code of 204.

**Example**

This PATCH request updates the title of a file:

```
/connect/files/069D00000001FHF?title=A+New+Title
```

## Asset File

Create an asset file.

**Resource**

```
/connect/files/fileId/asset
```

```
/connect/communities/communityId/files/fileId/asset
```

**Available version**

38.0

**HTTP methods**

POST

 **Note:** POST doesn't take a request body and doesn't require request parameters.

#### Request parameters for POST

| Parameter Name           | Type     | Description                                                                                                                                                                                                                                                | Required or Optional | Available Version |
|--------------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| assetLabel               | String   | Master label for the asset file. This internal label doesn't get translated.                                                                                                                                                                               | Optional             | 46.0              |
| developerName            | String   | Developer name for the asset file. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's org. | Optional             | 46.0              |
| isVisibleByExternalUsers | Boolean  | Indicates whether unauthenticated users can see the asset file ( <code>true</code> ) or not ( <code>false</code> ). If not specified, the default value is <code>false</code> .                                                                            | Optional             | 43.0              |
| shareWith                | String   | An org ID, Experience Cloud site ID, or content workspace ID with which to share the file.                                                                                                                                                                 | Optional             | 38.0 only         |
| shareWithIds             | String[] | A list of org IDs, Experience Cloud site IDs, or content workspace IDs with which to share the file.                                                                                                                                                       | Optional             | 39.0              |

#### Response body for POST

## Asset File Information

Get information about an asset file or change the visibility of an asset file for unauthenticated users.

#### Resource

```
/connect/file-assets/assetId
```

```
/connect/communities/communityId/file-assets/assetId
```

#### Available version

38.0

#### HTTP methods

GET, PATCH

PATCH is supported in version 43.0 and later.

### Request body for PATCH

#### Root XML tag

```
<fileAsset>
```

#### JSON example

```
{
  "isVisibleByExternalUsers": "true"
}
```

#### Properties

| Name                     | Type    | Description                                                                                                         | Required or Optional | Available Version |
|--------------------------|---------|---------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| isVisibleByExternalUsers | Boolean | Indicates whether unauthenticated users can see the asset file ( <code>true</code> ) or not ( <code>false</code> ). | Required             | 43.0              |

### Response body for GET and PATCH

## Asset File Content

Get the streamed content of an asset file.

#### Resource

```
/connect/file-assets/fullyQualifiedName/content
```

```
/connect/communities/communityId/file-assets/fullyQualifiedName/content
```

**Note:** The *fullyQualifiedName* is the namespace prefix, if there is one, followed by the developer name of the ContentAsset.

#### Available version

42.0

#### HTTP methods

GET

#### Request parameters for GET

| Parameter Name | Type    | Description                                                                                        | Required or Optional | Available Version |
|----------------|---------|----------------------------------------------------------------------------------------------------|----------------------|-------------------|
| versionNumber  | Integer | Specify an existing version number for the file. If not specified, the latest version is returned. | Optional             | 42.0              |

### Response body for GET

Binary stream of the content

## Asset File Rendition

Get up to 25 streamed renditions of an asset file. A rendition is a binary preview of the file.

### Resource

```
/connect/file-assets/fullyQualifiedName/rendition
```

```
/connect/communities/communityId/file-assets/fullyQualifiedName/rendition
```

**Note:** The *fullyQualifiedName* is the namespace prefix, if there is one, followed by the developer name of the ContentAsset.

### Available version

42.0

### HTTP methods

GET

### Request parameters for GET

| Parameter Name | Type    | Description                                                                                                                                                                                                                                                                                      | Required or Optional | Available Version |
|----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| format         | String  | Specify the format of the file, either <code>jpg</code> or <code>png</code> . If unspecified, BMP and JPG files default to JPG, and PNG files default to PNG.                                                                                                                                    | Optional             | 60.0              |
| height         | Integer | Specify the height of the image file in pixels.<br><br>You must specify a dimension greater than 24 pixels and smaller than the original image dimension. You can specify up to 25 image dimension combinations. If only height or width is specified, the original image dimension is returned. | Optional             | 42.0              |
| versionNumber  | Integer | Specify an existing version number for the file. If not specified, the latest version is returned.                                                                                                                                                                                               | Optional             | 42.0              |
| width          | Integer | Specify the width of the image file in pixels.<br><br>You must specify a dimension greater than 24 pixels and smaller than the original image dimension. You can specify up to 25 image dimension combinations. If only height or width is specified, the original image dimension is returned.  | Optional             | 42.0              |

### Response body for GET

Binary stream of the rendition

## Asset Files, Batch

Get information about a comma-separated list of up to 100 asset files.

**Resource**

/connect/file-assets/batch/*assetIds*

/connect/communities/*communityId*/file-assets/batch/*assetIds*

**Available version**

43.0

**HTTP methods**

GET

**Response body for GET**

[Batch Results](#)

## File Content

Returns the content of the file, including references to external files. The content is streamed as the body of the response.

**Resource**

/connect/files/*fileId*/content

/connect/communities/*communityId*/files/*fileId*/content

**Available since version**

36.0

In versions 24.0–35.0, use `/chatter/files/fileId/content` and `/connect/communities/communityId/chatter/files/fileId/content`, which require Chatter.

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name | Type    | Description                                                                                        | Required or Optional | Available Version |
|----------------|---------|----------------------------------------------------------------------------------------------------|----------------------|-------------------|
| isDataSync     | Boolean | Indicates whether an automated client generates the request.                                       | Optional             | 31.0              |
| versionNumber  | Integer | Specify an existing version number for the file. If not specified, the latest version is returned. | Optional             | 24.0              |

**Response body**

Binary stream of the file content.

## File Image

Get information about a file image.

**Resource**

```
/connect/files/fileId/image
```

```
/connect/communities/communityId/files/fileId/image
```

**Available version**

39.0

**HTTP methods**

GET

**Response body for GET**[Image File](#)

## File Shares

Get the users, groups, or records with which a file has been shared. Share a file with users.

**Resource**

```
/connect/files/fileId/file-shares
```

```
/connect/communities/communityId/files/fileId/file-shares
```

**Available since version**

36.0

In versions 24.0–35.0, use `/chatter/files/fileId/file-shares` and `/connect/communities/communityId/chatter/files/fileId/file-shares`, which require Chatter.

**HTTP methods**

GET, POST

POST is available in versions 30.0 and later.

**Request parameters for GET**

In versions 30.0 and later, the first share returned in a GET request is the organization record share. In communities, the first share returned is the network record share.

| Name     | Type    | Description                                                                                      | Required or Optional | Available Since |
|----------|---------|--------------------------------------------------------------------------------------------------|----------------------|-----------------|
| page     | Integer | An integer greater than 0 specifying a page of topics. The default value is zero.                | Optional             | 24.0            |
| pageSize | Integer | Specifies the number of items per page. Valid values are from 1 to 100. The default value is 25. | Optional             | 24.0            |

**Request body for POST****Root XML tag**

```
<fileShares>
```

**JSON example**

```
{
  "message": "I shared a document with you.",
  "shares": [
    { "id": "005D0000001Az4l", "sharingType": "V" },
    { "id": "005D0000001B2ny", "sharingType": "C" }
  ]
}
```

**Properties**

| Name    | Type                          | Description                                                                                                                           | Available Version |
|---------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| message | String                        | Private message body that's sent to the recipients. If digital experiences is enabled, an email is sent instead of a private message. | 30.0              |
| shares  | <a href="#">Share Input[]</a> | Collection of Share Input request bodies.                                                                                             | 30.0              |

**Request parameters for POST****Parameters for sharing a file with users**

| Name                       | Type   | Description                                                                                                                              | Required or Optional | Available Since |
|----------------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-----------------|
| id ( <b>1–9</b> )          | String | List of up to 9 user IDs to share this file with. This list must match the list of sharing types.                                        | Required             | 30.0            |
| message                    | String | Private message body that's sent to the recipients. If Salesforce Communities is enabled, an email is sent instead of a private message. | Optional             | 30.0            |
| sharingType ( <b>1–9</b> ) | String | List of sharing types, either C for collaborator or V for viewer. This list must match the list of user IDs.                             | Required             | 30.0            |

**Response body for GET and POST**

[File Shares Page](#)

**Example for POST**

This example uses request parameters to share a file with two users.

```
POST /connect/files/069D00000001JDU/file-shares?
id1=005D0000001LL8O&id2=005D0000001QdEL&sharingType1=C&sharingType2=V
```

Here is the same example using a request body.

```
POST /connect/files/069D00000001JDU/file-shares

{
```

```
"shares": [
  { "id": "005D0000001LL8O", "sharingType": "C" },
  { "id": "005D0000001QdEL", "sharingType": "V" }
]
```

## Files Shares Link

Get, create, and delete a file’s share link.

### Resource

```
/connect/files/fileId/file-shares/link

/connect/communities/communityId/files/fileId/file-shares/link
```

### Available since version

36.0

In versions 30.0–35.0, use `/chatter/files/fileId/file-shares/link` and `/connect/communities/communityId/chatter/files/fileId/file-shares/link`, which require Chatter.

### HTTP methods

GET, PUT, DELETE

### Request body for PUT

In version 36.0–57.0, PUT requests don’t require a request body and they ignore any request body provided. In version 58.0 and later, the [File Share Link Input](#) request body is available for PUT requests but isn’t required.

### Root XML tag

<fileShareLink>

### JSON example

```
{
  "expirationDate": "2024-07-07T23:59:11.168Z",
  "isPasswordRequired": "true"
}
```

### Properties

| Name                | Type    | Description                                                                                                                                                               | Required or Optional | Available Version |
|---------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| expirationDate      | String  | Expiration date of the generated public link.                                                                                                                             | Optional             | 58.0              |
| isPassword Required | Boolean | Specifies whether a password is needed for the file’s public link ( <code>true</code> ) or not ( <code>false</code> ). Specifying <code>true</code> generates a password. | Optional             | 58.0              |

## File Previews

Get information about a file's supported previews and generate up to 500 pages in a file preview.

Resource

/connect/files/**fileId**/previews

/connect/communities/**communityId**/files/**fileId**/previews

Available version  
36.0

In version 35.0, use /chatter/files/**fileId**/previews and /connect/communities/**communityId**/chatter/files/**fileId**/previews, which require Chatter.

HTTP methods  
GET, HEAD, PATCH

Request parameters for GET and PATCH

| Parameter Name | Type    | Description                                                  | Required or Optional | Available Version |
|----------------|---------|--------------------------------------------------------------|----------------------|-------------------|
| versionNumber  | Integer | Version number of the file. Default value is latest version. | Optional             | 40.0              |

Response body for GET and PATCH  
[File Preview Collection](#)

## File Preview

Get up to 500 pages in a file preview or get a specific page in a preview.

Resource

/connect/files/**fileId**/previews/**previewFormat**

/connect/communities/**communityId**/files/**fileId**/previews/**previewFormat**

Supported values for *previewFormat*:

- `jpg`—Preview format is JPG.  
If you're concerned that feature-rich SVG previews don't work in your org, choose alternative file previews. To use JPG file previews, enter `general` in the Quick Find box in Setup. Select General Settings, and then select **Display alternative file previews**.
- `pdf`—Preview format is PDF.  
PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. If you need a PDF preview for files of type PDF, call the download version using the [File Content](#) resource.
- `svg`—Preview format is SVG.

SVG files are generated on demand. Alternatively, you can generate an SVG preview by making a PATCH request to `/connect/files/fileId/previews`.

 **Note:** Hyperforce doesn't support the SVG file preview format. Any org hosted on Hyperforce defaults to JPG file preview format regardless of the org preference in Setup.

- `thumbnail`—Preview format is 240 x 180 PNG.
- `big-thumbnail`—Preview format is 720 x 480 PNG.
- `tiny-thumbnail`—Preview format is 120 x 90 PNG.

**Available version**

36.0

In version 35.0, use `/chatter/files/fileId/previews/previewFormat` and `/connect/communities/communityId/chatter/files/fileId/previews/previewFormat`, which require Chatter.

**HTTP methods**

GET, HEAD

**Request parameters for GET**

| Parameter Name               | Type    | Description                                                                                           | Required or Optional | Available Version |
|------------------------------|---------|-------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>endPageNumber</code>   | Integer | The ending page number in the range of file preview URLs. Up to 500 pages are available in preview.   | Optional             | 35.0              |
| <code>startPageNumber</code> | Integer | The starting page number in the range of file preview URLs. Up to 500 pages are available in preview. | Optional             | 35.0              |
| <code>versionNumber</code>   | Integer | Version number of the file. Default value is latest version.                                          | Optional             | 40.0              |

**Response body for GET**

[File Preview](#)

**File Rendition**

A rendition of the file. A rendition is a binary preview of the file. The format of the binary depends on the format specified in the request.

 **Note:** For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.

**Resource**

`/connect/files/fileId/rendition`

`/connect/communities/communityId/files/fileId/rendition`

**Available since version**

36.0

In versions 24.0–35.0, use `/chatter/files/fileId/rendition` and `/connect/communities/communityId/chatter/files/fileId/rendition`, which require Chatter.

### HTTP methods

GET

### Request parameters

| Name | Type    | Description                                                                                                                                                                                                                                                                                              |
|------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| page | Integer | <p>Specify a rendition of a specific page. The first page is 0. If you don't specify a specific page, a rendition of the first page is returned.</p> <p>For a PDF file rendition, the rendition is for the entire document. The only valid value is 0: you can't get the rendition of a single page.</p> |
| type | String  | <p>Specify the type of rendition to be returned. Default value is THUMB120BY90. Valid values are:</p> <ul style="list-style-type: none"><li>• PDF</li><li>• THUMB120BY90</li><li>• THUMB240BY180</li><li>• THUMB720BY480</li></ul>                                                                       |

### Response body

Binary stream of the rendition.

## File Information, Batch

Information about a list of files, specified by file IDs. Get information about a list of files and delete a list of files.

The number of file IDs you can specify is limited by the length of the URL. In general, you can specify up to 100 file IDs in a comma-separated list.

### Resource

```
/connect/files/batch/fileIds
```

```
/connect/communities/communityId/files/batch/fileIds
```

### Available since version

36.0

In versions 26.0–35.0, use `/chatter/files/batch/fileIds` and `/connect/communities/communityId/chatter/files/batch/fileIds`, which require Chatter.

### HTTP methods

GET, DELETE

**Response body**[Batch Result Item](#)

## Folders Resources

Get information about a folder or the contents of a folder. Modify, delete, and add items to folders.

Available resources:

| Resource                                                            | Description                                                                                 |
|---------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <a href="#">/connect/folders/<i>folderId</i></a>                    | Get information about the specified folder. Move, rename, and delete a folder.              |
| <a href="#">/connect/folders/<i>folderId</i>/items</a>              | Get information about the contents of a folder. Add a file to a folder and create a folder. |
| <a href="#">/connect/folders/<i>folderId</i>/folder-shares/link</a> | A folder shared as a link. Create, access, and delete a folder's share link.                |

## Folder Information

Get information about the specified folder. Move, rename, and delete a folder. Deleting a folder deletes all the folders within that folder and removes all files from the deleted folders.

**Resource**

```
/connect/folders/folderId
```

**Note:** You can use `root` as the *folderId*.

**Available since version**

36.0

In versions 30.0–35.0, use `/chatter/folders/folderId`, which requires Chatter.

**HTTP methods**

GET, HEAD, PATCH, DELETE

**Request body for PATCH**[Folder Input](#)**Request parameters for PATCH****Move a folder**

| Parameter                                                       | Type    | Description                                                                                                                         | Required or Optional | Available Version |
|-----------------------------------------------------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>isInMyFileSync</code>                                     | Boolean | <code>true</code> if the folder and all folders in this folder are synced with Salesforce Files Sync; <code>false</code> otherwise. | Optional             | 33.0              |
| <b>Note:</b> Salesforce Files Sync was retired on May 25, 2018. |         |                                                                                                                                     |                      |                   |

| Parameter          | Type   | Description                                                                                                                                                                                                       | Required or Optional | Available Version |
|--------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| parent<br>FolderId | String | The ID of the new parent folder. If <code>null</code> , the folder is removed from its current folder. If the specified ID is <code>root</code> , the folder is moved to the root of the user's folder hierarchy. | Required             | 30.0              |

### Rename a folder

| Parameter          | Type    | Description                                                                                                                                                                                                                                                                                  | Required or Optional | Available Version |
|--------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| isInMy<br>FileSync | Boolean | <code>true</code> if the folder and all folders in this folder are synced with Salesforce Files Sync; <code>false</code> otherwise.<br><br> <b>Note:</b> Salesforce Files Sync was retired on May 25, 2018. | Optional             | 33.0              |
| name               | String  | The new name for the folder                                                                                                                                                                                                                                                                  | Required             | 30.0              |

### Response body for GET and PATCH

[Folder](#)

## Folder Contents

Get information about the contents of a folder. Add a file to a folder and create a folder.

To create a folder, you can use a request body or request parameters in a POST request.

To create a file, you must send it as a body part in a multipart/form-data POST request. You can send the description and title information in a JSON or XML rich input body in a part of the multipart/form-data request. Alternately, you can send the description, title, and type in request parameters. See [Uploading Binary Files](#). To upload a file to the Files home, use </connect/files/users/me>.

### Resource

```
/connect/folders/folderId/items
```

 **Note:** You can use `root` as the `folderId`.

### Available since version

36.0

In versions 30.0–35.0, use `/chatter/folders/folderId/items`, which requires Chatter.

### HTTP methods

GET and POST

**Request parameters for GET**

| Parameter             | Type    | Description                                                                                                                  | Required or Optional | Available Version |
|-----------------------|---------|------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>filter</code>   | String  | Specifies a filter for items within a folder.                                                                                | Optional             | 33.0              |
| <code>page</code>     | Integer | An integer specifying a page of items. The default value is 0, which returns the first page.                                 | Optional             | 30.0              |
| <code>pageSize</code> | Integer | Specifies the number of items per page. Valid values are from 1 through 100. If you don't specify a size, the default is 25. | Optional             | 30.0              |

**IN THIS SECTION:**[Forecasting Jump-To-User-Or-Territory](#)

Get a list of users and territories whose forecasts the context user has access to view.

[Forecasting Manager Parents by User Role or Territory ID](#)

Get a list of managers or territories between the context user and a specified user or territory in the forecast hierarchy.

[Forecasting My Forecasts List](#)

Get the appropriate list of forecasts for a given user's dropdown menu on the forecasts page.

[Forecasting User Access by Forecasting Type](#)

Get information about the context user's access to the user to which you need access.

## Forecasting Jump-To-User-Or-Territory

Get a list of users and territories whose forecasts the context user has access to view.

**Resource**

```
/connect/forecasting/jump-to-user/forecastingTypeId
```

**Available version**

44.0

In versions 36.0–43.0, use [Forecasting Jump-To-User](#).

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Required or Optional | Available Version |
|----------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| nameStartsWith | String | <p>The first few letters of the user's or territory's name. The system compares the string and returns entries that match any of the following.</p> <ul style="list-style-type: none"><li>• The first name and last name of all users that the context user has access to</li><li>• The names of all territories that the context user has access to</li></ul> <p>Typing one or two letters returns a list of users only. Typing three or more letters returns a list of users and territories. For best results, start typing a territory name, and then select a user's name from the results.</p> | Required             | 44.0              |

**Response body for GET**[Forecasting User Collection](#)

## Forecasting Manager Parents by User Role or Territory ID

Get a list of managers or territories between the context user and a specified user or territory in the forecast hierarchy.

**Resource**

```
/connect/forecasting/ancestors/forecastingTypeId
```

**Available version**

44.0

In version 36.0–43.0, use [Forecasting Manager Ancestors Query](#) and [Forecasting Manager Ancestors, Specific User](#).

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name | Type   | Description                                                      | Required or Optional | Available Version |
|----------------|--------|------------------------------------------------------------------|----------------------|-------------------|
| territory2Id   | String | The unique identifier of the territory attached to this profile. | Required             | 44.0              |

| Parameter Name          | Type   | Description                                                                    | Required or Optional | Available Version |
|-------------------------|--------|--------------------------------------------------------------------------------|----------------------|-------------------|
| <code>userRoleId</code> | String | The unique identifier of the forecasting user's role attached to this profile. | Required             | 44.0              |

**Response body for GET**[Forecasting Ancestors](#)

## Forecasting My Forecasts List

Get the appropriate list of forecasts for a given user's dropdown menu on the forecasts page.

**Resource**

```
/connect/forecasting/my-forecasts-list/forecastingTypeId
```

**Available version**

44.0

**HTTP methods**

GET

**Response body for GET**[Forecasting My Forecasts Collection](#)**Usage**

For the default case, only `forecastingTypeId` is passed in as a parameter. The appropriate lists are populated in `MyForecastsCollection` based on the `forecastingTypeId` that is passed in. For example, if a context user who does not have the View All Forecasts permission and does not have any forecasts shared with them passes in a territory-based `forecastingTypeId`, the `forecastManagerList` and `representativeList` are populated but the `viewAllForecastsList` and `sharedList` are not.

## Forecasting User Access by Forecasting Type

Get information about the context user's access to the user to which you need access.

**Resource**

```
/connect/forecasting/user-access/userId/forecastingTypeId
```

**Available version**

43.0.

In version 36.0–42.0, use [Forecasting User Access](#).

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name | Type | Description                                                                   | Required or Optional | Available Version |
|----------------|------|-------------------------------------------------------------------------------|----------------------|-------------------|
| territory2Id   | Id   | ID of the territory that we're trying to determine whether a user can access. | Optional             | 43.0              |
| user           | Id   | ID of the user for which we're trying to retrieve access.                     | Optional             | 43.0              |

**Response body for GET**[Forecasting User Access Collection](#)

## Knowledge Article View Stat Resource

Increase the view count of a knowledge article by one.

**Resource**

```
/connect/knowledge/article/view-stat
```

```
/connect/communities/communityId/knowledge/article/view-stat
```

**Available version**

48.0

**HTTP methods**

PATCH

**Request body for PATCH****Root XML tag**

```
<knowledgeArticleViewStat>
```

**JSON example**

```
{
  "articleOrVersionId": "ka230000000PCiy"
}
```

**Properties**

| Name               | Type   | Description                                                                                                                                                                                          | Required or Optional | Available Version |
|--------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| articleOrVersionId | String | ID of the knowledge article or knowledge article version to increase the view count by one.<br><br>If you provide the ID of a knowledge article version, the parent article view count is increased. | Required             | 48.0              |

**Request parameters for PATCH**

| Parameter Name     | Type   | Description                                                                                                                                                                                          | Required or Optional | Available Version |
|--------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| articleOrVersionId | String | ID of the knowledge article or knowledge article version to increase the view count by one.<br><br>If you provide the ID of a knowledge article version, the parent article view count is increased. | Required             | 48.0              |

## List Share Resources

Share list views with different groups in your org and use sharing to limit who is able to see a list view.

Available resources:

| Resource                                               | Description                                                                   |
|--------------------------------------------------------|-------------------------------------------------------------------------------|
| <a href="#">/connect/list-shares/<i>listViewId</i></a> | Get share data for a list view.                                               |
| <a href="#">/connect/list-share-recipients</a>         | Get data on all groups, and all potential groups, a list view is shared with. |

## List Shares

Get share data for a list view.

**Resource**

```
/connect/list-shares/listViewId
```

**Available version**

44.0

**HTTP methods**

GET, PUT, DELETE

**Request body for PUT**

A PUT request replaces all shares associated with a list view with the provided collection.

**JSON example**

```
{ "currentListShares": [ "00GD00000000izfKAA", "00GD00000000izfKAA",  
  "00GD00000000izfKAA" ]  
}
```

**Properties**

| Name              | Type     | Description                                                                                           | Required or Optional | Available Version |
|-------------------|----------|-------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| currentListShares | String[] | List of API names or 15-character IDs that identify the groups or roles with which to share the list. | Required             | 44.0              |

**Response body for GET and PUT**[List Current Share Collection](#)**Response for DELETE**[204: Successful Delete](#)

## List Share Recipients

Get data on all groups, and all potential groups, a list view is shared with.

**Resource**

```
/connect/list-share-recipients
```

**Available version**

44.0

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name | Type   | Description                                                                                                                                                                                                                                                                                       | Required or Optional | Available Version |
|----------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| listViewId     | String | To find out which groups a specific list view can be shared with, use this parameter. When provided, entities that are already shared with the provided list view are removed from the output.<br><br>To return all the possible groups to share a new a new list view with, omit this parameter. | Optional             | 44.0              |
| q              | String | Filters results to groups or roles whose name contains the search term.                                                                                                                                                                                                                           | Optional             | 44.0              |
| shareType      | String | Filters results to the type of group a list view is shared with. Values are: <ul style="list-style-type: none"><li>ChannelProgramGroup—Shared with a channel program.</li><li>Regular—Shared with a group.</li></ul>                                                                              | Optional             | 44.0              |

| Parameter Name | Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                    | Required or Optional | Available Version |
|----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
|                |      | <ul style="list-style-type: none"> <li>• <b>Role</b>—Shared with a role.</li> <li>• <b>RoleAndSubordinates</b>—Shared with a role and all subordinates types.</li> <li>• <b>RoleAndSubordinatesInternal</b>—Shared with a role and subordinates that aren't partners.</li> <li>• <b>Territory</b>—Shared with a territory.</li> <li>• <b>TerritoryAndSubordinates</b>—Shared with a territory and its subordinates.</li> </ul> |                      |                   |

**Response body for GET**[List Share Collection](#)

## Managed Topics Resources

Managed topics for an Experience Cloud site. Get a list of managed topics. Create a managed topic hierarchy. Create, delete, or reorder managed topics.

Available resources:

| Resource                                                                                                                                            | Description                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="/connect/communities/{communityId}/managed-topics">/connect/communities/{communityId}/managed-topics</a>                                   | Get all the managed topics for an Experience Cloud site. Create a managed topic, create managed topic hierarchies, and reorder managed topics. |
| <a href="/connect/communities/{communityId}/managed-topics/{managedTopicId}">/connect/communities/{communityId}/managed-topics/{managedTopicId}</a> | Get information about or delete a managed topic in an Experience Cloud site.                                                                   |

## Managed Topics

Get all the managed topics for an Experience Cloud site. Create a managed topic, create managed topic hierarchies, and reorder managed topics.

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can create or reorder managed topics.

**Resource**

```
/connect/communities/{communityId}/managed-topics
```

**Available version**

32.0

**HTTP methods**

GET, POST, PATCH, HEAD

**Request parameters for GET**

If you make a GET request without request parameters, you get only featured and navigational topics. To get content topics, make a GET request with the `managedTopicType` parameter set to `Content`, for example:

```
/connect/communities/communityId/managed-topics?&managedTopicType=Content
```

To see all your managed topic hierarchies, make a GET request with the `depth` parameter set to `8` and the `managedTopicType` set to `Navigational`, for example:

```
/connect/communities/communityId/managed-topics?depth=8&managedTopicType=Navigational
```

| Parameter Name                | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Required or Optional                                                                                                                       | Available Version |
|-------------------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <code>depth</code>            | Integer | Specify an integer 1–8. If you specify 1, the <code>children</code> property of the Managed Topic response body is null. If you specify 2, the <code>children</code> property of the Managed Topic response body contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If <code>depth</code> isn't specified, it defaults to 1.                                                                                                                                                                                                                                                                                     | Optional                                                                                                                                   | 35.0              |
| <code>managedTopicType</code> | String  | <p>Type of managed topic.</p> <ul style="list-style-type: none"> <li><code>Content</code>—Topics that are associated with native content.</li> <li><code>Featured</code>—Topics that are featured, for example, on the Experience Cloud site home page, but don't provide overall navigation.</li> <li><code>Navigational</code>—Topics that display in a navigational menu in the Experience Cloud site.</li> </ul> <p>A topic can be associated with all three managed topic types, so a topic can be a <code>Featured</code>, <code>Navigational</code>, and <code>Content</code> topic.</p> <p>If you specify <code>Content</code> and you want more than 50 topics to be returned, use the <code>page</code> and <code>pageSize</code> parameters.</p> | <p>Optional</p> <p>Required if specifying <code>recordIds</code> or <code>depth</code></p> <p>Required for <code>Content</code> topics</p> | 32.0              |
| <code>page</code>             | Integer | Number of the page you want returned. Starts at 0. If you don't specify a value or if you specify 0, the first page is returned. If you specify 2–8 for the <code>depth</code> , the <code>page</code> and <code>pageSize</code> properties apply only to                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Optional                                                                                                                                   | 44.0              |

| Parameter Name | Type         | Description                                                                                                                                                                                                                                                                                                                       | Required or Optional | Available Version |
|----------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
|                |              | the top-level managed topics and not to children managed topics.                                                                                                                                                                                                                                                                  |                      |                   |
| pageSize       | Integer      | Specifies the number of items per page. Valid values are from 1 through 100. If you pass in <code>null</code> , the default size is 50. If you specify 2–8 for the <code>depth</code> , the <code>page</code> and <code>pageSize</code> properties apply only to the top-level managed topics and not to children managed topics. | Optional             | 44.0              |
| recordId       | String       | ID of the topic associated with the managed topics.<br><br>In version 38.0 and later, use <code>recordIds</code> .                                                                                                                                                                                                                | Optional             | 35.0–37.0         |
| recordIds      | List<String> | List of up to 100 topic IDs associated with the managed topics.<br><br>If you list more than 10 topic IDs, you can't specify 2–8 for <code>depth</code> .                                                                                                                                                                         | Optional             | 38.0              |

**Response body for GET**[Managed Topic Collection](#)**Request body for POST**

Make POST requests to create managed topics and create topic hierarchies.

**Root XML tag**

```
<managedTopic>
```

**JSON example using recordId**

This example creates a managed topic from an existing standard topic (using the `recordId` of the standard topic). It also creates a topic hierarchy by assigning a parent topic with the `parentId`.

```
{
  "managedTopicType": "Navigational",
  "parentId": "0mtR000000001KLIAY",
  "recordId": "0TOD000000000cwk"
}
```

**JSON example using name**

This example creates a new managed topic by name and creates a topic hierarchy by assigning a parent topic with the `parentId`.

```
{
  "name": "Child Topic",
  "managedTopicType": "Navigational",
  "parentId": "0mtR000000001KLIAY"
}
```

**Properties**

| Name                          | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Required or Optional                                                                                                              | Available Version |

**Response body for POST**[Managed Topic](#)**Request body for PATCH**

Make a PATCH request to reorder parent managed topics or children managed topics with the same parent. You can't reorder Content topics.

**Root XML tag**

```
<managedTopicPositionCollection>
```

**JSON example**

```
{
  "managedTopicPositions" : [
    {
      "managedTopicId" : "0mtD0000000001aIAA",
      "position" : "0"
    },
    {
      "managedTopicId" : "0mtD0000000002qIAA",
      "position" : "2"
    }
  ]
}
```

```

    ]
  }

```

**Properties**

| Name                  | Type                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Required or Optional | Available Version |
|-----------------------|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| managedTopicPositions | <a href="#">Managed Topic Position Input[]</a> | <p>Collection of managed topic position request bodies. This collection can include <code>Featured</code> and <code>Navigational</code> managed topics and doesn't have to include all managed topics.</p> <p>If you don't include all managed topics in <code>managedTopicPositions</code>, the managed topics are reordered by respecting the positions indicated in <code>managedTopicPositions</code>. Any managed topics that aren't included in <code>managedTopicPositions</code> are pushed down to the next available position. See <a href="#">Reorder managed topics example</a>.</p> | Required             | 32.0              |

**Reorder managed topics example**

If you have these managed topics:

| Managed Topic | Position |
|---------------|----------|
| ManagedTopicA | 0        |
| ManagedTopicB | 1        |
| ManagedTopicC | 2        |
| ManagedTopicD | 3        |
| ManagedTopicE | 4        |

And you reorder managed topics by including this information in Managed Topic Position Collection Input:

| Managed Topic | Position |
|---------------|----------|
| ManagedTopicD | 0        |
| ManagedTopicE | 2        |

The result is:

| Managed Topic | Position |
|---------------|----------|
| ManagedTopicD | 0        |
| ManagedTopicA | 1        |
| ManagedTopicE | 2        |
| ManagedTopicB | 3        |
| ManagedTopicC | 4        |

**Response body for PATCH**[Managed Topic Collection](#)

## Managed Topic

Get information about or delete a managed topic in an Experience Cloud site.

Only community managers (users with the Create and Set Up Experiences or Manage Experiences permission) can delete managed topics.

**Resource**

```
/connect/communities/communityId/managed-topics/managedTopicId
```

**Available version**

32.0

**HTTP methods**

GET, DELETE, HEAD

**Request parameters for GET**

| Parameter Name | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                | Required or Optional | Available Version |
|----------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| depth          | Integer | Specify an integer 1–8. If you specify 1, the <code>children</code> property of the Managed Topic response body is null. If you specify 2, the <code>children</code> property of the Managed Topic response body contains the direct children managed topics, if any, of the managed topic. If you specify 3–8, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1. | Optional             | 35.0              |

**Response body for GET**[Managed Topic](#)**Response body for DELETE**[204: Successful Delete](#)

## Messaging Channels Resource

Manage Messaging channels. You can get Messaging channels using the GET method. If a channel doesn't already have an ID, you can add and register it by taking the data from the GET method and passing it to the POST method.

### Resource

```
/connect/livemessage/channels
```

### Available version

44.0

### HTTP methods

GET, POST

### Request parameters for GET

| Parameter Name | Type    | Description                                                                                                                                                                                                                                                                                                                                           | Required or Optional                                 | Available Version |
|----------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|-------------------|
| authProviderId | String  | ID of the authentication provider record that the user created during authentication. If this value is not provided, the request only queries the org and doesn't query any external sources. If this value is provided, it must have a valid, unexpired token.                                                                                       | Optional                                             | 44.0              |
| cursor         | String  | Paged cursor position. The response to a GET can be paged. If it is paged, we provide a cursor in the response. Passing that cursor as an argument to the next GET request provides the next page. If the cursor is missing from the response, there are no additional pages. If the cursor is not passed as an argument, the first page is returned. | Optional                                             | 44.0              |
| limit          | Integer | Maximum number of channels to return in the response to the GET request. If provided, the response is paged. If not provided, the response contains all channels, which can take some time if you have many channels.                                                                                                                                 | Optional                                             | 44.0              |
| messageType    | String  | Type of channel. Values are: <ul style="list-style-type: none"><li>• <code>Facebook</code>—A Facebook message.</li><li>• <code>Line</code>—A LINE message.</li><li>• <code>Text</code>—A text message.</li></ul>                                                                                                                                      | Required if the <code>authProviderId</code> is given | 44.0              |

|---------------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|-------------------|
| <code>contentDocumentIds</code> | String[] | List of content document IDs to create content document links between files and records.                                                                                                                                                                    | Optional                                                           | 56.0              |
| <code>groupBy</code>            | String   | Grouping of records for batch creation. The default behavior groups records by network ID. For example, if you specify account ID, records are grouped by network ID and account ID. You can specify one value, and there isn't validation of the property. | Optional                                                           | 55.0              |
| <code>keyPrefix</code>          | String   | Object <code>keyPrefix</code> that a specified <code>processType</code> is tied to in the microbatching framework.                                                                                                                                          | Required for <code>GENERIC</code> process type, otherwise optional | 55.0              |
| <code>processType</code>        | String   | Logical name of the flow in the microbatching framework, for example, <code>LEAD_MS</code> or <code>GENERIC</code> .                                                                                                                                        | Required                                                           | 55.0              |

| Name        | Type                | Description                              | Required or Optional | Available Version |
|-------------|---------------------|------------------------------------------|----------------------|-------------------|
| requestBody | Map<String, Object> | Map of input fields in name value pairs. | Required             | 55.0              |

## Microbatching Errors Resource

Get and delete microbatching errors.

### Resource

```
/connect/communities/communityId/microbatching/errors
```

/connect/microbatching/errors (version 54.0 only)

### Available version

54.0

### HTTP methods

GET, DELETE

### Request parameters for GET

| Parameter Name | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Required or Optional | Available Version |
|----------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| earliestDate   | String | ISO 8601 date string for the oldest date from which to get records. The results include errors that occurred on the oldest date.                                                                                                                                                                                                                                                                                                                                                                                                         | Optional             | 54.0              |
| errorCategory  | String | Category of the errors. Values are: <ul style="list-style-type: none"><li>AdminActionable—Errors caused by conditions that can be fixed by site admins.</li><li>AutoRetry—Errors that are automatically reprocessed with the <a href="#">Microbatching Errors Resubmission</a> resource.</li><li>InvalidSetup—Errors caused by invalid setup. Errors of this category can't be reprocessed with the <a href="#">Microbatching Errors Resubmission</a> resource.</li><li>NonRetryable—Errors that can't be reprocessed with the</li></ul> | Optional             | 54.0              |

| Parameter Name      | Type    | Description                                                                                                                                                                                                                                                                                                                       | Required or Optional | Available Version |
|---------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
|                     |         | <a href="#">Microbatching Errors Resubmission</a> resource. <ul style="list-style-type: none"> <li>Unknown—Errors caused by conditions that can't be fixed by site admins or users.</li> <li>UserActionable—Errors caused by conditions that can be fixed by users.</li> </ul> If unspecified, all error categories are returned. |                      |                   |
| errorCode           | String  | Error code associated with the failed record.                                                                                                                                                                                                                                                                                     | Optional             | 54.0              |
| includeRequest Body | Boolean | Specifies whether to include the JSON request body in the response ( <code>true</code> ) or not ( <code>false</code> ). Only users with the Manage Experiences user permission can include the request body in the response. If unspecified, the default value is <code>false</code> .                                            | Optional             | 54.0              |
| latestDate          | String  | ISO 8601 date string for the most recent date from which to get records. The results include errors that occurred on the most recent date.                                                                                                                                                                                        | Optional             | 54.0              |
| pageSize            | Integer | Specifies the number of records per page. Valid values are from 1 through 100. If unspecified, the default is 100.                                                                                                                                                                                                                | Optional             | 54.0              |
| pageToken           | String  | Token specifying the page of records. Page tokens are returned as part of the response, such as <code>currentPageToken</code> or <code>nextPageToken</code> . If unspecified, the first page is returned.                                                                                                                         | Optional             | 54.0              |
| processType         | String  | Logical name of the flow in the microbatching framework. Values are: <ul style="list-style-type: none"> <li>LEAD_MS</li> <li>SELF_REGISTRATION</li> </ul>                                                                                                                                                                         | Required             | 54.0              |
| status              | String  | Status of failed records. Values are: <ul style="list-style-type: none"> <li>Error—Records in failed state.</li> <li>Reprocessing—Records that are reprocessing.</li> </ul>                                                                                                                                                       | Optional             | 54.0              |

**Example GET request with required request parameter**

```
/connect/communities/0DBD20000004CZsOAM/microbatching/errors?processType=SELF_REGISTRATION
```

**Example GET request showing correct date format**

```
connect/communities/0DBD20000004CZsOAM/microbatching/errors?processType=SELF_REGISTRATION&earliestDate=2023-10-02T00:14:15.375Z
```

| errorCode      | String | Error code associated with the failed record.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Optional             | 54.0              |

| Parameter Name | Type    | Description                                                                                                                                                                                                                                                                                    | Required or Optional | Available Version |
|----------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| latestDate     | String  | ISO 8601 date string for the most recent date from which to get records. The results include errors that occurred on the most recent date.                                                                                                                                                     | Optional             | 54.0              |
| pageSize       | Integer | Specifies the maximum number of records to delete in a single DELETE request. Valid values are from 1 through 100. If unspecified, the default is 100.<br><br>If there is more than one page of records to delete, continue making DELETE requests until all the pages of records are deleted. | Optional             | 54.0              |
| processType    | String  | Logical name of the flow in the microbatching framework. Values are: <ul style="list-style-type: none"> <li>LEAD_MS</li> <li>SELF_REGISTRATION</li> </ul>                                                                                                                                      | Required             | 54.0              |
| status         | String  | Status of failed records. Values are: <ul style="list-style-type: none"> <li>Error—Records in failed state.</li> <li>Reprocessing—Records that are reprocessing.</li> </ul>                                                                                                                    | Optional             | 54.0              |

## Microbatching Errors Resubmission

Resubmit microbatching error records.

**Note:** InvalidSetup and NonRetryable categories of errors aren't supported by this API. If you resubmit errors of those categories, they aren't reprocessed.

**Resource**

```
/connect/communities/communityId/microbatching/errors/resubmission
```

/connect/microbatching/errors/resubmission (version 54.0 only)

**Available version**

54.0

**HTTP methods**

POST

**Request parameters for POST**

| Parameter Name            | Type    | Description                                                                                                                                                                             | Required or Optional | Available Version |
|---------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>earliestDate</code> | String  | ISO 8601 date string for the oldest date from which to resubmit records. The results include errors that occurred on the oldest date.                                                   | Optional             | 54.0              |
| <code>errorCode</code>    | String  | Error code associated with the failed record.                                                                                                                                           | Optional             | 54.0              |
| <code>keyPrefix</code>    | String  | Object <code>keyPrefix</code> that a specified <code>processType</code> is tied to in the microbatching framework.                                                                      | Optional             | 54.0              |
| <code>latestDate</code>   | String  | ISO 8601 date string for the most recent date from which to resubmit records. The results include errors that occurred on the most recent date.                                         | Optional             | 54.0              |
| <code>pageSize</code>     | Integer | Specifies the maximum number of records to resubmit. Valid values are from 1 through 1500. If unspecified, the default is 1500.                                                         | Optional             | 54.0              |
| <code>pageToken</code>    | String  | Page token specifying the last submission. The response returns the <code>nextPageToken</code> . If unspecified, the first page is returned.                                            | Optional             | 54.0              |
| <code>processType</code>  | String  | Logical name of the flow in the microbatching framework. Values are: <ul style="list-style-type: none"> <li>• <code>LEAD_MS</code></li> <li>• <code>SELF_REGISTRATION</code></li> </ul> | Required             | 54.0              |

**Response body for POST**

[Microbatching Error Resubmission](#)

## Motifs Resources

Returns URLs for sets of small, medium, and large motif icons. Records have different sets of motif icons depending on the record type. The motif can also include the record type's base color.

Available resources are:

| Resource                                                 | Description                                                                                                                                 |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <code>/connect/motifs/<i>idOrPrefix</i></code>           | Returns a set of small, medium, and large motif icons for the specified record. Can also return the base color for the specified record.    |
| <code>/connect/motifs/batch/<i>idOrPrefixList</i></code> | Returns a set of small, medium, and large motif icons for the specified records. Can also contain the base color for each specified record. |

## Motifs Resource

Returns a set of small, medium, and large motif icons for the specified record. Can also return the base color for the specified record.

Specify either an ID or key prefix for *idOrPrefix*.

### Resource

```
/connect/motifs/idOrPrefix
```

```
/connect/communities/communityId/motifs/idOrPrefix
```

### Available since release

27.0

### HTTP methods

GET or HEAD

### Response body

Motif

### Example of GET

Request for user motifs: `/connect/motifs/005D0000001LLO1`

Response:

```
{
  "color": "1797C0",
  "largeIconUrl": "/img/icon/profile64.png",
  "mediumIconUrl": "/img/icon/profile32.png",
  "smallIconUrl": "/img/icon/profile16.png"
}
```

## Batch Motifs Resource

Returns a set of small, medium, and large motif icons for the specified records. Can also contain the base color for each specified record.

Specify a comma-separated list of IDs and key prefixes for *idOrPrefixList*. You can mix IDs and key prefixes in the same request.

### Resource

```
/connect/motifs/batch/idOrPrefixList
```

```
/connect/communities/communityId/motifs/batch/idOrPrefixList
```

### Available since release

27.0

HTTP methods

GET or HEAD

Response body

[Batch Results](#)

Example of GET

Request for motifs for a user and a file: /connect/motifs/batch/005D0000001LLO1,069D00000001FHF

Response:

```
{
  "results": [
    {
      "result": {
        "color": "1797C0",
        "largeIconUrl": "/img/icon/profile64.png",
        "mediumIconUrl": "/img/icon/profile32.png",
        "smallIconUrl": "/img/icon/profile16.png"
      },
      "statusCode": 200
    },
    {
      "result": {
        "color": "993333",
        "largeIconUrl": "/img/content/content64.png",
        "mediumIconUrl": "/img/content/content32.png",
        "smallIconUrl": "/img/icon/files16.png"
      },
      "statusCode": 200
    }
  ]
}

## Credential

Get, create, refresh, update, replace, or delete a credential.

### Resource

```
/named-credentials/credential
```

### Available version

56.0

### HTTP methods

GET, POST, PUT, PATCH, DELETE

PATCH is supported in version 59.0 and later only for custom protocols.

### Request parameters for GET

| Parameter Name     | Type   | Description                                                                                                                                                   | Required or Optional                        | Available Version |
|--------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|-------------------|
| externalCredential | String | Fully qualified developer name of the external credential.                                                                                                    | Required                                    | 56.0              |
| principalName      | String | Name of the external credential named principal.                                                                                                              | Required if principalType is NamedPrincipal | 56.0              |
| principalType      | String | Type of credential principal. Values are: <ul style="list-style-type: none"> <li>AwsStsPrincipal</li> <li>NamedPrincipal</li> <li>PerUserPrincipal</li> </ul> | Required                                    | 56.0              |

**Response body for GET**[Credential](#)**Request parameters for POST**

Use this request parameter to refresh an OAuth or AWS Roles Anywhere credential.

| Parameter Name | Type   | Description                                                                                                      | Required or Optional | Available Version |
|----------------|--------|------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| action         | String | Action to take when creating the credential. Value is: <ul style="list-style-type: none"> <li>Refresh</li> </ul> | Optional             | 58.0              |

**Request body for POST, PUT, and PATCH**

Use this request body to create (POST), replace (PUT), and update (PATCH) a credential.

**Root XML tag**

```
<credential>
```

**JSON example for creating a credential (POST)**

```
{
  externalCredential: "ecNameAws",
  authenticationProtocol: "AwsSv4",
  principalName: "principalA",
  principalType: "NamedPrincipal",
  credentials: {
    awsAccessKeyId: {
      value: "000000000000",
      encrypted: false
    },
    awsSecretAccessKey: {
      value: "aws-secret-value",
      encrypted: true
    },
    awsRoleArn: {
      value: "arn:partition:service:region:account-id:resource-id",
      encrypted: false
    }
  }
}
```

**JSON example for replacing a credential (PUT)**

In this example, assume the credential has two values: `apiKey` and `apiSecret`. When this request body is used with PUT, `apiKey` is updated and `apiSecret` is deleted.

```
{
  authenticationProtocol: String : "Custom",
  externalCredential: String : "medicalIntegrationExternalCredential",
  principalName: String : "customerSupportGroup",
  principalType: String : "NamedPrincipal",
  // Map<String, ConnectApi.CredentialValue>
  credentials: {
```

```
    apiKey: {
      value: String : "00000000",
      encrypted: Boolean : false
    }
  }
}
```

**JSON example for updating a custom credential (PATCH)**

PATCH is supported only for custom credentials. Only the credentials included in the request body are updated. In this example, assume the credential has two values: `apiKey` and `apiSecret`. When this request body is used with PATCH, `apiKey` is updated and `apiSecret` remains the same.

```
{
  authenticationProtocol: String : "Custom",
  externalCredential: String : "medicalIntegrationExternalCredential",
  principalName: String : "customerSupportGroup",
  principalType: String : "NamedPrincipal",
  // Map<String, ConnectApi.CredentialValue>
  credentials: {
    apiKey: {
      value: String : "00000000",
      encrypted: Boolean : false
    }
  }
}
```

**Properties**

## External Auth Identity Providers

Get a list of external auth identity providers in the org. Create an external auth identity provider.

**Resource**

```
/named-credentials/external-auth-identity-providers
```

**Available version**

62.0

**HTTP methods**

GET, POST

**Response body for GET**

[External Auth Identity Provider List](#) on page 1611

**Request body for POST****Root XML tag**

```
<externalAuthIdentityProvider>
```

JSON example

To create an external auth identity provider, you must also use the POST method with the `/named-credentials/external-auth-identity-provider-credentials/fullName` resource to populate the identity provider's credentials.

## External Auth Identity Provider

Get, update, and delete an external auth identity provider.

**Resource**

```
/named-credentials/external-auth-identity-providers/fullName
```

**Available version**

62.0

**HTTP methods**

GET, PUT, DELETE

**Request body for PUT****Root XML tag**

&lt;externalAuthIdentityProvider&gt;

**JSON example**

To create an external auth identity provider, you must also use the POST method with the [/named-credentials/external-auth-identity-provider-credentials/](#)**fullName** resource to populate the identity provider's credentials.

```

## External Auth Identity Provider Credentials

Get, create, and update external auth identity provider credentials.

**Resource**

```
/named-credentials/external-auth-identity-provider-credentials/fullName
```

**Available version**

62.0

**HTTP methods**

GET, PUT, POST

**Request body for PUT and POST**

**Root XML tag**

```
<externalAuthIdentityProviderCredentials>
```

**JSON example for creating (POST) or replacing (PUT) an external auth identity provider's credentials**

Use this example request body to create or update credentials for an external auth identity provider that uses OAuth2.0 authentication with an authorization code. Assume the credential has two values: `clientId` and `clientSecret`.

```
{
  "credentials": [
    {
      "credentialName": "clientId",
      "credentialValue": "SampleClientID"
    },
    {
      "credentialName": "clientSecret",
      "credentialValue": "SampleClientSecret"
    }
  ]
}
```

**Properties**

| Name        | Type                                                                            | Description                                               | Required or Optional | Available Version |
|-------------|---------------------------------------------------------------------------------|-----------------------------------------------------------|----------------------|-------------------|

## Navigation Menu Items Resource

Get navigation menu items for an Experience Cloud site.

Supported navigation menu item types are:

- DataSourceDriven—Menu items dynamically added from a data source.
- Event—Event, such as logging in, logging out, or switching accounts.
- ExternalLink—URL outside of your site.
- GlobalAction—Lets users create records that aren't related to other records.
- InternalLink—Relative URL inside your site.
- MenuLabel—Menu label.
- Modal—Modal, such as Account Switcher.
- NavigationalTopic—Dropdown list with links to the navigational topics in your site.
- SalesforceObject—Objects such as accounts, cases, contacts, and custom objects.
- SystemLink—System link, such as a link to Builder, Workspaces, or Setup.

## Notification App Setting

Get, set, and reset a notification app setting for the org.

Notification app settings have default values that come from the notification type definition and application settings. Admins can disable standard notification app settings that are enabled by default; however, they can't enable standard notification app settings that are disabled by default. If your app accepts custom notification app settings, admins can enable custom notification app settings that are disabled by default.

| <a href="#">/connect/notifications/status</a>                | Get the status of notifications for the context user.                                          |

## Notifications

Get notifications for the context user. Mark notifications as read, unread, seen, or unseen.

When the context user makes a GET request, the API returns the context user's notifications. The API uses the context of the requesting connected app and returns notifications for the appropriate types.

If a connected app makes a GET request, the API returns only custom notifications for the types that the connected app subscribes to with org-level settings applied. For example, if an admin disabled a notification type for the app, the API doesn't return notifications for that type.

If a third party (not a connected app) makes a GET request, the API returns only custom notifications for the types that are enabled for desktop.

#### Response body for GET and PATCH

[Notification Collection](#)

## Notification

Get a notification for the context user. Mark a notification as read, unread, seen, or unseen.

### Resource

/connect/notifications/*notificationId*

### Available since version

49.0

### HTTP methods

GET, PATCH

### Request parameters for GET

| Parameter                 | Return Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                            | Required or Optional | Available Version |
|---------------------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>trimMessages</code> | Boolean     | Specifies whether the content of a notification is trimmed ( <code>true</code> ) or returned in full ( <code>false</code> ). If <code>true</code> , the title of a notification returns up to 120 characters and the body returns up to 320 characters. If <code>false</code> , the title of a notification returns up to 250 characters and the body returns up to 750 characters. If unspecified, the default is <code>true</code> . | Optional             | 50.0              |

### Request body for PATCH

#### Root XML tag

```
<notification>
```

#### JSON example

```
{ "read" : "true" }
```

### Properties

## Personalization Resources

Get a list of assigned audiences that match the user context. Get audience information for a batch of audience IDs. Create, get, update, and delete an audience. Get a list of targets that match the user context, based on the assigned audiences that include the user. Create and update targets. Get target information for a batch of target IDs. Get and delete a target.

**Note:** Personalization varies what the user can see in the browser but doesn't secure data in any way. To prevent users accessing sensitive data, use standard Salesforce security features, such as sharing rules and permission sets.

Available resources are:

| groupNames                           | String[] | A comma-separated list of group names. Groups bundle related target and audience pairs. If you're specifying group names, you must also specify a single <code>targetTypes</code> value.                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Optional                                                            | 48.0              |
| includeAllMatchingTargetsWithinGroup | Boolean  | Specifies whether to include all the matching targets within a target group ( <code>true</code> ) or not ( <code>false</code> ). If not specified, the default is <code>false</code> . If <code>false</code> , the first matching target within each group, based on priority within the group, is returned.                                                                                                                                                                                                                                                                                                                                | Optional                                                            | 47.0              |
| includeAudience                      | Boolean  | Specifies whether to include the matching audience ( <code>true</code> ) or not ( <code>false</code> ). If not specified, the default is <code>false</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Optional                                                            | 47.0              |
| ipAddress                            | String   | IP address of the user. If not specified, no audience targets with location criteria are returned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Optional                                                            | 47.0              |
| publishStatus                        | String   | Publish status of the target. Values are: <ul style="list-style-type: none"> <li>• <code>Draft</code></li> <li>• <code>Live</code></li> </ul> If not specified, the default is <code>Live</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                          | Optional                                                            | 47.0              |
| recordId                             | String   | ID of the record, if you want to specify field based criteria in audiences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Optional                                                            | 47.0              |
| targetTypes                          | String[] | Comma-separated list of target types to filter the results. Supported values include: <ul style="list-style-type: none"> <li>• <code>ExperienceVariation</code> (version 47.0 and later)</li> <li>• Custom object API names, such as <b><i>CustomObjectName__c</i></b> (version 47.0 and later)</li> <li>• <code>NavigationLinkSet</code> (version 49.0 and later)</li> <li>• <code>Topic</code> (version 49.0 and later)</li> <li>• <code>CollaborationGroup</code> (version 49.0 and later)</li> <li>• <code>KnowledgeArticle</code> (version 49.0 and later)</li> <li>• <code>ContentDocument</code> (version 49.0 and later)</li> </ul> | Required if specifying <code>groupNames</code> ; otherwise optional | 47.0              |

| Parameter Name | Type   | Description                                                                                                                                                                                                                 | Required or Optional | Available Version |
|----------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
|                |        | <ul style="list-style-type: none"><li>ManagedContent (version 49.0 and later)</li><li>Report (version 49.0 and later)</li><li>Dashboard (version 49.0 and later)</li></ul> If not specified, all target types are returned. |                      |                   |
| userId         | String | ID of the user. If not specified, the default is the ID of the context user.                                                                                                                                                | Optional             | 47.0              |

### Request body for POST

Create targets using POST with the [Target Collection Input](#).

#### Root XML tag

```
<targetCollection>
```

#### JSON example

```
{
  "targets": [{
    "audienceId": "6AuRM0000004D5w0AE",
    "groupName": "2b8bc305-d415-49f9-8e24-814455427324",
    "priority": 1,
    "publishStatus": "Draft",
    "targetType": "ExperienceVariation",
    "targetValue": "ContactSupport_ContactSupportForCalifornia_Page"
  }]
}
```

### Properties

| Name    | Type                            | Description                | Required or Optional | Available Version |
|---------|---------------------------------|----------------------------|----------------------|-------------------|
| targets | <a href="#">Target Input</a> [] | List of targets to create. | Required             | 47.0              |

### Request body for PATCH

Update targets, such as assigning audiences to targets, using PATCH with the [Target Collection Update Input](#).

#### Root XML tag

```
<targetCollection>
```

#### JSON example

```
{
  "targets": [{
    "audienceId": "6AuRM0000004D5w0AE",
    "priority": 1,
```

```
{
  "targetId": "6AtRM0000000II30AM"
}
```

### Properties

| Name    | Type                                  | Description                | Required or Optional | Available Version |
|---------|---------------------------------------|----------------------------|----------------------|-------------------|
| targets | <a href="#">Target Update Input[]</a> | List of targets to update. | Required             | 47.0              |

### Response body for GET, POST, and PATCH

[Target Collection](#)

## Personalization Targets, Batch

Get target information for a comma-separated list of target IDs.

### Resource

```
/connect/communities/communityId/personalization/targets/batch/targetIds
```

### Available version

47.0

### HTTP methods

GET

## Private Connect Resources

Get the inbound and outbound network topologies for a private connection type. Provision, sync, or tear down an inbound or outbound connection.

Available resources are:

| Resource                                                                                       | Description                                                           |
|------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| <a href="#">/network-connection/inbound/connection-types/<i>connectionType</i>/topologies</a>  | Get the inbound network connection topologies for a connection type.  |
| <a href="#">/network-connection/inbound/connections/<i>developerName</i></a>                   | Provision, sync, or tear down the inbound network connection.         |
| <a href="#">/network-connection/outbound/connection-types/<i>connectionType</i>/topologies</a> | Get the outbound network connection topologies for a connection type. |
| <a href="#">/network-connection/outbound/connections/<i>developerName</i></a>                  | Provision, sync, or tear down the outbound network connection.        |

## Network Connection Topologies, Inbound

Get the inbound network connection topologies for a connection type.

### Resource

```
/network-connection/inbound/connection-types/connectionType/topologies
```

In version 49.0 and later, `AwsPrivateLink` is the only supported *connectionType*.

### Resource Example

```
GET https://MyDomainName.my.salesforce.com/services/data/v65.0/network-connection/inbound/connection-types/AwsPrivateLink/topologies?regions=us-east-1,us-west-2&scope=ALL
```

### Available version

49.0

### HTTP methods

GET

### Request parameters for GET

| Parameter Name       | Type                  | Description                                                                                                                                                                                    | Required or Optional | Available Version |
|----------------------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>regions</code> | <code>String[]</code> | Comma-separated list of regions. If unspecified, returns all the regions. For a list of supported regions, see <a href="#">Considerations for Private Connect with AWS</a> in Salesforce Help. | Optional             | 58.0              |

| Parameter Name | Type   | Description                                                                                                                                                                                                                                                                                              | Required or Optional | Available Version |
|----------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| scope          | String | Scope of the topologies. Values are: <ul style="list-style-type: none"><li>• <code>All</code>—List of regions with additional information, such as status and service name.</li><li>• <code>Region</code>—List of regions.</li></ul> If a value isn't specified, the default value is <code>All</code> . | Optional             | 50.0              |

### Response body for GET

[Inbound Network Connection Topologies](#)

## Network Connection, Inbound

Provision, sync, or tear down the inbound network connection.

### Resource

```
/network-connection/inbound/connections/developerName
```

### Available version

49.0

### HTTP methods

POST

### Request parameters for POST

| Parameter Name | Type   | Description                                                                                                                                                                                | Required or Optional | Available Version |
|----------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| action         | String | Action to take on the network connection. Values are: <ul style="list-style-type: none"><li>• <code>Provision</code></li><li>• <code>Sync</code></li><li>• <code>TearDown</code></li></ul> | Required             | 49.0              |

### Response body for POST

In version 49.0–50.0, the response is empty.

In version 51.0 and later, the response body is [Network Connection](#).

## Network Connection Topologies, Outbound

Get the outbound network connection topologies for a connection type.

Resource

```
/network-connection/outbound/connection-types/connectionType/topologies
```

In version 49.0 and later, `AwsPrivateLink` is the only supported `connectionType`.

Resource Example

```
GET
https://MyDomainName.my.salesforce.com/services/data/v65.0/network-connection/outbound/
/connection-types/AwsPrivateLink/topologies?regions=us-east-1,us-west-2&scope=ALL
```

Available version

49.0

HTTP methods

GET

Request parameters for GET

| Parameter Name | Type     | Description                                                                                                                                                                                                                                                                                          | Required or Optional | Available Version |
|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| regions        | String[] | Comma-separated list of regions. If unspecified, returns all the regions. For a list of supported regions, see <a href="#">Considerations for Private Connect with AWS</a> in Salesforce Help.                                                                                                       | Optional             | 58.0              |
| scope          | String   | Scope of the topologies. Values are: <ul style="list-style-type: none"><li>• <code>All</code>—List of regions with additional information, such as status and IAM role.</li><li>• <code>Region</code>—List of regions.</li></ul> If a value isn't specified, the default value is <code>All</code> . | Optional             | 50.0              |

Response body for GET

[Outbound Network Connection Topologies](#)

Network Connection, Outbound

Provision, sync, or tear down the outbound network connection.

HTTP methods

POST

**Request parameters for POST**

| Parameter Name | Type   | Description                                                                                                                                            | Required or Optional | Available Version |
|----------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| action         | String | Action to take on the network connection.<br>Values are: <ul style="list-style-type: none"><li>• Provision</li><li>• Sync</li><li>• TearDown</li></ul> | Required             | 49.0              |

**Response body for POST**

In version 49.0–50.0, the response is empty.

In version 51.0 and later, the response body is [Network Connection](#).

## Push Notifications Resource

Send a mobile push notification to connected apps on users' devices. This resource is only accessible when the session is established with a connected app that is developed in the same organization or installed in the same package as the recipient's connected app.

**Resource**

```
/connect/notifications/push
```

**Available version**

31.0

**HTTP methods**

POST

**Request body for POST****Root XML tag**

```
<pushNotification>
```

**JSON example**

```
{  "appName" : "TestApp",  "namespace" : "abc",  "userIds" : ["005x00000013dPK", "005x00000013dPL"],  "payload" : "{ 'aps': { 'alert': 'test', 'badge': 0, 'sound': 'default' } }"
```

**Properties**

| Name      | Type   | Description                                                               | Required or Optional             | Available Version |
|-----------|--------|---------------------------------------------------------------------------|----------------------------------|-------------------|
| appName   | String | The API name of the connected app that the push notification is sent to.  | Required                         | 31.0              |
| namespace | String | The namespace of the connected app that the push notification is sent to. | Required if the namespace is set | 31.0              |

| Name    | Type     | Description                                   | Required or Optional | Available Version |
|---------|----------|-----------------------------------------------|----------------------|-------------------|
| payload | String   | The push notification payload in JSON format. | Required             | 31.0              |
| userIds | String[] | The push notification recipient user ids.     | Required             | 31.0              |

**Request parameters for POST**

| Parameter Name | Type     | Description                                                               | Required or Optional             | Available Version |
|----------------|----------|---------------------------------------------------------------------------|----------------------------------|-------------------|
| appName        | String   | The API name of the connected app that the push notification is sent to.  | Required                         | 31.0              |
| namespace      | String   | The namespace of the connected app that the push notification is sent to. | Required if the namespace is set | 31.0              |
| payload        | String   | The push notification payload in JSON format.                             | Required                         | 31.0              |
| userIds        | String[] | The push notification recipient user ids.                                 | Required                         | 31.0              |

## Quick Text Resource

Get the body of a quick text.

**Resource**

```
/connect/quicktextbody
```

**Available version**

## Salesforce Omnichannel Inventory Resources

Manage inventory across locations. Available in Salesforce Omnichannel Inventory.

Available resources are:

| Resource                                                                                 | Description                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/commerce/oci/availability/availability-records/actions/get-availability</a> | Retrieve inventory availability data for one or more products at one or more inventory locations or location groups.                                                                                                                                                                                                                   |
| <a href="#">/commerce/oci/availability-records/actions/batch-update</a>                  | Update a batch of inventory records to Omnichannel Inventory. Add a new inventory record or update on hand, future quantity, future date, safety stock count, and shipping eligibility to an existing inventory record.                                                                                                                |
| <a href="#">/commerce/oci/availability-records/uploads</a>                               | Upload an inventory availability data file to Omnichannel Inventory.                                                                                                                                                                                                                                                                   |
| <a href="#">/commerce/oci/availability-records/uploads/<b>uploadId</b></a>               | Retrieve the status of an inventory availability upload job.                                                                                                                                                                                                                                                                           |
| <a href="#">/commerce/inventory/check-availability</a>                                   | Get information about inventory availability for products in locations or location groups in your commerce inventory system. Provides available to fulfill, available to order, and on hand quantity information.                                                                                                                      |
| <a href="#">/commerce/inventory/levels</a>                                               | Get information about inventory levels for products in locations and location groups in your commerce inventory system.                                                                                                                                                                                                                |
| <a href="#">/commerce/oci/location-graph/uploads</a>                                     | Asynchronously publish information about your inventory locations and location groups to Omnichannel Inventory. The publish includes records whose <code>IsEnabled</code> and <code>ShouldSyncWithOci</code> fields are both <code>true</code> . This method returns an ID that you can use to retrieve the status of the publish job. |
| <a href="#">/commerce/oci/location-graph/uploads/<b>uploadId</b></a>                     | Retrieve the status of a publish location structure job.                                                                                                                                                                                                                                                                               |
| <a href="#">/commerce/oci/reservation/actions/reservations</a>                           | Create an inventory reservation in Omnichannel Inventory.                                                                                                                                                                                                                                                                              |
| <a href="#">/commerce/oci/reservation/actions/fulfillments</a>                           | Fulfill one or more inventory reservations.                                                                                                                                                                                                                                                                                            |
| <a href="#">/commerce/oci/reservation/actions/releases</a>                               | Release one or more existing inventory reservations to free up that inventory.                                                                                                                                                                                                                                                         |
| <a href="#">/commerce/oci/reservation/actions/transfers</a>                              | Transfer one or more inventory reservations between locations or location groups. This API doesn't change physical quantities, but reduces the reserved quantity at the source and increases it at the destination.                                                                                                                    |
| <a href="#">/commerce/oci/reservation/actions/update</a>                                 | Updates an existing reservation in Omnichannel Inventory. Add, remove, and update quantities for existing SKUs in the reservation.                                                                                                                                                                                                     |

## IN THIS SECTION:

[Availability Records, Batch Update](#)

Update a batch of inventory records to Omnichannel Inventory. Add a new inventory record or update on hand, future quantity, future date, safety stock count, and shipping eligibility to an existing inventory record.

[Availability Records, Get Availability](#)

Retrieve inventory availability data for one or more products at one or more inventory locations or location groups.

[Availability Records, Upload](#)

Asynchronously upload inventory data to Omnichannel Inventory and check the status of upload jobs. Upload inventory data using either a NDJSON or CSV file.

[Inventory Check Availability](#)

Get information about inventory availability for products in locations or location groups in your commerce inventory system. Provides available to fulfill, available to order, and on hand quantity information.

[Inventory Levels](#)

Get information about inventory levels for products in locations and location groups in your commerce inventory system.

[Location Graph, Upload](#)

Asynchronously upload inventory location and location group data to Omnichannel Inventory and check the status of upload jobs.

[Reservations, Create](#)

Create an inventory reservation in Omnichannel Inventory.

[Reservations, Fulfill](#)

Fulfill one or more inventory reservations.

[Reservations, Release](#)

Release one or more existing inventory reservations to free up that inventory.

[Reservations, Transfer](#)

Transfer one or more inventory reservations between locations or location groups. This API doesn't change physical quantities, but reduces the reserved quantity at the source and increases it at the destination.

[Reservations, Update](#)

Updates an existing reservation in Omnichannel Inventory. Add, remove, and update quantities for existing SKUs in the reservation.

## Availability Records, Batch Update

Update a batch of inventory records to Omnichannel Inventory. Add a new inventory record or update on hand, future quantity, future date, safety stock count, and shipping eligibility to an existing inventory record.

Supports partial success. For example, when 10 items are sent and two fail, the failed items show in the error section.

**Resource**

```
/commerce/oci/availability-records/uploads
```

**Available version**

51.0 (JSON), 63.0 (CSV)

**HTTP methods**

POST

**Request parameters for POST**

| Parameter Name | Type   | Description                                              | Required or Optional | Available Version         |
|----------------|--------|----------------------------------------------------------|----------------------|---------------------------|
| fileUpload     | Binary | JSON or CSV file containing inventory availability data. | Required             | 51.0 (JSON)<br>63.0 (CSV) |

To create an inventory data file, format the data as a series of NDJSON or CSV entries that represent locations and individual inventory records.

Inventory Import Data Considerations:

- Separate the top-level entries with line feeds, not commas. Each entry must be on a single line.
- When the system reads a location entry, it assigns the subsequent inventory entries to that location until it reads another location entry.

- Legacy NDJSON requires that you specify a header record for each location entry (`{"location": "wickenburg", "mode": "UPDATE"}`). The header isn't required for a high-performance NDJSON layout or CSV file.
- Each inventory record entry requires a unique `recordId`. Best practice is to use a UUID. The `recordId` protects against importing duplicate data. The `recordId` is provided in NDJSON and automatically generated for CSV.
- Each inventory record entry requires an `effectiveDate`.
- If provided, each futures entry requires a nonzero quantity and a future `expectedDate`.

 **Note:** The file must be in NDJSON or CSV format. For larger collections, use the Commerce API or split the data into multiple files. The Commerce API accepts GZIP, NDJSON, or CSV files up to 100 MB.

This example illustrates the data format:

 **Note:** For readability, this example shows the first few entries on multiple lines. In the import file, each location and inventory record entry must be on a single line.

```
{

## Response body for POST

OCI Inventory Check Availability Output

## Inventory Levels

Get information about inventory levels for products in locations and location groups in your commerce inventory system.

There are limits to how many product IDs, SKUs, and locations requests can be made at a time. Refer to the parameter descriptions for limits. Previously retrieved product inventory values are cached. Cached products aren't included in subsequent requests to external inventory systems, like Omnichannel Inventory. Consequently, the number of products counted towards request limits may be lower, depending on how many products have been cached when the request is made.

## Salesforce Order Management Resources

Manage orders and the order fulfillment process. Available in Salesforce Order Management orgs.

Available resources are:

| Resource                                                                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/commerce/fulfillment/estimate-shipment-date</a>                                              | Forecast an expected delivery date and time based on delivery estimation settings and the selected shipping carrier method.                                                                                                                                                                                                                                                                                                                                                          |
| <a href="#">/commerce/fulfillment/fulfillment-orders</a>                                                  | Create one or more FulfillmentOrders and FulfillmentOrderLineItems for an OrderDeliveryGroupSummary, which defines a delivery method and recipient for an OrderSummary. You specify the OrderItemSummaries to allocate, which can be fulfilled from different locations. Specifying multiple fulfillment groups creates one FulfillmentOrder for each location. For each OrderItemSummary, a FulfillmentOrderLineItem is created and assigned to the corresponding FulfillmentOrder. |
| <a href="#">/commerce/fulfillment/fulfillment-orders/<b>fulfillmentOrderId</b>/actions/cancel-item</a>    | Cancel FulfillmentOrderLineItems from a FulfillmentOrder. This action doesn't cancel the associated OrderItemSummaries, so reallocate the canceled quantities to a new FulfillmentOrder.                                                                                                                                                                                                                                                                                             |
| <a href="#">/commerce/fulfillment/fulfillment-orders/<b>fulfillmentOrderId</b>/actions/create-invoice</a> | Create an invoice for a FulfillmentOrder that doesn't have one.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <a href="#">/commerce/fulfillment/actions/create-multiple</a>                                             | Create FulfillmentOrders for multiple OrderDeliveryGroups in a single request.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <a href="#">/commerce/fulfillment/actions/create-multiple-invoices</a>                                    | Create Invoices for multiple FulfillmentOrders.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <a href="#">/commerce/order-management/analytics/insights/products-return-rate</a>                        | Get a page of products with return rates.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <a href="#">/commerce/order-management/exchanges/actions/preview-cart-to-exchange-order</a>               | Retrieves a preview of an exchange order. This action considers the order summary balance and the difference between the return order and the cart that represents the exchange order.                                                                                                                                                                                                                                                                                               |

| Resource                                                                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/commerce/order-management/exchanges/actions/submit-cart-to-exchange-order</a>                          | Creates an exchange order summary, based on the return order and the cart used for exchanges. The new exchange order summary is attached to the original order summary (created before any exchanges occurred). You can also provide optional payment information and optional information about order summary sequences, which affect the newly created exchange order summary.             |
| <a href="#">/commerce/order-management/order-payment-summaries</a>                                                  | Create an OrderPaymentSummary for an OrderSummary. Specify a payment authorization or payments that share the same payment method. In an org with the multicurrency feature enabled, the OrderPaymentSummary inherits the CurrencyIsoCode value from the OrderSummary.                                                                                                                       |
| <a href="#">/commerce/order-management/order-summaries</a>                                                          | Create an OrderSummary based on an order. That order is considered the original order for the OrderSummary. Subsequent change orders that apply to the OrderSummary are also represented as orders. You can specify whether the order is managed in Salesforce Order Management or by an external system. Most Salesforce Order Management APIs can run only on orders that it manages.      |
| <a href="#">/commerce/order-management/order-summaries/<b>orderSummaryId</b>/actions/create-credit-memo</a>         | Create a credit memo to represent the refund for one or more change orders associated with an OrderSummary.                                                                                                                                                                                                                                                                                  |
| <a href="#">/commerce/order-management/order-summaries/actions/create-multiple-change-invoices</a>                  | Create Invoices to represent the charges for one or more change orders. Create Invoices for change orders that increase order amounts, such as for return fees. When you ensure the refund for a return, include the invoices for any associated return fees in the request.                                                                                                                 |
| <a href="#">/commerce/order-management/order-summaries/<b>orderSummaryId</b>/async-actions/ensure-funds-async</a>   | Ensure funds for an Invoice and apply them to it. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status. |
| <a href="#">/commerce/order-management/order-summaries/<b>orderSummaryId</b>/async-actions/ensure-refunds-async</a> | Ensure refunds for a CreditMemo or excess funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and don't affect the background operation status.                                        |
| <a href="#">/commerce/order-management/order-summaries/async-actions/multiple-ensure-funds-async</a>                | Ensure and apply funds for one or more Invoices. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its                                                                                                                         |

| Resource                                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                              | status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <a href="#">/commerce/order-management/order-summaries/<b>orderSummaryId</b>/actions/adjust-item-preview</a> | Retrieve the expected results of adjusting the price of one or more OrderItemSummaries from an OrderSummary, without actually executing the adjustment. The response data contains the financial changes that would result from submitting the proposed adjustment.                                                                                                                                                                                                                                                                                 |
| <a href="#">/commerce/order-management/order-summaries/<b>orderSummaryId</b>/actions/preview-cancel</a>      | Retrieve the expected change order values for canceling one or more OrderItemSummaries from an OrderSummary, without actually executing the cancel.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <a href="#">/commerce/order-management/order-summaries/<b>orderSummaryId</b>/actions/preview-return</a>      | Retrieve the expected change order values for a simple return of one or more OrderItemSummaries from an OrderSummary, without actually executing the return.                                                                                                                                                                                                                                                                                                                                                                                        |
| <a href="#">/commerce/order-management/order-summaries/<b>orderSummaryId</b>/actions/adjust-item-submit</a>  | Adjust the price of one or more OrderItemSummaries from an OrderSummary, and create corresponding change orders.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <a href="#">/commerce/order-management/order-summaries/<b>orderSummaryId</b>/actions/submit-cancel</a>       | Cancel one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <a href="#">/commerce/order-management/order-summaries/<b>orderSummaryId</b>/actions/submit-return</a>       | Return one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order. This return is a simple return that creates a change order but not a ReturnOrder.                                                                                                                                                                                                                                                                                                                                                              |
| <a href="#">/commerce/order-management/webstores/<b>webstoreId</b>/products</a>                              | Search a webstore for products by search term.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <a href="#">/commerce/order-management/webstores/<b>webstoreId</b>/products/<b>skuOrProductId</b></a>        | Get details of a product in a web store.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <a href="#">/commerce/returns/return-orders/</a>                                                             | Create a ReturnOrder and ReturnOrderLineItems for items belonging to an OrderSummary.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <a href="#">/commerce/returns/return-orders/<b>returnOrderId</b>/actions/return-items</a>                    | Process ReturnOrderLineItems belonging to a ReturnOrder. Processing a ReturnOrderLineItem generates a change Order and makes that ReturnOrderLineItem read-only. The change order for a returned item or delivery charge has a positive amount and should be used to create a credit memo. The change order for a return fee has a negative amount and should be used to create an invoice. If a processed ReturnOrderLineItem has any remaining expected quantity, then the API creates a separate ReturnOrderLineItem representing that quantity. |
| <a href="#">/commerce/order-management/routing/fulfillment-order-capacity/actions/confirm-held-capacity</a>  | Confirm held fulfillment order capacity at one or more locations. This call decreases a location's held capacity and increases its assigned fulfillment order count. Confirm held capacity when you assign a fulfillment order to a location.                                                                                                                                                                                                                                                                                                       |

| Resource                                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/commerce/order-management/routing/actions/find-routes-with-fewest-splits</a>                    | Returns combinations of inventory locations that can fulfill an order within a specified limit of shipment splits. By default, checks up to 1,000,000 potential routes, returning a maximum of 10,000 results.                                                                                                                                                                                                  |
| <a href="#">/commerce/order-management/routing/actions/find-routes-with-fewest-splits-using-oci</a>          | For one or more order summaries, find inventory availability using Omnichannel Inventory and identify the fulfillment routes with fewest splits. This method combines the functionality of the Get Inventory Availability and Find Routes With Fewest Splits resources.                                                                                                                                         |
| <a href="#">/commerce/order-management/routing/fulfillment-order-capacity/actions/get-capacity-values</a>    | Get information about the current fulfillment order capacity of one or more locations.                                                                                                                                                                                                                                                                                                                          |
| <a href="#">/commerce/order-management/routing/fulfillment-order-capacity/actions/hold-capacity</a>          | Hold fulfillment order capacity at a location. Holding capacity at a location reserves a space for a fulfillment order that you'll assign to it.                                                                                                                                                                                                                                                                |
| <a href="#">/commerce/order-management/routing/actions/rank-byaverage-distance</a>                           | Calculates the average distance from sets of inventory locations to an order recipient, and ranks them. Use this method to compare the average shipping distances for different sets of locations that can fulfill an order. While this method is executing, you can't invoke another Apex callout.                                                                                                             |
| <a href="#">/commerce/order-management/routing/fulfillment-order-capacity/actions/release-held-capacity</a>  | Release held fulfillment order capacity at one or more locations. This call decreases a location's held capacity without changing its assigned fulfillment order count. Release held capacity when you cancel the assignment of a fulfillment order to a location.                                                                                                                                              |
| <a href="#">/commerce/order-summaries/</a>                                                                   | Create pending order summaries from order summary graphs. The High Scale Orders feature must be active, but a B2C Commerce connection isn't required. Created pending order summaries are queued for automatic processing into order summaries, the same as pending order summaries ingested from B2C Commerce. The provided JSON example references person accounts, but business accounts are also supported. |
| <a href="#">/commerce/webstores/<b>webstoreId</b>/accounts/<b>accountId</b>/actions/register-guest-buyer</a> | Register a guest buyer for a webstore using an account ID. This action enables a guest buyer to order on behalf of another buyer.                                                                                                                                                                                                                                                                               |

## Register Guest Buyer

Register a guest buyer for a webstore using an account ID. This action enables a guest buyer to order on behalf of another buyer.

## Fulfillment Orders

Create one or more `FulfillmentOrders` and `FulfillmentOrderLineItems` for an `OrderDeliveryGroupSummary`, which defines a delivery method and recipient for an `OrderSummary`. You specify the `OrderItemSummaries` to allocate, which can be fulfilled from different locations. Specifying multiple fulfillment groups creates one `FulfillmentOrder` for each location. For each `OrderItemSummary`, a `FulfillmentOrderLineItem` is created and assigned to the corresponding `FulfillmentOrder`.

## Submit Cart to Exchange Order

Creates an exchange order summary, based on the return order and the cart used for exchanges. The new exchange order summary is attached to the original order summary (created before any exchanges occurred). You can also provide optional payment information and optional information about order summary sequences, which affect the newly created exchange order summary.

**Response body for POST**

- When the HTTP status code indicates success, the response body is a [Create Order Payment Summary Output](#). The response body can still indicate processing errors.
- When the HTTP status code is in the 400 (client error) or 500 (server error) range, the response body is an [Error with Output](#). The output property is a [Create Order Payment Summary Output](#), and the value of the enhancedErrorType property can be ignored.

## Order Summaries

Create an OrderSummary based on an order. That order is considered the original order for the OrderSummary. Subsequent change orders that apply to the OrderSummary are also represented as orders. You can specify whether the order is managed in Salesforce Order Management or by an external system. Most Salesforce Order Management APIs can run only on orders that it manages.

```

**JSON example**

```
{
  "orderId": "801xx000003GbTgAAK"
}
```

**Properties**

| Name                | Type   | Description                                                                                                                                                                                                                                                                                                                            | Required or Optional | Available Version |
|---------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| businessModel       | String | The order's business model. It can have one of these values: <ul style="list-style-type: none"> <li>B2B</li> <li>B2C</li> </ul>                                                                                                                                                                                                        | Optional             | 53.0              |
| externalReferenceId | String | Used internally to prevent duplicate records. This value is case-sensitive.                                                                                                                                                                                                                                                            | Optional             | 56.0              |
| name                | String | Specifies an OrderNumber to assign to the order summary.                                                                                                                                                                                                                                                                               | Optional             | 50.0              |
| orderId             | String | ID of the original order.                                                                                                                                                                                                                                                                                                              | Required             | 48.0              |
| orderLifecycleType  | String | Specifies whether the order is managed in Salesforce Order Management or by an external system. It can have one of these values: <ul style="list-style-type: none"> <li>MANAGED—Managed in Salesforce Order Management.</li> <li>UNMANAGED—Managed by an external system.</li> </ul> If no value is specified, the default is MANAGED. | Optional             | 49.0              |

| Name          | Type   | Description                                                                                                                                                                                                                                                                                                                                               | Required or Optional | Available Version |
|---------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| sourceProcess | String | Describes the order process creating the OrderSummary. It can have one of these values: <ul style="list-style-type: none"> <li>Exchange—An Exchange process.</li> <li>OrderOnBehalf—An Order on Behalf Of process.</li> <li>Standard—Any process other than Exchange or Order on Behalf Of.</li> </ul> If no value is specified, the default is Standard. | Optional             | 57.0              |
| status        | String | Specifies a status to assign to the order summary. The value must match one of the picklist values on the Status field of the OrderSummary object.                                                                                                                                                                                                        | Optional             | 50.0              |

### Response body for POST

- When the HTTP status code indicates success, the response body is an [Order Summary Output](#). The response body can still indicate processing errors.
- When the HTTP status code is in the 400 (client error) or 500 (server error) range, the response body is an [Error with Output](#). The output property is an [Order Summary Output](#), and the value of the enhancedErrorType property can be ignored.

## Order Summaries, Create Credit Memo

Create a credit memo to represent the refund for one or more change orders associated with an OrderSummary.

### Resource

```

### JSON example

```
{
  "changeOrderIds": [
    "801R0000000EAAkIAO"
  ]
}
```

```

    ]
  }

```

**Properties**

| Name           | Type     | Description                       | Required or Optional | Available Version |
|----------------|----------|-----------------------------------|----------------------|-------------------|
| changeOrderIds | String[] | List of IDs of the change orders. | Required             | 48.0              |

**Response body for POST**

- When the HTTP status code indicates success, the response body is a [Create Credit Memo Output](#). The response body can still indicate processing errors.
- When the HTTP status code is in the 400 (client error) or 500 (server error) range, the response body is an [Error with Output](#). The output property is a [Create Credit Memo Output](#), and the value of the enhancedErrorType property can be ignored.

## Order Summaries, Create Multiple Invoices from Change Orders

Create Invoices to represent the charges for one or more change orders. Create Invoices for change orders that increase order amounts, such as for return fees. When you ensure the refund for a return, include the invoices for any associated return fees in the request.

**Resource**

```
/commerce/order-management/order-summaries/actions/create-multiple-change-invoices
```

**Available version**

56.0

**HTTP methods**

**Root XML tag**

```
<createMultipleInvoicesFromChangeOrdersInput>
```

**JSON example**

```

[
  {
    "changeOrderIds" ["0a3xx000000000W1", "0a3xx000000000W2", "0a3xx000000000W3"],
    "orderSummaryId": "10sxx00000004EAqCAM"
  }
]

```

**Properties**

| Name                     | Type                                                    | Description                                                                                                          | Required or Optional | Available Version |
|--------------------------|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| invoicesFromChangeOrders | <a href="#">Create Invoice From Change Orders Input</a> | List of OrderSummary IDs with the IDs of the associated change orders to create Invoices for. Each entry in the list | Required             | 56.0              |

| Name | Type | Description                                                            | Required or Optional | Available Version |
|------|------|------------------------------------------------------------------------|----------------------|-------------------|
|      |      | generates one invoice, which combines the change orders in that entry. |                      |                   |

### Response body for POST

- When the HTTP status code indicates success, the response body is a [Create Multiple Invoices From Change Orders Output](#). The response body can still indicate processing errors.
- When the HTTP status code is in the 400 (client error) or 500 (server error) range, the response body is an [Error with Output](#). The output property is a [Create Multiple Invoices From Change Orders Output](#), and the value of the enhancedErrorType property can be ignored.

## Order Summaries, Ensure Funds Async

Ensure funds for an Invoice and apply them to it. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

### Resource

```
/commerce/order-management/order-summaries/orderSummaryId/async-actions/ensure-funds-async
```

### Available version

48.0

### HTTP methods

POST

### Request body for POST

[Ensure Funds Async Input](#)

### Root XML tag

```
<ensureFundsAsyncInput>
```

### JSON example

```
{
  "invoiceId": "3ttR000000000JNIAy"
}
```

### Properties

| Name               | Type    | Description                                                                                                                                                                                          | Required or Optional | Available Version |
|--------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| invoiceId          | String  | ID of the Invoice.                                                                                                                                                                                   | Required             | 48.0              |
| isOrderBalanceUsed | Boolean | If true, the reserved balance amount is used for the Order Summary to fund the invoice. If not enough reserved balance amount, any available balance that isn't reserved by another Order Summary is | Optional             | 59.0              |

| Name | Type | Description                                    | Required or Optional | Available Version |
|------|------|------------------------------------------------|----------------------|-------------------|
|      |      | used. If false, any available balance is used. |                      |                   |

### Response body for POST

- When the HTTP status code indicates success, the response body is an [Ensure Funds Async Output](#). The response body can still indicate processing errors.
- When the HTTP status code is in the 400 (client error) or 500 (server error) range, the response body is an [Error with Output](#). The `output` property is an [Ensure Funds Async Output](#), and the value of the `enhancedErrorType` property can be ignored.

### Usage

This method checks the `OrderPaymentSummaries` associated with the specified `OrderSummary` for funds to apply to the Invoice balance following this logic:

 **Note:** If multiple `OrderPaymentSummaries` have equal `BalanceAmount` values, their order of selection is random.

1. Verify that the Invoice balance doesn't exceed the total `BalanceAmount` of all the `OrderPaymentSummaries` associated with the `OrderSummary`.
2. If an `OrderPaymentSummary` has a `BalanceAmount` equal to the Invoice balance, apply the funds from that `OrderPaymentSummary`.
3. If no exact match was found, apply funds from the `OrderPaymentSummary` with the largest `BalanceAmount`.
4. If the Invoice still has a balance to ensure, repeat steps 2 and 3 until the full balance is ensured or no captured funds remain.
5. If the Invoice still has a balance, look for an `OrderPaymentSummary` with an authorized amount equal to the remaining Invoice balance. If one exists, capture and apply the funds from that `OrderPaymentSummary`.
6. If no exact match was found, capture and apply funds from the `OrderPaymentSummary` with the largest authorized amount.
7. If the Invoice still has a balance to ensure, repeat steps 5 and 6 until the full balance is ensured.

 **Note:** If the method creates a payment, the payment record's `ClientContext` value isn't predictable. Don't use it in custom logic.

| excessFundsAmount | Double                                 | Amount of excess funds to refund.                                                                                                                                                                                                                                                                                                                                                                                                                                         | Either excessFundsAmount or creditMemoId is required | 49.0              |
| invoicesToPay     | <a href="#">Invoice To Pay Input[]</a> | List of invoices for any fees that reduce the refund, such as return fees.                                                                                                                                                                                                                                                                                                                                                                                                | Optional                                             | 56.0              |
| isAllowPartial    | Boolean                                | This value controls the behavior when the amounts included in the <code>sequences</code> list don't cover the entire refund amount. If this value is false, then the default refund logic is applied to ensure the remaining refund amount. If this value is true, then the unrefunded balance remains on the credit memo. If you don't specify a <code>sequences</code> list, this value is ignored and the default refund logic is applied. The default value is false. | Optional                                             | 56.0              |

| Name                             | Type                                                   | Description                                                                                                                                                                                                                                                                                                         | Required or Optional | Available Version |
|----------------------------------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <del>isReservedBalanceUsed</del> | Boolean                                                | If true, the refundable amount is used to open the payment balance for the reservedBalanceAmount in the Order Payment Summaries. The remaining refundable amount considers the sequence of order payment summaries, if provided. If false, any reserved balance amount for exchanges is refunded.                   | Optional             | 59.0              |
| sequences                        | <a href="#">Sequence Order Payment Summary Input[]</a> | Ordered list of refund amounts and OrderPaymentSummaries to apply them to. An OrderPaymentSummary must either belong to the order summary or be a reference to the order summary in the OrderPaymentSummaryReference entity. The process traverses this list in order and stops when it's refunded the full amount. | Optional             | 56.0              |

### Response body for POST

- When the HTTP status code indicates success, the response body is an [Ensure Refunds Async Output](#). The response body can still indicate processing errors.
- When the HTTP status code is in the 400 (client error) or 500 (server error) range, the response body is an [Error with Output](#). The output property is an [Ensure Refunds Async Output](#), and the value of the enhancedErrorType property can be ignored.

### Usage

This method applies the refund to the OrderPaymentSummaries associated with the specified OrderSummary following this logic.

**Note:** If multiple OrderPaymentSummaries have equal AvailableToRefund amounts, their order of selection is random.

- Verify that the CreditMemo balance and excess funds amount don't exceed the total AvailableToRefund amount of all the OrderPaymentSummaries associated with the OrderSummary.
- If sequences is specified, follow these steps.
  - Traverse the sequences list in order and apply the specified refund amounts to the specified OrderPaymentSummaries.
  - If the specified CreditMemo and excess funds are fully refunded, or if isAllowPartial is true, then the action stops here.
- If a CreditMemo is specified, follow these steps.
  - If an OrderPaymentSummary has an AvailableToRefund amount matching the CreditMemo's remaining balance, apply the refund to that payment.
  - If no exact match was found but one or more OrderPaymentSummary has a large enough AvailableToRefund amount to cover the balance, use the OrderPaymentSummary with the smallest AvailableToRefund amount.

- c. If no single OrderPaymentSummary has a large enough AvailableToRefund amount, use multiple OrderPaymentSummaries in descending order of AvailableToRefund amount. This ensures the fewest OrderPaymentSummaries are used.
- 4. If only one OrderPaymentSummary is specified but has multiple payments, follow these steps.
  - a. If a payment has an amount matching the CreditMemo's remaining balance, apply the refund to that payment.
  - b. If no exact match was found but one or more payment has a large enough amount to cover the balance, use the payment with the smallest amount.
  - c. If no single payment has a large enough amount, use multiple payments in descending order of amount. This ensures the fewest payments are used.
- 5. If an excess funds amount is specified, follow these steps.
  - a. Examine those OrderPaymentSummaries. If one has an AvailableToRefund amount matching the excess funds amount, apply the refund to that OrderPaymentSummary.
  - b. If no exact match was found but one or more OrderPaymentSummary has a large enough AvailableToRefund amount to cover the balance, use the OrderPaymentSummary with the smallest AvailableToRefund amount.
  - c. If no single OrderPaymentSummary has a large enough AvailableToRefund amount, use multiple OrderPaymentSummaries in descending order of AvailableToRefund amount. This ensures the fewest OrderPaymentSummaries are used.

**Note:** If the method creates a refund, the refund record's ClientContext value isn't predictable. Don't use it in custom logic.

## Order Summaries, Multiple Ensure Funds Async

Ensure and apply funds for one or more Invoices. If needed, capture authorized funds by sending a request to a payment provider. This method inserts a background operation into an asynchronous job queue and returns the ID of that operation so you can track its status. Payment gateway responses appear in the payment gateway log and do not affect the background operation status.

|-------------|--------------------------------------------------|-------------------------------------------------------------------------|----------------------|-------------------|
| asyncInputs | <a href="#">Inner Ensure Funds Async Input[]</a> | List of Invoices to ensure funds for and the associated OrderSummaries. | Required             | 56.0              |

### Response body for POST

- When the HTTP status code indicates success, the response body is a [Multiple Async Output](#). The response body can still indicate processing errors.
- When the HTTP status code is in the 400 (client error) or 500 (server error) range, the response body is an [Error with Output](#). The output property is a [Multiple Async Output](#), and the value of the `enhancedErrorType` property can be ignored.

### Usage

For each Invoice in the request, this method checks the OrderPaymentSummaries associated with the specified OrderSummary for funds to apply to the Invoice balance following this logic.

 **Note:** If multiple OrderPaymentSummaries have equal `BalanceAmount` values, their order of selection is random.

- Verify that the Invoice balance doesn't exceed the total `BalanceAmount` of all the OrderPaymentSummaries associated with the OrderSummary.
- If an OrderPaymentSummary has a `BalanceAmount` equal to the invoice balance, apply the funds from that OrderPaymentSummary.
- If no exact match was found, apply funds from the OrderPaymentSummary with the largest `BalanceAmount`.
- If the Invoice still has a balance to ensure, repeat steps 2 and 3 until the full balance is ensured or no captured funds remain.
- If the Invoice still has a balance, look for an OrderPaymentSummary with an authorized amount equal to the remaining Invoice balance. If one exists, capture and apply the funds from that OrderPaymentSummary.
- If no exact match was found, capture and apply funds from the OrderPaymentSummary with the largest authorized amount.
- If the Invoice still has a balance to ensure, repeat steps 5 and 6 until the full balance is ensured.

 **Note:** If the method creates a payment, the payment record's `ClientContext` value isn't predictable. Don't use it in custom logic.

Values are:</p> <ul style="list-style-type: none"> <li>• <b>Disallowed</b>—When distributing the adjustment, ignore any quantities being fulfilled. If an order item summary's entire quantity is being fulfilled, return an error. This is the default value.</li> <li>• <b>InFulfillment</b>—When distributing the adjustment, include quantities being fulfilled. Create a separate change order for the adjustments made to those quantities.</li> <li>• <b>PreFulfillment</b>—When distributing the adjustment, include quantities being fulfilled. Include the adjustments made to those quantities in the change order for pre-fulfillment quantity adjustments.</li> </ul> | Optional             | 55.0              |
| initialTaxAdjustments         | Boolean                              | Specifies whether to create multiple lines for each tax adjustment or one line with all tax adjustments. The default value is false.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Optional             | 59.0              |

**Response body for POST**

- When the HTTP status code indicates success, the response body is an [Adjust Order Summary Output](#). The response body can still indicate processing errors.
- When the HTTP status code is in the 400 (client error) or 500 (server error) range, the response body is an [Error with Output](#). The `output` property is an [Adjust Order Summary Output](#), and the value of the `enhancedErrorType` property can be ignored.

**Usage**

When a price adjustment is applied to an `OrderItemSummary`, its quantities are considered in three groups:

**Pre-fulfillment**

`QuantityAvailableToFulfill`, which is equal to `QuantityOrdered` - `QuantityCanceled` - `QuantityAllocated`

**In-fulfillment**

`QuantityAllocated` - `QuantityFulfilled`

**Post-fulfillment**

`QuantityAvailableToReturn`, which is equal to `QuantityFulfilled` - `QuantityReturnInitiated`

You can apply adjustments to these groups in three different ways, controlled by the `allocatedItemsChangeOrderType` input property:

- Distribute the adjustment evenly between pre-fulfillment and post-fulfillment quantities. Ignore in-fulfillment quantities. Create one change order for the adjustments to pre-fulfillment quantities and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Create one change order for the adjustments to both pre-fulfillment and in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.
- Distribute the adjustment evenly between pre-fulfillment, in-fulfillment, and post-fulfillment quantities. Create one change order for the adjustments to pre-fulfillment quantities, one change order for the adjustments to in-fulfillment quantities, and one change order for the adjustments to post-fulfillment quantities.

After submitting a price adjustment, process refunds as appropriate:

- If the discount only applied to `OrderItemSummaries` for which payment has not been captured, it does not require a refund. This situation normally applies to `OrderItemSummaries` in the US that have not been fulfilled.
- If the discount applied to `OrderItemSummaries` that have not been fulfilled and for which payment has been captured, process a refund. In this case, pass the `totalExcessFundsAmount` from the response body to the [Order Summaries, Ensure Refunds Async](#) resource.
- If the discount applied to `OrderItemSummaries` that have been fulfilled, process a refund. Pass the `postFulfillmentChangeOrderId` from the response body to the [Order Summaries, Create Credit Memo](#) resource, then pass the `CreditMemo` to the [Order Summaries, Ensure Refunds Async](#) resource.
- If the discount applied to both fulfilled and unfulfilled `OrderItemSummaries` for which payment has been captured, process both refunds. Pass the `postFulfillmentChangeOrderId` from the response body to the [Order Summaries, Create Credit Memo](#) resource, then pass the credit memo and the `totalExcessFundsAmount` from the response body to the [Order Summaries, Ensure Refunds Async](#) resource.

## Order Summaries, Submit Cancel

Cancel one or more OrderItemSummaries from an OrderSummary, and create a corresponding change order.

### Resource

```
/commerce/order-management/order-summaries/orderSummaryId/actions/submit-cancel
```

### Available version

48.0

### HTTP methods

POST

### Request body for POST

[Change Input](#)

### Root XML tag

```
<changeInput>
```

### JSON example

```
{
  "changeItems": [
    {
      "orderItemSummaryId": "10uxx0000004FYDAA2",
      "quantity": 1.0,
      "reason": "Wrong Item",
      "shippingReductionFlag": true
    }
  ]
}
```

### Properties

| Name        | Type                                | Description                            | Required or Optional | Available Version |
|-------------|-------------------------------------|----------------------------------------|----------------------|-------------------|
| changeItems | <a href="#">Change Item Input[]</a> | List of changes to OrderItemSummaries. | Required             | 48.0              |

### Response body for POST

- When the HTTP status code indicates success, the response body is a [Submit Cancel Output](#). The response body can still indicate processing errors.
- When the HTTP status code is in the 400 (client error) or 500 (server error) range, the response body is an [Error with Output](#). The output property is a [Submit Cancel Output](#), and the value of the enhancedErrorType property can be ignored.

## Order Summaries, Submit Return

Return one or more `OrderItemSummaries` from an `OrderSummary`, and create a corresponding change order. This return is a simple return that creates a change order but not a `ReturnOrder`.

### Resource

```
/commerce/order-management/order-summaries/orderSummaryId/actions/submit-return
```

### Available version

48.0

### HTTP methods

POST

## Pending Order Summaries

Create pending order summaries from order summary graphs. The High Scale Orders feature must be active, but a B2C Commerce connection isn't required. Created pending order summaries are queued for automatic processing into order summaries, the same as pending order summaries ingested from B2C Commerce. The provided JSON example references person accounts, but business accounts are also supported.

### Request parameters for GET

| Parameter Name     | Type    | Description                                                                                                                                         | Required or Optional               | Available Version |
|--------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|-------------------|
| effectiveAccountId | String  | ID of the account for which the request is made. If unspecified, defaults to the account ID for the context user.                                   | Required for B2B and D2C webstores | 59.0              |
| facets             | String  | A list of facet names to filter the search. For example, ["size_medium", "color_red"] is encoded to <code>wyZaPlX211ZG1bStsICrJb2wcl9vZQixQ=</code> | Optional                           | 59.0              |
| page               | Integer | Maximum number of search results pages to return. If you don't specify a value, the default is 1.                                                   | Optional                           | 59.0              |
| pageSize           | Integer | Number of items per page. Valid values are from 1 through 100. If you don't specify a value, the default size is 20.                                | Optional                           | 59.0              |
| searchTerm         | String  | Term used for the search.                                                                                                                           | Required                           | 59.0              |

### Response body for GET

[Product Search](#)

## Return Orders, Return Items

Process ReturnOrderLineItems belonging to a ReturnOrder. Processing a ReturnOrderLineItem generates a change Order and makes that ReturnOrderLineItem read-only. The change order for a returned item or delivery charge has a positive amount and should be used to create a credit memo. The change order for a return fee has a negative amount and should be used to create an invoice. If a processed ReturnOrderLineItem has any remaining expected quantity, then the API creates a separate ReturnOrderLineItem representing that quantity.

| <a href="#">/payments/payment-link-configs/<i>paymentLinkId</i></a>       | Retrieve the payment link details.                            |

## Payment Authorization

Authorize a payment.

To access Salesforce Payments resources, you need one of the following permissions:

- PaymentsAPIUser user permission. This permission is available with the Salesforce Order Management License & B2B Community License. Your Salesforce admin assigns it to your user profile.
- Authorize Payment user permission. This permission is available with the Salesforce Payment License. Your Salesforce admin assigns it to your user profile.
- Authorize and Capture Payment user permission. This permission is available with the Salesforce Payment License. Your Salesforce admin assigns it to your user profile.
- Make Payments user permission. This permission is available with the Salesforce Payment License. Your Salesforce admin assigns it to your buyer profile.

### Resource

```
/commerce/payments/authorizations
```

### Available version

49.0

### HTTP methods

POST

### Request body for POST

 **Note:** Supports JSON only. XML isn't supported.

### JSON example (without idempotency)

```
{
  "accountId": "000000",
  "amount": "5000",
  "comments": "Authorization for $5000",
  "currencyIsoCode": "USD",
  "effectiveDate": "15-01-2020",
  "paymentGatewayId": "0000000",
  "paymentGroup": {
    "createPaymentGroup": "true",
    "sourceObjectId": "",
    "currencyIsoCode": "USD"
  },
  "paymentMethod": {
    "address": "123 Test Street, San Francisco, CA, 94105",
```

```
    "cardPaymentMethod": "",
    "id": "00000000" ,
    "saveForFuture": "false"
  }
}
```

**JSON example (idempotency key in JSON payload)**

```
{
  "accountId": "0000000",
  "amount": "5000",
  "idempotencyKey": "qw",
  "comments": "Authorization for $5000",
  "currencyIsoCode": "USD",
  "effectiveDate": "15-01-2020",
  "paymentGatewayId": "00000000",

  "paymentGroup": {
    "createPaymentGroup": "true",
    "sourceObjectId": "",
    "currencyIsoCode": "USD"
  },
  "paymentMethod": {
    "address": "123 Test Street, San Francisco, CA, 94105",
    "cardPaymentMethod": "",
    "id": "00000000" ,
    "saveForFuture": "false"
  }
}
```

**JSON example (idempotency key in header)**

```
{
  "accountId": "0000000",
  "amount": "5000",
  "comments": "Authorization for $5000",
  "currencyIsoCode": "USD",
  "effectiveDate": "15-01-2020",
  "paymentGatewayId": "00000000",
  "paymentGroup": { "createPaymentGroup": "true", "sourceObjectId": "",
"currencyIsoCode": "USD" },
  "paymentMethod": {
    "address": "123 Test Street, San Francisco, CA, 94105",
    "cardPaymentMethod": "",
    "id": "00000000" ,
    "saveForFuture": "false"
  }
}
```

**Header**

Name: sfdc-Payments-Idempotency-Key

Data Type: String

Max Length: 255

Example:

```
Content-Type: application/json; charset=UTF-8
Accept: application/json
sfdc-Payments-Idempotency-Key: UniqueIdempotencyKey
```

[Authorization Output](#)

## Payment Authorization, Capture

Capture an authorized payment.

To access Salesforce Payments resources, you need one of the following permissions:

- `PaymentsAPIUser` user permission. This permission is available with the Salesforce Order Management License. Your Salesforce admin assigns it to your user profile.

- Capture and Reverse Payment user permission. This permission is available with the Salesforce Payment License. Your Salesforce admin assigns it to your user profile.
- Authorize and Capture Payment user permission. This permission is available with the Salesforce Payment License. Your Salesforce admin assigns it to your user profile.

### Resource

```
/commerce/payments/authorizations/authorizationId/captures
```

The *authorizationId* is a unique ID associated with the payment authorization record.

### Available version

48.0

### HTTP methods

POST

### Request body for POST

#### JSON example (without idempotency)

```
{
  {
    "accountId": "",
    "amount": 150,
    "comments": "capture request",
    "paymentGroup": {
      "createPaymentGroup": "true",
      "sourceObjectId": "",
      "currencyIsoCode": "USD"
    },
  },

**Properties**

| <b>Name</b>    | <b>Type</b>                         | <b>Description</b>                                                                                                                                                                                                                                            | <b>Required or Optional</b> | <b>Available Version</b> |
|----------------|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|--------------------------|
| accountId      | String                              | ID of the account that must be linked to this capture request.                                                                                                                                                                                                | Optional                    | 48.0                     |
| additionalData | Map<String, String>                 | Allows users to enter additional data, if needed for a payment request. The additionalData object consists of entries, each of which includes a key and value. Supports up to five key-value pairs. Each key and each value can contain up to 255 characters. | Optional                    | 48.0                     |
| amount         | Double                              | Amount that must be captured.                                                                                                                                                                                                                                 | Required                    | 48.0                     |
| clientContext  | String                              | Provides context for payment APIs. Used for a payment caller to reestablish context.                                                                                                                                                                          | Optional                    | 49.0                     |
| comments       | String                              | Comments for payment capture request.                                                                                                                                                                                                                         | Optional                    | 48.0                     |
| effectiveDate  | String                              | Date that the payment becomes effective.                                                                                                                                                                                                                      | Optional                    | 48.0                     |
| email          | String                              | Email of the client that initiated the request.                                                                                                                                                                                                               | Optional                    | 48.0                     |
| idempotencyKey | String                              | Idempotency key used for the payment request. Can be provided in the payload or the header, but not in both places at once.                                                                                                                                   | Optional                    | 48.0                     |
| ipAddress      | String                              | IP address of the client who made the request.                                                                                                                                                                                                                | Optional                    | 48.0                     |
| macAddress     | String                              | MAC address of the client who made the request.                                                                                                                                                                                                               | Optional                    | 48.0                     |
| paymentGroup   | <a href="#">Payment Group Input</a> | Payment group details associated with the payment request.                                                                                                                                                                                                    | Optional                    | 48.0                     |
| phone          | String                              | Phone number of the client that initiated the request.                                                                                                                                                                                                        | Optional                    | 48.0                     |

**Response body for POST**[Capture Output](#)**Payment Authorization, Reverse**

Reverse an authorized payment.

To access Salesforce Payments resources, you need one of the following permissions:

- PaymentsAPIUser user permission. This permission is available with the Salesforce Order Management License. Your Salesforce admin assigns it to your user profile.
- Capture and Reverse Payment user permission. This permission is available with the Salesforce Payment License. Your Salesforce admin assigns it to your user profile.

### Resource

```
/commerce/payments/authorizations/authorizationId/reversals
```

### Available version

51.0

### HTTP methods

POST

### Request body for POST

 **Note:** Supports JSON only. XML is not supported.

#### JSON example (without idempotency key)

```
{
  "paymentAuthReversal": {
    "accountId": "0000000032",
    "amount": "19.39",
    "effectiveDate": "2020-11-02T08:59:59+08:00"
  }
}
```

#### JSON example (idempotency key in JSON payload)

```
{
  "accountId": "",
  "amount": "5000",
  "idempotencyKey": "qw",
  "comments": "Sale of 20 renewed licenses",
  "currencyIsoCode": "USD",
  "effectiveDate": "05-01-2020",
  "paymentGatewayId": "0000000",
  "paymentGroup": "",
  "paymentMethod": "SamplePaymentMethod"
}
```

#### JSON example (idempotency key in header)

```
{
  "accountId": "",
  "amount": "5000",
  "comments": "Sale of 20 renewed licenses",
  "currencyIsoCode": "USD",
  "effectiveDate": "05-01-2020",
  "paymentGatewayId": "0000000",
  "paymentGroup": "",
  "paymentMethod": "SamplePaymentMethod"
}
```

**Header**

Name: sfdc-Payments-Idempotency-Key

Data Type: String

Max Length: 255

Example:

```
Content-Type: application/json; charset=UTF-8
Accept: application/json
sfdc-Payments-Idempotency-Key: UniqueIdempotencyKey
```

**Properties**

| Name           | Type                | Description                                                                                                                                                                                                                                                   | Required or Optional | Available Version |
|----------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| accountId      | String              | Account for the payment authorization reversal. Must match the payment authorization's account.                                                                                                                                                               | Optional             | 51.0              |
| additionalData | Map<String, String> | Allows users to enter additional data, if needed for a payment request. The additionalData object consists of entries, each of which includes a key and value. Supports up to five key-value pairs. Each key and each value can contain up to 255 characters. | Optional             | 51.0              |
| amount         | Double              | Amount of adjustment applied to the payment authorization.                                                                                                                                                                                                    | Required             | 51.0              |
| comments       | String              | Users can add comments to provide additional details about a record. Maximum of 1,000 characters.                                                                                                                                                             | Optional             | 51.0              |
| effectiveDate  | String              | Date that the adjustment takes effect on the authorization.                                                                                                                                                                                                   | Required             | 51.0              |
| email          | String              | Email of the client that initiated the request.                                                                                                                                                                                                               | Optional             | 51.0              |
| idempotencyKey | String              | Idempotency key used for the payment request. Can be provided in the payload or the header, but not in both places at once.                                                                                                                                   | Optional             | 51.0              |
| ipAddress      | String              | IP address of the client who made the request.                                                                                                                                                                                                                | Optional             | 51.0              |
| macAddress     | String              | MAC address of the client who made the request.                                                                                                                                                                                                               | Optional             | 51.0              |
| phone          | String              | Phone number of the client that initiated the request.                                                                                                                                                                                                        | Optional             | 51.0              |

**Response body for POST**[Authorization Reversal Output](#)

## Post Authorization

Confirms that the merchant is ready to capture payment of an existing pre-authorized transaction.

To access Salesforce Payments resources, you need one of the following permissions:

- PaymentsAPIUser user permission. This permission is available with the Salesforce Order Management License & B2B Community License. Your Salesforce admin assigns it to your user profile.
- Make Payments user permission. This permission is available with the Salesforce Payment License. Your Salesforce admin assigns it to your buyer profile.

## Payment, Create Refund

Create a refund for a payment.

To access Salesforce Payments resources, you need one of the following permissions:

- PaymentsAPIUser user permission. This permission is available with the Salesforce Order Management License. Your Salesforce admin assigns it to your user profile.
- Refund Payment user permission. This permission is available with the Salesforce Payments License. Your Salesforce admin assigns it to your user profile.

**Resource**

```
/commerce/payments/payments/paymentId/refunds
```

The *paymentId* parameter represents a payment record.

**Available version**

48.0

**HTTP methods**

POST

**Request body for POST**

**Note:** Supports JSON only. XML isn't supported.

**JSON example (without idempotency)**

```
{
  "accountId": "",
  "amount": 150,
  "comments": "refund request",
  "paymentGroup": {
    "createPaymentGroup": "true",
    "sourceObjectId": "",
    "currencyIsoCode": "USD"
  },
  "effectiveDate": "2019-10-18T11:32:27.000Z",
  "ipAddress": "202.95.77.70",
  "macAddress": "00-14-22-01-23-45",
  "phone": "100-456-67",
  "email": "test@ccs.org",
  "additionalData": {
    "key1": "value1",
    "key2": "value2",
    "key3": "value3",
    "key4": "value4",
    "key5": "value5"
  }
}
```

**JSON example (idempotency key in JSON payload)**

```
{
  "accountId": "",
  "amount": 150,
  "idempotencyKey": "UniqueIdempotencyKey",
  "comments": "capture request",
  "paymentGroup": {
    "createPaymentGroup": "true",
    "sourceObjectId": "",
    "currencyIsoCode": "USD"
  },
  "effectiveDate": "2019-10-18T11:32:27.000Z",
  "ipAddress": "202.95.77.70",
  "macAddress": "00-14-22-01-23-45",
  "phone": "100-456-67",
  "email": "test@ccs.org",
  "additionalData": {
    "key1": "value1",
    "key2": "value2",
    "key3": "value3",
    "key4": "value4",
    "key5": "value5"
  }
}
```

**JSON example (idempotency key in header)**

```
{
  "accountId": "",
  "amount": 150,
  "comments": "capture request",
  "paymentGroup": {
    "createPaymentGroup": "true",
    "sourceObjectId": "",
    "currencyIsoCode": "USD"
  },
  "effectiveDate": "2019-10-18T11:32:27.000Z",
  "ipAddress": "202.95.77.70",
  "macAddress": "00-14-22-01-23-45",
  "phone": "100-456-67",
  "email": "test@ccs.org",
  "additionalData": {
    "key1": "value1",
    "key2": "value2",
    "key3": "value3",
    "key4": "value4",
    "key5": "value5"
  }
}
```

**Header**

Name: sfdc-Payments-Idempotency-Key

Data Type: String

Max Length: 255

Example:

```
Content-Type: application/json; charset=UTF-8
Accept: application/json
sfdc-Payments-Idempotency-Key: UniqueIdempotencyKey
```

**Properties**

| Name           | Type                | Description                                                                                                                                                                                                                                                  | Required or Optional | Available Version |
|----------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| accountId      | String              | ID of the account which must be linked to this referenced refund request.                                                                                                                                                                                    | Optional             | 48.0              |
| additionalData | Map<String, String> | Allows users to enter additional data, if needed a payment request.<br>The additionalData object consists of entries, each of which includes a key and value. Supports up to five key-value pairs. Each key and each value can contain up to 255 characters. | Optional             | 48.0              |
| amount         | Double              | Amount that must be refunded.                                                                                                                                                                                                                                | Required             | 48.0              |

| Name           | Type                                | Description                                                                                                                 | Required or Optional | Available Version |
|----------------|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| clientContext  | String                              | Provides context for payment APIs. Used for a payment caller to reestablish context.                                        | Optional             | 49.0              |
| comments       | String                              | Comments for the refund.                                                                                                    | Optional             | 48.0              |
| effectiveDate  | String                              | Date that the refund becomes effective.                                                                                     | Optional             | 48.0              |
| email          | String                              | Email of the client that initiated the request.                                                                             | Optional             | 48.0              |
| idempotencyKey | String                              | Idempotency key used for the payment request. Can be provided in the payload or the header, but not in both places at once. | Optional             | 48.0              |
| ipAddress      | String                              | IP address of the client that made the request.                                                                             | Optional             | 48.0              |
| macAddress     | String                              | MAC address of the client that made the request.                                                                            | Optional             | 48.0              |
| paymentGroup   | <a href="#">Payment Group Input</a> | Payment group details associated with the refund request.                                                                   | Optional             | 48.0              |
| phone          | String                              | Phone number of the client that initiated the request.                                                                      | Optional             | 48.0              |

**HTTP methods**

POST

## Request body for POST

### JSON example (without idempotency)

```
{
  "accountId": "",
  "amount": "5000",
  "comments": "Sale of 20 renewed licenses",
  "currencyIsoCode": "USD",
  "effectiveDate": "05-01-2020",
  "paymentGatewayId": "00000000",
  "paymentGroup": "",
  "paymentMethod": "SamplePaymentMethod"
}
```

### JSON example (idempotency key in JSON payload)

```
{
  "accountId": "",
  "amount": "5000",
  "idempotencyKey": "qw",
  "comments": "Sale of 20 renewed licenses",
  "currencyIsoCode": "USD",
  "effectiveDate": "05-01-2020",
  "paymentGatewayId": "00000000",
  "paymentGroup": "",
  "paymentMethod": "SamplePaymentMethod"
}
```

### JSON example (idempotency key in header)

```
{
  "accountId": "",
  "amount": "5000",
  "comments": "Sale of 20 renewed licenses",
  "currencyIsoCode": "USD",
  "effectiveDate": "05-01-2020",
  "paymentGatewayId": "00000000",
  "paymentGroup": "",
  "paymentMethod": "SamplePaymentMethod"
}
```

## Header

Name: sfdc-Payments-Idempotency-Key

Data Type: String

Max Length: 255

Example:

```
Content-Type: application/json; charset=UTF-8
Accept: application/json
sfdc-Payments-Idempotency-Key: UniqueIdempotencyKey
```

**Properties**

| <b>Name</b>      | <b>Type</b>                                   | <b>Description</b>                                                                                                                                                                  | <b>Required or Optional</b>            | <b>Available Version</b> |
|------------------|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|--------------------------|
| accountId        | String                                        | Salesforce account that contains the payment for the sale request.                                                                                                                  | Optional                               | 54.0                     |
| additionalData   | Map<String, String>                           | Additional data that can be passed with a payment request. This property can include a maximum of five key-value pair entries. Each key and value can contain up to 255 characters. | Optional                               | 54.0                     |
| amount           | Double                                        | The amount of the sale.                                                                                                                                                             | Required                               | 54.0                     |
| comments         | String                                        | Optional comments for the payment sale request.                                                                                                                                     | Optional                               | 54.0                     |
| currencyIsoCode  | String                                        | A three-letter ISO 4217 currency code associated with the payment group record.                                                                                                     | Required, if multi-currency is enabled | 54.0                     |
| effectiveDate    | String                                        | The date that the sale request takes effect.                                                                                                                                        | Optional                               | 54.0                     |
| email            | String                                        | Email of the client that initiated the request.                                                                                                                                     | Optional                               | 54.0                     |
| idempotencyKey   | String                                        | Idempotency key used for the payment request. The key can be in the payload or the header but not both.                                                                             | Optional                               | 54.0                     |
| ipAddress        | String                                        | IP address of the client that made the request.                                                                                                                                     | Optional                               | 54.0                     |
| macAddress       | String                                        | MAC address of the client that made the request.                                                                                                                                    | Optional                               | 54.0                     |
| paymentGatewayId | String                                        | The gateway that evaluates the payment sale request.                                                                                                                                | Required                               | 54.0                     |
| paymentGroup     | <a href="#">Payment Group Input</a>           | Represents a group of payment requests.                                                                                                                                             | Optional                               | 54.0                     |
| paymentMethod    | <a href="#">Sale API Payment Method Input</a> | Represents a payment method for a payment sale transaction.                                                                                                                         | Required                               | 54.0                     |
| phone            | String                                        | Phone number of the client that initiated the request.                                                                                                                              | Optional                               | 54.0                     |

## Apple Pay Domains

Retrieve a list of Apple Pay Domains or register an Apple Pay domain with the payment gateway.

To access Salesforce Payments resources, you need the following license and permissions.

- Salesforce Payments License
- Payments Administrator permission set

#### Resource

```
/payments/merchant-accounts/merchantAccountId/apple-pay-domains
```

#### Resource example

```
https://yourInstance.salesforce.com/services/data/v65.0/payments/merchant-accounts/8zbLIT00000000ckYAA/apple-pay-domains
```

#### Available version

58.0

#### HTTP methods

GET, POST

#### Response body for GET

[Apple Pay Domain](#)

#### Request body for POST

##### JSON example

```
{
  "domainName": "https://www.mysite.com"
}
```

#### Properties

| Name       | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Required or Optional | Available Version |
|------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| domainName | String | Store's org domain. A valid domain name must use HTTPS, and must not contain a port, path, query parameter, or fragment. Valid domain examples: <ul style="list-style-type: none"><li>• https://salesforce.com</li><li>• https://www.mysite.com</li></ul> Don't enter URLs such as: <ul style="list-style-type: none"><li>• storefront.example.com (doesn't use HTTPS)</li><li>• https://storefront.example.com:1234 (has a port)</li><li>• https://storefront.example.com/abc (has a path)</li><li>• https://storefrontexample.com?id=8907283 (has a query parameter)</li></ul> | Required             | 58.0              |

## Apple Pay Domain, Delete

Unregisters an Apple Pay domain from the payment gateway.

### Resource

```
/payments/merchant-accounts/merchantAccountId/apple-pay-domains/applePayDomainId
```

### Available version

58.0

### HTTP methods

DELETE

### URI parameters

| Parameter Name    | Type   | Description                                                                            | Required or Optional | Available Version |
|-------------------|--------|----------------------------------------------------------------------------------------|----------------------|-------------------|
| merchantAccountId | string | Salesforce Payments merchant account ID associated with the Apple Pay domain.          | Required             | 58.0              |
| applePayDomainId  | string | Unique identifier used by Apple to recognize your business for Apple Pay transactions. | Required             | 58.0              |

## Payment Intents

Initiate a payment with Salesforce Payments.

To access this resource, you need the following license and permissions.

- Salesforce Payments License
- Payments Administrator permission set

### Resource

```
/payments/payment-intents
```

### Available version

57.0

### HTTP methods

POST

### Request body for POST

#### JSON examples

Here's an example without saved payment method information:

```
{
  "amount": 8.99,
  "currencyIsoCode": "USD",
  "sourceObjectIds": [
    "0a6xx0000000cuvAAA"
  ],
  "paymentGatewayId": "{{paymentGatewayId}}",
  "paymentMethodType": "card",
}
```

```

    "payerAccountId": "001xx000003GYwy"
  }

```

Here's an example with saved payment method information:

```

{
  "amount": "250",
  "applyDomainValidations": true,
  "currencyIsoCode": "USD",

| additionalData          | Map<String, String> | More data about the payment request. This property can include up to five key-value pairs. Each key and value can contain up to 255 characters.                                                                                                                                                                                                                                                                                                                                                | Optional             | 57.0              |
| amount                  | Double              | Amount to be captured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Required             | 57.0              |
| applyDomain Validations | Boolean             | Indicates whether to apply domain-specific validations on the payment intent request ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .<br><br>This field is applicable to these domains: <ul style="list-style-type: none"> <li>• Collections</li> <li>• Commerce</li> <li>• Custom</li> <li>• FieldService</li> <li>• OrderManagement</li> <li>• Payments</li> <li>• Revenue</li> <li>• Sales</li> <li>• Scheduler</li> <li>• Service</li> </ul> | Optional             | 63.0              |

| Name                 | Type                                       | Description                                                                                                                                                                                                                                  | Required or Optional | Available Version |
|----------------------|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| currencyIsoCode      | String                                     | Three-letter ISO 4217 code indicating the currency of the payment.                                                                                                                                                                           | Required             | 57.0              |
| isExpress            | Boolean                                    | Indicates whether the payment intent request is for Express checkout ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .<br><br>This field is applicable to only the PayPal gateway.              | Optional             | 60.0              |
| isShippingApplicable | Boolean                                    | Indicates whether shipping is applicable to this particular payment ( <code>true</code> ) or not ( <code>false</code> ). The default value is <code>false</code> .<br><br>This field is applicable to only the PayPal gateway.               | Optional             | 60.0              |
| paymentGatewayId     | String                                     | ID of the payment gateway that processes the payment intent.                                                                                                                                                                                 | Required             | 57.0              |
| paymentMethod        | <a href="#">Saved Payment Method Input</a> | Details required to save a payment method.                                                                                                                                                                                                   | Optional             | 58.0              |
| paymentMethodType    | String                                     | Type of payment instrument, such as a credit card or digital wallet.                                                                                                                                                                         | Required             | 57.0              |
| payerAccountId       | String                                     | ID of the payer's Salesforce account. The ID is shown in the URL of any record. For example, if the record's URL is <code>https://na1.lightning.force.com/lightning/r/Account/001OK000002KF2RYAW/view</code> , the ID is 001OK000002KF2RYAW. | Optional             | 61.0              |
| shippingAddress      | <a href="#">Address Input</a>              | Shipping address of the payment intent.                                                                                                                                                                                                      | Optional             | 59.0              |
| sourceObjectIds      | String[]                                   | A list of cart or checkout IDs that indicates what the payment was made for.                                                                                                                                                                 | Required             | 57.0              |
| useManualCapture     | Boolean                                    | Indicates whether to use manual capture of a payment ( <code>true</code> ) or not ( <code>false</code> ).                                                                                                                                    | Optional             | 58.0              |

**Response body for POST**[Payment Intents](#)**Payment Method Sets**

Retrieve a list of all configured payment method sets.

To access this resource, you need the following license and permissions.

- Salesforce Payments License
- Payments Administrator permission set

**Resource**

```
/payments/payment-method-sets/paymentMethodSetId
```

```
/payments/payment-method-sets?developerName=XYZ
```

**Available version**

58.0

**HTTP methods**

GET

**Request parameters for GET**

| Parameter Name     | Type   | Description                                                                                                                                           | Required or Optional | Available Version |
|--------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| developerName      | String | Developer-assigned unique name to identify a payment method set. You can use this query parameter instead of the payment method set ID path variable. | Optional             | 58.0              |
| paymentMethodSetID | String | Unique identifier for the payment method set. You can use the developerName query parameter in place of this path variable.                           | Required             | 58.0              |

**Response body for GET**[Payment Method Sets](#)

## Payment Activity Timeline

Retrieve the payment activity timeline for a payment intent. The timeline chronologically shows key events relating to a payment intent in one place, so your users can see information from a single source of truth.

**Resource**

```
/payments/payment-intents/paymentIntentId/timeline
```

**Resource example**

```
https://yourInstance.salesforce.com/services/data/v65.0/payments/payment-intents/0wpPI0000xxxxx/timeline
```

**Available version**

60.0

**HTTP methods**

GET

**Response body for GET**[List Timeline](#)

## Saved Payment Method

Deletes or updates (patches) a single saved payment method associated with a given merchant account.

### Special Access Rules

To access Salesforce Payments resources, you need the following license and permissions:

- Salesforce Payments License
- Payments Administrator permission set

### Resource

```
/payments/merchant-accounts/merchantAccountId/saved-payment-methods/{savedPaymentMethodId}
```

### Example

```
https://yourInstance.salesforce.com/services/data/v5.0/payments/merchant-accounts/merchantAccountId/saved-payment-methods/{savedPaymentMethodId}
```

### Available version

58.0

### HTTP methods

DELETE, PATCH, POST

PATCH is available in version 59.0 and later.

POST is available in version 60.0 and later.

### Request parameters for DELETE and PATCH

| Parameter Name     | Type   | Description                        | Required or Optional | Available Version |
|--------------------|--------|------------------------------------|----------------------|-------------------|
| effectiveAccountId | String | Owner of the saved payment method. | Required             | 58.0              |

### Response body for PATCH

| flowContext              | String              | Checkout or My Account flow for this payment method.                                                                                                           | Optional             | 59.0              |
| gatewayCustomerReference | String              | Owner associated with the payment method to the payment gateway.                                                                                               | Required             | 60.0              |

| Name                      | Type    | Description                                                                                      | Required or Optional | Available Version |
|---------------------------|---------|--------------------------------------------------------------------------------------------------|----------------------|-------------------|
| gatewayInitiatorReference | String  | Specifies the gateway initiator reference, such as setup intent ID for gateway Stripe.           | Required             | 60.0              |
| id                        | String  | Salesforce ID of the saved payment method record.                                                | Optional             | 58.0              |
| isDefault                 | Boolean | Marks the saved payment method as the default method to use for transactions.                    | Optional             | 58.0              |
| paymentGatewayId          | String  | Salesforce ID of the Payment Gateway object record.                                              | Required             | 58.0              |
| paymentMethodType         | String  | Payment method type, such as a credit card.                                                      | Required             | 59.0              |
| referenceOwnerId          | String  | ID of the merchant account of the contact record.                                                | Required             | 58.0              |
| usageType                 | String  | Specifies whether the payment method is used <code>OnSession</code> or <code>OffSession</code> . | Required             | 58.0              |

**Response body for POST**[Saved Payment Method Collection](#)

## Save Payment Method Token

Store the setup intent and payment method details in the `SavedPaymentMethod` object. Update the setup intent and payment method details record. Delete the payment method details record.

The Save Payment Method Token API call happens after the Save Payment Method request with the save payment method details is made to the payment gateway, such as Stripe, and the Setup Intent creation happens at the payment gateway end. The setup intent and payment method details are fetched from the payment gateway and stored in the `SavedPaymentMethod` object. This is a synchronous call.

## Special Access Rules

To access Salesforce Payments resources, you need the following license and permissions:

- Salesforce Payments License
- Payments Administrator permission set

**Resource**

```
/payments/merchant-accounts/{merchantAccountId}/saved-payment-methods/saveToken
```

**Example**

```
https://yourInstance.salesforce.com/services/data/v65.0/payments/merchant-accounts/{merchantAccountId}/saved-payment-methods/saveToken
```

**Available version**

60.0

**HTTP methods**

DELETE, PATCH, POST

**Request parameters for DELETE and PATCH**

| Parameter Name     | Type   | Description                        | Required or Optional | Available Version |
|--------------------|--------|------------------------------------|----------------------|-------------------|
| effectiveAccountId | String | Owner of the saved payment method. | Required             | 58.0              |

**Response body for PATCH**[Saved Payment Method Output](#)**Request body for POST****JSON example**

```
{
  "gatewayCustomerReference" : "cus_N9hYyZflb2ObdN",
  "gatewayInitiatorReference" : "seti_1Mm8s8LkdIwHu7ix00XBfTRG",

## Payment Link, Get Details

Retrieve the payment link details.

To access this resource, you need the following license and permissions.

- Salesforce Payments License
- Payments Administrator permission set

You can use Pay Now to generate and share payment links with your users from any Salesforce app. The payment link redirects the user to the Pay Now page, presenting payment details including the amount, designated payment method, and currency to complete the payment. Once users input the payment details and additional information, make a POST request with the [Payment Link, Create Order API](#) to process the payment.

For more information on setting up Pay Now to create and send payment links to users, see [Salesforce Pay Now](#).

**Resource**

```
/payments/payment-link-configs/paymentLinkId
```

**Resource example**

```
https://yourInstance.salesforce.com/services/data/v65.0/payments/payment-link-configs/12f1Q000000PCTs
```

**Available version**

58.0

**HTTP methods**

GET

**Response body for GET**[Payment Link Config Output](#)

## Payment Link, Create Order

Create an order for a payment link.

To access this resource, you need the following license and permissions.

- Salesforce Payments License
- Payments Administrator permission set

First, the [Payment Link, Get Configuration API](#) is called to fetch the payment link details, which are then shown on the Pay Now page. These details include the amount, payment method, and currency. Upon users inputting their payment details and additional information, the Payment Link, Create Order API is called to process the payment and generate the payment order.

### Resource

```
/payments/link-to-order/paymentLinkId
```

### Resource example

```
https://yourInstance.salesforce.com/services/data/v65.0/payments/link-to-order/12f1Q000000PCTs
```

### Available version

58.0

### HTTP methods

POST

### Request body for POST

#### JSON example

```
{
  "paymentData": "{\\"id\\":\\"pi_3PLpeFBDODMbR10X0czqEOVI\\",
  \\"uuid\\":\\"20d7702d-73bb-48bd-8b55-67ef02d0b97e\\",
  \\"paymentGatewayId\\":\\"0b01Q000000Xo6YQAS\\", \\"gatewayCustomerId\\":null}"
}
```

### Properties

| Name           | Type                | Description                                                                                                                                                                                                                  | Required or Optional | Available Version |
|----------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| additionalData | Map<String, String> | Map of additional data.                                                                                                                                                                                                      | Optional             | 58.0              |
| paymentData    | String              | Payment data identifier received from the payment gateway, such as Stripe, after successful validation of the payment data. This data is in JSON format and is stored in Salesforce object after successful payment request. | Required             | 58.0              |

## Salesforce Scheduler Resources

Get service territories and create service appointments using Salesforce Scheduler resources.

Available resources:

| Resource                                                      | Description                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">/connect/scheduling/available-territory-slots</a> | Get consolidated availability of each service resource within specified territories.                                                                                                                                                                                          |
| <a href="#">/connect/scheduling/engagement-channel-types</a>  | Retrieve a list of the engagement channel types from your Salesforce org.                                                                                                                                                                                                     |
| <a href="#">/connect/scheduling/group-appointments</a>        | Get a list of group appointments along with the remaining attendee limit.                                                                                                                                                                                                     |
| <a href="#">/connect/scheduling/service-appointments</a>      | Create and update service appointment records, assign resources, and generate leads, including group appointments with multiple participants.                                                                                                                                 |
| <a href="#">/connect/scheduling/service-territories</a>       | Get service territories for a <code>workTypeId</code> or <code>workTypeGroupId</code> . Filter and sort the service territories using the <code>radius</code> , <code>latitude</code> , <code>longitude</code> , <code>sortBy</code> , and <code>sortOrder</code> properties. |
| <a href="#">/connect/scheduling/waitlists</a>                 | Get waitlist details with the list of participants. A waitlist is a queue that includes participants without a scheduled appointment.                                                                                                                                         |
| <a href="#">/connect/scheduling/waitlist-checkin</a>          | Check in or register a participant to a waitlist who arrives at the service territory for a drop-in appointment.                                                                                                                                                              |

|---------------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| accountId                 | String  | ID of the associated account.                                                                                                                                                                                                                                                                                                       | Optional             | 49.0              |
| allowConcurrentScheduling | Boolean | Indicates whether concurrent appointments are allowed ( <code>true</code> ) or not allowed ( <code>false</code> ). The default value is <code>false</code> .                                                                                                                                                                        | Optional             | 49.0              |
| correlationId             | String  | ID to pass custom information to the <code>ServiceResourceScheduleHandler</code> Apex interface. For example, you can use the correlation ID to identify the app, website, or any other external system that calls this Apex interface implementation. If you don't pass a custom value, a randomly generated identifier is passed. | Optional             | 53.0              |
| endTime                   | String  | Latest time that an appointment can end.                                                                                                                                                                                                                                                                                            | Optional             | 49.0              |

 **Note:** The API only returns time slots up to 31 days from the `startTime`.

| Name                                  | Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Required or Optional | Available Version |

[Available Territory Slots Output](#)

## Engagement Channel Types

Retrieve a list of the engagement channel types from your Salesforce org. The API returns only the channel types that are active and whose usage type is set to Salesforce Scheduler.

**Resource**

```
/connect/scheduling/engagement-channel-types
```

**Examples**

```
https://yourInstance.salesforce.com/services/data/v56.0/connect/scheduling/engagement-channel-types
```

```
https://yourInstance.salesforce.com/services/data/v56.0/connect/scheduling/engagement-channel-types?workTypeGroupIds=0VSRM000000BgX4AU
```

```
https://yourInstance.salesforce.com/services/data/v56.0/connect/scheduling/engagement-channel-types?workTypeIds=08q2w000000XmniAAC,08q2w000000XmniAAS
```

**Available version**

56.0

**HTTP methods**

GET

**Request parameters for GET**

**Note:** You can either specify `workTypeGroupIds` or `workTypeIds` in the request to filter the engagement channel type results.

| Parameter Name                | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Required or Optional | Available Version |
|-------------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>workTypeGroupIds</code> | String | <p>List of the work type group IDs. The API returns the list of engagement channel type records that are associated with the specified work type group IDs.</p> <p>For example, suppose that you have three engagement channel types: EC1, EC2, and EC3. If you pass work type group IDs WTG1 that is associated with EC1 and EC2 and WTG2 that is associated with EC2, the API returns the list of engagement channel types where:</p> <ul style="list-style-type: none"> <li>• EC1 is with WTG1 only</li> <li>• EC2 is with both WTG1 and WTG2</li> </ul> <p>Because EC3 is not associated with any of the specified work type group IDs, the API doesn't return the engagement channel type EC3.</p> | Optional             | 56.0              |
| <code>workTypeIds</code>      | String | <p>List of the work type IDs. |--------------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| filterByEngagementChannelTypes | String[] | ID of the engagement channel type record. Group appointments are filtered based on the selected engagement channel type.             | Optional             | 61.0              |
| filterByParentRecords          | String[] | The ID of the associated parent record.                                                                                              | Optional             | 61.0              |
| filterByResources              | String[] | List of the group appointments where all the given resources are present.                                                            | Optional             | 61.0              |
| filterByTerritories            | String[] | List of IDs of the service territories where the requested work is performed.                                                        | Optional             | 61.0              |
| filterByWorkTypeGroups         | String[] | IDs of the work type groups containing the work types that are being performed.                                                      | Optional             | 61.0              |
| filterByWorkTypes              | String[] | List of IDs of the work types to be performed.                                                                                       | Optional             | 61.0              |
| limit                          | Integer  | Maximum number of records to be fetched.                                                                                             | Optional             | 61.0              |
| offset                         | Integer  | Number of records to be skipped.                                                                                                     | Optional             | 61.0              |
| startTime                      | String   | The earliest start time for the group appointments to be retrieved. If not provided, it defaults to the current time of the request. | Optional             | 61.0              |

**Response body for POST**[Group Appointments](#)

## Service Appointments

Create and update service appointment records, assign resources, and generate leads, including group appointments with multiple participants.

**Note:** When these parameters aren't specified, the API doesn't check for the availability of time slots. To ensure that duplicate service appointments aren't created, specify these parameters.

- WorkTypeId
- ServiceTerritoryId
- SchedStartTime
- SchedEndTime
- AssignedResources

**Resource**

```
/connect/scheduling/service-appointments
```

**Example**

```
https://yourInstance.salesforce.com/services/data/v65.0/connect  
/scheduling/service-appointments
```

**Available version**

48.0

**HTTP methods**

POST, PATCH

PATCH is available in version 51.0 and later.

**Request example to update the scheduled time**

**Note:** The API updates the equivalent Salesforce calendar events and block times when the scheduled time is updated.

```
{
  "serviceAppointmentId": "08pxx0000004C92AAE",
  "serviceAppointment": {
    "schedStartTime": "2020-09-15T16:00:00+0000",
    "schedEndTime": "2020-09-15T17:00:00+0000",
  }
}
```

Request example to update the work type

```
{
  "serviceAppointmentId": "08pxx0000004C92AAE",
  "serviceAppointment": {
    "workTypeId": "08qxx0000004C92AAE",
  }
}
```

Request example to update the service territory

```
{
  "serviceAppointmentId": "08pxx0000004C92AAE",
  "serviceAppointment": {
    "serviceTerritoryId": "0Hhxx0000004CAeCAM"
  }
}
```

**Response body for POST and PATCH**[Service Appointment Output](#)**Considerations for using engagement channel types with the `service-appointments` resource**

- **Schedule Appointments Using Engagement Channels** must be enabled in Salesforce Scheduler Settings in your Salesforce org.
- When you create or modify appointments, shifts must be defined in the scheduling policy. For more information on setting up shifts in the scheduling policy, see [Define Shift Rules in Scheduling Policy](#).  
  
 **Note:** Engagement channel types are not supported with operating hours rules in the scheduling policy.
- When you use engagement channels and shifts to create or modify a service appointment, Salesforce Scheduler must consider the default value for the Appointment Type (if not specified). However, Salesforce Scheduler only considers the engagement channel and Appointment Type is ignored.

## Service Territories

Get service territories for a `workTypeId` or `workTypeGroupId`. Filter and sort the service territories using the `radius`, `latitude`, `longitude`, `sortBy`, and `sortOrder` properties.

### Resource

```
/connect/scheduling/service-territories
```

### Resource example

```
https://yourInstance.salesforce.com/services/data/65.0/connect/scheduling/service-territories?workTypeGroupId=0VSRM000000009Z4AQ&latitude=37.79332&longitude=-122.392761&radius=50&radiusUnit=km&sortBy=Distance&sortOrder=asc
```

### Available version

48.0

### HTTP methods

GET

### Query parameters

| Parameter Name                    | Type     | Description                                                                                                                                                                                                                        | Required or Optional | Available Version |
|-----------------------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>filterByTerritoryIds</code> | String[] | Comma-separated list of service territory IDs to filter the API response.                                                                                                                                                          | Optional             | 57.0              |
| <code>latitude</code>             | Double   | Latitude of the service territory area.                                                                                                                                                                                            | Optional             | 48.0              |
| <code>limit</code>                | Integer  | Limit of the service territories returned. For example, specify <code>limit=1</code> to have only one service territory in the service territories list. The default value is 40.                                                  | Optional             | 48.0              |
| <code>longitude</code>            | Double   | Longitude of the service territory area.                                                                                                                                                                                           | Optional             | 48.0              |
| <code>offset</code>               | Integer  | Offset for the service territories returned. The default value is 0.                                                                                                                                                               | Optional             | 48.0              |
| <code>radius</code>               | Integer  | Radius around the latitude and longitude values to get service territories. Default value is 5 when latitude and longitude values are provided, otherwise there is no default value.                                               | Optional             | 48.0              |
| <code>radiusUnit</code>           | String   | Unit for the radius value. Possible values are <code>mi</code> for miles and <code>km</code> for kilometer. Default value is <code>mi</code> when latitude and longitude values are provided, otherwise there is no default value. | Optional             | 48.0              |
| <code>schedulingPolicyId</code>   | String   | ID of the <code>AppointmentSchedulingPolicy</code> object. If no scheduling policy is passed in the request body, the default                                                                                                      | Optional             | 48.0              |

| Parameter Name     | Type     | Description                                                                                                                                                                                                                                                 | Required or Optional                                 | Available Version |

## Waitlists

Get waitlist details with the list of participants. A waitlist is a queue that includes participants without a scheduled appointment.

### Resource

```
/connect/scheduling/waitlists
```

### Resource example

```
https://yourInstance.salesforce.com/services/data/v65.0/connect/scheduling/waitlists?waitlistIds=0010000XKJSMEDD
```

```
https://yourInstance.salesforce.com/services/data/v65.0/connect/scheduling/waitlists?waitlistIds=0010000XKJSMEDD,0010000XKJSMEDD
```

```
https://yourInstance.salesforce.com/services/data/v65.0/connect/scheduling/waitlists?serviceTerritoryId=0010000XKJSMEDD&isActive=true
```

```
https://yourInstance.salesforce.com/services/data/v65.0/connect/scheduling/waitlists?waitlistIds=0010000XKJSMEDD&participantFields=Source_c
```

### Available version

59.0

### HTTP methods

GET

### Request parameters for GET

| Parameter Name | Type    | Description                                                                                                                                                                               | Required or Optional | Available Version |
|----------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| isActive       | Boolean | Indicates whether to fetch the active waitlists ( <code>true</code> ) or inactive waitlists ( <code>false</code> ). Used when the <code>serviceTerritoryId</code> parameter is specified. | Optional             | 59.0              |
| maxLimit       | Integer | Batch size of the waitlist participant records to fetch for each waitlist ID or service territory ID. The default value is 50.                                                            | Optional             | 59.0              |
| offset         | Integer | Number of waitlist participant records to skip from the response, in ascending order as per the created date. The default value is 0. The maximum offset value is 2000.                   | Optional             | 59.0              |

| Parameter Name     | Type     | Description                                                                   | Required or Optional                                          | Available Version |
|--------------------|----------|-------------------------------------------------------------------------------|---------------------------------------------------------------|-------------------|
| participantFields  | String[] | Comma-separated list of fields to fetch from the waitlist participant object. | Optional                                                      | 59.0              |
| requestId          | String   | For internal use only.                                                        | Optional                                                      | 59.0              |
| serviceTerritoryId | String   | ID of the service territory to fetch the details of the waitlists.            | Required if the waitlistIds parameter isn't specified.        | 59.0              |
| waitlistIds        | String   | Comma-separated list of the waitlist IDs to filter the result.                | Required if the serviceTerritoryId parameter isn't specified. | 59.0              |

## Search Objects Answer

Search objects using a natural language query and return an answer.

**Note:** To use this resource, enable search answers in your Salesforce org from Einstein Search settings. This resource doesn't support the search customizations configured in Search Manager.

**Resource**

```
/connect/search/subjects/answer
```

**Available version**

63.0

**HTTP methods**

GET

**Example**

```
/services/data/v63.0/connect/search/subjects/answer?q=how to sign documents with docusign
&htmlEncode=false
```

**Request parameters for GET**

| Parameter Name | Type   | Description                                      | Required or Optional | Available Version |
|----------------|--------|--------------------------------------------------|----------------------|-------------------|
| q              | String | Natural language query to search for in the org. | Required             | 63.0              |

**Response body for GET**[Search Answer](#)

## Surveys Resources

Understand customer feedback as it evolves over time by engaging customers and users with relevant, personalized surveys. Incorporate survey data into your feedback management process and gain actionable insights at every stage of the customer lifecycle.

**Note:** Salesforce Feedback Management (SFM) Business API performance can be impacted if a POST request exceeds 5,400 calls per minute and if a PATCH request exceeds 2,700 calls per minute at the org level. For more rate limit information, see [Connect REST API Limits](#).

The invitation records are shared with Read access.                                                                                                                                        | Optional             | 50.0              |

| Name              | Type     | Description                                                                                                                                                              | Required or Optional | Available Version |
|-------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| subject           | String   | Subject of the email. Specify the subject in case you don't specify an email template.                                                                                   | Optional             | 50.0              |
| surveyQuestionIds | String[] | IDs of the questions that are embedded in the email. You can send an email invitation for questions of the following types: Net Promoter Score (NPS), rating, and score. | Optional             | 50.0              |

**Response body for POST**[Survey Email](#)

## Survey Responses Using Invitation Configurations (POST, PATCH)

Create responses using the invitation configuration details and initiate the process of submitting the survey responses by making a POST request. Submit the survey responses using the PATCH request. You can create a survey to collect data from customers, employees, or other people whose feedback you need. The survey responses are stored in the SurveyResponse object and the responses to individual questions in the SurveyQuestionResponse object.

**Note:** Salesforce Feedback Management (SFM) Business API performance can be impacted if a POST request exceeds 5,400 calls per minute and if a PATCH request exceeds 2,700 calls per minute at the org level. For more rate limit information, see [Connect REST API Limits](#).

## Special Access Rules

The Feedback Management - Starter and Feedback Management - Growth licenses are required to use this resource.

**Resource**

```
/connect/surveys/surveyId/survey-response
```

**Example**

```
https://yourInstance.salesforce.com/services/data/56.0/connect/surveys/0Kdx00000000H46CAE/survey-response
```

**Available version**

56.0

**HTTP methods**

PATCH, POST

**Note:** The HTTP header request format only accepts `Content-Type: application/json`.

## List of Topics

Get information about topics in the organization or create a topic.

### Resource

```
/connect/topics
```

```
/connect/communities/communityId/topics
```

### Available since version

29.0

In version 28.0, use `/chatter/topics`.

### HTTP methods

GET, POST, or HEAD

POST is available in version 36.0 and later.

## Request parameters for GET

| Parameter Name                       | Values  | Description                                                                                                                                                                                                                                                                                                                                                                                                             | Required or Optional | Available Version |
|--------------------------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| <code>exactMatch</code>              | Boolean | Use with the <code>q</code> parameter and specify <code>true</code> to find a topic by its exact, case-insensitive name. Specify <code>true</code> and use with the <code>q</code> parameter and the <code>fallBackToRenamedTopics</code> parameter set to <code>true</code> to find the most recent renamed topic match if there isn't an exact match. Default value is <code>false</code> .                           | Optional             | 28.0              |
| <code>fallBackToRenamedTopics</code> | Boolean | Use with the <code>q</code> parameter and the <code>exactMatch</code> parameter set to <code>true</code> . If an exact match isn't found and <code>fallBackToRenamedTopics</code> is set to <code>true</code> , the most recent renamed topic match is returned. If there are multiple renamed topic matches, only the most recent is returned. If there are no renamed topic matches, an empty collection is returned. | Optional             | 35.0              |
| <code>page</code>                    | Integer | An integer greater than 0 specifying a page of topics. The default value is zero.                                                                                                                                                                                                                                                                                                                                       | Optional             | 28.0              |
| <code>pageSize</code>                | Integer | Specifies the number of items per page. Valid values are from 1 to 100. The default value is 25.                                                                                                                                                                                                                                                                                                                        | Optional             | 28.0              |
| <code>q</code>                       | String  | A query string to filter the results. The string must contain at least                                                                                                                                                                                                                                                                                                                                                  | Optional             | 28.0              |

| Parameter Name | Values | Description                                                                                                                                                                                                                         | Required or Optional | Available Version |
|----------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
|                |        | two characters, not including wildcards.                                                                                                                                                                                            |                      |                   |
| sort           | String | <p>One of the following values:</p> <ul style="list-style-type: none"> <li>popularDesc—Sorts topics by popularity with the most popular first. This value is the default.</li> <li>alphaAsc—Sorts topics alphabetically.</li> </ul> | Optional             | 28.0              |

**Response body for GET**[Topic Collection](#)**Example for GET**

This example requests a list of topics sorted alphabetically:

```
/connect/topics?sort=alphaAsc
```

**Request body for POST****Root XML tag**

```
<topic>
```

**JSON example**

```
{
  "description": "World Wide Web Consortium (W3C) is the main international standards organization for the web.",
  "name": "W3C"
}
```

**Properties**

| Parameter Name | Type   | Description                   | Available Since |
|----------------|--------|-------------------------------|-----------------|
| description    | String | Text description of the topic | 36.0            |
| name           | String | Name of the topic             | 36.0            |

**Request parameters for POST**

| Parameter Name | Type   | Description                   | Available Since |
|----------------|--------|-------------------------------|-----------------|
| description    | String | Text description of the topic | 36.0            |
| name           | String | Name of the topic             | 36.0            |

[Topic Collection](#)

# Topic and Article Assignment Rules

Get, create, and reassign topic and article assignment rules by data category.

**Resource**

```
/connect/topics/data-category-rules/data-category-groups/dataCategoryGroup/data-categories/dataCategory
```

```
/connect/communities/communityId/topics/data-category-rules/data-category-groups/dataCategoryGroup/data-categories/dataCategory
```

**Available version**

40.0

**HTTP methods**

GET, POST, PUT

**Request body for POST and PUT**

Use POST to create topic and article assignment rules. Use PUT to reassign topic and article assignment rules by deleting the existing rules and creating new rules.

**Root XML tag**

```
<topicNamesCollection>
```

**JSON example**

```
{ "topicNames": ["API", "Connect REST API", "ConnectApi"]
}
```

**Properties**

| Name             | Type     | Description                                                                                        | Required or Optional | Available Version |
|------------------|----------|----------------------------------------------------------------------------------------------------|----------------------|-------------------|
| topicNames       | String[] | A list of up to 10 topic names for a feed item or 100 topic names for a record.                    | Required             | 35.0              |
| topicSuggestions | String[] | A list of suggested topics to assign to a record or feed item to improve future topic suggestions. | Optional             | 37.0              |

**Response body for GET, POST, and PUT**[Topic Collection](#)

## Topics Suggestions

Get a list of topic suggestions for a string of text, feed item, or record.

**Resource**

```
/connect/topics/suggestions
```

```
/connect/communities/communityId/topics/suggestions
```

**Available since version**

29.0

In version 28.0, use `/chatter/topics/suggestions`.

**HTTP methods**

GET or HEAD

**Request parameters**

| Parameter Name          | Values  | Description                                                                                                                                                                                                                     | Required or Optional                                       |
|-------------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| <code>maxResults</code> | Integer | Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.                                                                                             | Optional                                                   |
| <code>recordId</code>   | String  | 18-character ID of a feed item or record from which to extract topics. Administrators must enable topics for objects to see topic suggestions for records of that object type. Topics for objects is available in version 30.0. | Required if the <code>text</code> parameter isn't used     |
| <code>text</code>       | String  | Text from which to extract topics.                                                                                                                                                                                              | Required if the <code>recordId</code> parameter isn't used |

**Response body**

[Topic Suggestion Collection](#)

**Example for GET**

This example gets topic suggestions for the text "Working on the planning meeting for our new initiative."

```
/connect/topics/suggestions?text=Working+on+the+planning+meeting+for+our+new+initiative.
```

## Trending Topics

Get the top five trending topics for the org.

The more frequently people add a specific topic to their posts and comments and comment on or like posts with the same topic over a short period of time, the more likely it is to become a trending topic. For example, if your coworkers are attending the upcoming Dreamforce conference and have started discussing it in Chatter, you may see a trending topic for Dreamforce. A trending topic is not solely based on popularity and usually relates to a one-time or infrequent event that has a spike in activity, such as a conference or a project deadline.

 **Note:** In API versions earlier than 28.0, topics began with a hashtag (#).

**Resource**

```
/connect/topics/trending
```

```
/connect/communities/communityId/topics/trending
```

**Available since version**

29.0

In versions 24.0–28.0, use `/chatter/topics/trending` and `/connect/communities/communityId/chatter/topics/trending`.

**HTTP methods**

GET or HEAD

**Request parameters**

| Parameter Name | Values  | Description                                                                                                            |
|----------------|---------|------------------------------------------------------------------------------------------------------------------------|
| maxResults     | Integer | Maximum number of trending topics that get returned. The default is 5. Value must be greater than 0 and less than 100. |

#### Response body for GET, HEAD, or PATCH

[Topic](#)

#### Response body for DELETE

[204: Successful Delete](#)

Topic deletion is asynchronous. If a topic is requested before the deletion completes, the response is [200: Successful](#) and the `isBeingDeleted` property of the Topic output is `true` in version 33.0 and later. If a topic is requested after the deletion completes, the response is [404: Not found](#).

#### Example for PATCH

This example uses request parameters to update the description of a topic:

```
/connect/topics/0TOD000000006RxOAI?description=Edit+requests
```

This example uses a JSON request body to make the same request:

```
/connect/topics/0TOD00000006RxOAI

{
  "description" : "Edit requests"
}
```

## Topic Files

Returns information about the five files most recently posted to the specified topic.

### Resource

```
/connect/topics/topicId/files
```

```
/connect/communities/communityId/topics/topicId/files
```

### Available since version

29.0

In version 28.0, use `/chatter/topics/topicId/files`.

### HTTP methods

GET or HEAD

### Response body

[File Summary Page](#)

### Example response body

This GET request returns information about every file in the specified topic:

```
/connect/topics/0TOD00000009Q2/files
```

The response is:

```
{

## Topics on Records Resource

Get information about topics assigned to a record or feed item and add, remove, and replace topics on a record or feed item. Optionally, suggest a list of topics to assign to a record or feed item to improve future topic suggestions. Only users with the Assign Topics permission can remove topics from records or feed items and add existing topics to records or feed items. Only users with the Create Topics permission can add new topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

### Resource

```
/connect/records/recordId/topics
```

```
/connect/communities/communityId/records/recordId/topics
```

### Available since version

30.0

### HTTP methods

GET, DELETE, POST, PUT

PUT is supported in version 35.0 and later.

### Request parameters for DELETE

| Parameter Name | Type   | Description             | Required or Optional | Available Version |
|----------------|--------|-------------------------|----------------------|-------------------|
| topicId        | String | ID of an existing topic | Required             | 30.0              |

### Response body for DELETE

[204: Successful Delete](#)

### Request body for POST

#### Root XML tag

```
<topicAssignment>
```

#### JSON

The following example assigns a topic to a record:

```
{ "topicId": "0TOD0000000090r"
}
```

### Properties

| Name      | Type   | Description                      | Required or Optional                                                                                   | Available Version |
|-----------|--------|----------------------------------|--------------------------------------------------------------------------------------------------------|-------------------|
| topicId   | String | ID of an existing topic.         | Required for existing topics if the <code>topicName</code> property isn't used.                        | 30.0              |
| topicName | String | Name of a new or existing topic. | Required for new topics; required for existing topics if the <code>topicId</code> property isn't used. | 30.0              |

**Request parameters for POST**

| Parameter Name | Type   | Description                     | Required or Optional                                                                      | Available Version |
|----------------|--------|---------------------------------|-------------------------------------------------------------------------------------------|-------------------|
| topicId        | String | ID of an existing topic         | Required for existing topics if the topicName parameter isn't used                        | 30.0              |
| topicName      | String | Name of a new or existing topic | Required for new topics; required for existing topics if the topicId parameter isn't used | 30.0              |

**Response body for POST**[Topic](#)**Example for POST**

This example passes the ID of an existing topic in the `topicId` parameter to associate it with an opportunity record:

```
POST /connect/records/006D000000CtYBc/topics?topicId=0TOD0000000090r
```

**Request body for PUT**

PUT requests reassign all topics on a record or feed item, that is, replace all assigned topics on a record or feed item with different topics. Optionally, PUT requests can suggest a list of topics to assign to a record or feed item to improve future topic suggestions.

**Root XML tag**

```
<topicNamesCollection>
```

**JSON example**

```
{ "topicNames": ["API", "Connect REST API", "ConnectApi"]
}
```

**Properties**

| Name             | Type     | Description                                                                                        | Required or Optional | Available Version |
|------------------|----------|----------------------------------------------------------------------------------------------------|----------------------|-------------------|
| topicNames       | String[] | A list of up to 10 topic names for a feed item or 100 topic names for a record.                    | Required             | 35.0              |
| topicSuggestions | String[] | A list of suggested topics to assign to a record or feed item to improve future topic suggestions. | Optional             | 37.0              |

**Response body for PUT**[Topic Collection](#)

## Type System Resources

Use Type System resources to retrieve information about the types available in your org.

Available resources are:

| Resource                                                           | Description                                                                              |
|--------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| <a href="#">/connect/lightning-types</a>                           | Get a list of all standard and custom Lightning types.                                   |
| <a href="#">/connect/lightning-types/<i>fullyQualifiedName</i></a> | Get detailed information about standard and custom Lightning types.                      |
| <a href="#">/connect/lightning-model/types</a>                     | Get detailed information about standard and custom Lightning types and Apex class types. |

## Lightning Types

Get basic information, such as identifiers, title, and description about each Lightning type.

### Resource

```
/connect/lightning-types
```

### Available version

64.0

### HTTP methods

GET

### Request parameters for GET

| Parameter Name       | Type     | Description                                                                                                                                                                                                                                         | Required or Optional | Available Version |
|----------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| editorConfig Target  | String   | Editor configuration targets for lightning types. In version 64.0 and later, <code>LightningDesktopGenAi</code> is the only valid value.                                                                                                            | Optional             | 64.0              |
| fullyQualified Names | String[] | List of fully qualified names of types to return.                                                                                                                                                                                                   | Optional             | 64.0              |
| language             | String   | Language or locale code, such as <code>es</code> or <code>en_US</code> , to retrieve the title and description of a type. If unspecified, the logged-in user's language is used. The fallback language is English in case translations don't exist. | Optional             | 64.0              |
| page                 | Integer  | Number of the page to return. If unspecified or if you specify 0, the first page is returned.                                                                                                                                                       | Optional             | 64.0              |
| pageSize             | Integer  | Number of items on a page. Valid values are from 1 to 250. If unspecified, defaults to 25.                                                                                                                                                          | Optional             | 64.0              |

| Parameter Name           | Type   | Description                                                                                                                                | Required or Optional | Available Version |
|--------------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| rendererConfig<br>Target | String | Renderer configuration targets for lightning types. In version 64.0 and later, <code>LightningDesktopGenAi</code> is the only valid value. | Optional             | 64.0              |

## Users Files, General

Upload a file, including references to external files, to the Files home or get information about files a user owns. These files don't include files shared with a user, files a user follows, or general organization files.

When you upload a file to the Files home, it is private and available only to the file owner.

To upload a file, send it in a multipart/form-data request. You can include the description and title of the file in the multipart/form-data request as a JSON or XML request body. You can also send the information as request parameters. For information about how to create the multipart/form-data message, see [Uploading Binary Files](#).

To upload multiple files in the same call, see [Batch Resource](#).

 **Important:** This resource can return a large amount of data and, when it does, takes some time to process.

### Resource

```
/connect/files/users/userId
```

```
/connect/communities/communityId/files/users/userId
```

### Available since version

36.0

In versions 24.0–35.0, use `/chatter/users/userId/files` and `/connect/communities/communityId/chatter/users/userId/files`, which require Chatter.

### HTTP methods

GET, POST, or HEAD

POST is available to guest users in version 62.0 and later.

### Request body for POST

To upload a file, provide the binary file in a multipart/form-data body part where `name="fileData"`. See [Uploading Binary Files](#).

### Root XML tag

```
<fileInput>
```

### JSON example for creating a file

```
{
  "desc": "Employee Survey Results",
```

```
    "title": "emp_surv_results"
  }
```

JSON example for creating a reference to an external file

```
{
  "repositoryId": "0XCB00000004CHJ",
  "repositoryFileId": "document:1AnPHWYq_j56yryuRbxiVp93rD2qGqNWx7yZHvidxDpQ"
}
```

JSON example for a guest user creating a file

```
{
  "contentBodyId": "05Txx00000004CH6EAM",
  "title": "Screenshot 2024-06-17 at 6.24.49 PM",
  "networkId": "0DBxx00000004CH6GAM",
  "pathOnClient": "Screenshot 2024-06-17 at 6.24.49 PM.png",
  "firstPublishLocationId": null,
  "fieldName": "Guest_Record_Main_fileupload__c",
  "fieldValue": "Version1"
}
```

Properties

| Name                               | Type    | Description                                                                                                                                                                                                                                         | Required or Optional | Available Version |
|------------------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| contentBodyId                      | String  | ID of the content body.                                                                                                                                                                                                                             | Optional             | 62.0              |
| contentModifiedDate                | String  | File-specific last modified date that can be used to set a client-side modified date. Specify the date in ISO 8601 format.                                                                                                                          | Optional             | 32.0              |
| desc                               | String  | Description of the file to be uploaded.                                                                                                                                                                                                             | Optional             | 24.0              |
| fieldName                          | String  | Name of a custom field on the ContentVersion object. The API name of the customer field must end with fileupload__c.                                                                                                                                | Optional             | 62.0              |
| fieldValue                         | String  | Value to store for the custom field specified in fieldName for the uploaded file.                                                                                                                                                                   | Optional             | 62.0              |
| firstPublishLocationId             | String  | ID of the location where the version was first published.                                                                                                                                                                                           | Optional             | 62.0              |
| includeExternalFilePermissionsInfo | Boolean | Specifies whether to include permission information, such as whether the file is shared and what are the available permission types, for external files.<br><br>This property can be used with POST requests to /connect/files/users/ <b>userId</b> | Optional             | 35.0              |

| Name                                | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                | Required or Optional                                                                     | Available Version |

| Name           | Type    | Description                                                                                                                                                                                                                                                                                                                    | Required or Optional | Available Version |
|----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| reuseReference | Boolean | Specifies whether to reuse the latest version of a reference you own to an external file rather than creating a duplicate reference.<br><br>This property can be used with POST requests to<br><code>/connect/files/users/<b>userId</b></code><br>but not with POST requests to<br><code>/connect/files/<b>fileId</b></code> . | Optional             | 36.0              |
| sharingOption  | String  | Sharing option of the file. Values are: <ul style="list-style-type: none"> <li>Allowed—Resharing of the file is allowed.</li> <li>Restricted—Resharing of the file is restricted.</li> </ul>                                                                                                                                   | Optional             | 35.0              |
| sharingPrivacy | String  | Sharing privacy of a file. Values are: <ul style="list-style-type: none"> <li>None—File is visible to anyone with record access.</li> <li>PrivateOnRecords—File is private on records.</li> </ul>                                                                                                                              | Optional             | 41.0              |
| title          | String  | Title of the file.                                                                                                                                                                                                                                                                                                             | Optional             | 24.0              |

## Request parameters for POST

| Name                                                                                                                                                | Type    | Description                                                                                                                                              | Required or Optional | Available version |
|-----------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-------------------|
| content<br>ModifiedDate                                                                                                                             | String  | File-specific last modified date that can be used to set a client-side modified date. Specify the date in ISO 8601 format.                               | Optional             | 32.0              |
| desc                                                                                                                                                | String  | Description of the file                                                                                                                                  | Optional             | 24.0              |
| includeExternal<br>FilePermissions<br>Info                                                                                                          | Boolean | Specifies whether to include permission information, such as whether the file is shared and what are the available permission types, for external files. | Optional             | 35.0              |
| isDataSync                                                                                                                                          | Boolean | An automated client generates the request.                                                                                                               | Optional             | 31.0              |
| isInMyFileSync                                                                                                                                      | Boolean | <code>true</code> if the file is synced with Salesforce Files Sync; <code>false</code> otherwise.                                                        | Optional             | 31.0              |
|  <b>Note:</b> Salesforce Files Sync was retired on May 25, 2018. |         |                                                                                                                                                          |                      |                   |

| Name                  | Type    | Description                                                                                                                                                                                                                     | Required or Optional                                                         | Available version |
|-----------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|-------------------|
| isMajorVersion        | Boolean | <code>true</code> if the file is a major version; <code>false</code> if the file is a minor version. Major versions can't be replaced. The default value is <code>false</code> .                                                | Optional                                                                     | 31.0              |
| repository<br>FileId  | String  | ID of the external file.                                                                                                                                                                                                        | Optional                                                                     | 32.0              |
| repository<br>FileUri | String  | URI of the external file, such as <code>https://drive.google.com/file/d/0B7a_ei8brTlTMy1CQ0o5NmZQNEE/view</code> .                                                                                                              | Optional                                                                     | 39.0              |
| repositoryId          | String  | ID of the external data source.                                                                                                                                                                                                 | Required if <code>repositoryFileId</code> is specified. Otherwise, Optional. | 32.0              |
| reuseReference        | Boolean | Specifies whether to reuse the latest version of a reference you own to an external file rather than creating a duplicate reference.                                                                                            | Optional                                                                     | 36.0              |
| sharingOption         | String  | Sharing option of the file. Values are: <ul style="list-style-type: none"> <li>• <code>Allowed</code>—Resharing of the file is allowed.</li> <li>• <code>Restricted</code>—Resharing of the file is restricted.</li> </ul>      | Optional                                                                     | 35.0              |
| sharingPrivacy        | String  | Sharing privacy of a file. Values are: <ul style="list-style-type: none"> <li>• <code>None</code>—File is visible to anyone with record access.</li> <li>• <code>PrivateOnRecords</code>—File is private on records.</li> </ul> | Optional                                                                     | 41.0              |
| title                 | String  | Title of the file                                                                                                                                                                                                               | Optional                                                                     | 24.0              |

### Request parameters for GET

| Parameter Name | Type    | Description                                                                                                                  | Available Since |
|----------------|---------|------------------------------------------------------------------------------------------------------------------------------|-----------------|
| page           | Integer | An integer specifying a page of items. The default value is 0, which returns the first page.                                 | 24.0            |
| pageSize       | Integer | Specifies the number of items per page. Valid values are from 1 through 100. If you don't specify a size, the default is 25. | 24.0            |
| q              | String  | A query string to filter the results. The string must contain                                                                | 27.0            |

| Parameter Name | Type | Description                                                                                                        | Available Since |
|----------------|------|--------------------------------------------------------------------------------------------------------------------|-----------------|
|                |      | at least two characters, not including wildcards. For information about wildcards, see <a href="#">Wildcards</a> . |                 |

**Response body for GET**[File Summary Page](#)**Response body for POST**[File Summary](#)**Example POST request**

This example creates a file and uploads it to Salesforce. The example shows the body parts in a multipart/form-data request. The first body part is a File Input request body. The second is the content of the file. For more information, see [Uploading Binary Files](#).

```
