

Video Transcript: Shopify Connector Demo

[\[Link to video\]](#)

Hi, everyone. Today we're going to talk about how to set up the Shopify connection. Um, we will first go to the store that we have in Shopify. I, I've come to the settings part in here. The store has already been set up. I can go to something called Apps and sales channel.

Click on Develop apps. We should be able to create an app here and see the details for that app, which is the API token as well as all the scopes that have been configured for that app. So you can go to API credentials to see the one-time API access token that will be generated for this. And you can also see the scopes that have been assigned to this. This will help decide which objects can be ingested by you and the data inside them can be ingested by you via the Shopify connector. And also we should keep in mind that this URL out here, which I've opened separately as well, is going to be the URL for your Shopify. So let's say we search for Shopify. And Go here. Uh, we will be required to put in the access token and the URL here.

Since I have populated these details already, uh, I'll go to the connection that I've created and show how this would look like. If you click on edit, we'll be able to see uh the API token. Uh, the access token is basically the token that I would have received from the one-time access token here in settings in your Shopify app in under apps and sales channel, under API credentials. And the URL would have been the URL of your Shopify connector, which I showed would be on your top left.

I already have one product as well in my Shopify. It has some details and it has some price associated with it. You can click on test connection to see whether your credentials that you've put in are correct or not. You can then go into Data Cloud Data Streams and click on new.

And you'll be able to see the Shopify logo. And then you will be able to select the connection that you just established and then bring in whatever data you want to bring in. So let's say I want to bring in Products. We'll go to the next. It will take some time because it will actually see whether you have the permissions and the necessary scopes to bring in this. Uh, you can then tag it as what kind of object do you want to bring it in as. I'll keep it at

profile. Uh, you can provide which will be your primary key as well as which will be your, um, how will it be accessed, whether, when this key should be, you know, refreshed and changed. Um, then you can actually select the fields that you want to bring in from this. Let's say we select a few fields. It's important that you have access to these fields in your Shopify app. You can then select whether you want to do an incremental or a full refresh.

This will basically guide how often your data will be refreshed. And there's also a filter button here, which is basically that if suppose you want to bring in customers' data or product data or any other object, do you want to bring in the whole of it, or do you want to actually filter some of it and bring it in? You can actually give a SQL-like query here and say that you only want to bring in a certain customer's data or a certain product's data or whatever the object that you're bringing in from. I will just click deploy and uh this basically concludes our demo here.
